<td>Defines the process performed when the Link to Knowledge related link is clicked. Select <strong>Always create record</strong> to create a new knowledge article with the latest published revision attached. The knowledge article is then linked to the document. Select <strong>Update existing record</strong> to update the existing knowledge article to the latest published revision. If no knowledge articles exist for the document, a new knowledge article is created. The <strong>Update existing record</strong> option is not available when many knowledge articles are linked to a document.</td>
</tr>
<tr>
<td>Type</td>
<td>Specifies the type of knowledge article. Use Knowledge or any option that extends the kb_knowledge table. For example, if you have the IT GRC plugin installed to create GRC policies, select the type Policies. Note that when a knowledge article is created, the <strong>Type</strong> field becomes read-only.</td>
</tr>
<tr>
<td>Topic</td>
<td>Defines the subject of the document. Adds the topic information to the same field in the knowledge article.</td>
</tr>
<tr>
<td>Published</td>
<td>Date that the article should be published. Adds publishing date information to the same field in the knowledge article.</td>
</tr>
<tr>
<td>Valid to</td>
<td>Date that the article expires. Adds valid to date information to the same field in the knowledge article.</td>
</tr>
<tr>
<td>Short description</td>
<td>A few words or short phrase describing the knowledge article. Adds the short description to the same field in the knowledge article.</td>
</tr>
</tbody>
</table>

View knowledge linked to a document

You can view the knowledge linked to a document from the document record.

1. Navigate to the document record.
2. Select the **Knowledge Records** related list.
3. Select the knowledge article to view.

Create a document

After Managed Documents parameters have been set by the administrator, documents can be created, requested, checked out, edited, checked in, copied, and, if necessary, rolled back to an earlier version.

Once documents have been added to the Managed Documents application, they can be grouped into document collections.

Approval process

During the approval process, the approver approves or rejects the document. A document goes through the approval process after the review process.

Approval workflow

After the document has been reviewed, submit the document for approval. If the document does not have an approver, the approval process is omitted.

When the document is Active, the workflow Document Management Default is used to manage approvals:
Document Management Default workflow
If the approver rejects the document, the author and owner are notified and the document review is cancelled. The author, owner, and approver should discuss what changes need to be made to the document. When the document is ready, a new review can be initiated.

If the final approver approves the document, the author and the owner are notified. Once final approval is successful, the document stage changes to Ready for Publishing in the Document Revisions list.

**Document Management Default workflow result**

**Process modification for multiple approvers**

If there are multiple approvers, the approval process works in sequence and multiple approvers can be assigned to a single sequence. For example:

Sequence 1: approvers A and B
Sequence 2: approvers C and D
Sequence 3: approver E

Because the sequences take place in ascending chronological order, approvers A and B receive the approval request first (approvers C, D, and E are not part of the process yet). Similar to the review process, the first approver to act within a sequence dictates what happens to the document. If approver A acts first and rejects the document, the approval process stops and the state is set to Cancelled. Approver B’s status is changed to No Longer Required. If approver A acts first and approves the document, the process stops and approver B’s status is changed.
to No Longer Required. Then, the document moves to approval sequence 2. After at least one approver in each sequence approves the document, the author and the owner are notified that the document has been approved.

**Review process**

During the review process, the reviewer approves or rejects the document. Sometimes a document will have multiple reviewers.

If the reviewer rejects the document, the author and owner are notified and the review is cancelled. The author, owner, and reviewer should discuss what changes need to be made to the document. If the reviewer approves the document, the author and owner are notified that the review was successful and the document can move to the approval stage.

If multiple reviewers are assigned to a document, the first reviewer to act dictates what happens to the document. For example, there are two reviewers, A and B. If reviewer A acts first and rejects the document, the review process stops and the revision state is set to Cancelled. Reviewer B receives a notification email stating that the review was rejected and their status is changed to No Longer Required. If reviewer A acts first and approves the document, the review process stops and the document can move to the approval stage. Reviewer B’s status is changed to No Longer Required.

**Enable electronic signature for approval**

This topic explains how to enabling electronic signatures for approval. Electronic signatures are helpful if you must obtain a digital signature for compliance or auditing purposes.

You can activate the Approval with e-signature to require that users type in a user name and password when reviewing and approving documents.

The digital signature is not tracked or stored in the document record. Users must simply type in a user name and password after clicking the Approve or Reject button.

After activating the Approval with E-Signature plugin, ensure that a row in the e-signature registry table is created for the dms_document_revision table.

1. Navigate to System Definition > e-Signature Registry.
2. Check if dms_document_revision is already listed and Enabled is set to true.
3. If not listed, click New.
4. In Table name, select Document Revision.
5. Select Enabled.
6. Click **Submit**.

### Publish an approved revision

This topic explains how to publish a document revision that has been approved.

Once a document has been created and edited, a specific revision can be submitted for draft review and final approval. After final approval, the document can be published.

Publish the approved revision from the Document Revisions list.

**Note:** Publishing documents to the Knowledge Base requires the Knowledge Document Plugin.

1. Navigate to the document record.
2. In the Document Revisions List, click the revision marked **Ready for Publishing**.
3. Click **Publish Revision** to display the **Publish** dialog box.

The revision number matches the latest revision number. If your standard is to change the revision number when the document is published, such as incrementing the version number to 1.1 or 1.0.1, the change can be made on this dialog box manually.

4. Click **Publish**.

The published revision is highlighted in green and the stage of previous revisions is automatically changed to Retired.
Note: If the approval and publishing process is repeated, the published revision is retired when the new revision is published. Any workflows running against previous revisions are canceled when the document is published.

Submit a revision for draft review

This topic explains how to submit a document draft for review.

Once a document has been created and edited, a specific revision can be submitted for draft review and final approval. After final approval, the document can be published.

When a draft of the document is ready, submit the draft for review. If the document does not have reviewers identified in the Reviewers field of the document record, the review process is omitted.

1. Navigate to the document record.
2. Right-click the appropriate revision.
3. Select Submit Revision.

The revision stage is set to Awaiting Review.
Create or request a new document

Once an administrator has set parameters for the Managed Documents application, you can create or request new documents.

1. Navigate to Managed Documents > Create New.
2. Complete the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>An identifying number for the document. Automatically generated using number maintenance.</td>
</tr>
<tr>
<td>Field</td>
<td>Input value</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Name</td>
<td>A name for the document. Note that the name for the document is combined with other naming components (as defined by the name format) to create the names for each document revision.</td>
</tr>
<tr>
<td>Requested by</td>
<td>The person asking that the document be created or updated.</td>
</tr>
<tr>
<td>Owner</td>
<td>The approver of the document request. Also responsible for setting completion date with requesters and authors.</td>
</tr>
<tr>
<td>Reviewers</td>
<td>The user or users who review the document and provide feedback to owners and authors.</td>
</tr>
<tr>
<td>Department</td>
<td>The department responsible for the document.</td>
</tr>
<tr>
<td>Type</td>
<td>The document purpose. This is a choice list derived from the type parameters.</td>
</tr>
<tr>
<td>Classification</td>
<td>The document classification, based on security, audience, and confidentiality. This is a choice list derived from the classification parameters.</td>
</tr>
<tr>
<td>Audience</td>
<td>The document readers, such as external or internal. This is a choice list derived from the audience parameters.</td>
</tr>
<tr>
<td>State</td>
<td>The current status of the document in the editing and publication process.</td>
</tr>
<tr>
<td>Checked out by</td>
<td>The user who currently has the document checked out.</td>
</tr>
<tr>
<td>Description</td>
<td>A short description of the document.</td>
</tr>
<tr>
<td>Revision Settings</td>
<td></td>
</tr>
<tr>
<td>Name format</td>
<td>The format for the name of each individual revision of the document. For more information, see Defining Name Formats.</td>
</tr>
<tr>
<td>Revision format</td>
<td>A choice between the two digit (0.x) or the three digit (0.0.x) revision format.</td>
</tr>
<tr>
<td>Auto increment revision</td>
<td>If selected, the revision number automatically increments each time the document is revised.</td>
</tr>
</tbody>
</table>

The User Permissions related list determines which users have rights to view and contribute to the document:

**User permissions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>A reference to a user who is entitled to read and contribute to the document.</td>
</tr>
</tbody>
</table>
The Group Permissions related list determines which groups have rights to view and contribute to the document:

**Group permissions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Group</strong></td>
<td>A reference to a group of users who are entitled to read and contribute to the document.</td>
</tr>
</tbody>
</table>
| **Type** | A choice list describing how group members can interact with the document. Options are:  
  - Reader - Group members can read the document.  
  - Editor - Group members can upload new versions.  
  - Owner - Group members can edit the document. |

**Specify an approver**

You can specify approvers for a document record after you save it.

You can have one approver or multiple approvers. For example, set multiple approvers to have one person do a quality check of the document and a different individual to serve as a final approver. Approvers are assigned a number. The lowest number (usually number one) approver always goes first, then any other approvers in ascending chronological order. Multiple approvers can have the same sequence number. For example, two approvers can do a quality check and be assigned sequence number 1. Then, two individuals can be final approvers and be assigned sequence number 2.

1. Navigate to the document record.
2. Right-click in the document header bar and select **Add Approver**.
3. Add a user name.
4. Select a sequence number from the drop-down list. (Lower numbers approve before higher numbers. For example, approver number one approves before number two.)
5. Click **Add User**.
6. Repeat steps 2-5 to add more approvers.

**Check in a document**

Check in the document after you revise it so other users can check out the document.

1. Navigate to the document record.
2. Select the **Upload/Check In Revision** related link.
3. Click **Browse** and navigate to the revised file.
4. Click **Open**.
5. Check the Name and Revision Number.
6. Click **OK**.

The Document Revisions related list updates to contain the most recent revision:

![Document Revisions](image)

**Document revisions**

**Copy a document**

A document can be duplicated at any time. This is useful if you have an existing document that you want to use as a base for a new document.

1. Navigate to the document record.
2. Right-click the header bar and select **Copy Document**.
   
   An information message with a link to the new document displays:
3. Click **OK**.
   
   The new document is renamed and includes the word "Copy."

   ![Note: Only the latest revision is copied.](image)

**Deactivate a document**

To change the document state to Inactive, deactivate the document. This is useful when changes to a document have been put on hold. An inactive document can be reopened at any time.

1. Navigate to the document record.
2. Right-click the header bar and select **Deactivate Document**.

   ![Note: To activate a document, right-click on the header and click Reopen Document.](image)
Reopen a deactivated document
A document that has been deactivated can be reopened.
1. Navigate to the document record.
2. Right-click the header bar and select **Reopen Document**.

Roll back a document
A document can be rolled back to an earlier revision at any time. Before rolling back to an earlier revision, ensure that the document is not checked out and that you have Editor or Owner permissions for the document.
1. Navigate to the document record.
2. In the Document Revisions list, click the revision to which you want to roll back.
3. Right-click the header bar and select **Rollback**. The Rollback to Revision dialog box displays. The name and revision number are new. The note specifies the revision to which you are rolling back.

```
Rollback to revision

Name
Security_POL_0.6
Note: The uploaded file will be renamed to the name above
Revision Number 0.6

Rollback from revision 0.3
```
4. Change any information on the Rollback to Revision dialog box as necessary.
5. Click **OK**. The latest revision is now the revision you selected for rollback.

Cancel a document
Change the document state to Cancelled when no more changes will be made to the document.
When canceling a document, there is no confirmation message, so ensure that you want to cancel the document.
1. Navigate to the document record.
2. Right-click the header bar and select **Cancel Document**.
    
    An info message confirms the cancellation:
    
    The State is set to Cancelled:
Check out a document

Documents in the Managed Documents application can only be revised by one user at a time. Check out the document to revise it.

1. Navigate to the document record.
2. Select the Check Out Document related link.
3. Select Download file to download the current version of the document when it is checked out.
4. Click Check Out.

After checking out a document, you can edit the document and make any necessary changes.

Create a document collection

A document collection is a set of individual documents. After documents have been uploaded into Managed Documents, organize the documents by grouping them into collections.

1. Navigate to Managed Documents > Document > My Collections.
2. Select New.
3. Type in a Name.
4. (Optional) Type in a Description.
5. Click Submit.
6. Click the name of the collection you created.
7. Click Edit.
8. On the left, double-click an available document or select a document and click **Add**.
9. Click **Save**. The Document Collection page displays and the individual documents in the collection are listed:

![Document Collection](image1)

**Upload a document**

Upload a document into a saved record. You can upload text files, spreadsheets, presentations, PDF files, and more.

1. Navigate to the document record.
2. Click the **Upload/Check In Revision** related link.
3. Click **Choose File** and navigate to the file.
4. Click **Open**.
5. Check the Name and Revision Number.
6. Click **OK**.

After the initial document is uploaded, subsequent revisions can be created by checking out the document.
MetricBase

Use the MetricBase product to collect, retain, analyze, and visualize time series data on the Now Platform.

Time series data is a collection of values for an item taken at specific time intervals. Time series data is stored in a separate database, called the MetricBase database. An example is collecting CPU usage values for a computer every hour. You can then use the time series data to evaluate system capacity issues.

The MetricBase product is integrated with the Now Platform making it easy to handle time series data for applications on the Now Platform. The MetricBase database saves values as floating-point numbers.

The MetricBase product is available as a separate subscription. For more information, see Request the MetricBase product.

Request the MetricBase product

The MetricBase product requires a separate subscription and must be activated by ServiceNow personnel.

Role required: none

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and sub-production instances, generally within a few days.

View time series retention policies

The MetricBase application provides pre-defined retention policies that define the data collection interval for a metric.

Role required: admin

How often time series data is collected and how long the time series data is retained are important parameters for each metric. The MetricBase application provides pre-defined retention policies. You cannot create retention policies.

A retention policy is a series of time periods and collection rates. An example is 8d@1h, which means for eight days data is collected at one hour intervals. A retention policy is a series of these time periods with longer intervals for each subsequent time period. For example, 8d@1m, 94d@30m, 397d@1h.

Retention policies define the collection interval, which changes with the age of the data. Older data is compacted and stored with lower fidelity. You can see the available retention policies with the Retention Policies module. The 8d@1m, 31d@30m, 397d@1h retention policy means

- For the last eight days, data points are available at 1-minute intervals.
- Data points from 9 through 31 days are compressed to 30-minute intervals.
- Data points older than 32 days are compressed to 1-hour intervals.
- If data is ingested at 30-second intervals in the last eight days, one data point is lost. Data in the last eight days are always stored at 1-minute intervals.
- If data is ingested at 2-minute intervals in the last eight days, the missing data points are stored as NaN. Data in the last eight days are always stored at 1-minute intervals.

1. Navigate to MetricBase > Retention Policies.
2. Click a policy to view the collection interval specification.
Create a time series metric

Create a time series metric record for each item for which time series data is to be collected. You must define the table, metric field name, and the retention policy.

Role required: admin

2. Click New.
3. Complete the time series metric definition form then click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Name of the metric.</td>
</tr>
<tr>
<td>Table name</td>
<td>Name of the table to contain the metric. A table can have multiple metric columns. Required.</td>
</tr>
<tr>
<td>Metric field name</td>
<td>Required. Define the name of the column to add to the target table.</td>
</tr>
<tr>
<td>Retention policy</td>
<td>Required. Retention policy to use. Select one of the available retention policies.</td>
</tr>
<tr>
<td>Application</td>
<td>Application for which this metric is defined. (Auto filled)</td>
</tr>
<tr>
<td>Display value aggregator</td>
<td>Aggregation to use for the metric field display value on the list view of the table.</td>
</tr>
<tr>
<td>Display value re-sampling duration</td>
<td>Sample interval to use for the metric field display value on the list view of the table.</td>
</tr>
</tbody>
</table>

Add a float field with the name specified in the Metric field name field to the target table.

Store time series data

Use JavaScript, REST, or scriptable REST APIs to add time series data to a metric field.

It is recommended that you use the REST APIs to store time series data.

For information on the MetricBase REST APIs see the REST API Explorer on an instance with the MetricBase application installed, or see the Clotho Time Series API.

For information on the MetricBase JavaScript APIs, see Client, ClothoTransform, Data, DataBuilder, and DataSelector.

In practice, for performance reasons, batch multiple series of multiple data points and store them at one time, do not insert each data point individually.

Store time series data using REST APIs

```
curl -v "https://<your_instance.servicenow.com>/api/now/v1/clotho/put" --request POST --header "Accept:application/json" --header "Content-Type:application/json" --data "{"seriesRef":{"subject":"6d499254c70232007a89aba35a976359","table":"cmdb_ci_knode"}}"
```
Store time series data using JavaScript APIs

```javascript
// get the subject GlideRecord with which we are going to put metric data
var gr = new GlideRecord('cmdb_ci_computer');
gr.get(<sys id of record containing metric to be stored>);

// build time series data for cpu_percentage metric. time is GlideDateTime
var dataBuilder = new sn_clotho.DataBuilder(gr, 'cpu_percentage').add(time, 0.75);

// use clotho client to insert data
new sn_clotho.Client().put(dataBuilder);
```

Analyze time series data

Use JavaScript or REST APIs to extract time series data from the MetricBase database, and to run transforms on the data.

For information on the MetricBase REST APIs see the REST API Explorer on an instance with the MetricBase application installed, or see the **Clotho Time Series API**.

For information on the MetricBase JavaScript APIs, see **Client**, **ClothoTransform**, **Data**, **DataBuilder**, and **DataSelector**.

Analyze time series data with the JavaScript APIs

This example is to get the average CPU percentage over the specified time for each XYZ computer.

```javascript
// Query the cmdb_ci_computer table for the records for
var gr = new GlideRecord('cmdb_ci_computer');
gr.addEncodedQuery('manufacturer=xyz');
gr.query();

// Create a DataSelector object and specify the metric (cpu_percentage),
// the transform (avg), and label (avg cpu)
var transform = new sn_clotho.DataSelector(gr).addMetric('cpu_percentage').avg()
   .label('avg-cpu-percentage');

// Run the transform between startTime and endTime.
// startTime and endTime are GlideDateTime
var data = new sn_clotho.Client().transform(transform, startTime, endTime);
var values = data['avg-cpu-percentage'].getValues();
```
View time series data

You can view time series data for a metric. A metric is defined for all records in a table, and you can view the time series data for all records.

Role required: admin

1. Navigate to the table containing the metric.
   In the Filter Navigator, type `<table name>.list`, and hit enter.
2. Click on the menu icon above the metric column, and select **Time Series Chart**.
3. Change the **Time Span** and **Transform** fields to evaluate the data.
   When you select the **Add**, **Multiply**, or **Divide** transforms, the **Value** field and **Submit** button are shown. Enter a value and click **Submit** to view the adjusted data. The adjusted data is not saved to the MetricBase database.

View MetricBase status

You can view the status of the MetricBase database.

Role required: admin

1. Navigate to **MetricBase > MetricBase Status**.
   A list of MetricBase statistics is shown.
2. Set up the list to show the information you want to check.
   a) Click the Update Personalized List icon.
   b) Use the slush bucket to move the desired metric to the display, and click **OK**.
3. Click on the metric value to view the time series data for that statistic.

Debug MetricBase

You can use session debug tools to debug issues.

Role required: admin

1. Navigate to **System Diagnostics > Session Debug > Debug MetricBase**.
   This starts session debug tracking for MetricBase activities.
2. Navigate to **MetricBase > MetricBase Status**, and scroll to the bottom of the list.
   Debug information is listed below the list.

MID Server

The ServiceNow® MID Server application facilitates communication and movement of data between the platform and external applications, data sources, and services.

**Explore**
- [MID Server release notes](#)
- [Upgrade to Jakarta](#)
- [Introducing the MID Server](#)

**Set up**
- [MID Server installation](#)
- [Create the MID Server user and grant the role](#)
- [Configure a default MID Server for each application](#)

**Administer**

Introducing the MID Server

The Management, Instrumentation, and Discovery (MID) Server is a Java application that runs as a Windows service or UNIX daemon on a server in your local network.

The MID Server facilitates communication and the movement of data between a ServiceNow instance and external applications, data sources, and services.

This video gives you an overview of the MID Server:

Applications that use MID Servers

<table>
<thead>
<tr>
<th>ServiceNow applications</th>
<th>Other applications</th>
</tr>
</thead>

<td></td>
<td>Borland Starteam Integration</td>
</tr>
<tr>
<td></td>
<td>Microsoft MIIS</td>
</tr>
<tr>
<td></td>
<td>Service Assurance</td>
</tr>
</tbody>
</table>

Communicating with the MID Server

The MID Server initiates all communications with the ServiceNow® instance. The instance never initiates communications with the MID Server. This communication is recorded as records in the ECC queue, which is essentially the communication log between the instance and the MID Server. See The MID Server ECC queue for more information.

MID Server selection

An application can select a MID Server in these ways.
• **Auto-selection**: The application can automatically find an appropriate MID Server that meets the necessary selection criteria. The criteria is different for each application.

• **Default selection**: The application defaults to a single MID Server that you can specify for each application.

• **Manual selection**: The application selects a single MID Server that you specify. Not every application allows for manual selection.

See [MID Server selection](#) for details.

**Asynchronous Message Bus**

The MID Server opens a persistent connection to the instance through the Asynchronous Message Bus (AMB) Client and listens on the `/mid/server/<mid_sys_id>` AMB channel. When an output record is inserted into the Queue (ecc_queue) table, an AMB message is sent to the MID Server's channel. The MID Server receives this message and immediately polls the ecc_queue table for work.

The MID Server polls the ECC queue on the regular interval defined in the `mid.poll.time` configuration parameter, regardless of AMB message activity. The default polling interval is set to 40 seconds, but can be reconfigured. This polling of the ECC queue at a regular interval is done in case the AMB connection is dropped.
Note: The AMB client on the MID Server does not work in all environments and might need to be disabled to avoid performance issues. To disable AMB in your environment, set the `mid.disable_amb` parameter to `true`. When you disable AMB, the MID Server reverts to a default polling interval of 5 seconds, unless the `mid.poll.time` parameter is set to a different value.
System clones and the MID server

See KB0547597 for information on what to do with MID Servers when you are cloning your instance.

MID Server heartbeat

The Now Platform checks the MID Server for a response every 5 minutes, using a synthetic transaction monitoring system.

Checking for a heartbeat

ServiceNow instances send a synthetic transaction via the Heartbeat probe to every MID Server every 5 minutes. The Heartbeat probe functions exactly as a normal probe does and is sent by writing an output record to the ECC queue. A MID Server retrieves the record when it queries the ECC queue for work. The MID Server processes the probe just as it would any other probe and responses back to the instance. If the instance does not detect a response from a MID Server, the instance marks that MID Server as Down. If the MID Server responds, the instance considers the MID Server to not be Down and is communicating properly with the instance.

Note: Make sure that your MID Server can communicate on port 443. See MID Server connection prerequisites and MID Server system requirements for more information.

System events

When a MID Server transitions from one state to another, one of these events is triggered:

- **mid_server.up**: The MID Server goes from a status of Down, Paused, or Upgrading to a status of Up.
- **mid_server.down**: The MID Server goes from a status of Up to a status of Down.
- **mid_server.paused**: The MID Server is paused.
- **mid_server.upgrading**: The MID Server is being automatically upgraded because the instance is being upgraded.

You can use these events to send notifications or trigger actions that you specify in scripts.

Scheduled job

To change the trigger interval for the Heartbeat probe, navigate to System Scheduler > Scheduled Jobs > Scheduled Jobs. Open the MID Server Monitor record and edit the interval.
MID Server heartbeat trigger interval

MID Server system requirements

Use these minimum system requirements to allocate resources for computers hosting MID Servers.
MID Server supported systems

The following systems support the MID Server.

  **Note**: .NET Framework version 3.5, 4.0, or 4.5 is required for Service Mapping support and for Windows pattern-based discovery.

- **Linux**: The MID Server was tested on Linux Red Hat 6, Ubuntu 12, and CentOS 6. Linux MID Servers support virtual machines and 64-bit systems. On 64-bit Linux systems, you must install the 32-bit GNU C library (**glibc**). The installation command for CentOS is: `yum install glibc.i686`.

Java version support

The MID Server installs with JRE version 1.8. If you upgrade with a MID Server using JRE 1.6, the system automatically upgrades that MID Server to use version 1.8. Both the 32 bit and 64 bit MID Servers use JRE 1.8.

Setting the JVM Memory size

The MID Server installs with 1 GB of JVM memory. If the suggested memory size for your product is greater than 1 GB, see [Set the MID Server JVM memory size](#) for the procedure to override the default setting.

Standard deployments

System requirements for your instance are determined by the needs of the individual products you use that require a MID Server. The following products are considered “standard” because their MID Servers share the same minimum disk space and memory requirements:

- Discovery
- Event Management
- Integrations
- Orchestration
- Service Mapping

The minimum standard requirements pertain to both a single product and a combined product deployment. You can deploy a single MID Server for multiple standard products without significantly increasing the disk or memory requirements.

High resource deployments

Content Management Platform (CMP), Service Analytics and Operational Metrics are processing intensive and require more resources for each MID Server than the standard products. Install MID Servers for these products on dedicated hosts that do not support MID Servers for other products.
Recommended MID Server minimum requirements

All configurations listed here require a quad core processor with a speed of 2 GHz or greater and were calculated for a Windows Server 2012 R2 host.

**Note:** The MID Server minimum system requirements for 25 concurrent threads includes resource overhead that is independent of the number of threads. As a result, the system requirements for 200 threads do not require a linear increase in resources.

### MID Server minimum system requirements for 25 concurrent threads (base system)

<table>

### Use case 1: Single MID Server deployed for multiple standard products

In this example, Service Mapping, Discovery, and Orchestration share a MID Server with 25 threads that is installed on a dedicated host. The disk space and memory requirements specified here satisfy the minimum recommended requirements for the combined product deployment.
### Use case 2: Multiple MID Servers deployed to a single host

In this example, three MID Servers for standard products are deployed to a single host, where each MID Server has 25 threads. The required resources are calculated as follows:

- **Total disk space required**: Add the recommended disk space for the operating system from the **OS** column to the sum of the values in the **MID Server + product** column for all products mapped.
- **Total memory required**: Add the recommended memory for the operating system from the **OS memory** column to the sum of the values in the **JVM memory** column for all products mapped.

### Monitoring performance

To ensure that the MID Server resource allocations are sufficient for your environment, monitor performance during peak periods of product execution from the **MID Server dashboard**.

### MID Server version compatibility

The version of the MID Server must be compatible with the version of the instance. Otherwise, the MID Server cannot process commands or communicate with the instance.

The instance determines which version of the MID Server is allowed. The MID Server version must at minimum belong to the same major release, such as Helsinki. If the MID Server version belongs to the same major release, it can, but does not have to, belong to the same minor version, such as Helsinki Patch 1. In this case, communication with the instance might still be possible, but it is always suggested that you upgrade to the latest version.
Caution: You can pin the MID Server to a specific version using the `mid.version.override` property, but you should be aware that the version might become out of date.

For more information on upgrades, see MID Server upgrade.

Version indicators

If the version is not compatible, the MID Server status is not changed to Down in the MID Server dashboard. So it might still appear to be processing commands when it actually is not doing so. You must check the MID Server Version on the dashboard, which is available starting with the Istanbul release.

The icons in the Version column indicates the following:

- **Red**: Incompatible. The MID Server and instance do not belong to the same release. You must upgrade the MID Server and verify that it is not pinned to an older version with the `mid.version.override` property. The MID Server will not be upgraded until the parameter is cleared.
- **Yellow**: Compatible, but an upgrade is recommended. This indicates that the MID Server version belongs to the same family as the instance, but not the same version.
- **Green**: Compatible. No upgrade necessary.
- **Gray**: Incompatible. The instance cannot detect the version.

See KB0535181 for additional MID Server troubleshooting information.

MID Server connection prerequisites

You must install a MID Server on a local network resource and configure it to communicate with the machines it probes.

Network privileges

The local network resource must have these network privileges:

- Firewall access: Configure any firewalls between the MID Server and the target devices to allow a connection. If your network uses a DMZ, and if your network security protocols limit port access from within the network to the DMZ, you might have to deploy a MID Server to a machine within the DMZ to probe the devices there.
- Network access: Configure target devices to allow the MID Server probe to connect. If network security prevents you from configuring new machines that can connect to the targets, install the MID Server on an existing machine with connection privileges.
- Network account: Install the MID Server with the proper account, either local or domain administrator.

Additionally, for the MID Server to access your ServiceNow instance, satisfy these prerequisites:

- Network access to the ServiceNow instance: Configure the network that the MID Server uses to allow traffic over TCP port 443.
- A MID user: Create a ServiceNow user record for the MID Server to use. This user record must have the mid_server and import_admin roles.
Security considerations

Sometimes computers or devices have additional security measures configured, and these measures may interfere with the MID Server's ability to run commands or queries on those systems. For example, a Linux server might be configured to allow only certain IP address to connect to it via SSH. Similarly, a network router might be configured to allow only certain IP address to query SNMP on it. To allow access in such cases, use one of the following methods:

- Update the configuration of those computers or devices to allow the desired MID Server to run commands or query them. For example, a network router may be configured to only allow the network management systems to query SNMP on it. In that case, add the MID Server as though it were another network management system.
- Install a MID Server on a computer that already has access to the computers or network devices with such restrictions. For example, to use Discovery within a DMZ (where communication from outside the DMZ will be severely restricted), install a MID Server on a computer that is already in the DMZ.

External connectivity requirements

These requirements are specifically for the use of MID Servers with the ServiceNow Discovery and Orchestration products.

The MID Server communicates securely on port 443 to the instance and requires no inbound connections. In some cases, it might be necessary to allow this communication through the firewall if the MID Server fails to register on the instance. To determine if the application or a network security restriction is to blame for connection failure, attempt to telnet to the instance on port 443 from the server that is hosting the MID Server application. If this connection fails, then the problem could be a web proxy (since 443 is a https connection) or a Firewall rule preventing external TCP connections from that host. Contact network security personnel for the proxy information to add to the config.xml file, or request that the firewall be configured to allow access using one of the following syntax:

- `<source IP> to <any>`
- `<source IP> to <ServiceNow> any established`
- `<source IP> to <instance_name.service-now.com> 443`

Important: Ensure that the MID Server can connect to install.service-now.com to download and install updates.

Internal connectivity requirements

These methods are used for discovering various devices on a network and are specifically for the use of MID Servers with the ServiceNow Discovery and Orchestration products.

- **SSH:** For UNIX-like machines, Discovery and Orchestration use SSH protocol, version 2 to access target machines. SSH is a network protocol that allows data to be exchanged using a secure channel between two networked devices. SSH communicates on port 22 within an encrypted datastream and requires a login to access the targets using two available...
methods of authentication: a user name and password combination and a user name and shared private key. Specify SSH authentication information and type in the Credentials module. If multiple credentials are entered, the platform tries one after the other until a successful connection is established or all are ultimately denied. To provide for application relationships a limited number of SUDO commands must be available to be run. Additional details to these requirements can be found in UNIX/Linux commands requiring root privileges for Discovery and Orchestration.

- **WMI**: For Windows machines, Discovery uses the Windows Management Instrumentation (WMI) interface to query devices. Due to security restrictions for WMI, the MID Server application executing the WMI queries must run as a domain user with local (target) administrator privileges. When Discovery detects activity on port 135, it launches a WMI query. The response from the Windows device is sent over a Distributed Component Object Model (DCOM) port configured for WMI on Windows machines. This can be any port. Ensure that the MID Server application host machine has access to the targets on all ports due to the unique nature of the WMI requirements.

- **Windows PowerShell**: PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications. Orchestration uses PowerShell to run Workflow activities on Windows machines. PowerShell must be installed on any MID Server that executes these activities. MID Servers using PowerShell must be installed on a supported Windows operating system. ServiceNow supports PowerShell 2.0 and 3.0. Orchestration activities for PowerShell require a credentials Type of Windows.

- **SNMP - Network**: For network devices, Discovery uses an SNMP scan to get device specific MIBs and OIDs. SNMP is a common protocol used on most routers, switches, printers, load balancers and various other network enabled devices. Use a community string (password) for authentication when scanning a device via SNMP. Many devices have a default community string of public which Discovery uses by default when querying a target. Define additional community strings in the SNMP credentials form which are tried in succession, along with public, until a successful query returns. In addition to the credentials, the platform also requires the ability to make SNMP requests on port 161 from the MID Server to the target. If Access Control Lists (ACLs) are in place to control the IP addresses that can make these queries, ensure that the IP address of the MID Server is in the ACL. ServiceNow Discovery supports SNMP versions 1, 2c, and 3.

- **WBEM**: Web-Based Enterprise Management (WBEM) defines a particular implementation of the Common Information Model (CIM), including protocols for discovering and accessing each CIM implementation. WBEM requires either of two ports, 5989 or 5988 and uses the HTTP transport protocol. WBEM supports SSL encryption and uses CIM user name/password credentials. ServiceNow Discovery launches a WBEM port probe to detect activity on the target ports and to append gathered data to a classification probe that explores CIM Servers.

**MID Server installation**

The installation of the MID Server requires you to satisfy certain connection prerequisites and create a MID Server user before you download and install the MID Server service on a host machine.

You can perform the installation prerequisites and install the MID Server manually or use the MID Server Guided Setup utility, which streamlines the entire process and allows you to set up a basic MID Server quickly.

The manual process requires these setup tasks, performed in the order shown here:

1. Configure communication between the MID Server and the instance on the appropriate port and enable required web services. See Configure MID Server connection prerequisites for details.
2. **Create the MID Server user** and grant that user the mid_server role.

3. **Download the installer file** for the host machine.

4. Install the MID Server on a Linux or Windows host.

5. **Test the MID Server** connection to the instance.

6. **Validate the MID Server** to ensure that it is trusted to access credentials used by the instance for automations.

7. Configure **MID Server parameters**, which control several aspects of MID Server functionality, including proxy servers, debugging, and upgrade.

---

**Use MID Server guided setup**

MID Server guided setup provides a sequence of tasks that help you install a MID Server with the proper user account, select SNMP credentials for that MID Server, and assign IP addresses automatically.

Role required: admin

You are guided through configuration activities that create, download, and validate a MID Server. A progress indicator on each screen allows you to monitor your progress for each task.

Each configuration activity provides the following resources to help you:

- Contextual embedded help.
- Links to comprehensive documentation on the ServiceNow product documentation site.

**Important:** You must complete MID Server configuration before you can launch any other IT Operations Management guided setup.

1. Navigate to **Guided Setup > ITOM Guided Setup**.
   The IT Operations Management Guided Setup welcome screen appears.
2. **Click Get Started.**

The IT Operations Management Guided Setup category screen appears, with controls for starting the MID Server tasks.
3. In the MID Server pane, click **Get Started**.
The MID Server task list appears with a description of each task.
MID Server

The MID Server runs as a Windows service or a UNIX daemon to facilitate communication and the movement of data between a ServiceNow instance and external applications, data sources, and services. Complete the activities in this category to create a user for the MID Server, download the installation package, and validate the MID Server after installation.

Create MID User
Add Notes
Not started yet

Create the user account that the MID Server needs to authenticate on the ServiceNow instance.

Download & Install MID
Add Notes
Unlock by completing Create MID User

Select and download the appropriate MID Server installer archive for the operating system.

Validate MID
Add Notes
Unlock by completing Download & Install MID

You must validate the network connection between the MID server and your instance before the MID server is permitted to access automation credentials or execute any outbound EOC probes.
4. Click **Configure** to create the MID Server user and follow the instructions in the help pane that appears on the right edge of the screen.

5. When you have provided the requested information for the MID Server user, click **Submit**, and then click **Mark as Complete** at the bottom of the help pane.

The view returns to the task list. Notice that the circular progress indicator for the category shows 20% of the MID Server configuration complete. The progress indicator on the left edge of the screen shows the completion percentage for all the IT Operations Management tasks. In the case of the MID Server, the completed task represents 3% of the MID Server setup's contribution to the whole.
6. Click **Configure** for the next task, **Download & Install MID**, and continue with the MID Server setup.

7. After you create and validate your MID Servers, configure any SNMP credentials you need and select the MID Servers to use for IP range auto-assignment.

When all the required MID Server tasks are completed, you can begin the guided setup tasks for the applications that require a MID Server.
Configure MID Server connection prerequisites

You must perform several prerequisite tasks to allow the MID Server to connect to the instance.

Role required: admin

1. Configure the network to allow MID Server network connectivity to the ServiceNow instance over TCP port 443.
2. Configure basic authentication for SOAP communications with the ServiceNow instance.
3. Navigate to System Web Services > Scripted Web Services > Scripted SOAP Services.
4. Confirm that the following web services are active:
   - GetMIDInfo
   - InstanceInfo
   - MIDAssignedPackages
   - MIDFieldForFileProvider
   - MIDFileSyncSnapshot
   - MIDServerCheck
   - MIDServerFileProvider
5. Type sys_public.list in the navigation search field and press Enter. The Public Pages record list appears.
6. Verify that the InstanceInfo public page is active, to allow the MID Server to validate its version.
7. Make sure that the MID Server computer can access install.service-now.com.

Create the MID Server user and grant the role

Create the MID Server user ID and grant this user the role it needs to communicate with the instance. Additionally, the real-time system validation of MID Server role assignments prevents incompatible settings.

Role required: admin

The MID Server connects to an instance by using the SOAP web service. To allow authentication with the instance, create a separate user account for each MID Server or share the same account across multiple MID Servers. Grant each MID Server user the mid_server role, which is required for the MID Server user on any instance on which basic authentication is enabled. The mid_server role allows the MID Server to access protected tables when strict SOAP security is in place. The system adds the necessary SOAP roles automatically with this role.

Note: The strict SOAP security feature, enabled by default for any instance that uses basic authentication, protects all tables with Access Control Lists (ACL).

1. From the instance, navigate to User Administration > Users.
2. Click New.
3. Complete the fields in the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| User ID     | The same user ID that will be specified in the mid.instance.username parameter of config.xml. If you use special characters, such as an ampersand (&), you must encode the special character using character references in the config.xml file.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>First name</td>
<td>The user's first name.</td>
</tr>
<tr>
<td>Last name</td>
<td>The user's last name.</td>
</tr>
<tr>
<td>Password</td>
<td>The same password that will be specified in the <code>mid.instance.password</code> parameter of <code>config.xml</code>. If you use special characters, such as an ampersand (&amp;), you must encode the special character using character references in the <code>config.xml</code> file.</td>
</tr>
</tbody>
</table>

4. To configure your MID Server to use special characters in the user name or password, such as `passw&rd`:
   a) Open the config.xml file and find these lines:
      ```xml
      <parameter name="mid.instance.username" value="mid_user"/>
      <parameter encrypt="false" name="mid.instance.password" value="passw&rd"/>
      ```
   b) Make the following change:
      ```xml
      <parameter encrypt="false" name="mid.instance.password" value="passw&amp;rd"/>
      ```
   c) Save the file.

   **Note:** For examples of the character references required for well-formed XML, see [Character Entity References](#).

5. Right-click the header and select **Save**.
6. Under the **Roles** related list, click **Edit**.
7. Select the **mid_server** role for this user.
   Each MID Server account must have this role to access protected tables.

   **Important:** The mid_server and security_admin roles are incompatible and cannot be assigned to the same user. For information on how the instance checks role assignments, see [MID Server role validation](#).

8. Click **Save**.
9. To see if the **Logged in user** is the same as the user in the configuration file, look in the MID Server dashboard or view the list view of MID Servers.
   The icon in the **Logged in user** column indicates the following:
   - **Red:** Incompatible. The user does not have the `mid_server role` or the user does not match the value in the `mid.instance.username parameter` (in the `config.xml` configuration file). Reconfigure the MID Server user and verify that it has the `proper user and role`.
   - **Green:** Compatible. The user has the `mid_server role` and matches the user in the configuration file.

10. Confirm that the MID Server account was created successfully and the account has connectivity to the instance.
    a) On the MID Server host, Open a supported web browser on the MID Server host and navigate to the instance.
    b) If the account is already logged into the instance, log out.
    c) Right-click the header and select **Save**.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
d) Use the previously created MID Server user credentials and sign in. If the user name or password includes special characters, make sure that you edit the config.xml file to allow for well-formed XML.

**MID Server role validation**

Real-time system validation of MID Server role assignments prevents incompatible settings.

To prevent MID Server validation failure and ensure that your MID Server is configured correctly, the system runs several business rules that monitor the roles and settings you select for your MID Server user. The instance displays a warning and blocks the change when you attempt to save an incompatible configuration.

**Elevated privileges not permitted**

The mid_server role cannot be configured for elevated privileges. The *Invalid MID Server settings* business rule runs on the Role (sys_user_role) table and prevents the *elevated_privileges* field from being set to true for the mid_server role.

![Warning for elevated privileges on the mid_server role](image)
Relationship table protection

The User Role (sys_user_has_role) table creates the relationship between the (sys_user) and the (sys_user_role) tables.

- **Incompatible role**

  The mid_server and security_admin roles are incompatible and cannot be assigned to the same user. The system determines the user's current role and runs the Security Admin incompatible with MID business rule on the User Role (sys_user_has_role) table. This rule prevents an administrator from adding the security_admin role for a user who currently has the mid_server role.

  ![Image](image.png)

Warnings for incompatible security_admin role assignment

- **Incompatible user role and user record settings**

  The Incompatible MID Server user role business rule runs on the User Role (sys_user_has_role) table to protect its data from incompatible configurations. Validation for this related table ensures that an administrator cannot assign the mid_server role to a user who:

  - Already holds the security_admin role.
  - Has the web_service_access_only field set to true.
  - Has the internal_integration_user field set to true.
A user with the 'Web-Service Access' option set to true cannot be granted the mid_server role

A user cannot be granted both the mid_server and security_admin roles

*MID Server* role assignment rejected

<table>
<thead>
<tr>
<th>User ID</th>
<th>tyree.courgez</th>
</tr>
</thead>
<tbody>
<tr>
<td>First name</td>
<td>Tyree</td>
</tr>
<tr>

</tr>
<tr>
<td>Business phone</td>
<td></td>
</tr>
<tr>
<td>Mobile phone</td>
<td></td>
</tr>
<tr>
<td>Photo</td>
<td>Click to add...</td>
</tr>
</tbody>
</table>
**Incompatible user record settings**

Certain settings in the user record are not permitted with the mid_server role. The **User settings incompatible with MID** business rule runs on the User (sys_user) table to monitor the settings of the **web_service_access_only** and **internal_integration_user** check boxes. If the user has the mid_server role, this rule prevents either of these fields from being set to true.

*Incompatible MID Server settings*

**Note:** If you upgrade from a previous release with incompatible MID Server roles and settings, the system displays the appropriate warning messages when any change is made to the tables monitored by these business rules. If the change is unrelated to any role and settings validation, the system permits the updates and simply warns you of the existing incompatibilities. If the changes violate any compatibility rules in the Jakarta release, the business rules enforce the restrictions appropriately.

**Download the MID Server files**

The MID Server application is downloadable from the ServiceNow service instance. The IP address of the MID Server download site (install.service-now.com) can change without notice. To ensure that you can download the MID Server installation package and receive automatic MID Server upgrades, allow local network access to these IP addresses:

149.96.5.98 and 149.96.6.98

You download the MID Server and then enable Discovery, Orchestration, or any integration that requires the use of the MID Server.

1. On the ServiceNow instance, navigate to **Mid Server > Downloads** on your instance.
2. Select and download the MID Server for the appropriate operating system.
   If the download does not begin immediately, try again later when the system is not as busy.
MID Server downloads

3. Save the download file to a temporary file on the local drive.
4. Move the file into the designated MID Server folder you create for your operating system and run the installer from that location.
   - Linux
   - Windows

Install a MID Server on Linux

This MID Server installer automates the installation of a MID Server on a Linux computer.
Role required: admin, mid_server

Important: Verify that the computer meets the MID Server system requirements.

You can install a MID Server on a 32-bit or 64-bit Linux computer. Click this link to view the installation video:

1. From the Linux command line, type `mkdir -p /servicenow/mid server name` to create the installation directory. You need to have read/write/execute permissions on this folder.
2. Extract the downloaded MID Server archive file, `mid.os.zip` into the `servicenow/mid server name` directory. Use the MID Server name created in the instance or create a new name that you will use for this MID Server moving forward. The resulting directory structure is `/servicenow/<mid server name>/agent`.
3. Change to the `servicenow/mid server name /agent` directory, and enter the following command to start the MID Server installer: `./installer.sh`. If you prefer to manually configure the MID Server instead, skip to this step.
4. Use the installer to enter the following information.
Configure instance connectivity

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>

</tr>
</tbody>
</table>

Test your connection
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ServiceNow MID Server password</td>
<td>Enter the password for the user in the ServiceNow MID Server username.</td>
</tr>
<tr>
<td>Use proxy</td>
<td>Select this check box if your MID Server communicates through a proxy to connect to the instance.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Your proxy server must use Basic Authentication for the MID server to connect to the instance.</td>
</tr>
<tr>
<td>Proxy host</td>
<td>Enter the proxy server host name or IP address. Do not include the protocol in the host name. For example, enter proxyserver.domain.com, not <a href="https://proxyserver.domain.com">https://proxyserver.domain.com</a>.</td>
</tr>
<tr>
<td>Proxy port</td>
<td>Enter the port through which the proxy server communicates. If you leave this field blank, it should use the proxy server's default port number.</td>
</tr>
<tr>
<td>Proxy username</td>
<td>Enter the user name that has administrator rights to the proxy server.</td>
</tr>
<tr>
<td>Proxy password</td>
<td>Enter the password for the user name.</td>
</tr>
</tbody>
</table>

5. Click **Test your connection** to validate the credentials and instance information. If you encounter any errors, verify the information that you input.

6. Click **Next**.

7. Configure the MID name parameters (see table).
### Configure MID name parameters

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Server name</td>
<td>Enter any MID Server name.</td>
</tr>
<tr>
<td>MID Service wrapper name</td>
<td>Modify this field if necessary. It is populated automatically by prefixing <code>snc_mid_</code> to the MID Server name. In most cases, you do not need to modify this.</td>
</tr>
<tr>
<td>MID Server wrapper display name</td>
<td>Modify this field if necessary. It is populated automatically by prefixing <code>ServiceNow MID Server_</code> to the MID Server name. In most cases, you do not need to modify this.</td>
</tr>
</tbody>
</table>

8. Click **Next** to view the summary.
9. Click **Start MID Server**.
   The local host starts the MID Server.

10. Click **Mid Servers List Page**.
    The installer opens the MID Server list from your instance.

11. Select the MID Server name from the list.

   **Note:** It may take a few seconds for the MID Server time to establish a connection with your instance.

   The system displays the MID Server record.

12. From **Related Links**, click **Validate**.
    The MID Server **Validated** changes to **Yes**.
13. To configure the MID Server manually, change to the servicenow/mid server name/agent directory, and then edit the config.xml file as follows:
   a) Find the element `<parameter name="url" value="https://YOUR_INSTANCE.service-now.com" />` and change the value to the URL of your instance.
   b) Enter the MID user credentials in the mid.instance.username and mid.instance.password parameters.
      By default, the MID Server uses basic authentication for SOAP messages. The password value is also encrypted authentication.
   c) Find the `<parameter name="name" value="YOUR_MIDSERVER_NAME_GOES HERE" />` element and change the value for the MID Server name.
   d) Optional: Enter connection information for the proxy server. Remove the appropriate comment tags from the proxy configuration information.
      For example, you can configure these parameters:
      - mid.proxy.use_proxy
      - mid.proxy.host
      - mid.proxy.port
      - mid.proxy.username
      - mid.proxy.password

14. If you configured the MID Server manually, finalize the configuration as follows:
   a) Execute the shell script `start.sh`.
      The system starts the new MID Server.
   b) Log into the instance.
   c) Navigate to MID Servers > Servers.
      The system displays a list of MID Server records.
   d) Select the record matching your new MID Server and verify that the Status is listed as Up.

15. To configure the MID Server to restart automatically when the host is restarted, run `${base_install_dir}/agent/bin/mid.sh install` as root.
    This command installs the MID Server as a daemon service and adds the auto start scripts to the init.d directory.

    Note: You cannot install more than one MID Server service as a daemon on a Linux host. This is a limitation of the Tanuki wrapper service.

Configure MID Server parameters, which control several aspects of MID Server functionality, including proxy servers, debugging, and upgrade.

Install a MID Server on Windows

This MID Server installer automates the installation of a MID Server on a Windows computer.
Role required: admin or mid_server

You can install one or more MID Servers on a supported Windows computer. Click this link to view the installation video:

1. Log in to the Windows host machine where you want to install the MID Server.
2. Create a folder for the MID Server on the top level of the drive such as ServiceNow\MID Server1.
3. Download the MID archive file into the new folder.
4. Right-click the archive and select **Extract All**.
5. Navigate to the `service-now\<mid server name>\agent` folder that was created when the file was extracted.
6. Run `installer.bat` to start the MID Server installer.
   To configure the MID Server manually, skip to [this step](#).
7. Use the installer to enter the following information.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ServiceNow instance URL</td>
<td>Enter the full URL of your instance, for example:</td>
</tr>
<tr>
<td></td>
<td><a href="https://mycompanyinstance.service-now.com">https://mycompanyinstance.service-now.com</a></td>
</tr>
<tr>
<td>ServiceNow MID Server username</td>
<td>Enter the user name of the MID Server user that you already created. The MID Server user must have the mid_server role.</td>
</tr>
<tr>
<td>ServiceNow MID Server password</td>
<td>Enter the password for the user in the ServiceNow MID Server username.</td>
</tr>
<tr>
<td>Use proxy</td>
<td>Select this check box if your MID Server communicates through a proxy to connect to the instance.</td>
</tr>
<tr>
<td>Note: Your proxy server must use Basic Authentication for the MID server to connect to the instance.</td>
<td></td>
</tr>
<tr>
<td>Proxy host</td>
<td>Enter the proxy server host name or IP address. Do not include the protocol in the host name. For example, enter proxyserver.domain.com, not <a href="https://proxyserver.domain.com">https://proxyserver.domain.com</a>.</td>
</tr>
<tr>
<td>Proxy port</td>
<td>Enter the port through which the proxy server communicates. If you leave this field blank, it should use the proxy server’s default port number.</td>
</tr>
<tr>
<td>Proxy username</td>
<td>Enter the user name that has administrator rights to the proxy server.</td>
</tr>
<tr>
<td>Proxy password</td>
<td>Enter the password for the user name.</td>
</tr>
</tbody>
</table>

8. Click **Test your connection** to validate the credentials and instance information. If you encounter any errors, verify the information that you input.
9. Click **Next**.
10. Configure the MID name parameters (see table).
11. Click **Next** to view the summary.
12. Click **Start MID Server**.
   The local host starts the MID Server.

13. Click **Mid Servers List Page**.
    The installer opens the MID Server list from your instance.

14. Select the MID Server name from the list.

   **Note:** It may take a few seconds for the MID Server time to establish a connection with your instance.

15. From **Related Links**, click **Validate**.
    The MID Server **Validated** changes to **Yes**.
16. To configure the MID Server manually, edit the config.xml file with a text editor such as WordPad:
   a) Find the element `<parameter name="url" value="https://YOUR_INSTANCE.service-now.com" />` element and change the value to the URL of your instance.
   b) Enter the MID user credentials in the mid.instance.username and mid.instance.password parameters. By default, the MID Server uses basic authentication for SOAP messages. The password value is also encrypted authentication.
   c) Optional: Find the `<parameter name="name" value="YOUR_MIDSERVER_NAME_GOES_HERE" />` element and change the value for the MID Server name.
   d) Optional: Enter connection information for the proxy server. Remove the appropriate comment tags from the proxy configuration information. For example, you can configure these parameters:
      - mid.proxy.use_proxy
      - mid.proxy.host
      - mid.proxy.port
      - mid.proxy.username
      - mid.proxy.password

17. If you configured the MID Server manually, finalize the configuration as follows:
   a) Execute the batch file start.bat.
      The system starts the new MID Server.
   b) Log into the instance.
   c) Navigate to MID Servers > Servers.
      The system displays a list of MID Server records.
   d) Select the record matching your new MID Server and verify that the Status is listed as Up.

Configure MID Server parameters, which control several aspects of MID Server functionality, including proxy servers, debugging, and upgrade.

Manually install a MID Server as a Windows Service

If you did not start the MID server at the end of the installation procedure, you can manually install the MID Server to run as a Windows service.

Role required: admin

You can install a MID Server as a Windows service in these operating systems:

- Windows Server 2008
- Windows Server 2012
- Windows Server 2016

1. Open the agent directory in the directory you created for the MID Server installation files. For example, the path might be C:\ServiceNow\MID Server1\agent.
2. Right-click the start.bat file, and select Properties.
3. Select the option to Run as administrator.
4. Double-click the start.bat file to install the Windows service.
Test MID Server connectivity

Confirm network connectivity to the MID Server for automatic upgrades, and then ensure that the MID Server can communicate with the instance.

Role required: admin

The system that hosts the MID Server must be able to access one of these URLs to automatically upgrade:

- HTTPS: https://install.service-now.com on the default HTTPS port (443)
- HTTP: http://install.service-now.com on the default HTTPS port (80)

1. Use PING to test connectivity with the host on the network (ping<host IP>).
2. If no ping response is returned, use TRACEROUTE to see where traffic might be stopped (traceroute<host>).
3. Use TELNET to connect to any of the TCP ports (telnet<host> <port>).
4. Use an SNMP scanning tool to determine if a potential network device is responsive.
5. Resolve the most likely issues around network connectivity:
   - Routing: Confirm that the MID Server host has network access to the IP ranges you are attempting to discover.
   - Firewalls: Confirm access to the physical firewalls that protect a large environment such as the Data Center. Confirm access to any logical firewalls that protect an individual computer. MID Server communications are initiated inside the firewall and therefore do not require any special firewall rules or VPNs.
   - Access Control Lists (ACL): Confirm that ACLs contain the IP addresses based list on SNMP network devices that allows communication to a particular target.
   - Resolve all issues with your network teams to better understand your topology. Deploy additional MID Servers if necessary to help keep your network secure. Configure access from your existing MID Server host to networking components.

6. Verify that the MID Server service is running on the host:
   - Windows: In the Windows Services console, locate the ServiceNow [MID Server name] and confirm that each MID Server has the Started Status value.
   - Linux: Ensure that the agent0.log.0.lck appears in the /servicenow/ MID Server name]/agent folder.

7. After each MID Server restart, open the agent0.log.0 and address all error messages.
8. From the ServiceNow instance, navigate to MID Server > Servers.
9. Review and verify that all MID Servers that are connected to the instance are listed.
10. Verify that the Status is Up for the MID Servers.

Validate the MID Server

You must manually validate the MID Server after it is installed to enable it to execute automation tasks. You can invalidate a MID Server you suspect has been compromised to prevent it from accessing automation credentials in the instance or executing outbound ECC probes.

Role required: agent_admin, admin

Make sure that the MID Server version is compatible with the instance.

Validation restricts access to automation credentials to trusted MID servers only.

Starting in the Istanbul release, you can specify that the MID should be used for all capabilities, applications, and IP ranges when you validate a MID Server. You will be prompted to set the
initial selection criteria when you validate MID Servers that do not already have capabilities, applications, or IP ranges already configured. You do not have to set the initial selection criteria to actually validate the MID Server. See MID Server selection for more information on capabilities, applications, and IP ranges.

**Note:** When you upgrade to Geneva and later releases, MID Servers that are already configured in your instance are automatically validated. This prevents the interruption of automation tasks that MID Servers might be performing. See MID Server upgrade for more information.

1. Install the MID Server using the instructions in MID Server installation. This creates a record in the MID Server (ecc_agent) table.
2. Navigate to MID Server > Servers.
3. Open the new MID Server from the list of MID Servers.
4. Under Related Links click Validate.
   The Set Initial Selection Criteria window appears if there are no records in the Supported Applications, IP Ranges, or Capabilities related lists.
5. On the Set Initial Selection Criteria window, use the switches to enable or disable selection criteria for this MID Server:
   - **Allow ALL capabilities:** Allow all capabilities for Orchestration and Event Management use this MID Server.
     **Note:** Service Mapping and Service Analytics, which used capabilities in previous releases, rely on the application for MID Server selection starting with the Istanbul release.
   - **Allow ALL applications:** Allow all applications that use MID Servers use this MID Server.
   - **Allow ALL IP ranges:** Make all IP ranges valid for this MID Server, meaning that it can target any IP address.

6. Click **OK**.
   The Validated field on the dashboard is set to Validating, and then set to Yes after the validation completes.
7. To invalidate a MID Server, open the record for the MID Server you suspect has a security issue.
8. Under Related Links, click Invalidate.

Invalidating a MID Server forces it to clear its memory and restart. The MID Server generates a new keypair on restart.

Multiple MID Server deployments

Depending upon how you use the MID Server (for an external integration, Discovery, Service Mapping or Orchestration) and the load placed on it, you might find it necessary to deploy multiple MID Servers in your network.

Factors determining the number of MID Servers your network will require to support external applications that integrate with ServiceNow include the following:

- The security constraints in your network.
- Your network policies.
- The amount of traffic between ServiceNow and the integrations.
- The reliability of the MID Server machines.

Network policies and security

Security policies in your network (firewalls between network segments, for example) might make direct communication impossible between your instance and an integration’s data source (JDBC, LDAP, etc.). To retrieve data for the instance, you can install a MID Server that has access to both the data source and the instance.

These network policies can determine if you need to install multiple MID Servers in your environment:

- Access control lists (ACL): If your security policy controls access to network devices (e.g. switches and routers) with an ACL, it might be necessary to install one or more MID Servers on a machine in the network that is already on the ACL.
- DMZ: Your network policy might require you to install one or more MID Servers in your DMZ to probe the devices there. This is common in networks that tightly regulate the ports that are opened on the inside firewall.
- Probe types: If you are conducting probes of different operating systems, your network policy might require a separate MID Server for each type of probe (e.g., one MID server for Windows WMI probes and another for SSH probes on UNIX).

Load balancing

Deploy multiple MID Servers where capacity is an issue, as when Discovery has to gather information about thousands of configuration items quickly. In a high volume environment, it might be necessary to deploy multiple MID Servers as load balancers for certain transactions. For example, JDBC data transfers can tie up the resources of a MID Server, making it unable to respond to other requests. The following operations between an integration might require separate MID Servers in a busy network:

- File exports
- Running scripts
- JDBC data sources
- Reading files

© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
High availability model

Avoid installing MID Servers for critical integrations on a machine that might experience any type of planned outage or an outage caused by overloaded processes. If necessary for reliability, consider deploying these types of MID Servers to dedicated machines for high reliability.

**Note:** Do not integrate with an external application on a MID Server provisioned for ServiceNow Discovery or Orchestration.

Wide area network (WAN)

When determining where to deploy MID Servers in a WAN, consider the bandwidth available between your local area networks. In most cases, install a MID Server on each LAN to probe devices locally, rather than deploying MID Servers that must probe devices across slow WAN connections. An alternative to this type of deployment is to install MID Servers that probe other LANs via VPN connections that take advantage of fast Internet connections. If the bandwidth of your WAN connections is comparable to that of your Internet connection, then there is no performance impact in running MID Server probes across WAN connections.

Domain separation

In deployments where domain separation is enabled and domains are configured to form a hierarchy, place the MID Servers at the lowest domain level.
Deploying MID Servers with domain separation

Install multiple MID Servers on a single system

You can install multiple MID Servers on the same host computer.
Role required: admin, mid_server

You can install multiple MID Servers on a single host or on a virtual machine using either Linux or Windows. Installing multiple MID Servers may involve other setup steps depending on your network configuration.

1. Log in to the host system or virtual machine where you want to install multiple MID Servers.
2. Create a directory for each MID Server on the top level of the drive.
   Make sure you create a unique and descriptive name for each MID Server, such as MIDServ SMS_Int or MIDServ Disc1.
3. Extract the downloaded MID Server archive file into each MID Server directory.
When the extract completes, there should be a directory path that resembles the following for each MID Server. For example, ServiceNow< Mid Server name >\agent.

4. For each MID Server, run the installer appropriate to the host's operating system.

### MID Server installers

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Installer path</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows</td>
<td>/agent/installer.bat</td>
</tr>
<tr>
<td>Linux</td>
<td>/agent/installer.sh</td>
</tr>
</tbody>
</table>

5. Use the installer to enter the following information.
   - URL to your instance
   - User credentials to run the MID Server
   - Proxy server connection details
   - MID server name
   - MID server service wrapper name and display name (Windows systems only)

<i>Note: The MID Server user must have the mid_server role.</i>

6. From the installer, click Start MID Server.
The local host starts the MID Server.

7. Click **Mid Servers List Page**.
   The installer opens the MID Server list from your instance.

8. Select the MID Server name from the list.

   **Note:** It may take a few seconds for the MID Server time to establish a connection with your instance.

   The system displays the MID Server record.

9. From **Related Links**, click **Validate**.
    The MID Server **Validated** changes to **Yes**.
Uninstall a MID Server

The MID Server runs as a stand-alone service. You can remove a stand-alone MID Server service to accommodate such tasks as redeploying the MID Server to another host machine or changing the unique name of a MID Server when deploying multiple MID Servers.

Role required: admin

1. Do one of the following to stop the running MID Server service.
   - Windows command line: From the MID Server home directory, for example from the agent folder, type `stop.bat`.
   - Windows Services console: From the Windows Services console, right-click the ServiceNow MID Server name and then select stop.
   - Linux: From the MID Server home directory, for example the agent folder, type `stop.sh`.

2. From a command prompt, go to the \agent\bin directory in the MID Server installation directory.

3. Do one of the following:
   - Windows: Double-click the `UninstallMID-NT.bat` file.
   - Linux: Confirm that the MID Server is stopped by executing the `bin/mid.sh status` script. After the MID Server stops, delete the files in the agent directory.

4. On Windows machines, check in the Windows Services console for a service named ServiceNow WMI Collector. If it is running, open a command prompt, navigate to `agent\bin\sw_wmi\tools`, double-click `uninstall_wmi.bat`

Configure Windows MID Server service credentials

MID Server service credentials are required so the MID Server can communicate with devices on your network.

By default, the MID Server service runs as a Local System account. This account only grants access to the machine on which the MID Server is running, not to other systems on the network. Therefore, you must change the service credentials to one of the following types:

- A Domain User account. This account should have local admin rights to allow automatic MID Server upgrade.
- A specific user account that has local admin access to the MID Server machine as well as access to other systems on the network.

Note: Service credentials are not the same as the MID Server user credentials: the service credentials allow communication between the MID Server and your network, while the MID Server user credentials allow communication between the MID Server and the instance. You must configure both of these credentials separately. See [Create the MID Server user and grant the role](#) for instructions on MID Server user credentials.

1. Open the Windows Services console.
2. Double-click the ServiceNow <MID Server name> service for each MID Server.
3. Select the Log On tab.
4. Set Log on as privileges with the Domain User or another user account that has local admin access to the MID Server machine as well as access to other systems on the network. Whatever account you choose, verify that it has local admin access and access to other systems on the network. For local admin access, you can use Windows Explorer to grant write permissions to the MID Server agent folder.
5. In the General tab, set **Startup type** to **Automatic**.
6. Click **OK**.
7. Restart the ServiceNow <MID Server name> service, and make sure that ServiceNow\<MID Server name>\agent\logs\agent0.log does not have error messages. If the MID Server does not start, see the ServiceNow knowledge article Review the agent log for MID Server errors (article KB0535148).
8. On the instance this MID Server is connected to, navigate to **MID Server > Servers**. If Discovery is installed, navigate to **Discovery > MID Servers**.
   
   All MID Servers connected to this instance are listed.
9. Make sure that the Status of the MID Server you just installed is **Up**.

**Post installation MID Server administration**

You can manually start, stop, restart, and monitor the MID Server after it is installed.

The status of each MID Server activity appears in the **MID Servers** page. Additional log information appears in the following places:
- The MID Server log is available on the instance.
- The corresponding agent0.log.0 and wrapper logs (wrapper.log) are available in the MID Server agent\logs folder.

**Start the MID Server**

Manually start the MID Server to initiate communication with the instance.

Role required: admin

You can manually start the MID Server.

1. Do one of the following:
   - Windows command line: From the MID Server home directory, for example the agent folder, type `start.bat`.
   - Windows Services console: From the Windows Services console, right-click the **ServiceNow MID Server name** and then select **Start**.
   - Linux: From the MID Server home directory, for example the agent folder, type `start.sh`.

2. Monitor the MID Server to ensure that it is operating properly.

**Stop the MID Server**

Stop the MID Server to terminate communication with the instance.

Role required: admin

Consider **pausing the MID Server** instead. Pausing the MID Server from the instance still allows you to run certain commands on the MID server.

1. Do one of the following:
   - Windows command line: From the MID Server home directory, for example the agent folder, type `stop.bat`.
   - Windows Services console: From the Windows Services console, right-click the **ServiceNow MID Server name** and then select **stop**.
   - Linux: From the MID Server home directory, for example the agent folder, type `stop.sh`. 
2. **Restart the MID Server** when ready.

**Restart the MID Server**

You can restart the MID Server if it has been stopped.

Role required: admin

You can manually restart the MID Server.

1. Do one of the following:
   - MID Server instance: Navigate to the **MID Servers** and click a **Name**. Under Related Links, click **Restart MID**.
   - Windows command line: From the MID Server home directory, for example the **agent** folder, type `Restart.bat`.
   - Windows Services console: From the Windows Services console, right-click the **ServiceNow MID Server name** and then select **Start**.
   - Linux: From the MID Server home directory, for example the **agent** folder, run the `restart-service.sh` script using one of these commands:
     - `./restart-service.sh`
     - `sh restart-service.sh`
     - `bash restart-service.sh`

2. Monitor the MID Server to ensure that it is operating properly.

**Monitor the MID Server**

Monitoring MID Servers involves verifying entries in log files, confirming network connectivity, and checking MID server status.

Role required: agent_admin or admin

You can monitor MID Servers hosted by Windows or Linux MID servers.

1. **For Windows only**, navigate to the Windows Services console, locate the service name that matches the name that appears from the `wrapper-override.conf` file. If the MID Server process is the only Java process running on the host, monitor the memory used by `java.exe` and alert on less than the maximum configured memory defined in the `~\agent\conf\wrapper-override.conf` folder.
2. Ensure that the `agent0.log.0.lck` file appears in the `~\agent\logs` folder to confirm that the MID Server running and logging system activity in the `agent0.log.0` file.
3. Review the following logs for warning, critical, and severe errors:
   - `~\agent\logs\agent0.log.0`
   - `~\agent\logs\wrapper.txt`

   See [Access MID Server log entries from the ECC queue](#) to see how to open log entries from the instance.
4. **Confirm network connectivity**.
5. From the MID Server instance, navigate to the **MID Servers** page, and review the status of the MID Server. For additional information, click a **Name**.
6. Use Windows or Linux tools to monitor:
   - CPU
- Disk utilization
- Events
- Memory
- syslog

Set up email, SMS, and push notifications to alert you when issues occur with MID servers. The MID Server Down notification is enabled by default. See Notifications for details.

**MID Server upgrade**

MID Servers are automatically upgraded, but you can also manually upgrade each MID Server separately.

**Upgrade methods**

- **Automatic**: Allow the instance to automatically upgrade the MID Server. This functionality is available by default. Automatic upgrade occurs:
  - Every hour, when the MID Server checks with the instance to see if there is a different version available for upgrade. You cannot modify this time period.
  - When the instance is upgraded and the MID Server for that version is different than the version currently on the MID Server.
  - When the MID Server pre-upgrade test passes without an error. Any errors encountered during this automatic test prevent the upgrade from occurring until the issues are resolved. The pre-upgrade test is enabled by default, but can be disabled by adding and setting a system property.

- **Manual**: Manually start the upgrade by clicking a related link on the MID Server record. Use this method when you do not want to wait until the next hourly automatic update or if your upgrade failed and you want to force an upgrade. See Upgrade the MID Server manually for instructions.

**Upgrade version**

You can configure a property that specifies a different upgrade version if you do not want to use the default MID Server version that is determined by the instance. See Set the MID Server version for more information.

**The Upgrade state**

The instance initiates the upgrade by sending the autoUpgrade system command to the MID Server. Starting with MID Servers upgrading from an Istanbul version MID Server, the MID Server Status is changed to Upgrading while the upgrade is running. The Upgrading state is similar to thePaused state. This is done to avoid potential miscommunication between the new version of the instance and the previous version of the MID Server during upgrade. For the upgrade to run, MID servers must be in the Up state and must be validated.

While in the Upgrading state, you cannot resume or restart the MID Server. However, you can perform the same actions that you can when the MID Server is in the Paused state. After a
successful upgrade, the queued output is sent to the instance and the MID Server starts retrieving new commands to process. The status also changes to Up.

When the instance sends the `autoUpgrade` system command to the MID Server, if it is Down or Paused, or if it has not been validated, the command remains in the ECC Queue until the MID Server status changes to Up. Then the command is processed.

**Note:** If you are using an Istanbul instance but you are upgrading a pre-Istanbul MID Server to Istanbul, these upgrade states are not available. They are available only for MID Servers that are already on Istanbul.

# Failed upgrades

Failed upgrades are handled differently based on the version you are upgrading to:

- Upgrade to another major release: (such as Istanbul to the next full release): the status changes to **Upgrade Failed**.
- Upgrade from a minor version within a release (such as Helsinki patch 1 to patch 2): the MID Server continues using the version it is currently running. It does not perform the upgrade and the status eventually changes to **Up**, assuming the MID Server was already functioning properly.

# Upgrading MID Servers in the Down state

If a MID Server is in the **Down** state, it cannot process the upgrade command. When the MID Server changes to **Up**, it immediately checks to see if an upgrade is necessary. If it does need to upgrade, the upgrade process starts before the MID Server processes any other commands.

# Upgrade error messages

The MID Server can display the following upgrade error messages.

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unable to refresh packages</td>
<td>The MID Server displays this message as a generic error when the error is not handled by a defined error message.</td>
</tr>
<tr>
<td>Failed to query instance for MID Server buildstamp</td>
<td>Instance is unavailable or there is a major version mismatch between the MID Server and the instance.</td>
</tr>
<tr>
<td>Not a valid package buildstamp</td>
<td>InstanceInfo returned an assigned buildstamp that was not in the correct format, such as a version mismatch.</td>
</tr>
</tbody>
</table>

# MID Server pre-upgrade check

The instance automatically tests the MID Server’s ability to upgrade on your system prior to the actual upgrade, to identify issues that could cause a MID Server outage or require reinstallation.

Each MID Server contains an AutoUpgrade monitor that compares the MID Server version with that of the instance to determine if the MID Server needs to upgrade. If the AutoUpgrade monitor
disCOVERs that the MID Server version is out of date, the monitor runs pre-upgrade validation
tests for that MID Server. IF an issue is detected, a message is logged to the MID Server Issue
(ecc_agent_issue) table, and the upgrade is blocked. The AutoUpgrade monitor continues to run
every hour, until the tests all pass. IF there are no blocking issues, the MID Server downloads the
appropriate upgrade package and begins the upgrade process.

Failed tests leave the MID Server in one of these states:

• **Upgrade Failed**: For upgrades to a different release family, such as from Geneva to Jakarta.
• **Up**: For upgrades within the same release family, such as an upgrade to a patch.

Errors, such as insufficient disk space for the installer and lack of connectivity to install.service-
now.com, are written to both the MID Server agent log and to the MID Server Issue
(ecc_agent_issue) table. These errors are published before the actual MID Server upgrade occurs
and must be resolved before the upgrade can continue. You can view issues from the MID Server
Issue (ecc_agent_issue) table in any of these locations:

• **MID Server Issues** related list in a MID Server record.
• **MID Server > Server Issues** navigation module.
• **MID Server Issues** gauge on the MID Server dashboard.

Pre-upgrade tests

The pre-upgrade validation tests check these requirements:

• 1GB of free disk space.
• Access to the download site at install.service-now.com.
• Permission to execute these file operations:
  • Extract a ZIP archive to a temp folder.
  • Copy files from the temp folder to the agent folder.
  • Read a text file.
  • Delete the pre-upgrade contents.

• For Windows, ensure that the Log On As user for the Windows service is either LocalSystem or a
  user that is part of the local Administrator group. By default, domain administrators are added
to the local Administrator group when joining a computer to a domain. If the PowerShell script
that performs this test does not return the expected output, the system logs a warning to the
MID Server Issue (ecc_agent_issue) table, but the test passes.

Data provided

When the instance encounters issues during the pre-upgrade check, it populates these fields in
the MID Server Issue (ecc_agent_issue) table:

**MID Server issue fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last detected</td>
<td>Date and time the issue was last detected.</td>
</tr>
<tr>
<td>Short description</td>
<td>Contents of the generated message that specifies a possible issue with available disk space, download server access, or file permissions.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>MID Server</td>
<td>Name of the MID Server affected by a pre-upgrade test failure.</td>
</tr>
<tr>
<td>Issue source</td>
<td>The process that identified the issue. For all issues with MID Server pre-upgrade testing, the source is UpgradeCheck.</td>
</tr>
<tr>
<td>State</td>
<td>The current state of the issue. Possible states are:</td>
</tr>
<tr>
<td></td>
<td>· <strong>New</strong>: Starting state when the instance creates the issue.</td>
</tr>
<tr>
<td></td>
<td>· <strong>Acknowledged</strong>: State set by the administrator when he or she first examines the issue.</td>
</tr>
<tr>
<td></td>
<td>· <strong>Resolved</strong>: Ending state, set by the instance, indicating that the issue has been resolved. If the scheduled job does not encounter the issue when it runs again, the instance automatically sets the state to this value.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain for the MID Server. For all issues derived from MID Server pre-upgrade testing, the domain value is inherited from the domain of the MID Server user.</td>
</tr>
<tr>
<td>Count</td>
<td>Number of times an issue has been detected. Each time the pre-upgrade tests run and encounter the same issue, the AutoUpgrade monitor increments this field.</td>
</tr>
</tbody>
</table>

**Errors that block the upgrade**

These messages describe issues detected by the pre-upgrade test and published to the MID Server Issue (ecc_agent_issue) table. Failure of any of these tests blocks the upgrade.

- **Not enough free disk space. The system reports <n> bytes free**: This message is displayed when less than 1GB of free disk space is detected on the MID Server host. This error is also written to the MID Server agent log.

- **Unable to download updates from install server**: This message indicates that either the MID Server host does not have permission to download the installation package from install.service-now.com or network problems prevent connection. This error is also written to the MID Server agent log.

- **Unable to extract contents of pre upgrade check zip**: This message indicates that the service account on the MID Server host does not have permission to extract the pre-upgrade ZIP archive to the temporary folder specified by the system property, java.io.tmpdir. On a UNIX host, the value for this property is typically /tmp or /var/tmp. On Microsoft Windows hosts, the path is c:\WINNT\TEMP.

- **Unable to create folder <upgrade check file path>**: This message indicates that the MID Server service account does not have permission to create the upgradeCheck folder for the pre-upgrade checking files in the agent/package path.

- **Unable to verify file permissions: <message>**: This message indicates an exception has occurred when checking file permissions, such as a file that does not exist or access failure.

- **MID Server Windows Service is not running as LocalSystem or a local Administrator**: This message warns that the Windows service is not running with the desired permissions.
Non-blocking warnings

These warnings are displayed in the MID Server Issue (ecc_agent_issue) table and do not prevent a Windows MID Server from upgrading:

- **WARN: Unable to parse $logOnAsUser**: This message warns that the Log On As User value for the Windows service is not in either of these expected formats:
  - user@domain.company.com
  - domain\user

- **WARN: Unable to look up Log On As user’s groups**: When the instance attempts to look up the logged on user’s group memberships, it executes the `net user <username>` command. The instance expects a certain output structure by the Windows service from this command and issues this warning if the expected output does not match the actual output.

These PowerShell warnings are written to the MID Server agent log only. Because PowerShell is not required to use a MID Server, these configuration issues do not prevent a Windows MID Server from upgrading. However, these warnings might indicate issues in your environment that require attention.

- **Skipping PowerShell upgrade checks since PowerShell is not usable**: PowerShell 2.0 (at a minimum) is not installed or `powershell.exe` is not available to the MID Server service user.

- **Continuing with upgrade, but the following issue was encountered during upgradeCheck**: `<exception message>`. This message indicates that there was an issue running the PowerShell portion of the pre-upgrade tests.

Disabling the pre-upgrade check

A MID Server configuration parameter called `mid.upgrade.run_precheck` is set to **true** by default, which allows the automatic pre-upgrade test to run. To disable these tests for a single MID Server, add this parameter to that MID Server’s `config.xml` file and set it to **false**. To disable these tests for all MID Servers, add a new record to the MID Server Property (ecc_agent_property) table called `mid.upgrade.run_precheck`. Set the value of this property to **false** and leave the MID Server field blank.

Set the MID Server version

You can specify which version the MID server should upgrade to using a property.

Role required: admin

ServiceNow does not recommend pinning the MID Server to a specific version for a significant amount of time, especially if you upgrade the instance. Under most circumstances, you should let the instance determine which MID Server version to use.

These properties control the MID Server version:

- **mid.buildstamp**
  - The `mid.buildstamp` property identifies the MID Server version with an identifier based on the date of the build. This property uses a date and time format of `yyyy-mm-dd-hhmm`.
  - The MID Server checks for version information hourly. If no override version is configured, the MID Server looks at the `mid.buildstamp` property for the version to use. This property resets itself to the default version (the version that matches your instance version) when the instance is restarted or upgraded, so any user changes are lost at that time.

- **mid.version.override**
Use this property to set an override condition for the current MID Server version. When the MID Server checks the version each hour, it looks at the mid.version.override property first. If this property is empty, the MID Server will get its version information from the mid.buildstamp property. If an override version is configured, the MID Server uses this value and ignores the version information in the mid.buildstamp property. This override value remains when the instance is restarted and is passed to the MID Server. However, the version in the mid.version.override property is deleted during an upgrade, allowing the MID Server to reset itself to the version in the mid.buildstamp property.

The MID Server cannot be upgraded until the parameter is cleared.

**Note:** Downgrades are only possible within the same major release, such as Helsinki or Istanbul.

1. In the Navigation pane filter, type `sys_properties.list`.
   The list of system properties appears.
2. Click **New**.
3. Type `mid.version.override` in the Name field.
4. Enter a description, such as, Set an override value for the current MID Server version.
5. Enter a version for the MID Server to use that is different from the version ServiceNow has selected in the mid.buildstamp property.
   The date and time format is yyyy-mm-dd-hhmm.
6. Click **Submit**.

### Upgrade the MID Server manually

You can manually upgrade MID Servers at any time if you do not want to wait for the automatic upgrade.

Role required: mid_server or admin

For the upgrade to run, MID servers must be in the **Up** state and must be **validated**.

The MID Server is upgraded to the version specified by build stamp on the instance, or by the **upgrade property** that you specify.

1. Navigate to **Discovery** > **MID Servers** or **Orchestration** > **MID Server Configuration** > **MID Servers**.
2. Open the record of the MID Server that you want to upgrade.
3. Click **Upgrade MID** under **Related Links**.
4. Confirm that you want to perform the upgrade.

### MID Server configuration

Administrators must configure a MID Server to ensure that it has access to sufficient system resources, probes the proper data sources, and communicates with the instance as expected.

You must complete all the steps in **MID Server Installation** before attempting any of the configuration steps explained here.

Restart a MID Server after any configuration change for the changes to take effect.
MID Server Records that cannot be altered

These records cannot be modified or deleted.

Using special characters in an XML file

The XML specification defines five predefined entities that represent special characters, and requires that all XML processors honor them. If these characters are used in a password, you will experience unexpected results.

The following characters represent the five pre-defined entities:

- "
- &
- '
- <
- >

If you use the pre-defined entity characters in an XML file, such as the MID Server configuration file, you need to encode them. To encode pre-defined entities into an XML document:

- replace " with &quot;
- replace & with &amp;
- replace ' with &apos;
- replace < with &lt;
- replace > with &gt;

For example, to specify the password as test& in the MID Server config.xml file:

```xml
<parameter encrypt="true" name="mid.instance.password" value="test&amp;"/>
```
Use the MID Server dashboard

The MID Server dashboard is a central place for MID Server users to monitor ongoing operations. The dashboard consists of reports and gauges that display information from the MID Server Status table.

The MID Server Dashboard is available from the **MID Server > Dashboard** module.

The MID Server status gauge

The MID Server Status gauge on the dashboard displays basic information about each MID Server. This information comes from the MID Server Status (ecc_agent_status) table.

</table>
| Version | The version of the MID Server. An icon indicates the validity of the MID Server:  
- **Red**: Incompatible. The MID Server and instance do not belong to the same release. You must upgrade the MID Server and verify that it is not pinned to an older version with the `mid.version.override` property. The MID Server will not be upgraded until the parameter is cleared.  
- **Yellow**: Compatible, but an upgrade is recommended. This indicates that the MID Server version belongs to the same family as the instance, but not the same version.  
- **Green**: Compatible. No upgrade necessary.  
- **Gray**: Incompatible. The instance cannot detect the version. |
| User    | The login name of the user. An icon indicates the validity of the user:  
- **Red**: Incompatible. The user does not have the `mid_server` role or the user does not match the value in the `mid.instance.username` parameter (in the `config.xml` configuration file). Reconfigure the MID Server user and verify that it has the proper user and role.  
- **Green**: Compatible. The user has the `mid_server` role and matches the user in the configuration file.  
  **Note**: The user can also have any of the SOAP roles that the `mid_server` role inherits. |

**MID Server status**

- **Up**: The MID Server is up and running and communicating heartbeats and status with the instance. This does not mean the MID Server is validated. See Validate the MID Server for instructions.
- **Down**: The MID Server is not running. This means that you manually stopped the MID Server service or a network issue disrupted communication between the MID Server and the instance.
- **Paused**: The MID Server has been paused by the `mid_server` user or the administrator.
- **Upgrading**: The MID Server is upgrading to another version.
- **Upgrade failed**: The upgrade was not possible. The MID Server will not accept tasks from instance until it is successfully upgraded. See MID Server troubleshooting and KB0596459.

In the Validating field, the following can appear:
- **Validating**: The MID Server is being validated.
- **Validation failed**: Validation of the MID Server failed. See MID Server troubleshooting.
CPU and maximum memory usage

This graph shows the average percentage of CPU usage on all the systems that host MID Servers in the last 30 days.

This graph shows the average percentage of maximum memory used by all the systems that host MID Servers in the last 30 days.
MID Server selection

You can configure applications to select MID Servers in a variety of ways.
MID Server criteria

MID Servers offer these types of criteria that help an application determine which MID Server to use:

- **Application**: The application that you specify on the MID Server. You can designate these applications for a specific MID Server:
  - Discovery
  - Orchestration
  - Service Mapping
  - Service Analytics
  - Event Management
  - Cloud Management

An **ALL** application option is also available. By default, this option includes all applications except Service Analytics, which requires an exclusive MID Server. You can configure which applications are included in the **ALL** designation.

- **IP address or range**: The IP address or the IP ranges that the MID Server is allowed to work within. You can specify an IP address or IP range in the application, such as on a Discovery schedule or an Orchestration activity, and for the MID Server. If the IP configured in the application matches the IP address or falls within the allowable IP range configured on the MID Server, a match is possible, and that MID Server passes this criteria. To have the instance automatically assign IP ranges (subnets) to available MID Servers, see [MID Server IP range auto-assigment](#).

- **Capabilities**: The network capability an application needs to use, such as the PowerShell Orchestration activity. Some applications, like Cloud Management and alert aggregation and RCA, require a specific capability.

**Note**: Discovery and Service Mapping can also use behaviors, which determine the type of port probes used during the port scan phase of Discovery. Both Discovery and Service Mapping use a behavior to discover load balancers running on Linux. Other applications do not use behaviors. Behaviors are not used for auto-selection, default MID Servers, or specific MID Servers as described below.

How an application selects a MID Server

If you do not specify a specific MID Server for an application to use, the application tries to select one. Each application relies on different criteria to select an appropriate MID Server.

<table>
<thead>
<tr>
<th>Application</th>
<th>Supported Application on the MID Server</th>
<th>IP address range</th>
<th>Capability</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discovery</td>
<td>The <strong>Discovery</strong> or <strong>ALL</strong> application must be specified on the MID Server.</td>
<td>Discovery uses IP ranges that you configure on the Discovery Schedule form to see if they fall within the IP ranges that you configure on the MID Server, or the <strong>ALL</strong> IP ranges option must be selected on the MID Server.</td>
<td>N/A</td>
</tr>
</tbody>
</table>

**Note**: Any configured behaviors are ignored.
<table>
<thead>
<tr>
<th>Application</th>
<th>Supported Application on the MID Server</th>
<th>IP address range</th>
<th>Capability</th>
</tr>
</thead>
<tbody>
<tr>
<td>Orchestration</td>
<td>The <strong>Orchestration</strong> or ALL application must be specified on the MID Server.</td>
<td></td>
<td>The capability that is required for an Orchestration activity must match the capabilities you configure on the MID Server, or the MID Server capability must be set to ALL.</td>
</tr>
<tr>
<td>Service Analytics</td>
<td>The <strong>Service Analytics</strong> application must be specified on the MID Server.</td>
<td>N/A</td>
<td>One of these capabilities must be present on the MID Server: the RCA capability for Service Analytics and the ITOA metrics capability for operational metrics.</td>
</tr>
<tr>
<td>Service Mapping</td>
<td>The <strong>Service Mapping</strong> or ALL application must be specified on the MID Server.</td>
<td></td>
<td>One of the supported Service Mapping capabilities (for new installs) must be configured on the MID Server, or the MID Server capability must be set to ALL.</td>
</tr>
<tr>
<td>Event Management</td>
<td>The <strong>Event Management</strong> or ALL application must be specified on the MID Server.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Cloud Management</td>
<td>N/A</td>
<td>N/A</td>
<td>The <strong>Cloud Management</strong> or ALL capability must be added.</td>
</tr>
</tbody>
</table>

**Using a specific MID Server**

Discovery and Event Management can use a specific MID Server that you specifically call out.

*Note:* Selecting a specific MID Server is not the same as specifying the default MID Server for an application. A specific MID Server is always used. If it is Down or not validated, the application does not execute commands against the MID Server. A default MID Server is fallback that is used when the auto-selection of MID Servers does not find any eligible MID Server.
<table>
<thead>
<tr>

<td>N/A</td>
<td>N/A</td>
</tr>
</tbody>
</table>

**Note:** If a MID Server manages resources within defined IP ranges for Orchestration, you must map the fully-qualified domain name (FQDN) of a server with its IP address to run certain activities, such as Exchange activities.

**Domain separation**

If you are using domain separation, you can configure MID Servers to be in separate domains. The domain that the MID Server is in affects how the application selects the domain:

- **Discovery and Service Mapping**: On the Discovery schedule, the MID Servers and clusters that available for selection are limited to the same domain of the user who is configuring the schedule. This also applies to the auto-selection option: only MID Servers in the same domain as the user can be automatically selected.

- **Alert aggregation and RCA (Event Management)**: The metrics for a business service is done on the MID Server that is in the same domain as the business service. Otherwise, a MID Server from the global domain is used.

**MID Server selection test**

If Service Mapping is active, you can preview which MID Server that Service Mapping uses for a specific target device or computer. To do this, navigate to Service Mapping > MID Servers and click MID Selection Test. Enter the IP address and an optional application and capability, and then click OK. The name of the MID Server that Service Mapping will use appears in the window.

**Configure a default MID Server for each application**

You can configure a default MID Server on the application or MID Server record for all applications except Event Management.

Role required: agent_admin or admin

Applications are only available when their respective plugins are activated.

The default MID Server is used when applications fail to find a suitable MID Server that matches configured criteria during auto-select. The default MID Server for the ALL application is used if the default MID Server for the specific application is not available. Some applications also offer a property to set the default MID Server.
Important: If you configure a MID Server for **ALL IP ranges** (type **Include**) and also create an IP range of type: **Exclude** for the same MID Server, the system will ignore the excluded IP range for that MID Server.

The default MID Server does not need to meet any criteria (application, IP range, behavior, or capability) to be used. Specifying a default MID Server is optional, and you can use a MID Server as the default for more than one application.

<table>
<thead>
<tr>
<th>Application</th>
<th>Additional notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discovery</td>
<td>Discovery attempts to use the default MID Server when the Discovery schedule specifies <strong>Auto-Select MID Server</strong> and Discovery cannot find any MID Servers with the correct application and IP range.</td>
</tr>
</tbody>
</table>
| Orchestration             | Orchestration attempts to use the default MID Server when it cannot find any MID Servers with the capabilities that you define in the Orchestration activity.  
You can also specify a default MID Server. The value in that property automatically synchronizes with the default MID Server you select in the Orchestration application. |
| Service Analytics         | Not applicable. The MID Server is selected if it has the RCA capability. Route to right MID by domain.                                                                                                           |
| Service Mapping           | Starting with the Istanbul release, fresh Istanbul installs use the default MID Server for the Service Mapping application. Upgrades to Istanbul still use the MID Server.                                            |
| Event Management          | You can specify a default MID Server for Event Management using the **mid.server.connector_default** system property. Event Management does not use the default MID Server in the application record. |
| Cloud Management          | N/A                                                                                                                                                                                                              |

1. Configure the default MID Server for an application in the MID Server record.  
   a) Navigate to **MID Server > Servers** and open a record.  
   b) In the **Supported Applications** related list, click **Edit**.  
   c) In the left column of the slushbucket, click the applications that can use this MID Server and move them to the right column.  
      - You can define which applications are included in the **ALL** option.  
   d) Click **Save**.

2. Configure the default MID Server for an application in the application record.  
   a) Navigate to **MID Server > Applications**.  
      - The list of installed applications that can use MID Servers appears.  
   b) Click the name of an installed application.  
   c) On the MID Server Application form, select the MID Server in the **Default MID Server** field.  
   d) To select additional MID Servers for this application, click **Edit** in the **MID Servers** related list and select alternate MID Servers that this application is allowed to use.  
   e) Click **Update**.
Configure an IP address range for the MID Server

Configure an IP address range for the MID Server to use.

Role required: agent_admin or admin

Applications, such as Discovery and Orchestration, can specify an IP range or a specific IP address of a target. When the application looks for a MID Server to use during auto-selection, it chooses a MID Server that has corresponding IP range that includes the application's IP range or specific IP address. Applications also use other criteria, such as the MID Server supported application and capabilities. See MID Server selection for more information.

Note: This is a manual configuration procedure. To learn how the system can assign IP address ranges to selected MID Servers automatically, see MID Server IP range auto-assigment.

These applications use IP ranges as follows:

- **Orchestration**: Use the IP address of the target machine (together with the capability) to select the correct MID Server for Orchestration activities. Refer to the procedure in this topic to configure the IP address.
- **Service Mapping**: Select the MID Server whose IP address range matches the IP in the discovery request. See MID Server configuration for Service Mapping for more information.
- **Discovery**: Can select an IP address range using the same criteria as Service Mapping. Discovery can also use a quick IP range that you specify in the Discovery schedule.

Tip: You can also use the **ALL** IP range, which allows the MID Server to be used with any range of IP addresses that an application specifies. This only allows the MID Server to access IP ranges, it does not mean that the MID Server can actually reach all of the IP ranges. To function with an application, the MID server must have access to the IP ranges that the application needs.

Valid IP address ranges can be as follows:

- An IP address in dotted decimal or hexadecimal format. The hexadecimal format can be explicitly prefixed with 0x, this is not mandatory. Here are examples:
  - 10.11.144.155
  - 0x0A0B909B
  - 0A0B909B

- An IP address range in dotted decimal or hexadecimal format. Here are examples:
  - 10.11.144.150-10.11.144.160
  - 0x0A0B9096-0x0A0B90A0
  - 10.11.144.150-0x0A0B90A0

- An IP network address with the net mask specified after a slash (/) in regular notation (0-32 inclusive) or in IP address notation. Dotted decimal or hexadecimal format is not allowed. Here are examples:
  - 10.11.144.0/24 10.11.144.0/255.255.255.0
  - 10.11.144.0/0xFFFFFFFF
  - 0x0A0B9000/24
1. Navigate to MID Server > IP Ranges.
2. Click New.
3. Complete the form, using the fields in the table.

### IP address ranges

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the type of range:</td>
</tr>
<tr>
<td></td>
<td>- Include: Include the specified IP range.</td>
</tr>
<tr>
<td></td>
<td>- Exclude: Exclude the IP address range.</td>
</tr>
<tr>
<td>Note:</td>
<td>If a MID Server is configured for ALL applications, any IP addresses configured for exclusion are ignored by the system. If your goal is to configure default MID Servers for separate applications in your system, see <a href="#">Configure a default MID Server for each application</a>.</td>
</tr>
<tr>
<td>Range</td>
<td>Enter the range in a valid format.</td>
</tr>
<tr>
<td>Related list</td>
<td>The MID Servers that can use this IP address range.</td>
</tr>
</tbody>
</table>

4. Click Save.
Important: IP ranges assigned manually prior to using the auto-assignment feature are affected as follows:

- Individual IP ranges are retained and appended to the ranges assigned automatically by the system for the designated MID Server.
- If the MID Server was configured with the All ranges selection, the auto-assignment feature overwrites that designation with the ranges it finds.

Open the **ALL** IP range record and configure the MID Servers that you want to use with any set of IP addresses.

**Configure applications included in ALL Applications**

You can narrow down the list of applications that are included in the definition of ALL.

Role required: agent_admin or admin

You can specify the ALL application for a MID Server, which means that the MID Server is allowed work with any of the applications that require MID Servers, such as Discovery, Event Management, Service Mapping, and so on. But you might not want all applications to be included in the definition of ALL. For example, you might want to exclude Service Mapping from all the ALL definition if you already have a dedicated MID Server to work with Service Mapping.

1. Navigate to MID Server > Applications.
   - The list of installed applications that can use MID Servers appear.

2. If you do not see the **Included in application ALL** column, you can personalize the list and add it.

3. For each application, double-click the value in the **Included in application ALL** column.

4. Change the value to **true** (to include) or **false** (to exclude).

**MID Server IP range auto-assigment**

IP ranges that represent a subnet can be automatically assigned to MID Servers.

To be automatically assigned to a subnet, a MID Server must be:

- In a running (Up) state.
- Successfully validated.
• Able to access one or more subnets in your network.

You can select MID Servers for auto assignment using either of these methods:

• **Guided Setup:** The ITOM Guided Setup module leads you through the process of installing and configuring a MID Server and automatically assigning that MID Server to a subnet range. When you use the Guided Setup to assign MID Servers to subnets, the instance runs Discovery to identify the available subnets and then makes the assignments for the MID Servers you select. To get started with Guided Setup, navigate to **Guided Setup > ITOM Guided Setup.**

• **Auto-Assign IP Ranges:** The MID Server > Auto-Assign IP Ranges module displays the MID Server auto assignment list. When you select one or more MID Servers for auto-assignment, the instance runs Discovery to identify the subnets in your network and completes the MID Server IP range assignments.

The subnet assignments that the instance makes for the MID Servers you select are stored in the Automation Status Set (automation_status_set) table.

**Required SNMP OIDs for MID Server IP range auto-assignment**

Customers who use network service providers must request specific SNMP access to use MID Server IP range auto-assignment.

IP range auto-assignment requires SNMP credentials for read-only access to all routers that Discovery uses to identify subnets. In addition, your service provider must grant the following SNMPWALK access:

- iso.org.dod.internet.mgmt.mib-2.ip.ipRouteTable (1.3.6.1.2.1.4.21)
  - ipRouteDest (1.3.6.1.2.1.4.21.1.1)
  - ipRouteNextHop (1.3.6.1.2.1.4.21.1.7)
  - ipRouteType (1.3.6.1.2.1.4.21.1.8)
  - ipRouteMask (1.3.6.1.2.1.4.21.1.11)

- iso.org.dod.internet.mgmt.mib-2.ip.ipForward.ipCidrRouteTable (1.3.6.1.2.1.4.24.4)
  - ipCidrRouteDest (1.3.6.1.2.1.4.24.4.1.1)
  - ipCidrRouteMask (1.3.6.1.2.1.4.24.4.1.2)
  - ipCidrRouteNextHop (1.3.6.1.2.1.4.24.4.1.4)
  - ipCidrRouteType (1.3.6.1.2.1.4.24.4.1.6)

**Select MID Servers for auto-assignment**

Select the MID Servers you want the instance to automatically assign to discovered subnets.

Role required: admin

You can auto-assign MID Servers in ITOM Guided Setup or use this procedure to select MID Servers for subnet assignments from the instance navigator.

1. Navigate to **MID Server > Auto-Assign IP Ranges.**
   - The MID Server range auto-assignment lists appear. Only validated, running MID Servers are available for selection.
2. Drag and drop MID Servers selected for assignment from the **Available** list to the **Selected** list, or use the arrow buttons to move them.

3. Click **OK** when you are done.
The instance runs a subnet Discovery and automatically assigns the MID Servers you have selected to the subnets that Discovery finds.

**View automation status sets and IP range assignments**

The Automation Status Set form shows summary details of a subnet Discovery and the subsequent IP range assignments for MID Servers selected for automatic subnet assignment.

Role required: admin

1. Navigate to **MID Server** > **Automation Status Sets**.
2. Select a status record for a subnet Discovery you want to view.

   The form contains read-only status information about the selected Discovery, the subnets found, and the range assignment process for the MID Servers you selected for automatic assignment.

   **Important:** IP ranges assigned manually prior to using the auto-assignment feature are affected as follows:

   - Individual IP ranges are retained and appended to the ranges assigned automatically by the system for the designated MID Server.
   - If the MID Server was configured with the **All** ranges selection, the auto-assignment feature overwrites that designation with the ranges it finds.
The Automation Status Set shows the IP range assignments for the MID Servers selected for discovery. This form includes summary details of the Discovery that identified the available subnets and their status.

**Number:** STA0001003

**State:** Completed

**Subnet Discovery Status**

**Range Assignment Status**

This tab shows information for the currently running Subnet Discovery.

**Number:** DIS0010022

**Started:** 62

**Completed:** 31

**Duration:** 43 Minutes

**Related Links**

- Refresh

- Subnet Queue (31)
- Subnet ECC Queue
- Subnets Discovered (1)
- IP Range Assignments (565)
- Inaccessible IP Ranges (141)
- IP Range Assignment Log (3)
3. Select the **Subnets Discovered** related list to view the list of subnets available for assignment.

![Subnets Discovered related list](image)

4. Select the **IP Range Assignments** related list to view the IP ranges that were assigned to a MID Server.

   **Caution:** IP ranges identified by Discovery are stored in the IP collection (ip_address_collection) table, which is only used for MID Server IP range auto-assignment in the Jakarta release. This table is intended for future development and **should not** be used in any customizations, including column additions, business rules, or scripting actions.
### MID Server parameters

Parameters control the behavior of a particular MID Server. They have lower precedence compared to MID Server properties. Changes to parameters only take effect when the MID Server is started (or restarted).

#### Required parameters

*Note: Using special characters in an XML configuration file requires you to encode them.*

<table>

CIM parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Maximum number of messages sent at once to a CIM server. | mid.cim.batch.size | Specifies the maximum number of messages sent at once to a CIM server.  
- Type: integer  
- Default value: 1 |
| Interval to wait between requests to the same CIMOM (ms). | mid.cim.request.interval | Specifies the number of milliseconds to wait between requests to the same Common Information Model Object Manager (CIMOM).  
- Type: integer (milliseconds)  
- Default value: 0 |
| The maximum amount of simultaneous connections allowed per CIMOM. | mid.cim.host.connection.limit | Specifies the maximum number of simultaneous connections to each Common Information Model Object Manager (CIMOM). A value of zero disables simultaneous connections.  
- Type: integer (number of connections)  
- Default value: 0 |

Connection parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Asynchronous Message Bus Client disable | mid.disable_amb | Disables the Asynchronous Message Bus (AMB) Client. When AMB is enabled, the MID Server uses a default polling interval of 40 seconds. When the AMB client is disabled, the default polling interval switches to 5 seconds. If you set a polling interval with the mid.poll.time parameter, the MID Server uses that value whether or not the AMB client is enabled.  
- Type: true | false  
- Default value: false |
<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance date format</td>
<td>instance.date.format</td>
<td>Specifies the format the instance uses for dates and times. The primary impact of setting this parameter is to allow the MID Server to correctly refresh its start and stop times on the MID Server record in ServiceNow. The format of this date/time string is identical to that used by the Java SimpleDateFormat class.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Type: string (Date format)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default value: yyyy-MM-dd HH:mm:ss</td>
</tr>
<tr>
<td>MID Server immediate response enable</td>
<td>glide.mid.fast.responses</td>
<td>Instructs the MID Server to try sending messages to the instance as soon as they are ready. Normally the MID Servers end message to the ServiceNow instance serially (that is, one message at a time). Since many probes can be run in parallel, there can be multiple messages simultaneously transmitted to the instance. Setting this parameter to true may decrease the time between a probe's completion and its response arriving at the instance. However, the multiple simultaneous messages consume resources, decreasing the overall instance responsiveness. If there are communications problems, this parameter's value can also cause a logjam on the MID Server, as threads normally used for running probes may become consumed for sending messages. Generally, leave this parameter out of your configuration. Setting it to true is meaningful only under very special circumstances.</td>
</tr>
<tr>

</tr>
<tr>
<td>MID Server JMX enable</td>
<td>mid.jmx.enabled</td>
<td>Enables a JMX server on the MID Server, which exposes some management information to JMX consoles. Implementing JMX requires additional configuration of the Java runtime environment. Setting this parameter to <code>true</code> is only recommended for those with detailed knowledge of the Java security architecture and a specific need for JMX.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Type: true</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Default value: false</td>
</tr>
<tr>
<td>MID Server max transmission queue size</td>
<td>glide.mid.max.sender.queue.size</td>
<td>Places an upper limit on how large the queue is allowed to get. The MID Server starts deleting queued messages if this limit is exceeded. When the MID Server generates messages to the ServiceNow instance faster than it can send them, it queues them temporarily on the file system of the MID Server's host. This queue is normally quite small, and is completely emptied as soon as the MID Server processing slows for a short period. However, this queue can grow in size when there are communication problems between the MID Server and the instance, and especially if there is an integration running on the MID Server. The parameter is of the form <code>{number}{multiplier}</code>, where <code>{number}</code> is any positive decimal number including non-integers, and the optional multiplier is any spelling of bytes, kilobytes, megabytes, gigabytes, or terabytes (only the first character is tested, and the test is case-insensitive). The default multiplier is bytes. White space is liberally tolerated. The following strings all represent valid parameters: “1000000000”, “0.5m”, “5 GB”, “7.67gigas”, “145.69392 meg”, and “1.1 terra”.</td>
</tr>
<tr>
<td></td>
<td></td>

</tr>
</tbody>
</table>
| MID Server maximum number of probe threads | threads.max | Controls the number of execution threads (simultaneous work) that probes may use. This parameter provides direct control over what CPU resources the MID Server consumes on the computer that hosts it. To decrease the MID Server’s CPU consumption, lower the number of threads. To make the MID Server work faster, increase the number of threads. See Set MID Server Thread Use.  
- Type: integer (threads)  
- Default value: 25 |
| Maximum amount of interactive messages to queue in memory for processing. | threads.interactive.max | Sets the maximum amount of interactive messages to queue in memory for processing.  
- Type: integer (threads)  
- Default value: 4 |
| Maximum amount of expedited messages to queue in memory for processing. | threads.expedited.max | Sets the maximum amount of expedited messages to queue in memory for processing.  
- Type: integer (threads)  
- Default value: 4 (threads) |
| MID Server poll time in seconds when MID server is not busy. | mid.poll.time | Sets the default MID Server polling interval (in seconds). The polling interval is the amount of time the MID Server waits before checking the ECC queue for work when the ECC queue is not busy. The MID Server polls the ECC queue using this interval if the AMB client connection is dropped.  
- Note: The default polling interval resets to 5 seconds when the AMB client is disabled. If you configure the mid.poll.time parameter, the MID Server uses this polling interval whether or not the AMB client is connected.  
- Type: integer (seconds)  
- Default value: 40 |
## Credentials parameters

</table>
| Enable debug logging for ServiceNow SSH Client. | mid.ssh.debug | Enables SSH debug information in the log file. The parameter usage depends on whether the ServiceNow SSH client is enabled. 

When the ServiceNow SSH client is enabled, the parameter functions as follows:

- **Type:** String
- **Default value:** false

  The following string values are valid for the ServiceNow SSH client:

  - **true:** Enables SSH debug information in the log file.
  - **false:** Disables SSH debug information in the log file.
  - **<IP Addresses>:** Specify which IP ranges to enable SSH debug information in the log file. You can enter IP addresses in the following formats:
    - An IP range defined by a slash and the number of bits in the subnetwork. For example, the string 10.10.10.0/24 scans 24 bits of IP addresses from 10.10.10.0 to 10.10.10.254.
    - An IP range defined by a dash. For example, the string 10.10.11.0-10.10.11.165 scans the IP addresses from 10.10.11.0 to 10.10.11.165.
    - A comma-separated list of specific IP addresses. For example the string 10.10.11.200,10.10.11.235 scans the IP addresses 10.10.11.200 and 10.10.11.235.
  - **deferred:** Logs SSH debug information in memory unless an error or warning occurs. If an error or warning occurs, the platform publishes the debug information to the log file. This ensures that only the part of the log file pertaining to the error data from memory when the session closes. Each session stores up to 1000 log messages. If the session exceeds 1000 log messages, the deferred log discards the oldest log message to make room for the newest log message. |
<table>

</tbody>
</table>
| Query logging enable | mid.show.queries                | Instructs the MID Server whether to log details about every query it makes to the ServiceNow instance. Typically this parameter is only used by developers, but it is occasionally useful when troubleshooting a problem. Be aware that setting this parameter to true causes intensive logging on the MID Server, potentially using considerable disk space.  
  - Type: True | False  
  - Default value: false |
| Remote logging disable | disable.remote.logging         | Prevents the MID Server from logging any information to the MID Server log on the instance. Relatively little information is logged on the instance in any case, but setting this parameter to true eliminates all logging to the instance.  
  - Type: True | False  
  - Default value: false |
| Status sending disable | disable.status                 | Prevents the MID Server from sending a status report to the instance every 10 minutes.  
  - Type: True | False  
  - Default value: false |

### Proxy server parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>

<tr>
<td>Disable the privilege check for SSHCommand.</td>
<td>mid.ssh.disable_privilege_check</td>
<td>This parameter has no effect if the target is using a privileged command other than 'sudo.' For more information, see Privileged commands for the MID Server. The remainder of this section only applies to targets which run sudo. When this parameter is set to true, the MID Server assumes that the user configured in the credential has the privilege to run the given command using sudo. The MID Server assumes the target user can run any command string following sudo on the target. When this parameter is set to false, the MID Server runs 'sudo -l' on the target to verify the command which follows sudo has permission to run on the target. Regardless of this parameter's value, the MID Server always validates that 'sudo' by itself can be run on the target. Some releases do not show this parameter in the MID Configuration Parameters pull down list. In this case, you may optionally add this parameter in MID Properties.</td>
</tr>
</tbody>
</table>

- Type: true | false
- Default value: false

By default, the MID Server is configured to search for SSH commands in the following paths and the logged-on user's default paths:

- /usr/sbin
- /usr/bin
- /bin
- /sbin
## Upgrade parameters

### Windows Discovery parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Upgrade proxy password | glide.mid.autoupgrade.proxy_password | Your MID Server must go through a web proxy to access the upgrade URL. Define the proxy’s password here.  
- Type: string  
- Default value: none |
| Enable or disable Powershell parameter passing via the command line. | mid.powershell.command.parameter_passing | Enable this parameter to allow passing Powershell parameters from the command line.  
- Type: True | False  
- Default value: false |
| Enable or disable the Powershell script parameter passing via the command line. | mid.powershell.command.script.parameter_passing | Enable this parameter to allow passing Powershell scripts from the command line.  
- Type: True | False  
- Default value: true |
| Enable or disable the enforcement of UTF-8 for command output. | mid.powershell.enforce_utf8 | Enable this parameter to force commands on a target Windows system to return UTF-8 encoded output. Disabling it allows the target system to use its default encoding. This parameter is only valid when PowerShell is enabled. Setting this value to false may result in incorrect values in the CMDB when non-ASCII characters are returned by a probe.  
- Type: True | False  
- Default value: true |
| Enable PowerShell for Discovery. | mid.use_powershell | Specifies whether to enable PowerShell for Discovery. The MID Server requires PowerShell version 2 to operate. If the MID Server cannot find the correct version of PowerShell, it uses WMIrunner instead.  
- Type: True | False  
- Default value: true |
<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Enable/Disable automatically falling back to the MID Server service user credential if all other credentials fail. | mid.powershell.local_mid_service_credential_fallback | Specifies the login credentials the MID Server uses if all other credentials fail.  
• Type: True | False  
• Default value: false                                                                                                                                     |
| Timeout for Windows probes.                                         | mid.windows.probe_timeout            | Specifies the timeout value for the Windows probe, in seconds. The default value is 5 minutes.  
• Type: Integer  
• Default value: 600 seconds                                                                                                                                  |
| Powershell use credentials table.                                   | mid.powershell.use_credentials       | Specifies whether PowerShell Discovery should use the Windows credentials from the credentials table. To use PowerShell Discovery on a single domain, set this parameter to false, and then restart the MID Server. In this case, the MID Server runs the probes with the credentials of the user for the MID Server process.  
• Type: True | False  
• Default value: true                                                                                                                                     |
<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Path to Powershell executable.</td>
<td>mid.powershell.path</td>
<td>Enables an administrator to point to a specific PowerShell on a MID Server in cases where more than one PowerShell is installed. Supply the path to the directory containing the PowerShell executable, for example, C:\mypowershell or C:\mypowershell. ServiceNow automatically appends the string powershell.exe to the path. This parameter might be necessary when both 32-bit and 64-bit PowerShells are active on the same MID Server, and it becomes necessary to launch the correct PowerShell for the context. Note that 64-bit Windows employs file system redirection and the MID Server runs as a 32-bit application. If the path is in %WinDir%\System32, Windows automatically redirects to %WinDir%\SysWOW64. To avoid redirection, specify the path as %WinDir%\Sysnative. An example would be to specify C:\WINDOWS\sysnative\WindowsPowerShell\v1.0\ instead of C:\WINDOWS\system32\WindowsPowerShell\v1.0.</td>
</tr>
</tbody>
</table>
| Set the protocol MID Servers use to communicate with remote Windows hosts. | mid.windows.management_protocol | Enables administrators to select the Windows management protocol used for device and process classification. Options include:  
- WMI  
- WinRM  
- Type: String  
- Default value: WMI |

**Note:** On a 64-bit version of Windows Server 2003 or Windows XP, a Microsoft hotfix may be required to enable this capability.

- Type: String (path)  
- Default value: none

### ServiceNow: Jakarta Now Platform Capabilities

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Timeout for all Windows probes on a MID Server. | mid.windows.probe_timeout | Sets the timeout interval for all Windows probes on a specific MID Server. This value is overridden by the values configured for individual probes with the wmi_timeout probe parameter.  
- Type: Integer  
- Default value: 300 |

#### SNMP configuration parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Enable automatic inclusion of SNMP public community string. | mid.snmp.enable_auto_public | Specifies whether to use the SNMP public community string automatically if no other SNMP credentials were successful.  
- Type: True | False  
- Default value: true |
| Maximum time to wait for a response for the first OID request. | mid.snmp.request.timeout | Specifies the timeout value for the first OID request, in milliseconds. For subsequent requests (for example, table OIDs), the mid.snmp.session.timeout configuration parameter (see below) takes effect.  

**Note:** You can override this parameter with the timeout SNMP probe parameter.  
- Type: Integer  
- Default value: 1500 |
<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Maximum time to wait for responses to OID requests once a session has been established. | mid.snmp.session.timeout | Specifies the timeout value for subsequent OID request, in milliseconds. SNMP communication is stateless and does not have a session or connection in the normal sense. The system regards a positive response from the first OID request as a sign that it should expect prompt responses to subsequent requests. While the default is short, it may be useful to increase this parameter value to the same value as that used for `mid.snmp.request.timeout`.  

**Note:** You can override this parameter with the `establish_session_timeout` SNMP probe parameter.  

- **Type:** Integer  
- **Default value:** 500 |
| Use the Snmp4j library for SNMP communication. | mid.snmp.use_snmp4j | Use the Snmp4j library for SNMP communication. This is a strict requirement for SNMPv3. This parameter should only be set to `false` based on advice from ServiceNow Technical Support.  

- **Type:** True | False  
- **Default value:** true |
| Use SNMP v1 and v2c for probes. | mid.snmp.use_snmp_v1_v2c | Attempt communication using these SNMP protocol versions. Requires configuration of SNMP community string credentials or the `mid.snmp.enable_auto_public` parameter set to `true`, as applicable for targeted devices.  

- **Type:** True | False  
- **Default value:** true |
| Use SNMP v3 for probes. | mid.snmp.use_snmp_v3 | Attempt communication using the SNMPv3 protocol version. Requires configuration of SNMPv3 credentials.  

- **Type:** True | False  
- **Default value:** true |
### Event Management parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>

**Add a MID Server parameter**

Use a MID Server parameter to control the behavior of a particular MID Server. You modify MID Server parameters in the Configuration Parameters related list in the MID Server record and in the config.xml file in the \agent directory of your MID Server installation.

**Role required:** admin

1. Navigate to **MID Server > Servers**.
2. From the list of MID Servers, select a MID Server to configure.
3. Select the **Configuration Parameters** related list.

This related list shows all the parameters currently in the MID Server’s configuration file. If there are any passwords, they are displayed in asterisks for security reasons.
Defining MID Server configuration parameters

4. To add parameters, click **New**, and then complete the form.

   After the form is submitted, the configuration file for that MID Server is modified to include the new parameter. Changes to existing parameters are reflected in the MID Server configuration file as well. Changes made to the MID Server configuration file do not take place immediately, but rather the next time the MID Server is restarted. The MID Server form has a related link for restarting the MID Server.
Note: ServiceNow prevents you from saving changes, such as modifying or deleting parameters, that would cause the MID Server to lose communications with the instance. For example, you cannot change the url parameter. Any changes to these protected properties must be made directly in the config.xml file for that MID Server.

Setting Parameters from the config.xml File

MID Server configuration is controlled by an XML file called config.xml. This file is located in the \agent directory, immediately under the directory where the MID Server is installed. Edit this file directly to make any configuration changes to protected parameters. Many configuration changes, such as those that do not disrupt communication between the MID Server and the ServiceNow instance, may also be made from the instance.

The structure of the config.xml file is simply an outer parameters tag and a series of inner parameter tags. Each parameter tag has name and value attributes.

- To change the value of a parameter, edit the value attribute.
- To add a parameter, add another parameter tag with its name and value.
- To delete a parameter, delete the entire parameter tag.

The order of the parameters within the file is not important. Notice the green comment sections in the sample. Use these elements to add useful comments to the configuration file.

Note: When configuring the MID Server for use with a proxy server, be sure to remove the comment tags around the proxy sections that you configure.
MID Server config.xml file

Note: The sample file here is from a Firefox browser. Conventional text editors, such as Notepad, WordPad, or TextEdit, do not display colors and variable fonts.

MID Server properties

Properties control the behavior of all MID Servers or a particular MID Server. MID Server properties override MID Server parameters. You can add or MID Server properties from the MID Server > Properties module.

The MID Server properties are in the MID Server Property (ecc_agent_property) table and can be accessed by navigating to MID Server > Properties. You must add these properties if they are not already present.
### MID Server properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mid.discovery.max_payload_size</td>
<td>Specifies the maximum string length of Discovery results that the MID Server sends to the instance. If the Discovery probe results exceed the limit, the MID Server discards them and returns a warning message. For probes, this applies only to those probes where the Used by Discovery field is true. For patterns, this applies to the Horizontal Pattern probe. Set the value to any negative number to disable the payload limit and allow payloads of any size to be sent to the instance. For example, -1.</td>
</tr>
</tbody>
</table>
|                                           | * Type: integer (bytes)  
* Default value: 5000000  
You can also configure this as a **configuration parameter on a individual MID Server**.                                                                 |
| mid.eccq.max_payload_size                | Specifies the maximum string length of a payload that the MID Server sends to the instance. The MID Server verifies the size of the payload before sending it to the instance. If the payload size exceeds the limit, the MID Server discards it and returns an error message in the payload. |
|                                           | * Type: integer (bytes)  
* Default value: 20000000  
You can also configure this as a **configuration parameter on a individual MID Server**.                                                                 |
| mid.discovery.max_pattern_payload_size   | Defines the maximum overall payload size for the payload of results that come from patterns.                                                                                                               |
|                                           | * Type: integer (bytes)  
* Default value: 300000  
You can also configure this as a **configuration parameter on a individual MID Server**.                                                                 |
| mid.max_ci_count_per_page                | Defines the size of each chunk in a payload of results that come from patterns. The chunk can be greater than this parameter value, depending on the relationships of the CIs.                                  |
|                                           | * Type: integer (bytes)  
* Default value: 300000  
You can also configure this as a **configuration parameter on a individual MID Server**.                                                                 |

</tr>
<tr>
<td></td>
<td>· <strong>Default value</strong>: false</td>
</tr>
</tbody>
</table>

**Create a MID Server property**

Use a MID Server property to control either the behavior of all MID Servers or a particular MID Server.

Role required: admin

You set MID Server properties to override MID Server parameters. Configure MID Server properties in the MID Server plugin. Do not configure MID Server properties in the `glide.properties` file that is located in the properties folder of the agent. The `glide.properties` file gets overwritten during the upgrade process.

1. Navigate to **MID Server > Properties**.
2. Click **New**.
3. Fill in the fields, as appropriate (see table).

<table>
<thead>
<tr>
<th>MID Server properties field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>------</td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Value</td>
</tr>
</tbody>
</table>

After setting any MID Server properties, restart the MID Server to ensure the properties sync with the instance.
**MID Server pause**

The MID server can be put into a **Paused** state to temporarily prevent it from polling the ECC Queue for work or sending Discovery results back to the instance.

You might want to pause the MID Server when your network infrastructure is undergoing changes. This prevents applications like Discovery from throwing errors during a particular maintenance window.

A paused MID Server continues processing commands that it had already retrieved before it was paused. When you resume the MID Server, the MID Server starts retrieving new commands to process.

**Note:** Discovery continues to assign jobs to MID Servers that are **Paused**. MID Servers that are **Down** are not assigned jobs.

Unlike **stopping the MID Server** from the Windows or Linux server command line on the MID Server machine, pausing the MID server is something that you can do from the instance. The MID Server pause feature is available starting with the Istanbul release.

**Note:** You can only pause **validated MID Servers**.

You can still perform these actions when the MID Server is paused:

- Access the MID Server logs and delete log entries.
- View MID server statistics. While the MID Server is in the **Paused** state it stops generating statistics. But you can still view the statistics generated before you paused the MID Server.
- Retrieve the MID Server thread dump.
- Make and save **configuration changes** and property changes to the server. The changes take effect after the MID Server is resumed.
- Clear the ECC queue.

The **MID server heartbeat** continues to function while the MID Server is in the **Paused** state. If the MID Server is upgraded while it is in the **Paused** state, the MID Server state automatically changes to **Up** after successful upgrade. It does not return to the **Paused** state.

During **MID Server selection**, paused MID Server can still be selected but are prioritized below MID Servers that are not paused.

**Events that occur during MID Server pause**

The **vCenter** and **SNMP** event collectors, continue to run and process events when you pause the MID Server. These events are not part of the normal synchronous communication that the MID Server has with the instance that you see in the ECC queue. Events are still relayed to the instance and can even trigger actions on records in the instance, such as a CI update. For example, if vCenter detects that a virtual machine goes down or is deleted, a vCenter event makes a change to the status of the corresponding CI record for that virtual machine.

To prevent these events from being processed, stop the extensions from running. See:

- Configure and run the vCenter event collector extension
- Configure the SNMP Trap Collector Extension
Pause the MID Server

Pause the MID Server to temporarily prevent it from polling the ECC Queue for work or sending Discovery results back to the instance.

Role required: agent_admin

You can only pause validated MID Servers.

1. Open the MID server record.
2. Select a running MID Server that has been validated.
3. On the MID Server form, select Pause MID under Related Links.
   The state of the MID Server changes toPaused.

4. To resume MID Server processing, select Resume MID under Related Links.

MID Server domain separation

MID Servers can be configured in separate domains.

The records that can be read, updated, or created by a MID Server are determined by the credentials configured for that MID Server in the config.xml file. These are the user credentials that a MID Server uses to access the instance and specify which domain’s records that MID Server can access.

You can create versions of these specific MID Server policy records that only a MID Server from the same domain can use. This process separation is supported for records in tables that extend MID Server Synchronized Files (ecc_agent_sync_file):

- MID Server MIB File (ecc_agent_mib)
- MID Server JAR File (ecc_agent_jar)
- MID Server Script File (ecc_agent_script_files)

See Set up domain separation for MID servers for instructions on setting up domain separation through the MID server.

Note: Attachments on MIB or JAR file records might not appear as they did in a non-domain separated environment. The attachments do not appear because the Attachments (sys_attachment) table is data separated. When data is separated between domains, a record in a child domain cannot access records in a parent domain.

Set up domain separation for MID servers

Set up domain separation through the MID server user role and the MID Server configuration file.
Role required: admin, agent_admin

1. Configure a MID Server user within a specified domain with the proper `mid_server` role.
2. Specify this user within the MID Server `config.xml` file. When you set the `MID Server user credentials` in the `config.xml` file, make sure they are in the proper domain.

When the MID Server connects to the instance, the MID Server record is created in the proper domain.

If you must change the MID Server domain:

1. Stop the MID Server and delete the ecc_agent record.
2. Update the MID Server `config.xml` with the new user in the new domain and restart the MID Server service.

If you need to create versions of specific MID Server files that only MID Servers in your domain can use:

1. Open or create a record in one of these MID Server modules:
   - SNMP MIBs
   - JAR Files
   - Script Files
2. Update an existing domain policy or submit a new record.

   **Note:** Attachments on MIB or JAR file records might not appear as they did in a non-domain separated environment. The attachments do not appear because the `Attachments` (sys_attachment) table is data separated. When data is separated between domains, a record in a child domain cannot access records in a parent domain.

### Privileged commands for the MID Server

The Now Platform provides default privileged commands for the MID Server to use and the ability to add additional commands to the system.

An example of information that requires elevated privileges is information about storage disks on a host server, retrieved with the `fdisk -l` command. If your system cannot use sudo commands, you must configure the hosts in your network to use one of the other privileged commands. You can have different privileged commands set up for different hosts. However, Discovery supports only one privileged command per host.

**Important:** You can edit supported privileged commands, but do not delete them.

### SSH privileged escalation command requirements

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sudo</td>
<td>- Host must support the sudo <code>−S −p &lt;password&gt;</code> command and return the correct list of allowed SSH commands.</td>
</tr>
<tr>
<td></td>
<td>- Credentials provided for Discovery must be able to run the command sudo <code>−S −p &lt;password&gt; &lt;commands&gt;</code>.</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| pbrun   | · Host must support the `pbrun -v` command and return the correct version of PowerBroker.  
  · Credentials provided for Discovery must be able to run `pbrun <commands>`.  
  · Discovery does not support any other `pbrun` options, such as a password prompt.  
  · The instance must be able to reach the target host via SSH. |
| pfexec  | · Host must support the `pfexec id -a` command and return the correct ID.  
  · Credentials provided for Discovery must be able to run `pfexec <commands>`. Possible SSH commands are those listed in [Unix and Linux commands](https://en.wikipedia.org/wiki/Unix_and_Linux_commands).  
  · Discovery does not support any other `pfexec` options, such as a password prompt. |
| dzdo    | · Host must support the `dzdo command -v` command and return the path to `dzdo` in standard output.  
  · Credentials provided for Discovery must be able to run `dzdo <commands>`. Possible SSH commands are those listed in [Unix and Linux commands](https://en.wikipedia.org/wiki/Unix_and_Linux_commands).  
  · Discovery does not support any other `dzdo` options, but Discovery supports password authentication for `dzdo`. |

**Add a new privileged command**

Add a new privileged command to the Privileged Command (privileged_command) table that is available to your MID Servers.

Role required: admin

**Important:** Do not delete any of the supported commands.

1. Navigate to **MID Server > Privileged Command** and click **New**.
2. Complete these fields:
   - **Command**: The name of the privileged command.
   - **Password Prompt**: The password prompt displayed to the user for this privileged command, or a regular expression that matches this password prompt. If this field is empty, no password is required for this privileged command, and no prompt is displayed. SUDO commands do not require a password prompt.
3. Click **Submit**.

**Create a pbrun profile privileged command**

You can create a special configuration for the `pbrun` privileged command that allows it to run as a profile.
Role required: discovery_admin, admin

Of all the privileged commands, only the **pbrun** command can be configured to run as a profile, and only one of these special **pbrun** configurations can function on a MID Server.

**Important:** Edit the existing **pbrun** record for this purpose. The system ignores any additional commands you create for **pbrun**.

1. Navigate to MID Server > Privileged Command.
2. Select **pbrun** from the list.
3. In the Privileged Command record, edit the value in the **Command** field to use the format `pbrun -u <profile>`.
   For example, you can set `pbrun -u admin` as a command to run with an admin profile.
4. Click **Update**.

**Configure the MID Server to use specific privileged commands**

You can configure the MID Server to use specific commands in a defined order.

Role required: admin

1. Navigate to the list of MID Servers using one of the following paths:
   - MID Server > Servers
   - Discovery > MID Servers
   - Orchestration > MID Servers
2. Select the MID Server you want to configure.
3. Click the menu icon in the header bar and select **View** > **Advanced** from the context menu.
4. In the Privileged Command related list, click Edit.
5. Select the command you want this MID Server to use and click Save.
The default order of privileged commands is 100, but you can change the order as necessary. The privileged command with the smallest order number is tried first.
List of privileged commands to use for a MID Server

Map an IP address to a DNS name

If the MID Server manages resources within defined IP ranges, all host servers must have their DNS names mapped to an IP address.

Role required: admin

The association of an IP address to a DNS name ensures that the appropriate MID Server is selected based on the IP Address range configuration. If this is not done, Orchestration reverts to the default MID Server.

If Discovery cannot discover the server and resolve the DNS name to an IP address, you must creating the mapping manually, using this procedure.

1. Enter `cmdb_ci_dns_name.list` in the navigation filter.
   A list of DNS names appears.
2. Check the list for your host server.
   If the server does not appear in the list, continue with this procedure.
3. Click New.
4. Enter the fully-qualified domain name (FQDN) of the host server in the Name field.
5. Right-click in the form header and select Save from the context menu.
6. In the IP Address related list, click New.
7. In the IP Address field, enter the IP address of your host server.
8. In the Nic field, select eth0 or your preferred network interface controller.
9. Leave the Netmask field blank.
10. Click Submit.
MID Server security and encryption

Several options are available for you to enhance security on MID Servers, including credential and encryption security, the authorization of SOAP requests, and the establishment of secure socket layer (SSL) connections.

How MID Server encryption works

The MID Server login credentials appear in the config.xml file in clear text by default, but you can encrypt them. While the username and password are initially set in a config.xml configuration file on the MID server, once the MID server retrieves the credentials, it can replace the clear-text password with an encrypted password. For the encryption of the local MID server service account, the password is encrypted using an AES128 encryption algorithm. The MID server also maintains an encryption key that is generated each time it starts and remains in memory and not on the hard disk. When credentials need to be sent from the instance to the MID server, the following process takes place:

1. The instance retrieves the encrypted password and the unencrypted username from the instance database table.
2. The instance decrypts the encrypted password, and then re-encrypts it using the MID server encryption key.
3. The username and re-encrypted password are sent to the MID Server through the encrypted TLS session was already established between the MID server and the instance.
4. The MID server receives the credentials and decrypts the password in memory before using the credentials for remote operations. At no point is the credential password stored on the disk in an unencrypted format.

To enable this encryption, see Encrypt MID Server login credentials.

MID Server encryption keypairs

Automation credentials are secured by encrypting them in the instance with the MID Server’s trusted public key prior to transmission. When the MID Server is created, it generates a keypair, consisting of a public and private key. After the MID Server is validated, it can use the private key to decrypt automation credentials. You should occasionally rekey the MID Server to meet your organizations security requirements. See Rekey a MID Server for instructions.

SSL certificates

You can add certificates to the MID Server if you want communication to occur over SSL. You can add these certificates to the cacerts keystore file:

- Signing Certificate Authority (CA) certificate
- MID Server certificate

See Add SSL certificates for the MID Server for instructions.
Basic authentication credentials and SOAP requests

You can enforce basic authentication on each request. The MID Server is not able to communicate through a proxy server if the proxy server supports only NTLM authentication. You can use basic authentication with a proxy server or create an exception for the MID server host.

Supplying basic authentication information, regardless of whether it is required, has an added advantage. The web service invocation creates or updates data using the supplied credentials. For example, when you create an incident record, the journal fields have the user id of the basic authenticated user instead of the default Guest user. This behavior allows you to identify data added by a specific MID Server.

You can set basic authentication credentials for SOAP requests. See Require basic authorization for incoming SOAP requests for instructions. Each SOAP request contains an Authorization header as specified in the Basic Authentication protocol.

Note: The setting for enforcing strict security controls how the instance uses the credentials you provide for the MID Server. When the setting is enabled, you must provide a user ID with access to the tables the MID Server is trying to access. When the setting is disabled, any valid user ID allows the MID Server to access to all tables.

Encrypt MID Server login credentials

Encrypt the MID Server login credentials for added security.

Role required: admin

Note: Any field in this file can be encrypted, but once encrypted, a field can be managed only from within the instance. You should encrypt password fields only for the MID Server and any proxy server specified.

1. Navigate to the agent directory that was created when the MID Server was installed and open the config.xml file using a text editor such as WordPad.

The instance credentials section of the config.xml file looks like this:

   <!-- If your instance has authentication enabled (the normal case), set these parameters to define the user name and password the MID Server will use to log into the instance. -->
   <parameter name="mid.instance.username" value="midsrvadmin" />
   <parameter name="mid.instance.password" value="securepassw0rd"/>

2. Add the encrypt="true" attribute to the password tag.

   <parameter name="mid.instance.username" value="midsrvadmin" />
   <parameter name="mid.instance.password" encrypt="true" value="securepassw0rd"/>

3. Save the config.xml file, and then restart the MID Server service. The password is now encrypted.

   <parameter name="mid.instance.username" value="midsrvadmin" />
   <parameter name="mid.instance.password" encrypt="true" value="encrypted:rhrfUNYRz2AI8/BkTtZmNA=="/>

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
The password cannot be decrypted, which means it is displayed in clear text again, by changing the encryption attribute to false or by deleting the attribute. If the password is changed in the config.xml file and the MID Server restarted, the new password is encrypted.

**Rekey a MID Server**

Rekeying a MID Server forces it to restart and generate a new private key. Typically, this is only necessary if the MID Server keystore is compromised.

Role required: admin

When the MID Server comes back online, the system automatically validates the new key, and the MID Server resumes processing automation tasks.

1. Navigate to **MID Server > Servers**.
2. Open the MID Server whose keypairs you want to rotate.
3. Under Related Links, click **Rekey**.

**Add SSL certificates for the MID Server**

Configure the MID Server to connect to a source over SSL.

Role required: admin

**Note:** The MID Server does not support SSL when importing data from an integration, such as an LDAP server.

1. Open a command prompt and navigate to the folder containing the JRE `keytool`.
   An example path might be: `C:\Program Files (x86)\ServiceNow\<MidServer(s)>\agent\jre\bin`
2. Enter the following keytool command to import a certificate into the MID Server’s cacerts keystore:
   ```shell
   keytool -import -alias <certificate alias> -file "<path to certificate>" -keystore "<path to MID Server(s)>\agent\jre\lib\security\cacerts"
   ```
   For example, you might enter:
   ```shell
   keytool -import -alias MyCA -file "C:\myca.cer" -keystore "C:\Program Files (x86)\ServiceNow\MIDserver\agent\jre\lib\security\cacerts"
   ```
   **Note:** Keytool prompts for a certificate password. If the certificate is for a CA, keytool also asks whether to trust the certificate authority. To add a certificate to an instance, see [Upload a certificate to an instance](#).

**Require basic authorization for incoming SOAP requests**

For added security, you can enforce basic authentication on each incoming SOAP request to the MID Server.

Role required: admin

1. Navigate to **System Properties > Web Services**.
2. Select the check box for **Require basic authorization for incoming SOAP requests**.
3. Click **Save**.
4. To provide basic authentication credentials for a MID Server, navigate to `C:\Program Files \ServiceNow\<MID Server name>\agent` and edit the config.xml file, as follows:
   a) Find the element `<parameter name="mid.instance.username" value=""/>` and enter the instance administrator user name as the value.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
For example, you might enter `<parameter name="mid.instance.username" value="admin"/>`.

b) Find the element `<parameter name="mid.instance.password" value=""/>` and enter the configured password for this instance as the value. For example, you might enter `<parameter name="mid.instance.password" value="abc123"/>`.

Advanced MID Server configuration

There are several advanced options available for you to customize and configure the MID Server.

Enable script file synchronization for Windows browser security

Windows Internet Explorer enhanced security blocks downloaded files that it determines are potentially dangerous.

Enhanced security in Windows browsers, such as Internet Explorer, blocks downloaded files that it determines are potentially dangerous. This would block files downloaded for use by the MID Server. You would need to unblock each file manually through the browser.

To get around this issue, use file synchronization. File synchronization requires you to proactively take script files from your instance and save them on the MID Server. The files on the instance and the MID server stay synchronized, but there is no longer any need for the MID Server to download the whole file. File synchronization also protects any updates you make in those script files from being overwritten during the upgrade of an instance.

Script files synchronized with the MID Server are stored on the instance in the MID Server Script File [ecc_agent_script_file] table, which you can access in the MID Server > Script Files module.

When the MID Server first connects to the instance, the instance creates a directory called `\scripts` in the MID Server root. The instance then creates a parent directory in the path `\scripts\<parent name>` using definitions from the ecc_agent_script_file table. Finally, the instance creates the script files themselves inside the parent directory using the records from the ecc_agent_script_file table.

The record for the parent directory looks like this:
The instance creates each script file in the parent directory on the MID Server using the record Name from the ecc_agent_script_file table as the file name and the Script field payload as the file contents. A script file record looks like this:
The synchronization of the script file continues to work as if the script was manually added to the form.

See [Attach a script file to a MID Server](#) for instructions on how to attach a script file.

**Note:** The MID Server Script File (ecc_agent_script_file) table is domain separated. You can create versions of these policies that only a MID Server from the same domain can use. For instructions, see [Set up domain separation for MID servers](#).

**Attach a script file to a MID Server**

Attach a script file to a MID Server to keep script files in synch with the instance without having to download the file. Do this when your browser security settings are blocking the downloading of files that your MID Server needs from the instance.

Role required: admin

You can attach multiple files, but the last attached file gets synchronized to the MID Server. If you delete the attachment, the script file becomes inactive, and the synchronized file is deleted from MID Server.

1. Navigate to MID Server > Script Files.
2. Open the file to which you would like to attach the script file, or click New to create a new file.

   **Note:** The script file attachment name must match the MID Server script file name, since the record can contain other attachments.

3. Select **Use attachment**, and then click the paperclip icon to add the attachment.

   **Note:**
   When **Use attachment** is checked, an attached script file overrides the script contained in the **Script** field. If this check box is cleared, the script in the **Script** field is used instead of the attachment.

   The script file attachment name must match the MID Server script file name, since the record can contain other attachments.

4. Click **Update** to initiate the synchronization process.

   Ensure that the file name matches the script name.

   **Note:** If you receive the error message: **File type not permitted or mime type does not match the file content**, request that your administrator turn off mime type validation on attachments. The system property **glide.security.file.mime_type.validation** controls this setting.

---

**Configure a MID Server for Service Analytics RCA**

To activate the Service Analytics root cause analysis (RCA) feature, configure at least one dedicated MID Server with the ServiceAnalytics as a supported application, and with the RCA capability. To ensure uninterrupted services, it is recommended that you also configure a failover MID Server cluster for RCA.

If the Domain Support - Domain Extensions Installer plugin is activated, then you can configure a dedicated MID Server with the RCA capability, per domain. In this case, RCA for a business service is done on the MID Server that is in the same domain as the business service. Otherwise, a MID Server from the global domain is used.

**Hardware requirements**

<table>
<thead>
<tr>
<th>Component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Memory</td>
<td>• Minimum: 4 GB&lt;br&gt;• Recommended: 8 GB</td>
</tr>
<tr>
<td>Processor</td>
<td>• Minimum: Either of the following:&lt;br&gt;  • Core 2+&lt;br&gt;  • Xeon processor with a speed over 2 GHz&lt;br&gt;  • Recommended: Quad-core</td>
</tr>
<tr>
<td>Disk space (for 100 discovered services)</td>
<td>• Minimum: 8 GB&lt;br&gt;• Recommended: 10 GB</td>
</tr>
</tbody>
</table>
Role required: admin

The RCA MID Server supports the Service Analytics RCA process by hosting the RCA Learner and the real-time RCA query handler. On the RCA MID Server, the system builds models that support responses to root cause queries. The learner data on the RCA MID Server persists by default for a maximum of 90 days.

By default, the MID Server is set up as a dedicated MID Server for Service Analytics RCA, and an attempt to add additional supported applications to the same MID Server is prevented. It is recommended that Service Analytics Metrics is also implemented with its own dedicated Metrics MID Server. These recommendations ensure high level of performance. However, if needed, you can modify this default behavior and configure the RCA MID Server or the Metrics MID Server with additional supported applications. For information about modifying the behavior of the ALL option when selecting supported applications, see Configure applications included in ALL Applications.

1. Ensure that the MID Server is validated.
   For more information, see Validate the MID Server.
2. Navigate to MID Server > Servers.
3. Double-click the MID Server that you want to configure as an RCA MID Server.
4. Add the ServiceAnalytics application:
   a) At the center of the MID Server form, click Supported Applications.
   b) In the Supported Applications section click Edit.
   c) In the slushbucket select ServiceAnalytics and click the > add button.
   d) click Save.

If the MID Server needs to support ServiceAnalytics as well as one or more other applications, you can modify the definition of the ALL option to include these applications, and then select ALL in the slushbucket. ALL is the only option to which it is valid to add the ServiceAnalytics option. Performance might be compromised with these settings.

5. Add the RCA capability:
   a) At the center of the MID Server form, click Capabilities.
   b) In the Capabilities section click Edit.
c) In the slushbucket select RCA and click the ‘>’ add button.

d) click Save.

6. Click Update.

The RCA MID Server is automatically configured with a Discovery IP range set to 0.0.0.0-0.0.0.0.

Create a failover cluster for RCA. In this cluster, add the MID Servers that were configured for RCA.
For more information, see Configure a MID Server cluster.

MIDSystem methods

MIDSystem variables (referred to by the variable name ms.) provide a variety of methods to get information about the MID Server.

<table>
<thead>
<tr>
<th>Method summary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log(String message)</td>
<td>Logs the given message with a standard prefix to indicate that the message was generated by JavaScript.</td>
</tr>
<tr>
<td>getConfigParameter(String parameter name)</td>
<td>Returns the value of the named configuration parameter.</td>
</tr>
<tr>
<td>include(String script include)</td>
<td>Include the MID Server script include with the given name into the current context.</td>
</tr>
<tr>
<td>getName()</td>
<td>Returns the name of the MID Server.</td>
</tr>
<tr>
<td>getSysID()</td>
<td>Returns the sys_id of the MID Server.</td>
</tr>
<tr>
<td>toJavaScript(Object)</td>
<td>Converts the given Java object into the equivalent JavaScript object.</td>
</tr>
</tbody>
</table>

This example writes a message to the log:

```java
ms.log('Attempting to log in with user: ' +
      this.getParameter('user'));
```

Synchronize a JAR file to MID Servers

You can upload a JAR file to an instance and synchronize it to all MID Servers, or write custom probes that use the synchronized JAR file.

Role required: admin, agent_admin

The MID Server JAR File (ecc_agent_jar) table is domain separated. You can create versions of these policies that only a MID Server from the same domain can use. For instructions, see Set up domain separation for MID servers.

Caution: Synchronizing a JAR file with this procedure causes all MID Servers connected to the instance to restart automatically.

1. Navigate to MID Server > JAR Files.
2. Click New.
3. Complete the following fields:
• **Name:** A unique and descriptive name for identifying the file in the instance.
• **Version:** A version number for the file, if one is available.
• **Source:** Location of the JAR file for reference purposes. Source information is not used by the system.
• **Description:** Short description of the JAR file and its purpose in the instance.

4. Click the paper clip icon in the banner.

5. In the Attachments dialog box, click **Browse** and select the file you want to attach.
   The platform attaches the JAR file to the record and restarts the MID Servers to synchronize the file. It is not necessary to update the record to attach the file.

### Set the MID Server JVM memory size

The MID Server starts with a default JVM memory allocation, but you can modify this setting in the configuration file.

**Role required:** admin

In the base system, the MID Server JVM memory is set to 1024MB, which is configured in the `\agent\conf\wrapper-override.conf` file in the MID Server installation directory. This setting might not be appropriate for the way your organization uses the MID Server. If you want the MID Server to work harder, allocate more resources to it. If the MID Server is located in a small branch office and runs in an environment where memory allocation is shared between a print server, mail server, or web proxy server, the allocation might have to be reduced.

**Note:** For a complete list of minimum MID Server requirements, see [MID Server system requirements](#).

1. Open the `\ServiceNow\<MID Server name>\agent\conf\wrapper-override.conf` file in a text editor.
   For more information about this file, see [Installing Multiple MID Servers on a Single System](#).
2. Locate the following lines in the file:
   ```
   # OPTIONAL: Maximum Java Heap Size (in MB)
   # wrapper.java.maxmemory=1024
   ```
3. Edit the memory allocation.
4. Remove the comment tag (#) from the memory allocation parameter.
5. Save the file.
6. Restart the MID Server service.

Set MID Server thread use

If the MID Server is running on a host containing many other programs that must compete for CPU time, fewer threads than the default of 25 might be necessary.

Role required: admin

You can set the MID Server to use as few as 5 threads without issues. If the MID Server needs more speed, and the host is powerful enough or lightly loaded with other programs, raise the thread setting. The thread limit depends on the hardware and the operating system of the host. You might have to experiment to find the optimal value for your situation. The following general observations may be useful:

- Most MID Server tasks require file handles to do their job.
  - Windows: On the Windows operating system, file handles are available in a fixed quantity. If you configure too many MID Server threads on a Windows host, the MID Server can consume all the file handles before approaching maximum CPU usage. This situation appears as an Out of file handles error in the MID Server log and indicates that the MID Server is trying to use too many threads.
  - UNIX and Linux: UNIX and Linux hosts have a much different scheme for allocating file handles. Generally, you can increase MID Server thread use on these operating systems until the CPU of the host is overloaded. See your OS documentation for monitoring CPU usage.

- Each thread on the MID Server requires some memory. Exactly how much memory varies considerably from task to task and depends on the equipment being discovered. To increase the number of threads, you might have to **increase the amount of memory** that Java uses. If you configure insufficient memory, an Out of memory error appears in the MID Server log.

Follow the steps below to change the `config.xml` file. Alternatively, use the `threads.max` connection parameter.

1. Open the `\agent\config.xml` file using any text editor.
2. Locate the following lines:

   ```xml
   <!-- MID Server Threads -->
   <parameter name="threads.max" value="25"/>
   ```

3. Edit the value. Keep in mind the cautions described above.
4. Save the record.
5. Restart the MID Server service.

ECC queue retry policy

Define retry policies for outbound Web Services that are executed via the ECC Queue table.

Retry policies specify a matching error condition for ECC Queue input records that are a result or response of an output queue record, the interval for retry, and the maximum number of retries. Because it matches on the input queue record, the retry policies only work when an input ECC Queue record is expected, and therefore requires that the outbound messages are queued on the ECC Queue table as well. Advanced matching criteria may be specified using script.

Retry activity

The retry activity records document each attempt to retry the output queue record.
When the current policy is being retried, the **Status** of the activity will indicate Retrying. When all retries are exhausted, e.g. the maximum number of retries have occurred and the output queue still failed, the **Status** field will indicate a Failed state. Otherwise, at anytime during the retry, if the request then becomes successful, it indicates Succeeded.

**Queue Retry Activity**

You may also display the current list of retry activities and their states by selecting the **Queue Retry Activity** module.
### Queue Retry Activities

Retry policy example

This retry policy defines the matching criteria when an UnknownHostException response is received during a SOAPClient (outbound SOAP message invocation) call.

<table>
<thead>
<tr>
<th>Queue Retry Policy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name: SOAPClient java.net.UnknownHostException</td>
</tr>
<tr>
<td>Maximum retry: 3</td>
</tr>
<tr>
<td>Retry interval: Days 0 Hours 00:00:15</td>
</tr>
<tr>
<td>Active:</td>
</tr>
<tr>
<td>Description:</td>
</tr>
</tbody>
</table>

SOAP connection fails due to java.net.UnknownHostException

Condition:

<table>
<thead>
<tr>
<th>State</th>
<th>is</th>
<th>error</th>
</tr>
</thead>
</table>

Condition script:

```
answer = current.error_string.toString().startsWith('java.net.UnknownHostException');
```

Default Queue Retry Policy

The policy will only match if the Agent, Topic, ECC Name (matches the Name field), and Source fields match that of an input ECC queue record. Additionally, the Condition and Condition script criteria will also have to match "State == error" and the error_string field contains the text java.net.UnknownHostException.

When these conditions are met, and an input record is matched, it will retry the originating output queue record after 15 seconds, and for a maximum of 3 times.

The MID Server ECC queue

The External Communication Channel (ECC) Queue is a connection point between an instance and the MID Server. Jobs that the MID Server needs to perform are saved in this queue until the MID Server is ready to handle them.

The MID Server subscribes to messages published by the Asynchronous Message Bus (AMB), which notifies the MID Server that it has pending tasks in the ECC queue. If a job exists in the ECC Queue
for that MID Server, the MID Server sets the status to "I'm working on it." When finished working on a requested job, the MID Server reports back to the ECC queue with the results.

Access the ECC queue
Open ECC queue records to see details of the details of a discovery. You can view ECC queue records while a discovery is in process.

Role required: admin

1. Navigate to one of the following:
   - Discovery > Output and Artifacts > ECC Queue
   - Discovery > Discovery Schedules > {schedule name} > {Discovery status record}
   - ECC > Queue
   - {Discovery Status record} > ECC Queue

2. Sort the list by any column that interests you, such as Created or Queue.
3. Open an ECC queue record (see table for field descriptions).

ECC queue fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agent</td>
<td>The name of the external system that this messages is either from or to. If the message is from or to a MID Server, the agent name is in the form mid.server.xxx, where xxx is the name of a particular MID Server.</td>
</tr>
<tr>
<td>Topic</td>
<td>The name of the probe the MID server ran. If you are using a pattern for discovery, HorizontalDiscoveryProbe appears.</td>
</tr>
<tr>
<td>Name</td>
<td>The actual command the probe ran. For example, if Topic is SSHCommand, then the Name field contains the actual shell command to run. If you are using a pattern for discovery, the following appears: Pattern Launcher: followed by the name of the pattern and the multipage number.</td>
</tr>
<tr>
<td>Source</td>
<td>The IP address that the discovery is to run against. A few probes run against multiple IP addresses; in those cases, this field contains a human-readable description.</td>
</tr>
<tr>
<td>Response to</td>
<td>This optional field contains a reference (sys_id) to the ECC Queue message that this message is in response to. Discovery makes extensive use of this field to track the hierarchy of messages that result from a given scheduled Discovery. Click the record icon for the value in this field to open the ECC Queue record for the activity that spawned the current probe or sensor record.</td>
</tr>
<tr>
<td>Queue</td>
<td>An indicator of whether this message was an input message or an output message.</td>
</tr>
<tr>
<td>Field</td>
<td>Input value</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>State</td>
<td>The state of the current ECC queue record. States update automatically. See <a href="#">The ECC queue for Discovery</a> for a brief overview of the process flow.</td>
</tr>
<tr>
<td>Processed</td>
<td>The time when this message was processed.</td>
</tr>
<tr>
<td>Created</td>
<td>The time when this message was created.</td>
</tr>
<tr>
<td>Sequence</td>
<td>The unique sequence number for this message. This value is automatically generated when an ECC Queue record is inserted. Its use is deprecated.</td>
</tr>
<tr>
<td>Error string</td>
<td>An error message, if an error occurred during processing. This field is hidden on the standard form unless there was an error.</td>
</tr>
<tr>
<td>Payload</td>
<td>The body of the message in XML format. The returned XML has a root tag of <code>&lt;results&gt;</code> containing one or more <code>&lt;result&gt;</code> tags and a single <code>&lt;parameters&gt;</code> tag. The parameters are simply an echo of those sent to the MID server in the probe; they vary from probe to probe, but in general they tell the probe the details of what it is to do and how it should behave. The result tags are the most interesting ones: they contain the actual data generated by the probe.</td>
</tr>
</tbody>
</table>

4. Click any of these related links:

<table>
<thead>
<tr>
<th>Related link</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run again</td>
<td>Runs the probe again. You can re-run probes when you encounter a failed discovery or other unexpected results.</td>
</tr>
<tr>
<td>Go to CMDB item</td>
<td>Open the CI record for the CI that was updated during the discovery.</td>
</tr>
<tr>
<td>Go to Sensor</td>
<td>Open the record for the associated sensor.</td>
</tr>
</tbody>
</table>

**Create an ECC Queue message**

One of the capabilities of the MID Server is to be able to send remote commands through the MID Server to the hosting device, and then gather the response.

This feature enables an administrator to issue remote commands directly from the ECC Queue without running Discovery.

1. Navigate to **Discovery > Outputs and Artifacts > ECC Queue**.
2. Click **New**.
3. Create a message with the following settings:
   - **Agent**: The name of the MID Server that executes the command
   - **Topic**: Command
   - **Name**: The actual command that you want to process. For Windows, this is expressed in a DOS command line structure. For Linux, the structure could be a bash command line entry.
   - **Queue**: Output
- **Payload**: With proper XML tags, you can specify the command here instead of in the **Name** field. The advantage to this is that the command is not restricted by the **Name** field length of 120 characters. Use the following XML format for the command:

```xml
<parameters>
  <parameter name="name" value="ACTUAL_COMMAND_LINE"/>
</parameters>
```

The MID Server takes the XML entry in the ECC Queue and processes the command-line call locally. The STDOUT is returned to the ECC Queue as an Input queue entry.

**Note**: The command specified through the **Payload** field takes precedence over the command specified in the **Name** field.

### Access MID Server log entries from the ECC queue

You can access entries in the ECC Queue that show `agent0.log.0` logs and `wrapper.log` logs for an individual MID Server.

Role required: admin or mid_user

After you install and configure your MID Servers, there are several tasks you can perform to monitor the MID server, including viewing the logs to find warnings and errors.

1. Open a MID Server record.
2. Under **Related Links**, click **Grab MID Logs**.

   ECC queue records appear in the list using the following filter:

   - **Topic** is SystemCommand
   - **Source** is grabLog
   - **Agent** is {your MID Server}

   Only `agent0.log.0` and `wrapper.log` entries appear. These logs are also accessible in the `~\agent\logs\` file path.

3. To open a log entry, click the link under the **Created** column.

### View MID Server statistics

You can access entries in the ECC Queue that belong to the `queue.stats` topic for an individual MID Server. Use these statistics for monitoring and troubleshooting your MID Server.

Role required: admin or mid_user

Useful MID Server statistics include memory and CPU usage data.

1. Open a MID Server record.
2. Under **Related Links**, click **MID Statistics**.

   ECC queue records appear in the list using the following filter:

   - **Topic** is queue.stats
   - **Agent** is {your MID Server}
MID Server cluster configuration

MID Server clusters enable multiple MID Servers with the appropriate capabilities to be grouped together for load balancing and fail-over protection.

External data sources

For performance and reliability reasons, these data sources should not be used with MID Server clusters:

- LDAP
- Export sets
- JDBC data sources

These external data sources should only be used with dedicated MID Servers.

How clusters work

MID Servers in clusters must be able to connect to the instance and to all the devices with which they are expected to communicate. If all MID Servers in a cluster are down, the discovery is canceled. Make sure all the MID Servers are added to any Access Control List (ACL) in use. MID Server clusters are managed by a business rule called MID Server Cluster Management, which checks to see if the MID Server assigned to a job in the ECC Queue belongs to a cluster.

Load balancing

If the cluster business rule determines that a MID Server is part of a load balancing cluster, the application using the MID Server automatically balances the work between the MID Servers in that cluster. It is good practice to put MID Servers with the same capabilities in a load balancing cluster.

Fail-over protection

MID Servers in a fail-over cluster each have a configured order that the platform uses to determine which MID Server to use next in case of failure. MID Servers in a fail-over cluster work independently and do not load balance with other MID Servers in that cluster (although they might also be members of load balancing clusters). When a MID Server fails, the MID Server Cluster Management business rule selects the highest available MID Server in the order to take over the work. The selected MID Server checks the ECC Queue and starts with jobs that are either Processing or Ready.

Note: MID Server clustering does not supported the ECC queue topics Command or SystemCommand. If these commands are received, the clustered MID Servers do not redirect the ECC queue to another MID Server. The ECC queue records stay on the ECC queue without being processed.

Configure a fail-over MID Server with at least the same capabilities as the MID Server it is intended to relieve.

Note: If a MID Server fails while the Shazzam probe is running and auto-selection is configured, failover is not available. The Shazzam discovery stops. Discovery does not automatically choose another MID Server.
**MID Server cluster event**

The following event is triggered when the platform cannot find a MID Server with the appropriate capabilities to replace a MID Server in a fail-over cluster. Use this event to create an email to notify appropriate users that the cluster has failed.

<table>
<thead>
<tr>
<th>Event</th>
<th>Table</th>
<th>Description</th>
<th>Business Rule</th>
</tr>
</thead>
<tbody>
<tr>
<td>mid_server.cluster.down</td>
<td>MID Server Cluster</td>
<td>A MID Server cluster has failed</td>
<td>MID Server Cluster Management</td>
</tr>
</tbody>
</table>

**Combining clusters**

A MID Server can be added to both types of clusters at the same time. This diagram shows a scenario in which a MID Server from a load balancing cluster (MID Server D) is also present in a fail-over cluster. If MID Server D fails, MID Server E in the failover cluster is available to the load balancing cluster to perform the tasks previously assigned to MID Server D.

![MID Server failover example](image)

**Specifying a specific MID Server cluster**

You can specify a specific MID Server cluster for a Discovery schedule. The discovery process uses that cluster only. You cannot chain clusters or specify a single MID Server that belongs to multiple clusters.

**Configure a MID Server cluster**

Configure a cluster of MID Servers for either failover or load balancing.

Role required: admin

You can select a MID Server cluster from the Discovery Schedule form.

1. Navigate to **MID Server > Clusters**.
2. Click **New**.
3. Name the cluster and select the cluster type: **Failover** or **Load Balance**.
4. Right click in the header bar and select **Save** from the context menu.
5. Click **Edit** in the **Includes MID Servers** Related List.
6. Select appropriate MID Servers for this cluster from the slushbucket.

**Note:** All MID Servers in a cluster should have capabilities defined. Ensure that each MID Server has the appropriate capabilities for the job. A MID Server in a fail-over cluster must have the same capabilities (or expanded capabilities) as the MID Server it is expected to replace.

### MID Server capabilities

MID Server capabilities define the specific functions of a MID Server within an IP address range. Several applications, such as Discovery, Service Mapping, and Orchestration can use capabilities, IP ranges, and the supported application to narrow the pool of MID Servers it uses. At least one capability is required for each MID Server used by Orchestration. See MID Servers for Orchestration for more information.

The following capabilities are available by default with Discovery:

- SSH
- SNMP
- VMware
- PowerShell
- WMI
- SOAP
- REST
- JDBC
- Resolve DNS
- AWS
- Azure
- Cloud Management
- All

### MID Server capability values

Capabilities provided in the base system do not have a defined Value string. A MID Server configured to use a capability that has no Value can locate any device using that capability’s protocol. If a capability has a defined value, the MID Server using that capability finds only those devices using that protocol that match the value string exactly. The exception to this is the Resolve DNS capability, which is configured to resolve any DNS name into an IP address using a partial string match.

### Scripted MID Server capability value matching

You can use value tests to create capabilities that find devices using values without requiring exact string matching. Action on these values is controlled by a user-defined script.

The Resolve DNS capability is provided in the base system and is configured to resolve DNS names into IP addresses for devices whose names end with a specified domain name. The capability Value entered is automatically prefaced with a dot during processing to match domain syntax. This value can contain one or more sub-domains, but must include the end of the domain string. Matching devices must end with the identical syntax. The script for the Resolve DNS capability determines if a device name matches the criteria defined by Value. If
a match exists, the platform performs the address resolution automatically. For example, if the value for the Resolve DNS capability is service-now.com, the MID Server with this capability finds lnxlab01.sandiego.service-now.com and dbsrv101.sanjose.service-now.com. If the value is changed to sandiego.service-now.com, then the MID Server finds only lnxlab01.

Note: If Value in the Resolve DNS capability is blank, then all domains match.

To view the script for evaluating this capability, navigate to MID Server > Capability Value Tests and select Resolve DNS from the list.

Configure MID Server capabilities

A capability is required for each MID Server to work with Orchestration, Service Mapping, Cloud Management, and Service Analytics.

Role required: admin or sm_admin

1. Navigate to MID Server > Capabilities.
2. Select an existing capability. You can also select ALL to include all capabilities.
3. Create a new capability:
   a) Click New.
   b) Configure the value for a custom capability.
      An example is a capability for **DOMAIN**, with a value of **service-now**.
   c) Click Submit.

4. Click **Edit** in the MID Servers related list to add MID Servers to the capability.
5. Select one or more MID Servers for this capability from the slushbucket.
6. Click **Save**.

   The capability defined here also appears in the primary record for this MID Server.

### MID Server troubleshooting

The Knowledge Base on Hi contains several articles to help you troubleshoot MID Server issues.

<table>
<thead>
<tr>
<th>The MID Server Troubleshooting Guide</th>
<th>KB0597571</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start here if you are experiencing symptoms such as the MID Server going down or not responding, or CIs being duplicated during discovery.</td>
<td></td>
</tr>
</tbody>
</table>

You can also see the following video on NOWsupport YouTube channel:

- **How to set up a MID Server**

### MID Server active issues

The ServiceNow® instance has a dedicated table that publishes active issues with MID Servers and alerts administrators when a MID Server is in danger of exceeding its resources.

The MID Server Issue (ecc_agent_issue) table displays a number of common issues that a MID Server can experience, as they occur. Error checking processes attempt to pinpoint the most likely cause of the issue. Informative error messages name the affected MID Server and explain the possible cause of the issue. The ecc_agent_issue table retains its records for 30 days.

To access records in this table, navigate to **MID Server > Server Issues**.

Supported MID Server active issues:

- Bad user credentials after instance cloning.
- Approaching resource thresholds for CPU usage and JVM memory.
- Errors detected during **pre-upgrade testing**.
- User authentication and authorization failures.
- Network connectivity interruptions and role configuration errors.
Active MID Server post-cloning credential issues

The system provides automatic processes to detect and notify you of possible MID Server credential issues after instance cloning.

During an instance clone, the MID Server (ecc_agent) table is not copied from the source instance, but the User (sys_user) table is copied. As a result, the source MID Server user credentials copied into the target instance might not match those used by the existing set of MID Servers used by the target. Bad credentials can cause those MID Servers to be down for the target instance. Processes on the instance notify you if a MID Server is down from suspected bad credentials following an instance clone.

Table for post-cloning credential issues

The MID Server Issue (ecc_agent_issue) table stores active MID Server issues after an instance clone. Records in this table show a MID Server's current state, evaluation times, and the issue...
source. For cases in which a MID Server for a cloned instance is down because of possible bad credentials, the Issue source is InstanceClone. Data from the MID Server Issue (ecc_agent_issue) table are displayed in a related list on a MID Server record. Records in this table are removed after 10 days, regardless of their state. Ongoing issues reappear as they occur.

Post-cloning cleanup script and scheduled jobs

A cleanup script called Bad MID Server credentials after clone runs on the target instance after cloning and calls a script include called BadMIDCredentialAfterClone. This script include schedules the execution of the following jobs on the Schedule Item (sys_trigger) table:

- BadMIDCredentialAfterClone-1: Runs 15 minutes after clone execution.
- BadMIDCredentialAfterClone-2: Runs 75 minutes after clone execution.

These jobs log to the MID Server Issue (ecc_agent_issue) table any MID Servers that existed on the target instance prior to the clone that are in the Down state. These MID Servers are not ready for normal processing and might be down due to invalid credentials resulting from the cloning process. The state of MID Servers added to the target instance after the clone is not evaluated.

Note: The MID Server log shows that the MID Server user associated with the target instance could not be authenticated or was missing the proper role.

Business rule that checks for bad credentials

The Check for bad MID credential after clone business rule monitors the MID Server (ecc_agent) table for MID Servers that are transitioning from Down to Up. If the business rule finds a MID Server making that transition, the rule attempts to find a matching MID Server in the MID Server Issue (ecc_agent_issue) table that has an issue source of InstanceClone and a state other than Resolved. If a match is found, the business rule updates the state of the MID Server in the (ecc_agent_issue) table to Resolved.

Resolving MID Server issues

The error message in the MID Server Issue (ecc_agent_issue) table names the affected MID Server user. This message appears each time the business rule runs and finds a MID Server that is down from suspected bad credentials:

MID Server not operational (status: Down), possibly due to recent clone. Verify credentials for logged in User 'local-midserver'.

Attempt to resolve the issue first by comparing the user's credentials with the credentials that the affected MID Server is expecting. If the credentials are incorrect, fix the problem and check the MID Server status again. If the credentials are correct, but the MID Server remains down, check the Knowledge Base for other possible causes.

MID Server resource threshold alerts

The instance displays warnings when a MID Server breaches its resource thresholds for CPU and JVM memory usage, enabling users to create email notifications or custom scripts when a breach occurs.

The MID Server Issue (ecc_agent_issue) table warns users when a MID Server exceeds configured thresholds of its allocated CPU and memory resources. These warnings are published before the MID Server experiences performance degradation or an out-of-memory error, enabling the administrator to increase resources and avoid downtime. Administrators can use a registered
event to send email notification to selected recipients, advising them of any threshold breaches, or to create a custom script to do some other type of work. The instance continues to update the MID Server Issue (ecc_agent_issue) table to keep unresolved issues current.

By default, CPU and memory threshold alerts are disabled and no alerts are published to the MID Server Issue (ecc_agent_issue) table. To enable both types of alerting, add these properties to the System Property (sys_properties) table, and then set their values to true:

- mid.threshold.resource.breach.enable.cpu.alerts
- mid.threshold.resource.breach.enable.memory.alerts

For details on adding system properties to the platform, see Add a property using sys_properties.list.

Evaluation process

This processing occurs whether or not alerting is enabled:

1. Every 10 minutes, each MID Server transmits its CPU and memory consumption metrics to the instance. The instance inserts CPU metrics into the Mean CPU used % field of the ECC Agent Scalar Metrics (ecc_agent_scalar_metric) table and memory metrics into the Max memory used % field of the ECC Agent Memory Metrics (ecc_agent_memory_metric) table.

2. After a successful insert, the following business rules run on each table, invoking a script include that calls an appropriate function. Each function takes an average of the metric sets inserted into the tables, based on the configured sampling intervals.

   - **Update cpu mean on MID Server Status**: Calls the MIDResourceThresholdBreach.checkCpuUsage() script include.
   - **Update max memory on MID Server Status**: Calls the MIDResourceThresholdBreach.checkMemoryUsage script include.

   Each function takes an average of the metric sets inserted into the tables, based on the configured thresholds and sampling intervals. The instance first looks at each MID Server for configuration parameters that set custom threshold values or sampling intervals for that MID Server. If no configuration parameters for these attributes are found, the instance looks in the System Properties (sys_properties) table for custom values to use. If no properties are found, the instance uses the default threshold and interval values from the code.

   Note: Both the threshold percentages and the sampling intervals are configurable. See Configuring thresholds and sampling intervals for details.

Alerting process

When alerting for CPU or memory thresholds is enabled, this processing occurs:

1. If the aggregated average metric value equals or exceeds the configured percent threshold, the instance triggers the mid.threshold.resource.breach event. Administrators can use this event to create email notifications for threshold breach alerts or to create a custom script.

2. The instance inserts a record of the breach into the MID Server Issue (ecc_agent_issue) table with a State value of New and a Count of 1, and then publishes a message containing all the pertinent details of the breach. An example of this message is Mean CPU used % has exceeded threshold (96>=91) for a 40 minute interval span, occurring after start date 2017-01-11 14:25:19. This message appears in the Short description field of
the MID Server Issue form and in the event. You can copy any part of the message into your email notifications.

MID Server issue states

When the administrator first examines an issue in the MID Server Issue (ecc_agent_issue) table, the administrator can change the State of the issue to Acknowledged to indicate that the issue is being addressed. Each time the instance detects a breach, it attempts to match the breach with an existing issue. If a MID Server already has an issue record for that breach in a State of New or Acknowledged, the instance updates the Last Detected field with the current date/time and increments the Count field in the existing record. This prevents the creation of duplicate records in the MID Server Issue (ecc_agent_issue) table and records the number of times after the initial incident that the breach reoccurred. The administrator can increase MID Server resources gradually and watch the effect on the Count field. When the counter stops incrementing, the administrator knows that the MID Server has adequate resources. When the MID Server resource have been adjusted appropriately, the administrator sets the State to Resolved. If a new threshold breach is logged that matches a MID Server issue with a State of Resolved, the instance creates a new issue record.

Note: Any record in the MID Server Issue (ecc_agent_issue) table that has not been updated in 30 days is deleted, regardless of its state.

Recommendations for resolving resource issues

Administrators have the opportunity to resolve any resource issues with a MID Server when they receive notification of the event. Follow these recommendations for reducing the strain on MID Server resources:

- **JVM memory**:  
  - Allocate more max memory to the MID Server. For more information, see [Set the MID Server JVM memory size](#).
  - Add additional MID Servers to share the workload. For more information, see [MID Server cluster configuration](#).
  - Reduce the amount of concurrent processing for the MID Server. This includes segmenting IP Address ranges into smaller segments for a Discovery schedule or loading smaller segments of data within an import job.

- **CPU**: Reduce the activity on the host or migrate the MID Server to a new host with more available resources.
# Tables used for resource threshold evaluation

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Server Issue (ecc_agent_issue)</td>
<td>Stores data on various types of MID Server issues, including breaches of configured CPU and memory thresholds. Fields used for resource threshold breaches are:</td>
</tr>
<tr>
<td></td>
<td>• count: Number of times a previously reported threshold breach occurs, if the event is not marked Resolved.</td>
</tr>
<tr>
<td></td>
<td>• last_detected: Current date and time a threshold breach is detected. This field is updated each time a previously detected breach is found, if it is not marked Resolved.</td>
</tr>
<tr>
<td></td>
<td>• message: Descriptive message summarizing the conditions that triggered the threshold breach event. This message includes the actual percentage of CPU and memory calculated and the configured thresholds that were breached.</td>
</tr>
<tr>
<td></td>
<td>• mid_server: Name of the MID Server experiencing the resource threshold breach.</td>
</tr>
<tr>
<td></td>
<td>• source: The issue source for the breach. These are the possible sources:</td>
</tr>
<tr>
<td></td>
<td>• CpuMIDResourceThresholdBreach: CPU threshold issue sources.</td>
</tr>
<tr>
<td></td>
<td>• MemoryMIDResourceThresholdBreach: Memory threshold issue sources.</td>
</tr>
<tr>
<td>MID Server Status (ecc_agent_status)</td>
<td>Stores the percentages used for the CPU and memory resources, averaged over configurable intervals for each resource. The fields used are:</td>
</tr>
<tr>
<td></td>
<td>• Mean CPU used %</td>
</tr>
<tr>
<td></td>
<td>• Max Memory used %</td>
</tr>
<tr>
<td>ECC Agent Scalar Metric (ecc_agent_scalar_metric)</td>
<td>Stores the CPU usage data inserted by each MID Server every 10 minutes. The table field used by resource threshold alerting is mean.</td>
</tr>
<tr>
<td>ECC Agent Memory Metric (ecc_agent_memory_metric)</td>
<td>Stores the memory usage data inserted by each MID Server every 10 minutes. The table field used by resource threshold alerting is max_used_pct.</td>
</tr>
</tbody>
</table>
### Business rules that check for threshold breaches

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update cpu mean on MID Server Status</td>
<td>Runs after the MID Server inserts a record into the ECC Agent Scalar Metric (ecc_agent_scalar_metric) table. This business rule triggers the MIDResourceThresholdBreach script include function that evaluates threshold settings to determine if the MID Server has breached its configured CPU resource thresholds.</td>
</tr>
<tr>
<td>Update max memory on MID Server Status</td>
<td>Runs after the MID Server inserts a record into the ECC Agent Memory Metric (ecc_agent_memory_metric) table. This business rule triggers the MIDResourceThresholdBreach script include function that evaluates threshold settings to determine if the MID Server has breached its configured memory resource thresholds.</td>
</tr>
</tbody>
</table>

### Configuring thresholds and sampling intervals

You can use the default threshold percentages and sampling intervals or configure custom values using either of these methods:

- Add system properties to the instance and change the default values for all MID Servers.
- Add configuration parameters to change the default resource values for individual MID Servers.

The system properties and the configuration parameters use the same names.

<table>
<thead>
<tr>
<th>Property/configuration parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mid.threshold.mean_cpu.aggregate_interval_span</td>
<td>Number of 10 minute units in the interval for sampling CPU usage data. The default interval is 30 minutes (3 x 10 min.)</td>
</tr>
<tr>
<td>mid.threshold.mean_cpu.percent</td>
<td>Usage percentage of the total CPU resources that initiates a threshold breach alert.</td>
</tr>
<tr>
<td>mid.threshold.mean_max_memory.aggregate_interval_span</td>
<td>Number of 10 minute units in the interval for sampling memory usage data. The default interval is 30 minutes (3 x 10 min.)</td>
</tr>
<tr>
<td>mid.threshold.mean_max_memory.percent</td>
<td>Usage percentage of the total memory resources that initiates a threshold breach alert.</td>
</tr>
</tbody>
</table>
**MID Server resource reporting**

The **MID Server dashboard** contains two reports that give you views into the consumption of CPU and JVM memory resources. These reports show usage over the previous 30 days.

- **Avg Percentage of CPU Used:** Trending the daily average on CPU usage helps illustrate the amount of CPU processing that the MID Server host consumes. MID Servers deployed on the same host will report the same CPU usage.
- **Avg Percentage of Max Memory Used:** The maximum used percentage (\(\text{max\_used\_pct}\)) is a useful metric for determining if the MID Server has enough memory resources. This metric is a percentage of the max used memory over the total available memory. Trending this over time provides a visualization of how much memory is needed by the MID Server.

**MID Server user connectivity issues**

The instance writes issues involving MID Server user logins and network connectivity to the MID Server Issue \(\text{ecc\_agent\_issue}\) table and creates events you can use to send email notifications or to write custom scripts.

Records in the MID Server Issue \(\text{ecc\_agent\_issue}\) table can provide insight into why your MID Server user cannot log in or why a MID Server cannot connect to the instance. The system displays records for connectivity problems in this table that include informative error messages suggesting possible causes. By default, a scheduled job called MIDUserConnectivity runs every four hours and launches the MIDUserConnectivity script include to evaluate MID Server connection activity. Records in the MID Server Issue \(\text{ecc\_agent\_issue}\) table reflect the status of MID Server login attempts and connectivity at the time the scheduled job runs.

From the perspective of the instance, the MID Server is **Down** when:

- User authentication fails
- User authorization fails.
- Network issues prevent MID Server from establishing a TCP/IP connection.

**Note:** To associate a user with a MID Server, navigate to the `servicenow/<mid_server_name>/agent/config.xml` file and enter the user credentials in the `mid.instance.username` and `mid.instance.password` parameters. Make sure to restart the MID Server to activate your changes.

**How issues are logged**

User authentication failures and authorization issues are logged automatically to the MID Server agent log file. The message for both is the same: **User cannot be authenticated or is missing the proper roles.** If the issue is related to authorization, the agent.log file shows the list of missing roles.

When debugging is enabled, MID Server issues are logged to the system log (syslog) and are available for display in either a **summary or a detailed format**. You can also change the sampling interval from the default 4 hours to something shorter for tracking your remediation efforts. For instructions on enabling and configuring debugging for MID Server user issues, see [Test remediation efforts for MID Server user connectivity issues](#).

**Data provided**

When the instance encounters user connectivity issues, it opens a record in the MID Server Issue \(\text{ecc\_agent\_issue}\) table.
Example user authentication error message

The MID Server Issue table contains these fields:

**MID Server issue fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last detected</td>
<td>Date and time the issue was last detected.</td>
</tr>
<tr>
<td>Short description</td>
<td>Contents of the generated message that specifies a possible issue with the named user or the MID Server.</td>
</tr>
<tr>
<td>MID Server</td>
<td>Empty in the Jakarta release.</td>
</tr>
<tr>
<td>Issue source</td>
<td>The process that identified the issue. For all issues with MID Server user connectivity, the source is MIDUserConnectivity.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>State</td>
<td>The current state of the issue. Possible states are:</td>
</tr>
<tr>
<td></td>
<td>- New: Starting state when the instance creates the issue.</td>
</tr>
<tr>
<td></td>
<td>- Acknowledged: State set when the administrator first examines the issue.</td>
</tr>
<tr>
<td></td>
<td>- Resolved: Ending state, set by the instance, indicating that the issue has been resolved. If the scheduled job does not encounter the issue when it runs again, the instance automatically sets this value.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain associated with the MID Server user account.</td>
</tr>
<tr>
<td>Count</td>
<td>Number of times an issue has been detected. Each time the scheduled job runs and encounters the same issue, it increments this field.</td>
</tr>
</tbody>
</table>

### User authentication failure

The credentials that the instance uses to authenticate a MID Server user are configured in the MID Server Configuration Parameters (ecc_agent_config) table. If the MID Server user attempts to log into the instance with invalid credentials, the instance rejects the connection, and writes the `login.failed` event to the Events (sysevents) table for the user. Administrators can use this event to create email notifications for authentication failure or to create a custom script.

**Note:** If user authentication fails, user authorization is not attempted.

### User accounts associated with a MID Server

Either of the following messages in the MID Server Issue (ecc_agent_issue) table indicate authentication failure for user accounts that are associated with a MID Server:

- Login authentication failure for User `<user name>` associated with 1 down MID Server. Check password on MID server.
- Login authentication failure for User `<user name>` associated with `<n>` down MID Servers. Check password on MID servers.

The necessary conditions for these messages to appear are:

- The **Status** field in the MID Servers (ecc_agent) table that is associated with the MID Server indicates that the MID Server is **Down**.
- The user identified in the MID Server Configuration Parameters (ecc_agent_config) table is the user that one or more MID Servers is configured to use for authentication and authorization when connecting to the instance. The record in the (ecc_agent_config) table must have these values:
  - Parameter name (param_name) field set to `mid.instance.username`.
  - Value (value) field set to the user’s name, corresponding to the User ID (user_name) field in Users (sys_user) table.
- The Events (sysevent) table contains posts showing that the last login attempt associated with the user failed during the scheduled time period. The record created in the (sysevent) table contains these field values:
• Event Name (name) field is set to `login.failed`.
• Parm1 (parm1) field is set to the user’s name.

**Note:** The MID Server (mid_server) field in the MID Server Issues (ecc_agent_issue) table is empty (=NULL).

**User accounts with the mid-server role not associated with a MID Server**

The following message appears when a user with the mid_server role who is not associated with a MID Server fails to authenticate: **Login authentication failure for User <user name> with mid_server role not associated with a MID Server.**

The necessary conditions for this message to appear are:

- The User Roles (sys_user_has_role) table contains a record linking the sys_id associated with the user record stored in the (sys_user) table, with the sys_id associated with the mid_server role record stored in the (sys_user_role) table.
- The user is not identified in the MID Server Configuration Parameters (ecc_agent_config) table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- The Events (sysevent) table contains posts showing that the last login attempt associated with the user failed during the scheduled time period.
  - The (sysevent) table contains a record with the Event Name (name) field set to `login.failed`.
  - The Parm1 (parm1) field is set to the user’s name, corresponding to the User ID (user_name) field in Users (sys_user) table.

**Note:** The MID Server (mid_server) field in the MID Server Issues (ecc_agent_issue) table is empty (=NULL).

**User authorization failure**

The user authorization check occurs after the MID Server has successfully authenticated on the instance. In this step, the system ensures that the user account associated with a MID Server is granted the minimum roles required. A SOAP web service called `MIDServerCheck` performs the role checking on the instance. If the MID Server user has the proper roles, the connection is allowed and a `login` event is written to the Events (sysevents) table. If the user does not have the proper roles, the instance writes a `login.authorization.failed` event to the Events (sysevents) table.

This event provides a comma separated list of the user’s missing roles. Administrators can use this event to create email notifications for authorization failure or to create a custom script.

Authorization can fail if a user is missing the mid_server role or any of the important SOAP roles, as in these cases:

- If the user has the soap_script role, the `MIDServerCheck` SOAP web service runs to check for the appropriate MID Server roles. If the user lacks the mid_server role or any of the other SOAP roles, authorization fails, and the `login.authorization.failed` event is created.
- If the user is missing the soap_script role, that user is not authorized to launch the `MIDServerCheck` SOAP web service, which checks for all required MID Server roles. Authorization fails, but the `login.authorization.failed` event is not created. When this occurs,
the instance displays this message: **Connectivity of MID Server user <user name> cannot be detected by the instance.**

**Users associated with one or more down MID Servers**

Either of the following messages in the MID Server Issue (ecc_agent_issue) table indicate authorization failure for user accounts that are associated with a MID Server that is Down:

- **Login authorization failure for User <user name> associated with 1 down MID Server. Re-assign mid_server role to grant all required roles.**
- **Login authorization failure for User <user name> associated with <n> down MID Servers. Re-assign mid_server role to grant all required roles.**

The MIDUserConnectivity script include identifies active users associated with one or more down MID Servers whose last login attempt within the reporting period failed user authorization. This message is generated when user authorization failures are detected and reported by the MIDServerCheck scripted web service. However, user authorization failures are not reported for users who are not assigned the soap_script role. Should this occur, problems with the user are reported by the network connectivity message.

This message appears in the MID Server Issue (ecc_agent_issue) table when:

- The user may or may not have the mid_server role.
- The user is identified in the MID Server Configuration Parameters (ecc_agent_config) table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- The Events (sysevent) table contains posts showing that the last login attempt associated with the user failed during the scheduled time period. The (sysevent) table contains a record with these settings:
  - Event Name (name) field set to login.authorization.failed.
  - Parm1 (parm1) field set to the user’s name, corresponding to the User ID (user_name) field in Users (sys_user) table.

**Note:** The MID Server (mid_server) field in the MID Server Issues (ecc_agent_issue) table is empty (=NULL).

**Users with the proper role not associated with a MID Server**

The following message appears when a user with the mid_server role who is not associated with a MID Server fails authorization: **Login authorization failure for User <user name> with mid_server role not associated with a MID Server.**

This message is generated when user authorization failures are detected in which the user account, with the mid_server role, is not identified as a configured MID Server user in the (ecc_agent_config) table. It is possible that the user account was associated with a MID Server at the time of the failure.

This message appears in the MID Server Issue (ecc_agent_issue) table when:

- The user has the mid_server role. The User Roles (sys_user_has_role) table has a record linking the sys_id associated with the user record stored in the (sys_user) table, with the sys_id associated with the mid_server role record stored in the (sys_user_role) table.
- The user is not identified in the MID Server Configuration Parameters (ecc_agent_config) table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
The Events (sysevent) table contains posts showing that the last login attempt associated with the user failed during the scheduled time period. The (sysevent) table contains a record with these settings:

- Event Name (name) field set to `login.authorization.failed`.
- Parm1 (parm1) field set to the user’s name, corresponding to the User ID (user_name) field in Users (sys_user) table.

**Note:** The MID Server (mid_server) field in the MID Server Issues (ecc_agent_issue) table is empty (=NULL).

### Network issues

A network issue can prevent the MID Server from connecting to the instance’s TCP/IP server to begin a session. In this case, the instance marks the MID Server as **Down**, because the instance failed to receive the MID Server heartbeat within the prescribed 5 minute interval.

**Users associated with down MID Servers who have not attempted to log in**

Either of the following messages in the MID Server Issue (ecc_agent_issue) table name users associated with MID Servers who have not attempted to log in during the reporting period:

- **User `<user name>` is associated with 1 down MID Server. No login attempts within reporting period.**
- **User `<user name>` is associated with `<n>` down MID Servers. No login attempts within reporting period.**

The MIDUserConnectivity script include reports active users associated with down MID Servers where network connectivity cannot be detected by the instance.

This message appears in the MID Server Issue (ecc_agent_issue) table when:

- The user may or may not have the mid_server role.
- The user is identified in the MID Server Configuration Parameters (ecc_agent_config) table as the user which one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- There are no login attempts, either failed or successful, recorded in the Events (sysevent) table for the user during the scheduled reporting period.

**Note:** The MID Server (mid_server) field in the MID Server Issues (ecc_agent_issue) table is empty (=NULL).

### Users not associated with MID Servers who have not attempted to log in

The following message appears when a user with the mid_server role who is not associated with a MID Server has not attempted to login during the configured reporting interval: **User `<user name>` with mid_server role is not associated with a MID Server. No login attempts within reporting period.**

The MIDUserConnectivity script include reports active users with the mid_server role not associated with a MID Server, where connectivity cannot be detected by the instance.

This message appears in the MID Server Issue (ecc_agent_issue) table when:

- The user has the mid_server role. The User Roles (sys_user_has_role) table has a record linking the sys_id associated with the user record stored in the (sys_user) table, with the sys_id associated with the mid_server role record stored in the (sys_user_role) table.
The user is not identified in the MID Server Configuration Parameters (ecc_agent_config) table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.

There are no login attempts, either failed or successful, recorded in the Events (sysevent) table for the user during the scheduled reporting period.

**Note:** The MID Server (mid_server) field in the MID Server Issues (ecc_agent_issue) table is empty (=NULL).

### Configuration issues

Any of the following messages, discussed above, can indicate a configuration issue:

- **Login authentication failure for User `<user name>` with mid_server role not associated with a MID Server.**
- **Login authorization failure for User `<user name>` with mid_server role not associated with a MID Server.**
- **User `<user name>` with mid_server role is not associated with a MID Server. No login attempts within reporting period.**

These are some common configuration errors:

- An administrator neglected to associate the user record with the MID Server record as shown in the MID Server Configuration Parameters (ecc_agent_config) table. This table is read-only and cannot be updated directly. To associate a user with a MID Server, configure the user name and password in the MID Server's config.xml file and restart the MID Server.
- During the process of reconfiguring a MID Server to use a different account for TCP/IP connection, the administrator has not yet removed the mid_server role from the account or deleted the account.
- A multipurpose user account was created and granted a large number of roles, including the mid_server role, although this account was never intended to be used as a MID Server account.

### User who successfully authenticates and authorizes but might not need mid_server role

The following message appears when a user with the mid_server role who is not associated with a MID Server successfully logs in: **User `<user name>` with mid_server role successfully connected but not associated with a MID Server. The mid_server role should be reserved for MID Server use only.**

The MIDUserConnectivity script include reports active users with the mid_server role who are not identified as a configured MID Server user, and whose last login attempt was successful during the scheduled time period. This message suggests that the user's credentials are being used by a system administrator or a process that is not running on a MID Server. The assumption here is that the mid_server role should only be used for applications deployed to a MID Server. The presence of this message reminds the system administrator to remove extraneous mid_server roles from user accounts that do not require them.

This message appears in the MID Server Issue (ecc_agent_issue) table when:

- The user has the mid_server role.
- The user is not identified in the MID Server Configuration Parameters (ecc_agent_config) table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
The Events (sysevent) table contains posts showing that the last login attempt associated with the user succeeded during the scheduled time period. The (sysevent) table contains a record with these settings:

- Event Name (name) field set to login.
- Parm1 (parm1) field set to the user’s name, corresponding to the User ID (user_name) field in Users (sys_user) table.

**Note:** The MID Server (mid_server) field in the MID Server Issues (ecc_agent_issue) table is empty (=NULL).

Test remediation efforts for MID Server user connectivity issues

After attempting to resolve a user connectivity issue that appears in the MID Server Issue (ecc_agent_issue) table, you can test your remediation efforts without having to wait until the next scheduled reporting period by shortening the sampling interval.

Role required: admin

Reconfigure the sampling interval using this procedure and then examine the results in the MID Server Issue (ecc_agent_issue) table. You can set any time span for the sample, but you should define a window of not less than 5 minutes, since this is the default interval of the MID Server heartbeat that reports its status. The recommended method for configuring a shorter sampling interval is to copy and modify the code from the MIDUserConnectivity scheduled job, and then run it manually in the background script utility.

**Caution:** Avoid editing the script in the MIDUserConnectivity schedule record. If you make any change to this record, it will not be updated when you upgrade the instance.

1. Navigate to **System Definition > Scheduled Jobs**.
2. Open the MIDUserConnectivity scheduled job.
3. Copy this line from the **Run this script** field:
   
   ```
   MIDUserConnectivity(0).checkConnectivity(4 * (60 * 60 *1000));
   ```
   
   This code sets the 4 hour sampling interval in milliseconds and turns debugging off with the MIDUserConnectivity(0) value.

4. Navigate to **System Maintenance > Scripts - Background**.
5. Paste the code from the scheduled job into the **Run script** field.
6. Set the sampling interval to 5 minutes by changing the time calculation to **(5 * 60 *1000)**.
   
   The modified command looks like this: ```MIDUserConnectivity(0).checkConnectivity (5 * 60 *1000);```

7. Click **Run script**.
8. Open the record of the MID Server that had the issue and select the **MID Server Issues** related list.
   
   The issue is updated as follows:
   
   - If the issue persists, the Count column is incremented, and the Last detected column shows the current date and time.
   - If the issue no longer exists, the system changes the State to Resolved.

9. Optionally, you can enable debugging by selecting a level, and then run the script again to see the breakdown for each condition evaluated.

   Use these settings to select a debugging level:
   
   - For a summary view, enter **MIDUserConnectivity(1)**.
For a detailed view, enter MIDUserConnectivity(2).

For details about the type of debugging information provided, see **Interpreting MID Server user debugging output**.

**Interpreting MID Server user debugging output**

Debugging output from the system log is available in either a summary or detailed view for MID Server user issues, but must be enabled manually.

To enable debugging and display all connectivity issues in either of the available formats, you must run a method manually on your instance. For instructions on enabling debugging, see **Test remediation efforts for MID Server user connectivity issues**. For information about each error condition and how records are created in the MID Server Issue (ecc_agent_issue) table, see **MID Server user connectivity issues**.

**Available formats**

You can configure the instance to generate a simple summary of the issue or a detailed output that identifies users and MID Servers. Summaries provide a quick look at the issue conditions, by count, while the detailed view allows you to examine roles, MID Server associations, and login activity by named users.

In this summary example of an authorization issue, the instance evaluates each condition and indicates how many users met that condition. You can see that a MID Server is down and that one of two users configured for a MID Server failed authorization. Because this is a summary, neither the MID Server nor the users are named.

---

**Sample summary debug output**

```
[0:00:00.014] Script completed in scope global: script

*** Script: Log Object: MIDUserConnectivity: jobSchedulerDate
Java Object: com.glide.glideobj.GlideDate - 2017-02-21 17:35:08
*** Script: Log Object: MIDUserConnectivity: jobSchedulerDate (current users display format and timezone)
Java Object: java.lang.String = 2017-02-21 09:35:08
*** Script: MIDUserConnectivity: found (1) user(s) with the mid_server role defined
*** Script: MIDUserConnectivity: found (1) down MID Servers with a configured 'mid.instance.username' parameter
*** Script: MIDUserConnectivity: found (2) configured MID Server UserIds
*** Script: MIDUserConnectivity: found (0) user(s) with the MID Server role NOT also associated with a configured MID Server user
*** Script: MIDUserConnectivity: found (0) user(s) whose most recent login attempt during the reporting period failed
*** Script: MIDUserConnectivity: found (1) user(s) whose most recent login attempt during the reporting period failed due to user authorization
*** Script: MIDUserConnectivity: found (0) user(s) whose most recent login attempt during the reporting period succeeded
*** Script: MIDUserConnectivity: found (0) configured MID Server users where connectivity to the MID by the instance can not be detected
*** Script: MIDUserConnectivity: found (1) new message(s) skipped by the auto-resolver
*** Script: MIDUserConnectivity: processing completed
```
Authentication failure

When a MID Server user cannot authenticate on the instance, the system displays these error messages in the detailed output:

- Login authentication failure for User <user name> associated with 1 down MID Server. Check password on MID server.
- Login authentication failure for User <user name> associated with <n> down MID Servers. Check password on MID servers.
- Login authentication failure for User <user name> with mid_server role not associated with a MID Server.

In this example, three users with the mid_server role, midserver2, local-midserver, and ardis.maison, failed to authenticate. Two of these users were configured for MID Servers that were Down, and the other user was not configured for any MID Servers. Each of these users has an authentication failure and is named in the appropriate error message.

MID Server ID map

The debugging output lists all MID Servers that are marked as Down and maps them to their user accounts by the MID Server sys_id. This map includes all user accounts that have the mid_server role, whether or not they are associated with a MID Server. If there are no Down MID Servers, the map is not displayed in the debugging output.

The map is presented in three sections:

- User accounts not associated with any MID Servers.
- User accounts associated with Down MID Servers, identified by their sys_id.
- The sys_id of each Down MID Server, identified by name.

Authorization failure

If a user is missing any of the required roles, the instance generates these authorization failure messages:

- Login authorization failure for User <user name> associated with 1 down MID Server. Re-assign mid_server role to grant all required roles.
- Login authorization failure for User <user name> associated with <n> down MID Servers. Re-assign mid_server role to grant all required roles.
- Login authorization failure for User <user name> with mid_server role not associated with a MID Server.

In this example, three users with the mid_server role, midserver2, local-midserver, and ardis.maison have failed authorization. One user is not associated with any MID Server, but the other two users are. The system has logged an authorization failure, indicating that the user is missing at least one critical role. To see what roles are missing, look at the comma separated list in
the **Parm2** field in the *login.authorization.failed* event record. This record is the most recent login attempt in the Event (sysevent) table for the user account within the reporting period.
Network issues

Network issues may exist for these users who are associated with MID Servers, but who have not attempted to log in during the reporting period:

- User `<user name>` is associated with 1 down MID Server. No login attempts within reporting period.
- User `<user name>` is associated with `<n>` down MID Servers. No login attempts within reporting period.

Network issues may also exist for these users who are NOT associated with MID Servers, and who have not attempted to log in during the reporting period: User `<user name>` with mid_server role is not associated with a MID Server. No login attempts within reporting period.

In this example, no login attempts have been detected for midserver2, local-midserver, and ardis.maison, all of whom have the mid_server role. Two of those users are associated with MID Servers that are marked Down. The other user is not associated with any MID Server. None of these users has attempted to log in to the system within the configured reporting interval. The system assumes that these users would make an attempt to log in unless network issues prevented them from doing so.

Note: By default, the sampling period is 4 hours. However, during debugging or remediation, the sampling period can be reset to a value that matches the MID Server heartbeat interval of 5 minutes, or greater.
Configuration issues

Any of the following messages can indicate a user configuration issue:

- Login authentication failure for User <user name> with mid_server role not associated with a MID Server.
- Login authorization failure for User <user name> with mid_server role not associated with a MID Server.
- User <user name> with mid_server role successfully connected but not associated with a MID Server. The mid-server role should be reserved for MID Server use only.
- User <user name> with mid_server role is not associated with a MID Server. No login attempts within reporting period.

In this example, a user with the mid_server role has logged in successfully within the configured sampling interval. However, this user is not configured for a MID Server and might have the role in error.

Orchestration

ServiceNow® Orchestration extends the workflow engine to manage processes and to automate things outside of a ServiceNow instance.

Orchestration is available as a separate subscription from the rest of the ServiceNow platform. See Activate Orchestration for details.

### Introduction to Orchestration

Orchestration automates simple or complex multi-system tasks on remote services, servers, applications, and hardware.

An Orchestration process can cross all management disciplines and interact with hosted services and all types of infrastructure elements. These capabilities provide a powerful system for managing IT and Business processes quickly and reliably.

Orchestrated solutions aide collaboration among teams by providing reusable data and versioning for both the workflows and the activities within them. Subject matter experts can create activities that are reusable to numerous workflow developers. When an activity requires a change, developers can see the downstream implication of the change immediately by knowing which workflows use the activity. Well-designed orchestrations never fail and apply human tasks to address errors as they arise.

### Orchestration tools

Orchestration can make calls outside of a ServiceNow instance, directly to web services or through a MID Server to systems within corporate firewall. Orchestration also enables the creation reusable activities that wrapper Java Script functions for manipulating things inside the platform. Orchestration extends the Workflow editor by providing these features:

- **Activity packs** containing ready-to-use activities.
- **Activity Designer**, which enables developers to create custom activities without an over dependence to create scripts to orchestrate to third-party systems.
- Ability to create activity packs using **Scoped Applications**.
- A **Databus** for following the flow of data across orchestration activities.
Orchestration Core provides entitlements to use specific applications:

**Client Software Distribution**

An application that automates software delivery from the Service Catalog. Provides OOB support for SCCM. Partner solutions support Macs using JAMF. Other third-party solutions provide support through the extension framework.

**Password Reset**

An application for users to reset their password in Active Directory. It can expand to communicate with other third-party systems.

**Orchestration ROI**

Enables users to evaluate estimated costs and actual costs for tasks, automate these tasks, and track the ROI of these tasks.

**Systems that Orchestration can automate**

Orchestration can automate tasks such as employee onboarding, user access rights, server management, managed file transfers, and Security Operations Orchestration activities. For example, you might use the Active Directory and Exchange activities provided in the base Orchestration system to set up network accounts and mailboxes for new employees.

If Orchestration does not provide the activities you need for an integration, create the necessary activities using the templates in the Orchestration Activity Designer. The external systems that Orchestration can automate for:

- Any system exposing web services (SOAP, REST)
- Any system accessible from the command line (such as a UNIX system accessible through SSH, a Windows system enabled for PowerShell remoting or WMI)
- Numerous proprietary services: Windows Active Directory, Microsoft Exchange mail servers, InfoBlox, and F5 Networks.

> Note: For a full list of Activity Pack service offerings, see Orchestration Core Activity Packs.

- Any filesystem accessible by SFTP
- Any database with a compliant JDBC driver
- Additional Activity Packs are also available with other ServiceNow products, such as Security Operations
Orchestration capabilities

Orchestration workflow

When an Orchestration activity starts within a workflow, Orchestration launches a probe and writes a probe record to the ECC Queue. The workflow pauses as the MID Server picks up the
request and executes the probe. When the probe reports back, the workflow resumes as the results are analyzed. The workflow can exit or continue at this point.

Orchestration workflow

Orchestration video tutorial

Watch the introductory video for Orchestration.

Activate Orchestration

The Orchestration (com.snc.runbook_automation) plugin is available as a separate subscription from the rest of the ServiceNow platform.

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization’s production and sub-production instances, generally within a few days.

If you do not have an account manager, decide to delay activation after purchase, or want to evaluate the product on a sub-production instance without charge, follow these steps.

Role required: none

1. In the HI Service Portal, click Service Requests > Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows.</td>
</tr>
</tbody>
</table>

Note: Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.
3. Click **Submit**.

**List of Orchestration plugins**

This table lists all plugins available for Orchestration and their dependencies.

These Orchestration plugins are available for purchase or can be requested as part of your Orchestration subscription. Contact your account representative for details.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Dependencies</th>
</tr>
</thead>
<tbody>
<tr>
<td>Orchestration (com.snc.runbook_automation)</td>
<td>Main plugin for the Orchestration feature. This plugin extends Workflow to automate operations with external systems. Use this plugin to orchestrate business services, applications, and infrastructure. This plugin automates operations such as deployments, configurations, and information gathering. Orchestration can automate Web Services and uses MID Servers to execute commands on devices inside an enterprise’s network.</td>

<td>Orchestration</td>
</tr>
</tbody>
</table>

**Orchestration Runtime plugin**

The Orchestration - Runtime plugin enables other applications on the ServiceNow® platform to automate tasks, without requiring an Orchestration subscription.

The Orchestration - Runtime plugin can be activated as part of another plugin or application. It is used by strategic technology partners and ServiceNow applications to distribute activity packs to customers who may not own Orchestration. For example, the Security Incident Response Management (SIRM) application provides orchestration content, which includes activities that are available from the Packs tab in the Workflow Editor. Customers who purchase SIRM can consume and modify the activities that SIRM ships without having to purchase an Orchestration license.

**Included with the plugin**

The Orchestration - Runtime plugin provides access to the Packs and Data tabs in the Workflow Editor, which gives users access to custom activities for their applications and allows them to reuse data from the databus. This plugin does not provide access to custom Orchestration activity packs or to the activity designer. The Custom tab in the Workflow Editor is not available without an Orchestration subscription.
Orchestration plugin relationships

Dependencies

The Orchestration - Runtime plugin is activated by these application plugins:

- Security Incident Response Orchestration
- Service Release Automation

Access to activities

Custom activities shipped with ServiceNow® applications are available in the Packs tab of the Workflow Editor for use in workflows. To edit these activities, navigate to Orchestration > Activity Designer Activities and select the activity you want to modify. For information about the provider templates used to create these activities, see Orchestration custom activity templates.

List of Orchestration activities

Orchestration provides the following activities for use in workflows:
Several Orchestration activities have been rewritten as scoped activities using the activity designer and grouped into activity packs. Other non-scoped activities are deprecated and may or may not appear in the Workflow Editor. However, all deprecated activities still function in existing workflows that use them.

**Global activities**

These activities run in the global scope only. Any activities you create in the global scope are organized in the Global category in the Packs and Custom tabs in the Workflow Editor.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Test Server Alive</strong></td>
<td>Runs a command (including shell scripts) on a Linux or UNIX computer via SSH to validate whether the target system is alive.</td>
</tr>
</tbody>
</table>

**Active Directory (AD) activities**

All AD Orchestration activities were rewritten in the Geneva release as scoped activities and are available in the Active Directory activity pack. All previous version AD activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.

<table>
<thead>

<tr>
<td><strong>Unlock AD Account</strong></td>
<td>Unlocks a locked Active Directory user account.</td>
</tr>
</tbody>
</table>

**Azure AD**

All these activities are scoped and part of the Azure AD activity pack. They do not have legacy versions.
### ServiceNow Activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add User to Group</td>
<td>Adds a user to an existing security group in Azure Active Directory.</td>
</tr>
<tr>
<td>Assign User License</td>
<td>Assigns an extra Office 365 software license to the named user.</td>
</tr>
<tr>
<td>Create User</td>
<td>Creates a user for the Azure Active Directory tenant.</td>
</tr>
<tr>
<td>Delete User</td>
<td>Deletes the named user's account from the Azure Active Directory tenant.</td>
</tr>
<tr>
<td>Get User Info</td>
<td>Returns the named user's information from the Azure Active Directory.</td>
</tr>
<tr>
<td>Remove User from Group</td>
<td>Removes an existing user from a security group in Azure Active Directory.</td>
</tr>
<tr>
<td>Remove User License</td>
<td>Revokes the specified Office 365 software license for the named user.</td>
</tr>
<tr>
<td>Reset User Password</td>
<td>Changes the named user's Azure Active Directory password.</td>
</tr>
</tbody>
</table>

### F5 Network Management activities

All these activities are scoped and part of the F5 Network Management activity pack. They do not have legacy versions.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add F5 Pool</td>
<td>Creates the load balancer pool.</td>
</tr>
<tr>
<td>Check F5 Pool</td>
<td>Checks the status of a pool to validate whether it is available to accept traffic.</td>
</tr>
<tr>
<td>Delete F5 Pool</td>
<td>Deletes an F5 pool.</td>
</tr>
<tr>
<td>Add F5 Pool Member</td>
<td>Adds a member to an F5 pool.</td>
</tr>
<tr>
<td>Get F5 Pool Member</td>
<td>Returns the pool members and verifies the pool status.</td>
</tr>
<tr>
<td>Delete F5 Pool Member</td>
<td>Deletes an F5 pool member.</td>
</tr>
<tr>
<td>Add F5 Virtual Server</td>
<td>Adds a virtual server.</td>
</tr>
<tr>
<td>Modify F5 Virtual Server</td>
<td>Configures a virtual server assigned to an F5 pool with irules and a vlan.</td>
</tr>
<tr>
<td>Delete F5 Virtual Server</td>
<td>Deletes a virtual server from an F5 pool.</td>
</tr>
<tr>
<td>Add F5 Profile to Virtual Server</td>
<td>Adds a profile to a virtual server assigned to an F5 pool.</td>
</tr>
</tbody>
</table>

### Infoblox activities

All these activities are scoped and part of the Infoblox DDI activity pack. They do not have legacy versions.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DHCP Reserve IP v4 Address Range</td>
<td>Reserves an IP address range for DHCP use.</td>
</tr>
<tr>
<td>Activity</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DHCP Delete IP Reservation</td>
<td>Deletes IP reservations in DHCP using either an IPv4 or IPv6 address range.</td>
</tr>
<tr>
<td>DHCP List IP Reservations</td>
<td>Generates a list of all the DHCP range reservations on a specific Infoblox server.</td>
</tr>
<tr>
<td>List DNS C-records</td>
<td>Retrieves all canonical (CNAME) records from a specified Infoblox server.</td>
</tr>
<tr>
<td>Register DNS A-record</td>
<td>Creates a DNS A record on a specified Infoblox server.</td>
</tr>
<tr>
<td>Register DNS C-Record</td>
<td>Creates a DNS canonical (CNAME) record on a specified Infoblox server.</td>
</tr>
<tr>
<td>List DNS Record</td>
<td>Generates a list of all the DNS entries on a specific Infoblox server.</td>
</tr>
<tr>
<td>DNS Delete</td>
<td>Deletes DNS records of any type from in Infoblox server, such as C and A records.</td>
</tr>
<tr>
<td>IPAM Register IP Address</td>
<td>Registers an IP address in a network using Infoblox IPAM.</td>
</tr>
<tr>
<td>IPAM Reserve IP Address</td>
<td>Reserves an IP address in a network using Infoblox IPAM.</td>
</tr>
<tr>
<td>IPAM List IP Reservations</td>
<td>Returns an array of all IP Address within the named Infoblox Server.</td>
</tr>
<tr>
<td>IPAM Delete</td>
<td>Deletes an IP Address within a named Infoblox server.</td>
</tr>
<tr>
<td>Create Network</td>
<td>Creates networks on a specified Infoblox server.</td>
</tr>
<tr>
<td>Get Network Details</td>
<td>Retrieves the information about a specific network on an Infoblox server.</td>
</tr>
<tr>
<td>Delete Network</td>
<td>Deletes a network from an Infoblox server.</td>
</tr>
<tr>
<td>List Registered Networks</td>
<td>Retrieves all the networks associated with an Infoblox server.</td>
</tr>
</tbody>
</table>

Microsoft Exchange activities

All Exchange Orchestration activities were rewritten in the Geneva release as scoped activities and are available in the Exchange activity pack. All previous version Exchange activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Address List</td>
<td>Creates an address list that acts as an alias for emailing all users in the group. This alias cannot be used to manage user permissions.</td>
</tr>
<tr>
<td>Delete Address List</td>
<td>Removes an existing address list from an Exchange server.</td>
</tr>
<tr>
<td>Get Address List</td>
<td>Retrieves all attributes from the specified Exchange address list.</td>
</tr>
<tr>
<td>Move Address List</td>
<td>Moves an Exchange address list to another location in the address hierarchy.</td>
</tr>
<tr>
<td>Activity</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Set Address List</strong></td>
<td>Modifies an Exchange address list.</td>
</tr>
<tr>
<td><strong>Update Address List</strong></td>
<td>Adds or removes users from the specified address list and immediately applies any cached address list changes to the server.</td>
</tr>
<tr>
<td><strong>Create Mailbox</strong></td>
<td>If a user does not exist, creates a new Active Directory user and associated Exchange mailbox.</td>
</tr>
<tr>
<td><strong>Delete Mailbox</strong></td>
<td>Deletes the Exchange mailbox of an Active Directory user.</td>
</tr>
<tr>
<td><strong>Disable Mailbox</strong></td>
<td>Disables the mailbox associated with a specified Active Directory account.</td>
</tr>
<tr>
<td><strong>Enable Mailbox</strong></td>
<td>Creates a mailbox for an existing Active Directory user.</td>
</tr>
<tr>
<td><strong>Get Mailbox</strong></td>
<td>Gets the mailbox for the specified user or all mailboxes on an Exchange server.</td>
</tr>
<tr>
<td><strong>Set Mailbox</strong></td>
<td>Modifies the settings of an existing Exchange mailbox.</td>
</tr>
</tbody>
</table>

**PowerShell activities**

These PowerShell activities were rewritten as scoped activities and are available in the PowerShell activity pack. All previous version PowerShell activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Install Windows App</strong></td>
<td>Installs an application on a Windows target machine.</td>
</tr>
<tr>
<td><strong>Join Domain</strong></td>
<td>Joins a Windows machine to a domain.</td>
</tr>
<tr>
<td><strong>Uninstall Windows App</strong></td>
<td>Uninstalls an application from a Windows target machine.</td>
</tr>
<tr>
<td><strong>Change Service State</strong></td>
<td>Starts or stops a Windows service on a remote system.</td>
</tr>
</tbody>
</table>

**Probe activities**

These probe activities were rewritten as scoped activities and are available in the Probe activity pack. All previous versions of these activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Resolve DNS Name</strong></td>
<td>Resolves an IP address or a fully qualified domain name (FQDN) into one or more IP addresses.</td>
</tr>
<tr>
<td><strong>SNMP Query</strong></td>
<td>Queries an SNMP device.</td>
</tr>
</tbody>
</table>
### SCCM activities

All these activities are scoped and part of the SCCM activity pack. They do not have legacy versions.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add to Device Collection</td>
<td>Adds a device to a Microsoft System Center Configuration Manager (SCCM) device collection.</td>
</tr>
<tr>
<td>Add to User Collection</td>
<td>Adds a user to a Microsoft System Center Configuration Manager (SCCM) user collection.</td>
</tr>
<tr>
<td>Get Applications</td>
<td>Returns a list of all the applications available on a Microsoft System Center Configuration Manager (SCCM) server.</td>
</tr>
<tr>
<td>Get Deployments</td>
<td>Returns the list of deployments performed by Orchestration using a Microsoft System Center Configuration Manager (SCCM) server.</td>
</tr>
<tr>
<td>Get Device Collections</td>
<td>Returns the list of available device collections on a Microsoft System Center Configuration Manager (SCCM) host.</td>
</tr>
<tr>
<td>Get User Collections</td>
<td>Returns the list of available user collections on a Microsoft System Center Configuration Manager (SCCM) host.</td>
</tr>
<tr>
<td>Remove from Device Collection</td>
<td>Removes a device from a Microsoft System Center Configuration Manager (SCCM) device collection.</td>
</tr>
<tr>
<td>Remove from User Collection</td>
<td>Removes a user from a Microsoft System Center Configuration Manager (SCCM) user collection.</td>
</tr>
</tbody>
</table>

### SSH activities

These SSH activities were rewritten as scoped activities and are available in the SSH activity pack. The SSH activities not converted to scoped activities were moved to the Orchestration - Deprecated category, but are still available for all workflows.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Copy</td>
<td>Copies a file on a Linux or Unix computer, via SSH.</td>
</tr>
<tr>
<td>File Read</td>
<td>Reads a file on a Linux or Unix computer, via SSH.</td>
</tr>
<tr>
<td>File Write</td>
<td>Writes a file on a Linux or UNIX computer.</td>
</tr>
<tr>
<td>File Replace String</td>
<td>Finds and replaces a string in a file on a Linux or UNIX computer.</td>
</tr>
<tr>
<td>Files Compare</td>
<td>Compares two files on a Linux or Unix computer, via SSH.</td>
</tr>
</tbody>
</table>
### ServiceNow Jakarta Now Platform Capabilities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reset Linux User Password</td>
<td>Resets the password for a given user on a Linux computer.</td>
</tr>
<tr>
<td>Secure Copy</td>
<td>Copies a file from one host to another, without storing the copied file on the MID Server.</td>
</tr>
</tbody>
</table>

### SFTP activities

All these activities are scoped and part of the SFTP File Transfer activity pack. They do not have legacy versions.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Copy File</td>
<td>Copies a file from an SFTP server (source host) to another SFTP server (target host).</td>
</tr>
<tr>
<td>Create Directory</td>
<td>Creates a directory on an SFTP server.</td>
</tr>
<tr>
<td>Get File List</td>
<td>Returns a list of files from a given directory and its subdirectories on an SFTP server (source host).</td>
</tr>
<tr>
<td>Remove File or Directory</td>
<td>Removes a file or a directory on an SFTP server, including subdirectories, when configured.</td>
</tr>
<tr>
<td>Rename File or Directory</td>
<td>Renames a file or directory to a new name on an SFTP server.</td>
</tr>
<tr>
<td>Set File Attributes</td>
<td>Sets common file attributes, such as timestamps, size, permissions, and UID/GID, for a file or directory on an SFTP server.</td>
</tr>
</tbody>
</table>

### Deprecated activities

These activities have been removed from the Workflow Editor and are not available for new workflows, but continue to work normally in existing workflows. You can reactivate the deprecated activity or duplicate the functionality of a deprecated activity as a scoped activity by recreating it using the activity designer.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run Probe</td>
<td>Launches a MID Server probe on behalf of a document.</td>
</tr>
<tr>
<td>SOAP Request</td>
<td>Executes a SOAP request on a target server. The SOAP Message activity replaces this activity.</td>
</tr>
<tr>
<td>Run Command</td>
<td>Runs a command (including shell scripts) on a Linux or UNIX computer.</td>
</tr>
<tr>
<td>Run SCP</td>
<td>Uses Secure Copy Protocol (SCP) to copy a file from one computer to another, including the directory in which the file resides. The Secure Copy activity replaces the Run SCP activity.</td>
</tr>
<tr>
<td>Run Powershell</td>
<td>Executes Windows PowerShell commands on a MID Server.</td>
</tr>
</tbody>
</table>
Available activity packs

Activity packs are available with your subscription to Orchestration.

Role required: admin

The following activity packs are available and active with your Orchestration subscription:

- Orchestration - Active Directory (com.snc.orchestration.ad)
- Orchestration - Azure Active Directory (com.snc.orchestration.azure.ad)
- Orchestration - Exchange (com.snc.orchestration.exchange)
- Orchestration - SFTP (com.snc.orchestration.sftp)
- Orchestration - Infoblox DDI Activity Pack (com.snc.orchestration.infoblox)
- F5 Network Management activity pack (com.snc.orchestration.f5)
- Orchestration - SSH (com.snc.orchestration.ssh)
- Orchestration - PowerShell (com.snc.orchestration.powershell)
- Orchestration - System Center Configuration Manager (com.snc.orchestration.sccm_mgnt)

1. In the HI Service Portal, click Service Requests > Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows.</td>
</tr>
</tbody>
</table>

3. Click Submit.

Deprecated Orchestration activities

These Orchestration activities have been deprecated.

Run Probe

The Run Probe activity launches a MID Server probe on behalf of a document. All Orchestration activities that launch a probe on a target machine are based on the Run Probe activity. Your ServiceNow instance must have access to a MID Server configured to use SSH to run this activity.
Attention: This activity is deprecated and is unavailable for new workflows. To replace the functionality of this probe, use the Probe activity template to create a custom activity. Workflows from a previous release that use the Run Probe activity can continue to do so.

**Run Probe input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Probe</td>
<td>Select a MID Server probe from the list. This is the name of the probe as it appears in the discovery_probes table.</td>
</tr>
<tr>
<td>Source for probe</td>
<td>Enter the IP address of the host system against which the probe runs (the probe©s target).</td>
</tr>
<tr>
<td>Sensor script</td>
<td>The script to run using the results of the probe. The output from the probe is contained in a variable called output. Any error from the probe is contained in a variable called error.</td>
</tr>
</tbody>
</table>

**SOAP Request**

The SOAP Request activity executes a SOAP request on a target server.

Attention: This activity is deprecated and is replaced by the SOAP Message workflow activity. Workflows from a previous release that use the SOAP Request activity can continue to do so. However, this activity is not available for new workflows.

**SOAP Request input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAP URL</td>
<td>The SOAP endpoint.</td>
</tr>
<tr>
<td>Username</td>
<td>User name for basic authentication credentials.</td>
</tr>
<tr>
<td>Password</td>
<td>Password for basic authentication credentials.</td>
</tr>
<tr>
<td>Envelope Script</td>
<td>Script for setting up parameters for the web service.</td>
</tr>
<tr>
<td>Sensor Script</td>
<td>The script to execute after the request has been made and a response has been received.</td>
</tr>
</tbody>
</table>

**Reactivate a deprecated activity**

Orchestration activities that were converted to activity packs are deprecated for upgraded and new instances but can be reactivated for use in new workflows.

Role required: workflow_admin, admin

Note: Reactivation of deprecated activities for use in new workflows is discouraged. Legacy activities cannot use the unique features of the scoped applications, such as reuse of data from the databus and input variable testing.

1. Navigate to Workflow > Administration > Activity Definitions.
2. In the list of activities, clear the condition Category != deprecated from the filter.
3. Open the definition record for the activity you want to reactivate.
4. Select the What to Display tab.
5. In the Category field, replace the value deprecated with another category. This can be an arbitrary string.
6. Click Update.
   The system creates a new category using the value provided and reactivates the activity, which becomes available in the Core tab of the workflow editor.

**SOAP Message workflow activity**

The SOAP Message activity uses SOAP messages defined in the System Web Services plugin and can call the messages using a MID Server.

Your instance must have access to a MID Server configured to use SOAP.

**Input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAP Message</td>
<td>soap_message</td>
<td>The SOAP Message defined under the System Web Services plugin's Outbound SOAP Message (sys_soap_message) table. (System Web Services &gt; Outbound &gt; SOAP Message)</td>
</tr>
<tr>
<td>SOAP Message Function</td>
<td>soap_message_function</td>
<td>The function to call that is defined in the SOAP Message. Functions are listed in the SOAP Message Functions related list in each SOAP Message record.</td>
</tr>
<tr>
<td>SOAP Endpoint</td>
<td>soap_endpoint</td>
<td>Endpoint to use instead of the SOAP endpoint value in the SOAP Message Function record. Leave this field blank to use the defined endpoint in the SOAP Message Function record.</td>
</tr>
<tr>
<td>Field</td>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Variables</td>
<td>variables</td>
<td>Variables to substitute into the SOAP Envelope defined in the SOAP Message Function record. Use this format for the string: name1=value1, name2=value2, ... If either the name or value contains a comma or equal sign, escape these characters with a backslash.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>use_midserver</td>
<td>Check box for using a MID Server to send the SOAP message. A MID Server might be necessary to reach an endpoint within a firewall or a sub-network that is not visible from the instance. If this check box is selected (true), but no MID Server is defined in the MID Server field, workflow automatically attempts to find a MID Server.</td>
</tr>
<tr>
<td>MID Server</td>
<td>midserver</td>
<td>Name of the MID Server to use. This field appears when you select the Use MID Server check box. The workflow ignores this parameter if the use_midserver parameter is disabled.</td>
</tr>
<tr>
<td>Sensor Script</td>
<td>sensor_script</td>
<td>The script to execute after the request has been made and a response has been received. You can access the full XML response body from the activity.output object.</td>
</tr>
</tbody>
</table>

**Probes used by Orchestration**

Certain probes, controlled by MID Servers, perform Orchestration tasks on remote computers, such as restarting a server or creating virtual machines from templates.
How Orchestration probes work

When a Workflow executes an Orchestration activity, that activity launches a probe, which writes an output record to the ECC Queue. The MID Server selected for the activity checks the ECC Queue for assignments, and then executes the appropriate probe to do the work on the target machine. The information about the activity (machine restarted, files copied, etc.) that is returned from the target machine by the probe is written to the ECC Queue as an input record. This information is then sent from the ECC Queue to a sensor that is built into the Workflow activity. The Workflow is updated, and the next activity is executed.

Note: The probe parameters are set by the activities that launch the probe.

How Orchestration uses probes

Probe List

The base system includes the following Orchestration probes (Orchestration > Definition > Probes).

<table>
<thead>
<tr>
<th>Probe Name</th>
<th>ECC Queue Topic</th>
<th>ECC Queue Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>Command</td>
<td></td>
<td>A probe that runs a local command on the MID server.</td>
</tr>
<tr>
<td>DNS Name Resolver</td>
<td>DNSNameResolver</td>
<td></td>
<td>A probe that resolves a fully qualified domain name (FQDN) into an IP address.</td>
</tr>
<tr>
<td>SCPCommand</td>
<td>SCPCommand</td>
<td></td>
<td>A probe that copies files securely from one machine to another. The copy function is performed using the MID Server as a tunnel.</td>
</tr>
<tr>
<td>Shazzam</td>
<td>Shazzam</td>
<td></td>
<td>A probe that identifies active devices.</td>
</tr>
<tr>
<td>Probe Name</td>
<td>ECC Queue Topic</td>
<td>ECC Queue Name</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>-----------------</td>
<td>----------------</td>
<td>-------------</td>
</tr>
<tr>
<td>SNMPProbe</td>
<td>SNMP</td>
<td>SNMP Query</td>
<td>This is a generic SNMP probe.</td>
</tr>
<tr>
<td>SOAPProbe</td>
<td>SOAPProbe</td>
<td></td>
<td>A probe that sends a SOAP request to target machine.</td>
</tr>
<tr>
<td>SSHCommand</td>
<td>SSHCommand</td>
<td></td>
<td>A probe that executes shell scripts from a command line after logging in to a target machine via SSH.</td>
</tr>
<tr>
<td>SSHCommandLong</td>
<td>SSHCommandLong</td>
<td></td>
<td>A probe that executes long running shell scripts from a command line after logging in to a target machine via SSH.</td>
</tr>
<tr>
<td>VMWare</td>
<td>VMWareProbe</td>
<td></td>
<td>A generic VMware probe that executes the MID Server script include in the ECC queue name that is set by a VMware Orchestration activity. This probe can run any MID Server script include.</td>
</tr>
</tbody>
</table>
| Windows - PowerShell | PowerShell | Windows - PowerShell | A probe that runs a Windows PowerShell script on the MID Server. The PowerShell script is provided as the value of a parameter with name ending in `.ps1`. Two variables are available to the script:  
  - `$computer`: The computer pointed to as the source for this probe  
  - `$cred`: A PowerShell credential, using a user name and password from the Credentials table, that logs into `$computer` successfully. |

**PowerShell activities**

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications.

PowerShell must be installed on any MID Server that uses these activities. MID Servers using PowerShell must be installed on a supported Windows operating system. ServiceNow supports PowerShell 2.0 and above. PowerShell 3.0 does not support Windows 2003 Server.
The ServiceNow Orchestration plugin adds these basic PowerShell activities to workflows. For instructions on using activities from the PowerShell activity pack, see [PowerShell activity pack](#).

**Legacy Run PowerShell activity**
The Run PowerShell activity executes Windows PowerShell commands on a MID Server.

**Attention:** This activity is deprecated and is unavailable for new workflows. To replace the functionality of this activity, use the [Powershell activity template](#) to create a custom, scoped activity. Workflows from a previous release that use the Run PowerShell activity can continue to do so.

**Result Values**
The workflow designer can assign a result value using `activity.result` from within a script field of the activity. By default, the success or failure of the PowerShell commands used determines the result value of the Run PowerShell activity. Possible result values are:

- Success
- Failure

**Scratchpad Entries**
Information written to `stdout` by the executing script is captured and returned to the activity in the `activity.output` variable. This information can be parsed, processed, or saved (to a scratchpad variable, for example) for future processing in the activity’s sensor script.

An example would be to run the `get-date` command to get the MID Server’s current time. This sensor script saves the full output received, but we can process it to return and save only the time.

```
Hostname: $[workflow.inputs.host]
Command: get-date

// Save full output for a later processsing in scratchpad variable 'currentdatetime'
workflow.scratchpad.currentdatetime = activity.output;

// Process the output and fetch the time and store it in a scratchpad variable 'time'
var time = substring($[activity.output], 19, 23); // 19: first instance of the pattern, 23: end of pattern
workflow.scratchpad.time = time != "No time found" ? time : "No time found";
```

© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
**Note:** This is an over-simplified example. In most cases, the script operates against some remote Windows computer. However, the principal is the same – whatever is written to stdout is returned in activity.output and available to process.

### Input Variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>IP address of the target Windows machine. This value is mapped to the <code>$computer</code> variable for use in commands (see the example in the <strong>Command</strong> field). A PowerShell credential variable called <code>$cred</code> that is based on information in the ServiceNow Credentials table will authenticate on the computer pointed to by <strong>Hostname</strong>.</td>
</tr>
</tbody>
</table>
| Command        | Enter the PowerShell command to run. For example, to execute a simple WMI query against a remote machine pointed to by the **hostname** variable, the command is:  

```powershell
get-wmiobject <class> -computer $computer -credential $cred
```

If no credentials authenticate on the computer, the command runs in the context of the MID Server user. You cannot run both a command and a script file. Specifying a command hides the **Script file** variable. |
| Sensor script  | The script to run using the results of the probe. The output from the probe is contained in a variable called **output**. Any error from the probe is contained in a variable called **error**. |
| Script file    | The **MID Server script file to run**. You cannot run both a script file and a command. Selecting a script file hides the **Command** variable. |
| PowerShell script variables | Additional parameters, in JSON format, used by the specified script file. |

### States

The activity state tells the workflow engine what to do with the activity.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the onExecute function of the activity.</td>
</tr>
<tr>
<td>State</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was cancelled.</td>
</tr>
</tbody>
</table>

Example

Add workflow variables for the command line using the normal workflow variable syntax. In the example above, if the `<class>` was in a workflow input variable called `myclass`, the command would look like:

```powershell
get-wmiobject $ {workflow. inputs. myclass } -computer $computer -credential $cred
```

Similarly, if the variable is a scratchpad variable named `myclass`, the command would look like:

```powershell
get -wmiobject $ {workflow. scratchpad. myclass } -computer $computer -credential $cred
```

HResult codes

When a PowerShell script encounters an error, the Windows machine may return an HResult code as part of the error message.

PowerShell activities can read and interpret this code. Not all PowerShell errors include an HResult code. In the event of a failed PowerShell script, you can use the HResult code to move the workflow through a specific condition.

For example, when resetting an Active Directory password to a password that does not meet policy requirements, such as minimum length or complexity, the PowerShell script returns the HResult code `-2146022651`. To use this code, create an activity condition with the `Condition` value of `activity.hresult = -2146022651`. If the PowerShell script returns this code when the activity runs, the workflow transitions through this new condition.

SSH activities

SSH activities allow workflows to perform operations on Linux and Unix computers.

Your ServiceNow instance must have access to a MID Server configured to use SSH to run these Orchestration activities.

Run Command activity

The Run Command activity runs a command (including shell scripts) on a Linux or UNIX computer.

Attention: The Run Command activity is deprecated in this release. If you have a workflow created in a previous version that uses this activity, your workflow will continue to work normally after upgrading to Helsinki. However, to use this functionality in a new workflow, you must create a custom activity using the **SSH activity template** in the ServiceNow® activity designer.
Input variables

Run command input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Long running</td>
<td>Select this check box to disable the SSH connection timeout if you think the command will take longer to run than the default 60 seconds. Orchestration periodically checks the running process to determine its status until it is finished.</td>
</tr>
<tr>
<td>Hostname</td>
<td>Hostname or IP address of destination server for SSH activity.</td>
</tr>
<tr>
<td>Directory</td>
<td>Name of the working directory.</td>
</tr>
<tr>
<td>Command</td>
<td>The command to run from this activity.</td>
</tr>
<tr>
<td>Sudo</td>
<td>Select this check box to use <code>sudo</code> to run the command on the host machine.</td>
</tr>
<tr>
<td>Sensor script</td>
<td>The script to run using the results of the probe. The output from the probe is contained in a variable called <code>output</code>. Any error from the probe is contained in a variable called <code>error</code>.</td>
</tr>
</tbody>
</table>

Run SCP activity

The Run SCP activity uses Secure Copy Protocol (SCP) to copy a file from one computer to another, including the directory in which the file resides.

**Note:** This activity is deprecated in the Geneva release and is not available for use in new workflows. If you have a workflow created in a previous version that uses this activity, your workflow will continue to work normally after upgrading. The custom Secure Copy activity replaces the Run SCP activity in the Geneva release.

Input variables

Run SCP input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Host</td>
<td>Hostname or IP address of the source computer.</td>
</tr>
<tr>
<td>From File</td>
<td>Absolute path to the file to copy. This value can be a directory.</td>
</tr>
<tr>
<td>To Host</td>
<td>Hostname or IP address of the target computer.</td>
</tr>
<tr>
<td>To File</td>
<td>Path to the target file. This path can be absolute or relative to the logged in user’s home directory. The specified directory must already exist on the target computer.</td>
</tr>
<tr>
<td>Copy Directory</td>
<td>Check box to copy a directory defined in the <code>From File</code> variable and all files contained in that directory.</td>
</tr>
</tbody>
</table>
Orchestration applications

Orchestration provides several applications with your subscription.

Orchestration ROI

The Orchestration ROI application allows you to estimate and compute cost savings for tasks in your system that could be automated with Orchestration.

After you automate the tasks, you can track cost savings by associating Orchestration workflows with corresponding task areas. Configuration in the application allows you to select the hourly rate for performing the task manually, the rules the system uses to select tasks for evaluation, and the time period of the evaluation. Orchestration ROI estimates your savings by multiplying the cost of performing repetitive tasks manually by the estimated number of times the system performs those tasks automatically during a specific date/time range. The system also calculates the actual savings of your automations. Orchestration ROI is included with the base Orchestration subscription.

Orchestration ROI reports offer a number of views of the comparative data and allow you to access the associated records directly from the reports. The standard reports included with the Orchestration - ROI plugin provide summaries, estimated costs, and calculated costs for automated processes. The ROI premium dashboard uses Performance Analytics to provide detailed reports on calculated savings over time. Performance Analytics requires a different plugin and subscription.

Note: When Orchestration ROI is activated as a dependent plugin of Orchestration, demo data is not installed. If you want to use demo data as a template for your own ROI evaluation, submit a request to ServiceNow® technical support for an Orchestration ROI plugin upgrade with demo data selected.

To set up Orchestration ROI, complete the configuration tasks in the order shown here.

Create Orchestration ROI labor rate cards

Before calculating your Orchestration ROI, you must create labor rate cards for the manual work that would be required to complete the tasks correlated to the ROI calculations.

Role required: orchestration_manager

The hourly rates defined in the rate cards are used to determine the savings from your orchestrated tasks.

1. Navigate to Orchestration > ROI > Labor Rate Cards.
2. Complete the fields in the form using the descriptions in Manage a labor rate card.
3. Click Submit.
4. Create additional rate cards as needed.

Create an Orchestration ROI automation entry record

The ROI automation entry record couples the cost of performing a task with the specific workflow that automates the task, for the purpose of calculating the resulting savings.

Role required: orchestration_manager

Before starting this procedure, verify that the appropriate labor rate cards were created.

Use this record to apply a manual hourly rate to a task that is performed automatically by your instance. To determine the savings realized from orchestrating a task, the system can evaluate whether those savings were estimated or calculated.
- **Estimated savings**: Uses the labor rate, the time estimates for completion of the task, and the number of automations that have been run to determine savings.

- **Calculated savings**: Uses the labor rate, the time calculated for completion of the task, based on the configured evaluation period, and the number of automations that have been run to determine savings.

1. Navigate to Orchestration > ROI > Automation Entry Form.
2. Fill in the fields on the form, as appropriate.

### Automation Entry Form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>Category of the selected workflow automation. The following categories are provided in the base Orchestration - ROI system:</td>
</tr>
<tr>
<td></td>
<td>- Access &amp; Identity Management</td>
</tr>
<tr>
<td></td>
<td>- Datacenter Automation</td>
</tr>
<tr>
<td></td>
<td>- IT Service Management</td>
</tr>
<tr>
<td></td>
<td>- Other</td>
</tr>
<tr>
<td>Note:</td>
<td>To create a category, open the dictionary record for the Automation Entry Form (automation_entry_form) table and add an option to the choice list.</td>
</tr>
<tr>
<td>Item</td>
<td>Unique name for the specific task within the category. This value represents the work to which the labor rate card applies, such as Password Reset.</td>
</tr>
<tr>
<td>Resource</td>
<td>Labor rate card to apply to this automation entry. You must have IT Cost Management active on the instance for this field to appear.</td>
</tr>
<tr>
<td>Associated Workflows</td>
<td>Workflow automations created to automate this manual task. The system uses this field to identify the number of automations that have been run.</td>
</tr>
<tr>
<td>Estimated Duration (min) per Task</td>
<td>Estimated time to perform this task manually.</td>
</tr>
<tr>
<td>Estimated Volume per Month</td>
<td>Estimated number of times needed to perform this task manually per month.</td>
</tr>
<tr>
<td>Read-only fields</td>
<td></td>
</tr>
<tr>
<td>Start time</td>
<td>Start time for the evaluation period. Configure this value in the Time Range for Calculated Averages module.</td>
</tr>
<tr>
<td>End time</td>
<td>End time of the evaluation period. Configure this value in the Time Range for Calculated Averages module.</td>
</tr>
<tr>
<td>Calculated average duration per task (min)</td>
<td>Actual time required to perform this task manually.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Calculated average volume per month</td>
<td>Actual average number of times this task is performed manually per month.</td>
</tr>
</tbody>
</table>

3. Select one of these submission options:
   - **Submit**: Saves the record to the table without running any calculations.
   - **Submit and process now**: Saves the record and calculates the savings based on the hourly rate and the number of workflow contexts for this automation entry.

**Create an Orchestration ROI correlated task rule**

The correlated task rule applies configurable conditions to fields in a selected table that tell the instance which manual tasks correspond to an automation entry record.

Role required: orchestration_manager

Before starting this procedure, make sure you have created *labor rate cards* and the appropriate *automation entry records* for the automated tasks you want to evaluate.

Create conditions that the system can use to correlate manual tasks to the automation entry. For example, a rule on the Incident (incident) table uses these conditions to correlate the employee on-boarding task to values configured in the Employee OnBoarding automation entry record:

- (Subcategory) (is) (Employee OnBoarding)
- (Sort description) (contains) (new employee)

When a new employee opens an incident to request services or assets which are typically handled manually, Orchestration applies the usual labor rate for the manual work to the potential automated solution, and then computes the actual savings.

1. **Navigate to** Orchestration > ROI Task Correlation > Correlated Tasks Rules.
2. **Click** New.
3. **Fill in the fields** on the form, as appropriate.

**Automation entry form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automation entry</td>
<td>Automation entry record that correlates to the manual task defined by these conditions. The entry record names the workflow used to automate the task and defines the labor rate used to calculate the cost of the task.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to filter, using these conditions. The rule selects records from this table that match the conditions. Information from these records is used to calculate the actual time to perform a manual task and the actual volume for that manual task.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition builder to use to filter records for this table. Use these conditions to identify all manual tasks correlated to this automation entry.</td>
</tr>
</tbody>
</table>

Read-only fields
4. Select one of these submission options:
   - **Submit**: Saves the record to the table without running any calculations.
   - **Submit and process now**: Saves the record, looks up all matching tasks, and saves matching record information to the Correlated Tasks (manual_mapping_records) table.

5. To view a rule, select the link in the Table column of the Correlated Tasks Rules related list for the automation entry you want to see.

6. To view the list of tasks that match all correlated rules in the system, navigate to Orchestration > ROI Task Correlation > Correlated Tasks.

7. To view the list of tasks that match this rule in the system, click Correlated Tasks under Related Links in this form.

### Configure the time range for Orchestration ROI calculations

Select a date range to calculate the average number of tasks and the duration per month for the correlated tasks.

Role required: orchestration_manager

By default, the system creates a range ending at the current date and time and extending back over the previous month. You can change this range at any time and recalculate the ROI instantly.

1. Navigate to Orchestration > ROI Task Correlation > Time Range for Calculated Averages.
2. Enter a new start or end date and time or click the icon to select a date using the calendar.
3. Click Calculate to recalculate the ROI based on the new time range and to save your settings.

### Installed with Orchestration ROI

Several types of components are installed with the Orchestration - ROI plugin (com.snc.runbook_automation.roi).

**Tables installed with Orchestration ROI**

Orchestration - ROI adds the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expense and Savings (run_rate_predicted_savings)</td>
<td>Contains the data for the reports in Orchestration &gt; ROI Reports &gt; Predicted Savings.</td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Savings Report (savings_report) | Contains the number of automations that have been run before the date specified in the **Processed On** column, based on:  
- Each automation entry’s associated workflows  
- Estimated savings based on the estimated duration per task.  
- Calculated savings based on calculated duration. |
| Detailed Savings Report (detailed_savings_report) | Contains a detailed list for the **Savings Report** (savings_report) table. This list contains each automation’s run date and savings for that automation. |
| Automation Entries (automation_entry_form) | Contains automation entries that couple labor resources to specific manual tasks. You can specify the estimated duration to perform a task manually and the estimated number of times that a task is performed per month. If this automation entry already has workflow automations implemented, you can specify the associated workflows. The system calculates the savings, based on the labor rate card and the number of workflow automations that have been performed. |
| Roadmap Planning (roadmap_planning) | Contains roadmap planning for each automation entry to be implemented. You can provide estimated hours to implement a workflow automation, the automation percentage anticipated by the end of the year, and the starting month to implement the workflow. |
| Correlated Tasks (manual_mapping_records) | Contains all matching manual tasks for each automation entry. Each task’s information is stored in this table for the system to use to calculate the actual duration and volume for each manual task. |
| Correlated Tasks Rules (manual_mapping_conditions) | Contains the correlated task rules the system uses to look up manual tasks corresponding to each automation entry. |

**Plugins installed with Orchestration ROI**

These plugins are installed with the Orchestration - ROI plugin, if they are not already active.

**Plugins for Orchestration ROI**

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cost Management (com.snc.cost_management)</td>
<td>Provides the labor rate cards Orchestration ROI uses to determine the savings for each automated task. See Cost Management for more information.</td>
</tr>
</tbody>
</table>

**User roles installed with Orchestration ROI**

These roles are installed with the Orchestration - ROI plugin.
Orchestration - ROI adds the following roles.

**Roles for Orchestration - ROI**

<table>
<thead>
<tr>
<th>Role title (name)</th>
<th>Description</th>
<th>Contains Roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Orchestration manager</td>
<td>Manages all activities in the Orchestration ROI module.</td>
<td>· pa_admin</td>
</tr>
<tr>
<td>(orchestration_manager)</td>
<td></td>
<td>· report_admin</td>
</tr>
</tbody>
</table>

**UI actions installed with Orchestration ROI**

Orchestration - ROI adds the following UI actions.

**UI actions for Orchestration - ROI**

<table>
<thead>
<tr>
<th>UI action</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Savings Report</td>
<td>Automation Entry Form</td>
<td>Displays the savings report specific to this automation entry, if the associated workflows are not empty.</td>
</tr>
<tr>
<td></td>
<td>(automation_entry_form)</td>
<td></td>
</tr>
<tr>
<td>Estimated and Projected Savings</td>
<td>Automation Entry Form</td>
<td>Displays the estimated savings, based on the estimated duration of the task, and calculated savings, based on the calculated duration of the task.</td>
</tr>
<tr>
<td></td>
<td>(automation_entry_form)</td>
<td></td>
</tr>
<tr>
<td>Show Workflow Context</td>
<td>Detailed Savings Report</td>
<td>Shows the related workflow context.</td>
</tr>
<tr>
<td></td>
<td>(detailed_savings_report)</td>

<tr>
<td>Task</td>
<td>Correlated Tasks</td>
<td>Displays the task record.</td>
</tr>
<tr>
<td></td>
<td>(manual_mapping_records)</td>
<td></td>
</tr>
<tr>
<td>Submit AND process now</td>
<td>Correlated Tasks Rules</td>
<td>Processes a correlated task rule. This action performs matching on the specified table and the filter conditions.</td>
</tr>
<tr>
<td></td>
<td>(manual_mapping_conditions)</td>
<td></td>
</tr>
</tbody>
</table>

**Script includes installed with Orchestration ROI**

Orchestration - ROI adds the following script includes.
Script includes for Orchestration ROI

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OrchestrationROIAjax</td>
<td>Script that calculates the actual duration and volume of a task.</td>
</tr>
<tr>
<td>OrchestrationROI</td>
<td>Script that calculates the number of workflow contexts, looks up all matching tasks, calculates savings, and other functions used in the UI actions.</td>
</tr>
<tr>
<td>ROIDemoDataUtil</td>
<td>Script that updates demo data timestamps.</td>
</tr>
</tbody>
</table>

Client scripts installed with Orchestration ROI

Orchestration ROI adds the following client scripts.

Client scripts for Orchestration ROI

<table>
<thead>
<tr>
<th>Client script</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display info for processing rules</td>
<td>Correlated Tasks Rules (manual_mapping_conditions)</td>
<td>Displays annotation on the Correlated Task Rule form advising that new task rules are not evaluated until the time specified in the ROI schedule.</td>
</tr>
</tbody>
</table>

Business rules installed with Orchestration ROI

Orchestration ROI adds the following business rules.

Business rules for Orchestration ROI

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete corresponding records</td>
<td>Automation Entry Form</td>
<td>When a record is deleted from the Automation Entry Form (automation_entry_form) table, this business rule deletes all records in other ROI tables that reference this entry.</td>
</tr>
<tr>
<td></td>
<td>(automation_entry_form)</td>
<td></td>
</tr>
<tr>
<td>Insert into Run Rate &amp; Savings</td>
<td>Automation Entry Form</td>
<td>When a new automation entry is provided, this business rule calculates the estimated savings, based on the estimated duration of a task and its associated labor rate card.</td>
</tr>
<tr>
<td></td>
<td>(automation_entry_form)</td>
<td></td>
</tr>
<tr>
<td>Insert into Savings Reports</td>
<td>Automation Entry Form</td>
<td>When a new automation entry is provided, this business rule inserts a new record into the Savings Report (savings_report) table with the automations_run field set to 0.</td>
</tr>
<tr>
<td></td>
<td>(automation_entry_form)</td>
<td></td>
</tr>
</tbody>
</table>

Orchestration ROI reports

Orchestration ROI provides a collection of standard and premium reports to help you calculate savings from automating services in your organization.
The ROI standard reports are included with Orchestration ROI. The premium reports provide enhanced views generated with Performance Analytics and require the Orchestration - ROI Premium plugin.

**Orchestration ROI standard reports**
The dashboard of standard ROI reports provides summaries, estimated costs, and calculated costs for automated processes.

To access the ROI standard dashboard, navigate to Orchestration > ROI Reports > Dashboard.

**Summary tab**

The Summary tab contains four reports on automation categories.
Automation Savings by Category Over Time (Uses Estimated Duration)

April 2015, Datacenter Automation = $11,227.50
(80.03%)

IT Service Management
Datacenter Automation
Access & Identity Management
## Standard ROI summaries by category

<table>
<thead>
<tr>
<th>Report</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manual Tasks by Category Over Time</td>
<td>Trend of manual tasks by category over time. For example, if you use automations to perform a portion of the necessary tasks, the report shows the number of tasks still executed manually, decreasing over time.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Type:</strong> Line chart</td>
</tr>
<tr>
<td></td>
<td>- <strong>Table:</strong> Detailed Savings Report</td>
</tr>
<tr>
<td>Automations by Category Over Time</td>
<td>Trend of automated tasks by category over time. For example, this chart can show the increase in the number of automated tasks as a workflow automation rolls out slowly over time.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Type:</strong> Line chart</td>
</tr>
<tr>
<td></td>
<td>- <strong>Table:</strong> Detailed Savings Report</td>
</tr>
<tr>
<td>Automation Savings by Category Over Time (Uses Estimated Duration)</td>
<td>Amount of savings from automated tasks over time, based on the estimated duration of the task, the number of automations performed, and the cost from the labor rate card.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Type:</strong> Line chart</td>
</tr>
<tr>
<td></td>
<td>- <strong>Table:</strong> Detailed Savings Report</td>
</tr>
<tr>
<td>Automation Savings by Category Over Time (Uses Calculated Duration)</td>
<td>Amount of savings from automated tasks over time, based on the calculated duration of the task, the number of automations performed, and the cost from the labor rate card.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Type:</strong> Line chart</td>
</tr>
<tr>
<td></td>
<td>- <strong>Table:</strong> Detailed Savings Report</td>
</tr>
</tbody>
</table>

### Estimated Costs tab

The Estimated Costs tab contains eight reports on estimated time and expense for automations.
Estimated Time Spent by Task Category

- Datacenter Automation = 450.00 (68.70%)
- IT Service Management = 150.00 (22.90%)
- Access & Identity Management = 55.00 (8.40%)

### Schedule Orchestration ROI Calculations for Standard Reports

The scheduled job that calculates Orchestration ROI standard reports is active by default and controlled by system properties.

**Role required:** orchestration_manager, admin

The system provides a default scheduled job called Processing ROI Schedule that allows you to configure when Orchestration calculates the ROI for standard reports. This schedule allows scripting for advanced conditions. To modify the schedule or write a script to run, open Processing ROI Schedule from **System Scheduler > Scheduled Jobs > Scheduled Jobs** and click **Configure Job Definition**. To execute the schedule directly from the job definition, click **Execute Now**.

To control the running of the schedule job with the Orchestration properties:

1. Navigate to **Orchestration ROI > Properties**.
2. Configure the following properties:

#### ROI Schedule Properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>roi.processing.active</td>
<td>Activate scheduled job for ROI processing. This property activates the Processing ROI Schedule scheduled job.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type</strong>: true</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default</strong>: true</td>
</tr>
<tr>
<td>roi.processing.interval</td>
<td>Scheduled ROI processing interval (hours). This property sets the repeat interval for the scheduled job that processes savings reports and correlated tasks.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type</strong>: integer</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default</strong>: 24</td>
</tr>
</tbody>
</table>
3. Click **Save** to save your changes.

**Orchestration ROI premium reports**
The premium dashboard provides detailed reports on calculated savings over time.

The ROI premium reports require the Orchestration - ROI Premium plugin and are built using **Performance Analytics concepts**. The Orchestration - ROI Premium plugin is dependent on the **Performance Analytics - Premium** plugin which requires a separate subscription.

**Important:** You must activate the Performance Analytics **scheduled collection job** before Orchestration ROI premium can display data.

To access the ROI premium dashboard, navigate to **Orchestration > ROI Reports > Premium Dashboard**.

**ROI By Category tab**

The ROI By Category tab contains three reports showing the calculated savings over time by category.

Activate Orchestration ROI premium reports

To view the Orchestration ROI premium reports, you must activate the Orchestration - ROI Premium (com.snc.runbook_automation.roi_premium) plugin.

The Orchestration - ROI Premium plugin requires the Performance Analytics - Premium plugin, which must be purchased separately.

Role required: admin

The Orchestration - ROI Premium plugin is included with an Orchestration subscription, but must be activated by request.

1. In the HI Service Portal, click **Service Requests > Activate Plugin**.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.

<table>
<thead>
<tr>
<th>Reason/Comments</th>
<th>Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows.</th>
</tr>
</thead>
</table>

3. Click **Submit**.

Schedule Orchestration ROI calculations for premium reports

Orchestration ROI premium reports use a Performance Analytics job that must be activated before premium reports can be generated.

Role required: orchestration_manager, admin

The scheduled job required to calculate premium ROI reports is called (PA ROI) Historic Data Collection and is installed with the Orchestration - ROI Premium (com.snc.runbook_automation.roi_premium) plugin. This job is not active by default.

1. Navigate to **Performance Analytics > Data Collector > Jobs**.
2. Search for the (PA ROI) Historic Data Collection job.
3. Select the **Active** check box.
4. The scheduling options appear for the value selected in the **Run** field.
   - For instructions on creating a schedule, see **Schedule a data collection job**.
5. To execute the schedule directly from the job definition, click **Execute Now**.
6. Click **Update**.

Client Software Distribution

The Client Software Distribution (CSD) application allows administrators to distribute software from the service catalog using third-party management systems.

CSD allows an administrator to create all the records necessary to deploy software from service catalog requests, including software models and catalog items. You can use the CSD application to automate the deployment and revocation of software from an SCCM host using the custom **SCCM activity pack**. You can define lease periods for software distributed from the Service Catalog and allow lease extensions in some cases, pending approvals. Deployment is accomplished using Orchestration activities and workflows.

CSD also integrates with **Software Asset Management** to manage license counts for deployed software.
CSD process flow using SCCM

Activate client software distribution

Client software distribution requires the Orchestration - Client Software Distribution plugin (com.snc.orchestration.client_sf_distribution), which is available by request with a subscription to Orchestration.
The Orchestration - Client Software Distribution plugin activates the *Orchestration - System Center Configuration Manager* plugin that contains the custom SCCM activities used to deploy or revoke software using an SCCM server. For additional plugin dependencies, see *Plugins installed with client software distribution*.

**Note:** The Orchestration - Client Software Distribution plugin runs in its own application scope.

1. In the HI Service Portal, click **Service Requests > Activate Plugin**.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.

| Reason/Comments | Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows. |

3. Click **Submit**.

**Installed with client software distribution**

Several types of components are installed with client software distribution (CSD).

**Tables installed with client software distribution**

These tables are installed with the Orchestration - Client Software Distribution plugin (com.snc.orchestration.client_sf_distribution).

**Client software distribution tables**

<table>
<thead>
<tr>
<th>Table</th>

Properties installed with client software distribution
Properties for client software distribution (CSD) manage the installation status of requested software deployments and configure scheduled Discoveries.

To access CSD properties, navigate to Client Software Distribution > Properties. The following properties are available:
Client software distribution properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Status check expiration interval (days) | sn_client_sf_dist.softwareInstallExpDays | Controls how many days the system waits before ignoring the software installation status. The default time limit for installing software is 30 days before the system stops checking the installation status of a deployment. Installation statuses are:  
  - **Not installed**: User has not installed requested software prior to the expiration of the configured time limit.  
  - **Installed**: Software was installed within the configured time limit.  
  - **Status check expired**: Time limit has expired for the user to install the requested software. The system no longer checks the status of this deployment.  
  - **Revoked**: Software was revoked by the administrator.  
  - **Type**: integer  
  - **Default value**: 30 |
| Reconcile software installation status interval (hours) | sn_client_sf_dist.softwareInstallIntervalHour | Determines when the scheduled job runs that determines the installation status. By default, the system checks the installation status every hour.  
  - **Type**: integer  
  - **Default value**: 24 |
| Set scheduled application Discovery interval (days) | sn_client_sf_dist.discoveryExeDay | Sets the repeat interval for the scheduled job that runs application Discovery. By default, Discovery runs at midnight on the day set with this value.  
  - **Type**: integer  
  - **Default value**: 5 |
| Set lease execution schedule job interval (minutes) | sn_client_sf_dist.lease_execution_interval | Interval in which the CSD Lease Schedule scheduled job checks for requested software leases to start, stop, or extend.  
  - **Type**: integer  
  - **Default value**: 1 |
<table>

For example, this workflow triggers the Revoke SCCM Application workflow for applications in SCCM uninstall collections.</td>
</tr>
<tr>
<td>Revoke SCCM Application</td>
<td>Revokes SCCM applications that are members of an uninstall collection. The Revoke Client Software workflow triggers this workflow to revoke software deployed by an SCCM server. This workflow moves either the user or the device from the SCCM collection into the appropriate uninstall collection.</td>
</tr>
</tbody>
</table>

**Create licenses and counters for distributed software**

Licenses and software counters are associated with the software model and must be created if you want to track the license for software deployed by client software distribution (CSD).

Role required: sam or admin
You can create software licenses and counters in Software Asset Management for software items deployed from the service catalog by CSD. CSD depends on the software counter result to determine if the license is available for the requested software. If the license Valuation is greater than 0, and the license type is Not allocated, CSD assumes that the license is available for the software.

1. Navigate to Software Asset > Software Licenses.
2. Add a new software license for the software model you used in CSD.
3. Navigate to Software Asset > Reconciliation > Software Counters.
4. Create a software counter for the software model you created.
5. Run the counter to retrieve the software license information.

Client software distribution ordering process
Software deployed by Client Software Distribution (CSD) can be ordered from the service catalog by individual users or by approved users on behalf of others.

Client Software Distribution catalog items have different options, depending on how ordering is configured.

Lease start and end dates
All software deployed by CSD requires users to specify the beginning date for the lease. This is enforced by the Orchestration - Asset Lease Management plugin that is activated automatically with CSD. The system prepopulates the Lease start field with the current date and time.

If the catalog item is configured for revocation (uninstall), the form displays the Lease end field, which allows the requester to define an end date and time for the lease. The system validates user input in these fields to ensure that the dates selected define a future window. The Lease end field is not mandatory and can be left blank to order software with no end date.

Note: For systems deploying software from Microsoft System Center Configuration Management (SCCM), the Lease end field is only available if the SCCM configuration specifies an uninstall collection.

Software offered only to the logged in user
If the software catalog item is configured with the Order on behalf of check box cleared, the User field does not appear on the order form. The logged in user selects the device on which to deploy the software from the Device to install this software on field. Only those devices assigned to the logged in user appear in the list.

In this example, a user has logged into the service catalog to order Firefox for a computer that is assigned to her. She selects the machine from a list of devices she owns and selects the date and time the lease should begin. This software is deployed through Microsoft System Center Configuration Management (SCCM), but does not have an uninstall collection configured and cannot be revoked automatically by the system. As a result, the Lease end field is not available.
Ordering software as the logged in user

Software ordered on behalf of another user

If the software catalog item is configured with the Order on behalf of check box selected, the User field appears on the form. The logged in user can select any user from this field. The Device to install this software on field only lists the devices assigned to the user selected in the User field. If an approval is required for software ordered on behalf of another user, the system automatically sends an approval request to the manager of the user receiving the software. The approval is skipped if the requester is the named user’s manager.

In this example, a manager is ordering Google Chrome for a contractor. The manager selects the contractor from the User field and then chooses a computer from the list of devices assigned to the contractor. This software has an SCCM uninstall collection configured, which allows the manager to select an end date for the lease that coincides with the end of the user’s contract. When the lease expires, SCCM automatically uninstalls the software from the device.
Defining software lease window

Extend a software lease

Users of software deployed by Client Software Distribution (CSD) can request the extension of a lease window, if the software is revocable by a software distribution system.

Role required: Any system user

If your software has a lease end date defined, and the software status is **Installed**, you can request an extension of the lease, pending any approvals your organization requires.

1. Navigate to **Service Catalog > My Requested Software**.
   The list shows only the software you have requested from the service catalog.
2. Select the record for the installed software whose lease you want to extend.
3. Under **Related Links** click **Extend Lease**.
4. In the dialog box that appears, select a new lease end date in the calendar and click OK. You must select a date later than the current date.

If the lease extension is subject to manager approval, you are notified of the decision. If the request is approved, a notification shows the new lease end date. If the new end date is within 5 days (the default notification period) of the date when you made the request, CSD sends an immediate end-of-lease notification.

**Important:** If lease extensions in your organization require approval, make sure the approver is available and has enough time to process your extension request. If the extension cannot be approved before the original end date expires, the software is revoked.
Client software distribution from SCCM

You can use Client Software Distribution (CSD) to deploy and revoke software deployments from Microsoft System Center Configuration Management (SCCM) and manage distributions on SCCM hosts.

The SCCM activity pack contains Orchestration activities that CSD uses to deploy software from a service catalog request and manage user and device collections on SCCM servers. In addition, CSD can manage license counts for deployed software using ServiceNow Software Asset Management, revoke software deployed by SCCM without user interaction, and manage lease periods.

Configuring SCCM

Follow the SCCM configuration procedures in the order shown.

Configure the Application Administrator role on the SCCM server

To deploy software using ServiceNow® Client Software Distribution (CSD), ensure that an SCCM administrative user has the correct permissions to deploy software and that PowerShell is properly configured.

SCCM role required: Application Administrator

These instructions are for Microsoft 2012 R2 Server.

1. In the System Center Configuration Manager console, navigate to Administration > Security > Administrative Users.
2. Right-click the user to whom you want to grant the Application Administrator role.
3. Select Properties from the drop-down menu.
4. In the Properties dialog box, select the Security Roles tab.
5. Ensure that the user has the Application Administrator role.
6. If the user does not already have this role, click Add, select this role from the list, and click OK.
Granting the Application Administrator role on the SCCM server
7. Log into SCCM as the user with the Application Administrator role.
8. Open the menu from the upper left corner of the console and select **Connect via Windows PowerShell**.

9. Ensure that the user can access the CM console.
   This action establishes the environment path to PowerShell for the logged in Application Administrator user.

Update the SCCM cmdlet libraries

Ensure that the System Center Configuration Manager SCCM Cmdlet Library is up-to-date.

SCCM role required: Either current user or system administrator, depending on settings.

The System Center Configuration Manager SCCM Cmdlet Library installs and updates the Windows PowerShell module for SCCM. SCCM checks for library updates on a daily basis. Out-of-date libraries can cause Discovery of the SCCM server to fail, because the system cannot parse the SCCM activity output. This warning message appears in the ECC queue input records for the SCCM GET activities:

```
WARNING: An update to the System Center 2012 Configuration Manager Cmdlet Library is available. Please go to 'http://go.microsoft.com/fwlink/?LinkID=528947' to download the latest version.
```

If you elect to use an earlier version library, use this procedure to disable the CM update check, which allows Discovery to proceed without issues.

1. Log into the SCCM console as an administrator.
2. Open the menu from the upper left corner of the console.
4. Run one of these commands to disable the update check:
   - **Per-user**: `Set-CMCmdletUpdateCheck -CurrentUser -IsUpdateCheckEnabled 0`
   - **Per-system**: `Set-CMCmdletUpdateCheck -System -IsUpdateCheckEnabled 0`

**Important:** The per-system cmdlet must run in an elevated Windows PowerShell session.

5. Run the `Get-CMCmdletUpdateCheck` command to refresh the console and check the settings.
6. Ensure that the value of the `IsEnabled` configuration variable has changed to `False`. This indicates that the warning for an out of date cmdlet library is disabled for the users specified.
7. To re-enable the update check, run the `-IsUpdateCheckEnabled 1` command for either the current user or for the system.

Configure the MID Server for SCCM activities
To use a MID Server with Microsoft System Center Configuration Management (SCCM) activities, configure it to communicate with the SCCM server.

Role required: admin

1. In the navigation filter, enter `cmdb_ci_dns_name.list`.
2. Click New.
3. Enter the fully-qualified domain name (FQDN) of the SCCM server in the Name field.
4. Right-click in the form header and select Save.
5. In the IP Address related list, click New.
6. In the IP Address field, enter the IP address of the SCCM server.
7. In the Nic field, select eth0 or your preferred network interface controller.
8. Leave the Netmask field blank.
9. Click Submit.

Create Windows credentials for SCCM deployments
Microsoft System Center Configuration Manager (SCCM) requires the appropriate credentials to deploy applications using the Client Software Distribution application.

Role required: sn_client_sf_dist.csd_admin or admin

Client software distribution requires Windows credentials that have administrative rights on the SCCM server.

1. Navigate to Orchestraton > Credentials.
2. Click New.
3. In the list of credential types, select Windows Credentials.
4. Provide a user name and password with administrative rights on the SCCM server.
Important: Ensure the following:
- This user must have the Application Administrator role on the SCCM server.
- Use the credentials to log into the SCCM Server and connect via Windows PowerShell from the System Center Configuration Manager console at least once to set the path variable for that credential.

5. Fill in the other fields on the form, as appropriate.
   For details, see Windows credentials.
6. Click Submit.

Retrieve SCCM data for client software distribution
Retrieve the collections and the list of applications available for deployment from your SCCM servers.

Role required: sn_client.sf_dist.csd_admin or admin

Before starting this procedure:
- Set up your Microsoft System Center Configuration Manager (SCCM) server, create the applications and collections, and configure the deployments you need. For information, see your SCCM documentation.
- Configure a user with the Application Deployment Manager role on the SCCM server.
- Set up the MID Server to communicate with the SCCM server.
- Add Powershell credentials to the ServiceNow Credentials (discovery_credentials) table for the SCCM user who has the Application Deployment Manager role.

To populate the Client Software Distribution application with SCCM data:
1. Navigate to Client Software Distribution > SCCM > SCCM Server Instance.
2. Click New.
3. In the SCCM Server Instance form, identify the server by name and provide the fully qualified domain name.
4. Click Submit.
   The new SCCM server appears in the list.
5. Open the new SCCM record and click Discover now under Related links.
   The system runs the Discover SCCM workflow that retrieves the application, collection, and deployment data from the SCCM server.
Retrieving SCCM data with Discovery

SCCM server Discovery for client software distribution

A Discovery workflow populates ServiceNow tables with collection, application, and deployment data retrieved from SCCM servers.

Users run the Discover SCCM workflow from an SCCM Server Instance record to populate the following ServiceNow tables:

**SCCM data populated in ServiceNow tables**

<table>
<thead>
<tr>
<th>Table</th>
<th>Fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCCM Application</td>
<td>name, publisher, version, model, sccm_server</td>
</tr>
<tr>
<td>(sn_client_sf_dist_sccm_application)</td>
<td></td>
</tr>
<tr>
<td>SCCM Collection</td>
<td>name, type, sccm_server</td>
</tr>
<tr>
<td>(sn_client_sf_dist_sccm_collection)</td>
<td></td>
</tr>
<tr>
<td>SCCM Deployment</td>
<td>application, collection, type</td>
</tr>
<tr>
<td>(sn_client_sf_dist_sccm_deployment)</td>
<td></td>
</tr>
</tbody>
</table>
Set up a software model for an SCCM application

Using the applications discovered on the SCCM server, set up a software model used by the Software Asset Management application to manage licenses.

Role required: sn_client_sf_dist.csd_admin or admin

Before creating software models, you must discover the applications available for deployment on the SCCM server. See Retrieve SCCM data for client software distribution for details.

You can link an SCCM application to an existing software model or create a new model.

1. Navigate to Client Software Distribution > SCCM > SCCM Applications.
   A list of applications discovered on the SCCM server appears.

2. Open an SCCM application record.

3. To link to an existing model, click the magnifying glass icon in the Model field and select a model from the list.<info>

4. To create a model, click Create Software Model under Related Links.
   a) Complete the software model fields.
      See for details.
   b) Click Submit.
      The view returns to the SCCM Applications form.

Define an SCCM configuration
To create catalog items for SCCM software deployment or to configure your instance to revoke software through SCCM, you must first associate that software with a collection through an SCCM configuration.

Before you create an SCCM configuration record, make sure you have discovered the SCCM applications, collections, and deployments and set up the necessary software models.

Role required: sn_client_sf_dist.csd_admin or admin

The SCCM configuration process associates software with SCCM collections. To deploy software from an SCCM server, the user or device must be a member of an SCCM collection associated with an install deployment. Client Software Distribution (CSD) allows you to revoke unentitled software using an SCCM server when that software can be removed using an uninstall collection. Users requesting revokable software from the Service Catalog also have the ability to define lease start and stop dates and request lease extensions.
SCCM table references

1. Navigate to **Client Software Distribution > SCCM > SCCM Applications**.
2. Open an application that has a configured software model.
3. Under **Related Links**, click **Create Software Configuration**.
4. Complete the form, using the fields in the table.
### SCCM configuration form

#### SCCM configuration fields

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Create a catalog item for an SCCM application

Using the applications discovered on the SCCM server, create a catalog item for an application you want to offer for distribution from the service catalog.

Role required: sn_client_sf_dist.csd_admin or admin

Before creating a catalog item, you must link the application to a software model and create at least one software configuration.

1. Navigate to Client Software Distribution > SCCM > SCCM Applications.  
   A list of applications discovered on the SCCM server appears.
2. Open a record for an SCCM application.
3. Under Related Links, click Create Catalog Item.  
   A new SCCM Application Catalog Item record appears with preconfigured information. For information about common service catalog fields, see .
Catalog items are available to order software applications from the service catalog. Update name and short description to display for the item. Configure approve processes, license check, order on behalf of, software configuration and other information as needed.

**Name:** Dropbox - 3.1

**Availability:** Desktop Only

**Category:** Software

**Workflow:** Order Client Software

**Short Description:** Mobile file backup & sharing.

**Description:**

Dropbox is a service that keeps your files safe, synced, and easy to share. Bring your photos, docs, and videos anywhere and never lose a file again.

**Skip approval:**

**Check license compliance:**

**Order on behalf of:**

**Software configuration:** Dropbox

© 2020 ServiceNow, Inc. All rights reserved.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
4. Add price information and complete the following fields added to the Client Software Distribution Catalog Item (sn_client_sf_dist_cat_item) table by the Orchestration - Client Software Distribution plugin:

**SCCM fields in the catalog item form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Skip approval (skip_approval)</td>
<td>Check box that allows skipping approval for this item by the requester's manager when a user orders it from the service catalog. Use this field in conjunction with the <strong>Order on behalf of</strong> field to ensure that software ordered by a logged in user on behalf of another user is subject to approval. By default, this check box is cleared, requiring manager approval for all new catalog items.</td>
</tr>
<tr>
<td>Check license compliance (check_license_compliance)</td>
<td>Check box that forces the system to determine if deploying this item is allowed under the current license.</td>
</tr>
</tbody>
</table>

**Note:** There are two levels of approval possible. By default, all category items require group approval for items in excess of $1000. If that approval is given or skipped, the system evaluates the **Skip approval** check box to determine if the software item requires approval by the requester's manager.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Order on behalf of    | Check box that allows the logged-in user to order this software from the service catalog for another user. This permits service desk personnel to order SCCM deployments for other users in the system. By default, this feature is enabled. To prevent unauthorized users from ordering software, ensure that approvals are required for this type of deployment by clearing the Skip approval check box. If an approval is required for software ordered on behalf of a user, the system automatically sends an approval request to the manager of the user receiving the software. The approval is skipped if the requestor is the named user's manager. Software items requested from the service catalog on behalf of a different user require the following information:  
- **User**: User selected for deployment. This field is automatically populated with the name of the logged in user. You can select another user from the list.  
- **Device to install this software on**: Device belonging to the selected user on which to deploy the software. Only devices belonging to that user appear in the choice list.  
- **Lease start**: Date and time to deploy the software. This is the start time for the lease. A lease can be open-ended or have a lease end time.  |
| SCCM configuration    | Name of the [SCCM configuration record](https://service-now.com) for this application. This record defines the collection and uninstall collection for this application. This configuration is required for all deployments, revocations, and leases performed by the SCCM server. |

5. If the catalog item requires approval because of cost, be sure to configure an approval group in the **Approved By Group** related list. By default, the Service Catalog Request workflow runs when an item costing more than $1000 is ordered and looks for an appropriate approval group. If no approval group is configured for the item, this workflow skips approval altogether and ends. The system then runs the Order Client Software workflow, which evaluates the Skip approval check box to determine if approval by the requester's manager is required.

6. Click **Update**. The view returns to the SCCM Applications list.

7. To see all client software distribution (CSD) catalog items, navigate to **Client Software Distribution > Maintain Items > Software Items**.

**Workflow process for SCCM deployment**  
Ordering an SCCM application from a client software distribution (CSD) catalog item in the service catalog triggers the Order Client Software workflow.
This process deploys an SCCM application to a user or device through a service catalog order:

1. If the **Skip approval** check box is cleared in the software catalog item, the Order Client Software workflow sends the catalog request to the requesting user's manager for approval.

2. If the **Check license compliance** check box is selected in the software catalog item, the workflow performs a software license check. If there is no license available, the workflow creates a catalog task to procure more licenses and assigns the task to the Client Software Distribution Administrators group.

3. The Order Client Software workflow triggers the Deploy SCCM Application workflow as a subflow. This workflow adds either the user or the device to the SCCM collection using the **Add to User Collection** or **Add to Device Collection** SCCM activity.

4. If the software configuration specifies **SCCM uninstall collection** in the software catalog item, the Deploy SCCM Application workflow checks if the user or device exists in the uninstall collection. The workflow uses the **Is Device in Collection** or **Is User in Collection** SCCM activity. If the user or device exists in the uninstall collection, the workflow removes the device or user. The workflow uses the **Remove from Device Collection** or **Remove from User Collection** SCCM activity before adding it to the **SCCM install collection**.

**Client software distribution validation process**

After SCCM deploys software to a target computer, client software distribution (CSD) detects the installation and validates its status.

Client software distribution uses the following methods for detecting software installed on the target machine:

- **Discovery**: CSD is configured to leverage Discovery to detect software installations. You can run Discovery manually at any time, or by a scheduled job.

- **Microsoft SCCM Integration**: You can import SCCM data into the CMDB using the features in the Integration - Microsoft SCCM plugin if Discovery is not active on the instance.

The instance uses the data gathered by Discovery or the SCCM integration plugin to populate the Software Installation (cmdb_sam_sw_install) table. To validate installations using this data, CSD runs a scheduled job called Reconcile Requested Software that uses CSD property settings. This process reconciles the software installation data accumulated in the CMDB and makes these status updates:

- **Not installed** to **Installed**: The user has installed the requested software within the time limit configured in the **sn_client_sf_dist.softwareInstallExpDays** property.

- **Not installed** to **Status check expired**: The time limit has expired for the user to install the requested software. The system stops checking for installation when the time limit expires.

**SCCM software revocation**

An administrator can revoke software without any user interaction using Microsoft System Center Configuration Manager (SCCM) if the software configuration specifies an SCCM uninstall collection, even if the software was installed by some other process or user.

Revoke software deployed through the service catalog

Software deployed by SCCM can be revoked, but only when the software's status is **Installed** and the application associated with the software configuration has an uninstall collection configured.

- Create an **SCCM configuration record** for the application that names an appropriate uninstall collection.

- Associate the **CSD catalog item** for the application with the SCCM configuration that specifies the uninstall collection.

Role required: **sn_client_sf_dist.csd_admin** or **admin**
A workflow called **Revoke SCCM Application** moves either the user or the device from its respective collection and adds it to the appropriate uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.

1. Navigate to **Client Software Distribution > Reports > Requested Software**.
2. Open the record for the SCCM software package you want to revoke.
   The package must have a **Status** of **Installed** to be revocable.
3. Under **Related Links**, click **Revoke software**.
   This action runs the Revoke Client Software workflow, which triggers the Revoke SCCM Application subflow that moves the user or device from the install collection to the uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.

Revoke unentitled software
An administrator can revoke software using Microsoft System Center Configuration Manager (SCCM) that a user is not entitled to use even if the software was installed by some other process or user.

To revoke software using SCCM, you must create an **SCCM configuration record** for the application, in which the appropriate software Discovery model is defined. See **Software discovery models**.

Role required: sn_client_sf_dist.csd_admin or admin

Client Software Distribution (CSD) uses **Software Asset Management** (SAM) to identify unentitled software installations. Discovery detects the software on the user's machine, and SAM determines if the user or device is entitled to use that software. This might include software that was not installed through a catalog request or software that the user installed without approval. If the software installation's Discovery model is associated with an SCCM software configuration that has an uninstall collection defined, then an administrator can use CSD to revoke that software from the user's machine without involving the user.

1. Navigate to **Client Software Distribution > Reports > Installed Software Not Entitled**.
2. Select the record for the installation that has unentitled users.
3. Under **Related Links**, click **Revoke software**.
   This action runs the Revoke Client Software workflow, which triggers the Revoke SCCM Application subflow that moves the user or device from the install collection to the uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.
Revoking a software installation

SCCM software revocation workflow

The Revoke SCCM Application workflow moves a user or device from an install collection to an uninstall collection to revoke software installed from Microsoft System Center Configuration Manager (SCCM).
For the revocation workflow to run, the software package must have a status of **Installed** and must be pre-configured for an appropriate uninstall collection. See [Revoke software deployed through the service catalog](#) for configuration instructions. When an administrator initiates the revocation process, the system launches the Revoke SCCM Application workflow to move the user or device collection associated with installation to the appropriate SCCM uninstall collection. When the SCCM server performs a policy check, it finds the additions to the user or device uninstall collection and revokes the software package associated with that collection.

The workflow employs two custom activities, *Remove from User Collection* and *Remove from Device Collection*, to remove either the user or the device from its original collection. The workflow then adds the user or device to the appropriate uninstall collection on the SCCM server with the *Add to User Collection* or *Add to Device Collection* activity.

**Note:** This workflow is triggered by the Revoke Client Software workflow as a subflow.

---

**Client software distribution dashboard**

The CSD dashboard provides a collection of visual reports for the Client Software Distribution application.

To access the CSD dashboard, navigate to **Client Software Distribution > Requested Software > Dashboard**.

---

**Sample report from CSD dashboard**

**Client software distribution extension framework**

Client software distribution (CSD) provides built-in extension points for integrating a ServiceNow instance with client software distribution providers, such as Casper, Altiris, or LANDesk.
**Caution:** The use of CSD extension points is an advanced procedure intended for use by experienced Now Platform developers only. Instructions for customizing your instance to deploy and revoke software from a software distribution provider can be found in the CSD Extension Implementation Guide.

**Configure client software distribution providers**

Identify the provider and specify the workflows and extension points for a customized software distribution process.

Perform the development tasks described in the CSD Extension Implementation Guide before attempting this procedure.

Role required: `sn_client_sf_dist.csd_admin`, `admin`

1. Navigate to **Client Software Distribution > Extensions > Providers**.
2. Click **New**.
3. Complete the form using the fields in the table.

---

**Provider information for Casper integration**

**Client software distribution provider fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name of the provider.</td>
</tr>
<tr>
<td>Provider server</td>
<td>Table name of the provider server. You must create this table as an extension of the Configuration Item (<code>cmdb_ci</code>) table. For example, you might call your table Casper Server Instance (<code>cmdb_ci_casper_server_instance</code>).</td>
</tr>
<tr>
<td>Discovery workflow</td>
<td>Workflow that discovers the provider server and returns the data from that server back to the instance. This is the workflow you create with custom activities that query the provider server.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
Software configuration | Table name of the software configuration for this provider. You create this table as an extension of the Client Software Distribution Software Configuration (sn_client_sf_dist_software_config) table. For example, you might create a table called Casper Software Configuration (sn_client_sf_dist_casper_sf_config).
Deployment extension key | The `SetDeploymentData` key provided with CSD. This key sets up the data for the software ordering and deployment workflow.
Deployment workflow | Workflow that deploys software from the provider server. This is the workflow you created with custom activities that tells the provider where to deploy an application requested from the service catalog.
Revocation extension key | The `SetRevocationData` key provided with CSD. This key sets up the data for installation revocation.
Revocation workflow | Workflow that revokes an installation from a provider server. This is the workflow you created with custom activities that tells the provider which application to remove from a device.

**Client software distribution extension keys**

Client software distribution (CSD) extension keys allow you to customize the deployment and revocation of software from distribution providers.

These pre-defined keys allow you to generate input variables for workflows that deploy and revoke software from external distribution providers:

- **SetDeploymentData**: Sets the software order information and generates the input variables for the deployment workflow.
- **SetRevocationData**: Generates the input variables for the revocation workflow.
- **CheckRevocable**: Specifies the conditions that determine if an installation can be revoked. If the software configuration associated with the installed software allows uninstallation, the installed software can be revoked.

**Client software distribution extension points**

The client software distribution (CSD) extension points create the customization code for the specific provider and the extension keys.

The purpose of the extension points is to associate extension keys with a specific provider, and then create a script that sets input variables for your custom deployment and revocation workflows. Another extension point script tells CSD if the provider has the capability to revoke software. If this is the case, CSD enables the UI action that triggers revocation from the provider.

**SetDeploymentData**

The script associated with this extension key must set the `csdExtensionResult` object with these attributes:

- **deploymentWorkflowInputs**: Object that specifies the deployment workflow input variables.
CheckRevocable

The script associated with this extension key gets the input parameter `csdExtensionInputs.softwareConfiguration`, which is a Client Software Distribution record in the Software Configuration (sn_client_sf_dist_software_config) table. All providers' software configurations are extended from this table, but may have different attributes.

This script must set the `csdExtensionResult` object to `true` or `false`, depending on whether the software configuration specifies uninstallation.

SetRevocationData

The script associated with this extension key gets the input parameter `csdExtensionInputs.softwareConfiguration`, which is a Client Software Distribution record in the Software Configuration (sn_client_sf_dist_software_config) table. All providers' software configurations are extended from this table, but may have different attributes.

The script must set the `csdExtensionResult` object with these attributes:

- `revocationWorkflowInput`: Object that specifies the revocation workflow input variables.
- `softwareModel`: Software model sys_id.
- `deploymentType`: An integer. Use 1 for deployment to a user and 2 for deployment to a device.

Password Reset and Password Change applications

The ServiceNow® Password Reset application enables an end user to use a self-service process to reset the password. Alternatively, your organization can implement a process that requires a service desk agent to reset passwords for end users.

Password Reset setup guide

A simple version of the Password Reset application is active by default. You can install a plugin to extend functionality.

Requirements

Role required: admin

What is installed

- Password Reset is active by default and includes example verifications. The base system enables connections only to the Local ServiceNow Instance credential store type. For details, see [Credential stores for Password Reset](https://www.servicenow.com/cdsk read the link). To enable connections to Active Directory (AD) and Remote (SOAP) ServiceNow Instance credential store types, you must activate the Password Reset - Orchestration Add-on plugin. The plugin also activates the Password Reset Windows Application (com.glideapp.password_reset_desktop). No other components are installed. Orchestration is available as a separate subscription. See [Activate the Password Reset - Orchestration Add-on plugin](https://www.servicenow.com/cdsk read the link).

Next steps

Plan and configure the Password Reset processes for your organization. See the [Password Reset admin guide](https://www.servicenow.com/cdsk read the link).

Activate the Password Reset - Orchestration Add-on plugin

The Password Reset - Orchestration Add-on plugin activates the Password Reset Windows Application (com.glideapp.password_reset_desktop) and enables connections to the Active Directory (AD) and ‘Remote (SOAP) ServiceNow instance’ credential store types. No other components are installed.

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization’s production and sub-production instances, generally within a few days.

If you do not have an account manager, decide to delay activation after purchase, or want to evaluate the product on a sub-production instance without charge, follow these steps.

Role required: none

1. In the HI Service Portal, click **Service Requests > Activate Plugin**.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
</tbody>
</table>
Specify the date and time you would like this plugin to be enabled

| Date and time must be at least 2 business days from the current time. |

**Note:** Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.

<table>
<thead>
<tr>
<th>Reason/Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

*Installed with Password Reset*

Tables, roles, business rules, scripts, and workflows are installed with the Password Reset application.

<td>UI for verifying questions.</td>
</tr>
<tr>
<td>$pwd_verify_simple_ui</td>
<td>Input section for a simple verification method. This field is a single input field.</td>
</tr>
</tbody>
</table>

UI scripts installed with Password Reset

You can create a UI script and reference the script from a UI macro or UI page by using a `<g:include_script>` Jelly tag. The following example shows how the $pwd_enroll_questions_ui UI macro can reference the $pwd_enroll_questions_ui script. In the example, `[UI Script Name]+".jsdbx"` is the name of the script:

```xml
<g:include_script src="$pwd_enroll_questions_ui.jsdbx" />
```

By referencing an external script, you can maintain separation between client JavaScript code and Jelly code, which simplifies maintenance. You can use the following installed scripts with Password Reset UI macros:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$pwd_csrf_common_ui_script</td>
<td>Common UI script for handling a Cross-site Request Forgery (CSRF).</td>
</tr>
<tr>
<td>$pwd_enroll_questions_ui</td>
<td>JavaScript code for the $pwd_enroll_questions_ui UI macro.</td>
</tr>
<tr>
<td>$pwd_enroll_sample_ui</td>
<td>Included sample client JavaScript for the $pwd_enroll_sample_ui UI macro.</td>
</tr>
</tbody>
</table>
## Password Reset workflows

The Password Reset plugin adds workflows that you can use as examples to create custom workflows for Password Reset processes.

### Workflows that connect to a credential stores

<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pwd Reset - AD</td>
<td>Connects to an AD server.</td>
</tr>
<tr>
<td>Pwd Reset - Local ServiceNow</td>
<td>Current (local) instance.</td>
</tr>
<tr>
<td>Pwd Reset - Master</td>
<td>Password Reset master workflow.</td>
</tr>
<tr>
<td>Pwd Reset - Mock Fatal</td>
<td>Example workflow to use in Password Reset testing to simulate a fatal error.</td>
</tr>
<tr>
<td>Pwd Reset - Mock Non Fatal</td>
<td>Example workflow to use in Password Reset testing to simulate a non-fatal error.</td>
</tr>
<tr>
<td>Pwd Reset - Mock Success</td>
<td>Example workflow to use in Password Reset testing to simulate a successful completion.</td>
</tr>
<tr>
<td>Pwd Reset - Remote ServiceNow</td>
<td>Connects to a remote(SOAP) ServiceNow instance.</td>
</tr>
</tbody>
</table>

### Workflows that test the connection to a credential store

<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pwd Connection Test - AD</td>
<td>Tests connection to an AD server.</td>
</tr>
<tr>
<td>Pwd Connection Test - Local SN</td>
<td>Tests connection to local instance.</td>
</tr>
<tr>
<td>Pwd Connection Test - Master</td>
<td>Master workflow to test credential store connectivity.</td>
</tr>
<tr>
<td>Pwd Connection Test - Mock Failure</td>
<td>Example credential store connection test that simulates a failed connection.</td>
</tr>
<tr>
<td>Pwd Connection Test - Mock Success</td>
<td>Example credential store connection test that simulates a successful connection.</td>
</tr>
<tr>
<td>Pwd Connection Test - Remote SN</td>
<td>Tests connection to a remote(SOAP) ServiceNow instance.</td>
</tr>
</tbody>
</table>

### Workflows that determine the lock state of a user account

<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pwd Get Lock State - AD</td>
<td>Gets a user account lock state for the AD server.</td>
</tr>
</tbody>
</table>
### Workflows that get a user account lock state

<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pwd Get Lock State - Local SN</td>
<td>Workflow to get a user account lock state for the local instance.</td>
</tr>
<tr>
<td>Pwd Get Lock State - Master</td>
<td>Master workflow to get a user account lock state.</td>
</tr>
<tr>
<td>Pwd Get Lock State - Remote SN</td>
<td>Gets a user account lock state for the remote(SOAP) ServiceNow instance.</td>
</tr>
</tbody>
</table>

### Workflows that unlock a user account

<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pwd Unlock Account - AD</td>
<td>Unlocks a user account for a local instance.</td>
</tr>
<tr>
<td>Pwd Unlock Account - Local SN</td>
<td>Workflow to unlock a user account for a local instance.</td>
</tr>
<tr>
<td>Pwd Unlock Account - Master</td>
<td>Master workflow to unlock a user account.</td>
</tr>
<tr>
<td>Pwd Unlock Account - Remote SN</td>
<td>Unlocks a user account for a remote(SOAP) ServiceNow instance.</td>
</tr>
</tbody>
</table>

### Workflows that change a password

<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pwd Change - Master</td>
<td>Password change master workflow.</td>
</tr>
<tr>
<td>Pwd Change – Local ServiceNow</td>
<td>Connects to a local instance to change a password.</td>
</tr>
<tr>
<td>Pwd Change – AD</td>
<td>Connects to an AD server to change a password.</td>
</tr>
<tr>
<td>Pwd Change – Remote ServiceNow</td>
<td>Connects to a remote(SOAP) ServiceNow instance to change a password.</td>
</tr>
</tbody>
</table>

### Password Reset notifications

<table>
<thead>
<tr>
<th>Name</th>
<th>Fired by event name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password Reset – Send SMS Code</td>
<td>pwd.send_sms_code.trigger</td>
<td>Sends out SMS authentication code for verification.</td>
</tr>
<tr>
<td>Password Reset - New Password</td>
<td>pwd.email.trigger</td>
<td>For the Email Password process, sends an email that includes the new password.</td>
</tr>
<tr>
<td>Confirmation</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Password Reset URL</td>
<td>password.reset.url</td>
<td>For the Email Password Reset URL process: Sends email that includes a link to the password reset URL.</td>
</tr>
</tbody>
</table>
SOAP messages for Password Reset

<table>
<thead>
<tr>
<th>SOAP Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change Password</td>
<td>When the Orchestration Add-on plugin is active, the system can use the SOAP protocol to change passwords on remote credential stores such as a remote ServiceNow instance.</td>
</tr>
<tr>
<td>Password Reset Request</td>
<td>When the Orchestration Add-on plugin is active, the system can use the SOAP protocol to reset passwords on remote credential stores such as a remote ServiceNow instance.</td>
</tr>
</tbody>
</table>

REST API

Name: Pwd Reset

API ID: pwd_reset

Base API path: /api/now/pwd_reset

Resources (Version v1)

<table>
<thead>
<tr>
<th>Name</th>
<th>Resource path</th>
<th>API Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pwd_init</td>
<td>/api/now/v1(pwd_reset/init</td>
<td>v1</td>
<td>Initial request to establish session, write logs, and fetch UI messages.</td>

</tbody>
</table>

Password Reset Windows Application

If a user forgets the password or is locked out of a Windows computer, the user can reset the password directly from the Windows login screen.

Installer and documentation

Download the installer and installation instructions from KB0542328 in the ServiceNow Knowledge Base. The installer uninstalls any earlier version of the Password Reset Windows Application.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
How the Password Reset Windows Application works

Administrators download and run an EXE or MSI file to install or distribute the application to user computers. The application installs a link on the Windows login screen. The user clicks the link (Forgot Password? in the examples on various Windows versions) and is then guided through the process of resetting the password.

![Password Reset Windows Application](image)
By default, when a user requests a reset, the instance sends the user a URL with a user-specific token. After the user opens the URL, the instance prompts the user to enter and confirm the new password. The instance does not send a temporary password.

Restrictions on the Password Reset Windows Application

- The Password Reset Windows Application does not support custom verifications.
- The Password Reset Windows Application uses the base-system CAPTCHA service even if the Password Reset application is configured to use Google reCAPTCHA with the web interface. See the section titled "Settings on the Details tab" in Configure your Password Reset or Password Change process.
- The Password strength indicator is not supported. See Configure and test the Password Reset connection to a credential store.
- For some verification types, you can use only one verification. Custom verifications are not supported. See Password Reset verifications for details.
- Custom UI macros configured on the Process > Advanced page are not supported (for example, entry, success, or failure macros). The system displays only the default success and failure messages.
- The Password Reset Windows Application supports newline characters in the Password rule hint text. Other formatting is not supported (bold, underline, hyperlink, and so on). See Configure and test the Password Reset connection to a credential store.

Password Reset Windows Application installation requirements

You must activate the Password Reset Orchestration Add-on plugin to use the Password Reset Windows Application.

<table>
<thead>
<tr>
<th>Requirement</th>

</tbody>
</table>

- Password Reset Windows Application clients must have direct access to both the Internet and the ServiceNow instance where the Password Reset Windows Application is configured.
- The ServiceNow SHA certificate must not be blocked by the corporate network. Information on the ServerCertificateSHA256 file appears in the documentation for Password Reset Windows Application.
- To reset an AD password, the client must be on the corporate network.

**Password Reset admin guide**

The Password Reset application enables an end user to reset or change a password using a self-service process. Alternatively, your organization can implement a process that requires a service desk agent to reset passwords for end users.

Watch the video: *Introducing Password Reset (Video)*

**Password Reset processes**

Users with the password_reset_admin role configure how the process of resetting a password works for an end user.

- **Self-service process**: Users reset passwords over the Internet using a browser on any supported interface, including mobile devices.
- **Service desk-assisted process**: A user requests the assistance of a service desk agent, over the phone or in person. Users do not reset passwords.

**End-user experience of the self-service process**

The following example is typical:

1. On the login page, the user clicks the **Forgot Password?** link to start the process.

![Login Page](image)

2. The Identify page opens and the user enters their identifying information (typically username or email address). The example includes the default CAPTCHA security feature:
3. On the Verify page, the user verifies their identity by providing information that proves that they are who they say they are. You, the admin, configure the method of verification and you can require multiple verifications. In the example, the admin has configured the Security Question verification. The user must answer a question to prove identity. (The user had earlier selected the question and provided a secure private answer while enrolling for the password reset process.) Other possible verifications require the user to enter a code number that was sent to a mobile device by SMS text, through the Google Authenticator app, or by email.

4. The system checks the credential store to verify identity and then displays the new password on the Reset page.
Elements of a password reset process

You configure the following elements of the process for your organization:

- A connection to the credential store for your organization where user credentials (like username/password) are securely stored.
- One or more user groups on the ServiceNow instance that can use the password reset process.
- The type of identification that users must enter to identify themselves (typically username or email address).
- One or more verifications — methods to verify the identity of the user. Examples:
  - Answer a question that only the user knows how to answer — the QA Verification (based on the Security Question verification type).
  - Enter a code number that was texted to a mobile device — the SMS verification.
How you implement a password reset process

1. Plan your implementation: Ensure that all applicable organizational guidelines, security policies, and areas of the organization are considered.

2. Set up the elements of the password reset and password change processes according to the plan:
   - Connection to the credential store.
   - User groups that will use the password reset process.
   - Identification type to use.
   - Verifications to use.

3. In the service desk-assisted model, assign service desk agents to monitor and reset passwords as needed.

4. Monitor password reset activity to identify security threats and to ensure compliance with the password policy requirements of your organization.

Password Reset Windows Application

If a user forgets the password or gets locked out of a Windows computer, the user can reset the password directly from the Windows login screen. The user clicks the Forgot Password? link and is then guided through the process of resetting the password. To learn more, see Password Reset Windows Application.

Password Change application

The Password Change application extends the Password Reset application by letting admins define how users change their passwords. Only a self-service process is supported and an admin must publish the URL to the password change form.

1. The user logs in to the instance and then selects the Change Password module or link from the user profile record.

2. On the Change Password page, the user selects the credential store where the password resides.

3. The user enters the old password and then enters and confirms a new password.

4. Workflows validate the old password and then implement the new password.

5. The system notifies the user that the password was changed.

What to do next

Plan your Password Reset processes

To ensure security and efficiency, take the time to plan your Password Reset implementation.

Role required: password_reset_admin or admin

1. Decide on the password reset process:
   - Self-service process: Users reset their password over the Internet using a browser on any supported interface, including mobile devices. To make the Password Reset application
with Orchestration available to all users publicly, create a new Password Reset process only for this purpose and make it accessible to all users by setting the Public access property.

- Service desk-assisted process: Users reset passwords by requesting the assistance of a service desk agent, over the phone or in person. Only service desk agents with the password_reset_service_desk role can reset user passwords. Watch the videos: Resetting User Passwords (Video) and How to Set Up a Service Desk-Assisted Password Reset Process (Video).

2. Understand how groups and roles differ in their access and security needs.
    Analyze and assess how members of each group in your organization access the system. For example, if members of the sales group primarily access the system remotely, consider using a stronger method or multiple methods to verify the identity of each user.
    Identify user roles that have access to critical information and resources. For example, stronger verifications might be required for roles that have access to employee data, accounting information, or network configurations.
    Based on your analysis of groups and roles, determine the number and variety of verifications needed for the different Password Reset processes.

3. Consider how to manage credentials.
    Determine whether single sign-on is enabled with the type of directory service or other credential store used. If the directory service is configured for single sign-on, consider increasing the level of security by using multiple methods to verify identity of a user. A compromised user name and password can easily allow access to associated systems in a single sign-on environment.

4. Consider how to implement enrollment in the Password Reset program.
    For example, will enrollment be optional or required? Will users be auto-enrolled? How will users be notified to enroll in the program? The answers to these questions will help you determine the appropriate verification types to use.

5. Consider which Password Reset options to offer to users.
    - If your organization uses single sign-on, how will users reset their password if they are unable to log on?
    - What options are available to users working off-site?

Example: The default self-service Password Reset process
    The default self-service Password Reset process enables a user to reset the password without assistance from service desk agents.

The default self-service password reset flow
    1. If a user does not remember the password, the user can click the **Forgot Password?** link on the login screen.
2. The Password Reset application starts. On the **Identity** page, the user identifies himself or herself by entering a **Username**.

![Identity Page](image)

3. On the **Verify** page, the user proves that they are the person who is associated with the username. In this example, the user enters the email address that is associated with the user profile. The admin can configure a different verification method or can require additional verifications, for example, a personal question that only the user can answer.

![Verify Page](image)

4. The **Reset** page tells the user to check email for instructions.

![Reset Page](image)

5. The user opens the email and clicks the **here** link to reset the password. The link is valid for a period that you specify (use the **password_reset.request.expiry** property).

![Preview Email](image)

6. The **Reset Password** page guides the user to reset the password.
The default self-service Password Reset process (com.glideapp.password_reset) defines:

- The URI that specifies where users are redirected when they click **Forgot Password?**. By default, this value is /$pwd_reset.do?sysparm_url=ss_default, which is the same value used in the glide.security.password_reset.uri property. In previous releases, this value was set to /reset_password.do.
- The **Enable Password Reset URL** option, which specifies that the user should receive an email with a link to reset their password after they click **Forgot Password?**.
- The **Personal Data - Enter Email Address** verification flow that specifies the three-step password reset flow.

See [Configure your Password Reset process](#) for instructions on accessing this form and configuring the fields.

**Note:**

- This feature works for locally authenticated users who enter the username and password specified in their user record. Users logging in to the instance via an SSO solution or an LDAP integration cannot reset passwords with self-service Password Reset.
- The end user must enable and configure notification preferences. See [Subscription-based notifications](#). Administrators can [modify the email that is sent to the end user](#).

---

**Configure your Password Reset or Password Change process**

To implement the process, you configure credentials, verifications, and users.

Role required: password_reset_admin or admin

1. Be sure to [Plan your Password Reset processes](#).
2. Create the credential store record for user names and passwords that are managed.

**Note:** For LDAP integrations: If the Active Directory settings require users to reset the password when logging in, the results depend on the password reset plugin that is installed.
The Password Reset plugin cannot change an AD password. End users will not be able to log in to the instance.

- The Self Service Password Reset plugin depends on the Password Reset Basic plugin. Self-service is intended for password reset only on the local ServiceNow instance and cannot change an AD password.
- The Password Reset Orchestration Add-on plugin is built on top of Orchestration AD activities. The plugin supports changing the AD password.

3. Define the verifications that the process will use.

A Password Reset process consists of the following elements:

- The credential store that contains user login credentials.
- Optionally, the user groups that are authorized to use the Password Reset process.
- The verifications (extension script includes) that verify the identity of the requesting user and that enable the service desk agents to authorize reset of the password.

1. Navigate to Password Reset > Processes.
2. Click New and then specify a meaningful Name and Description for the process.
3. Select the Credential store that contains the user credentials that the process applies to.
4. Specify the process that you are defining: Select the Password Reset check box and/or the Password change check box.
5. Specify the Apply to all users setting.

<table>
<thead>
<tr>
<th>Apply to all users setting</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Selected</td>
<td>All users use the process that you are defining. This setting is useful only if all users have access to the authentication methods that are defined in this process.</td>
</tr>
<tr>
<td>Not selected</td>
<td>Only the users in the groups that you specify use the process. You specify the groups in the Groups related list.</td>
</tr>
</tbody>
</table>

6. If you selected Password Reset, fill in the Password Reset Details tab and, optionally, the Advanced tab. See Settings on the Password Reset Details tab and Settings on the Password Reset Advanced tab.
7. Save the form. The form refreshes and additional related lists appear.
8. From the Password Reset Process Verifications related list, select one or more verifications. See Password Reset verifications.
9. Optional: From the Password Reset Process Groups related list, select the user groups that will use the process that you are defining.

The Password Reset Process Groups related list appears only if the Apply to all users check box is not selected.
10. Select the Active check box to enable the Password Reset process that you configured. The check box is available only after the record has been saved.
11. Click Update.
12. Navigate to Password Reset > Properties to set the properties that configure the Password Reset experience for end users.

Credential stores for Password Reset

Credential stores hold user information such as user names and passwords that can be used as login credentials. Examples include the User (sys_user) table or an Active Directory server.
Users with the password_reset_admin or password_reset_credential_manager role can create and modify connections to credential stores.

**Credential store types installed with the base system**

A credential store type is a set of workflows that specify how to connect to a credential store. Navigate to **Password Reset > Credential Stores** to view the list of example credential stores that are based on the base-system types. The base system includes the following credential store types:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local ServiceNow Instance</td>
<td>Represents the current (local) ServiceNow instance.</td>
</tr>
<tr>
<td>AD Credential Store</td>
<td>Represents an Active Directory credential store. Installed with the Orchestration Add-on plugin.</td>
</tr>
<tr>
<td>Remote (SOAP) ServiceNow instance</td>
<td>Represents a remote ServiceNow instance. Installed with the Orchestration Add-on plugin.</td>
</tr>
</tbody>
</table>

**Remote credential stores**

A remote credential store refers to any credential store other than the local ServiceNow instance. Remote credential stores, such as Active Directory, manage user names and passwords outside of the local instance. A remote credential store can also be a remote ServiceNow instance, a UNIX or Linux server, or any other directory-like service that relies on the SOAP protocol. The Password Reset Orchestration Add-on plugin is required to connect to remote credential stores. Review the information in the section on credential store types before you create, test, or delete credential stores.

**Connection workflows for credential store types**

A credential store type workflow requires a subflow that defines how to connect to the store, and can include an optional subflow that defines how to test the connection. Use the **Pwd reset – AD** and **Pwd Reset - Local** subflows as models for your custom connection workflows.
Pwd Reset Local sub workflow
Creating a custom credential store type

You can use a credential store type as a model to create a custom type. See Create a credential store type for Password Reset.

Configure and test the Password Reset connection to a credential store

You specify a credential store to access during the Password Reset or Password Change process and configure other settings that control the process.

Role required: password_reset_admin or password_reset_credential_manager

Note: The Password Reset Windows Application supports only Active Directory (AD) credential stores.

1. Navigate to **Password Reset > Credential Stores**.
2. Click **New**, enter a unique and meaningful **Name** and **Description**, and then fill in the form.

<table>
<thead>
<tr>
<th>Type</th>
<th>You can use credential store types (templates that provide a desired set of capabilities). Credential stores inherit the functionality of the credential store type.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note:</td>
<td>The Password Reset Windows Application supports only AD Credential Store.</td>
</tr>
</tbody>
</table>

Installed credential store types:

- **Local ServiceNow Instance** installed with Password Reset.
- **AD Credential Store** installed with the Orchestration Add-on.
- **Remote (SOAP) ServiceNow** installed with the Orchestration Add-on.
<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Auto-generate password</strong></td>
<td>Script include that generates a temporary password for use during the reset process.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>If you select the <strong>Enforce history policy</strong> check box, then you must specify a value for <strong>Auto-generate password</strong>.</td>
</tr>
<tr>
<td><strong>Enforce history policy</strong></td>
<td><strong>Note:</strong> This option appears only if you select a credential store Type of <strong>AD Credential Store</strong>.</td>
</tr>
<tr>
<td></td>
<td>To enforce the history policy that is configured for the credential store:</td>
</tr>
<tr>
<td></td>
<td>1. Select the <strong>Enforce history policy</strong> check box.</td>
</tr>
<tr>
<td></td>
<td>2. Follow the procedure that appears after this table.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>Active Directory domains can be configured to include a history policy that ensures that users do not reuse passwords. For example, the history policy might be configured to not allow the user to reuse any of the previous three passwords when resetting a password.</td>
</tr>
<tr>
<td><strong>Hostname</strong></td>
<td>URL or IP address of the credential store that contains the user credential (for example, user names and passwords).</td>
</tr>
<tr>
<td><strong>User account lookup</strong></td>
<td>Script include that maps the user ServiceNow platform ID to the user credential store ID. A default script, <code>PwdDefaultUserAccountLookup</code>, returns the user ServiceNow platform user name.</td>
</tr>
<tr>
<td><strong>Password rule hint</strong></td>
<td>Text that appears on the password reset page to help the user to create a password that meets all requirements. The <strong>Password rule</strong> script enforces the requirements.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>The Password Reset Windows Application supports newline characters in the hint. Other formatting is not supported (bold, underline, hyperlink, and so on).</td>
</tr>
<tr>
<td><strong>Password rule</strong></td>
<td>Client script that validates the password that the user enters. The script is invoked when the user enters a new password and clicks <strong>Password Reset</strong>. You can use the script to enforce password strength/complexity requirements.</td>
</tr>
<tr>
<td><strong>Enable Password Strength</strong></td>
<td>Select the check box to:</td>
</tr>
<tr>
<td></td>
<td>• Display the text box for the <strong>Strength rule</strong> script so you can update the script.</td>
</tr>
<tr>
<td></td>
<td>• Display the graphical <strong>Password Strength</strong> bar to the user while the user changes or resets the password.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>The Password Reset Windows Application does not support <strong>Password Strength</strong>.</td>
</tr>
</tbody>
</table>
Strength rule  This text box appears only if you select **Enable Password Strength**.

Note: The Password Reset Windows Application does not support Password Strength.

Client script that calculates the strength/complexity of the password that the user enters. The script is invoked when the user begins to enter a new password during the reset process.

Default settings:
- Selected for local ServiceNow credential stores
- Not selected for other credential stores

Note:
To guide the user during the reset process, the system displays a graphical bar labeled **Password Strength** under the **New password** field.

3. Click **Submit**.
   The connection is created. You should test the connection to a credential store after you configure a new credential store or when users experience problems that might involve the connection.

4. Navigate to **Password Reset > Credential Stores** and then open the credential store.

5. In the header bar, click **Save and Test Connection**.
   A progress page displays the result of the test.

If you selected the **Enforce history policy** check box, then follow these steps:

1. Open the associated Password Reset process definition: **Password Reset > Processes**.

2. On the Details tab of the Password Reset Process form, clear the **Auto-generate password** check box and then save the process definition.

3. On the domain controller, set **Password Aging** (**MIN_PASSWORD_AGE**) to zero.

4. On the domain controller, set the history policy to twice the desired number of passwords. For example, to enforce that the last three passwords are not repeated, set the history policy to six.

   Note: To enforce the history policy that is configured for the credential store, the system auto-generates a new temporary password for each reset cycle. The system auto-generates the temporary password even though you have cleared the **Auto-generate password** check box on the Password Reset Process form. Because the user immediately replaces the temporary password with a new password, two passwords are created for each reset cycle.
Set up SOAP credentials for Password Reset

When the Orchestration Add-on plugin is activated, the ServiceNow platform can use the SOAP protocol to interact with remote credential stores such as a remote ServiceNow instance.

Role required: admin or web_service_admin

1. Navigate to System Web Services > Outbound > SOAP Message.
2. Click Password Reset Request.
3. From the Soap Message Functions related list, configure both the password_reset and sys_user_get_record functions by completing the following steps.
   a) In Basic auth user ID, enter the user ID for the remote system user who has privileges to update records on the User [sys_user] table.
   b) In Basic auth user password, enter the password for the remote system user who has privileges to update records on the User [sys_user] table.
   c) Select Use basic auth.
   d) Click Update.

You do not need to enter a value in the SOAP endpoint field. The field shows the name of the ServiceNow instance used for Password Reset.

Configure Password Reset for Active Directory

When the Orchestration Add-on plugin is activated, the Password Reset application can change passwords on an Active Directory credential store. The application changes passwords by referencing an Active Directory user role with the appropriate password change privileges.

Active Directory must have a user role with the following privileges:

Descendent User objects:
- Reset password
- Read/Write pwdlastset
- Read/Write UserAccountcontrol
- Write Account Restrictions
- Read/Write lockouttime
- Read MemberOf

Descendent Group objects:
- Read Members
- Read MemberOf

1. Install MID Server on a Windows computer that can connect to Active Directory.
2. Configure the MID Server.
3. In the ServiceNow instance, navigate to Orchestration > Credentials.
4. Click New and then complete the form with the following values for the credential.
   - Type: Select Windows.
   - User name: Enter your Active Directory domain user. For example, domain\admin.
   - Password: Enter your Active Directory domain user password.
   - Applies to: Select the MID Server that is used to access the Active Directory server.
5. Click Submit.
6. Create a credential store for Active Directory.

Delete a connection to a credential store for Password Reset
Important: Before you delete the connection to a credential store, check all Password Reset processes to ensure that the credential store is not in use. If the credential store is being used by a process, update the process before deleting the credential store.

Role required: password_reset_admin or password_reset_credential_manager

1. Navigate to Password Reset > Credential Stores and then select the check box for the credential store.
2. In the Actions choice list, select Delete.

Password Reset verifications
Each verification specifies the method and process for verifying the identity of the user that is requesting password reset.

### Verifications included with Password Reset

The Password Reset application includes the following verifications in the base system. You can create a verification based on either a base-system verification or a verification type (a template).

**Note:** The Password Reset Windows Application does not support custom verifications.

#### Password Reset verifications

<table>
<thead>
<tr>
<th>Verification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QA verification</td>
<td>Implements a self-service Password Reset model with questions that are included with the base system or custom questions that the admin defines. While enrolling for the process, the user decides which questions to provide answers for.</td>
</tr>
<tr>
<td></td>
<td>When a user requests password reset, the system poses a specified number of the questions that the user selected during enrollment. The user must answer all questions correctly to verify identity.</td>
</tr>
<tr>
<td></td>
<td>This verification is based on the Security Questions verification type.</td>
</tr>
<tr>
<td></td>
<td>For information on the user enrollment experience, see Users: Enroll in the Password Reset program using questions and answers.</td>
</tr>
<tr>
<td>SMS verification</td>
<td>Implements a self-service or service desk-assisted Password Reset model that relies on auto-generated code numbers.</td>
</tr>
<tr>
<td></td>
<td>When a user requests password reset, the system sends a code to an SMS-capable device that the user has authorized. To verify identity, the user then submits the code on the Password Reset Verify page.</td>
</tr>
<tr>
<td></td>
<td>You can use the ServiceNow Notify feature to send the codes.</td>
</tr>
<tr>
<td></td>
<td>This verification is based on the SMS Code verification type.</td>
</tr>
<tr>
<td></td>
<td>For information on the user enrollment experience, see Users: Enroll in the Password Reset program using SMS codes.</td>
</tr>
<tr>
<td>Personal Data — Confirm Email Address</td>
<td>Implements a self-service Password Reset model that relies on user information that is available in the user profile on the instance.</td>
</tr>
<tr>
<td></td>
<td>This verification is based on the Personal Data Confirmation verification type.</td>
</tr>
<tr>
<td>Personal Data — Enter User Name</td>
<td>Implements a self-service Password Reset model that relies on user information that is available in the user profile on the instance.</td>
</tr>
<tr>
<td></td>
<td>This verification is based on the Personal Data verification type.</td>
</tr>
</tbody>
</table>
Verifications included with the demo data

The following demo data is based on the Mock verification type:
- Sample Mock verification #1
- #2

Personal data identification types and confirmation type verifications

Personal data verifications allow users to verify their identity by providing answers to questions that are generated from personal information stored in the User table [sys_user].

### Personal data identification types

The Password Reset application provides the email and username identification types. You can use either type as provided or as a model to create a custom identification type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Identification</td>
<td>Identifies users by their email addresses.</td>
</tr>
<tr>
<td>Username Identification</td>
<td>Identifies users by their user names.</td>
</tr>
</tbody>
</table>

### Personal data confirmation verifications

- **Personal data verification**: If users are associated with a Password Reset process that uses a personal data verification, the users are typically not required to enroll for Password Reset.
- **Personal data confirmation verifications** allow employees with the password_reset_service_desk role to access personal data from the sys_user table when assisting a user with a password reset request.

To configure personal data and personal data confirmation verifications, you specify parameters as name/value pairs that correspond to a particular piece of user information. For example, to verify users by their email address:

1. Set the **label** parameter (the text that the end user should see) to Email (that is, label=Email).
2. Set the **column** parameter (the column in the table that holds the verification data) to email (that is, column=email).

**Note**: You can use only one set of name/value pair parameters per verification. Additional parameters are ignored.

To use multiple pieces of personal information for user verification, create more personal data or personal data confirmation verifications and add the verifications to the related Password Reset process.
Personal data and personal data confirmation type verifications

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| label          | Label that the user sees during the password reset request.  
                 Data Type: string  
                 Default Value: n/a |
| column         | Column of the sys_user table that provides the data that is used to verify the identity of the user.  
                 Data Type: string  
                 Default Value: n/a |

SMS Code Verification type for Password Reset

Using the Simple Message Service (SMS) Code Verification type, a user can verify identity through any SMS-enabled device, like a cell phone that accepts text messages. When a user requests password reset, the system sends a numerical code to the device and the user enters the code on the password reset page.

You can change the default behavior of an SMS code verification using either of the following methods:

- Set parameter values, as shown in the table
- Update property settings for the Password Reset application

**Note:** The system allows only one instance of each SMS code parameter.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Description</th>
</tr>
</thead>
</table>
| expiry         | Number of minutes the verification code is valid.  
                 **Data Type:** integer (any positive integer)  
                 **Default Value:** 5 |
| complexity     | Number of digits in the numerical verification code.  
                 **Data Type:** integer (any positive integer)  
                 **Default Value:** 4 |
| pause_window   | Number of minutes before the user can request another SMS code for verification.  
                 **Data Type:** integer (any positive integer)  
                 **Default Value:** 2 |
| max_per_day    | Maximum number of codes sent for verification in one day.  
                 **Data Type:** integer (any positive integer)  
                 **Default Value:** 10 |
Use NotifyNow to send SMS codes for enrollment and verification
You can configure the Password Reset application to send SMS codes for enrollment and verification using ServiceNow NotifyNow (via Twilio SMS Messaging). NotifyNow is tightly integrated with the workflow engine and business rules and delivers a highly configurable and trusted way to deliver SMS messages.

Role required: admin

NotifyNow requires a separate contract with Twilio.

1. Enroll for a Twilio account and telephone number at https://www.twilio.com/
2. Activate the Notify plugin.
3. Associate the Twilio account with Notify.

No other configuration is required. Users who request password change or reset receive SMS codes through NotifyNow.

Settings on the Password Reset Details tab
The settings define the user experience when resetting or changing a password.

The Password Reset Details tab appears when you are configuring a Password Reset process (Password Reset > Processes).

### Password Reset Details tab

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Public access | The check box is available only when Password reset is selected.  
  - Clear the check box to define a service desk-assisted process in which only service desk agents and not users can reset a password.  
  - Select the check box to enable a self-service process with public user access to the Password Reset or Password Change form through a URL. |
| Public URL   | This field is available only when Public access is selected.  
  URL of the page where users go to reset or change the password. The value from the URL suffix field is appended to the URL when you tab out of the URL suffix field. For the Default self-service Password Reset process, this value must be /$pwd_reset.do?sysparm_url=ss_default. |
| URL suffix   | This field is available only when Public access is selected.  
  Suffix used to create a unique URL for the Password Reset or Password Change form. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display CAPTCHA</td>
<td>This check box is available only when <strong>Public access</strong> is selected. Select the check box to display a CAPTCHA on the user identification page. The Password Reset application uses Google reCAPTCHA as the default CAPTCHA service. See Configure Google reCAPTCHA.</td>
</tr>
<tr>
<td>Note:</td>
<td>The Password Reset Windows Application uses the base-system CAPTCHA service even if the Password Reset application is configured to use Google reCAPTCHA.</td>
</tr>
<tr>
<td>Note:</td>
<td>To use the CAPTCHA service that is provided with the base system, change the password_reset.captcha.google.enabled system property to <strong>false</strong>.</td>
</tr>
<tr>
<td>Note:</td>
<td>Because on-premises instances do not have access to the Internet, they cannot use the Google reCAPTCHA service. Set the password_reset.captcha.google.enabled property to <strong>false</strong> for on-premises instances.</td>
</tr>
<tr>
<td>Identification type</td>
<td>Method that the user employs to claim their identity for the public Password Reset or Password Change process. Any selection overrides the default identification that is associated with the process. The base system includes the <strong>Email</strong> and <strong>Username Identification</strong> identification types. You can create a custom identification type (some knowledge of JavaScript is recommended). See Personal data identification types and confirmation type verifications.</td>
</tr>
<tr>
<td>Minimum verifications</td>
<td>Number of verifications that a user must successfully submit to reset the password. If the number exceeds the number of mandatory verifications, then the user must submit enough additional optional verifications to meet the number specified for Minimum verifications. By default during the password reset process, the system presents optional verifications to the user based on the <strong>Order</strong> values for the verifications.</td>
</tr>
<tr>
<td>Note:</td>
<td>Each user must submit all mandatory verifications regardless of the number specified.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Email Password Reset URL</td>
<td>Select the check box to enable users to reset the password by clicking a link in an email that the instance sends to them. By default, the self-service Password Reset processes enable this option. When you select this option, the <strong>Auto-generate password</strong> check box is not available.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> See Example: The default self-service Password Reset process for an outline of the process that is enabled by default.</td>
</tr>
<tr>
<td>Enable account unlock</td>
<td>This check box is available only when <strong>Password reset</strong> is selected. Select the check box to allow user accounts on credential stores to be unlocked without resetting the password.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Not supported by the default self-service Password Reset process.</td>
</tr>
<tr>
<td>Unlock user account</td>
<td>Select the check box to unlock user accounts on credential stores after a password reset.</td>
</tr>
</tbody>
</table>
| Auto-generate password        | This check box is available only when:  
  - The **Password reset** check box is selected.  
  - The **Email Password Reset URL** check box is not selected  
  Select the check box to auto-generate a new password for the user. When this check box is selected, you must select the **Email password** or **Display password** check box, or both. This setting is useful for service desk-assisted processes. |
<p>|                               | <strong>Note:</strong> Clear the check box to enable the <strong>Enforce history policy</strong> option for a credential store. See Configure and test the Password Reset connection to a credential store.                                                                                                       |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User must reset password</td>
<td>This check box is available only when <strong>Auto-generate password</strong> is selected. Select the check box to require users to reset their password immediately after logging in with the auto-generated password.</td>
</tr>
<tr>
<td>Display password</td>
<td>This check box is available only when <strong>Auto-generate password</strong> is selected. Select the check box to display the new password on the screen. In a self-service process, the password appears on the user screen. In a service desk-assisted process, the password appears on the service desk agent screen.</td>
</tr>
<tr>
<td>Email password</td>
<td>This check box is available only when <strong>Auto-generate password</strong> is selected. Select the check box to email the new password to the user. The setting is useful in both self-service and service desk-assisted processes. The setting can add a layer of security by requiring that users access their email to view the password. In a service desk-assisted process, emailing the password to users ensures that only the user requesting the password reset can view the password.</td>
</tr>
</tbody>
</table>

**Related lists**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Verifications</td>
<td>This related list is available only after the record has been saved. One or more verifications that the process uses. See <strong>Password Reset verifications</strong>.</td>
</tr>
<tr>
<td>Groups</td>
<td>The Groups related list is available only after the record has been saved and if the <strong>Apply to all users</strong> check box is cleared. ServiceNow user groups to associate with the Password Reset process.</td>
</tr>
</tbody>
</table>

**Configure Google reCAPTCHA**

To use the Google reCAPTCHA service, instances that are running on a domain other than `service-now.com` require an API key pair from Google. The process described in this topic is optional for instances that are running on the `service-now.com` domain.
Role required: admin

**Note:** Because on-premises instances do not have access to the Internet, they cannot use the Google reCAPTCHA service. Do not follow the process described in this topic. Instead, set the `password_reset.captcha.google.enabled` system property to false. This setting enables the CAPTCHA service that is provided with the base system.

The Password Reset Windows Application uses the base-system CAPTCHA service even if the Password Reset application is configured to use Google reCAPTCHA.

1. Request an API key pair (a site key and a secret) from Google at [https://www.google.com/recaptcha](https://www.google.com/recaptcha)
2. Set the following system properties:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>password_reset.captcha.google.enabled</strong></td>
<td>Set to true. Type: string. Default: true.</td>
</tr>
<tr>
<td><strong>google.captcha.site_key</strong></td>
<td>Set to the site key that Google provided. Type: string. Default: A site key that Google provided to ServiceNow</td>
</tr>
<tr>
<td><strong>google.captcha.secret</strong></td>
<td>Set to the secret that Google provided. Type: password2. Default: An encrypted secret that Google provided to ServiceNow</td>
</tr>
</tbody>
</table>

Settings on the Password Reset 'Advanced' tab

UI macros and script includes can extend the basic functionality of a Password Reset process. The Advanced tab appears when you are configuring a Password Reset process (Password Reset > Processes).

**Advanced tab**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Entry UI macro</td>
<td>UI macro that displays a customized message to users when they access the initial Password Reset screen.</td>
</tr>
<tr>
<td>Success UI macro</td>
<td>UI macro that displays a customized message to users on the final Password Reset screen when their password is successfully reset.</td>
</tr>
<tr>
<td>Failure UI macro</td>
<td>UI macro that displays a customized message to users on the final Password Reset screen when their password reset fails.</td>
</tr>
<tr>
<td>Post reset script</td>
<td>Script include that performs actions after the Password Reset process completes whether the outcome is success or failure. For more information on customizing post processor scripts, see the Post reset script category as described in Password Reset extension scripts.</td>
</tr>
</tbody>
</table>

Configure the number of questions for a 'Security Questions' verification
When designing a Security Questions verification for Password Reset, you can specify the number of questions to display when users enroll and the number to display when a user requests password reset.

Role required: password_reset_admin or admin

1. Navigate to Password Reset > Verifications and then open a verification that uses the Security Questions Verification Type.
2. Configure the parameters in the Password Reset Verification Parameters related list.

Parameters for Security Questions Verification

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| num_enroll     | Number of security questions that are displayed while a user is enrolling for Password Reset.  
**Data Type:** Positive integer that does not exceed the number of questions in the security questions list (Password Reset > Security Questions).  
**Default Value:** 5 |
| num_reset      | Number of security questions that are displayed while a user is attempting to reset the password. The questions are selected at random and are presented in random order.  
**Data Type:** Positive integer that does not exceed the value of the num_enroll parameter  
**Default Value:** 3 |

3. Click Update.

Configure the required strength for passwords

The password that a user defines must meet certain requirements — it must contain at least eight characters, it must include a numeral, and so on. You can configure the requirements as needed for your organization.

Role required: password_reset_admin

The base system includes example credential stores with various password requirements. You can modify password requirements and provide users with hints for creating password. The default requirements for a new password are:

- At least eight characters
- At least one uppercase and one lower case letter
- At least one numeral

**Note:** This topic describes the procedure for configuring password strength requirements only. You can configure several other settings for the credential store, as described in Configure and test the Password Reset connection to a credential store.

1. Navigate to Password Reset > Credential Stores.
2. Select the credential store in the list and then configure the following settings:
<table>
<thead>
<tr>
<th><strong>Password rule</strong></th>
<th>Text that appears on the password reset page to help the user to create a password that meets all requirements. The <strong>Password rule</strong> script enforces the requirements.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong></td>
<td>The Password Reset Windows Application supports newline characters in the hint. Other formatting is not supported (bold, underline, hyperlink, and so on).</td>
</tr>
</tbody>
</table>

| **Password rule** | Client script that validates the password that the user enters. The script is invoked when the user enters a new password and clicks **Password Reset**. You can use the script to enforce password strength/complexity requirements. |

| **Enable Password Strength** | Select the check box to:  
| | · Display the text box for the **Strength rule** script so you can update the script.  
| | · Display the graphical **Password Strength** bar to the user while the user changes or resets the password. |
| **Note:** | The Password Reset Windows Application does not support Password Strength. |

| **Strength rule** | This text box appears only if you select **Enable Password Strength**. |
| **Note:** | The Password Reset Windows Application does not support Password Strength. |

Client script that calculates the strength/complexity of the password that the user enters. The script is invoked when the user begins to enter a new password during the reset process.

**Default settings:**  
- Selected for local ServiceNow credential stores  
- Not selected for other credential stores

**Note:**  
To guide the user during the reset process, the system displays a graphical bar labeled **Password Strength** under the **New password** field.

![Password Strength](image)

3. Click **Submit**.  
You should test the connection to a credential store after you configure a new credential store or when users experience problems that might involve the connection.

4. Navigate to **Password Reset > Credential Stores** and then open the credential store.

5. In the header bar, click **Save and Test Connection**.
A progress page displays the result of the test.

Specify lockout for failed login attempts
The system provides inactive script actions that enable you to specify the number of failed login attempts before a user account is locked and to reset the count after a successful login.

Role required: admin

Navigate to **System Policy > Script Actions** to view or activate the scripts.

<table>
<thead>
<tr>
<th>SNC User Lockout Check with Auto Unlock</th>
<th>Uses the value of the <code>glide.user.max_unlock_attempts</code> property to set the limit for failed login attempts.</th>
<th>Unlocks the user account after the time period that is specified for the <code>glide.user.unlock_timeout_in_mins</code> property. If no value is specified, then the system unlocks the user account after the default period of 15 minutes.</th>
</tr>
</thead>
<tbody>
<tr>
<td>SNC User Lockout Check</td>
<td>Tracks the number of failed login attempts and locks the user account after a specified number of failed login attempts (default: 5).</td>
<td>Updates the user record after a successful login: Resets the number of failed login attempts and updates the date of the last login.</td>
</tr>
</tbody>
</table>

Each time a user attempts to log in, the action is recorded in an event log. You can view a log of failed login attempts.

1. Navigate to **System Policy > Event Logs**.
2. Filter for `login.failed` in the **Name** field. You can view the attempted login name, date, and IP address logged for the attempt.

Configure Password Reset properties
You can specify properties that configure the Password Reset experience for end users.

Role required: password_reset_admin

While there are no range limits for the values you can enter for properties, consider using only positive integer values starting at 1. When you determine the limit for the upper range of a property, consider the task that the user is performing.

For example, you would not want to allow 100 attempts for users to verify their identity. A more common value is three attempts. Similarly, you may not want to force users who are completing the enrollment process to spend time selecting and answering 30 security questions. The more commonly used number of security questions is between five and seven.

1. Navigate to **Password Reset > Properties**.
2. Update settings as needed and then click **Save**.

### Password Reset Security Question properties

<table>
<thead>
<tr>
<th>Property name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>password_reset.qa.ans_min_len</td>
<td>Minimum number of alphanumeric characters that the user must enter in the answer text box for any security question. Default value: 3 characters</td>
</tr>
<tr>
<td>password_reset.qa.num_reset</td>
<td>Number of questions that a user must answer to verify identity during the Password Reset process.</td>
</tr>
<tr>
<td></td>
<td>· Type: integer</td>
</tr>
<tr>
<td></td>
<td>· Default value: 3 (questions)</td>
</tr>
<tr>
<td></td>
<td>· Possible values: Integers that are less than the number specified for the num_enroll property.</td>
</tr>
</tbody>
</table>

**Note:** You can override this security question property by adding the `num_reset` parameter in the security question verification.
<table>
<thead>
<tr>
<th>Label on the Password Reset Properties page</th>
<th>Property name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Number of security questions required during enrollment | `password_reset.qa.num_enroll` | During the enrollment process, the number of questions that a user must answer to be enrolled in the Password Reset program.  
- **Type**: integer  
- **Default value**: 5 (questions)  

**Note:** You can override this security question property by adding the `num_enroll` parameter in the security question verification. |

| Password Reset SMS Code properties | Message number of SMS codes sent for verification per day | `password_reset.sms.max_per_day` | Maximum number of SMS codes that are sent to a user within one 24-hour period. The 24-hour period begins when a user clicks **Send Code**.  
- **Type**: integer  
- **Default value**: 10 (per day)  

**Note:** You can override this SMS code property by adding the `max_per_day` parameter in the SMS code verification. |

| Number of minutes before the user can attempt to send another SMS code for verification | `password_reset.sms.pause_window` | Time that must pass before another SMS code can be sent to a user.  
- **Type**: integer  
- **Default value**: 2 (minutes)  

**Note:** You can override this SMS code property by adding the `pause_window` parameter in the SMS code verification. |
<table>
<thead>
<tr>
<th>Label on the Password Reset Properties page</th>
<th>Property name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Number of digits in the SMS code sent to the user | password_reset.sms.default_complexity | Number of characters required for a user to reset their password.  
- Type: integer  
- Default value: 4 (digits)  
You can override this SMS code property by adding the complexity parameter in the SMS code verification. |
| Number of minutes before the SMS code expires | password_reset.sms.expiry | Time, in minutes, until the SMS code sent to the user expires.  
- Type: integer  
- Default value: 5 (minutes)  
**Note:** You can override this SMS code property by the expiry parameter in the SMS code verification. |

**Password Reset Monitoring and Reporting properties**

| Time interval, in minutes, for counting blocked users | password_reset.activity_monitor.incident_window | Time window to count the number of blocked users.  
- Type: integer  
- Default value: 60 (minutes)  
| Number of blocked users, in the defined time interval, that triggers a system log event | password_reset.activity_monitor.incident_threshold | Number of blocked (or locked) users, within the specified time window, that triggers a system log event.  
- Type: integer  
- Default value: 10 (blocked users)  

**Note:** Several components in the Self Service Password Reset (com.snc.password_reset) plugin and the Password Reset (com.glideapp.password_reset) plugin control the password reset flow. The following properties affect Password Reset, but do not appear on the Password Reset > Properties page:  
- You can add the glide.pwd_reset.onetime.token.validity property to the System Properties (sys_properties) table to specify the number of hours that the Password Reset token should be valid. Default: 12.
Properties accessible from the System Properties (sys_properties) table:

- For Password Reset on mobile devices, you can specify the URL that the user is taken to when user taps the **Forgot password?** button. See the `glide.security.password_reset.uri` property in **High Security Settings**. Default: `/$pwd_reset.do?sysparm_url=ss_default`
- If `glide.security.forgot_password.display.link` is set to `true`, displays the **Forgot Password?** link on the login page.

Customizing Password Reset processes

Password Reset scripting enables you to customize Password Reset by creating your own credential store, verification, and identification types, and extend them by defining extension scripts. You can also create a custom credential store type, custom verification type, or verification.

Password Reset scripting is available to users with the **password_reset_admin** role. The easiest way to customize Password Reset is:

1. Create custom types and scripts as described in **Password Reset extension scripts**.
2. Follow the configuration steps described in **Configure your Password Reset or Password Change process**.
3. Select the new types that you created. You can customize the following components:
   - Credential store types: Define new types for how to connect to your credential stores by creating custom workflows for connection and testing. See **Create a credential store type for Password Reset**.
   - Verification types: Define new types for how users are verified. See **Create a custom Password Reset verification type**.
   - Identification types: Define new types for how users can identify themselves. See **Create a custom identification type for Password Reset**.

Extension scripts

Extension scripts enable you to extend Password Reset functionality by defining custom scripts that can be used in a credential store, verification, or identification type, or as a post-processor in a process. Extension scripts are predefined hooks within the Password Reset application that perform specific types of behavior defined by the extension category, which refers to where the script will be used. See **Password Reset extension scripts**.

Create a credential store type for Password Reset

You can create a custom credential store type if the base-system types do not meet your needs.

Role required: **password_reset_admin** or **password_reset_credential_manager**

1. Navigate to **Password Reset > Extensions > Credential Store Types**.
2. Click **New**, enter a unique and meaningful **Name** and **Description**, and then fill in the form.

**Note:** You may need to configure the form to see the **Get user lock state** workflow and the **Unlock user** workflow.
### New credential store fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Password Reset workflow</strong></td>
<td>Subflow that defines the credential store processing. Password Reset workflows are available to use as a model. Provide scripts for each of the activities defined for the subflow. For more information about how to create a workflow, see <a href="#">Create a workflow</a>. For installed workflows, see <a href="#">Installed with Password Reset</a>.</td>
</tr>
<tr>
<td><strong>Connection test workflow</strong></td>
<td>Subflow that defines how to test the connection. Connection test workflows are available to use as a model. If you create a connection test subflow, provide scripts for each of the activities defined for the subflow. For more on how to create a workflow, see <a href="#">Create a workflow</a>. For installed workflows, see <a href="#">Installed with Password Reset</a>.</td>
</tr>
<tr>
<td><strong>Get user lock state workflow</strong></td>
<td>Subflow that defines how to get the user lock state. Get user lock state workflows are available to use as a model. Provide scripts for each of the activities defined for the subflow. For more on how to create a workflow, see <a href="#">Create a workflow</a>. For installed workflows, see <a href="#">Installed with Password Reset</a>.</td>
</tr>
<tr>
<td><strong>Unlock user workflow</strong></td>
<td>Subflow that defines how to unlock a user. Unlock user workflows are available to use as a model. If you create a connection test subflow, provide scripts for each of the activities defined for the subflow. For installed workflows, see <a href="#">Installed with Password Reset</a>.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

Create a custom question for a 'Security Questions' verification

To enroll for the 'Security Questions' verification, the user selects several questions and supplies answers that only the user knows. You can add a custom question to the set of questions that are included with the base system.

Role required: password_reset_admin or admin

The default language is English, and you can create a custom question in a non-English language. If you create the appropriate non-English language questions, then the questions appear in the language that the user requested during login.

1. Navigate to **Password Reset > Security Questions** and then click **New**.
2. Enter the English language question in the **Security question** field and then click **Submit**. The question appears in the Translations related list.
3. To add the same question in another language, complete the following steps.
   a) Click the English language question to translate.
   
   **Note:** Do not change the **Language** value for the default questions that come with the base system.
   
   b) On the Password Reset Question page, in the Translations related list, click **New**.
   c) Select the language in the **Language** field.
d) Enter the non-English text in the Security question field.
e) Click Submit.

The question appears in the Translations related list on the Password Reset Question page. If a user selects the language while logging in, then the verification question appears in that language.

Create a custom identification type for Password Reset

A custom identification type enables the user to enter alternative verification information such as an employee ID while resetting the password.

Role required: password_reset_admin or admin

1. Navigate to Password Reset > Extensions > Identification Types.
2. Click New, enter a unique and meaningful Name and Description, and then fill in the form.

<table>
<thead>
<tr>
<th>Identification field label</th>
<th>Text to display as a label for the Identification field.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identification processor</td>
<td>Identification processor script. Choose an existing script, or create your own using the Identification form processor category (extension script).</td>
</tr>
</tbody>
</table>

3. Click Submit.

Create a Password Reset verification from an existing verification

The Password Reset application includes several example verifications that you can use as they are or as the basis for a custom verification. If the verification types in the base system do not meet your needs, you can create a custom verification type.

Role required: password_reset_admin

Note: The Password Reset Windows Application does not support custom verifications. Custom verifications might work, but you must test and verify.

1. Navigate to Password Reset > Verifications and select a verification.
2. If needed, modify the parameters on the Password Reset Verification Parameters tab. The parameters are described in the instructions for the type of verification that you are working on.
3. Click Submit.
4. Each verification type has properties that control the user experience. Review the property settings and update as needed.

Create a custom Password Reset verification type

If the verification types in the base system do not meet your needs, you can create a custom verification type.

Review the verification types that are provided in the base system to determine whether to create a custom verification type. Then review the verification type components to develop.

Role required: password_reset_admin or admin

1. Navigate to Password Reset > Extensions > Verification Types.
2. Click New, enter a unique and meaningful Name and Description, and then fill in the form.
Enrollment check | Script to check whether a user is enrolled for verification. Automatic enrollment requires an enrollment check. If no script is specified when Automatic Enrollment is selected, a default script is provided.

Automatic enrollment | Indicator for whether users are auto-enrolled. If Automatic enrollment is not selected, then you must provide an enrollment UI macro and enrollment processor script.

Enrollment UI | Enrollment UI macro that provides the UI for the enrollment.

Enrollment processor | Enrollment processor script that processes the enrollment.

Verification UI | Verification UI macro that provides the UI for the verification.

Verification processor | Verification processor script (extension scripts) that processes the verification.

3. Click Submit.

Create a custom Password Reset verification
Use a verification type in the base system as a template to design a custom verification. The Password Reset Windows Application does not support custom verifications.

Role required: password_reset_admin

**Verification types in the base system**

<table>
<thead>
<tr>
<th>Personal Data Confirmation Verification Type</th>
<th>Verifies user identity using data from the User (sys_user) table. The user data is displayed to a service desk agent. The agent verifies the data. Enrollment is not required for this type. Recommended for service desk-assisted processes.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong> The Password Reset Windows Application does not support the Personal Data Confirmation Verification type.</td>
<td></td>
</tr>
<tr>
<td>See <a href="#">Personal data identification types and confirmation type verifications</a>.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Personal Data Verification Type</th>
<th>Verifies user identity using data from the User (sys_user) table. The user is required to answer questions. Enrollment is not required for this type.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong> The Password Reset Windows Application allows you to define and use multiple verifications of the Personal Data type.</td>
<td></td>
</tr>
<tr>
<td>See <a href="#">Personal data identification types and confirmation type verifications</a>.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Security Questions Verification Type</th>
<th>Verifies user identity by presenting personal security questions that the user must answer correctly.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong> The Password Reset and Password Reset Windows Application support only a single verification of the Security Questions type.</td>
<td></td>
</tr>
<tr>
<td>See <a href="#">Create a custom question for a ‘Security Questions’ verification</a>.</td>
<td></td>
</tr>
</tbody>
</table>
When a user requests password reset, the system sends a code to an SMS-capable device that the user has authorized. To verify identity, the user then enters the code on the Password Reset web page.

**Note:** The Password Reset and Password Reset Windows Application support only a single verification of the SMS Code type.

See [SMS Code Verification type for Password Reset](#).

<table>
<thead>
<tr>
<th>Mock Verification Type</th>
<th>Not a functional identity verification. Demonstrates how to add a verification type in a Password Reset process.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Note:</strong> The Password Reset Windows Application does not support the Mock verification type.</td>
</tr>
<tr>
<td></td>
<td>• The enrollment UI macro for this verification gets the user input and returns the entered value in the enrollment processor.</td>
</tr>
<tr>
<td></td>
<td>• The Password Reset UI macro for this verification gets input from the user and returns the entered value through the verification processor.</td>
</tr>
</tbody>
</table>

1. Navigate to **Password Reset** > **Extensions** > **Verification Types**.
2. Click **New**, enter a unique and meaningful **Name** and **Description**, and then fill in the form.

| Type | Create verifications based on one of the verification types in the base system. Password Reset supports the following types. You can create multiple instances of any type. |
|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------
|      | • Personal Data Confirmation Verification  
|      | • Personal Data Verification  
|      | • Security Question Verification  
|      | • SMS Code Verification  

The Password Reset Windows Application supports the following types:  
• Personal Data Verification. You can create only a single instance.  
• Security Question Verification. You can create multiple instances.  
• SMS Code Verification. You can create only a single instance.

| Order | Position of the verification as it appears on the Enrollment form and Password Reset form. |

| Password Reset Verification Parameters | Parameters used by a verification to configure specific behaviors, like number of questions required to enroll, request expiration time, and columns used. Set parameters for any behavior that should be different from the default specified in the Password Reset properties. The available parameters are described separately for each verification type. |

3. Click **Submit**.
4. Each verification type has properties that control the user experience. Review the property settings and update as needed.

Enrollment options for the Password Reset service
You can configure the Password Reset process to enroll users automatically, or you can define an enrollment check.

To define an enrollment check, you must define:

- An enrollment processor script, which specifies how enrollment is processed
- A corresponding enrollment UI macro, which specifies how the enrollment information is displayed to the user

The following example uses `PwdEnrollSMSProcessor` as the enrollment processor script and `pwd_enroll_sms_ui` as the enrollment UI macro.
A verification type must also define a verification processor script and a corresponding verification UI macro. The example uses `PwdVerifySMSProcessor` as the verification processor script and `pwd_verify_sms_ui` as the verification UI macro. The following shows the verification processor script:

```javascript
var PwdVerifySMSProcessor = Class.create();
PwdVerifySMSProcessor.prototype = {
  category: 'password_reset.extensionverification_form_processor', // DO NOT REMOVE THIS LINE!

  initialize: function() {
    // Initialization stuff here...
  },

  // Process the verification form request, and return whether the user was successfully verified
  // @param params:resetRequestId The sys-id of the current password-reset request (table: pwd_reset_request)
  // @param params:userid: The sys-id of the user trying to be verified (table: sys_user)
  // @param params:verificationId: The sys-id of the verification to be processed (table: pwd_verification)
  // @param params:request: The form request object. Fields in the form can be accessed using:
  // request.getParameter('element-id')
  request.getParameters().then(function(data) {
    if (data) {
      // Verify whether the user is successfully verified
    }
  });
};
```

Verification type SMS processor

The following is the corresponding UI macro:
Password Reset script includes

The Password Reset plugin installs script includes that implement password reset processes. To enable you to extend functionality, each base-system script include provides extension points that you can use to invoke “extension scripts” that you have customized.

Verification type SMS UI macro
The *extension script category* refers to the specific types of behavior for an extension script (for example, credential store, verification, identification type, or as a post-processor).

### 'Enrollment check' script includes

All enrollment check script includes take the following parameters and return a boolean indicating whether the user is enrolled for Password Reset.

- `params.userId`: The sys_id of the user being checked (table: [sys_user]).
- `params.verificationId`: The sys_id of the verification being checked (table: [pwd_verification]).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdAlwaysEnrolled</td>
<td>Default check of whether a user is enrolled that always returns true.</td>
</tr>
<tr>
<td>PwdMockIsEnrolled</td>
<td>Default check of whether a user is enrolled that always returns true.</td>
</tr>
<tr>
<td>PwdQuestionsEnrollmentCheck</td>
<td>Determines whether a user has enrolled for Password Reset using security question verification.</td>
</tr>
<tr>
<td>PwdSMSEnrollmentCheck</td>
<td>Determines whether a user has enrolled for Password Reset using SMS verification.</td>
</tr>
</tbody>
</table>

### 'Identification form processor' script includes

Identification form processor script includes provide functionality for extending identification processing.

All identification form processor script includes take the following parameters, and return the sys_id of the user that corresponds to the requested input. If the user was not identified, it returns null.

- `params.processId`: The sys_id of the calling Password Reset process (table: [pwd_process]).
- `param request`: The form request object. Fields in the form can be accessed with `request.getParameter('<element-id>')`. The supported request parameter is `sysparm_user_id`, the user identifier value entered in the form.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdIdentifyViaEmail</td>
<td>Verifies a user's identity by checking the email address.</td>
</tr>
<tr>
<td>PwdIdentifyViaUsername</td>
<td>Verifies a user's identity by checking the user name.</td>
</tr>
</tbody>
</table>

### 'Enrollment form processor' script includes

Enrollment form processor script includes provide functionality for extending enrollment form processing.

All enrollment form processor script includes take the following parameters, and return a boolean indicating whether the user was successfully enrolled.
- `params.userId`: The sys_id of the user trying to enroll (table: [sys_user]).
- `params.verificationId`: The sys_id of the verification used to enroll (table: [pwd_verification]).
- `params.enrollmentId`: The sys_id of this enrollment process.
- `request`: The form request object. Fields in the form can be accessed with `request.getParameter('<element-id>')`.

You should add the following information to the state of the enrollment process:

- `gs.getSession().putProperty("result.status", status)`: Whether the user was successfully enrolled.
- `gs.getSession().putProperty("result.message", message)`: An associated message to be returned to the UI, such as a detailed error message.
- `gs.getSession().putProperty("result.value", value)`: A custom value associated with the enrollment.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdEnrollQuestionsProcessor</td>
<td>Handles questions and answers for verification.</td>
</tr>
<tr>
<td>PwdEnrollSampleProcessor</td>
<td>Provides an enrollment processor for sample verification.</td>
</tr>
<tr>
<td>PwdEnrollSMSProcessor</td>
<td>Provides an enrollment processor for SMS verification.</td>
</tr>
</tbody>
</table>

‘User account lookup’ script includes

User account lookup script includes return the credential store account_id for a given user.

The following parameter returns the credential store account_id for a given user.

- `params.userId`: The sys_id of the user being checked (table: [sys_user]).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdDefaultUserAccountLookup</td>
<td>Provides a default script for user account lookup from a user_id to the account in a credential store. The default mapping is to use the user name as the account name.</td>
</tr>
</tbody>
</table>

‘Password generator’ script includes

Password generator script includes take the following parameter, and return an auto-generated string password.

- `params.credentialStoreId`: The sys_id of the calling Password Reset process (table: [pwd_process]).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdDefaultAutoGenPassword</td>
<td>Generates a password from a random word and 4 digits.</td>
</tr>
</tbody>
</table>
"Verification processor' script includes

If the user identity is verified, the verification processor script includes return true.

Verification processor script includes take the following parameters:

- `params.resetRequestId`: The sys_id of the current Password Reset request (table: [pwd_reset_request]).
- `params.userId`: The sys_id of the user to be verified (table: [sys_user]).
- `params.verificationId`: The sys_id of the verification (table: [pwd_verification]).
- `request`: The form request object. Access the fields in the form with `request.getParameter('<element-id>')`.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdVerifyPersonalDataConfirmationProcess</td>
<td>Verifies that the user accepts the answer.</td>
</tr>
<tr>
<td>PwdVerifyPersonalDataProcessor</td>
<td>Verifies that the user's answers match the expected data in the system.</td>
</tr>
<tr>
<td>PwdVerifyQuestionsProcessor</td>
<td>Provides question and answer verification of user input on the second page of the verification form.</td>
</tr>
<tr>
<td>PwdVerifySimpleProcessor</td>
<td>Provides simple verification of user input on the second page of the verification form.</td>
</tr>
<tr>
<td>PwdVerifySMSProcessor</td>
<td>Provides SMS verification of user input on the second page of the verification form.</td>
</tr>
</tbody>
</table>

"Post processor' script includes

Post processor script includes execute custom actions after the Password Reset process has completed.

All post processor script includes take the following parameters.

- `params.resetRequestId`: The sys_id of the current Password Reset request (table: [pwd_reset_request]).
- `params.wfSuccess`: A flag indicating whether the workflow completed successfully: True if, and only if, successful.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdPostProcessor</td>
<td>Executes actions after the process completes for success, failure, or both conditions.</td>
</tr>
</tbody>
</table>

Example custom scripts for Password Reset

The example scripts perform a user account lookup and processes an identification form, define a credential store, and create an identification type.
Perform a user account lookup and process an identification form

The main script calls two extension scripts, one to perform the user account lookup, and the other to process the identification form.

```javascript
// User account lookup
var lookupExtensionSysId =
  getExtensionScriptSysId('SampleUserAccountLookupExtension', 'user_account_lookup');
var lookupExtension = new SNC.PwdExtensionPoint(lookupExtensionSysId);

// Setup parameters required for this extension type - userId
var params = new SNC.PwdExtensionPointParameter();
params.userId = 'joe.employee';

// Invoke the extension
var answer = lookupExtension.process(params);
gs.print('user: ' + answer);

// Form processor sample - Identification form processor
var identExtensionSysId =
  getExtensionScriptSysId('SampleIdentificationProcessorExtension', 'identification_form_processor');
var identificationExtension = new SNC.PwdExtensionPoint(identExtensionSysId);

// Setup parameters required for this extension type - processId
var params = new SNC.PwdExtensionPointParameter();
params.processId = 'pwdreq1234';

// Simulate the posted form parameter for the indentification processor
var request = new SNC.PwdExtensionPointParameter(); // A real life case will inject it's own request object
request.setParameter('sysparm_user_id', 'joe.employee');

var userIdentity = identificationExtension.processForm(params, request);
gs.print('identity: ' + userIdentity);
```

Define a credential store

The following is an example of an extended process function in the User Account Lookup category used to define a credential store. To create this extension script, go to [Password Reset >](#)
Extensions > New extension script and create a new script as described in Create an Extension Script. To configure the User Lookup in a Password Reset process, see Credential Stores.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<record_update table="sys_script_include">
    <sys_script_include action="INSERT_OR_UPDATE">
        <active>true</active>
        <client_callable>false</client_callable>
        <description>Simple account lookup that returns the supplied user id</description>
        <name>SampleUserAccountLookupExtension</name>
        <script><![CDATA[
            var SampleUserAccountLookupExtension = Class.create();
            SampleUserAccountLookupExtension.prototype = {
                category: 'password_reset.extension.user_account_lookup', // DO NOT REMOVE THIS LINE!
                process: function(params) {
                    return params.userId;
                },
                type: 'SampleUserAccountLookupExtension'
            };
        ]]></script>
        <sys_created_by>admin</sys_created_by>

Create an identification type

The following is an example of an extended processForm function in the Identification Form Processor category that can be used to create an identification type. To create this extension script, go to Password Reset > Extensions > New extension script and create a new script as described in Create an Extension Script.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<record_update table="sys_script_include">
    <sys_script_include action="INSERT_OR_UPDATE">
        <active>true</active>
        <client_callable>false</client_callable>
        <description>Script that processes an identification form. Returns the sys-id of the user that corresponds to the requested input; if no user was found, null should be returned.</description>
        <name>SampleIdentificationProcessorExtension</name>
        <script><![CDATA[
            var SampleIdentificationProcessorExtension = Class.create();
            SampleIdentificationProcessorExtension.prototype = {
                category: 'password_reset.extension.identification_form_processor', // DO NOT REMOVE THIS LINE!
                **********
                // Process the identification form request, and returns the user's sys_id. if user was not identified return null.
                //
                // * @param params.processId The sys-id of the calling password-reset process (table: pwd_process)
                // * @param request The form request object. fields in the form can be accessed using: request.getParameter('element-id')
                // * Supported request parameters:
                //     sysparm_user_id - the user identifier value entered in the form.
                // * @return The sys-id of the user that corresponds to the requested input; if no user was found, null should be returned.
                **********
                processForm: function(params, request) {
                    return request.getParameter('sysparm_user_id') + '_' + params.processId;
                },
                type: 'SampleIdentificationProcessorExtension'
            };
        ]]>]]></script>
    </sys_script_include>
</sys_script_include>
```

Use the `process` and `processForm` extensions

This example shows a script that uses two sample extensions, one `process` extension and one `processForm` extension.

```javascript
// User account lookup
var lookupExtensionSysId =
  getExtensionScriptSysId('SampleUserAccountLookupExtension','user_account_lookup');
var lookupExtension =new SNC.PwdExtensionPoint(lookupExtensionSysId);

// Setup parameters required for this extension type - userId
var params =new SNC.PwdExtensionPointParameter();
params.userId='joe.employee';

// Invoke the extension
var answer = lookupExtension.process(params);
gs.print('user: '+ answer);

// Form processor sample - Identification form processor
var identExtensionSysId =
  getExtensionScriptSysId('SampleIdentificationProcessorExtension','identification_form_processor');
var identificationExtension =new SNC.PwdExtensionPoint(identificationExtensionSysId);

// Setup parameters required for this extension type - processId
var params =new SNC.PwdExtensionPointParameter();
params.processId='pwdreq1234';

// Simulate the posted form parameter for the indentification processor
var request =new SNC.PwdExtensionPointParameter();// A real life case will inject it's own request object
request.setParameter('sysparm_user_id','joe.employee');

var userIdentity = identificationExtension.processForm(params, request);
gs.print('identity: '+ userIdentity);
```

```javascript
function getExtensionScriptSysId(scriptName, category){
  var result;
  var gr =new GlideRecord('sys_script_include');
  gr.addQuery('name', scriptName);
  gr.addQuery('script','CONTAINS','category: \'password_reset.extension.'+ category +'\');
  gr.query();
  return gr.sys_id;
}
```

sys_script_include>
Password Reset extension script categories

You can use a custom extension script to extend Password Reset functionality for credential store, verification, or identification types.

**Note:** To use a script include as an extension script, you must set it to **Active** status.

Password Reset extension script categories

Extension scripts must specify a category that indicates which script include is being extended, for example, `category: 'password_reset.extension.enrollment_check'`. The ServiceNow platform installs several scripts in each category. A script in the **Enrollment check** category can perform the enrollment check for a verification. Detailed information on each extension script appears in [Password Reset extension scripts](#).
<table>
<thead>
<tr>
<th>Extension script category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enrollment check</td>
<td>Defines how to check that a user is enrolled in the Password Reset process. Scripts of this category are available in the Enrollment check field when you define a verification type (Password Reset Verification Type form).</td>
</tr>
<tr>
<td>Enrollment form processor</td>
<td>Defines how an enrollment form is processed (if automatic enrollment is not configured). Scripts of this category are available in the Enrollment form processor field when you define a verification type (Password Reset Verification Type form).</td>
</tr>
<tr>
<td>Identification form processor</td>
<td>Defines how a user identification is processed. Scripts of this category are available in the Identification processor field when you define a verification type (Password Reset Identification Type form).</td>
</tr>
<tr>
<td>Password generator</td>
<td>Defines how to generate a password. Scripts of this category are available in the Auto generate password field when you configure a credential store (Password Reset Credential Store Type form).</td>
</tr>
<tr>
<td>Post reset script</td>
<td>Executes at the end of a Password Reset process. Scripts of this category are available in the Post reset script field when you configure a process (Password Reset Process form).</td>
</tr>
<tr>
<td>User account lookup</td>
<td>Defines how to look up a user account. Scripts of this category are available in the User account lookup field when you configure a credential store (Password Reset Credential Store form).</td>
</tr>
<tr>
<td>Verification form processor</td>
<td>Defines how a verification form is processed. Scripts of this category are available in the Verification processor field when you define a verification type (Password Reset Verification Type form).</td>
</tr>
</tbody>
</table>

Password Reset extension scripts

Extension scripts allow you to extend Password Reset functionality in credential store, verification, or identification types.

**Password Reset extension script includes**

Each script include is associated with a specific category, which is available in the appropriate field of a Password Reset form.

> Note: Create extension scripts only from the Password Reset Extension Script form (Password Reset > Extensions > New extension script). Extension scripts are special purpose script includes that are not created in the System Definition > Script Includes interface. To use a script include as an extension script, you must set it to Active status.
'Enrollment Check' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
</table>
| Enrollment Check        | Checks whether a user is enrolled for a given verification. | process(params) | Parameters:  
  - params.userId - The sys_id of the user to check (table: sys_user).  
  - params.verificationId - The sys_id of the verification to check (table: pwd_verification). | Returns: (boolean) true, if the user is enrolled in the specified verification; otherwise, false. |

This Enrollment Check example signals that the user is enrolled if both expected parameters are supplied. The code would be contained in the Script field of an extension script named SampleEnrollmentCheck:

```javascript
var SampleEnrollmentCheck = Class.create();
SampleEnrollmentCheck.prototype = {
  category: 'password_reset.extension.enrollment_check', // DO NOT REMOVE THIS LINE!
  process: function (params) {
    return (params.userId && params.verificationId) ? true : false;
  },
  type: 'SampleEnrollmentCheck'
};
```

### Script Include category

<table>
<thead>
<tr>
<th>Script Include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enrollment Form Processor</td>
<td>Checks whether all necessary information has been collected from the user. Stores the information so it can be used for verification when the user resets their password.</td>
<td>process(params)</td>
<td>Parameters:</td>
<td>Returns: (boolean) true, if the user is enrolled in the specified verification; otherwise, false.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>· params.resetRequestId - The sys_id of the current Password Reset request (table: pwd_reset_request).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>· params.userId - The sys_id of the user to be verified (table: sys_user).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>· params.verificationId - The sys_id of the verification to be processed (table: pwd_verification).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>· request - The form request object. Fields in the form can be accessed with request.getParameter(&quot;&lt;element-id&gt;&quot;).</td>
<td></td>
</tr>
</tbody>
</table>

The following information should be added to the state of the enrollment process:

- `gs.getSession().putProperty("result.status",status)` - Whether the user was successfully enrolled.
- `gs.getSession().putProperty("result.message",message)` - An associated message to be returned to the UI, such as a detailed error message.
- `gs.getSession().putProperty("result.value",value)` - A custom value associated with the enrollment.
This example processes an enrollment form submission successfully if the user-submitted response was success. The code would be contained in the **Script** field of an extension script named **SampleEnrollmentProcessor**:

```javascript
var SampleEnrollmentProcessor = Class.create();
SampleEnrollmentProcessor.prototype = {
    category: 'password_reset.extension.enrollment_form_processor', // DO NOT REMOVE THIS LINE!

    processForm: function (params, request) { var verificationId = params.verificationId; var sampleInput = request.getParameter('sample_input');
        if (gs.nil(verificationId) || (sampleInput != 'success')) { return false; }
        var gr = new GlideRecord('sys_user');
        gr.get(params.userId);
        gs.print('User: ' + gr.getValue('user_name') + ' successfully enrolled');
        return true;
    },

    type: 'SampleEnrollmentProcessor'
};
```
Identification Form Processor script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identification Form Processor</td>
<td>Processes an identification form request.</td>
<td>processForm(params, request)</td>
<td>Parameters:</td>
<td>Returns: the sys_id of the user that corresponds to the requested input. Returns null, if no user was found.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>· params.processId - The sys_id of the calling Password Reset process (table: pwd_process).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>· request - The form request object. Fields in the form can be accessed with request.getParameter('&lt;element-id&gt;'). Use request.getParameter('sysparm_user_id') to get the user ID that was entered into the form.</td>
<td></td>
</tr>
</tbody>
</table>

This example attempts to identify the user within the sys_user table given a user name submitted from the identification form. The code would be contained in the Script field of an extension script named PwdIdentifyViaUsername:

```javascript
var PwdIdentifyViaUsername = Class. create () ;
PwdIdentifyViaUsername.prototype = {
  category : 'password_reset.extension.identification_form_processor', // DO NOT REMOVE THIS LINE!

  initialize : function () {} ,

  processForm : function (params , request ) { var processId = params. processId ; var sysparm_user_id = request. getParameter ('sysparm_user_id') ;
    gr = new GlideRecord ('sys_user') ;
    gr. addQuery ('user_name', sysparm_user_id ) ;
    gr. query () ; if ( !gr. next () ) { return null ; } return gr. sys_id ; },
```

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
'Password Generator' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password Generator</td>
<td>Returns an auto-generated password.</td>
<td>process(params)</td>
<td>Parameters:</td>
<td>Returns: (String) an auto-generated password.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>· params.processId - The sys_id of the calling Password Reset process (table: pwd_process).</td>
<td></td>
</tr>
</tbody>
</table>

This example randomly generates a password from a base word and numbers. The base word is selected depending on the credential store. The code would be contained in the Script field of an extension script named SamplePasswordGenerator:

```javascript
var SamplePasswordGenerator = Class.create();
SamplePasswordGenerator.prototype = {
  category : 'password_reset.extension.password_generator', // DO NOT REMOVE THIS LINE!

  // **********
  // * Returns an auto-generated string password.
  // * This sample randomly generates 4 digits to add to the password.
  // *
  // * @param params.credentialStoreId The sys_id of the target Password Reset credential store to generate
  // * a password for (table: pwd_cred_store)
  // * @return An auto-generated string password
  // **********/
  process : function (params) { var basePassword ;

    var gr  = new GlideRecord ( 'pwd_cred_store' ) ;
    gr. addQuery ( 'name' , 'Local ServiceNow Instance' ) ;
    gr. query ( ) ; if (gr. next ( ) ) { if (params. credentialStoreId == gr. getValue ( 'sys_id' ) )
      basePassword  = "Password" ; else
      basePassword  = "Dorwssap" ; } return this. generateSimple
      (basePassword ) ; },

    generateSimple : function (base) { var pwd  = base ; var numbers  = '0123456789' ; var length  = 4 ;

      for ( var i  = 0 , n  = numbers. length ; i  < length ; i ++ ) {
        pwd  += numbers. charAt (Math. floor (Math. random ( ) * n ) + 1 ) ; } return pwd ; },

    type : 'SamplePasswordGenerator' }

};
```

© 2020 ServiceNow, Inc. All rights reserved.

### 'Post Reset' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Post Reset</td>
<td>Performs additional operations after the completion of the Password Reset process.</td>
<td>process(params)</td>
<td>Parameters:</td>
<td>Returns: void</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>· params.resetRequestId</td>
<td>- The sys_id of the calling Password Reset process (table: pwd_process).</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>· params.wfSuccess</td>
<td>- A flag indicating whether the workflow completed successfully. True if, and only if, successful.</td>
</tr>
</tbody>
</table>

This example adds failed reset requests to the system log. The code would be contained in the **Script** field for an extension script named `PwdPostProcessor`:

```javascript
var PwdPostProcessor = Class.create();

PwdPostProcessor.prototype = {
  category: 'password_reset.extension.post_reset_script', // DO NOT REMOVE THIS LINE!
  initialize: function() {},

  //**********
  // Execute custom actions after the Password Reset process has completed.
  //**********
  // * @param params.resetRequestId The sys_id of the current Password Reset request (table: pwd_reset_request)
  // * @param params.wfSuccess A flag indicating if the workflow completed successfully.
  // * @return no return value

  process: function(params) {
    if (!params.wfSuccess) {
      gs.log('[PwdPostProcessor.process] failure post processing for request [' + params.resetRequestId + ']
    }

    // We could place actions here that we always want executed
    return;
  },

  type: 'PwdPostProcessor'
}
```
'User Account Lookup' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
</table>
| User Account Lookup    | Gets the credential store account ID for a given user. | process(params) | Parameters:  
* params.userId - The sys_id of the user being checked (table: sys_user). | Returns: (String) the credential store account ID for the given user. |

This example gets the credential store account for a user. This code would be contained in the `Script` field of an extension script named `SampleUserAccountLookupExtension`:

```javascript
var SampleUserAccountLookupExtension = Class.create();
SampleUserAccountLookupExtension.prototype = {
    category: 'password_reset.extension.user_account_lookup', // DO NOT REMOVE THIS LINE!

    process: function (params) {
        return params.userId;
    },

    type: 'SampleUserAccountLookupExtension'
};
```

© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
This example shows a verification processor that returns true only if the user sent ok in the input field; otherwise, it returns false. The code would be contained in the Script field of an extension script named SampleVerificationFormProcessor:

```javascript
var SampleVerificationFormProcessor = Class.create();
SampleVerificationFormProcessor.prototype = {
  category: 'password_reset.extension.verification_form_processor', // DO NOT REMOVE THIS LINE!

  processForm: function(params, request) {
    return request.getParameter('ok') === 'ok';
  }
};
```

The method signature is as follows:
- **processForm** (params, request)
  - Parameters:
    - `params.resetRequestId` - The sys_id of the current Password Reset request (table: pwd_reset_request).
    - `params.userId` - The sys_id of the user trying to be verified (table: sys_user).
    - `params.verificationId` - The sys_id of the verification to be processed (table: pwd_verification).
    - `request` - The form request object. Fields in the form can be accessed with `request.getParameter('<element-id>')`.
  - Returns: (boolean) true, if the user is verified; otherwise, false.
Create a Password Reset extension script

Create extension scripts only from the Password Reset Extension Script form. Do not create extension scripts in the System Definition > Script Includes interface.

Role required: password_reset_admin or admin

- **Note:** To use a script include as an extension script, you must set it to Active status.

1. Navigate to Password Reset > Extensions > New extension script.
2. Enter a name in the Extension script name field.
   
   Use CamelCase to construct a name without spaces, for example, PwdEnrollmentCustom.
3. Select an Extension script category.
   - Enrollment check
   - Enrollment form processor
   - Identification form processor
   - Password generator
   - User account lookup
   - Verification form processor
4. Click Submit.
   
   A new instance of the script include for the selected category opens.
5. Edit the script by providing an implementation in the body of the process or processForm function, depending on the script category. You can add additional functions as long as the process or processForm function accepts the defined parameters and returns the expected results.

- **Note:** Do not edit or delete the Category declaration.
6. Click Update.

Service desk: Reset a password for a user

In a service desk-assisted Password Reset process, service desk agents with the password_reset_service_desk role reset user passwords. Users do not reset passwords. Watch a video example of service desk agents resetting passwords: Resetting User Passwords (Video).

Role required: password_reset_admin or password_reset_service_desk

**Note:** You must set the Public access property to enable the service desk-assisted process. See Settings on the Password Reset Details tab.

1. Navigate to Password Reset > Service Desk.
2. Select a user and the Password Reset process to use.
3. Click Verify Identity.
4. On the Verify Identity form, enter the answers that the user provides and then click Continue.
   If the user identity is verified, the Reset Password form displays identity verification and status of the account lock.
5. Perform one of the following actions.
   - If the user is not locked, the form displays the Reset password button. Enter the new password and click Reset password.
   - If the user is locked, the form displays the Reset password and Unlock account buttons. You can enter a new password and click Reset password to reset the password and unlock the
account. If the **Enable account unlock** check box is selected for the password process, you can unlock the account without resetting the password by clicking **Unlock account**.

6. To reset the password for a different user, you must first navigate out of the Service Desk and then navigate to **Password Reset > Service Desk**.

Service desk: View user requests for password reset

The **Reset Requests** module displays the status of each password reset request from the Password Reset Request table (pwd_reset_request).

Role required: password_reset_admin or password_reset_service_desk

Navigate to **Password Reset > Reset Requests**.

<table>

| Status | The result of the Password Reset request:  
• **Completed With Failure**: User completed all steps in the Password Reset process, but the password was not reset in the credential store.  
• **Completed With Success**: User completed all steps in the Password Reset process and the password was reset in the credential store.  
• **Expired**: User did not complete all steps in the Password Reset process in the time allowed.  
• **In Progress**: User is working through the steps to reset the password.  
• **Max Number of Attempts**: User failed to answer the security questions correctly during the identity verification step and has exceeded the maximum number of attempts allowed.  
• **Verified**: User has completed the identity verification step and is verified. The user can move to the Password Reset step. |
| Active | Whether the request is open or closed. |
| Retry  | The total number of times the user has attempted to complete a password reset request. |

Service desk: Unblock a Password Reset user

If a user is manually banned or flagged as exceeding max attempts, the user can be blocked (not allowed to use the Password Reset application). You can unblock a blocked user.

Role required: password_reset_admin or password_reset_service_desk

Blocking events include:

- The user exceeded the limit for the number of failed password attempts.
- The most recent password reset occurred before the wait time required until the next reset.
- The user failed to provide the correct information while attempting to reset the password.

If the number of blocked or locked users exceeds the limit within a defined time interval, it triggers a system log event. You can configure the number of blocked, or locked, users and the time interval required to generate the log event by setting the `password_reset.activity_monitor.incident_threshold` and `password_reset.activity_monitor.incident_window` properties.

1. To view the list of blocked users, navigate to Password Reset > Blocked Users.
2. To unblock a self-service user:
   a) Navigate to Password Reset > Blocked Users.
   b) Select a user from the list.
   c) Select Delete on the Actions on selected rows list.
3. To unblock a user whose password was reset by a service desk agent:
If a user is manually banned or flagged as exceeding max attempts, the user can be blocked (not allowed to use the Password Reset application). When the password reset request is made through self-service, the user is unblocked when the password is successfully reset.

In contrast, service desk agents are allowed any number of retries. The `max_attempt_reached` limit does not apply and the `Blocked` status for the user is not reset after the password is reset. As a result, after you successfully reset a user password, you must unblock the user manually.

If the user is not unblocked manually, then the system resets the blocked state only when the `max_attempt_window` time period elapses and the user tries to reset the password using self-service.

a) After you successfully reset a user password, navigate to **Password Reset > Blocked Users**.

b) Change the `Blocked` setting for the user from true to false.

**Integrate Password Reset with a CMS integration**

You can configure a site in the ServiceNow content management (CMS) application to define a single-site access point that includes the Password Reset service. For example, you can create an employee self-service site that provides Password Reset service.

Role required: `content_admin`

Each Password Reset process requires a separate CMS page.

1. Navigate to **Content Management > Specialty Content > iFrames** and create an iFrame record.
2. Go to **Content Management > Sites** and create a site that has no login page.
3. Go to Content Management > Pages and create a password reset page.
4. Enter the name of the site that you created in the Content site field (Password Reset self-service in the example).
5. Right-click the form header and click Save.
6. Click the Edit Page related link and then click Add content.
7. In the Content Blocks section, select the iFrame that you created. Add more content as needed.
8. Click Update.

Password Reset and Password Change reports and logs

The Password Reset application provides several tools for monitoring and troubleshooting password reset activities.

Users with the password_reset_credential_manager or password_reset_admin role can view the status of password reset activities, identify potential security threats, and monitor for compliance with password security policies.

The Reset Requests, Activity Log, and Blocked Users modules are useful for monitoring password reset activities and for troubleshooting password reset issues. They also provide access to more detailed information than is provided on the Overview module.
To make room for new data, the system periodically purges the data that is used for password reset monitoring and reporting.

**Password Reset Overview module**

The **Password Reset > Overview** module displays reports on password reset and password change activities. Users with the password_reset_admin role can customize the layout of the reports that appear in the Overview module.

**Password Reset reports**

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password Requests (last 7 days)</td>
<td>Number of password reset requests by type during the last 7 days.</td>
</tr>
<tr>
<td>Blocked Users (last 7 days)</td>
<td>Number of users blocked over the last 7 days.</td>
</tr>
<tr>
<td>Password Reset Request Status (last 7 days)</td>
<td>The status of all password reset requests by process.</td>
</tr>
<tr>
<td>Password Reset Request by Action (last 30 days)</td>
<td>Number of password reset requests by action type: Reset Password, Unlock Account, or Reset and Unlock.</td>
</tr>
<tr>
<td>Password Reset Top Users (last 30 days)</td>
<td>Number of password reset requests per user. Many password reset requests from a single user could indicate a security issue.</td>
</tr>
<tr>
<td>Password Reset Failed Verifications (last 7 days)</td>
<td>Number of failed verification attempts, by verification instance. A failed verification occurs when a user attempts to reset the password, but fails for one reason or another, during the identity verification step. Many failed verification attempts for a specific type of verification could indicate that the process is too complicated or unclear.</td>
</tr>
<tr>
<td>Password Reset Enrollment By Verification</td>
<td>Number of users by verification type who have and have not enrolled in the password reset program. A large number for users who have not enrolled could indicate a compliance or communication issue within the organization.</td>
</tr>
<tr>
<td>Password Change Top Users (last 30 days)</td>
<td>Number of password change requests per user. Many password change requests from a single user could indicate a security issue.</td>
</tr>
</tbody>
</table>

**Password Reset activity log**

The activity log (**Password Reset > Activity Log**) provides detailed information that you can use to troubleshoot and to generate reports on password reset metrics. Information contained in the activity log is stored in the Password Reset activity log (pwd_reset_activity) table.

You must have the password_reset_credential_manager or password_reset_admin role to view the log.
Password Reset event log

The event log is a valuable resource for troubleshooting. On the Start menu, click Programs (or All Programs) > Administrative Tools > Event Viewer.

If the log does not appear, then, on the Windows Logs menu, click Applications > Service Logs.

You must have the admin role to view the log.

To write to the Password Reset event log

Edit the DebugFlag registry key entry at: Computer > HKEY_LOCAL_MACHINE > SOFTWARE > Microsoft > Windows > CurrentVersion > Authentication > Credential Providers > {B6EFF27D-C1C4-481F-B81B-F3547C47D58A}

By default, the key is set to 0. Set the key to 1 to write log entries to the ServiceNowPwdReset event log.

You must have the password_reset_credential_manager or password_reset_admin role to write to the log.

Password Reset blocked user notification

You can receive email notifications when the number of users that are blocked or locked exceeds the password blocked threshold. Notifications can alert you to suspicious activities. The default threshold is 10.

To subscribe: Add an email notification device or modify an existing device and then subscribe to the Password Reset-Activity Monitor Lockout notification.

You must have the password_reset_credential_manager or password_reset_admin role to subscribe.

Schedule for purging Password Reset data

To make room for new data, the system periodically purges the data that is used for password reset monitoring and reporting. Information contained in reports and monitoring tools could change dramatically immediately after a data purge. Contact ServiceNow Technical Support to modify purge intervals.

Purge intervals for Password Reset tables

<table>
<thead>
<tr>
<th>Table name</th>

**Users: Reset your password on Windows systems**

If your organization uses the Password Reset Windows Application, you can reset your password directly from your Windows login screen.

Role required: none

1. Start your computer or press **Ctrl+Alt+Delete** to go to the Windows login screen.
2. Click the **Forgot Password?** link. (Your administrator may have configured different text for the link.)

3. On the **Identify** page, enter the requested information and then click **Next**.

4. On the **Verify** page, enter the requested information, and then click **Next**.

   **Note:** You might be given the option to choose the method used to verify your identity.

If your identity is verified, the **Reset** page displays whether you were successfully verified and the state of your account (either locked or unlocked).

5. Based on your locked/unlocked state, perform one of the following actions:
   - If your account is not locked, the page displays the **Reset Password** button. Enter and reenter the new password and then click **Reset Password**.
   - If your account is locked, the page displays the **Reset Password** and **Unlock Account** buttons.
     - You can enter a new password and click **Reset password** to reset the password and unlock the account.
If your administrator has selected **Enable account unlock** for the password process, you can unlock the account without resetting the password by clicking **Unlock account**.

**Users: Enroll in the Password Reset program**

Some organizations auto-enroll users in a Password Reset program. Your organization could offer you the option to enroll for one or more methods of verifying your identity when you reset your password.

You might enroll for any combination of the following methods:

**Verify your identity using security questions (QA verification)**

To enroll, you choose multiple questions that only you can answer (like the name of your first pet) and then supply answers. The system stores your answers securely. Later, when you want to reset your password, the system presents one or more of the questions. You answer the questions to verify your identity.

**Verify your identity using an SMS code (SMS verification)**

To enroll, you authorize a device like a cellular phone for SMS verification. Later, when you want to reset your password, you get a code number on the device and enter the code on the web page to verify your identity.

**Users: Enroll in the Password Reset program using questions and answers**

Your organization might ask you to select the questions to use when resetting your password. You select the questions and provide answers that only you know. At another time, when you reset your password, your answers verify your identity.

Role required: none

1. Navigate to **Password Reset > Enroll** and then click the **QA Verification** tab.
   
   If you are required to enroll for the QA verification method, then the tab is marked with an asterisk (*).

2. For each **Question** field, select a question from the list and then enter the answer in the **Answer** field. Repeat the process until the required number of **Question** and **Answer** fields are filled in.

3. Click **Submit**.

4. Optional: Enroll for an extra identity verification using any of the other methods that your organization offers. See:
   
   - **Users: Enroll in the Password Reset program using SMS codes**

**Users: Enroll in the Password Reset program using SMS codes**

To prove that you are who you say you are (verify your identity) while resetting your password, you can use a code number (the SMS code) that was delivered to your mobile phone or device.

Role required: none

1. **Note**: You cannot enroll for this program on a mobile device.

   Navigate to **Password Reset > Enroll** and then click the **SMS Verification** tab.

   If your organization requires you to enroll for the SMS verification method, then the tab is marked with an asterisk (*).

2. If you had previously added an SMS-enabled device to your Password Reset profile, the device is listed. To add and verify a device, click **Add Device** and then follow the instructions.
Provide a meaningful **Name** for each device. Repeat the process for as many devices as you need.

3. After you have verified each device, select the **Authorized** check box for each device that you expect to use to change or reset your password.

   **Note:** You can deauthorize a device at any time by clearing the **Authorized** check box.

4. Click **Submit**.

5. Optional: Enroll for an additional identity verification using any of the other methods that your organization offers. See:
   - **Users: Enroll in the Password Reset program using questions and answers**

**Orchestration examples**

These examples demonstrate how Orchestration can be used to automate common tasks.

**Active Directory automation example**

A set of six Orchestration Active Directory activities enables organizations to automate their on-boarding/off-boarding processes with auditable, self-documenting workflows that save time and eliminate mistakes.

The activities in the **Active Directory activity pack** are designed to manage user accounts and reset user passwords. The following activities cover the most common use cases administrators encounter when managing Active Directory user accounts:

- Create AD User Account
- Update AD User Account
- Remove AD User Account
- Disable AD User Account
- Query AD
- Reset AD User Password.

These activities share a common design, have complementary functionality, and share a common set of parameters. They can be used singly or together to create consistent workflows for provisioning and de-provisioning user accounts.

**Update Active Directory with Orchestration**

An organization plans to make their ServiceNow instance the single system of record for user account data and wants to update Active Directory with the latest changes.

The solution is to create an Orchestration workflow that pushes changes from the ServiceNow user record down to the Active Directory to create a new user record or update an existing record. This is accomplished by creating an Orchestration workflow that can create and update records in Active Directory based on the data in the ServiceNow User (sys_user) table.

**Note:** This example workflow assumes that ServiceNow is configured for LDAP and an LDAP server is configured to accept the new user accounts. The Active Directory user management activities are not dependent on LDAP, but the presence of LDAP makes this example workflow much easier. You must provide the domain controller’s IP address to the...
workflow, either by hardcoding it, adding another workflow input, or using a script to look it up from the CMDB.

1. Navigate to Workflow > Workflow Editor.
2. In the Workflow tab, click the + icon to create a new workflow using these variables:
   - Name: Sync AD User
   - Table: Global (global)
3. Click Submit.
   A basic workflow with a Begin and End point appears on the canvas.
4. Click the menu icon in the upper left corner of the canvas and select Edit Inputs from the context menu.
5. In the Workflow Inputs form, click New in the Variables record list, and create a new variable, using the fields in the table.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Reference</td>
</tr>
<tr>
<td>Label</td>
<td>User</td>
</tr>
<tr>
<td>Column name</td>
<td>u_user</td>
</tr>
<tr>
<td>Reference Specification &gt; Reference</td>
<td>User (sys_user)</td>
</tr>
</tbody>
</table>

6. Click Submit.
7. In the Custom tab, expand Custom Activities > Active Directory.
8. Drag and drop the Update AD Object activity onto the transition line between the Begin and End points of the new workflow.
   This action automatically links the activity with the end point and opens the Workflow Activity property form.
9. Complete the form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as <strong>Update user data</strong>.</td>
</tr>
<tr>
<td>Domain controller</td>
<td>The ServiceNow LDAP integration adds a reference to the LDAP server to which the user's account is linked. To identify the LDAP server, enter the following statement: ${workflow.inputs.u_user.ldap_server.server_url}</td>
</tr>
<tr>
<td>Type</td>
<td>Type of AD object. In this case, the type is <strong>User</strong>, which is the default.</td>
</tr>
<tr>
<td>Object name</td>
<td>This example assumes that the ServiceNow user name matches the Active Directory sAMAccountName. Enter the following: ${workflow.inputs.u_user.user_name}</td>
</tr>
<tr>
<td>Object data</td>
<td>Updates the user's account in Active Directory, if the user exists. In this example, the user's title is updated: &quot;title&quot; : &quot;QA&quot;</td>
</tr>
</tbody>
</table>

10. Click Submit.
   The workflow looks like this:
Updating an AD user

11. Attach both activity outcomes (Success and Failure) to the end point. At this point, the workflow takes a ServiceNow user record as input and updates the First Name, Last Name, and Title of the corresponding Active Directory account. If the account does not exist in Active Directory, the workflow fails.

   **Note:** In a normal workflow, some type of alternate action is desirable upon failure. For example, you might send an email notification if the workflow failed to update the record.

12. To prevent the workflow from failing, add a Create AD Object activity to the transition lines between Begin and the Update AD Object activity.

13. Complete the Workflow Activity property form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as Create user data.</td>
</tr>
<tr>
<td>Domain controller</td>
<td>Same as for the update activity. $(workflow.inputs.u_user.ldap_server.server_url)</td>
</tr>
<tr>
<td>Ou</td>
<td>The organizational unit to which this object belongs. For the purpose of this example, you can enter <strong>OU=HQ,OU=Managed Objects</strong></td>
</tr>
<tr>
<td>Object name</td>
<td>Same as for the update activity. $(workflow.inputs.u_user.user_name)</td>
</tr>
<tr>
<td>Object data</td>
<td>Creates an account with only the user name in it. For the purpose of this example, you can enter <code>{&quot;givenName&quot; : &quot;$(workflow.inputs.u_user.first_name)&quot;, &quot;SN&quot; : &quot;$(workflow.inputs.u_user.last_name)&quot; }</code></td>
</tr>
</tbody>
</table>

14. Click **Submit**.

15. Connect the Failure outcome of the Create AD Object activity to End.

   For this example, we are ignoring errors. The workflow now looks like this:
Creating an AD user

This procedure builds a simple workflow that creates a bare-bones Active Directory account consisting of a user name only. The workflow then updates that account with additional information provided by the ServiceNow User (sys_user) table. However, we do not want to execute the Create AD Object activity if the user account already exists. The workflow needs to query Active Directory for matching user records and then branch the workflow based on the results of the query. If an account already exists, then the workflow should update the account. If the account does not exist, then the workflow should create the account in Active Directory.

16. Drag and drop the Query AD activity onto the transition between Begin and Create AD Object.

17. Complete the Workflow Activity property form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as <strong>Search for existing account</strong>.</td>
</tr>
<tr>
<td>Domain controller</td>
<td>${workflow.inputs.u_user.ldap_server.server_url}</td>
</tr>
<tr>
<td>Properties</td>
<td>A comma-separated list of Active Directory properties to return. For example, givenName, SN, title. If the parameter field is blank, then all properties are returned. In this workflow, we leave the field blank.</td>
</tr>
</tbody>
</table>
| Search filter  | An LDAP filter string that defines the search parameters. Use any valid LDAP filtering criteria. To find user accounts matching the input record, we use:  
\{(samaccountname= ${workflow.inputs.u_user.user_name})\} |
20. Connect the Success outcome of the query activity to the Update AD Object activity. The workflow now looks like this:

![Workflow diagram](image)

### Querying AD for user accounts

The Query AD activity returns its results as a JSON string in the workflow data bus. This JSON string is always an array of objects. Each object corresponds to an Active Directory entry that matched the query. Our workflow should branch, whether that array is empty or not.

21. Drag a standard If activity from the Conditions folder in the Core tab and drop it onto the transition between Query AD and Update AD Object.

22. Complete the Workflow Activity properties form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as Account exists.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to open the Script field.</td>
</tr>
<tr>
<td>Script</td>
<td>For the If activity to work correctly, we must return a yes or no in the answer variable (var) which corresponds to the Yes and No outcomes of the query activity. Line 1 converts the Query AD results from a JSON string into a Javascript array called queryResults. Line 2 checks the length of that array. If the array is more than 0, a match to the account was found, and we set our answer to yes. Otherwise, the answer is no. var queryResults=new JSON().decode(data.get(5).output); answer = (queryResults.length&gt;0 ? 'yes' : 'no');</td>
</tr>
</tbody>
</table>
Note: The expression `data.get(5)` in this script identifies the Query AD output in the Databus by order number, since it was the fifth activity added to the workflow.

Query AD outputs in the Databus

23. Click Submit.
24. In the canvas, create a transition from the Yes outcome of the If activity to the Update AD Object activity.
25. Create a transition from the No outcome of the If activity to the Create AD Object activity.
This is the final step. This workflow will query Active Directory to determine if an account already exists. If an account exists, the workflow updates that account. If an account does not exist, the workflow creates the account and then updates the Active Directory with the configured user data set.

Creating the conditional paths

Orchestration activity packs

The base Orchestration system includes packs of custom activities you can use to automate typical IT and business processes in your network.

Activity packs allow you to automate several common business processes, such as managing Active Directory accounts and Exchange server mailboxes. Activity packs can also automate IT functions such as starting and stopping Windows servers, joining domains, assigning IP addresses, and configuring load balancers.

Use an activity pack

The Packs tab of the Workflow Editor contains any activity packs downloaded from the ServiceNow Store and any activity packs that you create.

Roles required: admin, activity_admin, activity_creator

You can organize custom activities into packs and upload them to the ServiceNow Store. Your custom packs do not appear in the tree until at least one activity in the pack is published. Activities added to an existing pack are not displayed until they are published. Activity packs from any application scope can appear in the Packs tab, regardless of the current scope setting for the instance.

1. In the Workflow Editor palette, select the Packs tab.
2. Click the download icon.
The hierarchy in the tab organizes packs by vendor, scope, category, and activity.

Active Directory activity pack

The Active Directory (AD) activity pack enables an administrator to create, delete, and manage objects in Windows Active Directory, such as users, groups, and computers, using a ServiceNow Orchestration workflow.

Activities in this pack can reset a password automatically from a user request or manage any user account in Active Directory, whether or not it was created by an Orchestration workflow.

Domain controllers are identified by the IP address of the host machine. To use the hostname of the domain controller, add the Resolve DNS Name activity to resolve the hostname into an IP, and then pass the IP into the Active Directory activity.

Your instance must have access to a MID Server configured to use PowerShell to run these activities.

Note: All Active Directory activities pass through error messages returned from Active Directory. To view these error messages, point to the failed activity in the workflow canvas or select the Workflow Log tab in a Workflow Context record.
Custom Active Directory activities

Orchestration provides custom Active Directory activities that were created with the Orchestration Create a PowerShell activity, starting with the Geneva release. These activities perform the same functions as AD activities by the same name from previous releases and replace those activities for all new workflows. Existing workflows from earlier versions that were created with legacy AD activities continue to function normally after an upgrade to Istanbul. However, all new workflows must use these custom AD activities. The Powershell activity template gives workflow administrators the ability to store input and output variables from the Query AD activity in the databus.

Note: To use the Active Directory custom activities, you must request activation of the Orchestration - Active Directory plugin.

Active Directory credentials with LDAP

If you are using an LDAP Server with MID Servers, note that Orchestration and Active Directory activities do not use the user name and password configured on LDAP Servers. You must create a Windows type orchestration credential record. The username and password in the credentials record is used for LDAP queries that Orchestration and workflow activities perform.

Connection port used by AD Orchestration activities

All Active Directory activities use port 389 for LDAP access. If you are using AD activities with Oracle Virtual Directory (OVD) as a proxy, set up pass-through on port 389 only.

Add User to Group AD activity

The Add User to Group activity adds a user to a group in Windows Active Directory.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

Input variables

Add User to Group input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>
</tr>
<tr>
<td>UserName</td>
<td>Name of the user to add to the group.</td>
</tr>
<tr>
<td>GroupName</td>
<td>Name of the group to which this user is added.</td>
</tr>
</tbody>
</table>

Output variables

Add User to Group output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>Either success or failure.</td>
</tr>
</tbody>
</table>
### Variable Description

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>errorMessage</td>
<td>The <code>executionResult.errorMessages</code> from the <code>Activity designer parsing sources</code>.</td>
</tr>
</tbody>
</table>

### Conditions

#### Add User to Group conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>User was successfully added to group.</td>
</tr>
<tr>
<td>Failure</td>
<td>An error occurred while attempting to add the user to the group. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>

### Change AD User Password activity

The Change AD User Password activity changes the password for an Active Directory user account.

This activity requires the user's current password to run, unlike the `Reset AD User Password` activity. If the new password violates any Active Directory password requirements, such as length or character combinations, the activity fails and returns the appropriate error message. This error message appears in the ECC queue and in hint text when a user points to the activity in the workflow editor.

To access this activity in the workflow editor, select the **Custom** tab, and then navigate to **Custom Activities > Active Directory**.

**Note:** This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the `PowerShell activity designer`.

### Input variables

#### Change AD User Password input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>
</tr>
<tr>
<td>User</td>
<td>The <code>sAMAccountName</code> of the Active Directory user account.</td>
</tr>
<tr>
<td>New_password</td>
<td>The new password to assign this user.</td>
</tr>
<tr>
<td>Old_password</td>
<td>The user's current password.</td>
</tr>
</tbody>
</table>
Output variables

Change AD User Password output variables

<td>The executionResult.errorMessages from the Activity designer parsing sources.</td>
</tr>
<tr>
<td>hresult</td>
<td>Powershell command result.</td>
</tr>
</tbody>
</table>

Conditions

The activity provides the following conditions:

Change AD User Password conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Password successfully reset.</td>
</tr>
<tr>
<td>Policy Failure</td>
<td>Password does not comply with the organization’s Active Directory requirements.</td>
</tr>
<tr>
<td>Incorrect old password</td>
<td>Password being changed was not entered correctly.</td>
</tr>
<tr>
<td>Failure</td>
<td>An error occurred while attempting to change the password. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>

Active Directory credentials with LDAP

If you are using an LDAP Server with MID Servers, note that Orchestration and Active Directory activities do not use the user name and password configured on LDAP Servers. You must create a Windows type orchestration credential record. The username and password in the credentials record is used for LDAP queries that Orchestration and workflow activities perform.

Create AD Object activity

The Create AD Object activity creates an object in Windows Active Directory.
This activity fails if it finds an existing object with matching input variables.
To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

Note: This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work.

normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

## Input variables

**Create AD Object input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>
</tr>
<tr>
<td>Type</td>
<td>The object type to create: user, group, or computer.</td>
</tr>
<tr>
<td>OU</td>
<td>The organizational unit to which this object belongs.</td>
</tr>
<tr>
<td>ObjectName</td>
<td>The sAMAccountName of the Active Directory object. Object name is also used for the name attribute in Active Directory. This behavior is available in ActiveDirectory.psm1. Whatever is passed as the Object name becomes both the samAccountName and the name of the new user in Active Directory.</td>
</tr>
<tr>
<td>ObjectData</td>
<td>A JSON object containing Active Directory property names and their corresponding values. For example:</td>
</tr>
<tr>
<td></td>
<td>`{</td>
</tr>
<tr>
<td></td>
<td>&quot;givenName&quot; : &quot;John&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;SN&quot; : &quot;Doe&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;title&quot; : &quot;Sr. Account Specialist&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;allowLogin&quot; : true</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
<tr>
<td></td>
<td>This example sets the first name (givenName), last name (SN), and title on the Active Directory user account and allows that user to log in (allowLogin). This field allows expression evaluation via the ${} variable substitution syntax.</td>
</tr>
</tbody>
</table>

## Output variables

**Create AD Object output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>Either success or failure.</td>
</tr>
<tr>
<td>errorMessage</td>
<td>The executionResult.errorMessages from the Activity designer parsing sources.</td>
</tr>
</tbody>
</table>
Conditions

Create AD Object conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>A Windows Active Directory object was created successfully.</td>
</tr>
<tr>
<td>Failure</td>
<td>An error occurred while attempting to create the AD object. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>

Disable AD User Account activity

The Disable AD User Account activity disables a Windows Active Directory user account, making it inactive.

To access this activity in the workflow editor, select the **Custom** tab, and then navigate to **Custom Activities > Active Directory**.

**Note:** This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the **PowerShell activity designer**.

Input variables

Disable AD User Account input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>
</tr>
<tr>
<td>User</td>
<td>The sAMAccountName of the Active Directory user account.</td>
</tr>
</tbody>
</table>

Output variables

<tr>
<td>Failure</td>
<td>An error occurred while attempting to disable the account. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>

Enable AD User Account activity

The Enable AD User Account activity enables a Windows Active Directory user account, making it active.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

ℹ️ Note: This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Input variables

<td>An error occurred while attempting to enable the AD user account. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>

Is AD Account Locked activity

The Is AD Account Locked activity determines whether an Active Directory user account is locked. An account may be locked automatically if a user enters an incorrect password more times than allowed by the Active Directory security policy. You can unlock an account using the Unlock AD User Account activity.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

Note: This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Input variables

Is AD Account Locked input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>

</tr>
</tbody>
</table>

Query AD activity

The Query AD activity retrieves entries from the Windows Active Directory based on an LDAP search filter and stores the results as a JSON string that can be used in the data bus.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > Active Directory > .

Note: This activity replaces an AD activity by the same name available in releases prior to Geneva. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul and will continue to save query results to the scratchpad. However, all new workflows must use the custom version of this activity. This activity was built with the Create a PowerShell activity, which stores input and output variables in the databus instead of the scratchpad.

Input variables

Query AD input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>
</tr>
<tr>
<td>Properties</td>
<td>A comma-separated list of Active Directory properties to return. For example, givenName,SN,title. If this field is blank, then all properties are returned.</td>
</tr>
<tr>
<td>SearchFilter</td>
<td>An LDAP filter string that defines the search parameters. Use any valid LDAP filtering criteria. For example, to find user accounts matching the ServiceNow input record, use: $(samaccountname= ${(workflow.inputs.u_user.user_name)})</td>

<td>An error occurred while attempting to remove the user from the group. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>

Reset AD User Password activity

The Reset AD User Password activity resets the password of a user account in Windows Active Directory.

If the new password violates any Active Directory password requirements, such as length or character combinations, the reset activity fails and returns the appropriate error message. This error appears in the ECC Queue and when you point to the activity in the workflow editor.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

Note: This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Input variables

</tbody>
</table>

Unlock AD Account activity

The Unlock AD Account activity unlocks a locked Active Directory user account.

You can use the `Is AD Account Locked` activity to determine if an account is locked.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

Note: This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Update AD Object activity

The Update AD Object activity updates an object in Windows Active Directory.

This activity only replaces existing values with new values. It cannot add new values to AD records such as adding a new group member to an AD group. For complex AD operations, use the Run PowerShell activity instead. The activity fails if it cannot find an existing account with matching object name and data.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

Note: This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Input variables

### Azure AD activity pack

The Azure AD activity pack enables an administrator to automate employee onboarding and offboarding functions on Azure AD and manage Office 365 licensing.

Use the Azure AD activities to add and remove users to Azure Active Directory, manage security group membership, and assign or remove Office 365 licenses for individual users.

The Azure AD activities were created with the Orchestration REST Web Service activity template.

### Add User to Group Azure AD activity

The Add User to Group activity adds a user to an existing security group in Azure Active Directory.
To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > Azure AD. This activity was built with the REST web service activity template.

**Important:** The REST message used for this activity must be configured to use OAuth2 authentication.

### Input variables

**Add User to Group input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user_id</td>
<td>Object ID (GUID) of the member to be added.</td>
</tr>
<tr>
<td>group_id</td>
<td>Object ID (GUID) of the target group.</td>
</tr>
</tbody>
</table>

### Output variables

**Add User to Group output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error</td>
<td>Returns the error string from the REST message. If there are no errors, this variable returns a null value.</td>
</tr>
<tr>
<td>body</td>
<td>Contains a string value representing the output from the REST message.</td>
</tr>
<tr>
<td>status_code</td>
<td>Contains the status code returned from the Web service.</td>
</tr>
</tbody>
</table>

### Conditions

**Add User to Group conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully added the object ID to the security group.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to update the group's membership, or the activity failed to connect to Azure AD.</td>
</tr>
</tbody>
</table>

### Assign User License Azure AD activity

The Assign User License activity assigns an additional Office 365 software license to the named user.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > Azure AD. This activity was built with the REST web service activity template.
Important: The REST message used for this activity must be configured to use OAuth2 authentication.

Input variables

Assign User License input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user_id</td>
<td>The object ID (GUID) or the user principal name of the target user. An example of a user principal name is <a href="mailto:someuser@ca830edad9050849NDA1.onmicrosoft.com">someuser@ca830edad9050849NDA1.onmicrosoft.com</a>.</td>
</tr>
<tr>
<td>sku_id</td>
<td>Subscription SKU ID associated with the tenant’s enterprise agreement.</td>
</tr>
</tbody>
</table>

Output variables

Assign User License output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>

</tbody>
</table>

Conditions

Assign User License conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully assigned an Office 365 license to a user.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to assigned an Office 365 license to a user, or the activity failed to connect to Azure AD.</td>
</tr>
</tbody>
</table>

Create User Azure AD activity

The Create User activity creates a user for the Azure Active Directory tenant.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > Azure AD. This activity was built with the REST web service activity template.
**Important:** The REST message used for this activity must be configured to use OAuth2 authentication.

### Input variables

**Create User input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>display_name</td>
<td>Name of the Azure AD user in the accepted display format, such as jacinto.gawron.</td>
</tr>
<tr>
<td>user_principal_name</td>
<td>User principal name (UPN) in an email format. For example, you might enter <a href="mailto:jacinto.gawron@khitomer.com">jacinto.gawron@khitomer.com</a>.</td>
</tr>
<tr>
<td>mail_nickname</td>
<td>User's email alias that redirects to the user's full address.</td>
</tr>
<tr>
<td>password</td>
<td>User's Azure AD password. This password must be passed as a workflow input with a type of <strong>Password (2 Way Encrypted)</strong> and must meet the password policy set in Azure AD.</td>
</tr>
<tr>
<td>change_password</td>
<td>Control that requires the user to change his or her password at the next login, if set to true.</td>
</tr>
<tr>
<td>account_enabled</td>
<td>Control that sets the user's account is enabled, if set to true.</td>
</tr>
<tr>
<td>given_name</td>
<td>First name of the user.</td>
</tr>
<tr>
<td>surname</td>
<td>Last name of the user.</td>
</tr>
<tr>
<td>other_mails</td>
<td>List of additional email addresses for the user. For example, you might enter [&quot;<a href="mailto:jac@home.com">jac@home.com</a>&quot;, &quot;<a href="mailto:jgawron@fabrikam.com">jgawron@fabrikam.com</a>&quot;].</td>
</tr>
<tr>

<tr>
<td>User does not exist</td>
<td>Specified user does not have an account in the tenant domain.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to connect to Azure AD.</td>
</tr>
</tbody>
</table>

### Get User Info Azure AD activity

The Get User Info activity returns the named user's information from the Azure Active Directory. To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > Azure AD. This activity was built with the REST web service activity template.

Important: The REST message used for this activity must be configured to use OAuth2 authentication.
## Input variables

### Check If User Exists input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user_id</td>
<td>The object ID (GUID) or the user principal name of the target user. An example of a user principal name is <code>someuser@a830edad9050849NDA1.onmicrosoft.com</code>. Note: Version 2 of this activity enforces input validation. If empty, the following message appears: &quot;Mandatory input 'user_id' is empty&quot;.</td>
</tr>
</tbody>
</table>

## Output variables

### Check If User Exists output variables

</tbody>
</table>

### Exchange activity pack

The Exchange activity pack allows workflows to manage Microsoft Exchange mail systems. The use of Orchestration Exchange activities requires the following:

- Microsoft Exchange 2010 or 2013.
- A MID Server configured to run Powershell 2.0
- A target Exchange server in the same Active Directory domain as the instance.
- Powershell Remoting enabled on the target Exchange server.

**Note:** These activities cannot be used to interact with Microsoft Exchange Online.

Orchestration provides custom Exchange activities that were created with the Orchestration activity designer template. These activities perform the same functions as Exchange activities by the same name from previous releases and replace those activities for all new workflows. The custom Exchange activities were built with a [Powershell activity template](#), which gives workflow administrators the ability to store input and output variables in the databus.

**Note:** Existing workflows from earlier versions that were created with legacy Exchange activities continue to function normally after an upgrade to Geneva. However, all new workflows must use these custom Exchange activities.

To use the Microsoft Exchange custom activities, you must request activation of the Orchestration - Exchange plugin. The custom Exchange activities are available in the Workflow Editor on the Custom tab. Expand the Custom Activities tree and select the Exchange category for the activity you want to use.
Accessing custom Exchange activities

**Configure MID Server for Exchange**

Configure a MID Server with defined IP ranges to use Exchange.
If the MID Server manages resources within defined IP ranges, instead of all computers on your network, you must perform additional configuration steps to run Exchange activities. You do not need to perform these steps if your MID Server uses the default configuration.

1. In the navigation filter, enter `cmdb_ci_dns_name.list`.
2. Click **New**.
3. Enter the fully-qualified domain name (FQDN) of your Exchange server in the **Name** field.
4. Right-click the form header and select **Save**.
5. In the **IP Address** related list, click **New**.
6. In the **IP Address** field, enter the IP address of your Exchange server.
7. In the **Nic** field, select **eth0** or your preferred network interface controller.
8. Leave the **Netmask** field blank.
9. Click **Submit**.

### Pass multivalued properties with an Exchange activity

To set a multivalued property using an Exchange activity, you must use a specific parameter format.

The Optional parameters shared input variable allows you to set multivalued properties.

- To set a multivalued property, replacing any existing values, use this format:
  
  "PropertyName":"(value1,value2,value3)"

- To add values, use this format: "PropertyName":"+(value1,value2,value3);"

- To remove values, use this format: "PropertyName":"-(value1,value2,value3);"

- To both add and remove values, use this format: "PropertyName":"-(value1,value2,value3);
  + (value1,value2,value3);"

### Create Address List activity

The Create Address List activity creates a new address list that acts as an alias for emailing all users in the group.

This alias cannot be used to manage user permissions. This activity implements the Microsoft Exchange `New-AddressList` command.

To access this activity in the workflow editor, select the **Custom** tab, and then navigate to **Custom Activities > Exchange > Address List**.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the **PowerShell activity designer**, which gives workflow administrators the ability to store input and output variables in the **databus**.

### Input variables

**Create Address List input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.</td>
</tr>
<tr>
<td>Variable</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>domain</td>
<td>The name of the Exchange server’s assigned domain.</td>
</tr>
<tr>
<td>name</td>
<td>Name of the new address list to create.</td>
</tr>
<tr>
<td>parameters</td>
<td>Optional parameters to pass to the Exchange server written in JavaScript Object Notation (JSON). Exchange activities cannot pass parameters that reference an object, such as a PSCredential object. Plain text is automatically converted to SecureString objects for parameters that require that data type. Attempting to save an activity that specifies duplicate parameters, including parameters from activity variables, or incorrectly formatted JSON causes a warning message to appear.</td>
</tr>
</tbody>
</table>

**Note:** When passing a switch parameter, such as ForceUpgrade, you must use the format “parameter”: “true”.

**Output variables**

**Create Address List output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>Either success or failure.</td>

<td>Failure</td>
<td>The activity failed to create a new address list.</td>
</tr>
</tbody>
</table>

**Delete Address List activity**

The Delete Address List activity removes an existing address list from an Exchange server. This activity implements the Microsoft Exchange Remove-AddressList command.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > Exchange > Address List.
Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

</table>

Get Address List activity

The Get AddressList activity retrieves all attributes from the specified Exchange address list. This activity implements the Microsoft Exchange `Get-AddressList` command.

To access this activity in the workflow editor, select the **Custom** tab, and then navigate to **Custom Activities > Exchange > Address List**.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the **PowerShell activity designer**, which gives workflow administrators the ability to store input and output variables in the **databus**.

**Move Address List activity**

The Move Address List activity moves a Microsoft Exchange address list to another location in the address hierarchy.

This activity implements the Microsoft Exchange `Move-AddressList` command.

The Exchange server caches the changes from this activity but does not immediately apply them. Use the `Update Address List` activity after this activity to apply the changes or wait for the Exchange server to automatically apply cached changes.

To access this activity in the workflow editor, select the **Custom** tab, and then navigate to **Custom Activities > Exchange > Address List**.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the `PowerShell activity designer`, which gives workflow administrators the ability to store input and output variables in the `databus`.

Set Address List activity

The Set Address List activity modifies a Microsoft Exchange address list.
Use the Optional parameters variable to pass specific values to the Microsoft Exchange server. This activity implements the Microsoft Exchange Set-AddressList command.

The Exchange server caches the changes from this activity but does not immediately apply them. Use the Update Address List after this activity to apply the changes or wait for the Exchange server to automatically apply cached changes.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > Exchange > Address List.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. ### Create Mailbox activity

The Create Mailbox activity creates a new Active Directory user, if that user does not already exist, and a Microsoft Exchange mailbox for that user.

This activity implements the Microsoft Exchange `New-Mailbox` command.

To access this activity in the workflow editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Exchange** > **Mailbox**.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the **PowerShell activity designer**, which gives workflow administrators the ability to store input and output variables in the **databus**.

<td>Failure</td>
<td>The activity failed to create a new mailbox or an Active Directory account for the specified user.</td>
</tr>
</tbody>
</table>

### Delete Mailbox activity

The Delete Mailbox activity deletes the Microsoft Exchange mailbox of an Active Directory user. Optional parameters determine how the Exchange server handles the mailbox after deleting the user. This activity implements the Microsoft Exchange `Remove-Mailbox` command.

To access this activity in the workflow editor, select the **Custom** tab, and then navigate to **Custom Activities > Exchange > Mailbox**.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the **PowerShell activity designer**, which gives workflow administrators the ability to store input and output variables in the **databus**.

### Input variables

**Delete Mailbox input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.</td>
</tr>
<tr>
<td>domain</td>
<td>The name of the Exchange server’s assigned domain.</td>
</tr>
<tr>
<td>user</td>
<td>Active Directory user to delete. The activity passes this value to Exchange as the Identity Exchange variable.</td>
</tr>
</tbody>
</table>
### Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameters</td>
<td>Optional parameters to pass to the Exchange server written in JavaScript Object Notation (JSON). Exchange activities cannot pass parameters that reference an object, such as a PSCredential object. Plain text is automatically converted to SecureString objects for parameters that require that data type. Attempting to save an activity that specifies duplicate parameters, including parameters from activity variables, or incorrectly formatted JSON causes a warning message to appear.</td>
</tr>
</tbody>
</table>

**Note:** When passing a switch parameter, such as ForceUpgrade, you must use the format "parameter":true.

### Output Variables

Delete Mailbox output variables

<table>

<td>The activity failed to delete the specified user's mailbox.</td>
</tr>
</tbody>
</table>

### Disable Mailbox activity

The Disable Mailbox activity disables the mailbox associated with a specified Active Directory account.

This activity implements the Microsoft Exchange Disable-Mailbox command.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > Exchange > Mailbox.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity...
was built with the *PowerShell activity designer*, which gives workflow administrators the ability to store input and output variables in the *databus*.

Enable Mailbox activity

The Enable Mailbox activity creates a new mailbox for an existing Active Directory user.

This activity implements the Microsoft Exchange Enable-Mailbox command.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > Exchange > Mailbox.

Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

</table>

### Get Mailbox activity

The Get Mailbox activity gets the mailbox for the specified user or all mailboxes on a Microsoft Exchange server.

This activity implements the Microsoft Exchange *Get-Mailbox* command.

To access this activity in the workflow editor, select the **Custom** tab, and then navigate to **Custom Activities > Exchange > Mailbox**.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity
was built with the *PowerShell activity designer*, which gives workflow administrators the ability to store input and output variables in the *databus*.

Set Mailbox activity

The Set Mailbox activity modifies the settings of an existing Microsoft Exchange mailbox.

Use the optional parameters variable to pass specific values to the Exchange server. This activity implements the Microsoft Exchange `Set-Mailbox` command.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > Exchange > Mailbox.

Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. F5 Network Management activity pack

Orchestration provides custom activities for configuring elements of an F5 load balancer, including pools, pool members, and the virtual servers contained in the pool.

All F5 custom activities are in the F5 Network Management Application scope and are activated by the Orchestration - F5 network management plugin, which must be activated by request.

ServiceNow provides custom F5 activities, built from the REST web service activity template, that you can use to perform the following tasks:

- Add, delete, or verify pools.
- Add, delete, or identify pool members.
- Add or delete virtual servers.
• Add a profile to a virtual server.
• Configure the virtual server for vlans, irules, pool, and persistence.

Add F5 Pool Member activity
The Add F5 Pool Member activity adds a member to an F5 load balancer pool.
This activity was built using the REST web service activity template. To access the activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

REST settings
• REST message: F5 POOL Membership Management
• REST function: post

Input variables
Add F5 Pool Member input variables

<table>
<thead>
<tr>

### Infoblox DDI activity pack

This activity pack supports Infoblox DDI management through ServiceNow Orchestration.

The Infoblox DDI activity pack manages the IP addresses used in a network by integrating DNS and DHCP. Custom Orchestration activities use Infoblox Web API (WAPI) REST web services to access the Infoblox GRID server.

**Important**: Managing IP addresses through the Infoblox server requires a fully functional MID Server.
Starting with the Jakarta release, the Infoblox activity pack updates to version 2. This update supports Infoblox network views, which can restrict the visibility of network data. The view parameter can be passed as a query parameter or payload content, to do operations in a specific view. Version 2 also supports specifying the version of WAPI to use in integration endpoints.

Supported for Infoblox:
- WAPI version 2.0 for REST messages
- NIOS appliance version 7.0

**Note:** To use the Infoblox DDI activities and workflow, you must request activation of the Orchestration - Infoblox DDI Activity Pack plugin.

### Create a REST credential for Infoblox activities

All Infoblox activities require a REST credential to manage IP addresses from the Infoblox DDI server.

Before starting this procedure, make sure you have the following:
- A properly configured and running Infoblox DDI Grid Server.
- REST credentials defined on the Infoblox DDI server.

Role required: admin

You must create a REST credential record on the ServiceNow instance that each Infoblox activity can use to access management features on the Infoblox server.

1. Navigate to Orchestration > Credentials and click New.
2. In the list of credential types, select Basic Auth Credentials.
3. Create the credential record with a logical name, such as InfobloxCred.
4. Right-click in the header bar of your new credential record and select Copy sys_id from the context menu. Follow browser instructions to copy the sys_id if browser security measures restrict this function.
5. Paste the sys_id into the restCredentials input field of each activity you use.

### Infoblox workflows

The Infoblox DDI activity pack includes two default workflows, one that reserves and registers IP addresses and another that releases IP addresses.

To access these workflows, navigate to Workflow > Workflow Editor and select the Workflows tab. Click on a workflow to open it, and then click the information icon in the workflow header to display the properties dialog box.

### Infoblox Reserve/Register IP in IPAM

Use this workflow to register IPv4 addresses or request the next available IP address on IPAM. Optionally, you can use it to register IP addresses on DNS. The custom Infoblox activities used in this workflow are:
- IPAM Register IP Address
- IPAM Reserve IP Address
- Register DNS A-Record
- Get Network Details
Infoblox Reserve/Register IP input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Infoblox Server</td>
<td>IP address of the Infoblox DDI server.</td>
</tr>
<tr>
<td>Network</td>
<td>Network containing the target IP address.</td>
</tr>
<tr>
<td>Zone</td>
<td>The DNS zone for the IP address being registered.</td>
</tr>
<tr>
<td>Rest Credentials</td>
<td>The sys_id of the REST credentials from the ServiceNow instance.</td>
</tr>
<tr>
<td>DNS Host Name</td>
<td>Name of the DNS server machine on which the IP address is being registered.</td>
</tr>
<tr>
<td>IPv4 Address</td>
<td>IP address being reserved or registered.</td>
</tr>
</tbody>
</table>

Infoblox Release IPAM Reservations

Use this workflow to release (delete) all the IPAM reservations associated with an IPv4 address. The custom Infoblox activities used in this workflow are:

- IPAM List IP Reservations
- List DNS Record
- DNS Delete
- IPAM Delete

Infoblox Release IPAM Reservations input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>

<td>Rest Credentials</td>
<td>The sys_id of the REST credentials from the ServiceNow instance.</td>
</tr>
<tr>
<td>IP to Delete</td>
<td>IP address to release.</td>
</tr>
<tr>
<td>Infoblox Server</td>
<td>IP address of the Infoblox DDI server.</td>
</tr>
</tbody>
</table>

Infoblox roles and permissions

Define the roles and permissions that the Infoblox activities need to access the various resources on the Infoblox server.

Admin groups

There are three types of admin groups on an Infoblox server:

- Superuser
- Default
- Limited Access

To perform specific operations on the Infoblox server, the Limited Access user must have a minimum set of privileges for the desired resources, using either the user interface or an API. These privileges are based on read and read/write access. For more information, refer to the “About Admin Groups” section in the Infoblox NIOS Administrator Guide.
Permission hierarchy

1. **User**: A user can be part of multiple groups.
2. **Group**: A group can have many roles.
3. **Role**: Each role consists of specific resource permissions.

Required permissions

The ServiceNow Infoblox activity pack requires appropriate read and read/write privileges for these resources:

- Network
- DHCP
- DNS
- IPAM

This example shows a default DHCP admin role, its resources, and the related permissions for each.
Infoblox permissions

Infoblox DHCP activities

The Infoblox DHCP activities manage the IP addresses reserved for DHCP in your network. Use these activities to reserve, list, or delete IP addresses that are used for DHCP assignment in your network.

**DHCP Reserve IP v4 Address Range activity**

The DHCP Reserve IP v4 Address Range activity reserves an IP address range for DHCP use.

The DHCP activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > DHCP.

**Input variables**

**DHCP Reserve IP v4 Address Range input variables**

</table>

DHCP Delete IP Reservation activity
The DHCP Delete IP Reservation activity deletes IP reservations in DHCP using either an IPv4 or IPv6 address range.

An automation can obtain an Infoblox DHCP object to delete from either of these activities:
- DHCP List IP Reservations
- DHCP Reserve IPv4 Address Range

The DHCP activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > DHCP.

Input variables

DHCP List IP Reservations activity
The DHCP List IP Reservations activity generates a list of all the DHCP range reservations on a specific InfoBlox server.

The DHCP activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > DHCP.

### Infoblox DNS activities

The Infoblox DNS activities manage DNS records in your network using an Infoblox DDI Grid Server. Use these activities to register, list, or delete DNS records managed on an Infoblox server.

**List DNS C-records activity**

The List DNS C-records activity retrieves all canonical (CNAME) records from a specified Infoblox server.

The DNS activities use the REST web service activity template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the **Custom** tab, and then navigate to **Custom Activities > Infoblox DDI > DNS**.

DNS Delete activity

The DNS Delete activity deletes DNS records of any type from in Infoblox server, such as C and A records.

The DNS activities use the [REST web service activity](#) template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > DNS.

**Note:** It is faster to create a new record than recover one that has been deleted.

**Infoblox IPAM activities**

The Infoblox IPAM activities manage IP addresses in your network using an Infoblox DDI Grid Server. Use these activities to register, reserve, list, or delete IP addresses.

*IPAM Register IP Address activity*

The IPAM Register IP Address activity registers an IP address in a network using Infoblox IPAM.

The output of this activity produces an InfoBlox IP address record that can be used for other IPAM functions in the format fixedaddress/<encrypted key>:<reserved ip address>/<view>.

The IPAM activities use the [REST web service activity template](#) to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > IPAM.

**IPAM Reserve IP Address conditions**

<table>
<thead>
<tr>
<th><strong>Variable</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully reserved the specified IP address.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to reserve the specified IP address.</td>
</tr>
</tbody>
</table>

**IPAM List IP Reservations activity**

The IPAM List IP Reservations activity returns an array of all IP Address within the named InfoBlox Server.

The IPAM activities use the **REST web service activity template** to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the **Custom** tab, and then navigate to **Custom Activities > Infoblox DDI > IPAM**.

**Infoblox network activities**

The Infoblox network activities manage networks using an Infoblox DDI Grid Server.

Use these activities to create, list, or delete networks on an Infoblox server.

**Create Network activity**

The Create Network activity creates new networks on a specified Infoblox server.

The network activities use the [REST web service activity template](#) to manage network addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the **Custom** tab, and then navigate to **Custom Activities > Infoblox DDI > Network**.

**Input variables**

Get Network Details activity

The Get Network Details activity retrieves the information about a specific network on an Infoblox server.

The network activities use the REST web service activity template to manage network addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > Network.

Input variables

</table>

  - **reference**: Reference value for the network requested. This value is in the form of `network/2G5zLm51dHdvcmskMTAuM54wLjAvMTYvMA:10.1.0.0%2F1`
  - **options**: The **options** array contains these attributes:
    - **name**: Name of the network option returned, such as `domain-name-server`.
    - **num**: Index number of the option. For example, the index for `domain-name-server` is 6.
    - **use_option**: Indicates whether a DHCP option is used at that level in the network hierarchy. Set this value to `True` to override the Grid Level DHCP option with this option at the network level.
    - **value**: Value to use for this option. For example, the value for the `domain-name-server` option is the IP address of the server machine.
    - **vendor_class**: The class of the network object. The options are `DHCP`, `DNS`, or `IPAM`.

PowerShell activity pack

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications.

Orchestration provides custom PowerShell activities that were created with the PowerShell activity designer template. These activities perform the same functions as PowerShell activities by the same name from previous releases and replace those activities for all new workflows. These custom activities give workflow administrators the ability to store input and output variables in the databus.

Note: Existing workflows from earlier versions that were created with legacy PowerShell activities continue to function normally after an upgrade to Geneva. However, all new workflows must use these custom PowerShell activities.

To use the PowerShell custom activities, you must request activation of the Orchestration - PowerShell plugin. These activities are available in the workflow editor on the Custom tab. Expand the Custom Activities tree and select the PowerShell category for the activity you want to use.

ServiceNow supports PowerShell 2.0 and above. PowerShell 3.0 does not support Windows 2003 Server.

PowerShell activity designer

PowerShell activities are configured to return data to a workflow from a host using Microsoft PowerShell.

You must purchase Orchestration to use this template. For specific information about using the tools in the activity designer, refer to these resources:

- Orchestration activity designer
- Create input variables
- Create a parsing rule

ServiceNow supports PowerShell 2.0 and above. PowerShell 3.0 does not support Windows 2003 Server.

PowerShell protocols and troubleshooting

PowerShell uses the Windows Management Instrumentation (WMI) and Windows Remote Management (WinRM) protocols to enable Orchestration activities to run commands on remote Windows hosts.

Windows Management Instrumentation (WMI)

WMI provides a uniform interface for any local or remote applications or scripts that obtain management data from a computer system, a network, or an enterprise. WMI contains these components:

- Managed objects and WMI providers: A WMI provider is a COM object that monitors one or more managed objects for WMI. A managed object is a logical or physical enterprise component, such as a hard disk drive, network adapter, database system, operating system, process, or service.
- WMI infrastructure: The WMI infrastructure is a Microsoft Windows operating system component know as the WMI service (winmgmt). The WMI infrastructure is composed of the WMI Core and the WMI repository. The WMI repository is organized by WMI namespaces. The WMI service creates namespaces, such as root\default, root\cimv2, and root\subscription, at system startup and preinstalls a default set of class definitions, including the Win32 Classes, the
WMI System Classes, and others. The remaining namespaces found on your system are created by providers for other parts of the operating system or products.

- **WMI consumers**: A WMI consumer is a management application or script that interacts with the WMI infrastructure. A management application can query, enumerate data, run provider methods, or subscribe to events by calling either the COM API or the Scripting API for WMI.

### WMI installation and configuration

For the MID Server to successfully make a remote connection to the target host, TCP port 135 must be open. The Windows firewall automatically creates an inbound rule for WMI connectivity called Windows Management Instrumentation (DCOM-In).

### Windows Remote Management (WinRM)

WinRM is the Microsoft implementation of WS-Management Protocol, a standard Simple Object Access Protocol (SOAP) protocol that allows hardware and operating systems from different vendors to interoperate.

WinRM contains these components:

- **WinRM Scripting API**: This scripting API enables Orchestration to obtain data from remote computers, using scripts that perform WS-Management protocol operations.
- **WMI Service**: The WMI service continues to run side-by-side with WinRM and provides requested data or control through the WMI plug-in. You can continue to obtain data from standard WMI classes, such as Win32_Process.

### WinRM configuration

WinRM is automatically installed on Windows 2008 R2 and above operating systems, but must be configured before use.

1. In a command prompt, enter `winrm quickconfig`. This command is not case sensitive.
2. When the console displays "Make these changes (y/n)?", enter `y`.

   The `winrm quickconfig` command performs the following operations:

   - Starts the WinRM service, and sets the service startup type to `auto start`.
   - Configures a listener for the ports that send and receive WS-Management protocol, using either HTTP or HTTPS on any IP address.
   - Creates a firewall exception for the current user profile.

### MID Server PowerShell files

PowerShell functions are stored in script files (*.ps1) that use a PowerShell Script module (*.psm1) file name extension.

The PowerShell functions are used by the PowerShell MID Server script files included in these activity packs:

- Active Directory
- Exchange
- SCCM
- PowerShell
PSScript.ps1

This script performs a number of tasks, such as credential testing, password encryption, and the execution of scripts configured in the Orchestration Activity Designer or in MID Script Files. However, this document focuses on how PSScript.ps1 uses the credential.psm1 module for testing access to remote hosts.

The PowerShell variables are generally used directly in the PowerShell execution command or as arguments in the MID Server script file you specify. There are special variables that are passed to PSScript.ps1, such as credType.
PowerShell credTypes

The PowerShell credential types:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WMI</td>
<td>testCredentialWMI</td>
</tr>
<tr>
<td>Exchange</td>
<td>testCredentialExchange</td>
</tr>
<tr>
<td>AD</td>
<td>testCredentialAD</td>
</tr>
<tr>
<td>SCCM</td>
<td>testCredentialSCCM</td>
</tr>
</tbody>
</table>

If no credential type is passed to the PSScrip.ps1 script, the MID Server defaults to the WMI test function to test access to the target host. If there is a credential type used, the MID Server runs the corresponding test function for that credential type.

Exit codes

These exit codes are returned from the PSScript.ps1 script and logged in the MID Server log file.

<table>
<thead>
<tr>
<th>PSScript.ps1 exit codes</th>
<th>Test function</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>PowerShell command/script ran successfully.</td>
</tr>
<tr>
<td>1</td>
<td>Test finished successfully, but the command/script failed to execute.</td>
</tr>
<tr>
<td>2</td>
<td>Incorrect syntax passed to script.</td>
</tr>
<tr>
<td>3</td>
<td>All credentials including MID Server service account failed to execute the command/script.</td>
</tr>
<tr>
<td>4</td>
<td>Passed test and executed the activity, but an error was returned. Example user cannot be found.</td>
</tr>
</tbody>
</table>

Credentials.psm1

The MID Server uses this module file to test access to a target host. The MID Server loops through all Windows credentials stored in its credentials table using the following access type functions, unless the PowerShell activity has a credential type (credType) defined. All ServiceNow® authored PowerShell activities are hardcoded to use a specific credential type. As a result, the MID Server only tests credential access against the designated function.

PowerShell test functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>testCredentialWMI</td>
<td>Tests the given user and password on the target host using the Get-WMI object.</td>
</tr>
<tr>
<td>testCredentialAD</td>
<td>Tests the given user and password on the target host using the built-in DirectoryEntry object.</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>testCredentialExchange</td>
<td>Tests the given user and password to create a session on an Exchange host. This test uses the built-in PowerShell remoting feature on a remote host. WinRM is configured on Exchange servers by default.</td>
</tr>
<tr>
<td>testCredentialSCCM</td>
<td>Tests the given user and password to create a session on an SCCM server. This test uses the built-in PowerShell remoting feature on a remote host. This requires WinRM to be configured.</td>
</tr>
<tr>
<td>testNoCredentialAccessWMI</td>
<td>Tests the given user and password on the target host, using the Get-WMI object. This test is used when no credType is used.</td>
</tr>
</tbody>
</table>

**Note:** If the test passes using one of these functions, that credential is used to run the PowerShell script/command. If the tests fail to access the target host using these functions, the MID Server runs the PowerShell script/command under the account of the MID Server service.

This diagram illustrates the dependency of the credential selection behavior on the host being targeted by the PowerShell activity. If the target host is the IP address or host name of the MID Server, the MID Server bypasses all credentials in the Credentials table and uses the account of the MID Server service. If the target host is not the MID Server, then all Windows credentials are used first. If all credentials in the Credentials table are unsuccessful in running the PowerShell activity, then the MID Server uses the MID Server service account.
PowerShell credential selection criteria
ActiveDirectory.psm1

This module file stores the functions used by the PowerShell scripts shipped with the Active Directory activity pack.

Exchange.psm1

This module file stores the functions used by the PowerShell scripts shipped with the Exchange activity pack.

SCCM.psm1

This module file stores the functions used by the PowerShell scripts shipped with the SCCM activity pack.

Set up credential tags for a PowerShell activity
Credential tagging gives an administrator more control over the credentials used in a PowerShell activity.

Role required: admin, activity_creator or workflow_admin

Tagging is useful when the activity requires specific credentials to perform a task. By populating the Credential tag field you are telling the activity to use a credential that has a specific tag set for it. Additionally, credential tagging allows you to use a different underlying credential in development, testing, and production systems without having to change the activity for a given target system. For example, you can use the SCCMCred tag and have it point to both a development and test instance.

1. Navigate to Orchestration > Credentials.
2. Select the credential you want to tag.
3. Enter a unique name in the Tag field that is descriptive of the credentials purpose.
4. Click **Update**.
5. Open the Workflow Editor and select the PowerShell activity you want to tag.
6. In the activity's Execution Command, add the name of the tag you created to the **Credential tag** field.
**PowerShell troubleshooting**

Authentication and access denied errors can prevent PowerShell activities from running a command on a target host.

Use these procedures for troubleshooting authentication failures with Orchestration PowerShell activities and when the Remote Procedure Call (RPC) server is unavailable or when access is denied. The authentication failure error displays when all credentials, including those of the local MID Server service account, do not have the correct permissions to run the Powershell script/command. The same error displays when the target host is unreachable.

**Authentication error message**

Authentication failure in an Active Directory activity

This example uses the Create AD Object activity to illustrate troubleshooting authentication failure in PowerShell.

Role required: Permissions to access and create accounts on Active Directory

Validate that the account you are using has the proper permissions to run the activity.

1. Log on to the target machine using the account under which you want to run the activity.
   Active Directory tools must be installed on this machine.
2. Launch the Active Directory Users and Computers application.
3. Navigate to the OU under which you want to create the Active Directory object.
4. Attempt to create the object.

   If this procedure is successful under the specified user, the following might be the cause of the authentication failure:
   - User name is invalid.
   - Password entered incorrectly.
   - Domain controller is unreachable.

**Note:** The majority of the return codes listed in the MID Server log for this error are 1s and 3s. This is because the Active Directory activities use the ADSI provider and not WMI or WinRM. An error code of 1 means the account was able to connect with the test account, but running the script failed.
An error code of 3 means that the MID Server attempted to run the PowerShell activity under the MID Server service account but failed.

Authentication failure in an Exchange activity

This example uses the Create Mailbox activity to illustrate troubleshooting authentication failure in PowerShell.

Role required: Permissions to access and create mailboxes on the Exchange server

1. Validate that the account you are using has the proper permissions to run the PowerShell activity.
2. Log on to a machine that has the Exchange Management Shell (EMS) installed.
3. Create a user using the `New-mailbox` Exchange commandlet.
Creating a new user in Exchange

If this procedure is successful under the specified credential, the following is the likely cause of the failure:

- User name is invalid.
- Password entered incorrectly.
- Exchange server is unreachable.

4. If the Exchange server is unreachable, examine the MID Server logs. Because the Exchange activities use WinRM to access the Exchange server, the logs can provide more troubleshooting information.

**Note:** Ensure that the error is NOT WinRM cannot process the request.

Remote Procedure Call (RPC) server unavailable or access denied

Typically, this error is logged when running a PowerShell script/command that uses WinRM or WMI.

**Possible causes of error**

The target host might have one of these issues:

- WinRM isn’t configured.
- Firewall is blocking access to the host over TCP port 135 (WMI) or HTTP/HTTPs and TCP port 5985 (WinRM).
- Kerberos issue, caused by hopping to multiple hosts using WMI.
Example WinRM error

The Create Mailbox activity from the Exchange activity pack has generated an error in the ECC queue involving authentication using the MID Server service credential. This occurred because the MID Server credential is the last to be used if the targeted host is not the MID Server.

Response

Authentication failure with the local MID server service credential.

Authentication failure error message

The MID Server log shows that the MID Server tried to run the activity under specific credentials, but wasn’t successful and received an exit code of 1.

MID Server error code

```
Attempting to use credential with username 'service-now\joel.zama' Running command: --> C:\windows\System32\WindowsPowerShell\v1.0\powershell\PSScript.ps1' -computer '10.11.129.140' -script 'C:\Users\x.ps1' -useCred $true -isDiscovery $false -debug $true; exit $LAST Thread name is Powershell is executing...

```
Join Domain activity

The Join Domain activity joins a Windows computer to a domain.

If the computer is already a member of a domain, this activity completes without modifying the computer. Joining a domain requires a username and password. This user must have domain administration privileges or privileges to join a computer to the domain.

Note: This activity replaces a PowerShell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

**Install Windows App activity**

The Install Windows App activity installs an application from an MSI package on a Windows target machine.

**Note:** This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the [PowerShell activity designer](https://www.servicenow.com), which gives workflow administrators the ability to store input and output variables in the [databus](https://www.servicenow.com).

**Input variables**

**Install Windows App input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>Hostname or IP address of the target Windows machine on which the service is installed. Use the Resolve DNS <a href="https://www.servicenow.com">MID Server capability</a> to resolve hostnames into IP addresses.</td>
</tr>
<tr>
<td>installerpath</td>
<td>Path to the installer. The installer can be on any machine that is visible to both the MID Server and the target machine (local drive, UNC path, mapped drive, etc.).</td>
</tr>
<tr>
<td>installer</td>
<td>Name of the installer file, such as winzip150.msi. The installer must be an MSI package.</td>
</tr>
<tr>
<td>arguments</td>
<td>The parameter that contains the command line arguments to the MSI package. These are name=value pairs, separated by a space. For example, the argument might appear as: INSTALLDIR=c:\myinstallfolder ADDDESKTOPICON=0. These arguments are dependent on the what the actual MSI being installed defines. If there are no arguments, leave the field empty.</td>
</tr>
</tbody>
</table>

**Output variables**

**Install Windows App output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>Either <strong>success</strong> or <strong>failure</strong>.</td>
</tr>
</tbody>
</table>
### Conditions

The activity state tells the workflow engine what to do with the activity.

#### Install Windows App conditions

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The Windows application was successfully installed on the target machine.</td>
</tr>
<tr>
<td>Failure</td>
<td>The Windows application failed to install on the target machine.</td>
</tr>
</tbody>
</table>

#### Enable WMI Windows Installer provider

To install software on Windows machines using the Install Windows App activity, enable WMI Windows Installer provider on all target machines.

- It is recommended that the MID Server, the target machine, and the installer source machine be on the same Active Directory domain. However, if these computers are on separate domains, those domains must have a **trust relationship** established between them.
- If the installer path is a **UNC file sharing** machine, the Active Directory account of the target computer must be trusted for delegation. For instructions on this configuration, see the posting on the community for installing and uninstalling Windows applications.

**Note:** See [WMI Providers](#) for a list of Windows operating systems that provide this tool by default.

1. Open the Control Panel.
2. Go to **Add or Remove Programs**.
3. Select **Add/Remove Windows Components**.
4. Double-click **Management and Monitoring Tools**.
   - This action opens a secondary window displaying additional selections.
5. Select **WMI Windows Installer Provider** check box.
6. Click **OK** to return to the Windows Components Wizard window.
7. Click **Next**.
   - You might be asked for the Windows installation CD to complete this process.

### Change Service State activity

The Change Service State activity starts or stops a Windows service on a remote system.

This activity replaces a Powershell activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the **Powershell activity template**, which gives workflow administrators the ability to store input and output variables in the **databus**.
Input Variables

Change Service State input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>Hostname or IP address of the target Windows machine on which the service is installed. Use the Resolve DNS activity to resolve hostnames into IP addresses.</td>
</tr>
<tr>
<td>service</td>
<td>Name of the Windows service to start or stop. The service parameter is the service name, not the display name of the service affected.</td>
</tr>
<tr>
<td>state</td>
<td>There are two actions to select for a service state change: StartService or StopService.</td>
</tr>
</tbody>
</table>

Output variables

Change Service State output variables

<table>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The target service was successfully started or stopped.</td>
</tr>
<tr>
<td>Failure</td>
<td>The update to the target service was unsuccessful, or the service was not found on the target system.</td>
</tr>
</tbody>
</table>

Restart Windows Server activity

The Restart Windows Server activity stops and then restarts a Windows server using Powershell.

Note: This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the Powershell activity template, which gives workflow administrators the ability to store input and output variables in the databus.
### Input variables

**Restart Windows Server input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>

</tr>
</tbody>
</table>

### Uninstall Windows App activity

The Uninstall Windows App activity uninstalls an application from a Windows target machine.

The only applications that can be uninstalled using this activity are those that were installed by a Windows Installer.

**Note:** This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the [Powershell activity template](https:// servicenow.com), which gives workflow administrators the ability to store input and output variables in the **databus**.
Input variables

</tbody>
</table>

Probe activity pack

Orchestration provides an activity pack customized using the ServiceNow activity designer that runs probes on target hosts to return specific information.

These custom activities were built with the Create a probe activity, which gives workflow administrators the ability to store input and output variables in the databus.

To use the custom probe activities, you must request activation of the Orchestration - Probe plugin.

Resolve DNS Name activity

The Resolve DNS Name activity takes an IP address or a fully qualified domain name (FQDN), which it resolves into one or more IP addresses.

The domain name is sent through the MID Server to the domain name system (DNS) to resolve the name. If a single IP address is returned, it is stored in two variables: resolved_ip and resolved_ips.
If multiple IP addresses are returned, the first IP address is stored in the `resolved_ip` variable, and all the addresses are stored in the `resolved_ips` variable. If an IP address is provided instead of an FQDN, this address is output directly to both variables. Your ServiceNow instance must have access to a MID Server configured to use Resolve DNS to run this activity.

This activity replaces an activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the **Probe activity template**, which gives workflow administrators the ability to store input and output variables in the **databus**.

### Input variables

**Resolve DNS Name input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FQDN</td>
<td>The fully qualified domain name to resolve or an IP address.</td>
</tr>

<td>Activity failed to resolve the DNS name.</td>
</tr>
</tbody>
</table>

### SNMP Query activity

The SNMP Query activity queries an SNMP device.

Your ServiceNow instance must have access to a MID Server configured to use SNMP to run this activity.
This activity replaces an activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the Probe activity template, which gives workflow administrators the ability to store input and output variables in the databus.

### Input variables

**SNMP Query input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>Hostname or IP address of the SNMP device being queried.</td>
</tr>

</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully ran the query on the target device.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to run the query on the target device. Failure could be caused by invalid credentials or a device that is not accessible.</td>
</tr>
</tbody>
</table>

### SCCM activity pack

The Microsoft System Center Configuration Management (SCCM) activity pack provides Orchestration activities you can use to manage software deployments and collections on an SCCM server.
You can use SCCM Orchestration activities to deploy and revoke software from an SCCM server or manage user and device collections. The system manages software on an SCCM server using Orchestration activities and workflows.

Client software distribution requires:

- SCCM 2012 R2.
- Powershell 3.x.
- Powershell Remoting enabled.
- The Windows PowerShell x86 execution policy must be set to unrestricted mode.
- Latest version of the SCCM cmdlet library installed on the SCCM server.
- Use the credentials to log onto the SCCM Server and connect via Windows PowerShell from the System Center Configuration Manager console at least once to set the path variable for that credential.

### Activate SCCM activities

The Orchestration - System Center Configuration Manager plugin installs the SCCM activity pack that deploys software from an SCCM host and manages user and device collections.

The SCCM plugin is activated automatically when the Orchestration - Client Software Distribution (com.snc.orchestration.sccm_mgnt) plugin is activated, but can be activated separately.

**Note:** The activities in the SCCM plugin run in the System Center Configuration Manager scope.

1. In the IN Service Portal, click **Service Requests > Activate Plugin**.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.

| Reason/Comments | Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows. |

3. Click **Submit**.

### Configure the MID Server for SCCM activities

To use a MID Server with Microsoft System Center Configuration Management (SCCM) activities, configure it to communicate with the SCCM server.
Role required: admin

1. In the navigation filter, enter `cmdb_ci_dns_name.list`.
2. Click New.
3. Enter the fully-qualified domain name (FQDN) of the SCCM server in the Name field.
4. Right-click in the form header and select Save.
5. In the IP Address related list, click New.
6. In the IP Address field, enter the IP address of the SCCM server.
7. In the Nic field, select `eth0` or your preferred network interface controller.
8. Leave the Netmask field blank.
9. Click Submit.

### Add to Device Collection activity

The Add to Device Collection activity adds the specified device into a Microsoft System Center Configuration Manager (SCCM) device collection.

The Add to Device Collection activity uses the `Powershell activity template` to add a specified device to an SCCM device collection. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called `AddToDeviceCollection.ps1` to edit the collection.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities &gt; System Center Configuration Manager (SCCM).

![Note: The Add to Device Collection activity does not use pre-processing or post processing scripts.](image)

#### Input variables

</tr>
</tbody>
</table>

Add to User Collection activity

The Add to User Collection activity adds a user to a Microsoft System Center Configuration Manager (SCCM) user collection.

The Add to User Collection activity uses the *Powershell activity template* to access the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called *AddToUserCollection.ps1* to edit the collection.

To access this activity in the workflow editor, select the *Custom* tab, and then navigate to *Custom Activities > System Center Configuration Manager (SCCM)*.

*Note:* The Add to User Collection activity does not use pre-processing or post processing scripts.

Input variables

Add to User Collection input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sccmServer</td>
<td>The fully qualified domain name (FQDN) of the SCCM server.</td>

</table>

Get Applications activity

The Get Applications activity returns a list of all the applications available on a Microsoft System Center Configuration Manager (SCCM) server.

The Get Applications activity uses the Powershell activity template to access the applications on the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called GetApplications.ps1. This script filters the results of the GET, so that only specific attributes are returned for the applications on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable application data. The list of available applications is returned as an array in a JSON object.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > System Center Configuration Manager (SCCM).

Note: The Get Applications activity does not use a pre-processing script.

Input variables

Get Applications input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sccmServer</td>
<td>The fully qualified domain name (FQDN) of the SCCM server.</td>

</table>

Get Deployments activity

The Get Deployments activity returns the list of deployments performed by Orchestration using a Microsoft System Center Configuration Manager (SCCM) server.

The Get Deployments activity uses the Powershell activity template to access the deployments on the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called `GetDeployments.ps1` that returns the deployments on the host. This script filters the results of the GET, so that only specific attributes are returned for the deployments on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable deployment data. The list of available deployments is returned as an array in a JSON object.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > System Center Configuration Manager (SCCM).
Note: The Get Deployments activity does not use pre-processing scripts.

Get Device Collections activity

The Get Device Collections activity returns the list of available device collections on a Microsoft System Center Configuration Manager (SCCM) host.

The Get Device Collections activity uses the *Powershell activity template* to access the collections on the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called `GetDeviceCollections.ps1` that returns the device collections on the server. This script filters the results of the GET, so that only specific attributes are returned for the device collections on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable device collection data. The list of available collections is returned as an array in a JSON object.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > System Center Configuration Manager (SCCM).

*Note:* The Get Device Collections activity does not use pre-processing scripts.

Is Device in Collection activity

This activity verifies if a device exists in an SCCM device collection.

The Is Device in Collection activity uses the PowerShell activity template to verify if a specific device exists in an SCCM device collection. The activity is configured to use a MID Server with PowerShell capabilities and to run a MID Server script called IsDeviceInCollection.ps1 to perform the test.
To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > System Center Configuration Manager (SCCM).

**Input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sccmServer</td>
<td>The fully qualified domain name (FQDN) of the SCCM server.</td>

<td>Activity failed.</td>
</tr>
</tbody>
</table>

**Is User in Collection activity**

This activity verifies if a user exists in an SCCM user collection.

The Is User in Collection activity uses the PowerShell activity template to verify if a specific user exists in an SCCM user collection. The activity is configured to use a MID Server with PowerShell capabilities and to run a MID Server script called IsUserInCollection.ps1 to perform the test.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > System Center Configuration Manager (SCCM).

</table>

Remove from Device Collection activity

The Remove from Device Collection activity removes a device from a Microsoft System Center Configuration Manager (SCCM) device collection.

The Remove from Device Collection activity uses the *Powershell activity template* to remove a device from a device collection on a Microsoft SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called *RemoveFromUserCollection.ps1* to edit the collection.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > System Center Configuration Manager (SCCM).
Remove from Device Collection activity

The Remove from User Collection activity removes a user from a Microsoft System Center Configuration Manager (SCCM) user collection.

The Remove from User Collection activity uses the Powershell activity designer template to access a user collection on a Microsoft SCCM target host. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called RemoveFromUserCollection.ps1 to edit the collection.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > System Center Configuration Manager (SCCM).

</table>

SFTP File Transfer activity pack

Use the SFTP File Transfer activities to manage files and directories on an SFTP server and to move files from one SFTP server to another.

The SFTP activity pack includes scoped activities for common file transfer tasks and a ready-to-use workflow that includes these activities. Use the SFTP workflow to control which files are going to be moved, what conditions the files need to meet, the order in which the files are moved, and which overwrite options are executed.

Note: To use the SFTP File Transfer activities and workflow, you must request activation of the Orchestration - SFTP plugin.

SFTP File Transfer workflow

The SFTP File Transfer activity pack includes a scoped workflow that uses multiple activities to manage files on SFTP servers.
The maximum activity count for the SFTP File Transfer workflow is set to 10,000. This allows the workflow to move up to 1,000 files from one server to another.

**Accessing the workflow**

- Navigate to **Workflow > Workflow Editor** and select the **Workflows** tab.
- Click on the SFTP File Transfer workflow to open it.
- Click the information icon in the workflow header to display the properties dialog box.

**Input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source host</td>
<td>Name or IP address of the server containing the files you want to move.</td>
<td></td>
</tr>
<tr>
<td>Source port</td>
<td>Port number to use to communicate with the source server.</td>
<td>22</td>
</tr>
<tr>
<td>Source directory</td>
<td>Full path to the directory where the source files are located.</td>
<td></td>
</tr>
<tr>
<td>Source files</td>
<td>Names of specific source files to move. Separate the file names in this list with semi-colons. This field supports the use of wild cards. For information about how the values in this field are affected by options in other fields, see the section below the table.</td>
<td></td>
</tr>
<tr>
<td>Excluded files</td>
<td>Names of specific source files to exclude from the move. The system moves all other files found in the source directory or subfolders. Separate the file names in this list with semi-colons. This field supports the use of wild cards. For information about how the values in this field are affected by options in other fields, see the section below the table.</td>
<td></td>
</tr>
<tr>
<td>Target host</td>
<td>Name or IP address of the server to which the files are being moved.</td>
<td></td>
</tr>
<tr>
<td>Target port</td>
<td>Port number to use to communicate with the target host.</td>
<td>22</td>
</tr>
<tr>
<td>Variable</td>
<td>Description</td>
<td>Default value</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------------</td>
</tr>
<tr>
<td>Datetime format</td>
<td>Timestamp format to apply when the $[DateTime]$ variable is used in the <strong>Target directory</strong> or <strong>Target files</strong> field. The system uses the current time from the instance to create timestamp values.</td>
<td>yyyy-MM-dd</td>
</tr>
<tr>
<td>Target directory</td>
<td>Path to the directory in the target host where the files are being moved. You can specify a target directory whose name includes the timestamp by adding the $[DateTime]$ variable to the directory name. For example, you might enter this path to a target directory: <code>/user/jacinto.gawron/documents/projects_ $[DateTime]</code>. This produces the <code>projects_20150505</code> directory. When the timestamp variable is used, the system uses the format specified in the <strong>Datetime format</strong> field.</td>
<td></td>
</tr>
</tbody>
</table>
| Target file         | Format to use for target file names when a timestamp is added. You can configure the system to add the timestamp as a prefix to the file name or insert the timestamp into the name, using these variables:  
  - $[DateTime]$: Current timestamp, using the format defined in the **Datetime format** field.  
  - $[SourceFile]$: Complete file name.  
  - $[SourceFile:Base]$: Base file name without the extension.  
  - $[SourceFile:Ext]$: File extension only.  
  A target file name with the timestamp added as a prefix is expressed as: $[DateTime]_ $[SourceFile]$. This produces a file name that looks like this: `20150505_file1.txt`.  
  A target file name with the timestamp inserted into the name is expressed as: $[SourceFile:Base]_ $[DateTime][SourceFile:Ext]$. This produces a file name that looks like this: `file1_20150505.txt`. |                |

</tr>
</tbody>
</table>

**File selection logic**

When selecting the files to move from the source host, the system uses this logic:

- **If the Source files and Excluded files fields are empty, the system moves all the files in the source directory.**
- **When the Include subfolders check box is selected, the following dependencies exist:**
  - If no files are specified in the Source files and Exclude files fields, the system moves all files in the source directory and all files in all subfolders of the source directory.
  - If the Source files field contains file names, the system moves those files from their location on either the source directory or any of its subfolders.
  - If the Exclude files field contains file names, the system moves all the files from the source directory and its subfolders except those excluded files.
- **When the Include subfolders check box is cleared, the system looks only in the source directory for files to move or exclude.**

**Copy File activity**

The Copy File activity copies a file from an SFTP server (source host) to another SFTP server (target host).

**Input variables**

**Copy File input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sourceHost</td>

</tbody>
</table>
Conditions

Rename File or Directory conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The activity succeeded in renaming the file or directory.</td>
</tr>
<tr>
<td>Failure</td>
<td>The activity failed to rename the file or directory.</td>
</tr>
</tbody>
</table>

Set File Attributes activity

The Set File Attributes activity sets common file attributes, such as timestamps, size, permissions, and UID/GID, for a file or directory on an SFTP server.

A good practice is to use the Get File List activity to return a list of files and their attributes first. Then, when you moved a file from a source host to a target host, use the Set File Attributes activity to set the source file attributes on the target file. This is demonstrated in the SFTP File Transfer workflow.

Input variables

Set File Attributes input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sourceHost</td>
<td>Name or IP address of the server containing the file or directory whose attributes you want to change.</td>
</tr>
<tr>
<td>sourcePort</td>
<td>Port number to use to communicate with the target server. The default port number is 22.</td>
</tr>
<tr>
<td>sourceFilePath</td>
<td>Full path to the file or directory whose attributes you want to change.</td>
</tr>
<tr>
<td>userID</td>
<td>User ID attribute to apply to the file or directory. The UID and GUID variables must be set together as a pair.</td>
</tr>
<tr>
<td>groupID</td>
<td>Group ID attribute to apply to the file or directory. The UID and GUID variables must be set together as a pair.</td>
</tr>
<tr>
<td>permissions</td>
<td>File or directory permissions to set for the user and group specified. This value must be expressed as an integer, such as 16877, which defines these permissions: rwxr-xr-x.</td>
</tr>
<tr>
<td>accessTimestamp</td>
<td>Override the timestamp when the file or directory was last accessed. The access and modification timestamps must be set together as a pair.</td>
</tr>
</tbody>
</table>

Note: The permissions number is an internal value returned by the Get File List activity.
### Variable Description

</tr>
</tbody>
</table>

### SSH activity pack

Orchestration provides an activity pack of SSH activities that were customized using the ServiceNow activity designer.

These activities perform the same functions as SSH activities by the same name from previous releases and replace those activities for all new workflows. The custom SSH activities were built with the [Create an SSH activity](#), which gives workflow administrators the ability to store input and output variables in the databus.

**Note:** Existing workflows from earlier versions that were created with legacy SSH activities continue to function normally after an upgrade to Geneva. However, all new workflows must use these custom SSH activities.

To use the SSH custom activities, you must [request activation](#) of the Orchestration - SSH plugin.
Secure Copy activity

The Secure Copy activity copies a file from one host to another, without storing the copied file on the MID Server.

This activity replaces an SSH activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity designer template, which gives workflow administrators the ability to store input and output variables in the databus.

### Files Compare activity

The Files Compare activity compares two files on a Linux or UNIX computer.

This activity replaces an SSH activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the [SSH activity designer template](#), which gives workflow administrators the ability to store input and output variables in the databus.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > Global > Orchestration - SSH.

File Read activity

The File Read activity reads a file on a Linux or UNIX computer.

This activity replaces an SSH activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the [SSH activity designer template](#), which gives workflow administrators the ability to store input and output variables in the databus.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > Global > Orchestration - SSH.

## File Write activity

The File Write activity writes a file on a Linux or UNIX computer.

The source file can be an absolute or relative path from the Directory. If an absolute path is used, then no value is required in the Directory field.

This activity replaces an SSH activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity template, which gives workflow administrators the ability to store input and output variables in the databus.

## Input variables

</table>

File Copy activity

The custom File Copy activity copies a file on a Linux or UNIX computer.

This activity replaces an SSH activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity designer template, which gives workflow administrators the ability to store input and output variables in the databus.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities > Global > Orchestration - SSH.

File Replace String activity

The File Replace String activity finds and replaces a string in a file on a Linux or UNIX computer. This activity replaces an SSH activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity template, which gives workflow administrators the ability to store input and output variables in the databus.

</table>

Reset Linux User Password activity

The Reset Linux User Password activity resets the password for a given user on a Linux computer. This activity requires that the user executing the command be able to run the `chpasswd` command and, if expiring the password immediately, to run `chage` with `sudo privileges`.

This activity replaces an SSH activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Reset Linux User Password input variables

<table>
<thead>

</tbody>
</table>

Global activities

Global activities are Orchestration activities created in the global scope.

Any activities you create in the global scope are listed in the Global category in the Packs and Custom tabs of the Workflow Editor.
Test Server Alive activity

The Test Server Alive activity determines if a target system is alive by its response to a particular protocol.

This activity replaces an activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will
continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the *Probe activity template*, which gives workflow administrators the ability to store input and output variables in the *databus*.

### Input variables

**Test Server Alive input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>port_probes</td>
<td>A comma separated list of protocols to use to check for signs of activity on the target machine (example: <code>wmi,wins,https,ssh,http,https,snmp,dns</code>)</td>
</tr>
<tr>
<td>hostname</td>
<td>Hostname or IP address of the target system to check.</td>
</tr>
</tbody>
</table>

### Output variables

**Test Server Alive output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alive</td>
<td>Code that indicates whether or not the server is alive. If any value but '1' is returned, the server is not alive.</td>
</tr>
</tbody>
</table>

### Conditions

**Test Server Alive conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity determined that the device is running.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to determine if the target device is running. Failure could be caused by a missing protocol or a device that is not accessible.</td>
</tr>
</tbody>
</table>

### Orchestration activity designer

The Orchestration activity designer enables a user with either the workflow_admin or activity_creator and workflow_creator roles to construct reusable activities that suit an organization’s business needs.

Activities created by the activity designer offer the following advantages over core activities offered in previous releases:

- Reuse *custom activities* in multiple workflows.
- Upload and download custom activities from the ServiceNow Store.
- Parse data from standard input formats.
- Test input variables against a target host or endpoint and inspect the payload.
• Automatically map values from a test payload to an activity’s output variables.
• Share data between activities.
• View previous versions of an activity.

Access to the activity designer requires activation of ServiceNow Orchestration. For instructions about managing transitions and conditions for all activities, see Workflow activities.

Orchestration provides numerous pre-defined activities, which are reusable components that can be used in numerous workflows without having to understand the complexities of the underlying system. These activities are grouped into activity packs, which address specific business needs, such as Active Directory, Azure AD, Exchange, Infoblox DDI, and PowerShell. There are other ServiceNow applications which provide and maintain their own separate activity packs, such as Security Incident Response, Cloud Management, or Release Automation.

Customers can also build their own activities and activity packs. You can construct custom activities with a specified template through the Orchestration Activity Designer. Custom-built activities built with the Activity Designer are referred to as activity elements. Activity elements provide optimal operations, enable code reuse, and minimize the need to write code. They also enable you to follow the flow of data within a given workflow across orchestration activities. Incorporating activity elements limits the dependency on the scratchpad which reduces problems in complex workflows. Limit the use of core activities, like ‘Run Script’, unless you need direct access the scratchpad, for example, for a counter. Activity elements do not have direct access to the scratchpad. You can, however, pass scratchpad variables as inputs into your activities.

Orchestration activities created by the activity designer:
• Can be uploaded and shared in the ServiceNow App Store
• Use the databus, which allows the activity to have well-defined inputs and outputs
• Share data across activities within a workflow
• Use versioning
• Provide a consistent approach for activity development regardless protocol

Note: Prior to the Fujirelease, activities were built with Activity Definitions. In Fuji, a new architecture was introduced using the Activity Designer. Orchestration Core activities, built originally as Activity Definitions, have been converted to use the new template format (Activity Elements) and the databus offered with the activity designer. Workflows in upgraded instances that use legacy activities continue to work normally.

For instructions on using activities to construct a workflow, see Add an activity to a workflow.

Using credentials with Orchestration

Orchestration activities require credentials to their respective applications to access resources.

Before you can execute Orchestration activities, you must create and configure the corresponding credentials. The type of activity template you use can present different options for your credential configuration. For example, a REST or SOAP activity can use the credentials on the REST or SOAP message record. You can also override certain credentials with credentials configured in the central credential store. If support for OAuth or WS-Security is required, you must use the credentials on the SOAP or REST message record.

Some activity templates, such as PowerShell, SSH, JMS, and SFTP, provide support for resolving credentials through credential tagging. Tagging decouples the credential from an Activity Definition, the credential then resolves based on your environment configuration. This facilitates an easier experience to promote content to a production environment, share content, or publish content to the ServiceNow store. You should always employ credential tagging if it is available.
Syncing to MID: Any change to credential triggers a notification to MID to download latest credentials. This happens almost immediately but as always with any syncing mechanism expect a little bit of delay MID server service account vs Remote credentials. For AD/exchange activities, use credentials of user with right access to domain controller.

You should use the central Credentials table, when possible. The Credentials table provides security through ACLs, which require a credential_admin role to access the credentials table. There is also support for on-premise credential stores. The table stores the following:

- Basic authentication credentials (REST and SOAP activities)
- Cloud Management credentials (AWS communications)
- JDBC credentials (Database communications through JDBC driver)
- JMS credentials
- SNMPv3 credentials
- SSH credentials (Target instance communications)
- SSH private key credentials form
- VMware credentials
- Windows credentials (PowerShell communications)

**Credential tagging for Orchestration activities**

Credential tagging gives an administrator more control over the credentials used in Orchestration activities.

This is useful when an activity requires specific credentials to perform a task. You can use a credential tag to assign individual credentials to any activity in a Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow.

Credential tagging interacts with **credential affinity** to determine which credentials should be used for an Orchestration activity.

**How credential tagging works**

A **business rule** called Insert Discovery Affinity (renamed from Insert Credential Affinity in the Geneva release) runs when a record is inserted into the ECC Queue. This rule determines whether a credential affinity exists for the device and identifies the proper credential_id (the sys_id of the record in the Credentials [discovery_credentials] table) to use. When the platform encounters an affinity with a credential tag value defined (credential_tag in the business rule), the business rule determines if the credential referenced by the affinity has the specified tag. If it does, the business rule selects the credential_id of the tagged credential and passes that value to the MID Server. If the credential does not have the specified tag, any other affinities that exist for the target system will be checked. If no affinity references an appropriately tagged credential, the MID Server iterates through the Credentials (discovery_credentials) table and selects the credential with the appropriate tag. The MID Server then creates a new affinity for this credential.

Create custom activities using custom activity designer templates

You can create and update different types of custom activities in the Workflow Editor using a custom template.

Roles required: workflow_admin or activity_creator
The Activity Designer contains common steps which are applicable to all the activities that you create. This procedure guides you through the common steps and the order they should be set up. You specify an activity template before you create a custom activity.

1. Navigate to **Orchestration > Workflow Editor**.
   - The **Welcome** tab of the Workflow Editor opens.

2. On the **Custom** tab in the palette, click + to create a new activity select the appropriate **template** from the list.

   ![Activity Designer form](image)

   The Activity Designer form appears, with a stage indicator at the top. All new activities start at the **General** stage. The current stage shows with a blue underscore.

3. Add the **general properties**.
   - This information is standard for each custom activity, include a name, description, and other related information.
4. Create the template **Create input variables** for the template. Create the variables to pass into the activity in the Inputs form of the activity designer.

5. Optional: Add a **pre-processing script**. For input validation or transforming input data, you might need a pre-processing script.

   **Note:** This step is not included in the Run Script activity.

6. Click **Continue** to open the **Execution Command** form, then fill out the **Execution Command** step based on the corresponding execution templates:
   - Create a SOAP web service activity
   - Create a JDBC activity
   - Create a JavaScript Probe activity
   - Create a PowerShell activity
   - Create a REST web service activity
   - Create a Probe activity
   - Create an SFTP activity
   - Create a Run Script activity
   - Create an SSH activity
   - Create a JMS activity

7. Optional: **Test your inputs**.

8. Optional: In the Outputs form, define local and/or output variables. Local variables can be used for temporary storage when cascading parsing rules. For example, you might extract an XML payload from within a JSON payload. A local variable can access the XML document and use that as a source for another parsing rule. The graphic shows a Local1 variable source to parse data for Output2.

![Define local variable](image)

9. Use one of the options to assign values to Outputs:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parsing rule</td>
<td>You can create a parsing rule and map them to the output fields by dragging and dropping the variables into the <strong>parsing rules</strong> structure. The REST, SOAP, and JDBC templates provide auto-mapping to create the parsing rules automatically. If available from the test inputs form, auto-mapping should be used when possible.</td>
</tr>
</tbody>
</table>
### Option Description

**Post-processing**

Post-processing scripts allow you to code your own output data validation, output parsing code, and related tasks. Post-processing executes after the execution command results have been returned and before the parsing rules and conditions are run. Click [Go to Post-Processing (Advanced)] to create a post-processing script.

**Note:** If you create a script, this step reflects as a stage in the indicator.

#### 10. Click Continue to open the **Conditions** form to create exit condition rules for your activity and then click Save.

### General properties for activity designer templates

The following General Property fields are common to all activity designer templates.

**General Property fields common to all activity designer templates**

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name of the activity. Select a unique name that makes the activity easily identifiable in the palette. If you do not name the activity, it is identified in the Data tab of the workflow editor with an index number when it is added to a workflow. This index reflects the order in which the custom activity was added to the workflow. Only custom activities and their output variables appear in the Data tab.</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of what the activity does.</td>
</tr>
<tr>
<td>Image</td>
<td>Icon that identifies an activity of this type in the workflow palette.</td>
</tr>
<tr>
<td>Execution template</td>
<td>Predefined template selected for this activity.</td>
</tr>
<tr>
<td>Application</td>
<td>Current scope set on the instance. To view the scope, click the gear icon on the right side of the title bar in any record or list and look at the value in the Application field. The activity runs in this scope within a workflow. You cannot view or change the scope for the instance in the workflow editor.</td>
</tr>
</tbody>
</table>
| Accessible from               | Accessibility setting for this activity, by scope. The following options are available:  
  - All application scopes: This activity is available to all application scopes.  
  - This application scope only: Use of this activity is restricted to the scope named in the Application field.                                                                                           |
| Category                      | Category for this activity in the Custom and Packs tabs. All categories are listed under their scope in the collapsible hierarchy.                                                                  |
Create input variables

Create the variables to pass into the activity in the Inputs form of the activity designer. You must name your activity in the General form before you can advance to the Inputs stage. Roles required: workflow_admin or activity_creator

**Note:** Variable strings in the Inputs form have a 255 character limit.

1. Click the + icon to create a new input variable.
   The designer creates a default variable called Input1.

2. Type your new variable name in the field.
3. To change the name of a variable or any of its attributes, double-click the value and then select or enter a new value in the field that appears.
4. Configure your variable using these fields:
Variable configuration

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Data type for this variable. Double-click on the field to display the choice list. In addition to the usual data types, you can create input arrays and encrypt individual variables that contain sensitive data. Encrypted variables are passed to the ECC Queue and then decrypted by the MID Server when they run on the target host. Sensitive data returned from running these variables on the host can then be passed to another activity through encrypted output variables.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Marks an input variable as mandatory. Variables marked as mandatory are required fields in the properties form for the activity in the workflow. The input testing feature allows you to filter on mandatory variables.</td>
</tr>
<tr>
<td>Default</td>
<td>Default value for this input variable. Default values are prepopulated for variables in the properties form for the activity in the workflow. You can override this value when you test the variables.</td>
</tr>
</tbody>
</table>

5. To reorder the variable list, select a row and then drag the row to its new location. When you select a row to move it, the pointer icon changes to an up/down arrow icon.

6. To delete a variable, click the delete icon (−) in the row.

7. Click Continue to advance to the Execution Command stage or click Go to Pre-Processing (Advanced) to create a script that runs before the activity executes.

Map an input variable
After you create the input variables, map them to the fields in the Execution Command form.

Role required: activity_admin, activity_creator
These fields contain values required by the target host or endpoint to authenticate and query for data. Included in this example are fields for a command to run on the target and the MID Server to use, if one is required.

To map a variable, drag it into the appropriate field.

The designer automatically expresses the variable in the syntax the system requires.
Configure the PowerShell execution command

Use the input variables you created to configure the command that Orchestration executes on the Windows target machine.

Create the input variables you need in the **Inputs** form before you can advance to the **Execution Command** stage.

Role required: activity_creator, admin

**Note:** You can test the PowerShell connection between the MID Server and the target computer without having to run the activity in a workflow context. For details, see [test template outputs](#).

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
PowerShell execution command

2. Complete the fields shown in the table.

**PowerShell command fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. <em>Create variables</em> to map to available fields.</td>
</tr>
<tr>
<td>Target host</td>
<td>Host name or IP address of the target server for this PowerShell activity.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Script type              | Type of script to run on the PowerShell host. Available options are:  
  * Custom Powershell command  
  * MID Server script file  

| MID Server script file   | MID Server script file to run. This field is available when the **Script type** selected is MID Server script file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Command                  | Command that this activity runs on the target host. This field is available when the **Script type** selected is Custom Powershell command. You can drag and drop input variables from the variable builder into this field to create your command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Powershell variables     | Name-value pairs to pass to the host with PowerShell. You can create these variables manually, or drag input variables into the **Value** field. Encrypted input variables retain their encryption, regardless of the data type settings in this field. If you type in a value and select the **Encrypted** data type, your value appears in plain text in this field and is only encrypted when it passes to the ECC Queue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Use MID service account  | Forces this activity to authenticate on the target host using the credentials of the MID Server service account only, without trying any other credentials. When this check box is selected, the **Credential tag** field is not available.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Credential tag           | Specific **credential tag** this activity must use to run Powershell commands on the host. If this field is left blank, the MID Server tries all the available credentials until it finds a valid one, ending with the MID Server service account. If a credential tag is defined, the MID Server tries the credentials for that tag only and does not try the MID Server service account. This field is not available when the **Use MID service account** check box is selected.                                                                                                                                                                                                                                                                                                                                                                              |
| Required MID Server capabilities | MID Server to use for querying Powershell, by capabilities. By default, the system selects a PowerShell MID Server.  

3. Click **Save**.  
4. Click **Continue** to advance to the **Outputs** stage.

**Test activity template inputs**

You can test the input parameters of a custom activity during its development without having to run the activity in a workflow context.

Create input variables and map them to fields in the **Execution Command** form or provide actual values for these fields.

Role required: web_service_admin, activity_admin, activity_creator
An input test executes only the input parameters against an endpoint and not the pre-processing or post-processing scripts. You need to use a workflow to test a pre-processing or post-processing script. You do not need to check out the activity to test it, and you can test input variables from any stage in the activity designer, if your activity is properly configured. Typically, the **Execution Command** stage is the point at which your inputs are ready for testing.

**Note:** If you intend to use auto-mapping, you must test your input variables.

1. Click **Test Inputs**.
   
The list of input source variables appears. If you added default values for these variables, those values appear in the **Substitute Value** column. Mandatory variables are marked with a red star. In this example, a SOAP endpoint returns a value for a stock quote variable.

2. Filter the variable list with these controls:
   - **All Inputs**: Displays all input variables. This is the default view.
   - **Mandatory Inputs**: Displays only mandatory input variables.
   - **Inputs Without Defaults**: Shows input variables that do not have assigned default values.

3. Reset values as needed.
   - **Reset default values**: Replaces any test values set in this form with the default values, if they are present.
   - **Clear values**: Clears all values in the input variable list, even if default values exist.

4. When your test values are configured correctly, click **OK**.
   
The system runs the values for all the inputs configured against the specified target and returns the resulting payload. The buttons in the Response form display different views of the payload. The entire payload appears in the **Raw Output** window.
5. To map appropriate parameter values in the payload to variables in the Outputs stage automatically, select an auto-mapping option.

6. Alternately, you can click Save for parsing rules to copy the entire payload to the parsing rules.
This allows you to manually select values for the output variables directly from the payload. This action completely overwrites any previous payload that existed in the parsing rules.

7. Click the X in the upper right corner of the window to close it.

Data encryption for activity variables

You can protect sensitive data passed from Orchestration activities by encrypting input and output variables.

The system never stores encrypted variables as clear text. If the MID Server is used to fulfill the activity, the corresponding ECC Queue’s input payload is encrypted if an encrypted output variable is defined in the template. Output variables passed to a downstream activity as input variables maintain their encryption throughout processing.

Inputs that require data encryption come from one of these sources:

- Workflows: These inputs are provided through the Workflow Editor and must be in the password2 format for two-way encryption.
- Service catalog requests: These input values are provided to an activity as encrypted variables from a service catalog item.
- GlideRecord: These are variables attached to any ServiceNow table. The source column in the table must be a password2 type variable.
- Activity outputs: These are variables passed as outputs from one activity to a downstream activity as inputs, through the data bus.
- Empty string: The system allows you to define encrypted input variables but never pass a value into the variable.

Activity designer template pre-processing fields

Use the Pre Processing form of the activity designer to define a script to run before the activity executes.

Pre-processing fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input process script</td>
<td>Script to run before the activity executes.</td>
</tr>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the input process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution parameters and input variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the pre-processing script with this syntax: activityInput.variable. Before the activity executes and makes a call to the service or host, you can override the effective execution value of this variable by assigning values to the executionParam.variable_name execution parameter. Refer to the specific execution parameters for your template.</td>
</tr>
</tbody>
</table>
Logging

Activity designers can add logging to the pre-processing using the `ActivityLogger` API, which works for scoped or global applications. Logged data from the script appears in the Workflow Log related list in the context records for any workflow that uses the activity. The Source for these messages in the workflow log is ACTIVITY.

Important: To display the debug messages in the workflow log, set the `glide.workflow.log.debug` property to `true`.

The supported messages are:

- `ActivityLogger.debug("Pre Processing Log Message");`
- `ActivityLogger.info("Pre Processing Log Message");`
- `ActivityLogger.warn("Pre Processing Log Message");`
- `ActivityLogger.error("Pre Processing Log Message");`

ActivityLogger API

Template post-processing fields

From the Post Processing form in the activity designer you can define a script to run after the activity executes.

Post-processing fields

To use the results returned by the activity, append the `executionResult.` prefix to these parameters.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output process script</td>
<td>Script to run after the activity executes.</td>
</tr>
</tbody>
</table>
### Variables

Input variables that are available to use as building blocks in the output process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution results and the variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the post-processing script with this syntax: `activityInput.variable`. For parameter descriptions, refer to the table in the post-processing parameters topic for this activity.

### Logging

Activity designers can add logging to the post-processing script using the `ActivityLogger` API, which works for scoped or global applications. Logged data from the script appears in the Workflow Log related list in the context records for any workflow that uses the activity. The Source for these messages in the workflow log is `ACTIVITY`.

**Important:** To display the debug messages in the workflow log, set the `glide.workflow.log.debug` property to `true`.

The supported messages are:

- `ActivityLogger.debug("Post Processing Log Message");`
- `ActivityLogger.info("Post Processing Log Message");`
- `ActivityLogger.warn("Post Processing Log Message");`
- `ActivityLogger.error("Post Processing Log Message");`
Auto-map activity output variables

You can map parameter values in a test payload to variables in the Outputs tab automatically.

**Role required: admin**

1. From the Execution Command in the template, select the Inputs tab.
2. Click Test Inputs to test the input parameters.
   If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.
3. Provide test values, if requested, and click OK to display the payload.
   The entire payload appears in the Raw Output tab of the Response form.

4. Select an auto-mapping option:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Auto-Map to Local   | Translates the entire payload into a JSON object and places it in the data bus. This allows for post-processing manipulation in JavaScript. This selection causes the entire data field on the right to disappear and the inputs structure to be auto-populated with these default variables:  
  - output  
  - totalRows  
  - errorMessage  
  - eccSysId |
| Auto-Map to Output  | Automatically populates the output variables in the activity with the same default variables used as inputs for the local variable.            |

**Note:** No parsing rules are available with auto-mapping selections.

Create an output variable

The Outputs form in the designer contains a variable builder for creating data structures of objects and arrays.

**Roles required: activity_admin, activity_creator**
Elements in this structure are mapped with [Create a parsing rule](#) to specific data contained in payloads returned from an endpoint or host. These variables and their values are then made available locally or for reuse in other activities.

1. Click the + icon in the Outputs column to create a local or output variable.

   Local variables are only available within an activity and are not visible in the data structures displayed in the Custom tab. Output variables are available for reuse in other activities, either individually or as an entire data structure. When you create a new variable of either type, the designer provides a default name of Local1 or Output1.

2. Type your new variable name in the field and select a data type.

   Variable names must be unique within an array or an object. You can assign a data type of Encrypted to output variables that contain sensitive data. Data protected by encryption is passed to other activities or processes encrypted and is never displayed in plain text.

3. To change the name of a variable or any of its attributes, double-click the value, type a new value in the editing field, and then press Enter.

   The icon to the left of the name reflects the data type of the variable.

4. To reorder the variable list, select a row and then drag the row to its new location.

   When you select a row to move it, the pointer icon changes to an up/down arrow icon.

5. Drag and drop the row into another location.

6. To reuse a variable from another activity, drag it from the Custom tab in the palette and drop it onto the Local or Output heading at the top of the variable list. To copy an entire data structure, drag the parent object or array into the variable list header.

   The designer duplicates the copied data structure in the outputs variable builder.
Reuse of data structures

7. To delete a variable, click the delete icon (−) in the row.

Activity designer template outputs
Output variables contain messages returned from a destination that are available to other activities in a workflow or internally to the activity.

Activity designer output fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable name</td>
<td>Name of a variable, either Local or Output, that this activity passes.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Local</td>
<td>Variable that contains a value used within an activity. For example, use a local variable to identify metadata that is processed within an activity before the final value is exported to an output variable.</td>
</tr>
<tr>
<td>Output</td>
<td>Variable that contains a value that is passed to other activities in the workflow.</td>
</tr>
</tbody>
</table>

**Map an output field**

Mapping is configured with parsing rules that allow you to build expressions in the appropriate data format for the selected payload.

**Role required: activity_admin, activity_creator**

When you are finished creating the output data structure, map each variable to the specific data you want to extract from the target host.

To map a variable, drag it from the Outputs variable builder and drop it into an empty **Variable name** field in the Parsing rules section.

See [create a parsing rule](#) for instructions on configuring parsing for output variables.
Create a parsing rule

Populate output variables defined in a custom activity with payload data returned from an input test on an external host or endpoint.

Roles required: activity_admin, activity_creator

1. Navigate to Workflow > Workflow Editor.
2. From the Custom tab in the palette, open a custom activity.
3. In the Activity Designer form, advance to the Output stage.
4. Drag an output variable from the data structure builder into the Variable name field in the Parsing rules builder.
Mapping variables to parsing rules

The parsing rules form appears for the selected variable. By default, the parsing type is set to **Direct**, which populates the variable with all the data from the selected payload, without parsing the contents. Each template has a specific default parsing source.

5. Complete the form using the fields in the table.

In this example, the parsing type selected is **XML**, which allows you to select specific parameters from the payload to parse.
Parsing rule for localBody

Parsing source: executionResult.body

Variable Name: activityLocal.localBody

Parsing Type: XML

Expression: $ age

Sample payload data:

```xml
<root>
  <data>
    <user>
      <name>user one</name>
      <age>42</age>
    </user>
    <user>
      <name>user two</name>
      <age>27</age>
    </user>
    <user>
      <name>user three</name>
    </user>
  </data>
</root>
```

Parsing result: 27
## Parsing rules fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parsing source</td>
<td>Source of the data returned from the target host or endpoint. Each template opens to a specific, default payload. Available choices depend on the execution template selected for the activity. You can also use local variables as a parsing source if a parsing rule has previously been defined for them. For a list of the available payloads for each template, see <a href="#">Activity designer parsing sources</a>.</td>
</tr>
<tr>
<td>Expression</td>
<td>Expression used to extract specific data from the selected parsing source. This expression is created from clickable data in the sample payload and appears in the format selected in the Parsing type field. When testing, the expression can return multiple results. Discern which choice gives reliable or predictable results before choosing your expression. Note: The system cannot generate clickable RegEx expressions from sample data. You must write all regular expressions manually.</td>
</tr>
<tr>
<td>Variable name</td>
<td>Revised variable name as it is used in the final output expression. The system adds the <code>activityOutput</code> or <code>activityLocal</code> prefix to the variable you specify.</td>
</tr>
<tr>
<td>Parsing type</td>
<td>The language to use for querying the target host's payload. The selections are:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Direct</strong>: Maps to the entire content of the payload selected in the Parsing source field, without any parsing. This is the default parsing type.</td>
</tr>
<tr>
<td></td>
<td>- <strong>XML</strong>: XPath query used for selecting nodes from an XML payload.</td>
</tr>
<tr>
<td></td>
<td>- <strong>JSON</strong>: JSONPath query for selecting parts of a JSON payload.</td>
</tr>
<tr>
<td></td>
<td>- <strong>RegEx</strong>: Parsing method that uses a regular expression to extract data from a payload. The RegEx parsing type does not support multi-line parsing and is not case sensitive.</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of this parsing rule.</td>
</tr>
<tr>
<td>Sample payload data</td>
<td>Sample data from the source containing the data requested. This field is not available for Direct parsing types. After you click Parse sample data, the data in this field cannot be edited, but becomes clickable for the purpose of creating expressions. Click Edit sample data to make the field editable again.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parsing results</td>
<td>Displays the data returned from the source by the selected expression. This field is not available for Direct parsing types.</td>
</tr>
</tbody>
</table>

6. To retest the inputs, click **Get sample payload from test**. This action reopens the test form, allowing you to substitute different test values and create a different payload.

7. Click **Save** to have the parsing rules overwrite the previous payload with the one you just created.

8. To create an expression for the parsing rule, click the specific parameter you want to see in the sample payload. The value for that parameter appears in the Parsing result field, and the system creates the appropriate expression in the Expression field.

9. Click **Submit** to save the parsing rule for that variable.

### Activity designer parsing sources

This table lists the parsing sources available with each execution template.

<table>
<thead>
<tr>
<th>Parsing sources</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Template</strong></td>
</tr>
</tbody>
</table>
| SOAP Web Service | • executionResult.body (Default)  
|                 | • executionResult.status_code  
|                 | • executionResult.header  
|                 | • executionResult.error |
| JDBC            | • executionResult.output (Default)  
|                 | • executionResult.errorMessages  
|                 | • executionResult.probeCompletedEccId  
|                 | • executionResult.totalRows |
| JavaScript Probe | • executionResult.payload (Default)  
|                 | • executionResult.output  
|                 | • executionResult.eccSysId  
|                 | • executionResult.errorMessages |
| Powershell      | • executionResult.output (Default)  
|                 | • executionResult.tags  
|                 | • executionResult.hresult  
|                 | • executionResult.eccSysId  
|                 | • executionResult.errorMessages |
| REST Web Service| • executionResult.body (Default)  
|                 | • executionResult.status_code  
|                 | • executionResult.header  
|                 | • executionResult.error |
### Activity designer parsing rule example

In this example, the parsing rule is configured to populate the `activityOutput.ipv4` variable with the value for the IP address from a domain server, using PowerShell.

**Role required:** `activity_creator`, `activity_admin`

To generate the sample data, the administrator must actually run the command on the host and then paste the data returned into the **Sample payload data** field when creating the parsing rule. The administrator can then create an expression that returns IP addresses from that sample in two formats: `ipv4` and `ipv6`. In this example, the system produces two expressions to use for the parsing rule.

1. Navigate to **Workflow > Workflow Editor** and open the activity that runs on the host.
2. Click the **Inputs** tab, and note the **Command**.

---

<table>
<thead>
<tr>
<th>Template</th>
<th>Source</th>
</tr>
</thead>
</table>
| SFTP     | • executionResult.output (Default)  
           | • executionResult.eccSysId  
           | • executionResult.errorMessages  
           | • executionResult.tags |
| Probe    | • executionResult.output (Default)  
           | • executionResult.payload

Parsing rule PowerShell inputs command

3. In a PowerShell console, run the **Command** on the host to extract the XML sample that contains the values you need.
4. Copy the data that is returned to the clipboard.
5. In the activity designer, click the **Outputs** tab and paste the returned data into the **Sample payload data** field.
   In this example, the data includes IP addresses in two different formats and the domain name.
6. Select the parsing type for the source. In this example, select **XML**.
7. Click **Parse sample data**.

The system displays the XML in the proper format, and it becomes clickable. In this view, the system can translate clicked data from the sample into an expression.
8. To create the expression, click the elements in the data sample you want to map to the variable.

Based on the sample data you clicked, the system creates two expressions.
9. Select an expression from the list.

The desired result is the IP address that has a **type** attribute of **ipv4**. The system populates the **Expression** field with this choice.
10. Click **Test expression**.

   The system parses the payload using the selected expression and returns the requested data in the **Parsing result** field.
11. Click **Submit**.

The view returns to the Outputs tab of the activity designer. The new parsing rule is listed, and a blank row is available for another rule.
Activity conditions

Create the exit conditions for your activity in the **Condition** column and set the order for each..

The system evaluates the condition with the lowest order number first and stops when it finds the first true condition. The system delays evaluation of conditions with an **Else** value set to **true** until all conditions with an **Else** value set to **false** are evaluated. If the system does not find a true condition, it looks for a default condition in which the value for **Else** is **true** and takes this exit. You must have at least one default exit condition, or the activity hangs when the workflow runs.

The following are possible conditions you might create for an activity:

### Sample activity conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Evaluation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Success</strong></td>
<td>Tests for a success condition. <strong>Else</strong> is set to <strong>false</strong> and the <strong>Order</strong> is set to 100. If this condition is true, the activity takes the <strong>Success</strong> exit. If this condition is false, the system evaluates the next condition in order.</td>
</tr>
<tr>
<td><strong>Retry</strong></td>
<td>Tests for a condition that runs the activity again. <strong>Else</strong> is set to <strong>false</strong>. If this condition is true, the activity runs again. If this condition is false, the system takes the default <strong>Failure</strong> exit.</td>
</tr>
<tr>
<td><strong>Failure</strong></td>
<td>Default condition that allows the workflow to continue if the other conditions in the activity are false. <strong>Else</strong> is set to <strong>true</strong>.</td>
</tr>
</tbody>
</table>
Orchestration custom activity templates

Orchestration provides customizable activity templates to create and manage custom activities in the workflow editor.

You create and update different types of Orchestration activities with the Activity Designer using activity templates for SSH, PowerShell, REST, SOAP, JMS, SFTP, JDBC, JavaScript Probes, and Probes. Hundreds of workflows can share these activities simultaneously. Before you change an activity, you should check the workflows that they are part of by clicking the form menu icon (≡) and selecting **Used In**. Any central change to a versioned activity automatically updates across workflows unless you have pinned that activity.

All the Orchestration Core activities are built using the Activity Designer in scoped applications. Custom activities can be developed in the global scope or their own application scope even if that scope is different from the scope of the workflow. Use **Activity scoping** when build your own activity packs.

Create a JDBC activity

Create a custom JDBC activity to automate SQL commands and stored procedure calls to relational databases from workflow.

Role required: activity_admin, activity_creator

The JDBC activity template allows you to execute ANSI SQL statements or stored procedures on a target database. Support for stored procedures with IN, OUT, and INOUT parameters are available in Jakarta. To learn how to set up these parameters, see **JDBC stored procedure parameters**.

**Note:** If you are transferring bulk data into a ServiceNow instance from an external data source, use **Import sets**. The JDBC activities allow you to transfer data between external
data sources and ServiceNow within a workflow. It is not intended to replace the bulk import features of data sources.

1. Create or verify your **JDBC credential**.
   Your JDBC credentials must have permission for the target database and proper configuration for the corresponding JDBC connection. Credentials must be set up before you can create a JDBC activity.

2. Create or verify your **JDBC connection**.
   Your JDBC connection must be configured with valid JDBC credentials set up before you can create a JDBC activity.

3. Create a **custom activity**.
   This action creates a custom activity using a template.

4. After setting up **general properties** and **creating input variables**, configure the JDBC Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| **JDBC Connection** | Configure or reference the appropriate JDBC Connection for the database. The connection selected provides the activity with the following information:  
  - Target database information (server and database names)  
  - Connection URL  
  - Target database port (if different from standard port number)  
  - Database instance name |
<p>| <strong>Credential</strong>     | JDBC credential to use for your JDBC connection.                           |</p>
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SQL statement</strong></td>
<td>Input the ANSI SQL to execute on the JDBC target database.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>This field is hidden when the Stored Procedure check box is selected.</td>
</tr>
<tr>
<td>You can <strong>map the input variables</strong> you created to configure the SQL statements. By default, you can run the following SQL statements.</td>
<td></td>
</tr>
<tr>
<td>Selection</td>
<td>1. select</td>
</tr>
<tr>
<td>Insertion</td>
<td>2. insert</td>
</tr>
<tr>
<td>Update</td>
<td>3. update</td>
</tr>
<tr>
<td>Deletion</td>
<td>4. delete</td>
</tr>
<tr>
<td>Show</td>
<td>5. show</td>
</tr>
<tr>
<td>Create</td>
<td>6. create</td>
</tr>
<tr>
<td>Describe</td>
<td>7. describe</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>You cannot run multiple statements of different types. For example, you cannot run a select statement and an update statement together, but you can run two insert statements. However, you cannot run multiple select statements in this activity.</td>
</tr>
<tr>
<td>Maximum rows</td>
<td>Maximum number of records to retrieve from database. The default is 1000.</td>
</tr>
<tr>
<td>Maximum payload size (KB)</td>
<td>You can set a limit on the maximum payload size of data retrieved from the database. The default is 64 kilobytes.</td>
</tr>
<tr>
<td>Connection timeout</td>
<td>How long the activity waits to make the connection. This field is populated automatically from the data source, but can be changed for this activity.</td>
</tr>
<tr>
<td>Query timeout</td>
<td>Elapsed time to wait after running the query until the data is returned. This field is populated automatically from the data source, but can be changed for this activity.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server to use for querying JDBC, by capabilities. By default, the system selects a MID Server that has JDBC capability.</td>
</tr>
<tr>
<td>Use stored procedure</td>
<td>If checked, you can run a stored procedure on MySQL, Oracle, or SQL Server databases by entering the procedure name and parameters. See JDBC stored procedure parameters.</td>
</tr>
</tbody>
</table>
Note: You can map parameter values in a test payload to variables in the Outputs tab automatically. See automap output variables.

- Test JDBC activity inputs
- Use auto-mapping to generate outputs and parsing rules (recommended for JDBC)
- If you do not use auto-mapping, you can manually create output variables and create parsing rules

Create a JDBC connection for an Orchestration activity

The JDBC Connection (jdbc_connection) table provides the information custom JDBC Orchestration activities use to connect to various target databases.

You must have an appropriate JAR file, whether it is supplied with the instance or a custom JAR file.

Note: The ServiceNow instance supplies mysql-connector-java-5.1.21.jar, sqlserver-jdbc-4.0.jar, and ojdbc6.jar files as part of the current release, which supports MySQL, SQLServer, and Oracle databases. Other databases, such as Sybase or DB2 Universal, must use a custom JAR file that must be uploaded to the instance before setting the JDBC connection.

Role required: activity_admin, activity_creator

JDBC credentials are retrieved separately by the activity designer template and support external credential storage, such as CyberArk.

1. Navigate to Orchestration > Credentials & Connections > JDBC Connections and click New.
2. Complete the form using the fields in the table.
   The database selection in the Format field determines which fields are available.

   **JDBC connection fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Database Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>All</td>
<td>Unique name of this JDBC connection. For example, you might enter JDBC MySQLProd.</td>
</tr>
<tr>
<td>Query timeout</td>
<td>All</td>
<td>Maximum elapsed time the JDBC query is allowed to run without a response.</td>
</tr>
<tr>
<td>Connection timeout</td>
<td>All</td>
<td>Maximum elapsed time for the JDBC activity to wait while attempting to connect to the target database.</td>
</tr>
<tr>
<td>Application</td>
<td>All</td>
<td>Scope for this table. By default, the JDBC Connection (jdbc_connection) table runs in the Global scope.</td>
</tr>
<tr>
<td>Domain</td>
<td>All</td>
<td>Domain for this table. By default, the JDBC Connection (jdbc_connection) table runs in the global domain.</td>
</tr>
<tr>
<td>Field</td>
<td>Database Format</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>--------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Format                | All                | Database type for this connection. The default choices are:  
|                       |                    | · MySQL  
|                       |                    | · Oracle  
|                       |                    | · SQLServer  
|                       |                    | · None  
|                       |                    | You can add **Sybase** or **DB2 Universal** to the choice list by uploading the appropriate JDBC driver JAR file to the instance. Orchestration automatically recognizes these drivers when they are loaded into the system and adds them to this list. |
| Server                | Oracle, MySQL, SQLServer | Host name or IP address of the database server. |
| Oracle sid            | Oracle             | The Oracle database site identifier. The default value is orcl. |
| Oracle port           | Oracle             | Port that the Oracle database is using. The default value is 1521. |
| Database name         | MySQL, SQLServer   | Name of the database. |
| Database port         | MySQL, SQLServer   | Port that the selected database is using. |
| Instance name         | SQLServer          | Instance name for the selected SQLServer |
| Connection URL        | All                | URL that the MID Server uses to connect to the specified database. The URL is created automatically when you save the form, and is read-only for the default databases.  
|                       |                    | **Note:** If the format selected is not one of the default databases, you must create the connection URL manually so that the MID Server knows how to create the connection. |
| JDBC driver           | None, DB2 Universal, Sybase | The JDBC driver to use for this connection when it is not a default database. |
|                       |                    | **Note:** If you add a Sybase or DB2 Universal database, you must enter the driver name in this field and upload the driver JAR file to the instance. |
Auto-map JDBC activity output variables
The ServiceNow activity designer allows you to map parameter values in a JDBC test payload to variables in the Outputs tab automatically.

Role required: admin

1. In the JDBC provider template form, select the Inputs tab.
2. Click Test Activity to test the input parameters.
   If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.
3. Provide test values, if requested, and click OK to display the payload.
   The entire payload appears in the Raw Output tab of the Response form.
4. Select one of these auto-mapping options.
   - **Auto-Map to Local**: Directly maps values to a local variable for use within the activity.
   - **Auto-Map to Output**: Directly maps values to the output variable to pass to other activities in the workflow. Auto-mapping to an output variable creates an array of objects, each of which contains the column names from the query result.

**JDBC stored procedure parameters**
You can use Orchestration to run a stored procedure on MySQL, Oracle DB, and MS-SQL databases.

There is support of multiple data types, with the following limitations:
- Only one result-set is returned.
- The order of input and output data types in the stored procedure parameters must match the activity definition.
- Binary, Blob, Varbinary, and LongBinary should be base64 encoded.
- Date, Time, and Timestamp have a specific format:
  - **Date format**: `yyyy-mm-dd`
    `yyyy-mm-dd` is the supported format.
  - **Time format**: `hh:mm:ss[.sss]`
    `hh:mm:ss[.sss]` is the supported format. Precision is in milliseconds only, microseconds or nanoseconds cannot be handled.
    
    **Note**: `10:30:59` and `10:30:59.999000` are correct but `10:30:59.` is incorrect.
  - **Timestamp format**: `yyyy-mm-dd hh:mm:ss[.ffffff]`
    `yyyy-mm-dd hh:mm:ss[.ffffff]` is the supported format. Precision is to microseconds.
- ResultSet is the first result set coming back from database server.
- MS-SQL does not support INOUT parameters. If you use INOUT parameters, the Activity Template transparently maps them to OUT parameters.

**Note**: If you do not want to do a validation of data types in stored procedure parameters, like the legacy behavior, you set the `glide.stored_proc.data_type.validation` as false. See **MID Server properties** for instructions.
### Stored procedure parameters

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>Type of stored procedure parameter. Supported parameters:</td>
</tr>
<tr>
<td></td>
<td>• IN</td>
</tr>
<tr>
<td></td>
<td>• OUT</td>
</tr>
<tr>
<td></td>
<td>• INOUT</td>
</tr>
<tr>
<td>Sql Type</td>
<td>A SQL data type. Supported data types:</td>
</tr>
<tr>
<td></td>
<td>• ARRAY</td>
</tr>
<tr>
<td></td>
<td>• BIGINT</td>
</tr>
<tr>
<td></td>
<td>• BINARY</td>
</tr>
<tr>
<td></td>
<td>• BIT</td>
</tr>
<tr>
<td></td>
<td>• BLOB</td>
</tr>
<tr>
<td></td>
<td>• CHAR</td>
</tr>
<tr>
<td></td>
<td>• CLOB</td>
</tr>
<tr>
<td></td>
<td>• DATE</td>
</tr>
<tr>
<td></td>
<td>• DECIMAL</td>
</tr>
<tr>
<td></td>
<td>• DISTINCT</td>
</tr>
<tr>
<td></td>
<td>• DOUBLE</td>
</tr>
<tr>
<td></td>
<td>• FLOAT</td>
</tr>
<tr>
<td></td>
<td>• INT</td>
</tr>
<tr>

<td>• INTEGER</td>
</tr>
<tr>
<td></td>
<td>• JAVA_OBJECT</td>
</tr>
<tr>
<td></td>
<td>• LONGVARBINARY</td>
</tr>
<tr>
<td></td>
<td>• LONGVARCHAR</td>
</tr>
<tr>
<td></td>
<td>• NULL</td>
</tr>
<tr>
<td></td>
<td>• NUMERIC</td>
</tr>
<tr>
<td></td>
<td>• OTHER</td>
</tr>
<tr>
<td></td>
<td>• REAL</td>
</tr>
<tr>
<td></td>
<td>• REF</td>
</tr>
<tr>
<td></td>
<td>• REF_CURSOR</td>
</tr>
<tr>
<td></td>
<td>• SMALLINT</td>
</tr>
<tr>
<td></td>
<td>• STRUCT</td>
</tr>
<tr>
<td></td>
<td>• TIME</td>
</tr>
<tr>
<td></td>
<td>• TIMESTAMP</td>
</tr>
<tr>
<td></td>
<td>• TINYINT</td>
</tr>
<tr>
<td></td>
<td>• VARBINARY</td>
</tr>
<tr>
<td></td>
<td>• VARCHAR</td>
</tr>
<tr>
<td>Name/Value</td>
<td>Name-value pairs to pass to the host. You can create these parameters manually, or drag and drop input variables into the parameter fields and assign a value.</td>
</tr>
</tbody>
</table>

**Note:** Not all database providers support the entire realm of JDBC data types. Reference your database reference manual to understand the supported datatypes for your installation.
Test JDBC activity template inputs
You can test the input parameters of a custom JDBC activity during its development without having to run the activity in a workflow context.

Create input variables and map them to fields in the Execution Command form or provide actual values for these fields. Role required: web_service_admin, activity_admin, activity_creator

This test executes only the input parameters against an endpoint and not the pre-processing or post-processing scripts. It is not necessary to check out the activity to test it.

**Note:** If you provide enough information for Orchestration to contact the endpoint or host and return data, you can test the input variables. You can test from any stage in the activity designer. Typically, the Execution Command stage is the point at which your inputs are ready for testing.

1. From the JDBC Execution Command, click Test Inputs.

   The list of input source variables appears. If you added default values for these variables, those values appear in the Substitute Value column. Mandatory variables are marked with a red star.

   **Note:** The test fails if the MID Server cannot be found or if it cannot connect to the target.
2. Filter the variable list with these controls:
   - **All Inputs**: Displays all input variables. This control is the default view.
   - **Mandatory Inputs**: Displays only mandatory variables.
   - **Inputs Without Defaults**: Shows input variables that do not have assigned default values.

3. Reset values as needed.
   - **Reset default values**: If values are present, this control replaces any test values set in this form with the default values.
   - **Clear values**: Clears all values in the input variable list, even if default values exist.

4. When your test values are configured correctly, click **OK**.
   The system runs the values for all the inputs configured against the specified target and returns the resulting payload. The buttons in the Response form display different views of the payload. The entire payload appears in the **Raw Output** window.
5. To map appropriate parameter values in the payload to variables in the **Outputs** stage automatically, select an **auto-mapping option**.

6.
7. Click the X in the upper right corner of the window to close it.

Create a SOAP web service activity

Use this template to create a custom SOAP activity.

Role required: web_service_admin, activity_admin, activity_creator

For instructions on using the activity template process flow, see [create custom activities](#).

1. Create a custom activity.
   This action creates a custom activity using a template.

2. After setting up [general properties](#) and [creating input variables](#), configure the SOAP web service Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Map the input variables</td>
<td>Use the variables you created to configure the command that Orchestration executes on the SOAP web service.</td>
</tr>
<tr>
<td>Web service message</td>
<td>Specify the SOAP web service message to use for this activity. If you need information on SOAP web service messages, see <a href="#">SOAP message</a>.</td>
</tr>
<tr>
<td>Web service message function</td>
<td>Specify the SOAP message function available in conjunction with the SOAP web service.</td>
</tr>
<tr>
<td>Endpoint</td>
<td>If you enter an endpoint in this field, it overrides the endpoint URL configured in the SOAP message web service. Click the lock icon to open the input field and add the endpoint.</td>
</tr>
<tr>
<td>SOAP message parameters</td>
<td>Name-value pairs to pass to the SOAP endpoint. You can create these parameters manually, or drag input variables into the parameter fields and then assign a value. Parameters defined in the SOAP message that use ${ } can be assigned data from this activity template. Use the Additional attribute column to configure the system to not escape the text. By default, text sent to the SOAP message is escaped. The Name column is auto-populated if the users have provided variables using variable substitution in the SOAP message.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>Check box that determines if a MID Server must be used to invoke the SOAP web service. If the SOAP web service message function defines a MID Server, that MID Server is used instead of the one selected here.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server with the appropriate capabilities for connecting to the SOAP endpoint. By default, the system selects a MID Server with SOAP capabilities. This field is available when the Use MID Server check box is selected.</td>
</tr>
<tr>
<td>Timeout</td>
<td>Allowed duration of the SOAP web service request before it times out, in seconds. The default is 10.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Authentication</td>
<td>Determines what type of authentication is required for the endpoint. The options are:</td>
</tr>
<tr>
<td></td>
<td>• Use existing credentials in SOAP message: Uses credential definitions from the SOAP message definition.</td>
</tr>
<tr>
<td></td>
<td>• Override with Basic Authentication credentials: Uses basic authentication credentials. Overrides the credentials in the SOAP message definition. Basic authentication credentials must be provisioned before they are available for selection.</td>
</tr>
<tr>
<td></td>
<td>• Override with Certificate Authentication credentials: Overrides the credentials in the SOAP message definition with certificate authentication credentials.</td>
</tr>
<tr>
<td></td>
<td>• Override with Both Basic and Certificate Authentication credentials: Overrides the credentials in the SOAP message definition with both basic authentication or certificate authentication credentials.</td>
</tr>
<tr>
<td></td>
<td>• Override with WS-Security Username profile: Overrides the credentials in the SOAP message definition with credentials defined a WS Security Profile.</td>
</tr>
<tr>
<td></td>
<td><strong>Credentials</strong> Required REST endpoint basic authentication credentials. This field is available when Override with Basic Authentication credentials is selected in the Authentication field. Only basic authentication credentials appear in the selection list, which includes credentials stored on the instance and credential IDs from an external storage system. If you are using credentials stored in a CyberArk safe, you can override the default safe defined in the MID Server configuration file by adding the name of a different safe as a prefix to the credential ID, separated by a colon. For example, newsafe:orch-test-f5.</td>
</tr>
<tr>
<td></td>
<td><strong>Protocol Profile</strong> Protocol profile to use for authentication. This field is available when the authentication type is either Override with Certificate Authentication credentials or Override with Both Basic and Certificate Authentication credentials.</td>
</tr>
</tbody>
</table>

**Note:** You can map parameter values in a test payload to variables in the Outputs tab automatically. See [automap output variables](#).

- Use auto-mapping to generate outputs and parsing rules (recommended for JDBC)
- If you do not use auto-mapping, you can manually create output variables and create parsing rules

**Auto-map SOAP activity output variables**
The ServiceNow activity designer allows you to map parameter values in a SOAP test payload to variables in the Outputs stage automatically.
Role required: web_service_admin, activity_admin, activity_creator

**Note:** You can test input variables from any stage in the activity designer if you have provided enough information for Orchestration to contact the endpoint and return data. Typically, the **Execution Command** stage is the point at which your inputs are ready for testing.

1. In the activity designer, proceed to the **Execution Command** stage.
2. Define an appropriate MID Server, if requested.
   The test fails if the MID Server cannot be found or if it cannot connect to the target.
3. Click **Test Activity** to test the input parameters.
   If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.
4. Provide test values, if requested, and click **OK** to display the payload.
   The entire payload appears in the **Raw Output** tab of the Response form.

5. Select one of these auto-mapping options.
   - **Auto-Map to Local**: Directly maps values to a local variable for use within the activity.
   - **Auto-Map to Output**: Directly maps values to the output variable to pass to other activities in the workflow. Auto-mapping to an output variable creates an array of objects, each of which contains the column names from the query result.

Provide credentials to access a SOAP message WSDL
If the SOAP WSDL you are requesting in a test payload requires authentication, you must provide basic auth credentials in either the SOAP message or the SOAP activity.

Role required: web_service_admin, activity_admin, activity_creator

The ServiceNow instance only supports basic auth credentials for accessing a WSDL. If the SOAP function or the SOAP message does not provide these credentials, you must configure them in the SOAP activity template. Orchestration uses these priorities for deciding which basic authentication credentials to use:

- **SOAP message**: Credentials for a SOAP message are used if no other credentials are defined.
- **SOAP function**: Credentials for a SOAP function override the credentials configured for the SOAP message.
- **SOAP activity template**: Credentials for a SOAP activity template override both the SOAP function and SOAP message credentials.

1. Navigate to **System Web Services > Outbound > SOAP Message**.
2. Select the SOAP message you want the activity to use.
3. In the SOAP Message record, select the **Download WSDL** check box.
4. In the **Authentication type** field, select **Basic**.
   The **Basic auth profile** field appears.
5. Select the basic auth profile to use with this SOAP message.
Basic authentication for a SOAP message

6. Alternately, you can configure basic authentication credentials in Configure the SOAP execution command.
   a) In the Authentication field, select Override with Basic Authentication credentials.
The **Credentials** field appears.

b) Select the basic auth credentials to use to access the WSDL. This setting overrides any credentials configured in the SOAP message.

Configure the SOAP execution command

Use the input variables you created to configure the command that Orchestration executes on the SOAP endpoint.

Create the input variables you need in the **Inputs** form before you can advance to the **Execution Command** stage.
Role required: web_service_admin, activity_admin, activity_creator

Note: You can test the SOAP connection between the MID Server and the endpoint without having to run the activity in a workflow context. For details, see test template outputs.

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
2. Complete the fields shown in the table.
### SOAP template execution command fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. Create input variables to map to available fields.</td>
</tr>
<tr>
<td>Web service message</td>
<td>SOAP message to use for this activity. Users must have the web_service_admin role to configure this field.</td>
</tr>
<tr>
<td>Web service message function</td>
<td>SOAP message function to use for this activity. Users must have the web_service_admin role to configure this field.</td>
</tr>
<tr>
<td>Endpoint</td>
<td>Endpoint URL for the SOAP web service this activity uses. Enter an endpoint in this field to override the endpoint configured in the SOAP message. Click the lock icon to open the input field.</td>
</tr>
<tr>
<td>SOAP message parameters</td>
<td>Name-value pairs to pass to the SOAP endpoint. You can create these parameters manually, or drag input variables into the parameter fields and then assign a value. Parameters defined in the SOAP message that use ${ } can be assigned data from this activity template. Use the Additional attribute column to configure the system to not escape the text. By default, text sent to the SOAP message is escaped. The Name column is auto-populated if the users have provided variables using variable substitution in the SOAP message.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>Check box that determines if a MID Server must be used to invoke the SOAP web service.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server with the appropriate capabilities for connecting to the SOAP endpoint. By default, the system selects a MID Server with SOAP capabilities. This field is available when the Use MID Server check box is selected.</td>
</tr>
<tr>
<td>Timeout</td>
<td>Allowed duration of the SOAP web service request before it times out, in seconds. The default is 10.</td>
</tr>
</tbody>
</table>

---

**Note:**
If the SOAP web service message function defines a MID Server, that MID Server is used instead of the one selected here.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

<td></td>
<td>- <strong>Override with Both Basic and Certificate Authentication credentials</strong>: Overrides the credentials in the SOAP message definition with both basic authentication or certificate authentication credentials.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Override with WS-Security Username profile</strong>: Overrides the credentials in the SOAP message definition with credentials defined a WS Security Profile.</td>
</tr>
<tr>
<td>Credentials</td>
<td>Required REST endpoint basic authentication credentials. This field is available when <strong>Override with Basic Authentication credentials</strong> is selected in the Authentication field. Only basic authentication credentials appear in the selection list, which includes credentials stored on the instance and credential IDs from an external storage system. If you are using credentials stored in a CyberArk safe, you can override the default safe defined in the MID Server configuration file by adding the name of a different safe as a prefix to the credential ID, separated by a colon. For example, newsafe:orch-test-f5.</td>
</tr>
<tr>
<td>Protocol Profile</td>
<td><strong>Protocol profile</strong> to use for authentication. This field is available when the authentication type is either <strong>Override with Certificate Authentication credentials</strong> or <strong>Override with Both Basic and Certificate Authentication credentials</strong>.</td>
</tr>
</tbody>
</table>
### Note:
You must use the `executionParam` prefix with all variables in this table.

### SOAP execution parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web service message</td>

<td></td>
<td>basic_auth_pick_credentials</td>
</tr>
</tbody>
</table>

Create a JavaScript array in a SOAP template

These are instructions for creating JavaScript arrays using SOAP execution parameters.

Role required: web_service_admin, activity_admin, activity_creator

To add more name-value pairs to the parameter’s array, append the values to the existing array.

1. Create a JavaScript object with the following syntax, and add it to the executionParam.parameters array:

   ```javascript
   var newParameter = {
     "name":"parameterName","value":"parameterValue","additional_attribute":"none";
   }
   executionParam.parameters.push(newParameter);
   ``

   By adding the new parameter JavaScript object to the array, you ensure that any elements already available in the array are not impacted.

2. Make sure to set the value in the Additional attribute column in the SOAP message parameters input field to Do not escape text.

   In this case, the system does not escape the value specified for the value attribute. An example of this is:

   ```javascript
   var newParameter = {
     "name":"parameterName","value":"parameterValue","additional_attribute":"do_not_escape_text";
   }
   executionParam.parameters.push(newParameter);
   ```

   Note: If the value for the additional_attribute field is None, then the system escapes the value specified by the value attribute. In the first example, parameterValue is escaped.

SOAP template post-processing parameters

Use these parameters to create a post-processing script.

Activity designer post-processing parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status code</td>
<td>status_code</td>
<td>Integer</td>
<td>Contains the status code returned from the web service.</td>
</tr>
<tr>
<td>Name</td>
<td>Variable</td>
<td>Type</td>
<td>Usage</td>
</tr>
<tr>
<td>---------</td>
<td>----------</td>
<td>---------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>Header</td>
<td>header</td>
<td>Hashmap of JavaScript object</td>
<td>Contains the key value paired hashmap associated with the header values passed into the web service. You can access each value with executionResult.header[keyName].</td>
</tr>
<tr>
<td>Body</td>
<td>body</td>
<td>String</td>
<td>Contains a string value representing the output from the SOAP message</td>
</tr>
<tr>
<td>Error</td>
<td>error</td>
<td>String</td>
<td>Returns the error string from the SOAP web service, unless there are no errors, in which case it returns null.</td>
</tr>
</tbody>
</table>

Create a JavaScript Probe activity

Create a JavaScript Probe activity to instruct a MID server to execute server-side javascript.

Role required: activity_creator or workflow_admin

The JavascriptProbe activity has the same functionality as making ‘Packages’ calls into standard Java libraries. It allows you to have more control over the Java libraries on the MID Server. You can load your own JAR files on the MID Server and have the JavascriptProbe make Package calls into those java files.

1. Create a custom activity.
   This action creates a custom activity using a template.

2. After setting up general properties and creating input variables, configure the JavaScript probe activity Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Map the input variables</td>
<td>Use the variables you created to configure the command that Orchestration executes on the MID server.</td>
</tr>
<tr>
<td>Script type</td>
<td>Select the type of script to include. Available options are:</td>
</tr>
<tr>
<td>Script</td>
<td>Custom JavaScript</td>
</tr>
<tr>
<td>MID Server script include</td>
<td>Script for the MID Server to run with this probe.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server to use, by capabilities.</td>
</tr>
</tbody>
</table>
Option | Description
---|---
Parameters | Name-value pairs to pass to the host with this probe. You can create these parameters manually, or drag input variables into the Parameters fields and assign a value.

**Note:** You can map parameter values in a test payload to variables in the Outputs tab automatically. See automap output variables.

Finish creating your JavaScript probe activity by creating output variables, creating a parsing rule, or creating template conditions. Refer to the create custom activities topic to know your template options.

**JavaScript probe template execution parameters**

You use execution parameters to create the input process script in the Preprocessing form of the activity designer.

For descriptions of the JavaScript Probe command fields, see the table in Configure the JavaScript Probe execution command.

**Note:** You must use the executionParam. prefix with all variables in this table.

**JavaScript template execution parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Script Type</td>
<td>script_type</td>
<td>Enumerated</td>
<td>Type of script to run. The possible types are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- custom_javascript_type</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- mid_script_include_type</td>
</tr>
<tr>
<td>Script</td>
<td>script</td>
<td>String</td>
<td>Script that runs custom JavaScript when the script_type is</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>custom_javascript_type</td>
</tr>
<tr>
<td>Mid script include</td>
<td>mid_script_include</td>
<td>Reference</td>
<td>The sys_id reference associated with the MID Server script include to</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>call, when the script_type is mid_script_include_type</td>
</tr>
<tr>
<td>Source</td>
<td>source</td>
<td>String</td>
<td>Target host on which to run the script.</td>
</tr>
<tr>
<td>MidCapabilities</td>
<td>midCapabilities</td>
<td>String (comma separated)</td>
<td>List of required MID Server capabilities.</td>
</tr>
<tr>
<td>Name</td>
<td>Variable</td>
<td>Type</td>
<td>Usage</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------</td>
<td>-------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Parameters   | parameters| Array of JavaScript object | Array of JavaScript objects, expressed with the executionParam. prefix. To add more name-value pairs to the parameters array, append them to the existing array. Create a JavaScript object with the following syntax, and add it to the executionParam.parameters array. This assigns additional parameters to the message:

```javascript
var newParameter = {
  "name": "parameterName",
  "value": "parameterValue"
};
executionParam.parameters.push(newParameter);
```

| ValueCapabilities | valueCapabilities | Array of hashmap | Capability values used to select the MID Server. For more information, see [Set up domain separation for MID servers](#). If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection:

```javascript
var valueCapability = {
  'NEW_MID_CAPABILITY': 'NEW_MID_CAPABILITY_VALUE'
};
executionParam.valueCapabilities.push(valueCapability);
```

---

**JavaScript probe template post-processing parameters**

Use these parameters to create a post-processing script.

**JavaScript probe post-processing parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Payload</td>
<td>payload</td>
<td>String</td>
<td>Contains raw payload returned from the JavaScript Probe.</td>
</tr>
<tr>
<td>Output</td>
<td>output</td>
<td>String</td>
<td>Contains output data returned from the JavaScript Probe.</td>
</tr>
<tr>
<td>Name</td>
<td>Variable</td>
<td>Type</td>
<td>Usage</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>
<td>--------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>EccSysId</td>
<td>eccSysId</td>
<td>String</td>
<td>Contains the reference ID associated with the ECC Queue input message.</td>
</tr>
<tr>
<td>Error Messages</td>
<td>errorMessages</td>
<td>String</td>
<td>Contains the error messages returned from the JavaScript probe. If no error messages are returned, this value is null.</td>
</tr>
</tbody>
</table>

**Configure the JavaScript Probe execution command**

Use the input variables you created to configure the command that Orchestration executes on the JavaScript Probe target host.

Create the input variables you need in the **Inputs** form before you can advance to the **Execution Command** stage.

Role required: activity_creator, admin

**Note:** You can test the JavaScript Probe connection between the MID Server and the target without having to run the activity in a workflow context. For details, see [test template outputs](#).

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
Drag variable from the left to template fields.

Script type: Custom JavaScript

```
1
2
car
this.probe.
```
2. Complete the fields shown in the table.

**JavaScript Probe execution command fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. <a href="#">Create input variables</a> to map to available fields.</td>
</tr>
<tr>
<td>Script type</td>
<td>Select the type of script to include. Available options are:</td>
</tr>
<tr>
<td></td>
<td>• Custom JavaScript</td>
</tr>
<tr>
<td></td>
<td>• MID Server script include</td>
</tr>
<tr>
<td>Script</td>
<td>Custom JavaScript to run with this probe. This field is available when the Script type selected is Custom JavaScript.</td>
</tr>
<tr>
<td>MID Server script include</td>
<td>Script for the MID Server to run with this probe. This field is available when the Script type selected is MID Server script include.</td>
</tr>
<tr>
<td>Select MID Server by host</td>
<td>MID Server on which the probe runs.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server to use, by capabilities.</td>
</tr>
<tr>
<td>Parameters</td>
<td>Name-value pairs to pass to the host with this probe. You can create these parameters manually, or drag input variables into the Parameters fields and assign a value.</td>
</tr>
</tbody>
</table>

3. Click **Save**.
4. Click **Continue** to advance to the Outputs stage.

**Create a PowerShell activity**

Create a custom PowerShell activity return data to a workflow from a host using Microsoft PowerShell.

Role required: activity_creator or workflow_admin

ServiceNow supports PowerShell 2.0 and above. PowerShell 3.0 does not support Windows 2003 Server.

1. Create a [custom activity](#).
   This action creates a custom activity using a template.
2. After setting up [general properties](#) and [creating input variables](#), configure the PowerShell Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Map the input variables</td>
<td>Use the variables you created to configure the command that Orchestration executes on the MID Server.</td>
</tr>
<tr>
<td>Target host</td>
<td>Host name or IP address of the target server for this PowerShell activity.</td>
</tr>
<tr>
<td>Script type</td>
<td>Type of PowerShell script to run on the PowerShell host. Available options are:</td>
</tr>
<tr>
<td></td>
<td>• Custom PowerShell command</td>
</tr>
<tr>
<td></td>
<td>• MID Server script file</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>MID Server script file</td>
<td>The MID Server script file contains the PowerShell scripts. This field is available when the <strong>Script type</strong> selected is MID Server script file.</td>
</tr>
<tr>
<td>Command</td>
<td>PowerShell command the activity executes. This field is available when the <strong>Script type</strong> selected is Custom PowerShell command. You can create your commands by dragging and dropping input variables from the variable builder into this field.</td>
</tr>
<tr>
<td>PowerShell variables</td>
<td>Name-value pairs to pass to the host with PowerShell. You can create these variables manually, or drag input variables into the <strong>Value</strong> field. Encrypted input variables retain their encryption, regardless of the data type settings in this field. If you type in a value and select the <strong>Encrypted</strong> data type, your value appears in plain text. It is only encrypted when it passes to the ECC Queue.</td>
</tr>
<tr>
<td>Use MID Service Account</td>
<td>If checked, this activity authenticates on the target host using the credentials of the MID Server service account only, without trying any other credentials.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>The <strong>Credential tag</strong> field is not available.</td>
</tr>
<tr>
<td>Credential tag</td>
<td>Credential tag this activity must use to run PowerShell commands on the host. If this field is left blank, the MID Server tries all the available credentials until it finds a valid one, ending with the MID Server service account. If a credential tag is defined, the MID Server tries the credentials with that tag specified only and does not try the MID Server service account.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>This field is not available when the <strong>Use MID service account</strong> check box is selected.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server to use for querying PowerShell, by capabilities. By default, the system selects a PowerShell MID Server.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>You can map parameter values in a test payload to variables in the <strong>Outputs</strong> tab automatically. See <strong>automap output variables</strong>.</td>
</tr>
</tbody>
</table>

Finish creating your PowerShell activity by **creating output variables**, **creating a parsing rule**, or **creating template conditions**. Refer to the **create custom activities** topic to know your template options.

**PowerShell template execution parameters**

You use execution parameters to create the input process script in the **Pre Processing** form of the activity designer.

For descriptions of the PowerShell command fields, see the table in **Configure the PowerShell execution command**.
Note: You must use the `executionParam` prefix with all variables in this table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source</td>
<td>source</td>
<td>String</td>
<td>Target host on which to execute the command.</td>
</tr>
<tr>
<td>Script type</td>
<td>script_type</td>
<td>Enumeration</td>
<td>Type of script to run. The possible types are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <code>command</code>: Custom PowerShell command.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <code>file</code>: Identifies the MID Server script file to run.</td>
</tr>
<tr>
<td>Command</td>
<td>command</td>
<td>String</td>
<td>Command sent to the MID Server for it to run on the target host.</td>
</tr>
<tr>
<td>MidScriptFile</td>
<td>midScriptFile</td>
<td>Reference</td>
<td>Reference sys_id of the MID Server script file to execute, when the <code>script_type</code> is <code>file</code>.</td>
</tr>
<tr>
<td>PowershellVariables</td>
<td>powershellVariables</td>
<td>Array of hashmap</td>
<td>Hashmap of JavaScript objects with <code>name</code>, <code>value</code>, and <code>type</code> for each object. The <code>type</code> of each object can be one of <code>plain</code>, <code>encrypted</code>, <code>boolean</code>, or <code>null</code>, corresponding to the PowerShell variable <code>type</code> selected in the inputs tab. For example, you might enter:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>var newParameter = {&quot;name&quot;:&quot;parameterName&quot;,&quot;value&quot;:&quot;value&quot;,&quot;type&quot;:&quot;plain&quot; }; executionParam.powershellVariables.push(newParameter);</td>
</tr>
<tr>
<td>Credential tag</td>
<td>credential_tag</td>
<td>String</td>
<td>Specific credential tag this activity must use to run PowerShell commands on the host.</td>
</tr>
<tr>
<td>MidCapabilities</td>
<td>midCapabilities</td>
<td>String (comma separated)</td>
<td>List of required MID Server capabilities.</td>
</tr>
<tr>
<td>Name</td>
<td>Variable</td>
<td>Type</td>
<td>Usage</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------</td>
<td>---------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| ValueCapabilities | valueCapabilities | Array of hashmap          | Capability values used to select the MID Server. For more information, see [Set up domain separation for MID servers](#). If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection:  

```javascript
var valueCapability = {
    'NEW_MID_CAPACITY': 'NEW_MID_CAPACITY_VALUE'
};

executionParam.valueCapabilities.push(valueCapability);
```                                                                                                                                                           |

*PowerShell post-processing parameters and payload parsing*

Use these parameters to create a post-processing script, payload parsing, and tagging.
## PowerShell post-processing parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
</table>
| Tags       | tags     | String| Contains the tags used to extract output using the PowerShell commands. The tag output is delimited by double percentage signs, as in `%%tagname %%`...
|            |          |       | Set up the command using the format in this example:                                                                                                                                                    |
|            |          |       | Write-Host `% %tagname1%%
output1 line 1
output1 line 2
...
Write-Host%%
Write-Host `% %tagname2%%
output2 line 1
output2 line 2
...
Write-Host%%`                                                                                                                                   |
|            |          |       | The tags returned are JavaScript hashmap objects in which each key is prefixed with `tag` appended with the `tagname`.                                                                               |
|            |          |       | `{ "__text__": "",
  "tagtagname1": "output1 line1\noutput1 line2"
  "tagtagname2": "output2 line1\noutput2 line2"
}`                                                                                                                                                    |
| Hresult    | hresult  | String| Contains any `hresult` returned from the PowerShell command. If no `hresult` is returned, this parameter is `null`.                                                                                  |
| Output     | output   | String| Contains the raw output from the PowerShell command.                                                                                                                                                  |
| EccSysID   | eccSysID | String| Contains the reference ID associated with the ECC Queue input message returned by the activity.                                                                                                        |
Create a REST web service activity

Use this procedure to create a custom REST web service Orchestration activity.

Role required: web_service_admin, activity_admin, activity_creator

To create and use a REST web service workflow activity:

- Create a REST message if an appropriate one is not already configured.
- Assign the web_service_admin role to any user who must create or edit a custom REST activity.
- Determine an application, or scope, for this activity.
- Determine the REST endpoint to use for the activity. Use this value to override the endpoint configured in the REST message.
- Optionally, create basic authentication credentials. Use this value to override the credentials configured in the SOAP message.

1. Create a custom activity.
   This action creates a custom activity using a template.

2. After setting up general properties and creating input variables, configure the REST web service Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Map the input variables</td>
<td>Use the variables you created to configure the command that Orchestration executes.</td>
</tr>
<tr>
<td>REST message</td>
<td>Name of an existing REST message to use in this activity.</td>
</tr>
<tr>
<td>REST message function</td>
<td>REST message function to use for this activity.</td>
</tr>
<tr>
<td>Endpoint</td>
<td>Endpoint URL for the REST web service this activity uses. Enter an endpoint in this field to override the endpoint configured in the REST message. Click the lock to open the input field.</td>
</tr>
<tr>
<td>Variable substitutions</td>
<td>Name-value pairs to pass to the REST endpoint. You can create these parameters manually, or drag input variables into the parameter fields, and then assign a value. Parameters defined in the REST message that use ${} can be assigned data from this activity template. Use the Additional attribute column to configure the system to not escape the text. By default the text sent to the REST message is escaped. If the users have provided variables using variable substitution in the REST message, then the Name column is automatically populated.</td>
</tr>
<tr>
<td>Additional Headers</td>
<td>Additional HTTP header parameters for the REST message selected. You can also use these values to override parameters inherited from the REST message.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Additional Query Parameters</td>
<td>Additional query parameters for the REST message selected. You can also use these values to override parameters inherited from the REST message.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>Check box that determines if a MID Server should be used to invoke the REST web service.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server with the appropriate capabilities for connecting to the REST endpoint. By default, the system selects a MID Server with REST capabilities. This field is available when the Use MID Server check box is selected.</td>
</tr>
<tr>
<td>Timeout</td>
<td>Allowed duration of the REST web service request before it times out, in seconds. The default is 10.</td>
</tr>
<tr>
<td>Authentication</td>
<td>Determines what type of authentication is required for the endpoint. The options are:</td>
</tr>
<tr>
<td></td>
<td>• Use existing credentials in REST message: Uses credential definitions from the REST message definition.</td>
</tr>
<tr>
<td></td>
<td>• Override with Basic Authentication credentials: Uses basic authentication credentials to override the credentials in the REST message definition. Basic authentication credentials must be provisioned before they are available for selection.</td>
</tr>
<tr>
<td></td>
<td>• Override with Certificate Authentication credentials: Uses a certificate, such as a private key, to override the credentials in the REST message definition.</td>
</tr>
<tr>
<td></td>
<td>• Override with Both Basic and Certificate Authentication credentials: Uses both basic authentication and certificate authentication to override the credentials in the REST message definition.</td>
</tr>
<tr>
<td></td>
<td>• Override with OAuth Authentication credentials: Uses OAuth 2.0 credentials to override the credentials in the REST message definition. The REST message selected for this activity must have its Authentication type set to OAuth 2.0 and its OAuth profile configured appropriately.</td>
</tr>
</tbody>
</table>
### ServiceNow Jakarta Now Platform Capabilities

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Credentials</strong></td>
<td>Required REST endpoint basic authentication credentials. This field is available when <strong>Override with Basic Authentication credentials</strong> is selected in the <strong>Authentication</strong> field. Only basic authentication credentials appear in the selection list, which includes credentials stored on the instance and credential IDs from an external storage system. If you are using credentials stored in a CyberArk safe, you can override the <em>default safe</em> defined in the MID Server configuration file. Add the name of a different safe as a prefix to the credential ID, separated by a colon. For example, <em>newsafe:orch-test-f5</em>.</td>
</tr>
<tr>
<td><strong>Protocol Profile</strong></td>
<td>Certificate authentication to use. This field is available when the selections in the <strong>Authentication</strong> are either <strong>Override with Certificate Authentication credentials</strong> or <strong>Override with Both Basic and Certificate Authentication credentials</strong>.</td>
</tr>
<tr>
<td><strong>OAuth profile</strong></td>
<td>Profile for the OAuth provider for this REST message. See <em>Specify an OAuth profile</em> for more information.</td>
</tr>
</tbody>
</table>

**Note:** You can map parameter values in a test payload to variables in the **Outputs** tab automatically. See *automap output variables*.

Finish creating your Rest web service activity by creating output variables, creating a parsing rule, or creating template conditions. Refer to the create custom activities topic to know your template options.

**Auto-map REST activity output variables**

The ServiceNow activity designer allows you to map parameter values in a REST test payload to variables in the **Outputs** stage automatically.

Role required: web_service_admin, activity_admin, activity_creator

**Note:** You can test input variables from any stage in the activity designer if you have provided enough information for Orchestration to contact the endpoint and return data. Typically, the **Execution Command** stage is the point at which your inputs are ready for testing.

1. In the activity designer, proceed to the **Execution Command** stage.
2. Define an appropriate MID Server, if requested.
   
   The test fails if the MID Server cannot be found or if it cannot connect to the target.
3. Click **Test Activity** to test the input parameters.
   
   If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.
4. Provide test values, if requested, and click **OK** to display the payload.

   The entire payload appears in the **Raw Output** tab of the Response form.
5. Select one of these auto-mapping options.

- **Auto-Map to Local**: Directly maps values to a local variable for use within the activity.
- **Auto-Map to Output**: Directly maps values to the output variable to pass to other activities in the workflow. Auto-mapping to an output variable creates an array of objects, each of which contains the column names from the query result.

**REST template execution parameters**

You use execution parameters to create the input process script in the Pre Processing form of the activity designer.

For descriptions of the REST web service command fields, see [Configure the REST execution command](#).

**Note**: You must use the `executionParam` prefix with all variables in this table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web service message</td>
<td>web_service_message</td>
<td>Reference</td>
<td>The sys_id of the corresponding web service message.</td>
</tr>
<tr>
<td>Web service message function</td>
<td>web_service_message_function</td>
<td>Reference</td>
<td>The sys_id of the REST message function.</td>
</tr>
<tr>
<td>Web service endpoint</td>
<td>web_service_endpoint</td>
<td>String</td>
<td>URL of the REST endpoint.</td>
</tr>
<tr>
<td>Parameters</td>
<td>parameters</td>
<td>Array of JavaScript objects</td>
<td>Array of JavaScript objects, expressed with the <code>executionParam</code> prefix. For instructions on creating arrays using this parameter see <a href="#">Create a JavaScript array in a REST template</a>.</td>
</tr>
<tr>
<td>Use mid server</td>
<td>use_mid_server</td>
<td>Boolean</td>
<td>Selects whether or not to use the MID Server. A value of <code>true</code> uses the MID Server, and a value of <code>false</code> does not use the MID Server.</td>
</tr>
<tr>
<td>Name</td>
<td>Variable</td>
<td>Type</td>
<td>Usage</td>
</tr>
<tr>
<td>--------------------</td>
<td>----------------</td>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------</td>
</tr>
<tr>
<td>MidCapabilities</td>
<td>midCapabilities</td>
<td>String (comma separated)</td>
<td>List of references to required MID Server capabilities.</td>
</tr>
<tr>
<td>Time out</td>
<td>time-out</td>
<td>String</td>
<td>Allowable time out duration, expressed in seconds.</td>
</tr>
<tr>
<td>ValueCapabilities</td>
<td>valueCapabilities</td>
<td>Array of hashmap</td>
<td>Capability values used to select the MID Server. For more information, see Set up domain separation for MID servers. Use this example to customize the MID Server selection if there are additional capabilities that are assigned by value:</td>
</tr>
<tr>
<td>Auth Type</td>
<td>auth-type</td>
<td>Boolean</td>
<td>Type of credentials to use. The choices are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>· basic_auth_pick_credentials</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>· use_existing_credentials</td>
</tr>
<tr>
<td>Credentials</td>
<td>credentials</td>
<td>Reference</td>
<td>Contains the credentials to use for this REST message when the auth_type selected is basic_auth_pick_credentials.</td>
</tr>
</tbody>
</table>

Create a JavaScript array in a REST template
These are instructions for creating JavaScript arrays using REST execution parameters.

Role required: web_service_admin, activity_admin, activity_creator

To add more name-value pairs to the parameter’s array, append the values to the existing array.

1. Create a JavaScript object with the following syntax, and add it to the executionParam.parameters array:

```
var newParameter = {
    "name": "parameterName",
    "value": "parameterValue",
    "additional_attribute": "none"
};
executionParam.parameters.push(newParameter);
```

By adding the new parameter JavaScript object to the array, you ensure that any elements already available in the array are not impacted.

2. Make sure to set the value in the Additional attribute column in the REST message parameters input field to Do not escape text.
In this case, the system does not escape the value specified for the \texttt{value} attribute. An example of this is:

```javascript
var newParameter = {
    "name": "parameterName", "value": "parameterValue", "additional_attribute": "do_not_escape_text"
};
executionParam.parameters.push(newParameter);
```

\textbf{Note:} If the value for the \texttt{additional_attribute} field is \texttt{None}, then the system escapes the value specified by the \texttt{value} attribute. In the first example, \texttt{parameterValue} is escaped.

\textit{REST template post-processing parameters}

Use these parameters to create a post-processing script.

\textbf{Activity designer post-processing parameters}

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status code</td>
<td>status_code</td>
<td>Integer</td>
<td>Contains the status code returned from the REST web service.</td>
</tr>
<tr>
<td>Header</td>
<td>header</td>
<td>Hashmap of JavaScript object</td>
<td>Hashmap of key value pairs associated with the header values passed into the web service. You can access each value with \texttt{executionResult.header[keyName]}.</td>
</tr>
<tr>
<td>Body</td>
<td>body</td>
<td>String</td>
<td>Contains a string value representing the output from the REST message</td>
</tr>
<tr>
<td>Error</td>
<td>error</td>
<td>String</td>
<td>Returns the error string from the REST web service, unless there are no errors, in which case it returns \texttt{null}.</td>
</tr>
</tbody>
</table>

\textit{Configure the REST execution command}

Use the input variables you created to configure the command that Orchestration executes on the REST endpoint.

Create the input variables you need in the \texttt{Inputs} form before you can advance to the \texttt{Execution Command} stage.

Role required: web_service_admin, activity_admin, activity_creator

\textbf{Note:} You can test the REST connection between the MID Server and the endpoint without having to run the activity in a workflow context. For details, see \texttt{test template outputs}.

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
2. Complete the fields shown in the table.

**REST execution command fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. <a href="#">Create input variables</a> to map to available fields.</td>
</tr>
<tr>
<td>REST message</td>
<td>Name of an existing REST message to use in this activity. Users must have the web_service_admin role to configure this field.</td>
</tr>
<tr>
<td>REST message function</td>
<td>REST message function to use for this activity. Users must have the web_service_admin role to configure this field.</td>
</tr>
<tr>
<td>Endpoint</td>
<td>Endpoint URL for the REST web service this activity uses. Enter an endpoint in this field to override the endpoint configured in the REST message. Click the lock to open the input field.</td>
</tr>
<tr>
<td>Variable substitutions</td>
<td>Name-value pairs to pass to the REST endpoint. You can create these parameters manually, or drag input variables into the parameter fields, and then assign a value. Parameters defined in the REST message that use ${} can be assigned data from this activity template. Use the <a href="#">Additional attribute</a> column to configure the system to not escape the text. By default the text sent to the REST message is escaped. If the users have provided variables using <a href="#">variable substitution</a> in the REST message, then the <a href="#">Name</a> column is automatically populated.</td>
</tr>
<tr>
<td>Additional Headers</td>
<td>Additional HTTP header parameters for the REST message selected. You can also use these values to override parameters inherited from the REST message.</td>
</tr>
<tr>
<td>Additional Query Parameters</td>
<td>Additional query parameters for the REST message selected. You can also use these values to override parameters inherited from the REST message.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>Check box that determines if a MID Server should be used to invoke the REST web service.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server with the appropriate <a href="#">capabilities</a> for connecting to the REST endpoint. By default, the system selects a MID Server with REST capabilities. This field is available when the <a href="#">Use MID Server</a> check box is selected.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Timeout</td>
<td>Allowed duration of the REST web service request before it times out, in seconds. The default is <strong>10</strong>.</td>
</tr>
<tr>
<td>Authentication</td>
<td>Determines what type of authentication is required for the endpoint. The options are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Use existing credentials in REST message</strong>: Uses credential definitions from the REST message definition.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Override with Basic Authentication credentials</strong>: Uses basic authentication credentials to override the credentials in the REST message definition. Basic authentication credentials must be provisioned before they are available for selection.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Override with Certificate Authentication credentials</strong>: Uses a certificate, such as a private key, to override the credentials in the REST message definition.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Override with Both Basic and Certificate Authentication credentials</strong>: Uses both basic authentication and certificate authentication to override the credentials in the REST message definition.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Override with OAuth Authentication credentials</strong>: Uses OAuth 2.0 credentials to override the credentials in the REST message definition. The REST message selected for this activity must have its Authentication type set to OAuth 2.0 and its OAuth profile configured appropriately.</td>
</tr>
<tr>
<td>Credentials</td>
<td>Required REST endpoint basic authentication credentials. This field is available when <strong>Override with Basic Authentication credentials</strong> is selected in the Authentication field. Only basic authentication credentials appear in the selection list, which includes credentials stored on the instance and credential IDs from an external storage system. If you are using credentials stored in a CyberArk safe, you can override the default safe defined in the MID Server configuration file. Add the name of a different safe as a prefix to the credential ID, separated by a colon. For example, newsafe:orch-test-f5.</td>
</tr>
<tr>
<td>Protocol Profile</td>
<td>Certificate authentication to use. This field is available when the selections in the Authentication field are either <strong>Override with Certificate Authentication credentials</strong> or <strong>Override with Both Basic and Certificate Authentication credentials</strong>.</td>
</tr>
<tr>
<td>OAuth profile</td>
<td>Profile for the OAuth provider for this REST message. See Specify an OAuth profile for more information.</td>
</tr>
</tbody>
</table>
3. Click **Save**.
4. Click **Continue** to advance to the **Outputs** stage.

### Create an SFTP activity

Create an activity that executes basic SFTP commands on a remote server.

Roles required: activity_creator or workflow_admin

You can create a custom activity that manages files and directories on a target host or copies a file from one SFTP server to another. The file content is streamed through a MID Server, which avoids having to store the data on the hard drive of the MID Server host machine.

**Note:** This activity requires the credentials of a user who can execute SFTP commands on the source host. The **Copy File** activity, provided in the activity pack, requires separate credentials to access the target host.

1. Create a **custom activity**.
   This action creates a custom activity using a template.
2. After setting up **general properties** and **creating input variables**, configure the SFTP Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command</strong></td>
<td>Type of activity to create. The choices are:</td>
</tr>
<tr>
<td></td>
<td>- Copy file</td>
</tr>
<tr>
<td></td>
<td>- Create directory</td>
</tr>
<tr>
<td></td>
<td>- Get file list</td>
</tr>
<tr>
<td></td>
<td>- Remove file or directory</td>
</tr>
<tr>
<td></td>
<td>- Rename file or directory</td>
</tr>
<tr>
<td></td>
<td>- Set file attributes</td>
</tr>
</tbody>
</table>

**Note:** The fields that display on the form depend on the command you select.

<table>
<thead>
<tr>
<th>Source host</th>
<th>Name or IP address of the server containing the files targeted by the activity.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source port</td>
<td>Port number to use to communicate with the source server. The default port number is <strong>22</strong>.</td>
</tr>
<tr>
<td>Source file path</td>
<td>Full path to a file (/temp/test_data_file.txt) or directory (/temp/test_dir) on a source host depending on the selected command. Field available on following commands:</td>
</tr>
<tr>
<td></td>
<td>- Copy file</td>
</tr>
<tr>
<td></td>
<td>- Remove file or directory</td>
</tr>
<tr>
<td></td>
<td>- Set file attributes</td>
</tr>
<tr>
<td>Source directory</td>
<td>Path to the directory where the source files are located. Field available on following commands:</td>
</tr>
<tr>
<td></td>
<td>- Create directory</td>
</tr>
<tr>
<td></td>
<td>- Get file list</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Source files</strong></td>
<td>Names of specific source files to include in the file transfer. Separate the file names with semi-colons. This field supports a semi-colon separated list of wild-card patterns. For example: * .txt; a? cd.pdf. If this field is blank, all files are included. Field available on following command: • Get file list</td>
</tr>
<tr>
<td><strong>Is a directory</strong></td>
<td>If checked, specifies the file path is a directory. Field available on following command: • Remove file or directory</td>
</tr>
<tr>
<td><strong>Credential tag for source</strong></td>
<td>Specific credential tag this activity must use to run SFTP commands on the source host.</td>
</tr>
<tr>
<td><strong>Credential tag for target</strong></td>
<td>Specific credential tag this activity must use to run SFTP commands on the target host. Field available on following command: • Copy file</td>
</tr>
<tr>
<td><strong>Excluded files</strong></td>
<td>Names of specific source files to exclude from the file transfer. The activity acts on all other files found in the source directory or subfolders. Separate the file names with commas. This field supports comma-separated list of wild-card patterns. For example: *.txt, a?cd.pdf.. Field available on following command: • Get file list</td>
</tr>
<tr>
<td><strong>Include subfolders</strong></td>
<td>If checked, includes the files from subfolders in the source directory. Field available on following command: • Get file list</td>
</tr>
</tbody>
</table>

<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Permissions               | File or directory permissions to set for the user and group specified. This value must be expressed as an integer, such as 16877, which defines these permissions: rwxr-xr-x. The permissions numbers are internal values returned by the Get File List activity. Typically, you first use the Get File List activity to return a list of files and their attributes. Then you can move a file from a source host to a target host and set the source file attributes on the target file. This flow is demonstrated in the SFTP File Transfer workflow. Field available on following command:  
  - Set file attributes | MID Server with the appropriate capabilities for connecting to the source and target servers.                                                                                                                   |
| Access timestamp          | Override the timestamp when the file or directory was last accessed. The access and modification timestamps must be set together as a pair. Field available on following command:  
  - Set file attributes |                                                                                                                                            |
| Modification timestamp    | Override the timestamp when the file or directory was last modified. The access and modification timestamps must be set together as a pair. Field available on following command:  
  - Set file attributes |                                                                                                                                            |
| Size in bytes             | Size of a file, expressed in bytes. Field available on following command:  
  - Set file attributes |                                                                                                                                            |

The system uses this logic to determine which files to move from the source host:

- If the Source files field is empty, the system selects all the files in the source directory. Otherwise, it only selects those files whose names match one of the file name patterns given in the field.
- If the Excluded files field is empty, the system excludes nothing. Otherwise, it excludes those files whose names match one of the file name patterns given in the field.
- The exclude rule has a higher preference than the include rule. If a file name matches one of the file name patterns in the Excluded files field, it does not get into the selection regardless of the include rule.
- When the Include subfolders check box is cleared, the system looks only in the source directory for files to include or exclude. Otherwise, it looks in the source directory and any of its subfolders for files to include or exclude.

Note: You can map parameter values in a test payload to variables in the Outputs tab automatically. See automap output variables.

- Use auto-mapping to generate outputs and parsing rules (recommended for JDBC)
• If you do not use auto-mapping, you can manually create output variables and create parsing rules.

**SFTP template execution parameters**

You use execution parameters to create the input process script in the Preprocessing form.

For descriptions of the command fields, see Configure the SFTP execution command.

**Note:** You must use the executionParam. prefix with all variables in this table.

### SFTP execution parameters

</tbody>
</table>
### Configure the SFTP execution command

Use the input variables you created to configure the command that Orchestration executes on the SFTP target.

Create the input variables you need in the **Inputs** form before you can advance to the **Execution Command** stage.

Role required: `activity_creator`, `admin`

**Note:** You can test the JDBC connection between the MID Server and the target without having to run the activity in a workflow context. For details, see [test template outputs](#).

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.

---

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tags</td>
<td>tags</td>
<td>Hashmap of tag values returned from the SSH command</td>
<td>Contains the tags used to extract output using the SSH commands. The tag output is delimited by double percentage signs, as in <code>%%%tagname%% ... %</code>. Set up the command using the following format:</td>
</tr>
</tbody>
</table>

```plaintext
%%%tagname1%%
output1 line 1
output1 line 2
...
%%

%%%tagname2%%
output2 line 1
output2 line 2
...
%%
```

The tags returned are JavaScript hashmap objects in which each key is prefixed with `tag` appended with the tagname.

```json
{"__text__":
"",
"tagtagname1":"output1 line1
output1 line2",
"tagtagname2":"output2 line1
output2 line2"}
```
SFTP execution command

2. Complete the fields shown in the table.
## SFTP command fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command</strong></td>
<td>Type of activity to create. The choices are:</td>

</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server with the appropriate capabilities for connecting to the source and target servers. By default, the system selects an SSH MID Server.</td>
<td>All</td>
</tr>
</tbody>
</table>

The system uses this logic to determine which files to move from the source host:

- If the **Source files** field is empty, the system select all the files in the source directory. Otherwise, it only selects those files whose names match one of the file name patterns given in the field.
If the **Excluded files** field is empty, the system excludes nothing. Otherwise, it excludes those files whose names match one of the file name patterns given in the field.

The exclude rule has a higher preference than the include rule. A file whose name matches one of the file name patterns in the **Excluded files** field does not get into the selection, even though it would be selected by the include rule.

When the ** Include subfolders** check box is cleared, the system looks only in the source directory for files to include or exclude. Otherwise, it looks in the source directory and any of its subfolders for files to include or exclude.

3. Click **Save**.
4. Click **Continue** to advance to the **Outputs** stage.

## Create a probe activity

Create an activity that runs a probe on the target host that is configured to return specific information.

**Role required:** activity_creator or workflow_admin

For instructions on using the activity template process flow, see [create custom activities](#).

1. **Create a custom activity.**
   This action creates a custom activity using a template.

2. **After setting up** general properties and creating input variables, configure the Probe Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Map the input variables</strong></td>
<td>Use the variables you created to configure the command that Orchestration executes.</td>
</tr>
<tr>
<td><strong>Probe</strong></td>
<td>Probe to run with this activity, from the list of probes in the system</td>
</tr>
<tr>
<td><strong>Target host</strong></td>
<td>Host name or IP address of the target server for this activity.</td>
</tr>
<tr>
<td><strong>Parameters</strong></td>
<td>MID Server to use, by capabilities.</td>
</tr>
<tr>
<td><strong>Required MID Server capabilities</strong></td>
<td>Name-value pairs to pass to the host with this probe. You can create these parameters manually, or drag and drop input variables into the parameter fields and assign a value.</td>
</tr>
</tbody>
</table>

**Note:** You can map parameter values in a test payload to variables in the **Outputs** tab automatically. See [automap output variables](#).

- **Use** auto-mapping **to generate outputs and parsing rules**
- **If you do not use auto-mapping, you can manually create output variables and create parsing rules**

**Probe template execution parameters**

You use execution parameters to create the input process script in the **Pre Processing** form.

For descriptions of the command fields, see [Configure the Probe execution command](#).

**Note:** You must use the executionParam. prefix with all variables in this table.
### Probe activity execution parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Probe</td>
<td>probe</td>
<td>Reference</td>
<td>The sys_id of the MID Server probe.</td>
</tr>
<tr>
<td>Source</td>
<td>source</td>
<td>String</td>
<td>Intended target host</td>
</tr>
<tr>
<td>Parameters</td>
<td>parameters</td>
<td>Array of JS object</td>
<td>Array of JavaScript objects, expressed with the executionParam. prefix. To add more name-value pairs to the parameters array, append them to the existing array. Create a JavaScript object with the following syntax, and add it to the executionParam.parameter array. This assigns additional parameters to the message:</td>
</tr>
<tr>
<td>MidCapabilities</td>
<td>midCapabilities</td>
<td>String (comma separated)</td>
<td>List of required MID server capabilities. For more information, see Set up domain separation for MID servers. If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection:</td>
</tr>
<tr>
<td>ValueCapabilities</td>
<td>valueCapabilities</td>
<td>Array of hashmap</td>
<td>Capability values used to select the MID Server. For more information, see Set up domain separation for MID servers. If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection:</td>
</tr>
</tbody>
</table>

#### Probe template post-processing parameters

Use these parameters to create a post-processing script.
**Probe post-processing parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Payload</td>
<td>payload</td>
<td>String</td>
<td>Contains raw payload returned from the probe.</td>
</tr>
<tr>
<td>Output</td>
<td>output</td>
<td>String</td>
<td>Contains output data returned from the probe.</td>
</tr>
<tr>
<td>EccSysId</td>
<td>eccSysId</td>
<td>String</td>
<td>Contains the reference ID associated with the ECC Queue input message.</td>
</tr>
</tbody>
</table>

Configure the Probe execution command

Use the input variables you created to configure the command that Orchestration executes on the target.

Create the input variables you need in the Inputs form before you can advance to the Execution Command stage.

Role required: activity_creator, admin

**Note:** You can test the activity connection between the MID Server and the target without having to run the activity in a workflow context. For details, see test template outputs.

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
Probes execution command

2. Complete the fields shown in the table.
Probe execution command fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. Create input variables to map to available fields.</td>
</tr>
<tr>
<td>Probe</td>
<td>Probe to run with this activity, from the list of probes in the system.</td>
</tr>
<tr>
<td>Target host</td>
<td>Host name or IP address of the target server for this activity.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server to use, by capabilities.</td>
</tr>
<tr>
<td>Parameters</td>
<td>Name-value pairs to pass to the host with this probe. You can create these parameters manually, or drag and drop input variables into the parameter fields and assign a value.</td>
</tr>
</tbody>
</table>

3. Click **Save**.
4. Click **Continue** to advance to the **Outputs** stage.

Create an SSH activity

Create an activity that extracts data from a target host that uses the SSH network protocol.

Role required: activity_creator or workflow_admin

For instructions on using the activity template process flow, see [create custom activities](#).

1. Create a [custom activity](#).
   This action creates a custom activity using a template.

2. After setting up [general properties](#) and [creating input variables](#), configure the SSH Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Map the input variables</td>
<td>Use the variables you created to configure the command that Orchestration executes.</td>
</tr>
<tr>
<td>Target host</td>
<td>Host name or IP address of the target server for this activity.</td>
</tr>
<tr>
<td>Command</td>
<td>Command this activity runs on the target host. You can invoke a MID Server script from this field using any script type that the SSH command line supports. For more information, see <a href="#">Advanced SSH script options</a> below the table.</td>
</tr>
<tr>
<td>Directory</td>
<td>Directory on the target host where the command is run.</td>
</tr>
<tr>
<td>Credential tag</td>
<td>The Orchestration credential tag to use when running the command.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server with the appropriate capabilities for connecting to the host. By default, the system selects a MID Server with SSH capabilities.</td>
</tr>
<tr>
<td>Long running</td>
<td>If checked, disables the SSH connection timeout for commands that might take longer to run than the default 60 seconds. Orchestration periodically checks the running process to determine its status until it is finished.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>------------------------------------</td>
</tr>
<tr>
<td>Must Sudo</td>
<td>If checked, enables the use of <code>sudo</code> to run commands.</td>
</tr>
</tbody>
</table>

**Note:** You can map parameter values in a test payload to variables in the Outputs tab automatically. See automap output variables.

**Advanced SSH script options**

To run a MID Server script on the target host, specify the script type and pass the name of the script into the `${syncFile()}` parameter. The system uses this parameter to locate the named script in the MID Server Script File (ecc_agent_script_file) table and run it on the target host. For example, a bash script can be expressed as:

```bash
bash ${syncFile("<MID script name>")} argument1 argument2 argument3
```

A base script (`main_script.bash`) can reference another script (`my_include.bash`) as well as a separate file (`.my_profile`) located on the target host. Both scripts and the file referenced must be synced to the MID Server, using the `${syncFile()}` parameter, to execute properly.

```bash
source ${syncFile(".my_profile")}
cp ${syncFile("my_include.bash")} /usr/ssmith/my_include.bash
bash ${syncFile("main_script.bash")} one two three four five six
rm /usr/ssmith/my_include.bash
```

A Python example with inline comments might look like this:

```python
set $LIB_DIR=/usr/bin;
# Sync a file that is referenced inside myF5CreateLBPool.py
cp ${syncFile("specialFunctions.py")} ~/specialFunctions.py
# set up environment variables
source ${syncFile(".python_profile")}
# call script that sets up dependencies on the box from remote package repos
python ${syncFile("setupPythonDependencies.py")} pycontrol
# call a script that requires functions from the package as well as a function from myIncludedFile
python ${syncFile("myF5CreateLBPool.py")} snow_pool myActualValue
# user is responsible for their own cleanup
rm ~/specialFunctions.py
```

- Use auto-mapping to generate outputs and parsing rules
- If you do not use auto-mapping, you can manually create output variables and create parsing rules

**SSH template execution parameters**

Use execution parameters to create the input process script in the Pre Processing form of the activity designer.

For descriptions of the command fields, see Configure the SSH execution command.
**Note:** You must use the `executionParam` prefix with all variables in this table.

### SSH execution parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source</td>
<td>source</td>
<td>String</td>
<td>Intended target or host.</td>
</tr>
<tr>
<td>Command</td>
<td>command</td>
<td>String</td>
<td>Comment to run on the host.</td>
</tr>
<tr>
<td>Directory</td>
<td>directory</td>
<td>String</td>
<td>Directory on the host in which to run the command.</td>
</tr>
<tr>
<td>Credential tag</td>
<td>credential_tag</td>
<td>String</td>
<td>Orchestration credential tag to use when running the command.</td>
</tr>
<tr>
<td>MidCapabilities</td>
<td>midCapabilities</td>
<td>String (comma separated)</td>
<td>List of required MID Server capabilities.</td>
</tr>
</tbody>
</table>
| ValueCapabilities | valueCapabilities | Array of hashmap | Capability values used to select the MID Server. For more information, see [Set up domain separation for MID servers](#). If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection:  
```
    var valueCapability = {'NEW_MID_CAPABILITY': 'NEW_MID_CAPABILITY_VALUE'};
    executionParam.valueCapabilities.push(valueCapability);
```
| Long running     | long_running | Boolean             | Indicates whether or not the command is long running. A value of true indicates that the command is long running. |
| Must sudo        | must_sudo   | Boolean             | Indicates whether or not this activity must use `sudo` to run root commands. A value of true indicates that `sudo` must be used. |

**SSH post-processing parameters and payload parsing**

Use these parameters to create a post-processing script, payload parsing, and tagging.
### SSH post-processing parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output</td>
<td>output</td>
<td>String</td>
<td>Contains the output returned from the SSH command.</td>
</tr>
<tr>
<td>EccSysID</td>
<td>eccSysID</td>
<td>String</td>
<td>Contains the reference ID associated with the ECC Queue input message returned by the activity.</td>
</tr>
<tr>
<td>ErrorMessages</td>
<td>errorMessages</td>
<td>String</td>
<td>Contains the error messages retrieved from the SSH command. This value is null if there are no error messages.</td>
</tr>
</tbody>
</table>
| Tags        | tags     | Hashmap of tag values returned from the SSH command | Contains the tags used to extract output using the SSH commands. The tag output is delimited by double percentage signs, as in %tagname%% ... %%. Set up the command using the following format:

```plaintext
%%tagname1%%
output1 line 1
output1 line 2
...
%%

%%tagname2%%
output2 line 1
output2 line 2
...
%%
```

The tags returned are JavaScript hashmap objects in which each key is prefixed with tag appended with the tagname.

```javascript
{
  "__text__": "",
  "tagtagname1": "output1 line1
output1 line2
",
  "tagtagname2": "output2 line1
output2 line2
"}
```
Configure the SSH execution command
Use the input variables you created to configure the command that Orchestration executes on the host target.

Create the input variables you need in the Inputs form before you advance to the Execution Command stage.

Role required: activity_creator, admin

Note: You can test the SSH connection between the MID Server and the target without having to run the activity in a workflow context. For details, see test template outputs.

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
SSH execution command

2. Complete the fields shown in the table.
### SSH activity inputs

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. <a href="#">Create input variables</a> to map to available fields.</td>
</tr>
<tr>
<td>Target host</td>
<td>Host name or IP address of the target server for this activity.</td>
</tr>
<tr>
<td>Command</td>
<td>Command this activity runs on the target host. You can invoke a MID Server script from this field using any script type that is supported by the SSH command line. For more information, see <a href="#">Advanced SSH script options</a> below the table.</td>
</tr>
<tr>
<td>Directory</td>
<td>Directory on the target host where the command is run.</td>
</tr>
<tr>
<td>Credential tag</td>
<td>The Orchestration <a href="#">credential tag</a> to use when running the command.</td>
</tr>
<tr>
<td>Select MID Server by capabilities</td>
<td>MID Server with the appropriate capabilities for connecting to the host. By default, the system selects a MID Server with SSH capabilities</td>
</tr>
<tr>
<td>Long running</td>
<td>Check box to disable the SSH connection timeout for commands that might take longer to run than the default 60 seconds. Orchestration periodically checks the running process to determine its status until it is finished.</td>
</tr>
<tr>
<td>Must Sudo</td>
<td>Check box to allow the use of <code>sudo</code> to run commands.</td>
</tr>
</tbody>
</table>

3. Click **Save**.
4. Click **Continue** to advance to the **Outputs** stage.

### Create a run script activity

Create an activity that runs any script.

Role required: activity_creator or workflow_admin

1. Create a **custom activity**.
   - This action creates a custom activity using a template.
2. After setting up **general properties** and **creating input variables**, configure the Run Script Execution Command:
   - Create a script for this activity to execute.

**Note:** You can map parameter values in a test payload to variables in the **Outputs** tab automatically. See [automap output variables](#).

- Use **auto-mapping** to generate outputs and parsing rules
• If you do not use auto-mapping, you can manually create output variables and create parsing rules.

Run Script template processing script
Use the Run Script custom template Script form to enter a script to call and use with other activities.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Processing script</td>
<td>Script that the activity runs.</td>
</tr>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the input process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays input variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the processing script with this syntax: activityInput.variable.</td>
</tr>
</tbody>
</table>

Create a JMS activity
Create a custom JMS activity to retrieve or send messages to external systems using the Java Messaging Service.

Role required: activity_creator or workflow_admin

The JMS activity supports third party JMS providers whose JMS client application is written with a typical Java EE pattern and can support these operations:

• Using JNDI to find a ConnectionFactory object.
• Using JNDI to find one or more destination objects.
• Using the ConnectionFactory to create a JMS connection object.
• Using the JMS connection to create one or more JMS session objects.
• Using a JMS session and the destinations to create the MessageProducer and MessageConsumer objects.
• Starting the JMS connection to enable delivery or consumption of messages.

Note: The JMS activity designer has been tested with the JMS providers ActiveMQ and Tibco EMS. When connecting to a JMS provider, refer to your third party user documentation.

1. Create or verify your JMS credential.
   Your JMS credentials must have permission for the target database and proper configuration for the corresponding JMS connection. Credentials must be set up before you can create a JMS activity.

2. Create or verify your JMS connection.
   Your JMS connection must be configured with valid JMS credentials set up before you can create a JMS activity.

3. Create a custom activity.
   This action creates a custom activity using a template.
4. After setting up `general properties` and `creating input variables`, configure the JMS Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configure your credential</td>
<td>Fill in the fields necessary for your database connection.</td>
</tr>
<tr>
<td>Connection Factory</td>
<td>Name of the JMS Connection Factory. You should create or verify your JMS connection. This configuration links the name of the Initial Context Factory with the URL of the JMS provider.</td>
</tr>
<tr>
<td>Destination Type</td>
<td>Type of destination used for this message:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Queue</strong>: Message is queued for point-to-point communications.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Note</strong>: The <strong>GET</strong> operation is only supported for the <code>Queue</code> destination type.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Topic</strong>: Message is used for publish and subscribe communication.</td>
</tr>
<tr>
<td>Destination Name</td>
<td>Name of the queue or topic destination that is configured on the JMS provider.</td>
</tr>
<tr>
<td>Message Type</td>
<td>The JMS message type value. Only the <strong>Text Message</strong> type is supported. The queue or topic destination must be configured to receive or send only Text Message. Other message types are dropped, since the JMS Activity cannot process them.</td>
</tr>
<tr>
<td>Operation</td>
<td>The programmatic operation to perform on the destination. The choices are <strong>PUT</strong> or <strong>GET</strong>.</td>
</tr>
<tr>
<td>Timeout (Secs)</td>
<td>Allowed time to wait for a message in the message queue before it times out, in seconds. The default is 30.</td>
</tr>
<tr>
<td>Custom message headers</td>
<td>The custom header values in a name/value pair format, that is available on the JMS destination.</td>
</tr>
<tr>
<td>Message payload</td>
<td>Actual message content or payload that is sent to the JMS destination.</td>
</tr>
<tr>
<td>Credential tag</td>
<td>A tag for an individual credential for a JMS activity in an Orchestration workflow.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server to use, by capabilities.</td>
</tr>
</tbody>
</table>

- Use `auto-mapping` to generate outputs and parsing rules
- If you do not use auto-mapping, you can manually `create output variables` and `create parsing rules`
Create a JMS connection for an Orchestration activity

Configure your system to use Java Messaging Service (JMS) with a custom Orchestration JMS activity.

Role required: admin

The MID Server must have the correct JMS connection factories for your organization. Configure those values in the `mid.property.jms.command.allowed_factory_names` property, found in MID Server > Properties. The default values for this property can be changed to any value or comma-separated list of values that the third-party JMS provider advertises.

1. Navigate to MID Server > JAR Files.
2. Click New and add:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique and descriptive name for identifying the file in the instance.</td>
</tr>
<tr>
<td>Version</td>
<td>A version number for the file, if one is available.</td>
</tr>
<tr>
<td>Source</td>
<td>Location of the JAR file for reference purposes. Source information is not used by the system.</td>
</tr>
<tr>
<td>Description</td>
<td>Short description of the JAR file and its purpose in the instance.</td>
</tr>
</tbody>
</table>

3. Click the paper clip icon in the banner and attach the JMS driver jar file.

The JMS driver jar file should be available as part of JMS provider installation. Few JMS vendors make them available as a separate product. Refer to the JMS provider documentation to determine which JMS client driver jar files require the client applications to connect to the JMS provider. For example, if you are trying to connect to ActiveMQ V5.10 (JMS provider), you need the `activemq-all-5.10.1.jar` file.

5. Click New, add the following, and click Submit:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of this connection factory.</td>
</tr>
<tr>
<td>Initial Context Factory</td>
<td>Name of the JNDI class that is used to create the InitialContext.</td>
</tr>
</tbody>
</table>

**Note:** For example, to connect to ActiveMQ V5.10 (JMS Provider), the value is `org.apache.activemq.jndi.ActiveMQInitialContextFactory`.

**Provider URL**

Location of the running JMS provider installation.

**Note:** For example, to connect to ActiveMQ V5.1: `tcp://ipAddressOrHostName:61616`.

6. Navigate to Orchestration > Credentials.
7. Click New, select JMS Credentials, and provide the user name and password the MID should use to communicate with the JMS provider.

For more information, see JMS credentials.

8. Click Submit. You are ready to create a custom JMS activity.
**JMS template execution parameters**

You use execution parameters to create the input process script in the **Preprocessing** form.

You must use the `executionParam` prefix with all variables in this table.

### JDBC execution parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Jms ds</td>
<td>jms_ds</td>
<td>Reference</td>
<td>Selected JMS data source.</td>
</tr>
<tr>

<td>Contains the reference ID associated with the ECC Queue input message returned by the activity.</td>
</tr>
<tr>
<td>ErrorMessages</td>
<td>errorMessages</td>
<td>String</td>
<td>Contains any error messages retrieved from the JMS command. This value is null if there are no error messages.</td>
</tr>
</tbody>
</table>

**Activity scoping**

Custom activities run in their own scope, even if it is different from that of the workflow.

Any script that runs inside a custom activity with a scope can only access outside artifacts that are within the scope of that activity or artifacts that are configured to run in any scope. Conversely, an outside artifact can only access the script inside that private activity if the outside artifact is running in the same scope. Activities with public scopes can interact with outside artifacts in any application scope.

You can use private activities as part of a workflow that has a public application scope. These activities are protected from reaching outside of the workflow or from being reached from outside the workflow. For details about setting application scoping for custom activities, see the field description table for the appropriate activity template.

**Note:** Custom activities uploaded to the ServiceNow Store must be configured as accessible to all application scopes.

Publish a custom activity

When a user creates a custom activity and saves or submits it, that activity appears in the Custom and Packs tabs of the designer palette, but is visible only to the user who created it.

Roles required: admin, activity_admin, activity_creator

1. When you finish configuring the activity, click Publish.
   This makes the activity accessible to other users on the instance with the workflow_admin or activity_creator role. Published activities are available for upload to the ServiceNow Store, can be added to workflows, and can be edited by any user with the proper roles.

2. To edit a published activity, click Checkout.
   When an activity is checked out by a user, only that user can modify it. The fields of a checked out activity are read-only for all other users.

3. When you are finished editing the checked out activity, publish it again.
   The system adds a new version of this activity to the Custom tab in the workflow editor palette.

   Note: Activities you create and publish are visible in the Packs tab only if they were created in the current application scope.

Return a locked activity to a published state

Problems can arise if an activity version is checked out by a user and not checked back in. An activity in this state cannot be checked out for update.

Role required: admin, activity_admin, activity_creator

An administrator can return a locked activity to a published state.

1. Open the workflow editor.

2. From the Custom tab, open the activity that is locked.

3. Click the menu icon in the title bar and select Versions from the context menu.
   A list of all the versions of that activity appears. The locked version displays the user who checked it out.
4. Select the checked out version.
   The system opens the record in the activity designer.
5. Click the menu icon again and select **Force Checkout** from the context menu.
   The activity fields become editable.
6. Click **Publish**.
   The activity becomes available to users with the appropriate roles.

**Copy a custom activity**

You can copy activities for reuse from the **Custom** tab in the global scope.

Role required: admin, activity_admin, activity_creator

**Note:** You cannot copy an activity in a private scope.

1. To reuse an activity in the global scope, expand the parent category to display the activities.
2. Right-click the activity you want to copy and select one of these options:
   - Copy into global scope as new activity: Copies the activity with the new name you provide, uses the same version number as the original activity, and moves it to the global scope in the **Custom** tab.
Naming an activity copy

- Copy into global scope as new version: Copies the activity using the same name, increments the version number, and moves it to the global scope in the Custom tab. The system automatically adds the parent category to the Custom tab if it does not already exist. This action will overwrite another activity with the same name and version number.

Creating a new activity version

**Note:** If the activity is in any other scope but global, the system displays this message: Cannot copy privately scoped activity.

Orchestration databus

The databus allows workflow designers to track the flow of data through an Orchestration workflow and provides access to output data that can be consumed by other custom activities.

Data is made available in a workflow when you use activities created with the Orchestration activity designer. The activity designer provides the ability to specify well defined inputs and outputs for your activities. When you use those activities on the workflow canvas, the outputs appear in the Data tab and are available for use as inputs in subsequent activities.

**Note:** Orchestration does not filter the data you are given for reuse in the Data tab. You must make sure an activity in the workflow canvas has executed before you consume its output data.

When you drop a custom activity onto the workflow canvas, the system assigns it an index. If you delete an activity from the canvas and add a new one, the indexes are not reused. This ensures that you don’t accidentally start subscribing to data you did not intend to use. If you update an activity in the activity designer, the system automatically updates the activity on the canvas to ensure the data you are subscribing to downstream is not affected.
Reuse data in the activity designer

The Data tab in the Workflow Editor lists all custom activities used in the current workflow that produce data and displays that data for reuse in other custom activities.

Roles required: workflow_creator

Activities are categorized by application in this tab and are available for use as data sources for other activities. The Data tab is a graphical representation of the workflow databus, which manages all the temporary data used by the current workflow.

1. Drag output variables from an activity in this tab into the inputs of another activity on the workflow canvas to link the activities together.

   You can use any of the outputs in the structure, regardless of the the application to which they belong. An index number in parenthesis after the activity name provides a unique identifier for the parameters that you use as input data in other activities. If you do not name a custom activity, the only identifier for that activity in the Data tab is the index number. Index numbers indicate the sequence in which custom activities were added to the workflow and are not reused. When you drag a custom activity onto the workflow canvas, the system adds that activity and its output data to the structure. Conversely, if you remove a custom activity from the canvas, that activity and its outputs disappear from the data list.

2. Point to an activity to display information about it in a pop-up window.

   Any output data reused by the activity is listed in the Databus Output field of the the pop-up window.
MID Servers for Orchestration

Orchestration automatically selects an appropriate MID Server based on the capabilities that you configure in activities, the IP addresses of target devices, and the application that the MID Server is allowed to use.

To allow a MID Server to work with Orchestration, it must have the **Orchestration** application or the **ALL** application assigned to it. See *Configure a default MID Server for each application* for instructions.

You can have MID Servers focus on different capabilities and separate sections of your network. See:

- MID Server capabilities
- Map an IP address to a DNS name

You can also specify a default MID Server to use if no MID Servers meet the capability and IP range criteria for an activity. See *Select the default MID Server for Orchestration*.

**MID Server capabilities**

MID Server capabilities define the specific functions of a MID Server within an IP address range.

Several applications, such as Discovery, Service Mapping, and Orchestration can use capabilities, IP ranges, and the supported application to narrow the pool of MID Servers it uses. At least one capability is required for each MID Server used by Orchestration. See *MID Servers for Orchestration* for more information.

The following capabilities are available by default with Discovery:

- SSH
- SNMP
ServiceNow Jakarta Now Platform Capabilities

- VMware
- PowerShell
- WMI
- SOAP
- REST
- JDBC
- Resolve DNS
- AWS
- Azure
- Cloud Management
- All

**MID Server capability values**

Capabilities provided in the base system do not have a defined Value string. A MID Server configured to use a capability that has no Value can locate any device using that capability’s protocol. If a capability has a defined value, the MID Server using that capability finds only those devices using that protocol that match the value string exactly. The exception to this is the Resolve DNS capability, which is configured to resolve any DNS name into an IP address using a partial string match.

**Scripted MID Server capability value matching**

You can use value tests to create capabilities that find devices using values without requiring exact string matching. Action on these values is controlled by a user-defined script.

The Resolve DNS capability is provided in the base system and is configured to resolve DNS names into IP addresses for devices whose names end with a specified domain name. The capability Value entered is automatically prefaced with a dot during processing to match domain syntax. This value can contain one or more sub-domains, but must include the end of the domain string. Matching devices must end with the identical syntax. The script for the Resolve DNS capability determines if a device name matches the criteria defined by Value. If a match exists, the platform performs the address resolution automatically. For example, if the value for the Resolve DNS capability is service-now.com, the MID Server with this capability finds lnxlab01.sandiego.service-now.com and dbsrv101.sanjose.service-now.com. If the value is changed to sandiego.service-now.com, then the MID Server finds only lnxlab01.

![Note: If Value in the Resolve DNS capability is blank, then all domains match.](image)

To view the script for evaluating this capability, navigate to MID Server > Capability Value Tests and select Resolve DNS from the list.
Configure MID Server capabilities

A capability is required for each MID Server to work with Orchestration, Service Mapping, Cloud Management, and Service Analytics.

Role required: admin or sm_admin

1. Navigate to MID Server > Capabilities.
2. Select an existing capability. You can also select ALL to include all capabilities.

   Note: Ensure that each IP address range has MID Servers with the necessary capabilities to complete the Orchestration activities on that network segment.

3. Create a new capability:
   a) Click New.
   b) Configure the value for a custom capability.
      An example is a capability for DOMAIN, with a value of service-now.
   c) Click Submit.

4. Click Edit in the MID Servers related list to add MID Servers to the capability.
5. Select one or more MID Servers for this capability from the slushbucket.
6. Click Save.

The capability defined here also appears in the primary record for this MID Server.

Select the default MID Server for Orchestration

Orchestration uses the default MID Server if it cannot find a MID Server with the correct IP range and capability.

Specify the default MID Server in either of these locations:

- The Default MID Server field on the Orchestration application record. See Configure a default MID Server for each application for instructions.
- The Default MID Server to use for Orchestration Activities property. Navigate to Orchestration > MID Server Properties to set this value.

These two values are automatically kept in synch. You can change the default MID Server in either location.

Use the Orchestration Usage dashboard

This dashboard shows an overview of Orchestration usage metrics to show customers how their organization uses Orchestration and to support license compliance.

Role required: orchestration_manager

1. To view the dashboard, navigate to Orchestration > Operations & Troubleshooting > Orchestration Usage Dashboard.

The Orchestration Usage dashboard displays. The tabs on the dashboard include Licensable Usage and Orchestration Usage. Reports on these tabs include:

**Orchestration Usage Metrics**

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transaction Summary Last 12 months</td>
<td>A running transaction count of all Orchestration transactions over the last 12 months. Includes:</td>
</tr>

<td></td>
</tr>
</tbody>
</table>

2. Optional: You can add more widgets to the dashboard by clicking the Add Content icon in the upper right corner of the dashboard.

Note: You should not modify the first tab in this Dashboard. If you want a different dashboard experience, add a tab and customize that with your usage reports.

**Password Reset and Password Change applications**

The ServiceNow® Password Reset application enables an end user to use a self-service process to reset the password. Alternatively, your organization can implement a process that requires a service desk agent to reset passwords for end users.

**Explore**
- [Password Reset release notes](#)
- [Upgrade to Jakarta](#)

**Set up**
- [Password Reset setup guide](#)

**Administer**
- [Password Reset admin guide](#)

**Use**
- [Developer training](#)

**Integrate**
Password Reset setup guide

A simple version of the Password Reset application is active by default. You can install a plugin to extend functionality.

Requirements

Role required: admin

What is installed

- Password Reset is active by default and includes example verifications. The base system enables connections only to the Local ServiceNow Instance credential store type. For details, see Credential stores for Password Reset.
- To enable connections to Active Directory (AD) and Remote (SOAP) ServiceNow Instance credential store types, you must activate the Password Reset - Orchestration Add-on plugin. The plugin also activates the Password Reset Windows Application (com.glideapp.password_reset_desktop). No other components are installed. Orchestration is available as a separate subscription. See Activate the Password Reset - Orchestration Add-on plugin.

Next steps

Plan and configure the Password Reset processes for your organization. See the Password Reset admin guide.

Activate the Password Reset - Orchestration Add-on plugin

The Password Reset - Orchestration Add-on plugin activates the Password Reset Windows Application (com.glideapp.password_reset_desktop) and enables connections to the Active Directory (AD) and 'Remote (SOAP) ServiceNow instance' credential store types. No other components are installed.

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and sub-production instances, generally within a few days.
If you do not have an account manager, decide to delay activation after purchase, or want to evaluate the product on a sub-production instance without charge, follow these steps.

Role required: none

1. In the HI Service Portal, click **Service Requests > Activate Plugin**.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

### Installed with Password Reset

Tables, roles, business rules, scripts, and workflows are installed with the Password Reset application.

<table>

<td>Second page of reset process (asks user to verify identity).</td>
</tr>
<tr>
<td>$pwd_new</td>
<td>Last page of password change process (asks for new password).</td>
</tr>
<tr>
<td>$pwd_success</td>
<td>Page that appears when password is reset successfully.</td>
</tr>
<tr>
<td>$pwd_error</td>
<td>Page that appears on error during reset process.</td>
</tr>
<tr>
<td>$pwd_confirm</td>
<td>For processes configured to email password reset URL: After successful verification, this page displays message about sending link to user.</td>
</tr>
<tr>
<td>$pwd_change</td>
<td>Page for changing password.</td>
</tr>
<tr>
<td>$pwd_change_success</td>
<td>Page that appears when password is changed successfully.</td>
</tr>
<tr>
<td>$pwd_change_error</td>
<td>Page that appears on error during password change process.</td>
</tr>
<tr>
<td>$pwd_enrollment_form_container</td>
<td>Enrollment page for all verifications.</td>
</tr>
<tr>
<td>$pwd_enrollment_success</td>
<td>Page that appears when enrollment is successful.</td>
</tr>
<tr>
<td>$pwd_enroll_error</td>
<td>Page that appears when any error happens during enrollment.</td>
</tr>
</tbody>
</table>

### Password Reset UI macros

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$pwd_unlock_success</td>
<td>Page that appears when locked user is successfully unlocked.</td>
</tr>
<tr>
<td>$pwd_reset_downloads_ui</td>
<td>Page for downloading Password Reset Windows Application.</td>
</tr>
<tr>
<td>$pwd_csrf_validation</td>
<td>CSRF validation for Password Reset Application. If violation is detected, the page will be redirected to the error page.</td>
</tr>
<tr>
<td>$pwd_display_password</td>
<td>Displays a temporary password on the success page if the process is configured to auto-generate.</td>
</tr>
<tr>
<td>$pwd_enroll_questions_ui</td>
<td>UI for question and answer security validation enrollment.</td>
</tr>
<tr>
<td>$pwd_enroll_questions_ui_js</td>
<td>JavaScript code that requires server-side data for security question and answer enrollment.</td>
</tr>
<tr>
<td>$pwd_enroll_sample_ui</td>
<td>Sample UI macro for enrollment for Mock Verification Type.</td>
</tr>
<tr>
<td>$pwd_enroll_sms_ui and $pwd_verify_sms_ui</td>
<td>UI for SMS enrollment and verification.</td>
</tr>
<tr>
<td>$pwd_enrollment_form_title</td>
<td>Jelly macro function that prints the title for the enrollment form. A verification ID is mandatory.</td>
</tr>
<tr>
<td>$pwd_error_message</td>
<td>UI for displaying error messages.</td>
</tr>
<tr>
<td>$pwd_process_flow</td>
<td>UI for indicating current stage.</td>
</tr>
<tr>
<td>$pwd_process_footer</td>
<td>JavaScript code to get the footer macro name.</td>
</tr>
<tr>
<td>$pwd_verify_personal_data_ui and $pwd_verify_personal_data_confirmation_ui</td>
<td>UI for verifying personal data and for confirming personal data.</td>
</tr>
<tr>
<td>$pwd_verify_questions_ui</td>
<td>UI for verifying questions.</td>
</tr>
<tr>
<td>$pwd_verify_simple_ui</td>
<td>Input section for a simple verification method. This field is a single input field.</td>
</tr>
</tbody>
</table>

### UI scripts installed with Password Reset

You can create a UI script and reference the script from a UI macro or UI page by using a `<g:include_script>` Jelly tag. The following example shows how the $pwd_enroll_questions_ui UI macro can reference the $pwd_enroll_questions_ui script. In the example, [UI Script Name]+".jsdbx" is the name of the script:

```
<g:include_script src="$pwd_enroll_questions_ui.jsdbx" />
```

By referencing an external script, you can maintain separation between client JavaScript code and Jelly code, which simplifies maintenance. You can use the following installed scripts with Password Reset UI macros:
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$pwd_csrf_common_ui_script</td>
<td>Common UI script for handling a Cross-site Request Forgery (CSRF).</td>
</tr>
<tr>
<td>$pwd_enroll_questions_ui</td>
<td>JavaScript code for the $pwd_enroll_questions_ui UI macro.</td>
</tr>
<tr>
<td>$pwd_enroll_sample_ui</td>
<td>Included sample client JavaScript for the $pwd_enroll_sample_ui UI macro.</td>
</tr>
<tr>
<td>$pwd_enroll_sms_ui</td>
<td>SMS enrollment UI script.</td>
</tr>
<tr>
<td>$pwd_enrollment_submit_event</td>
<td>UI script for an enrollment submission event.</td>
</tr>
<tr>
<td>$pwdWfManager</td>
<td>Helper class to handle workflow activities and post-processing.</td>
</tr>
</tbody>
</table>

**Password Reset workflows**

The Password Reset plugin adds workflows that you can use as examples to create custom workflows for Password Reset processes.

**Workflows that connect to a credential stores**

<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pwd Reset - AD</td>
<td>Connects to an AD server.</td>
</tr>
<tr>
<td>Pwd Reset - Local ServiceNow</td>
<td>Current (local) instance.</td>
</tr>
<tr>
<td>Pwd Reset - Master</td>
<td>Password Reset master workflow.</td>
</tr>
<tr>
<td>Pwd Reset - Mock Fatal</td>
<td>Example workflow to use in Password Reset testing to simulate a fatal error. No retries.</td>
</tr>
<tr>
<td>Pwd Reset - Mock Non Fatal</td>
<td>Example workflow to use in Password Reset testing to simulate a non-fatal error.</td>
</tr>
<tr>
<td>Pwd Reset - Mock Success</td>
<td>Example workflow to use in Password Reset testing to simulate a successful completion.</td>
</tr>
<tr>
<td>Pwd Reset - Remote ServiceNow</td>
<td>Connects to a remote(SOAP) ServiceNow instance.</td>
</tr>
</tbody>
</table>

**Workflows that test the connection to a credential store**

<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pwd Connection Test - AD</td>
<td>Tests connection to an AD server.</td>
</tr>
<tr>
<td>Pwd Connection Test - Local SN</td>
<td>Tests connection to local instance.</td>
</tr>
<tr>
<td>Pwd Connection Test - Master</td>
<td>Master workflow to test credential store connectivity.</td>
</tr>
<tr>
<td>Pwd Connection Test - Mock Failure</td>
<td>Example credential store connection test that simulates a failed connection.</td>
</tr>
<tr>
<td>Pwd Connection Test - Mock Success</td>
<td>Example credential store connection test that simulates a successful connection.</td>
</tr>
<tr>
<td>Pwd Connection Test - Remote SN</td>
<td>Tests connection to a remote(SOAP) ServiceNow instance.</td>
</tr>
</tbody>
</table>
## Workflows that determine the lock state of a user account

<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pwd Get Lock State - AD</td>
<td>Gets a user account lock state for the AD server.</td>
</tr>
<tr>
<td>Pwd Get Lock State - Local SN</td>
<td>Workflow to get a user account lock state for the local instance.</td>
</tr>
<tr>
<td>Pwd Get Lock State - Master</td>
<td>Master workflow to get a user account lock state.</td>
</tr>
<tr>
<td>Pwd Get Lock State - Remote SN</td>
<td>Gets a user account lock state for the remote(SOAP) ServiceNow instance.</td>
</tr>
</tbody>
</table>

## Workflows that unlock a user account

<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pwd Unlock Account – AD</td>
<td>Unlocks a user account for a local instance.</td>
</tr>
<tr>
<td>Pwd Unlock Account - Local SN</td>
<td>Workflow to unlock a user account for a local instance.</td>
</tr>
<tr>
<td>Pwd Unlock Account - Master</td>
<td>Master workflow to unlock a user account.</td>
</tr>
<tr>
<td>Pwd Unlock Account – Remote SN</td>
<td>Unlocks a user account for a remote(SOAP) ServiceNow instance.</td>
</tr>
</tbody>
</table>

## Workflows that change a password

<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pwd Change - Master</td>
<td>Password change master workflow.</td>
</tr>
<tr>
<td>Pwd Change – Local ServiceNow</td>
<td>Connects to a local instance to change a password.</td>
</tr>
<tr>
<td>Pwd Change – AD</td>
<td>Connects to an AD server to change a password.</td>
</tr>
<tr>
<td>Pwd Change – Remote ServiceNow</td>
<td>Connects to a remote(SOAP) ServiceNow instance to change a password.</td>
</tr>
</tbody>
</table>

## Password Reset notifications

<table>
<thead>
<tr>
<th>Name</th>
<th>Fired by event name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password Reset – Send SMS Code</td>
<td>pwd.send_sms_code.trigger</td>
<td>Sends out SMS authentication code for verification.</td>
</tr>
<tr>
<td>Password Reset - New Password</td>
<td>pwd.email.trigger</td>
<td>For the Email Password process, sends an email that includes the new password.</td>
</tr>
<tr>
<td>Confirmation</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Password Reset URL</td>
<td>password.reset.url</td>
<td>For the Email Password Reset URL process; Sends email that includes a link to the password reset URL.</td>
</tr>
</tbody>
</table>
SOAP messages for Password Reset

<table>
<thead>
<tr>
<th>SOAP Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change Password</td>
<td>When the Orchestration Add-on plugin is active, the system can use the SOAP protocol to change passwords on remote credential stores such as a remote ServiceNow instance.</td>
</tr>
<tr>
<td>Password Reset Request</td>
<td>When the Orchestration Add-on plugin is active, the system can use the SOAP protocol to reset passwords on remote credential stores such as a remote ServiceNow instance.</td>
</tr>
</tbody>
</table>

REST API

Name: Pwd Reset
API ID: pwd_reset
Base API path: /api/now/pwd_reset

**Resources (Version v1)**

<table>
<thead>
<tr>
<th>Name</th>
<th>Resource path</th>
<th>API Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pwd_init</td>
<td>/api/now/v1/pwd_reset/init</td>
<td>v1</td>
<td>Initial request to establish session, write logs, and fetch UI messages.</td>
</tr>
<tr>
<td>pwd_identify</td>
<td>/api/now/v1/pwd_reset/identify</td>
<td>v1</td>
<td>Get identification page components.</td>

<td>v1</td>
<td>Get success page components.</td>
</tr>
<tr>
<td>pwd_failure</td>
<td>/api/now/v1/pwd_reset/failure</td>
<td>v1</td>
<td>Get failure page components.</td>
</tr>
</tbody>
</table>

Password Reset Windows Application

If a user forgets the password or is locked out of a Windows computer, the user can reset the password directly from the Windows login screen.

Installer and documentation

Download the installer and installation instructions from KB0542328 in the ServiceNow Knowledge Base. The installer uninstalls any earlier version of the Password Reset Windows Application.
How the Password Reset Windows Application works

Administrators download and run an EXE or MSI file to install or distribute the application to user computers. The application installs a link on the Windows login screen. The user clicks the link (Forgot Password? in the examples on various Windows versions) and is then guided through the process of resetting the password.
By default, when a user requests a reset, the instance sends the user a URL with a user-specific token. After the user opens the URL, the instance prompts the user to enter and confirm the new password. The instance does not send a temporary password.

Restrictions on the Password Reset Windows Application

- The Password Reset Windows Application does not support custom verifications.
- The Password Reset Windows Application uses the base-system CAPTCHA service even if the Password Reset application is configured to use Google reCAPTCHA with the web interface. See the section titled "Settings on the Details tab" in Configure your Password Reset or Password Change process.
- The Password strength indicator is not supported. See Configure and test the Password Reset connection to a credential store.
- For some verification types, you can use only one verification. Custom verifications are not supported. See Password Reset verifications for details.
- Custom UI macros configured on the Process > Advanced page are not supported (for example, entry, success, or failure macros). The system displays only the default success and failure messages.
- The Password Reset Windows Application supports newline characters in the Password rule hint text. Other formatting is not supported (bold, underline, hyperlink, and so on). See Configure and test the Password Reset connection to a credential store.

Password Reset Windows Application installation requirements

You must activate the Password Reset Orchestration Add-on plugin to use the Password Reset Windows Application.

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required ServiceNow release</td>
<td>Password Reset Windows Application version 4.0 is supported on Kingston, London, and Madrid releases. Jakarta and earlier releases are not supported.</td>
</tr>
</tbody>
</table>
### Requirement Description

**Required hardware**
- 1 GHz or faster processor
- 512 MB of RAM
- 10 MB of available hard disk space (x86)
- 10 MB of available hard disk space (x64)

**Required software**

<table>
<thead>
<tr>
<th>Version of Password Reset Windows Application</th>
<th>Microsoft .NET Framework</th>
<th>Microsoft Visual C++</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0</td>
<td>4.7.1 and newer</td>
<td>Redistributable Visual Studio 2017</td>
</tr>
</tbody>
</table>

**Supported operating systems**
- Windows 7
- Windows 8.1
- Windows 10 Enterprise
- Windows 10 Pro

**Supported processor architecture**
- X86
- X64

**Supported network architecture**
- Password Reset Windows Application clients must have direct access to both the Internet and the ServiceNow instance where the Password Reset Windows Application is configured
- The ServiceNow SHA certificate must not be blocked by the corporate network. Information on the ServerCertificateSHA256 file appears in the documentation for Password Reset Windows Application.
- To reset an AD password, the client must be on the corporate network.

---

**Password Reset admin guide**

The Password Reset application enables an end user to reset or change a password using a self-service process. Alternatively, your organization can implement a process that requires a service desk agent to reset passwords for end users.

Watch the video: [Introducing Password Reset (Video)](#)

**Password Reset processes**

Users with the password_reset_admin role configure how the process of resetting a password works for an end user.

- **Self-service process:** Users reset passwords over the Internet using a browser on any supported interface, including mobile devices.
• **Service desk-assisted process**: A user requests the assistance of a service desk agent, over the phone or in person. Users do not reset passwords.

**End-user experience of the self-service process**

The following example is typical:

1. On the login page, the user clicks the **Forgot Password?** link to start the process.

![Login page](image)

2. The Identify page opens and the user enters their identifying information (typically username or email address). The example includes the default CAPTCHA security feature:
3. On the Verify page, the user verifies their identity by providing information that proves that they are who they say they are. You, the admin, configure the method of verification and you can require multiple verifications. In the example, the admin has configured the Security Question verification. The user must answer a question to prove identity. (The user had earlier selected the question and provided a secure private answer while enrolling for the password reset process.) Other possible verifications require the user to enter a code number that was sent to a mobile device by SMS text, through the Google Authenticator app, or by email.

4. The system checks the credential store to verify identity and then displays the new password on the Reset page.
Elements of a password reset process

You configure the following elements of the process for your organization:

- A connection to the credential store for your organization where user credentials (like username/password) are securely stored.
- One or more user groups on the ServiceNow instance that can use the password reset process.
- The type of identification that users must enter to identify themselves (typically username or email address).
- One or more verifications — methods to verify the identity of the user. Examples:
  - Answer a question that only the user knows how to answer — the QA Verification (based on the Security Question verification type).
  - Enter a code number that was texted to a mobile device — the SMS verification.
How you implement a password reset process

1. Plan your implementation: Ensure that all applicable organizational guidelines, security policies, and areas of the organization are considered.

2. Set up the elements of the password reset and password change processes according to the plan:
   - Connection to the credential store.
   - User groups that will use the password reset process.
   - Identification type to use.
   - Verifications to use.

3. In the service desk-assisted model, assign service desk agents to monitor and reset passwords as needed.

4. Monitor password reset activity to identify security threats and to ensure compliance with the password policy requirements of your organization.

Password Reset Windows Application

If a user forgets the password or gets locked out of a Windows computer, the user can reset the password directly from the Windows login screen. The user clicks the Forgot Password? link and is then guided through the process of resetting the password. To learn more, see Password Reset Windows Application.

Password Change application

The Password Change application extends the Password Reset application by letting admins define how users change their passwords. Only a self-service process is supported and an admin must publish the URL to the password change form.

1. The user logs in to the instance and then selects the Change Password module or link from the user profile record.

2. On the Change Password page, the user selects the credential store where the password resides.

3. The user enters the old password and then enters and confirms a new password.

4. Workflows validate the old password and then implement the new password.

5. The system notifies the user that the password was changed.

What to do next

Plan your Password Reset processes

Plan your Password Reset processes

To ensure security and efficiency, take the time to plan your Password Reset implementation.

Role required: password_reset_admin or admin

1. Decide on the password reset process:
• **Self-service process:** Users reset their password over the Internet using a browser on any supported interface, including mobile devices. To make the Password Reset application with Orchestration available to all users publicly, create a new Password Reset process only for this purpose and make it accessible to all users by setting the **Public access** property.

• **Service desk-assisted process:** Users reset passwords by requesting the assistance of a service desk agent, over the phone or in person. Only service desk agents with the password_reset_service_desk role can reset user passwords. Watch the videos: [Resetting User Passwords (Video)](#) and [How to Set Up a Service Desk-Assisted Password Reset Process (Video)](#).

2. Understand how groups and roles differ in their access and security needs.
   Analyze and assess how members of each group in your organization access the system. For example, if members of the sales group primarily access the system remotely, consider using a stronger method or multiple methods to verify the identity of each user.

   Identify user roles that have access to critical information and resources. For example, stronger verifications might be required for roles that have access to employee data, accounting information, or network configurations.

   Based on your analysis of groups and roles, determine the number and variety of verifications needed for the different Password Reset processes.

3. Consider how to manage credentials.
   Determine whether single sign-on is enabled with the type of directory service or other credential store used. If the directory service is configured for single sign-on, consider increasing the level of security by using multiple methods to verify identity of a user. A compromised user name and password can easily allow access to associated systems in a single sign-on environment.

4. Consider how to implement enrollment in the Password Reset program.
   For example, will enrollment be optional or required? Will users be auto-enrolled? How will users be notified to enroll in the program? The answers to these questions will help you determine the appropriate verification types to use.

5. Consider which Password Reset options to offer to users.
   • If your organization uses single sign-on, how will users reset their password if they are unable to log on?
   • What options are available to users working off-site?

---

**Example: The default self-service Password Reset process**

The default self-service Password Reset process enables a user to reset the password without assistance from service desk agents.

**The default self-service password reset flow**

1. If a user does not remember the password, the user can click the **Forgot Password?** link on the login screen.
2. The Password Reset application starts. On the **identity** page, the user identifies himself or herself by entering a **Username**.

3. On the **verify** page, the user proves that they are the person who is associated with the username. In this example, the user enters the email address that is associated with the user profile. The admin can configure a different verification method or can require additional verifications, for example, a personal question that only the user can answer.

4. The **Reset** page tells the user to check email for instructions.

5. The user opens the email and clicks the **here** link to reset the password. The link is valid for a period that you specify (use the `password_reset.request.expiry` property).
6. The Reset Password page guides the user to reset the password.

   ![Reset Password Page](image)

The default self-service Password Reset process (com.glideapp.password_reset) defines:

- The URI that specifies where users are redirected when they click Forgot Password? By default this value is /$pwd_reset.do?sysparm_url=ss_default, which is the same value used in the glide.security.password_reset.uri property. In previous releases, this value was set to /reset_password.do.
- The Enable Password Reset URL option, which specifies that the user should receive an email with a link to reset their password after they click Forgot Password?.
- The Personal Data - Enter Email Address verification flow that specifies the three-step password reset flow.

See Configure your Password Reset process for instructions on accessing this form and configuring the fields.

**Note:**
- This feature works for locally authenticated users who enter the username and password specified in their user record. Users logging in to the instance via an SSO solution or an LDAP integration cannot reset passwords with self-service Password Reset.
Configure your Password Reset or Password Change process

To implement the process, you configure credentials, verifications, and users.
Role required: password_reset_admin or admin

1. Be sure to Plan your Password Reset processes.
2. Create the credential store record for user names and passwords that are managed.

   Note: For LDAP integrations: If the Active Directory settings require users to reset the password when logging in, the results depend on the password reset plugin that is installed.
   - The Password Reset plugin cannot change an AD password. End users will not be able to log in to the instance.
   - The Self Service Password Reset plugin depends on the Password Reset Basic plugin. Self-service is intended for password reset only on the local ServiceNow instance and cannot change an AD password.
   - The Password Reset Orchestration Add-on plugin is built on top of Orchestration AD activities. The plugin supports changing the AD password.

3. Define the verifications that the process will use.

A Password Reset process consists of the following elements:
- The credential store that contains user login credentials.
- Optionally, the user groups that are authorized to use the Password Reset process.
- The verifications (extension script includes) that verify the identity of the requesting user and that enable the service desk agents to authorize reset of the password.

1. Navigate to Password Reset > Processes.
2. Click New and then specify a meaningful Name and Description for the process.
3. Select the Credential store that contains the user credentials that the process applies to.
4. Specify the process that you are defining: Select the Password Reset check box and/or the Password change check box.
5. Specify the Apply to all users setting.

<table>
<thead>
<tr>
<th>Apply to all users setting</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Selected</td>
<td>All users use the process that you are defining. This setting is useful only if all users have access to the authentication methods that are defined in this process.</td>
</tr>
<tr>
<td>Not selected</td>
<td>Only the users in the groups that you specify use the process. You specify the groups in the Groups related list.</td>
</tr>
</tbody>
</table>
6. If you selected Password Reset, fill in the Password Reset Details tab and, optionally, the Advanced tab. See Settings on the Password Reset Details tab and Settings on the Password Reset Advanced tab.

7. Save the form. The form refreshes and additional related lists appear.

8. From the Password Reset Process Verifications related list, select one or more verifications. See Password Reset verifications.

9. Optional: From the Password Reset Process Groups related list, select the user groups that will use the process that you are defining.

   The Password Reset Process Groups related list appears only if the Apply to all users check box is not selected.

10. Select the Active check box to enable the Password Reset process that you configured. The check box is available only after the record has been saved.

11. Click Update.

12. Navigate to Password Reset > Properties to set the properties that configure the Password Reset experience for end users.

Credential stores for Password Reset

Credential stores hold user information such as user names and passwords that can be used as login credentials. Examples include the User (sys_user) table or an Active Directory server.

Users with the password_reset_admin or password_reset_credential_manager role can create and modify connections to credential stores.

Credential store types installed with the base system

A credential store type is a set of workflows that specify how to connect to a credential store. Navigate to Password Reset > Credential Stores to view the list of example credential stores that are based on the base-system types. The base system includes the following credential store types:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local ServiceNow Instance</td>
<td>Represents the current (local) ServiceNow instance.</td>
</tr>
<tr>
<td>AD Credential Store</td>
<td>Represents an Active Directory credential store. Installed with the Orchestration Add-on plugin.</td>
</tr>
<tr>
<td>Remote (SOAP) ServiceNow instance</td>
<td>Represents a remote ServiceNow instance. Installed with the Orchestration Add-on plugin.</td>
</tr>
</tbody>
</table>

Remote credential stores

A remote credential store refers to any credential store other than the local ServiceNow instance. Remote credential stores, such as Active Directory, manage user names and passwords outside of the local instance. A remote credential store can also be a remote ServiceNow instance, a UNIX or Linux server, or any other directory-like service that relies on the SOAP protocol. The Password Reset Orchestration Add-on plugin is required to connect to remote credential stores. Review the information in the section on credential store types before you create, test, or delete credential stores.
Connection workflows for credential store types

A credential store type workflow requires a subflow that defines how to connect to the store, and can include an optional subflow that defines how to test the connection. Use the Pwd reset – AD and Pwd Reset - Local subflows as models for your custom connection workflows.

Pwd Reset Local sub workflow
Creating a custom credential store type

You can use a credential store type as a model to create a custom type. See Create a credential store type for Password Reset.

Configure and test the Password Reset connection to a credential store

You specify a credential store to access during the Password Reset or Password Change process and configure other settings that control the process.

Role required: password_reset_admin or password_reset_credential_manager

Note: The Password Reset Windows Application supports only Active Directory (AD) credential stores.

1. Navigate to Password Reset > Credential Stores.
2. Click New, enter a unique and meaningful Name and Description, and then fill in the form.

<table>
<thead>
<tr>
<th>Type</th>
<th>You can use credential store types (templates that provide a desired set of capabilities). Credential stores inherit the functionality of the credential store type.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note: The Password Reset Windows Application supports only AD Credential Store.</td>
<td></td>
</tr>
</tbody>
</table>

Installed credential store types:

- Local ServiceNow Instance installed with Password Reset.
- AD Credential Store installed with the Orchestration Add-on.
- Remote (SOAP) ServiceNow installed with the Orchestration Add-on.
<table>
<thead>
<tr>
<th><strong>Auto-generate password</strong></th>
<th>Script include that generates a temporary password for use during the reset process.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong> If you select the Enforce history policy check box, then you must specify a value for Auto-generate password.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Enforce history policy</strong></th>
<th><strong>Note:</strong> This option appears only if you select a credential store Type of AD Credential Store.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>To enforce the history policy that is configured for the credential store:</td>
</tr>
<tr>
<td></td>
<td>1. Select the Enforce history policy check box.</td>
</tr>
<tr>
<td></td>
<td>2. Follow the procedure that appears after this table.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Active Directory domains can be configured to include a history policy that ensures that users do not reuse passwords. For example, the history policy might be configured to not allow the user to reuse any of the previous three passwords when resetting a password.</td>

<td><strong>Note:</strong> The Password Reset Windows Application does not support Password Strength.</td>
</tr>
</tbody>
</table>
Strength rule: This text box appears only if you select **Enable Password Strength**.

*Note:* The Password Reset Windows Application does not support Password Strength.

Client script that calculates the strength/complexity of the password that the user enters. The script is invoked when the user begins to enter a new password during the reset process.

Default settings:
- Selected for local ServiceNow credential stores
- Not selected for other credential stores

*Note:* To guide the user during the reset process, the system displays a graphical bar labeled *Password Strength* under the *New password* field.

3. Click **Submit**.
   The connection is created. You should test the connection to a credential store after you configure a new credential store or when users experience problems that might involve the connection.

4. Navigate to **Password Reset > Credential Stores** and then open the credential store.

5. In the header bar, click **Save and Test Connection**.
   A progress page displays the result of the test.

If you selected the **Enforce history policy** check box, then follow these steps:

1. Open the associated Password Reset process definition: **Password Reset > Processes**.
2. On the Details tab of the Password Reset Process form, clear the **Auto-generate password** check box and then save the process definition.
3. On the domain controller, set **Password Aging** *(MIN_PASSWORD_AGE)* to zero.
4. On the domain controller, set the history policy to twice the desired number of passwords. For example, to enforce that the last three passwords are not repeated, set the history policy to six.

*Note:* To enforce the history policy that is configured for the credential store, the system auto-generates a new temporary password for each reset cycle. The system auto-generates the temporary password even though you have cleared the **Auto-generate password** check box on the Password Reset Process form. Because the user immediately replaces the temporary password with a new password, two passwords are created for each reset cycle.
Set up SOAP credentials for Password Reset
When the Orchestration Add-on plugin is activated, the ServiceNow platform can use the SOAP protocol to interact with remote credential stores such as a remote ServiceNow instance.

Role required: admin or web_service_admin

1. Navigate to System Web Services > Outbound > SOAP Message.
2. Click Password Reset Request.
3. From the Soap Message Functions related list, configure both the password_reset and sys_user_get_record functions by completing the following steps.
   a) In Basic auth user ID, enter the user ID for the remote system user who has privileges to update records on the User [sys_user] table.
   b) In Basic auth user password, enter the password for the remote system user who has privileges to update records on the User [sys_user] table.
   c) Select Use basic auth.
   d) Click Update.

You do not need to enter a value in the SOAP endpoint field. The field shows the name of the ServiceNow instance used for Password Reset.

Configure Password Reset for Active Directory
When the Orchestration Add-on plugin is activated, the Password Reset application can change passwords on an Active Directory credential store. The application changes passwords by referencing an Active Directory user role with the appropriate password change privileges.

Active Directory must have a user role with the following privileges:

Descendent User objects:
- Reset password
- Read/Write pwdlastset
- Read/Write UserAccountcontrol
- Write Account Restrictions
- Read/Write lockouttime
- Read MemberOf

Descendent Group objects:
- Read Members
- Read MemberOf

1. Install MID Server on a Windows computer that can connect to Active Directory.
2. Configure the MID Server.
3. In the ServiceNow instance, navigate to Orchestration > Credentials.
4. Click New and then complete the form with the following values for the credential.
   a) Type: Select Windows.
   b) User name: Enter your Active Directory domain user. For example, domain\admin.
   c) Password: Enter your Active Directory domain user password.
   d) Applies to: Select the MID Server that is used to access the Active Directory server.
5. Click Submit.
6. Create a credential store for Active Directory.
Delete a connection to a credential store for Password Reset

Important: Before you delete the connection to a credential store, check all Password Reset processes to ensure that the credential store is not in use. If the credential store is being used by a process, update the process before deleting the credential store.

Role required: password_reset_admin or password_reset_credential_manager

1. Navigate to **Password Reset > Credential Stores** and then select the check box for the credential store.
2. In the Actions choice list, select **Delete**.

Password Reset verifications

Each verification specifies the method and process for verifying the identity of the user that is requesting password reset.

Verifications included with Password Reset

The Password Reset application includes the following verifications in the base system. You can create a verification based on either a base-system verification or a verification type (a template).

**Note:** The Password Reset Windows Application does not support custom verifications.

### Password Reset verifications

<table>
<thead>
<tr>
<th>Verification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QA verification</td>
<td>Implements a self-service Password Reset model with questions that are included with the base system or custom questions that the admin defines. While enrolling for the process, the user decides which questions to provide answers for. When a user requests password reset, the system poses a specified number of the questions that the user selected during enrollment. The user must answer all questions correctly to verify identity. This verification is based on the <strong>Security Questions</strong> verification type. For information on the user enrollment experience, see <a href="#">Users: Enroll in the Password Reset program using questions and answers</a>.</td>
</tr>
<tr>
<td>SMS verification</td>
<td>Implements a self-service or service desk-assisted Password Reset model that relies on auto-generated code numbers. When a user requests password reset, the system sends a code to an SMS-capable device that the user has authorized. To verify identity, the user then submits the code on the Password Reset Verify page. You can use the ServiceNow Notify feature to send the codes. This verification is based on the <strong>SMS Code</strong> verification type. For information on the user enrollment experience, see <a href="#">Users: Enroll in the Password Reset program using SMS codes</a>.</td>
</tr>
<tr>
<td>Personal Data — Confirm Email Address</td>
<td>Implements a self-service Password Reset model that relies on user information that is available in the user profile on the instance. This verification is based on the <strong>Personal Data Confirmation</strong> verification type.</td>
</tr>
</tbody>
</table>
Verifications included with the demo data

The following demo data is based on the Mock verification type:

- Sample Mock verification #1
- #2

Personal data identification types and confirmation type verifications

Personal data verifications allow users to verify their identity by providing answers to questions that are generated from personal information stored in the User table [sys_user].

Personal data identification types

The Password Reset application provides the email and username identification types. You can use either type as provided or as a model to create a custom identification type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Identification</td>
<td>Identifies users by their email addresses.</td>
</tr>
<tr>
<td>Username Identification</td>
<td>Identifies users by their user names.</td>
</tr>
</tbody>
</table>

Personal data confirmation verifications

- **Personal data verification**: If users are associated with a Password Reset process that uses a personal data verification, the users are typically not required to enroll for Password Reset.
- **Personal data confirmation verifications** allow employees with the password_reset_service_desk role to access personal data from the sys_user table when assisting a user with a password reset request.

To configure personal data and personal data confirmation verifications, you specify parameters as name/value pairs that correspond to a particular piece of user information. For example, to verify users by their email address:

1. Set the `label` parameter (the text that the end user should see) to Email (that is, `label=Email`).
2. Set the `column` parameter (the column in the table that holds the verification data) to email (that is, `column=email`).

**Note**: You can use only one set of name/value pair parameters per verification. Additional parameters are ignored.

To use multiple pieces of personal information for user verification, create more personal data or personal data confirmation verifications and add the verifications to the related Password Reset process.
### Personal data and personal data confirmation type verifications

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| label          | Label that the user sees during the password reset request.  
Data Type: string  
Default Value: n/a |
| column         | Column of the sys_user table that provides the data that is used to verify the identity of the user.  
Data Type: string  
Default Value: n/a |

**SMS Code Verification type for Password Reset**

Using the Simple Message Service (SMS) Code Verification type, a user can verify identity through any SMS-enabled device, like a cell phone that accepts text messages. When a user requests password reset, the system sends a numerical code to the device and the user enters the code on the password reset page.

You can change the default behavior of an SMS code verification using either of the following methods:

- Set parameter values, as shown in the table
- Update property settings for the Password Reset application

**Note:** The system allows only one instance of each SMS code parameter.

### SMS Code Verification type parameters

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Description</th>
</tr>
</thead>
</table>
| expiry         | Number of minutes the verification code is valid.  
**Data Type:** integer (any positive integer)  
**Default Value:** 5 |
| complexity     | Number of digits in the numerical verification code.  
**Data Type:** integer (any positive integer)  
**Default Value:** 4 |
| pause_window   | Number of minutes before the user can request another SMS code for verification.  
**Data Type:** integer (any positive integer)  
**Default Value:** 2 |
| max_per_day    | Maximum number of codes sent for verification in one day.  
**Data Type:** integer (any positive integer)  
**Default Value:** 10 |
Use NotifyNow to send SMS codes for enrollment and verification

You can configure the Password Reset application to send SMS codes for enrollment and verification using ServiceNow NotifyNow (via Twilio SMS Messaging). NotifyNow is tightly integrated with the workflow engine and business rules and delivers a highly configurable and trusted way to deliver SMS messages.

Role required: admin

NotifyNow requires a separate contract with Twilio.

1. Enroll for a Twilio account and telephone number at https://www.twilio.com/
2. Activate the Notify plugin.
3. Associate the Twilio account with Notify.

No other configuration is required. Users who request password change or reset receive SMS codes through NotifyNow.

**Settings on the Password Reset Details tab**

The settings define the user experience when resetting or changing a password.

The Password Reset Details tab appears when you are configuring a Password Reset process (Password Reset > Processes).

<table>

<tr>
<td>Email Password Reset URL</td>
<td>Select the check box to enable users to reset the password by clicking a link in an email that the instance sends to them. By default, the self-service Password Reset processes enable this option. When you select this option, the <strong>Auto-generate password</strong> check box is not available.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> See <a href="#">Example: The default self-service Password Reset process</a> for an outline of the process that is enabled by default.</td>
</tr>
<tr>
<td>Enable account unlock</td>
<td>This check box is available only when <strong>Password reset</strong> is selected. Select the check box to allow user accounts on credential stores to be unlocked without resetting the password.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Not supported by the default self-service Password Reset process.</td>
</tr>
<tr>
<td>Unlock user account</td>
<td>Select the check box to unlock user accounts on credential stores after a password reset.</td>
</tr>
</tbody>
</table>
| Auto-generate password        | This check box is available only when:  
  - The **Password reset** check box is selected.  
  - The **Email Password Reset URL** check box is not selected  

Select the check box to auto-generate a new password for the user. When this check box is selected, you must select the **Email password** or **Display password** check box, or both. This setting is useful for service desk-assisted processes.  

**Note:** Clear the check box to enable the **Enforce history policy** option for a credential store. See [Configure and test the Password Reset connection to a credential store](#)
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User must reset password</td>
<td>This check box is available only when Auto-generate password is selected. Select the check box to require users to reset their password immediately after logging in with the auto-generated password.</td>
</tr>
<tr>
<td><strong>Note:</strong> Users whose credentials are held in the local ServiceNow instance credential store are prompted to change their password the first time that they log in. Users whose credentials are held in an Active Directory credential store are not prompted to change their passwords in the instance. Such users must change their passwords from a computer on the domain.</td>
<td></td>
</tr>
<tr>
<td>Display password</td>
<td>This check box is available only when Auto-generate password is selected. Select the check box to display the new password on the screen. In a self-service process, the password appears on the user screen. In a service desk-assisted process, the password appears on the service desk agent screen.</td>
</tr>
<tr>
<td>Email password</td>
<td>This check box is available only when Auto-generate password is selected. Select the check box to email the new password to the user. The setting is useful in both self-service and service desk-assisted processes. The setting can add a layer of security by requiring that users access their email to view the password. In a service desk-assisted process, emailing the password to users ensures that only the user requesting the password reset can view the password.</td>
</tr>
<tr>
<td>Related lists</td>
<td></td>
</tr>
<tr>
<td>Verifications</td>
<td>This related list is available only after the record has been saved. One or more verifications that the process uses. See Password Reset verifications.</td>
</tr>
<tr>
<td>Groups</td>
<td>The Groups related list is available only after the record has been saved and if the Apply to all users check box is cleared. ServiceNow user groups to associate with the Password Reset process.</td>
</tr>
</tbody>
</table>

*Configure Google reCAPTCHA*

To use the Google reCAPTCHA service, instances that are running on a domain other than service-now.com require an API key pair from Google. The process described in this topic is optional for instances that are running on the service-now.com domain.
Role required: admin

Note:
Because on-premises instances do not have access to the Internet, they cannot use the Google reCAPTCHA service. Do not follow the process described in this topic. Instead, set the `password_reset.captcha.google.enabled` system property to `false`. This setting enables the CAPTCHA service that is provided with the base system.

The Password Reset Windows Application uses the base-system CAPTCHA service even if the Password Reset application is configured to use Google reCAPTCHA.

1. Request an API key pair (a site key and a secret) from Google at https://www.google.com/recaptcha
2. Set the following system properties:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>password_reset.captcha.google.enabled</code></td>
<td>Set to <code>true</code>. Type: string Default: true</td>
</tr>
<tr>
<td><code>google.captcha.site_key</code></td>
<td>Set to the site key that Google provided. Type: string Default: A site key that Google provided to ServiceNow</td>
</tr>
<tr>
<td><code>google.captcha.secret</code></td>
<td>Set to the secret that Google provided. Type: <code>password2</code> Default: An encrypted secret that Google provided to ServiceNow</td>
</tr>
</tbody>
</table>

Settings on the Password Reset ‘Advanced’ tab

UI macros and script includes can extend the basic functionality of a Password Reset process.
The Advanced tab appears when you are configuring a Password Reset process (Password Reset > Processes).

Advanced tab

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Entry UI macro</td>
<td>UI macro that displays a customized message to users when they access the initial Password Reset screen.</td>
</tr>
<tr>
<td>Success UI macro</td>
<td>UI macro that displays a customized message to users on the final Password Reset screen when their password is successfully reset.</td>
</tr>
<tr>
<td>Failure UI macro</td>
<td>UI macro that displays a customized message to users on the final Password Reset screen when their password reset fails.</td>
</tr>
<tr>
<td>Post reset script</td>
<td>Script include that performs actions after the Password Reset process completes whether the outcome is success or failure. For more information on customizing post processor scripts, see the Post reset script category as described in Password Reset extension scripts.</td>
</tr>
</tbody>
</table>
**Configure the number of questions for a 'Security Questions' verification**

When designing a Security Questions verification for Password Reset, you can specify the number of questions to display when users enroll and the number to display when a user requests password reset.

Role required: password_reset_admin or admin

1. Navigate to **Password Reset > Verifications** and then open a verification that uses the **Security Questions Verification Type**.
2. Configure the parameters in the **Password Reset Verification Parameters** related list.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| num_enroll     | Number of security questions that are displayed while a user is enrolling for Password Reset.  
**Data Type**: Positive integer that does not exceed the number of questions in the security questions list (**Password Reset > Security Questions**).  
**Default Value**: 5 |
| num_reset      | Number of security questions that are displayed while a user is attempting to reset the password. The questions are selected at random and are presented in random order.  
**Data Type**: Positive integer that does not exceed the value of the num_enroll parameter  
**Default Value**: 3 |

3. Click **Update**.

**Configure the required strength for passwords**

The password that a user defines must meet certain requirements — it must contain at least eight characters, it must include a numeral, and so on. You can configure the requirements as needed for your organization.

Role required: password_reset_admin

The base system includes example credential stores with various password requirements. You can modify password requirements and provide users with hints for creating password. The default requirements for a new password are:

- At least eight characters
- At least one uppercase and one lower case letter
- At least one numeral

**Note**: This topic describes the procedure for configuring password strength requirements only. You can configure several other settings for the credential store, as described in **Configure and test the Password Reset connection to a credential store**.

1. Navigate to **Password Reset > Credential Stores**.
2. Select the credential store in the list and then configure the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password rule hint</td>
<td>Text that appears on the password reset page to help the user to create a password that meets all requirements. The Password rule script enforces the requirements.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>The Password Reset Windows Application supports newline characters in the hint. Other formatting is not supported (bold, underline, hyperlink, and so on).</td>
</tr>
<tr>
<td>Password rule</td>
<td>Client script that validates the password that the user enters. The script is invoked when the user enters a new password and clicks Password Reset. You can use the script to enforce password strength/complexity requirements.</td>
</tr>
<tr>
<td>Enable Password Strength</td>
<td>Select the check box to:</td>
</tr>
<tr>
<td></td>
<td>· Display the text box for the Strength rule script so you can update the script.</td>
</tr>
<tr>
<td></td>
<td>· Display the graphical Password Strength bar to the user while the user changes or resets the password.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>The Password Reset Windows Application does not support Password Strength.</td>
</tr>
<tr>
<td>Strength rule</td>
<td>Client script that calculates the strength/complexity of the password that the user enters. The script is invoked when the user begins to enter a new password during the reset process.</td>
</tr>
<tr>
<td>Default settings</td>
<td>· Selected for local ServiceNow credential stores</td>
</tr>
<tr>
<td></td>
<td>· Not selected for other credential stores</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>To guide the user during the reset process, the system displays a graphical bar labeled Password Strength under the New password field.</td>
</tr>
</tbody>
</table>

3. Click **Submit**. You should test the connection to a credential store after you configure a new credential store or when users experience problems that might involve the connection.

4. Navigate to **Password Reset > Credential Stores** and then open the credential store.
5. In the header bar, click **Save and Test Connection**. A progress page displays the result of the test.

**Specify lockout for failed login attempts**

The system provides inactive script actions that enable you to specify the number of failed login attempts before a user account is locked and to reset the count after a successful login.

Role required: admin

Navigate to **System Policy > Script Actions** to view or activate the scripts.

<table>
<thead>
<tr>
<th>SNC User Lockout Check with Auto Unlock</th>
<th>Uses the value of the <code>glide.user.max_unlock_attempts</code> property to set the limit for failed login attempts.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Unlocks the user account after the time period that is specified for the <code>glide.user.unlock_timeout_in_mins</code> property. If no value is specified, then the system unlocks the user account after the default period of 15 minutes.</td>
</tr>
<tr>
<td>SNC User Lockout Check</td>
<td>Tracks the number of failed login attempts and locks the user account after a specified number of failed login attempts (default: 5).</td>
</tr>
<tr>
<td>SNC User Clear</td>
<td>Updates the user record after a successful login: Resets the number of failed login attempts and updates the date of the last login.</td>
</tr>
</tbody>
</table>

Each time a user attempts to log in, the action is recorded in an event log. You can view a log of failed login attempts.

1. Navigate to **System Policy > Event Logs**.
2. Filter for `login.failed` in the **Name** field. You can view the attempted login name, date, and IP address logged for the attempt.

**Configure Password Reset properties**

You can specify properties that configure the Password Reset experience for end users.

Role required: **password_reset_admin**

While there are no range limits for the values you can enter for properties, consider using only positive integer values starting at 1. When you determine the limit for the upper range of a property, consider the task that the user is performing.

For example, you would not want to allow 100 attempts for users to verify their identity. A more common value is three attempts. Similarly, you may not want to force users who are completing the enrollment process to spend time selecting and answering 30 security questions. The more commonly used number of security questions is between five and seven.

1. Navigate to **Password Reset > Properties**.
2. Update settings as needed and then click **Save**.

**Password Reset properties**

<table>
<thead>
<tr>
<th>Property name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password Reset Global properties</td>
<td></td>
</tr>
<tr>
<td>Label on the Password Reset Properties page</td>
<td>Property name</td>
</tr>
<tr>
<td>--------------------------------------------</td>
<td>---------------</td>
</tr>
</tbody>
</table>
| Workflow polling frequency                 | password_reset.wf.refresh_rate | Time period in milliseconds between checks on status of the workflow.  
  - Type: integer  
  - Default value: 500 |
| Workflow expiration                         | password_reset.wf.timeout | Maximum wait time in milliseconds for the workflow to complete. The workflow is triggered during the password reset request when the user clicks Submit.  
  - Type: integer  
  - Default value: 90000 |
| Disable CAPTCHA validation functionality    | password_reset.captcha.ignore | Enables or disables CAPTCHA functionality.  
  - Type: true | false  
  - Default value: false |

The Password Reset application uses Google re-CAPTCHA as the default CAPTCHA service. To use the base system CAPTCHA, change the password_reset.captcha.google.enabled system property to false.

See Configure Google reCAPTCHA

| Password Reset Request properties | Number of unsuccessful attempts allowed to reset/change password | password_reset.request.max_attempt | Number of password reset attempts a user has before they are locked out for a period determined by the value in maxAttemptWindow.

  - Type: integer  
  - Default value: 1440 (minutes)                                                                                                                                                                                                                                                                                                                                 |
| Number of minutes a user must wait to start a reset request after the last successful unlock account            | password_reset.request.unlock_window_duration     | Time period that a user must wait after a successful unlock operation before starting a new request.  
  - Type: integer  
  - Default value: 1440 (minutes)                                                                                                                                                                                                                                                                                                                                 |
| Number of minutes before a password reset request expires                                                     | password_reset.request.expiry                     | Time period that a user is allowed to perform the Password Reset process.  
  - Type: integer  
  - Default value: 10 (minutes)                                                                                                                                                                                                                                                                                                                                  |
| Password Reset Security Question properties                                                                      |                                                   |                                                                                                                                                                                                                                                                                                                                                                     |
| Minimum number of characters in any answer                                                                       | password_reset.qa.ans_min_len                  | Minimum number of alphanumeric characters that the user must enter in the answer text box for any security question.  
  Default value: 3 characters                                                                                                                                                                                                                                                                                                                                 |
| Number of security questions required during the password reset request                                           | password_reset.qa.num_reset                      | Number of questions that a user must answer to verify identity during the Password Reset process.  
  - Type: integer  
  - Default value: 3 (questions)  
  - Possible values: Integers that are less than the number specified for the num_enroll property.  
  Note: You can override this security question property by adding the num_reset parameter in the security question verification.                                                                                                                                                                                                                                                                 |

<table>
<thead>
<tr>
<th>Label on the Password Reset Properties page</th>
<th>Property name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Number of security questions required during enrollment | password_reset.qa.num_enroll | During the enrollment process, the number of questions that a user must answer to be enrolled in the Password Reset program.  
- Type: integer  
- Default value: 5 (questions)  

**Note:** You can override this security question property by adding the `num_enroll` parameter in the security question verification. |

<table>
<thead>
<tr>
<th>Password Reset SMS Code properties</th>
<th>Property name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Maximum number of SMS codes sent for verification per day | password_reset.sms.max_per_day | Maximum number of SMS codes that are sent to a user within one 24-hour period.  
The 24-hour period begins when a user clicks **Send Code**.  
- Type: integer  
- Default value: 10 (per day)  

**Note:** You can override this SMS code property by adding the `max_per_day` parameter in the SMS code verification. |

| Number of minutes before the user can attempt to send another SMS code for verification | password_reset.sms.pause_window | Time that must pass before another SMS code can be sent to a user.  
- Type: integer  
- Default value: 2 (minutes)  

**Note:** You can override this SMS code property by adding the `pause_window` parameter in the SMS code verification. |
<table>
<thead>
<tr>
<th>Label on the Password Reset Properties page</th>
<th>Property name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Number of digits in the SMS code sent to the user | password_reset.sms.default_complexity | Number of characters required for a user to reset their password.  
- Type: integer  
- Default value: 4 (digits)  
You can override this SMS code property by adding the complexity parameter in the SMS code verification. |
| Number of minutes before the SMS code expires | password_reset.sms.expiry | Time, in minutes, until the SMS code sent to the user expires.  
- Type: integer  
- Default value: 5 (minutes) |

### Password Reset Monitoring and Reporting properties

<table>
<thead>
<tr>
<th>Property name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Time interval, in minutes, for counting blocked users | password_reset.activity_monitor.incident_window | Time window to count the number of blocked users.  
- Type: integer  
- Default value: 60 (minutes) |
| Number of blocked users, in the defined time interval, that triggers a system log event | password_reset.activity_monitor.incident_threshold | Number of blocked (or locked) users, within the specified time window, that triggers a system log event.  
- Type: integer  
- Default value: 10 (blocked users) |

**Note:** Several components in the Self Service Password Reset (com.snc.password_reset) plugin and the Password Reset (com.glideapp.password_reset) plugin control the password reset flow. The following properties affect Password Reset, but do not appear on the Password Reset > Properties page:

- You can add the glide.pwd_reset.onetime.token.validity property to the System Properties (sys_properties) table to specify the number of hours that the Password Reset token should be valid. Default: 12.
Properties accessible from the System Properties (sys_properties) table:
- For Password Reset on mobile devices, you can specify the URL that the user is taken to when user taps the **Forgot password?** button. See the glide.security.password_reset.uri property in High Security Settings. Default: /$pwd_reset.do?sysparm_url=ss_default
- If glide.security.forgot_password.display.link is set to true, displays the **Forgot Password?** link on the login page.

Customizing Password Reset processes

Password Reset scripting enables you to customize Password Reset by creating your own credential store, verification, and identification types, and extend them by defining extension scripts. You can also create a custom credential store type, custom verification type, or verification.

Password Reset scripting is available to users with the password_reset_admin role. The easiest way to customize Password Reset is:

1. Create custom types and scripts as described in Password Reset extension scripts.
2. Follow the configuration steps described in Configure your Password Reset or Password Change process.
3. Select the new types that you created. You can customize the following components:
   - Credential store types: Define new types for how to connect to your credential stores by creating custom workflows for connection and testing. See Create a credential store type for Password Reset.
   - Verification types: Define new types for how users are verified. See Create a custom Password Reset verification type.
   - Identification types: Define new types for how users can identify themselves. See Create a custom identification type for Password Reset.

Extension scripts

Extension scripts enable you to extend Password Reset functionality by defining custom scripts that can be used in a credential store, verification, or identification type, or as a post-processor in a process. Extension scripts are predefined hooks within the Password Reset application that perform specific types of behavior defined by the extension category, which refers to where the script will be used. See Password Reset extension scripts.

Create a credential store type for Password Reset

You can create a custom credential store type if the base-system types do not meet your needs.

Role required: password_reset_admin or password_reset_credential_manager

1. Navigate to Password Reset > Extensions > Credential Store Types.
2. Click New, enter a unique and meaningful Name and Description, and then fill in the form.

Note: You may need to configure the form to see the Get user lock state workflow and the Unlock user workflow.
### New credential store fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password Reset workflow</td>
<td>Subflow that defines the credential store processing. Password Reset workflows are available to use as a model. Provide scripts for each of the activities defined for the subflow. For more information about how to create a workflow, see <a href="#">Create a workflow</a>. For installed workflows, see <a href="#">Installed with Password Reset</a>.</td>
</tr>
<tr>
<td>Connection test workflow</td>
<td>Subflow that defines how to test the connection. Connection test workflows are available to use as a model. If you create a connection test subflow, provide scripts for each of the activities defined for the subflow. For more information about how to create a workflow, see <a href="#">Create a workflow</a>. For installed workflows, see <a href="#">Installed with Password Reset</a>.</td>
</tr>
<tr>
<td>Get user lock state workflow</td>
<td>Subflow that defines how to get the user lock state. Get user lock state workflows are available to use as a model. Provide scripts for each of the activities defined for the subflow. For more information about how to create a workflow, see <a href="#">Create a workflow</a>. For installed workflows, see <a href="#">Installed with Password Reset</a>.</td>
</tr>
<tr>
<td>Unlock user workflow</td>
<td>Subflow that defines how to unlock a user. Unlock user workflows are available to use as a model. If you create a connection test subflow, provide scripts for each of the activities defined for the subflow. For more information about how to create a workflow, see <a href="#">Create a workflow</a>. For installed workflows, see <a href="#">Installed with Password Reset</a>.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

---

**Create a custom question for a ‘Security Questions’ verification**

To enroll for the ‘Security Questions’ verification, the user selects several questions and supplies answers that only the user knows. You can add a custom question to the set of questions that are included with the base system.

Role required: password_reset_admin or admin

The default language is English, and you can create a custom question in a non-English language. If you create the appropriate non-English language questions, then the questions appear in the language that the user requested during login.

1. Navigate to **Password Reset > Security Questions** and then click **New**.
2. Enter the English language question in the **Security question** field and then click **Submit**. The question appears in the Translations related list.
3. To add the same question in another language, complete the following steps.
   a) Click the English language question to translate.
      
      **Note:** Do not change the **Language** value for the default questions that come with the base system.
      
      b) On the Password Reset Question page, in the Translations related list, click **New**.

© 2020 ServiceNow, Inc. All rights reserved.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
c) Select the language in the Language field.
d) Enter the non-English text in the Security question field.
e) Click Submit.

The question appears in the Translations related list on the Password Reset Question page. If a user selects the language while logging in, then the verification question appears in that language.

Create a custom identification type for Password Reset

A custom identification type enables the user to enter alternative verification information such as an employee ID while resetting the password.

Role required: password_reset_admin or admin

1. Navigate to Password Reset > Extensions > Identification Types.
2. Click New, enter a unique and meaningful Name and Description, and then fill in the form.

<table>
<thead>
<tr>
<th>Identification field label</th>
<th>Text to display as a label for the Identification field.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identification processor</td>
<td>Identification processor script. Choose an existing script, or create your own using the Identification form processor category (extension script).</td>
</tr>
</tbody>
</table>

3. Click Submit.

Create a Password Reset verification from an existing verification

The Password Reset application includes several example verifications that you can use as they are or as the basis for a custom verification. If the verification types in the base system do not meet your needs, you can create a custom verification type.

Role required: password_reset_admin

Note: The Password Reset Windows Application does not support custom verifications. Custom verifications might work, but you must test and verify.

1. Navigate to Password Reset > Verifications and select a verification.
2. If needed, modify the parameters on the Password Reset Verification Parameters tab. The parameters are described in the instructions for the type of verification that you are working on.
3. Click Submit.
4. Each verification type has properties that control the user experience. Review the property settings and update as needed.

Create a custom Password Reset verification type

If the verification types in the base system do not meet your needs, you can create a custom verification type.

Review the verification types that are provided in the base system to determine whether to create a custom verification type. Then review the verification type components to develop.
Role required: password_reset_admin or admin

1. Navigate to Password Reset > Extensions > Verification Types.
2. Click New, enter a unique and meaningful Name and Description, and then fill in the form.

<table>
<thead>

</tbody>
</table>

3. Click Submit.

Create a custom Password Reset verification

Use a verification type in the base system as a template to design a custom verification. The Password Reset Windows Application does not support custom verifications.

Role required: password_reset_admin

<table>
<thead>
<tr>
<th>Verification types in the base system</th>
</tr>
</thead>
<tbody>
<tr>
<td>Personal Data Confirmation Verification Type</td>
</tr>
<tr>
<td>Personal Data Verification Type</td>
</tr>
</tbody>
</table>

Note: The Password Reset Windows Application does not support the Personal Data Confirmation Verification type.

See Personal data identification types and confirmation type verifications.

Note: The Password Reset Windows Application allows you to define and use multiple verifications of the Personal Data type.

See Personal data identification types and confirmation type verifications.
### Security Questions Verification Type
Verifies user identity by presenting personal security questions that the user must answer correctly.

**Note:** The Password Reset and Password Reset Windows Application support only a single verification of the Security Questions type.

See [Create a custom question for a 'Security Questions' verification.](#)

### SMS Code Verification Type
When a user requests password reset, the system sends a code to an SMS-capable device that the user has authorized. To verify identity, the user then enters the code on the Password Reset web page.

**Note:** The Password Reset and Password Reset Windows Application support only a single verification of the SMS Code type.

See [SMS Code Verification type for Password Reset.](#)

### Mock Verification Type
Not a functional identity verification. Demonstrates how to add a verification type in a Password Reset process.

**Note:** The Password Reset Windows Application does not support the Mock verification type.

- The enrollment UI macro for this verification gets the user input and returns the entered value in the enrollment processor.
- The Password Reset UI macro for this verification gets input from the user and returns the entered value through the verification processor.

1. **Navigate to Password Reset > Extensions > Verification Types.**
2. **Click New,** enter a unique and meaningful **Name** and **Description,** and then fill in the form.

<table>
<thead>
<tr>
<th>Type</th>
<th>Create verifications based on one of the verification types in the base system. Password Reset supports the following types. You can create multiple instances of any type.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Personal Data Confirmation Verification</strong>&lt;br&gt;<strong>Personal Data Verification</strong>&lt;br&gt;<strong>Security Question Verification</strong>&lt;br&gt;<strong>SMS Code Verification</strong></td>
</tr>
<tr>
<td></td>
<td>The Password Reset Windows Application supports the following types:&lt;br&gt;<strong>Personal Data Verification.</strong> You can create only a single instance.&lt;br&gt;<strong>Security Question Verification.</strong> You can create multiple instances.&lt;br&gt;<strong>SMS Code Verification.</strong> You can create only a single instance.</td>
</tr>
</tbody>
</table>

| Order | Position of the verification as it appears on the Enrollment form and Password Reset form. |
| Password Reset Verification Parameters | Parameters used by a verification to configure specific behaviors, like number of questions required to enroll, request expiration time, and columns used. Set parameters for any behavior that should be different from the default specified in the Password Reset properties. The available parameters are described separately for each verification type. |

3. Click Submit.
4. Each verification type has properties that control the user experience. Review the property settings and update as needed.

**Enrollment options for the Password Reset service**

You can configure the Password Reset process to enroll users automatically, or you can define an enrollment check.

To define an enrollment check, you must define:

- An enrollment processor script, which specifies how enrollment is processed
- A corresponding enrollment UI macro, which specifies how the enrollment information is displayed to the user

The following example uses `PwdEnrollSMSProcessor` as the enrollment processor script and `pwd_enroll_sms_ui` as the enrollment UI macro.
Verification type example

A verification type must also define a verification processor script and a corresponding verification UI macro. The example uses `PwdVerifySMSProcessor` as the verification processor script and `pwd_verify_sms_ui` as the verification UI macro. The following shows the verification processor script:

```plaintext

```
Verification type SMS processor

The following is the corresponding UI macro:
The Password Reset plugin installs script includes that implement password reset processes. To enable you to extend functionality, each base-system script include provides extension points that you can use to invoke “extension scripts” that you have customized.
The extension script category refers to the specific types of behavior for an extension script (for example, credential store, verification, identification type, or as a post-processor).

'Enrollment check' script includes

All enrollment check script includes take the following parameters and return a boolean indicating whether the user is enrolled for Password Reset.

- `params.userId`: The sys_id of the user being checked (table: [sys_user]).
- `params.verificationId`: The sys_id of the verification being checked (table: [pwd_verification]).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdAlwaysEnrolled</td>
<td>Default check of whether a user is enrolled that always returns true.</td>
</tr>
<tr>
<td>PwdMockIsEnrolled</td>
<td>Default check of whether a user is enrolled that always returns true.</td>
</tr>
<tr>
<td>PwdQuestionsEnrollmentCheck</td>
<td>Determines whether a user has enrolled for Password Reset using security question verification.</td>
</tr>
<tr>
<td>PwdSMSEnrollmentCheck</td>
<td>Determines whether a user has enrolled for Password Reset using SMS verification.</td>
</tr>
</tbody>
</table>

'Identification form processor' script includes

Identification form processor script includes provide functionality for extending identification processing.

All identification form processor script includes take the following parameters, and return the sys_id of the user that corresponds to the requested input. If the user was not identified, it returns null.

- `params.processId`: The sys_id of the calling Password Reset process (table: [pwd_process]).
- `param request`: The form request object. Fields in the form can be accessed with `request.getParameter('<element-id>')`. The supported request parameter is `sysparm_user_id`, the user identifier value entered in the form.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdIdentifyViaEmail</td>
<td>Verifies a user's identity by checking the email address.</td>
</tr>
<tr>
<td>PwdIdentifyViaUsername</td>
<td>Verifies a user's identity by checking the user name.</td>
</tr>
</tbody>
</table>

'Enrollment form processor' script includes

Enrollment form processor script includes provide functionality for extending enrollment form processing.

All enrollment form processor script includes take the following parameters, and return a boolean indicating whether the user was successfully enrolled.
• `params.userId`: The sys_id of the user trying to enroll (table: `sys_user`).
• `params.verificationId`: The sys_id of the verification used to enroll (table: `pwd_verification`).
• `params.enrollmentId`: The sys_id of this enrollment process.
• `request`: The form request object. Fields in the form can be accessed with `request.getParameter('<element-id>')`.

You should add the following information to the state of the enrollment process:

• `gs.getSession().putProperty("result.status",status)`: Whether the user was successfully enrolled.
• `gs.getSession().putProperty("result.message",message)`: An associated message to be returned to the UI, such as a detailed error message.
• `gs.getSession().putProperty("result.value",value)`: A custom value associated with the enrollment.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdEnrollQuestionsProcessor</td>
<td>Handles questions and answers for verification.</td>
</tr>
<tr>
<td>PwdEnrollSampleProcessor</td>
<td>Provides an enrollment processor for sample verification.</td>
</tr>
<tr>
<td>PwdEnrollSMSProcessor</td>
<td>Provides an enrollment processor for SMS verification.</td>
</tr>
</tbody>
</table>

'User account lookup' script includes

User account lookup script includes return the credential store account_id for a given user.

The following parameter returns the credential store account_id for a given user.
• `params.userId`: The sys_id of the user being checked (table: `sys_user`).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdDefaultUserAccountLookup</td>
<td>Provides a default script for user account lookup from a user_id to the account in a credential store. The default mapping is to use the user name as the account name.</td>
</tr>
</tbody>
</table>

'Password generator' script includes

Password generator script includes take the following parameter, and return an auto-generated string password.

• `params.credentialStoreId`: The sys_id of the calling Password Reset process (table: `pwd_process`).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdDefaultAutoGenPassword</td>
<td>Generates a password from a random word and 4 digits.</td>
</tr>
</tbody>
</table>
'Verification processor' script includes

If the user identity is verified, the verification processor script includes return true.

Verification processor script includes take the following parameters:

- `params.resetRequestId`: The sys_id of the current Password Reset request (table: `pwd_reset_request`).
- `params.userId`: The sys_id of the user to be verified (table: `sys_user`).
- `params.verificationId`: The sys_id of the verification (table: `pwd_verification`).
- `request`: The form request object. Access the fields in the form with `request.getParameter('element-id')`.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdVerifyPersonalDataConfirmationProcess</td>
<td>Verifies that the user accepts the answer.</td>
</tr>
<tr>
<td>PwdVerifyPersonalDataProcessor</td>
<td>Verifies that the user’s answers match the expected data in the system.</td>
</tr>
<tr>
<td>PwdVerifyQuestionsProcessor</td>
<td>Provides question and answer verification of user input on the second page of the verification form.</td>
</tr>
<tr>
<td>PwdVerifySimpleProcessor</td>
<td>Provides simple verification of user input on the second page of the verification form.</td>
</tr>
<tr>
<td>PwdVerifySMSProcessor</td>
<td>Provides SMS verification of user input on the second page of the verification form.</td>
</tr>
</tbody>
</table>

'Post processor' script includes

Post processor script includes execute custom actions after the Password Reset process has completed.

All post processor script includes take the following parameters.

- `params.resetRequestId`: The sys_id of the current Password Reset request (table: `pwd_reset_request`).
- `params.wfSuccess`: A flag indicating whether the workflow completed successfully: True if, and only if, successful.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td>PwdPostProcessor</td>
<td>Executes actions after the process completes for success, failure, or both conditions.</td>
</tr>
</tbody>
</table>

Example custom scripts for Password Reset

The example scripts perform a user account lookup and processes an identification form, define a credential store, and create an identification type.
Perform a user account lookup and process an identification form

The main script calls two extension scripts, one to perform the user account lookup, and the other to process the identification form.

```javascript
// User account lookup
var lookupExtensionSysId = getExtensionScriptSysId('SampleUserAccountLookupExtension', 'user_account_lookup');
var lookupExtension = new SNC.PwdExtensionPoint(lookupExtensionSysId);

// Setup parameters required for this extension type - userId
var params = new SNC.PwdExtensionPointParameter();
params.userId = 'joe.employee';

// Invoke the extension
var answer = lookupExtension.process(params);
gs.print('user: ' + answer);

// Form processor sample - Identification form processor
var identExtensionSysId = getExtensionScriptSysId('SampleIdentificationProcessorExtension', 'identification_form_processor');
var identificationExtension = new SNC.PwdExtensionPoint(identExtensionSysId);

// Setup parameters required for this extension type - processId
var params = new SNC.PwdExtensionPointParameter();
params.processId = 'pwdreq1234';

// Simulate the posted form parameter for the identification processor
var request = new SNC.PwdExtensionPointParameter(); // A real life case will inject its own request object
request.setParameter('sysparm_user_id', 'joe.employee');

var userIdentity = identificationExtension.processForm(params, request);
gs.print('identity: ' + userIdentity);
```

Define a credential store

The following is an example of an extended process function in the User Account Lookup category used to define a credential store. To create this extension script, go to Password Reset >
Extensions > New extension script and create a new script as described in Create an Extension Script. To configure the User Lookup in a Password Reset process, see Credential Stores.

```
<?xml version="1.0" encoding="UTF-8"?>
<record_update table="sys_script_include">
    <sys_script_include action="INSERT_OR_UPDATE">
        <active>true</active>
        <client_callable>false</client_callable>
        <description>Simple account lookup that returns the supplied user id</description>
        <name>SampleUserAccountLookupExtension</name>
        <script><![CDATA[
            var SampleUserAccountLookupExtension = Class.create();
            SampleUserAccountLookupExtension.prototype = {
                category: 'password_reset.extension.user_account_lookup', // DO NOT REMOVE THIS LINE!
                process: function(params) {
                    return params.userId;
                },
                type: 'SampleUserAccountLookupExtension'
            };
        ]]]
    </sys_script_include>
</sys_app_file>
```
Create an identification type

The following is an example of an extended processForm function in the Identification Form Processor category that can be used to create an identification type. To create this extension script, go to Password Reset > Extensions > New extension script and create a new script as described in Create an Extension Script.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<record_update table="sys_script_include">
  <sys_script_include action="INSERT_OR_UPDATE">
    <active>true</active>
    <client_callable>false</client_callable>
    <description>Script that processes an identification form. Returns the sys-id of the user that corresponds to the requested input; if no user was found, null should be returned.</description>
    <name>SampleIdentificationProcessorExtension</name>
    <script><![CDATA[
    var SampleIdentificationProcessorExtension = Class.create();
    SampleIdentificationProcessorExtension.prototype = {
    category: 'password_reset.extension.identification_form_processor', // DO NOT REMOVE THIS LINE!

    **********
    * Process the identification form request, and returns the user's sys_id. If user was not identified return null.
    * @param params.processId The sys-id of the calling password-reset process (table: pwd_process)
    * @param request The form request object. Fields in the form can be accessed using: request.getParameter('<element-id>')
    * Supported request parameters:
    *     sysparm_user_id - the user identifier value entered in the form.
    * @return The sys-id of the user that corresponds to the requested input; if no user was found, null should be returned.
    **********
    processForm: function(params, request) {
    return request.getParameter('sysparm_user_id') + '_' + params.processId;
    },
    type: 'SampleIdentificationProcessorExtension'
    ];]]></script>
</sys_script_include>
</sys_update_table>
</sys_script_include>
</sys_app_file>
</record_update>
</sys_update_table>
</sys_app_file>
</record_update>
</sys_update_table>
</sys_app_file>
Use the `process` and `processForm` extensions

This example shows a script that uses two sample extensions, one `process` extension and one `processForm` extension.

```java
// User account lookup var lookupExtensionSysId =
get ExtensionScriptSysId('SampleUserAccountLookupExtension','user_account_lookup');
var lookupExtension = new SNC.PwdExtensionPoint(lookupExtensionSysId);

// Setup parameters required for this extension type - userId
var params = new SNC.PwdExtensionPointParameter();
params.userId='joe.employee';

// Invoke the extension var answer = lookupExtension.process(params);
gs.print('user: ' + answer);

// Form processor sample - Identification form processor
var identExtensionSysId =
get ExtensionScriptSysId('SampleIdentificationProcessorExtension','identification_form_processor');
var identificationExtension = new SNC.PwdExtensionPoint(identificationExtensionSysId);

// Setup parameters required for this extension type - processId
var params = new SNC.PwdExtensionPointParameter();
params.processId='pwdreq1234';

// Simulate the posted form parameter for the identification processor
var request = new SNC.PwdExtensionPointParameter();
// A real life case will inject it's own request object
request.setParameter('sysparm_user_id','joe.employee');

var userIdentity = identificationExtension.processForm(params, request);
gs.print('identity: ' + userIdentity);

// Simple helper to return the sys-id for a given extension script function
function getExtensionScriptSysId(scriptName, category){var result;var gr =new GlideRecord('sys_script_include');
gr.addQuery('name', scriptName);
gr.addQuery('script','CONTAINS','category: \"password_reset.extension.'+
category +"\"');
gr.query();
```
if(gr.next()){  
    result = gr.getValue('sys_id');}return result;}

process function:

```xml
<?xml version="1.0" encoding="UTF-8"?><record_update
    table="sys_script_include"><sys_script_include
    action="INSERT_OR_UPDATE"><active>true</active><client_callable>false</client_callable><description>Simple account lookup that returns the supplied user id</description><name>SampleUserAccountLookupExtension</name><script><![CDATA[var SampleUserAccountLookupExtension =Class.create();
    SampleUserAccountLookupExtension.prototype={
        category:'password_reset.extension.user_account_lookup',// DO NOT REMOVE THIS LINE!

        process:function(params){return params.userId;},

        type:'SampleUserAccountLookupExtension'

processForm function:

```xml
<?xml version="1.0" encoding="UTF-8"?><record_update
    table="sys_script_include"><sys_script_include
    action="INSERT_OR_UPDATE"><active>true</active><client_callable>false</client_callable><description>Script that processes an identification form. Returns the sys-id of the user that corresponds to the requested input; if no user was found, null should be returned.&amp;#13;</description><name>SampleIdentificationProcessorExtension</name><script><![CDATA[var SampleIdentificationProcessorExtension =Class.create();
    SampleIdentificationProcessorExtension.prototype=
        process:function(params){return params.userId;},

        type:'SampleIdentificationProcessorExtension'
    ];]]></script><sys_created_by>admin</sys_created_by><sys_created_on>2013-07-30 16:44:55</sys_created_on><sys_id>8306e143d73201002bb9af728e6103d3</sys_id><sys_mod_count>0</sys_mod_count><sys_name>SampleIdentificationProcessorExtension</sys_name><sys_parent/><sys_path>!!1W4/</sys_path><sys_policy/><sys_source_deleted>false</sys_source_deleted><sys_source_id>2df5a103d73201002bb9af728e610333</sys_source_id><sys_source_table>sys_script_include</sys_source_table><sys_type>code</sys_type><sys_update_name>SampleIdentificationProcessorExtension_2df5a103d73201002bb9af728e610333</sys_update_name><sys_update_by>admin</sys_update_by><sys_updated_on>2013-07-30 16:46:00</sys_updated_on></sys_app_file></record_update>
```
Password Reset extension script categories

You can use a custom extension script to extend Password Reset functionality for credential store, verification, or identification types.

**Note:** To use a script include as an extension script, you must set it to Active status.

Password Reset extension script categories

Extension scripts must specify a category that indicates which script include is being extended, for example, category: 'password_reset.extension.enrollment_check'. The ServiceNow platform installs several scripts in each category. A script in the Enrollment check category can perform the enrollment check for a verification. Detailed information on each extension script appears in [Password Reset extension scripts](#).
<table>
<thead>
<tr>
<th>Extension script category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enrollment check</td>
<td>Defines how to check that a user is enrolled in the Password Reset process. Scripts of this category are available in the Enrollment check field when you define a verification type (Password Reset Verification Type form).</td>
</tr>
<tr>
<td>Enrollment form processor</td>
<td>Defines how an enrollment form is processed (if automatic enrollment is not configured). Scripts of this category are available in the Enrollment form processor field when you define a verification type (Password Reset Verification Type form).</td>
</tr>
<tr>
<td>Identification form processor</td>
<td>Defines how a user identification is processed. Scripts of this category are available in the Identification processor field when you define a verification type (Password Reset Identification Type form).</td>
</tr>
<tr>
<td>Password generator</td>
<td>Defines how to generate a password. Scripts of this category are available in the Auto generate password field when you configure a credential store (Password Reset Credential Store Type form).</td>
</tr>
<tr>
<td>Post reset script</td>
<td>Executes at the end of a Password Reset process. Scripts of this category are available in the Post reset script field when you configure a process (Password Reset Process form).</td>
</tr>
<tr>
<td>User account lookup</td>
<td>Defines how to look up a user account. Scripts of this category are available in the User account lookup field when you configure a credential store (Password Reset Credential Store form).</td>
</tr>
<tr>
<td>Verification form processor</td>
<td>Defines how a verification form is processed. Scripts of this category are available in the Verification processor field when you define a verification type (Password Reset Verification Type form).</td>
</tr>
</tbody>
</table>

**Password Reset extension scripts**

Extension scripts allow you to extend Password Reset functionality in credential store, verification, or identification types.

**Password Reset extension script includes**

Each script include is associated with a specific category, which is available in the appropriate field of a Password Reset form.

**Note:** Create extension scripts only from the Password Reset Extension Script form (Password Reset > Extensions > New extension script). Extension scripts are special purpose script includes that are not created in the System Definition > Script Includes interface. To use a script include as an extension script, you must set it to Active status.
### 'Enrollment Check' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enrollment Check</td>
<td>Checks whether a user is enrolled for a given verification.</td>
<td><code>process(params)</code></td>
<td>Parameters:</td>
<td>Returns: (boolean)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- <code>params.userId</code> - The sys_id of the user to check (table: sys_user).</td>
<td>true, if the user is enrolled in the specified verification; otherwise, false.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- <code>params.verificationId</code> - The sys_id of the verification to check (table: pwd_verification).</td>
<td></td>
</tr>
</tbody>
</table>

This Enrollment Check example signals that the user is enrolled if both expected parameters are supplied. The code would be contained in the **Script** field of an extension script named `SampleEnrollmentCheck`:

```javascript
var SampleEnrollmentCheck = Class.create();
SampleEnrollmentCheck.prototype = {
    category : 'password_reset.extension.enrollment_check', // DO NOT REMOVE THIS LINE!
    process : function (params) { return (params.userId && params.verificationId) ? true : false; },
    type : 'SampleEnrollmentCheck'
};
```

### 'Enrollment Form Processor' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enrollment Form Processor</td>
<td>Checks whether all necessary information has been collected from the user. Stores the information so it can be used for verification when the user resets their password.</td>
<td>process(params)</td>
<td>Parameters:</td>
<td>Returns: (boolean) true, if the user is enrolled in the specified verification; otherwise, false.</td>
</tr>
</tbody>
</table>

#### Parameters:
- `params.resetRequestId` - The sys_id of the current Password Reset request (table: pwd_reset_request).
- `params.userId` - The sys_id of the user to be verified (table: sys_user).
- `params.verificationId` - The sys_id of the verification to be processed (table: pwd_verification).
- `request` - The form request object. Fields in the form can be accessed with `request.getParameter(<element-id>).`  

The following information should be added to the state of the enrollment process:

- `gs.getSession().putProperty("result.status",status)` - Whether the user was successfully enrolled.
- `gs.getSession().putProperty("result.message",message)` - An associated message to be returned to the UI, such as a detailed error message.
- `gs.getSession().putProperty("result.value",value)` - A custom value associated with the enrollment.
This example processes an enrollment form submission successfully if the user-submitted response was success. The code would be contained in the **Script** field of an extension script named `SampleEnrollmentProcessor`:

```javascript
var SampleEnrollmentProcessor = Class.create();
SampleEnrollmentProcessor.prototype = {
    category: 'password_reset.extension.enrollment_form_processor', // DO NOT REMOVE THIS LINE!

    processForm: function (params, request) {
        var verificationId = params.verificationId;
        var sampleInput = request.getParameter('sample_input');
        if (gs.nil(verificationId) || (sampleInput != 'success')) {
            return false;
        }
        var gr = new GlideRecord('sys_user');
        gr.get(params.userId);
        gs.print('User: ' + gr.getValue('user_name') + ' successfully enrolled');
        return true;
    }

    type: 'SampleEnrollmentProcessor'
};
```
### 'Identification Form Processor' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identification Form Processor</td>
<td>Processes an identification form request.</td>
<td>processForm(params, request)</td>
<td>Parameters:</td>
<td>Returns: the sys_id of the user that corresponds to the requested input. Returns null, if no user was found.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>· params.processId - The sys_id of the calling Password Reset process (table: pwd_process).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>· request - The form request object. Fields in the form can be accessed with request.getParameter('&lt;element-id&gt;'). Use request.getParameter('sysparm_user_id') to get the user ID that was entered into the form.</td>
<td></td>
</tr>
</tbody>
</table>

This example attempts to identify the user within the sys_user table given a user name submitted from the identification form. The code would be contained in the Script field of an extension script named PwdIdentifyViaUsername:

```javascript
var PwdIdentifyViaUsername = Class.create();
PwdIdentifyViaUsername.prototype = {
    category : 'password_reset.extension.identification_form_processor', // DO NOT REMOVE THIS LINE!

    initialize : function () { },

    **********
    // Process the identification form request, and returns the user's sys_id. If user was not identified return null.
    **********

    processForm : function (params , request ) { var processId = params.processId ; var sysparm_user_id = request.getParameter ('sysparm_user_id');

        gr = new GlideRecord ('sys_user');
        gr. addQuery ('user_name', sysparm_user_id );
        gr. query ();

        if ( !gr. next () ) { return null; } return gr.sys_id; },

```

© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
'Password Generator' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password Generator</td>
<td>Returns an auto-generated password.</td>
<td>process(params)</td>
<td>Parameters:</td>
<td>Returns: (String) an auto-generated password.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>· params.processId - The sys_id of the calling Password Reset process (table: pwd_process).</td>
<td></td>
</tr>
</tbody>
</table>

This example randomly generates a password from a base word and numbers. The base word is selected depending on the credential store. The code would be contained in the Script field of an extension script named SamplePasswordGenerator:

```javascript
var SamplePasswordGenerator = Class.create();
SamplePasswordGenerator.prototype = {
    category: 'password_reset.extension.password_generator', // DO NOT REMOVE THIS LINE!

    process: function (params) {
        var basePassword;
        var gr = new GlideRecord ('pwd_cred_store');
        gr.addQuery('name', 'Local ServiceNow Instance');
        gr.query();
        if (gr.next()) {
            if (params.credentialStoreId == gr.getValue('sys_id')) {
                basePassword = 'Password';
            } else {
                basePassword = 'Dorwssap';
            }
        }

        return this.generateSimple(basePassword);
    },

    generateSimple: function (base) {
        var pwd = base;
        var numbers = '0123456789';
        var length = 4;

        for (var i = 0, n = numbers.length; i < length; i++) {
            pwd += numbers.charAt(Math.floor(Math.random() * n) + 1);
        }

        return pwd;
    },

    type: 'SamplePasswordGenerator'};
```
**'Post Reset' script include category**

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
</table>
| Post Reset              | Performs additional operations after the completion of the Password Reset process. | process(params)   | Parameters: **Returns: void**  
- `params.resetRequestId` - The sys_id of the calling Password Reset process (table: `pwd_process`).  
- `params.wfSuccess` - A flag indicating whether the workflow completed successfully. True if, and only if, successful. |               |

This example adds failed reset requests to the system log. The code would be contained in the **Script** field for an extension script named `PwdPostProcessor`:

```javascript
var PwdPostProcessor = Class. create () ;

PwdPostProcessor. prototype = {
  category : 'password_reset.extension.post_reset_script', // DO NOT REMOVE THIS LINE!

  initialize : function ( ) {} ,

  //**********
  // Execute custom actions after the Password Reset process has completed.
  // * @param params.resetRequestId The sys_id of the current Password Reset request (table: `pwd_reset_request`)
  // * @param params.wfSuccess A flag indicating if the workflow completed successfully.
  //   True if (and only if) successful.
  // * @return no return value
  //**********/
  process : function (params) { if ( !params. wfSuccess ) {
    gs. log ( '[PwdPostProcessor.process] failure post processing for request [' + params. resetRequestId + ']');
  }

  // We could place actions here that we always want executed
  return ;
},

type : 'PwdPostProcessor' }
```
'User Account Lookup' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Account Lookup</td>
<td>Gets the credential store account ID for a given user.</td>
<td>process(params)</td>
<td>Parameters:</td>
<td>Returns: (String) the credential store account ID for the given user.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>· params.userId</td>
<td>The sys_id of the user being checked (table: sys_user).</td>
</tr>
</tbody>
</table>

This example gets the credential store account for a user. This code would be contained in the Script field of an extension script named SampleUserAccountLookupExtension:

```javascript
var SampleUserAccountLookupExtension = Class.create();
SampleUserAccountLookupExtension.prototype = {
    category : 'password_reset.extension.user_account_lookup', // DO NOT REMOVE THIS LINE!

    process : function (params) { return params.userId; },

    type : 'SampleUserAccountLookupExtension'
};
```

### 'Verification Form Processor' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Verification Form Processor</td>
<td>Processes a verification form request and indicates whether the user was verified or not.</td>
<td>processForm(params, request)</td>
<td>Parameters:</td>
<td>Returns: (boolean) true, if the user is verified; otherwise, false.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- params.resetRequestId - The sys_id of the current Password Reset request (table: pwd_reset_request).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- params.userId - The sys_id of the user to be verified (table: sys_user).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- params.verificationId - The sys_id of the verification to be processed (table: pwd_verification).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- request - The form request object. Fields in the form can be accessed with request.getParameter('&lt;element-id&gt;').</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This example shows a verification processor that returns true only if the user sent ok in the input field; otherwise, it returns false. The code would be contained in the Script field of an extension script named SampleVerificationFormProcessor:

```javascript
var SampleVerificationFormProcessor = Class. create ( ) ;
SampleVerificationFormProcessor. prototype = {
    category : 'password_reset.extension.verification_form_processor' , // DO NOT REMOVE THIS LINE!

    /**********
    * Process the verification form request, and return whether the user was successfully verified.
    * This is a sample verification processor returns true only if the user sent "ok" in the input field;
    * otherwise, it returns false.
    *
    * @param params.resetRequestId The sys_id of the current Password Reset request (table: pwd_reset_request)
    * @param params.userId The sys_id of the user trying to be verified (table: sys_user)
    * @param params.verificationId The sys_id of the verification to be processed (table: pwd_verification)
    * @param request The form request object. Fields in the form can be accessed with request.getParameter('<element-id>')
    * request.getParameter('<element-id>')
```

Create a Password Reset extension script

Create extension scripts only from the Password Reset Extension Script form. Do not create extension scripts in the System Definition > Script Includes interface.

Role required: password_reset_admin or admin

1. Navigate to Password Reset > Extensions > New extension script.
2. Enter a name in the Extension script name field.
   Use CamelCase to construct a name without spaces, for example, PwdEnrollmentCustom.
3. Select an Extension script category.
   - Enrollment check
   - Enrollment form processor
   - Identification form processor
   - Password generator
   - User account lookup
   - Verification form processor
4. Click Submit.
   A new instance of the script include for the selected category opens.
5. Edit the script by providing an implementation in the body of the process or processForm function, depending on the script category. You can add additional functions as long as the process or processForm function accepts the defined parameters and returns the expected results.

   Note: Do not edit or delete the Category declaration.
6. Click Update.

Service desk: Reset a password for a user

In a service desk-assisted Password Reset process, service desk agents with the password_reset_service_desk role reset user passwords. Users do not reset passwords. Watch a video example of service desk agents resetting passwords: Resetting User Passwords (Video).

Role required: password_reset_admin or password_reset_service_desk

Note: You must set the Public access property to enable the service desk-assisted process. See Settings on the Password Reset Details tab.

1. Navigate to Password Reset > Service Desk.
2. Select a user and the Password Reset process to use.
3. Click Verify Identity.
4. On the Verify Identity form, enter the answers that the user provides and then click Continue. If the user identity is verified, the Reset Password form displays identity verification and status of the account lock.
5. Perform one of the following actions.
   - If the user is not locked, the form displays the Reset password button. Enter the new password and click Reset password.
• If the user is locked, the form displays the **Reset password** and **Unlock account** buttons. You can enter a new password and click **Reset password** to reset the password and unlock the account. If the **Enable account unlock** check box is selected for the password process, you can unlock the account without resetting the password by clicking **Unlock account**.

6. To reset the password for a different user, you must first navigate out of the **Service Desk** and then navigate to **Password Reset** > **Service Desk**.

**Service desk: View user requests for password reset**

The **Reset Requests** module displays the status of each password reset request from the Password Reset Request table (pwd_reset_request).

Role required: password_reset_admin or password_reset_service_desk

Navigate to **Password Reset** > **Reset Requests**.

**Password Reset request fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>The user whose password is being reset or changed.</td>
</tr>
<tr>
<td>Process</td>
<td>The process that implements this password reset request.</td>
</tr>
<tr>
<td>Type</td>
<td>The type of Password Reset request:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Change Password</strong>: Request to change a password.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Help Desk</strong>: Request opened on behalf of the requesting user by a service desk agent.</td>

</table>
| **Status** | The result of the Password Reset request:  
- **Completed With Failure**: User completed all steps in the Password Reset process, but the password was not reset in the credential store.  
- **Completed With Success**: User completed all steps in the Password Reset process and the password was reset in the credential store.  
- **Expired**: User did not complete all steps in the Password Reset process in the time allowed.  
- **In Progress**: User is working through the steps to reset the password.  
- **Max Number of Attempts**: User failed to answer the security questions correctly during the identity verification step and has exceeded the maximum number of attempts allowed.  
- **Verified**: User has completed the identity verification step and is verified. The user can move to the Password Reset step. |
| **Active** | Whether the request is open or closed. |
| **Retry** | The total number of times the user has attempted to complete a password reset request. |

**Service desk: Unblock a Password Reset user**

If a user is manually banned or flagged as exceeding max attempts, the user can be blocked (not allowed to use the Password Reset application). You can unblock a blocked user.

Role required: password_reset_admin or password_reset_service_desk

Blocking events include:

- The user exceeded the limit for the number of failed password attempts.
- The most recent password reset occurred before the wait time required until the next reset.
- The user failed to provide the correct information while attempting to reset the password.

If the number of blocked or locked users exceeds the limit within a defined time interval, it triggers a system log event. You can configure the number of blocked, or locked, users and the time interval required to generate the log event by setting the `password_reset.activity_monitor.incident_threshold` and `password_reset.activity_monitor.incident_window` properties.

1. To view the list of blocked users, navigate to **Password Reset > Blocked Users**.
2. To unblock a self-service user:
   a) Navigate to **Password Reset > Blocked Users**.
   b) Select a user from the list.
   c) Select **Delete** on the **Actions on selected rows** list.
3. To unblock a user whose password was reset by a service desk agent:
If a user is manually banned or flagged as exceeding max attempts, the user can be blocked (not allowed to use the Password Reset application). When the password reset request is made through self-service, the user is unblocked when the password is successfully reset.

In contrast, service desk agents are allowed any number of retries. The `max_attempt_reached` limit does not apply and the `Blocked` status for the user is not reset after the password is reset. As a result, after you successfully reset a user password, you must unblock the user manually.

If the user is not unblocked manually, then the system resets the blocked state only when the `max_attempt_window` time period elapses and the user tries to reset the password using self-service.

a) After you successfully reset a user password, navigate to Password Reset > Blocked Users.

b) Change the `Blocked` setting for the user from true to false.

**Integrate Password Reset with a CMS integration**

You can configure a site in the ServiceNow content management (CMS) application to define a single-site access point that includes the Password Reset service. For example, you can create an employee self-service site that provides Password Reset service.

Role required: `content_admin`

Each Password Reset process requires a separate CMS page.

1. Navigate to Content Management > Specialty Content > iFrames and create an iFrame record.
2. Go to Content Management > Sites and create a site that has no login page.
3. Go to Content Management > Pages and create a password reset page.
4. Enter the name of the site that you created in the Content site field (Password Reset self-service in the example).
5. Right-click the form header and click Save.
6. Click the Edit Page related link and then click Add content.
7. In the Content Blocks section, select the iFrame that you created. Add more content as needed.
8. Click Update.

**Password Reset and Password Change reports and logs**

The Password Reset application provides several tools for monitoring and troubleshooting password reset activities.

Users with the password_reset_credential_manager or password_reset_admin role can view the status of password reset activities, identify potential security threats, and monitor for compliance with password security policies.
The Reset Requests, Activity Log, and Blocked Users modules are useful for monitoring password reset activities and for troubleshooting password reset issues. They also provide access to more detailed information than is provided on the Overview module.

To make room for new data, the system periodically purges the data that is used for password reset monitoring and reporting.

**Password Reset Overview module**

The Password Reset > Overview module displays reports on password reset and password change activities. Users with the password_reset_admin role can customize the layout of the reports that appear in the Overview module.

**Password Reset reports**

<table>
<thead>
<tr>
<th>Title</th>

<tr>
<td>Password Change Top Users (last 30 days)</td>
<td>Number of password change requests per user. Many password change requests from a single user could indicate a security issue.</td>
</tr>
</tbody>
</table>

**Password Reset activity log**

The activity log (Password Reset > Activity Log) provides detailed information that you can use to troubleshoot and to generate reports on password reset metrics. Information contained in the activity log is stored in the Password Reset activity log (pwd_reset_activity) table.

You must have the password_reset_credential_manager or password_reset_admin role to view the log.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Password Reset event log

The event log is a valuable resource for troubleshooting. On the Start menu, click Programs (or All Programs) > Administrative Tools > Event Viewer.

If the log does not appear, then, on the Windows Logs menu, click Applications > Service Logs.

You must have the admin role to view the log.

To write to the Password Reset event log

Edit the DebugFlag registry key entry at: Computer > HKEY_LOCAL_MACHINE > SOFTWARE > Microsoft > Windows > CurrentVersion > Authentication > Credential Providers > {B6EFF27D-C1C4-481F-B81B-F3547C47D58A}

By default, the key is set to 0. Set the key to 1 to write log entries to the ServiceNowPwdReset event log.

You must have the password_reset_credential_manager or password_reset_admin role to write to the log.

Password Reset blocked user notification

You can receive email notifications when the number of users that are blocked or locked exceeds the password blocked threshold. Notifications can alert you to suspicious activities. The default threshold is 10.

To subscribe: Add an email notification device or modify an existing device and then subscribe to the Password Reset-Activity Monitor Lockout notification.

You must have the password_reset_credential_manager or password_reset_admin role to subscribe.

Schedule for purging Password Reset data

To make room for new data, the system periodically purges the data that is used for password reset monitoring and reporting. Information contained in reports and monitoring tools could change dramatically immediately after a data purge. Contact ServiceNow Technical Support to modify purge intervals.

Purge intervals for Password Reset tables

<table>
<thead>

**Users: Reset your password on Windows systems**

If your organization uses the Password Reset Windows Application, you can reset your password directly from your Windows login screen.

Role required: none

1. Start your computer or press **Ctrl+Alt+Delete** to go to the Windows login screen.

![](image.png)
2. Click the Forgot Password? link. (Your administrator may have configured different text for the link.)

3. On the Identify page, enter the requested information and then click Next.

4. On the Verify page, enter the requested information, and then click Next.

   **Note:** You might be given the option to choose the method used to verify your identity.

   If your identity is verified, the Reset page displays whether you were successfully verified and the state of your account (either locked or unlocked).

5. Based on your locked/unlocked state, perform one of the following actions:
   - If your account is not locked, the page displays the Reset Password button. Enter and reenter the new password and then click Reset Password.
   - If your account is locked, the page displays the Reset Password and Unlock Account buttons.
     - You can enter a new password and click Reset password to reset the password and unlock the account.
• If your administrator has selected Enable account unlock for the password process, you can unlock the account without resetting the password by clicking Unlock account.

Users: Enroll in the Password Reset program

Some organizations auto-enroll users in a Password Reset program. Your organization could offer you the option to enroll for one or more methods of verifying your identity when you reset your password. You might enroll for any combination of the following methods:

Verify your identity using security questions (QA verification)

To enroll, you choose multiple questions that only you can answer (like the name of your first pet) and then supply answers. The system stores your answers securely. Later, when you want to reset your password, the system presents one or more of the questions. You answer the questions to verify your identity.

Verify your identity using an SMS code (SMS verification)

To enroll, you authorize a device like a cellular phone for SMS verification. Later, when you want to reset your password, you get a code number on the device and enter the code on the web page to verify your identity.

Users: Enroll in the Password Reset program using questions and answers

Your organization might ask you to select the questions to use when resetting your password. You select the questions and provide answers that only you know. At another time, when you reset your password, your answers verify your identity.

Role required: none

1. Navigate to Password Reset > Enroll and then click the QA Verification tab. If you are required to enroll for the QA verification method, then the tab is marked with an asterisk (*).
2. For each Question field, select a question from the list and then enter the answer in the Answer field. Repeat the process until the required number of Question and Answer fields are filled in.
3. Click Submit.
4. Optional: Enroll for an extra identity verification using any of the other methods that your organization offers. See:
   • Users: Enroll in the Password Reset program using SMS codes

Users: Enroll in the Password Reset program using SMS codes

To prove that you are who you say you are (verify your identity) while resetting your password, you can use a code number (the SMS code) that was delivered to your mobile phone or device.

Role required: none

Note: You cannot enroll for this program on a mobile device.

1. Navigate to Password Reset > Enroll and then click the SMS Verification tab.
If your organization requires you to enroll for the SMS verification method, then the tab is marked with an asterisk (*).

2. If you had previously added an SMS-enabled device to your Password Reset profile, the device is listed. To add and verify a device, click **Add Device** and then follow the instructions. Provide a meaningful **Name** for each device. Repeat the process for as many devices as you need.

3. After you have verified each device, select the **Authorized** check box for each device that you expect to use to change or reset your password.

   ![Note: You can deauthorize a device at any time by clearing the Authorized check box.]

4. Click **Submit**.

5. Optional: Enroll for an additional identity verification using any of the other methods that your organization offers. See:

   - Users: Enroll in the Password Reset program using questions and answers

**Self-service**

The Self-Service application gives supported end users a clean, simple front end to their IT support organization.

By default, the Self-Service application provides access to common actions, such as viewing your homepage, accessing the Service Catalog, viewing knowledge articles, working with incidents, and taking surveys.

**Service catalog requests**

This page contains links to content on service catalog requests.

**Add new request items**

Use ServiceNow's web-based interface to add new items to a request.

Roles required: Only an administrator or a user with the catalog_admin role can add a new item to a submitted request.

Modifying a request does not resubmit it to the approval process.

1. Navigate to **Service Catalog > Open Records > Requests** and open an existing request.
2. Click **Add New Item**.
3. In the dialog box that appears, choose an item and a quantity to add.
4. Click **OK**.

**Amazon EC2 instance request from the Service Catalog**

Users can request the provisioning and deletion of virtual computers (Linux or Windows) in the Amazon EC2 virtual computing environment through the ServiceNow Service Catalog.

The Amazon EC2 offering requires the purchase and activation of ServiceNow Orchestration Automaton.
Request an instance

Request the provisioning of a new Amazon EC2 instance through the service catalog.

1. Navigate to **Self-Service > Service Catalog**.
2. Select **Amazon EC2 Instance** from the **Request Application Infrastructure** category.

3. Select the operating system, the type of instance (Large or Small), and the number of instances requested.

   See the specifications for Large and Small instances in Amazon EC2 Instance Types.

4. Type a reason for the request.
EC2 Service Catalog

5. Click **Order Now** to order the instance.

The Order Status form appears, summarizing the request. A status bar tracks the progress of the approval and provisioning of the EC2 instance.
EC2 Order Status

Upon successful creation of the instance, you receive an email containing the instance ID, IP address, and the public DNS for the instances created.

Terminate an instance

Shut down an Amazon EC2 instance through the service catalog.

1. Navigate to Service Catalog > Routine Changes > Terminate Amazon EC2 Instance.
   A list appears displaying the instances that are assigned to you.
2. Select an instance from the list and click Order.
   This list does not support multi-line selection, and there is no undo feature.

Check-out redirect property

A property called One-step checkout redirect (glide.vm.checkout_redirect) controls the view presented to virtual machine requesters in the service catalog.

By default, this property is set to false, which redirects the view to the Order Status form when the requester clicks Order Now. When this property is set to true, ServiceNow redirects the requester to his or her My Virtual Assets portal. This property is located in Cloud Management > Administration > Properties.

Delete request items

Use ServiceNow's web-based interface to delete items from a request.

All users can delete items from their own requests any time prior to delivery. Modifying a request does not resubmit it to the approval process.

1. Navigate to Service Catalog > Open Records > Requests and open an existing request.
2. In the Requested Items related list, select the check box beside the item to delete.
3. In the **Actions** choice list, select Delete. ServiceNow recalculates the price and delivery date for the order.

**Place a request**

Use ServiceNow’s web-based interface for ordering predefined goods and services.

1. Navigate to **Self-Service > Service Catalog**.
   
The default catalog view organizes items in categories and subcategories.

   ![Service Catalog](image)

   **Default catalog view**

2. Select an item to order.

   **Note**: Some items are order guides, which combine related items for easier ordering. For example, an order guide called **New Employee Hire** presents a list of items that new employees typically receive (desk, phone, computer, email account). After you select the items you want to order, the order guide requests the information required and shows a separate time to delivery for each item ordered.

The order screen requests any additional information that’s needed, such as the requester’s name or location and the date the item is needed. It also displays the item’s delivery time after approval.
3. Enter complete and accurate information to expedite your order.
4. Order any other items required.
5. Click **Order Now** when the order is complete.
   
   ServiceNow displays a confirmation screen for your order:
Order submitted

You can view the order's progress in the **Stage** column.

**Note:** It may be useful to note the order number for future reference.

ServiceNow automatically notifies the approvers if approval is required and creates work orders to fulfill the order according to your organization's process. For example, if you order a new notebook computer, the purchasing group might receive a work order to order the computer, and the desktop services group might receive a work order to configure the new computer and deliver it to your office after it arrives.

### Create incidents and change requests from a requested item

To quickly open an incident or a change request from a requested item, use the **Create Change** or the **Create Incident** UI action from the context menu of the requested item. It also maintains a linked relationship between the requested item, and its associated incidents or change requests.

The **Create Change** or **Create Incident** UI actions should be enabled by setting the **Active** field to **true** when you **edit these UI actions**.

</tbody>
</table>
Role required: itil

1. Navigate to **Self-Service > Requested Items**.
2. Open a requested item.
3. From the **Additional Actions** menu, select the **Create Change** or **Create Incident** UI action. By default, these UI actions are inactive.

**View request status**

Use ServiceNow's web-based interface to view the status of a request.

1. Navigate to **Self-Service > Requested Items**.
2. Click your order number to view details.
3. View the order's progress in the **Stage** field.
Customize homepages

If you are assigned at least one role in the system, you can create a customized homepage that you can see when you log in.

The content on your homepage comes from a variety of sources, such as graphs and charts generated from a report, application modules, a service catalog category, the scrolling news widget, which is the News knowledge category.

1. Navigate to **Self-Service > Homepage**.
2. Add any item to the homepage by clicking the add content icon ( ) or the Add content link at the top.

A window will open that lets you select from a number of different homepage items you can add. Some items pertain to specific features and applications, such as CMS content blocks and the Work Management dispatch map. So the list of items varies depending on what is active on your system.

3. Reposition elements on your homepage by dragging and dropping them to a new location.

4. To remove a homepage item, click the (X) on the right side of the item's header.

Delete custom homepages

You can delete any of your custom homepages if you no longer need them.

1. Click the Delete page link at the bottom of the homepage.

2. Click Ok to confirm the deletion.

How Help the Help Desk identifies devices

Help the Help Desk uses a predefined series of queries to identify and update existing CIs in the CMDB or to create a new CI if no match is found.

These queries attempt to match devices using the three criteria listed here, in this order. Updates to an existing CI require only a single match as the list is evaluated. For example, if a device's name has changed, but the MAC address is the same, the CI with the matching MAC address is updated.

- Serial number in the cmdb_ci_computer table
- MAC address in the cmdb_ci_network_adapter table
- Computer name in the cmdb_ci_computer table
Note: Discovery Identifiers are incompatible with Help the Help Desk queries.

Script Include

The script include CIdentifierForHelpDesk provides the logic for updating existing CIs or creating a new CI if no matching device exists in the CMDB. Do not modify this script. Errors introduced into this script can result in update failures or in new CIs being created for every device found.

Running Help the Help Desk

Help the Help Desk is a tool that enables users to populate the CMDB automatically with information about their Windows computer. Help the Help Desk is a small Web application that downloads and runs locally, using a login script to gather information such as serial number, computer name, disk configuration, network configuration, installed software, memory, and much more.

To detect all system software successfully on a 64-bit machine, make sure to run the Help the Help Desk script from a 64-bit browser. A 64-bit browser can detect both 64-bit and 32-bit software, but a 32-bit browser cannot detect 64-bit software.

1. On your instance, navigate to Self Service > Help the Help Desk.
2. Click Start the Scan to Help the Help Desk.
   You are prompted to run or save the discovery.hta script.
3. If your browser is Internet Explorer, run the script. If you are using any other browser, click Save and save the script to the local machine.
4. To execute the saved script, double click the file.
   The script runs a series of WMI queries to gather information about the Windows machine. When it is done, the data is sent back to your ServiceNow instance and used to populate the configuration database (CMDB).

Service Delegation

Service delegation is the ability to designate other users to view and interact with approvals sent or tasks assigned to you, and to receive copies of all email notifications sent to you.

Note: Users to whom you delegate responsibility see all pending tasks and approvals regardless of the delegation period.

Note: Delegation does not cascade. When a user acts as a delegate for another user, the delegate cannot in turn delegate to a third party. The original delegate is the only user who receives assignments and notifications. Delegation does not grant the delegate access to tasks where the caller or requester is the user for whom the delegate was created.

Add the Delegates related list to a user profile

To delegate approvals and tasks to another user, configure your user profile form to display the Delegates related list.

Role required: personalize_form or admin.

1. Navigate to Self-Service > My Profile.
2. On the form context menu, navigate to Configure > Related Lists, and then add the Delegate->User related list.

The Delegates related list displays at the bottom of the user profile form.

Delegate approvals and tasks to another user

If a user is out of the office, that user can delegate responsibilities to other users for a period of time.

1. Navigate to Self Service > My Profile.
2. In the Delegates related list, click New.

Delegates Related List

If the list is not visible, configure the form to add the Delegate->User related list.
3. Select the Delegate (User).
4. Set the period of time.
5. Specify the responsibilities the delegate will assume using the following check boxes. You can delegate:

- **Approvals**: The delegate can approve items on your behalf.
- **Assignments**: The delegate can view and work on tasks assigned to you.
- **CC notifications**: The delegate receives a copy of email notifications sent to you, except those marked as Meeting Invitation.

**Note:** If the Approvals check box is selected but CC notifications is not, the delegate does not receive approvals.

- **Meeting invitations**: The delegate receives a copy of email notifications sent of the type Meeting Invitation.

**Note:** You must select an active user as your delegate. The instance only delegates to active users.

A sample delegation looks like this:

![Delegation Options](image)

**Delegation Options**

**Note:** If your delegate gets email notifications, they will be the same email notifications sent to you. The delegate may be confused to see “Incident assigned to you” emails, so make sure they know they are a delegate.
Service administration

Configure settings for services that support business applications or the platform.

Assessments

Use assessments to evaluate, score, and rank records from any table in the system.

You can assess projects that executives want to evaluate for effective management, or rate and compare a vendor's goods and services. Use assessments to send custom questionnaires to selected users or write scripts that query the database directly. You can then compare assessment results for the records using unique graphical views designed to highlight key performance information. Share an assessment between ServiceNow instances by using update sets, which is the recommended way to move assessment data from one instance to another.

The Assessments plugin is enabled by default.

Domain separation for assessments

Assessments support domain separation. If the metric type is global:

- All the categories and metric should be global
- Assessable records can be from different domains
- When the assessment is assigned to a user, then:
  - Users in the global domain can see all assessable records
  - Users in a particular domain can see assessable records in the global domain, in their domain, and in any child domains
  - If the user does not have access to any of the assessable records (for example, the metric type is global, but all assessable records are in acme domain and a user in the XYZ domain is assigned the assessment), the assessment instance will not be created and an "Instance could not be created" error is thrown.

If the metric type is not global:

- All categories and metrics must be in the same domain as the metric type
- All assessable records must be in the same domain as the metric type
- You can assign assessments to users that are in the global domain, in the domain of the metric type, or in any parent of the domain of the metric type

Installed with Assessments

- Demo data is available for assessments and surveys.
- Vendor Performance offers an additional set of vendor assessment demo data.

## Business rules

### Business rules for Assessments

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessable domain matches type</td>
<td>Assessable Record (asmt_assessable_record)</td>
<td>Ensures that all new assessable records are in the same domain as the metric type. This is a special requirement of assessment domain separation, that all records must be in the same domain.</td>
</tr>
<tr>
<td>Auto stakeholder creation</td>
<td>Assessment Category User (asmt_m2m_category_user)</td>
<td>Assigns new category users as stakeholders automatically for assessable records if the associated category has the Create stakeholders check box selected.</td>
</tr>
</tbody>
</table>
| Auto stakeholder creation                 | Category Assessable Records (asmt_m2m_category_assessment) | Creates stakeholders from all of a category’s category users automatically for new assessable records if:  
  - The Create stakeholders check box is selected for the metric category.  
  - The same metric category is associated to the new assessable record. |
| Auto stakeholder creation                 | Metric Category (asmt_metric_category)      | Assigns all of a category’s category users as stakeholders for each assessable record associated to the category when the Create stakeholders check box is selected for the category. |
| Calculate category max weight             | Assessment Metric (asmt_metric)             | Calculates the sum of all metric weights in a category.                                                                                                                                                     |
| Cancel notification workflow              | Assessment Instance (asmt_assessment_instance) | Cancels the workflow that generates assessment email notifications when an assessment instance is deleted or changes state to Complete or Canceled.                                                            |
| Category domain matches type              | Metric Category (asmt_metric_category)      | Ensures that all new categories are in the same domain as the metric type. This is a special requirement of assessment domain separation, that all records must be in the same domain. |

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Check Live Feed Groups</td>
<td>Assessable Record</td>
<td>Selects the Live feed check box if a live feed group is associated with the source record. If the Live feed check box is selected and no live feed group is associated with the source record, this business rule clears the check box.</td>
</tr>
<tr>
<td>Check only one default</td>
<td>Bubble Chart</td>
<td>Ensures there is only one default bubble chart for a metric type.</td>
</tr>
<tr>
<td>Check only one default</td>
<td>Decision Matrix</td>
<td>Ensures there is only one default decision matrix for a metric type.</td>
</tr>
<tr>
<td>Create actual results</td>
<td>Assessment Instance</td>
<td>Generates assessment and category results from the user responses if a user completes an assessment.</td>
</tr>
<tr>
<td>Create Business Rule on Remote table</td>
<td>Assessment Metric Type</td>
<td>Generates the following business rules if an assessment administrator creates or updates a metric type:</td>
</tr>
<tr>
<td></td>
<td>(asmt_metric_type)</td>
<td>· Business rule called Auto business rule for Assessments, which monitors the Table selected for the metric type. When someone adds a record that meets the metric type conditions, this business rule generates an assessable record. If someone changes the metric type's Table or conditions, the Create Business Rule on Remote table business rule updates the automatic business rule script to reflect the changes.</td>
</tr>
<tr>
<td></td>
<td>(asmt_assessment_instance)</td>
<td></td>
</tr>
</tbody>
</table>

The Create Business Rule on Remote table business rule generates automatic business rules only for metric types with Evaluation method set to Assessment.
<table>
<thead>

| Update records that match filter          | Metric Category (asmt_metric_category) | Automatically performs these tasks when an assessment administrator edits the Filter field:  
- Associates the category to assessable records that meet the filter conditions.  
- Disassociates the category from assessable records that do not meet the filter conditions.  
The Assessable records related list reflects these changes when the record is saved.                                                                                                               |
| Update scheduled job on schedule change   | Assessment Metric Type (asmt_metric_type) | Updates the survey creation scheduled job to reflect schedule period changes.                                                                                                                                                                                                                                                              |
| Validate mandatory and not applicable     | Assessment Metric (asmt_metric) | Sets the Mandatory and Allow not applicable fields to false if the metric method is Script. If the metric data type is Percentage, the business rule sets the Allow not applicable field to false.                                                                                      |
| Verify min/max                            | Assessment Metric (asmt_metric) | Ensures that the Min is greater than or equal to zero and less than the Max. Sets the Min to 0 and the Max to 1 if the data type is Checkbox or Yes/No.                                                                                                                                                                                             |
| Verify value                              | Assessment Template Definition (asmt_template_definition) | Ensures that the metric template definition Value is:  
- Greater than or equal to zero.  
- Different from the Value for all other metric template definitions related to the template.                                                                                                                                                                      |
| Verify value                              | Assessment Metric Definition (asmt_metric_definition) | Ensures that users can only enter a metric definition Value greater than or equal to zero. Ensures that the metric definition Value is different from the Value for all other metric definitions related to the metric.                                                                                                      |

Assessment Administrator tasks

Before you create assessments, assign the assessment_admin role to the appropriate users in your organization and determine your objectives for the assessment.

Decide which sets of records in the system to assess, which themes you are interested in, and which traits to measure. Consider your organization’s options for obtaining the data to compare. If you intend to use assessment questionnaires, consider which people can answer the questions.
Assessment terminology

Assessment admins use several terms when working with assessments.

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metric type</td>
<td>A metric type defines a set of records to evaluate, such as vendors, projects, or employees.</td>
</tr>
<tr>
<td>Assessable record</td>
<td>An assessable record links a record to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees. You define sets of assessable records when you create metric types.</td>
</tr>
<tr>
<td>Metric category</td>
<td>A metric category represents a theme for evaluating assessable records. Categories contain one or more individual metrics, which define specific traits or values that comprise the theme. Examples of categories include overall vendor performance or quality of delivery services. You can also set filter conditions that control which assessable records to evaluate for the metrics in a category.</td>
</tr>
<tr>
<td>Metric</td>
<td>A metric is a trait or value used to evaluate assessable records. A metric can measure subjective values in an assessment questionnaire, or gather objective values in a database query run by a script. Examples of metrics include perceived courtesy of sales representatives or number of incidents per vendor.</td>
</tr>
<tr>
<td>Category user</td>
<td>A category user is a person who knows about a specific category. One person can be a category user for multiple categories. Examples of category users include a vendor manager who oversees all purchasing operations or a supervisor of a sales team.</td>
</tr>
<tr>
<td>Stakeholder</td>
<td>A stakeholder is a category user who knows about a specific assessable record. Examples of stakeholders include a vendor manager who coordinates purchases from Amazon or a supervisor of a sales team who manages a specific employee.</td>
</tr>
<tr>
<td>Assessment instance</td>
<td>An assessment instance represents one assessment questionnaire assigned to one user. The system generates a new assessment instance for each assigned user when:</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Scorecard

A **scorecard** provides a visual illustration of an assessable record’s performance, based on assessment results. Use scorecards to view a variety of data summaries for one assessable record and to compare the ratings with other assessable records.

### Decision matrix

A **decision matrix** is a graph with two axes that plots the assessment results for multiple assessable records. Use decision matrixes to determine the relative standing of assessable records in selected categories.

### Bubble chart

A **bubble chart** is a graph with three axes that plots the assessment results for multiple assessable records. Use bubble charts to determine the relative standing of assessable records in selected categories, with an emphasis on one category.

### Assessment roles

The Assessments application requires certain roles to perform assessment tasks. No role is required to take assessment questionnaires that are assigned to you.

<table>
<thead>
<tr>
<th>Role Title</th>
<th>Role Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment administrator</td>
<td>assessment_admin</td>
<td>Assessment administrators set up assessments. They know which records to evaluate, the criteria on which to evaluate the records, and who to assign assessments to. <strong>Note:</strong> By default, users with the assessment_admin role have limited system rights and might not have access to all source records to assess. When planning assessments, grant additional roles to assessment administrators as needed. For example, to create and manage vendor assessments, the assessment administrator must also have the vendor_manager role, which grants access to the Company table and other relevant tables.</td>
</tr>
</tbody>
</table>
### Role Title | Role Name | Description
--- | --- | ---
ITIL user | itil | ITIL users perform basic technician operations in the system. In the Assessments application, they have read access to the Assessable Record table.

Administrator | admin | Administrators have access to all aspects of the assessment process. Only administrators can set up assessment schedules.

### Assessment methods

The available methods are **Assessment**, for non-scripted metrics, and **Script**, for scripted metrics. Each method serves a different function and can be used with certain data types.

Use the **Method** field to specify how to use the metric.

#### Assessment method

Metrics with the Method set to Assessment are called non-scripted metrics. Use each non-scripted metric to define a question for assessment questionnaires. Non-scripted metrics are useful if you want to obtain subjective data like personal opinions.

You can use the Assessment method with these **Data type** values:

- Attachment
- Checkbox
- Choice
- Date
- Date/Time
- Likert Scale
- Number
- Percentage
- String
- Template
- Yes/No

#### Script method

Metrics with the Method set to Script are called scripted metrics. Use each scripted metric to define a custom script for database queries. Scripted metrics are useful if your system contains reliable data for the traits you want to evaluate.

You can use the Script method with these **Data type** values:

- Duration
- Number
- Percentage

Use the Script field to write JavaScript code. By default, the field contains information about available variables and an example, which you can use as the basis of your script or replace entirely:

```
// The following variables are available:
// - primary: contains the sys_id of the assessable object to be evaluated
// - actual_result: the script sets the actual value for this metric to this variable
// - scaled_result: the script sets the scaled value (used in calculations) for this metric to this variable

For example:
var gr = new GlideRecord('cmdh_ci');
gr.addquery('manufacturer', primary);
gr.query();
actual_result = gr.getRowCount();
if (actual_result > 100) scaled_result = 5;
else scaled_result = 1;
```

### Metric form script field

You must use the following variables in your script:

- **primary**: Input variable used to access the sys_id of the record being assessed.
- **actual_result**: Output variable that contains the actual value for this metric. The system uses this variable to populate the Actual value field on the Metric Result form. For each actual_result, you must specify a corresponding **scaled_result** value.
- **scaled_result**: Output variable that contains a numerical scaled value to represent an actual value. The system uses this variable to populate the **Scaled value** field on the Metric Result form. Ensure the scaled values you specify are between or equal to the **Min** and **Max** values for the metric. The **Scale definition** field determines how the system uses the scaled value. A scale definition of **Low** means smaller numbers are better, such as for a metric that measures the number of incidents for a vendor. **High** means larger numbers are better, such as for a metric that measures user satisfaction on a scale of one to five.

### Script example

The metric Number of active devices uses the script pictured below. The **primary** variable is used to find CIs that are associated to the vendor record being assessed. The script retrieves the actual_result, the number of CIs associated to the vendor, then calculates the correct scaled_result. The script uses a series of scaled values, from the **Min** to the **Max** value, to represent actual values. Because the **Scale definition** is set to **High**, the greatest scaled values are best, meaning a vendor associated to the most CIs scores highest. The system stores the actual and scaled values in a metric result record for the vendor.
Scripted metric example

Data types for assessments

Metric data types have functions that depend on the method that you select.

<table>
<thead>
<tr>

</tr>
<tr>
<td>Yes/No</td>
<td>Assessment</td>
<td>On questionnaires, users select Yes or No from a list. Set the <code>Scale definition</code> field to <strong>High</strong> if selecting <strong>Yes</strong> equates to a better score.</td>
</tr>
</tbody>
</table>

### Assessment generation

In the Assessments application, administrators or assessment administrators can trigger the system to generate scheduled assessments or on-demand assessments when all the prerequisite steps are completed.

An assessment administrator must publish the metric type to enable assessment generation.

The system performs these tasks when it generates assessments:

- Creates assessment questionnaires from non-scripted metrics and assigns the questionnaires to users. When users complete their assigned questionnaires, the system uses their responses to calculate assessment results.
- Runs scripted metrics from each category to query the database and calculate assessment results.

Each time the system generates assessments, it creates some or all of the following components. Consider having an administrator set a schedule for recurring data cleanup, as the system can potentially generate a considerable amount of assessment data.

- Assessment group
- Assessment instances
- Assessment results

### Assessment groups

An assessment group is a container for assessment instances and assessment results generated in a single occurrence.
The system generates an assessment group every time the scheduled job runs or the API is called, when there is at least one assessable record associated to a category in the type. You can find assessment group records in Assessments > Assessments > Assessment Groups.

The Assessment Group form displays the group Number, the associated Metric type, and these related lists:

- **Assessment Instances**: Lists all assessment instances within this group. There may be no records in this related list. The system does not generate assessment instances if there are only scripted metrics for the type.
- **Metric Results**: Lists all metric results for this group. There may be no records in this related list initially. The system generates metric results immediately for scripted metrics, but not for non-scripted metrics, which appear as questions on assessments and require user response. The system dynamically updates the records in this list as users complete assessment questionnaires.
- **Assessment Category Results**: Lists all category results for this group. There may be no records in this related list initially. The system generates category results immediately if there are only scripted metrics in a category. Otherwise, the system does not calculate category results until a user completes an assessment questionnaire that contains questions from the category.

**Note:** To prevent the loss of important assessment data, you cannot delete an assessment group if it contains any assessment instances, metric results, or category results.

**Create an assessment category**

Assessment categories are used with assessment metric types and assessment metrics to generate bubble charts.

Role required: assessment_admin or admin

The Demand Management application comes with the Demand assessment metric type, five assessment metric categories, and assessment metrics. From the Assessment Categories section of the application menu, you can modify existing assessment categories and create ones.

1. Navigate to Demand > Settings > Assessments.
2. Click Create New to create a new record.

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Size</td>
<td>Assesses demand size relative to the size of other demands.</td>
</tr>
<tr>
<td>Strategic Alignment</td>
<td>Assesses how closely the demand aligns with strategic goals of the organization compared to other demands.</td>
</tr>
<tr>
<td>Risk</td>
<td>Assesses demand risks compared to other demands.</td>
</tr>
<tr>
<td>ROI</td>
<td>Assesses demand return on investment compared to other demands.</td>
</tr>
<tr>
<td>Cost</td>
<td>Assesses demand cost compared to other demands.</td>
</tr>
</tbody>
</table>

**Assessment metric categories**

In the Assessments application, a metric category represents a theme for evaluating assessable records in a given metric type.
Each category has a numeric weight value to indicate its importance relative to other categories. Within a category, records called metrics are the traits or values used to evaluate assessable records. For example, there are many categories within the Vendor metric type, including Support Rating, which contains metrics that measure the quality of vendors’ customer support services. Assessable records must be associated to categories to be eligible for evaluation. Assessment administrators create categories and manage which assessable records each category is associated to.

**Weight categories and metrics**

When you create a metric category or metric, you must specify a weight, a numeric value that indicates the importance of the category or metric relative to other categories and metrics. The greater the weight value, the more important the item is. The system uses weight values in assessment result calculations. Consider these recommendations when choosing weight values.

- Determine a weighting scale and use it consistently. In general, use a scale with a small numeric range. A standard 1-10 scale is usually appropriate, where 1 is least and 10 most important. Understand that increasing the maximum value of a weighting scale impacts all related result calculations.
- Use the same weighting scale for metric categories and metrics. Though there is no limitation, consider using the same or very similar weighting scales for both categories and metrics to make it easier to remember which values to use. A scale of 1-10 is an effective and simple weighting system, but may not be suitable for all organizations.

**Note:** If you do not want to use weighting, set the same weight value for all categories and metrics. The default weight value is 10.

Create a category for assessable records

After you create a metric type and generate assessable records, create categories for the themes you are interested in using to evaluate the assessable records.

Role required: none

1. Navigate to **Assessments > Metric Definition > Categories**.
2. Click **New** to create a new metric category and then complete the Metric Category form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the metric category. The name appears on assessment questionnaires.</td>
</tr>
<tr>
<td>Type</td>
<td>(Required) Metric type this category is used for. Metrics in this category can be used to evaluate assessable records for the type you select. This field becomes read-only after you save the record.</td>
</tr>
<tr>
<td>Create stakeholders</td>
<td>Check box that enables (selected) or disables (cleared) automatic stakeholder creation for this category. When the check box is selected, the system makes all associated category users stakeholders for each assessable record associated to this category. This saves the time required to manually create stakeholders. For more information, see Create Stakeholders Automatically. Existing stakeholders are not impacted if you clear the check box.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Table</td>
<td>(Read-Only) Table that contains the records to evaluate with metrics in this category. The system automatically populates this field with the same table as the metric type selected. The table does not appear in the field until you save the form. This field is visible depending on whether a <strong>Type</strong> is selected.</td>
</tr>
<tr>
<td>Weight</td>
<td>(Required) Numerical value that represents the importance of this category relative to other categories. A greater value indicates greater importance. For more information, see <a href="#">weight categories and metrics</a>. The default value is 10.</td>
</tr>
</tbody>
</table>
| Scoring type | Scoring method for an attestation category. This field appears only when the **metric type** is an attestation with a **Scoring type** of **Percent**. Use this field to configure different scoring types for specific attestation categories. Possible selections are:  
  - **Percent**: Attestation score as a weighted percentage of correct answers for scored questions.  
  - **All or nothing**: All answers for attestation type questions must be correct or the score is zero for the entire category. |
| Total metrics| (Read-Only) Number of metrics associated to this category.                                                                                   |
| Filter       | Filter conditions that assessable records must meet to be evaluated using metrics in this category. The filter operates on fields on the selected table.  
  If you specify a filter condition, the system automatically associates matching assessable records to the category when you save the record. If you change the filter conditions, the system removes and creates assessable record associations as needed. The system also deletes stakeholders for assessable records it disassociates. The system does not remove assessable record associations created by users, even if the assessable records do not match the filter conditions. This field is visible only when a **Type** is selected. |
<p>| Description  | Descriptive information about the category that appears on assessment questionnaires.                                                          |</p>
<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Assessable record associations

Only the assessable records associated to a category can be evaluated using metrics in that category. Manage which assessable records you evaluate for each category by creating and removing the associations.

Only the assessable records associated to a category can be evaluated using metrics in that category. Manage which assessable records you evaluate for each category by creating and removing the associations.

**Note:** You can also manage which categories an assessable record is associated to using the **Assessable Record** form.

Manage an assessable record automatically

You must define at least one filter condition in the Metric Category form to automatically associate assessable records with the category.
Role required: assessment_admin or admin

1. Navigate to Assessments > Metric Definition > Categories.
2. Open a category.
3. In the Filter field, create a condition statement that defines the records you want to associate to this category. The available fields are from the table defined for the metric type.

   For example, for a category in the Vendor type, you might create the condition (Country (is) (Germany)). Metrics in the category will be used only to evaluate vendors that meet this condition.

4. Save the record.

   The system associates this category to all assessable records that match the filter condition. As the system generates new assessable records that match the condition, it associates them to this category. If you change the filter condition, the system removes and creates assessable record associations, as appropriate. Note the following:
   - The system does not remove assessable record associations created manually, even if the assessable records do not match the filter conditions.
   - The system deletes any related stakeholders, if applicable, when it disassociates assessable records from a category.
   - The system does not create or remove assessable record associations if the related source records change. For example, consider the previous example in which all assessable records for vendors based in Germany were associated to a particular category. Assume that a user changes the Country of one of the vendor records from Germany to Canada. The system does not disassociate the related assessable record from the category, even though it no longer matches the filter condition.

   Note: To configure the system to automatically associate all assessable records from a metric type to a category, use the same category condition as the metric type condition. For example, if the Vendor metric type has the condition (Vendor) (is) (true), create the same condition for the category. If the metric type does not have a condition specified, you can use the category condition (Sys ID) (is not empty), which includes all records from any table.

Manage an assessable record manually

   You can manually create and remove assessable record associations for a category using a related list on the Metric Category form.

   Role required: assessment_admin or admin

   Keep in mind that when you disassociate an assessable record from a category, the system deletes any related stakeholders, if applicable, and you can no longer evaluate the assessable record using metrics in that category.

1. Navigate to Assessments > Metric Definition > Categories.
2. Open a category.
3. In the Assessable records related list, click Edit and use the slushbucket to add or remove one or more assessable records.

   Only assessable records associated to this category’s metric type are available for selection.

Delete a category

   When you delete a category, the system also deletes the associated category users and stakeholders.

   Role required: assessment_admin or admin

   1. Navigate to Assessments > Metric Definition > Categories.
Alternatively, navigate to a record that contains a related list for categories.

2. Open a record from the list.
3. On the Metric Category form, click Delete.
4. Click OK when asked to confirm the action.

The system displays messages at the top of the form describing the actions taken.

**Assessment metrics**

In the Assessments application, a metric is a trait or value used to evaluate assessable records. Depending on the metric method, a metric can be used as either of the following:

- A question on assessment questionnaires, to obtain a subjective value such as how much people enjoy using each cell phone offered in the service catalog.
- A script that queries the database, to obtain an objective value such as the number of incidents related to each cell phone.

Each metric is associated to one metric category and can be used to evaluate assessable records for that category only. For example, the Support Rating category contains metrics that measure the quality of vendors’ customer support services. One metric addresses the quality of product documentation. Others address the strength of the user community, self-service options, online training, and other support services. Each metric has a numeric weight value to indicate its importance relative to other metrics in the same category.

Assessment administrators can create and administer metrics and metric templates, which define reusable sets of answer options for metrics used as assessment questions. If you decide to use metric templates, you may want to create them before you create metrics.

**Note:** Changes to assessment metrics and metric templates are reflected in assessment questionnaires and results, even if users have saved responses already. If possible, avoid changing the original meaning of a metric question, the data type, or any metric templates in use by existing assessments.

**Create a metric for a category**

After you create a category, create metrics you can use to evaluate the assessable records for that category.

Role required: assessment_admin or admin

When you create metrics, consider the focus of the category and what characteristics you want to measure for the items you will assess. If you plan to use metrics for assessment questionnaires, you may want to review tips for writing good questions.

1. Navigate in one of the following ways:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Assessments &gt; Metric Definition &gt; Categories</strong></td>
<td>Open a category, and locate the Assessment Metrics related list. This is the suggested navigation path, as the system links metrics to the category from which they are created.</td>
</tr>
<tr>
<td><strong>Assessments &gt; Metric Definition &gt; Metrics</strong></td>
<td></td>
</tr>
</tbody>
</table>

2. Click New.
3. Fill in the fields, as appropriate.
Assessment Metric form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the metric.</td>
</tr>
<tr>
<td>Category</td>
<td>Metric category that the metric belongs to. The system automatically populates this category if you create a new metric from the Metric Category form.</td>
</tr>
</tbody>
</table>

**Note:** You cannot change the category if the **Depends on** field is set or if another metric depends on this metric.

<table>
<thead>
<tr>
<th>Method</th>
<th>Determines how to use the metric.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment</td>
<td>Non-scripted metric. Make the metric available as a question on an assessment questionnaire. The Assessment method is compatible with all data types except <strong>Duration</strong>.</td>
</tr>
<tr>
<td>Script</td>
<td>Scripted metric. Obtain values by writing a custom script. The Script method is compatible with the <strong>Duration</strong>, <strong>Number</strong>, and <strong>Percentage</strong> data types.</td>
</tr>
<tr>
<td>Default answer from field</td>
<td>This option appears only if you have selected an Assessment Metric Type that contains a table. The General tab adds two fields:</td>
</tr>
<tr>
<td>Default answer</td>
<td>Select the default answer for the question. The list comes from the selected table.</td>
</tr>
<tr>
<td>Ask question</td>
<td>Specifies when to ask the question: always or only if the default answer is empty.</td>
</tr>
<tr>
<td>Default answer from script</td>
<td>The General tab adds a field:</td>
</tr>
<tr>
<td>Ask question</td>
<td>Specifies when to ask the question: always or only if the script does not contain a default answer. The script is defined on the Field Type tab.</td>
</tr>
</tbody>
</table>

**Note:** If you select a Data type that is incompatible with the selected Method, the system automatically changes the Method to the correct value.
<table>
<thead>
<tr>

</tbody>
</table>

**Related List**

| Assessment Metric Definitions | Lists all metric definitions, which appear as answer options for questions on assessment questionnaires. Click New to create a new metric definition. This related list is available only if the Data type is Choice or Likert Scale. |

4. **Save the record.**

When you create a **Choice** or **Likert Scale** question, reopen the Assessment Metric form after you submit it to create a new metric definition. If you distribute a questionnaire without creating the answers for questions with these data types, recipients are unable to answer the questions. If the questions are mandatory, the recipients are unable to submit their questionnaires.

Create a metric definition

Metrics with Choice or Likert Scale data types must have metric definitions defined to represent answer options on questionnaires.

Role required: assessment_admin or admin

Each metric definition appears as one answer option for a question on an assessment questionnaire. For example, a metric for the question "How satisfied are you with the quality of this vendor?" has three metric definitions to create these answer options: **Very satisfied**, **Somewhat satisfied**, and **Not at all satisfied**.

1. **Open the metric record you want to edit.**
2. **In the Assessment Metric Definitions related list, click New to create a new metric definition.**
3. **Fill in the fields:**
   - **Display**: Enter the text you want to appear as the answer option.
   - **Value**: Enter the numeric value, greater than or equal to zero, to which the answer option equates. Values are used to calculate metric results. When you view assessment questions, metric definitions appear in order from least to greatest value.
     - The system sets the minimum and maximum values according to the metric definition values.
     - To prevent reporting confusion, no two metric definitions for a given metric should have the same Value.
4. **Click Submit.**

Change the order of an answer

By default, the order of answer options is established when a question is created with a data type of **Choice** or **Likert Scale**.

Role required: assessment_admin or admin
The system creates an Order value for each choice based on where it appears in the original list when you submit it. This order corresponds to the Value setting you give the answer. The choice with the lowest order number appears first, and the choice with the highest order number appears last. If you want to reconfigure the order of the answer options, you must do so by editing the Order field and not the Value field.

The Order column is hidden in the base system.

To edit these records, configure the Assessment Metric Definitions related list in the question record to show the Order column, and then edit the order number in the list. The Value setting remain the same for each answer option after reorganization.

Metric types and assessable records

In the Assessments application, assessment administrators create and administer metric types and assessable records.

A metric type defines a set of records an organization wants to evaluate, such as vendors, projects, or employees. For each type, the system generates unique assessable records that link the type to records that need to be evaluated, such as the individual records for the vendors Amazon and Intel. There may be multiple assessable records for the same source record if the source record meets the criteria for more than one type. For example, you might want to evaluate a record on the Company table, such as Intel, as a vendor and as a manufacturer, with different categories and metrics.

For configuration suggestions, see Assessment Administrator tasks.

Assessable records

An assessable record links a source record you want to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees.

You use assessments to evaluate the assessable record. The system generates assessable records from the source records that match the table and conditions set on the Assessment Metric Type form. You evaluate the assessable records with metric categories and metrics, which define traits and values to assess. For metric types with the On demand schedule type, you can generate on-demand assessments from the Assessable Record form. This method of assessment generation makes it easy to create and preview short questionnaires or to quickly obtain assessment results for specific assessable records.

You can set up an assessment description that includes information from multiple fields on an assessable record and is displayed on multiple lines. This provides the user who is taking the assessment with a more detailed and understandable description of the information being
requested on the assessment questionnaire. Create a multi-line description using table titles, which can be defined to use one or more fields from the selected table. See Define a new smartphone table title for more information.

Create metric types and generate assessable records
Each metric type sets a table and filter conditions that define a set of records to evaluate.
Role required: assessment_admin or admin

For example, the Vendor Performance application provides the Vendor metric type, which defines an assessable record for each source record in the Company (core_company) table that has the Vendor field selected. Create a metric type for each set of records you want to evaluate, such as vendors, users within an organization, or projects.

In addition to defining assessable records, metric types also determine how to filter decision matrix data and set the schedule type, which determines whether assessments are on-demand or scheduled.

1. Navigate to Assessments > Metric Definition > Types.
2. Click New.
3. Fill in the fields, as appropriate (see table).
4. When you are satisfied with the type settings, click Generate Assessable Records to save the record and create assessable records. The page redirects to the list of assessable records created.

You must click Generate Assessable Records to create the initial set of assessable records based on the table and conditions specified on the type record. After that, the system creates an assessable record each time a new matching record is created. Generate Assessable Records is located under Related Links.

Note: Clicking Generate Assessable Records can trigger the deletion of existing assessable records under certain circumstances. For more information, see Enforce a condition to delete an assessable record.

| Pagination setting for Service Portal view | Specify how the user will see pages on the desktop or tablet view in Service Portal.  
- **Category**: Display each category on a separate page. The categories appear in the following order:  
  - Each category appears in sequence on a separate page for the first assessable record  
  - Then each category appears in sequence on a separate page for the next assessable record  
  - and so on  
- **Question**: Display each question on a separate page. Questions appear on separate pages for mobile devices regardless of this setting. Each question appears for each category as described for the **Category** setting.  
- **None**: All items on a single page—no pagination  

Default: **Category**

**Note**: This field appears only when Service Portal is installed.

| Roles | Additional user roles that can view the results and access records associated with this type. Users with the specified roles have read access to this type record as well as to associated categories, metrics, assessable records and scorecards, category users, stakeholders, and decision matrices.  

**Note**: Users with these roles do not have access to Assessments modules unless they are also assessment administrators. Users with these roles can navigate to the records by other means, such as from reference fields on assessment instances. This field provides the option to easily grant certain users access to specific assessment data in special cases. For example, the **Vendor** metric type provides access to users with the vendor_manager role so they can view results and compare assessable records when they open scorecards or decision matrices in the Vendor Performance application. |

<tr>
<td>Default matrix filter</td>
<td>Record to use as the default filter choice on decision matrixes and scorecards. The selected Filter field and Filter condition control the available record choices. To see the records, if any, click the refresh icon next to the field. Consider the case that the filter field is Vendor type and you select Applications as the default matrix filter. The filter choice on decision matrixes for this type is set to Applications by default. If you change the value of the Table or Filter condition field, you must click the refresh icon to view the updated Default matrix filter choices. If you do not, the system selects the first available choice from the updated field choices when you save the record.</td>
</tr>
</tbody>
</table>

**Related Lists**

- **Metric Categories**: All metric categories associated with the type.
- **Assessable Records**: All assessable records associated with the type. This related list is hidden in the Attestation view of this form.

**Note:** The Generate Assessments button is visible to administrators in certain cases for scheduled assessments. Do not click the button until after completing the prerequisite tasks.

Delete a metric type

Deleting a metric type entails deleting many related records.

**Role required:** assessment_admin or admin

You must delete some of these records manually before deleting the type, while the system deletes others automatically with the type.

1. Delete the records associated with the type to delete:
   - **Assessment results** (metric and category results)
   - **Assessment instance** (questions and assessment instances, in that order)
   - **Assessment groups**

2. Delete the type.
   A confirmation dialog box appears and alerts you that certain records associated with the type will also be deleted.

3. Click **OK** to delete the type and these related records:
   - Scheduled job for assessment generation
   - Business rule for assessable record generation
   - Assessable records
   - Metric categories
   - Category users
   - Stakeholders
   - Metrics
Export an assessment
You can share assessments between ServiceNow instances by exporting an assessment and then importing the assessment on another instance.

Role required: assessment_admin or admin

Note: Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see [System update sets](#).

Note: The system exports a single XML file that does not contain result data.

The XML file contains a metric type [asmt_metric_type] and the following records that are associated with the type:

- Assessable records [asmt_assessable_record]
- Metric categories [asmt_metric_category]
- Metrics [asmt_metric]
- Metric definitions [asmt_metric_definition]
- Category users [asmt_m2m_category_user]
- Stakeholders [asmt_m2m_stakeholder]
- Decision matrixes [asmt_decision_matrix], [asmt_m2m_xcategory_matrix], and [asmt_m2m_ycategory_matrix]

1. Navigate to Assessments > Metric Definition > Types.
2. Right-click the record and select Export Assessment.
3. Save the XML file.

Import an assessment
Share assessments between ServiceNow instances by importing a previously exported assessment.

Role required: admin

Note: Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see [System update sets](#).

1. Ensure that the target instance has assessments enabled.
2. Follow the procedure detailed in [Import a Record as XML Data](#).

Use update sets for surveys and assessments
Use an update set to capture changes to surveys and assessments.

Role required: admin or survey_admin

When developing surveys and assessments, you can use an update set to capture the changes and move them from a development instance to a production instance. Once an update set is created and marked current, all of the updates to the following tables are recorded in the update set.

The following tables are now update set enabled and also extend the application file:

- Assessment Metric Templates (asmt_template)
- Assessment Template Definitions (asmt_template_definition)
Create an assessment signature

A signature on an assessment questionnaire contains assertions that can communicate directions, a legal statement, or any text that you want the recipient to consider.

Role required: assessment_admin or admin

You can require the recipient to select a check box or provide a full signature to acknowledge acceptance of the assertion before submitting the form. You can display assertions without requiring a signature. An assessment property called Require authentication for user signature allows you to require users to provide their user name and password when an assessment asks for a full name signature.

1. Navigate to Assessments > Metric Definition > Signatures.
   All signatures in the system appear in this list.
2. Click New.
3. Complete and submit the form using the fields in the table.

Assessment signature fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name for this signature</td>
</tr>
<tr>
<td>Signature type</td>
<td>Type of signature required. The selections are Checkbox, Full name, or Assertion only. If Assertion only is selected, no signature is required to submit the questionnaire. By default, the system requires user authentication for a full name entry.</td>
</tr>
<tr>
<td>Assertion</td>
<td>Text to present to recipients that requires acknowledgement.</td>
</tr>
</tbody>
</table>

Assessable records

An assessable record links a source record you want to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees.

You use assessments to evaluate the assessable record. The system generates assessable records from the source records that match the table and conditions set on the Assessment Metric Type form. You evaluate the assessable records with metric categories and metrics, which define traits and values to assess. For metric types with the On demand schedule type, you can generate on-demand assessments from the Assessable Record form. This method of assessment generation makes it easy to create and preview short questionnaires or to quickly obtain assessment results for specific assessable records.

You can set up an assessment description that includes information from multiple fields on an assessable record and is displayed on multiple lines. This provides the user who is taking the assessment with a more detailed and understandable description of the information being requested on the assessment questionnaire. Create a multi-line description using table titles, which
can be defined to use one or more fields from the selected table. See Define a new smartphone table title for more information.

View an assessable record
View the Assessable Record form to edit preferences and perform various actions.

Role required: assessment_admin or admin

1. Navigate to Assessments > Assessable Records.
2. Open a record from the list.
   By default, the list displays only assessable records with Active metric types.
3. On the Assessable Record form, edit fields and perform other actions as necessary (see table).

**Viewing Assessable Records**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>(Read-Only) Assessable record name based on the display value of the source record. The name appears on assessment questionnaires.</td>
</tr>
<tr>
<td><strong>Source</strong></td>
<td>(Read-Only) Source record the assessable record is linked to. The Source reflects the table name and source record display value. For example, if the Name field is the display value for the Company table, the assessable record for a company record named Amazon has the Source value Company: Amazon.</td>
</tr>
<tr>
<td><strong>Live feed</strong></td>
<td>Check box that, when selected, creates a live feed group for the assessable record, which appears on the scorecard. If you clear the check box after a live feed group has been created, the system deletes the live feed group and all its messages.</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>(Read-Only) Metric type from which the assessable record was generated.</td>
</tr>
<tr>
<td><strong>Decision matrix</strong></td>
<td>Check box that, when selected, enables this assessable record's results data to appear on decision matrices of the same metric type. Decision matrices are graphs that plot the assessment results for multiple assessable records. If you clear the check box, the assessable record still appears on the default decision matrices if you click the View Matrix related link on the assessable record's scorecard.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Live feed group</td>
<td>(Read-Only) Live feed group for this assessable record. When you select the Live feed check box and save the record, the system populates this field.</td>
</tr>
</tbody>
</table>

**Related Links**

**View Scorecard**
Opens the scorecard for the assessable record.

**Related Lists**

**Category**
All metric categories associated with the assessable record. An assessable record must be associated to a category to be evaluated. Click **Edit** to add or remove category associations. Note that it is often more efficient to **associate assessable records** to categories using the Metric Category form.

**Category users**
All stakeholders who can take assessment questionnaires about this assessable record. Click **Edit** to create and delete stakeholders. For more information about this and other methods of creating stakeholders, see **Stakeholders**.

This related list is available only when the associated metric type has the **Scheduled** schedule type.

---

**Enforce a condition to delete an assessable record**

By default, the system does not delete assessable records, even if you change the table or conditions for the type and the existing assessable records no longer match.

Role required: assessment_admin or admin

The system can be configured so you can trigger the deletion of assessable records that do not match the type table and conditions.

1. On the Assessment Metric Type form, select the **Enforce condition** check box to enable deletion of existing assessable records of this type that do not match the table or conditions specified.

   When the check box is cleared, the system retains existing assessable records of this type, even if they do not match the table and conditions specified.

2. Click **Generate Assessable Records** to delete all assessable records associated with the type that do not match the current table and conditions.

   The system does not automatically delete assessable records, even if the **Enforce condition** check box is selected. You must click **Generate Assessable Records** with the check box selected every time you want the system to delete non-matching assessable records.

**Delete an assessable record**

When you delete an assessable record, the system deletes any stakeholders for the record.

Role required: assessment_admin or admin
Note: If a source record is deleted, the system deletes the associated assessable record. To delete the source record, you must first delete all associated metric results and category results.

Delete the assessable record:
- To delete a single record, open the record and click **Delete**.
- To delete multiple records, use the Assessable Records list.

Create a metric template

Create a metric template to define reusable rating scales for evaluating non-scripted metrics.

Role required: assessment_admin or admin

1. Navigate to **Assessments > Metric Definition > Templates**.
2. Click **New**.
3. Fill in the **Name** field on the Assessment Metric Template form.
4. To use images for template choices, such as for image scale questions, select **Allow Image**.
5. Click **Submit**.
6. Under the **Assessment Template Definitions** related list, click **New**. Create a template definition for each answer option you want to appear on an assessment question.
7. Fill in the following fields:
   - **Display**: Enter the text to appear as the answer option.
   - **Value**: Enter a numeric value, equal to or greater than zero, that you want the answer option to equate to. Values are used in results calculations.
   - **Selected Image**: Click to add the image to use for selected state.
   - **Unselected Image**: Click to add the image to use for unselected state.

When you view assessment questions that use templates, answer options appear in order from least to greatest Value.

**Tip**: To prevent reporting confusion, no two template definitions for a given template should have the same Value.

8. Click **Update**.

**Metric templates**

Metric templates define reusable rating scales for evaluating non-scripted metrics.

Each answer option on the scale is defined as a template definition, much like a metric definition. For example, the metric template named Satisfaction contains the template definitions: **Very Satisfied**, **Satisfied**, **Neutral**, **Dissatisfied**, and **Very Dissatisfied**.

Metric templates are available for metrics that have **Template** as the Data type. The following metric templates are available by default.

**Default metric templates**

<table>
<thead>
<tr>
<th>Name</th>
<th>Assessment template definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Likert 5</td>
<td>Strongly Disagree, Disagree, Neutral, Agree, Strongly Agree</td>
</tr>
</tbody>
</table>
### Name | Assessment template definition
--- | ---
Satisfaction | Very Dissatisfied, Dissatisfied, Neutral, Satisfied, Very Satisfied
Frequency | Never, Seldom, Sometimes, Most of the time, All of the time
Amount | None, Few or little, Average amount, Many, Quite a lot
Size | Very Small, Small, Average, Large, Very Large
Quality | Very Poor, Poor, Average, Good, Very Good
Complexity | Very Complex, Complex, Moderate, Simple, Very Simple

**Update a metric minimum and maximum value to match a template**

For assessment results to be properly calculated, the Min and Max values of a metric that uses a template must be equal to the smallest and largest template definition Value, respectively.

**Role required:** assessment_admin or admin

The system sets the **Min** and **Max** fields automatically when you create a metric of the Template data type, based on the template definition values. However, the system does not update these fields for existing metrics if you add a new template definition to a template or if you update the Value of an existing template definition. If the new Value is less than the minimum value of any metrics that use the template or greater than the maximum value, update the metrics accordingly.

To edit the minimum and maximum values for a question that has the Template data type:

1. Navigate to **Assessments > Metric Definition > Metrics**.
2. Configure the **list** to show the **Min** and **Max** columns.
3. Run the following list filter condition: `[Template] [is] [<select the template you updated>]`
4. Ensure the Min and Max values match the smallest and largest template definition Value for the selected template, respectively.

If the values do not match, edit the Min and Max directly from the list.

**Note:** When the data type is Template, a UI policy prevents the editing of Min and Max from the form.

---

**Category users and stakeholders**

Users who take assessments are individuals in your organization who have specific knowledge of the assessment categories and the records being assessed. A person who is qualified to answer assessment questions from metrics in a specific category becomes a category user when associated to that category. A category user then becomes a stakeholder when associated to a specific assessable record.

The system determines which assessable records and questions a user receives by looking at the metric categories and assessable records for which those users are stakeholders. Assessment administrators can create and manage category users and stakeholders.

**Note:** Category users and stakeholders are used only for scheduled assessments.
Category users

Category users are users who can potentially answer assessment questions about a particular metric category for scheduled assessments. Category users should have special knowledge of the categories and the metrics those categories contain. A category user becomes a stakeholder when associated to an assessable record. Create at least one category user for each category you want to use for assessment questionnaires. There is no need for category users if the category contains only scripted metrics.

Stakeholders

A stakeholder is a category user with specific product or service knowledge, who is associated to an assessable record. A stakeholder is familiar with the assessable record and all the metrics within a specific category. The same category user can be associated to multiple assessable records, in which case the system creates a stakeholder record for each association.

There are multiple ways to create stakeholders:

- **Configure the system to create stakeholders automatically.**
- **Associate multiple category users to multiple assessable records.**
- **Associate multiple category users to one assessable record.**
- **Associate one category user to one assessable record.**

Note: Ensure you establish the desired user and assessable record associations to categories before attempting to creating stakeholders.

Create a category user

Create category users by associating users in the system to metric categories.

Role required: assessment_admin or admin

When you create category users, choose users who are knowledgeable and can answer questions from that category. For example, a purchasing agent is a good category user for metrics that evaluate a vendor’s discount practices.

1. Navigate to **Assessments > Metric Definitions > Categories**.
2. Open a category record.
   
   **Note:** The category must be associated to a metric type that has the **Schedule type** set to **Scheduled**.
3. In the **Users** related list, click **Edit**.
4. Select the appropriate users for this category.

Create stakeholders automatically

You can configure the system to create stakeholders automatically from all category users and assessable records associated with a category using the **Create stakeholders** check box on the Metric Category form.

Role required: assessment_admin or admin

If you associate a user to the category, the system makes the resulting category user a stakeholder for all the assessable records associated to the category. Similarly, if you associate a new assessable record to the category, the system makes all category users stakeholders for that record if they are not already stakeholders.
**Note:** Use the **Create stakeholders** check box with caution. You can end up with more stakeholders than you want and a large amount of unnecessary assessment data. Automatic stakeholder creation is best suited to assessment implementations in which category users are knowledgeable about all or most of the assessable records associated to each category.

1. Navigate to **Assessments > Metric Definition > Categories**.
2. Select a category.
3. Associate category users and assessable records to the category.
4. Select the **Create stakeholders** check box.
5. Click **Update**.
   All the category users are associated to all the assessable records as stakeholders.
6. In the **Assessable Records** related list, click **Edit**.
7. Using the slushbucket, associate an assessable record to the category.

8. Click **Save**.
   The system makes all category users stakeholders for the new assessable record.
9. Delete stakeholders as needed.

Associate multiple category users to multiple assessable records
The stakeholder list helper in the create stakeholders module is the most efficient way to associate multiple category users to multiple assessable records in a single interface.

Role required: assessment_admin or admin

You can select category users from one category at a time.

Note: You cannot edit or delete stakeholders using the list helper.

1. Navigate to Assessments > Advanced > Create Stakeholders.
   The stakeholder list helper appears.
2. Select a metric type from the list of available types.

   **Note:** Only metric types for scheduled assessments are available. On-demand assessments do not use category users or stakeholders.

3. Select a category from the list of available categories.

   **Note:** Only categories within the selected metric type are available.

The system populates the **Category User** and **Assessable Records** lists with category users and assessable records associated to the selected category.

4. Select one or more category users from the **Category Users** list.

5. Select one or more assessable records from the **Assessable Records** list.

6. Click the **Associate** arrow between the lists to complete the association.

   A message above the list helper advises you that the selected category users are now stakeholders for the selected assessable records.

Delete a stakeholder for multiple assessable records

You can delete stakeholders for multiple assessable records.

Role required: assessment_admin or admin

1. Navigate to **Assessments > Advanced > Assessment Stakeholders**.

2. Sort the list by **Assessable Record** or **Category User** depending on the perspective you want.

3. Select the check box for each stakeholder you want to delete.

4. Select **Delete** in the **Actions** choice list.

5. Click **OK** to confirm the action.

The system deletes the stakeholders.
Associate one category user to one assessable record
You can create a single stakeholder using the list in the Assessment Stakeholders module.

Role required: assessment_admin or admin

Associate any category user to any assessable record.

1. Navigate to Assessments > Advanced > Assessment Stakeholders.
2. Click New. On the Assessment Stakeholders form, fill in these fields:
   - Category user: Select a category user.
   - Assessable record: Select an assessable record.
3. Click Submit.
   The selected category user becomes a stakeholder for the selected assessable record. To verify the association, navigate to the assessable record and note that the selected category user is on the Category users related list.

Note: Do not create stakeholders from category users and assessable records of different metric types.

Associate multiple category users to one assessable record
You can create many stakeholders for a single assessable record from the Assessable Record form.

Role required: assessment_admin or admin

You can also edit or delete stakeholders from the form.

1. Navigate to Assessments > Assessable Records.
2. Open a record from the list.
3. In the Category users related list, click Edit.
   These category users are the stakeholders for this assessable record.
4. Use the slushbucket to edit the category users associated to this assessable record. Add category users to create stakeholders. Remove category users to delete stakeholders. The system only shows category users for categories associated to the assessable record. For example, if an assessable record is only associated to the Compliance Score and Support Rating categories, you do not see User Satisfaction category users.

Delete a stakeholder for one assessable record
You can delete stakeholders for one assessable record.

Role required: assessment_admin or admin

1. Navigate to Assessments > Assessable Records.
2. Open an assessable record.
3. In the **Category Users** related list, select the check box for each stakeholder you want to delete.
4. Select **Delete** in the **Actions** choice list.
5. Click **OK** to confirm the action.
The system deletes the stakeholders.

**Generate an on-demand assessment**

Use on-demand assessments to familiarize yourself with the basic assessment process and test your questionnaires using minimal configuration.

Role required: assessment_admin or admin

Select the assessable records to evaluate, create the categories and questions, and then assign an assessment to a user in the system. Pre-configured stakeholders are not used for on-demand assessments.
1. Create a **metric type** and set the **Schedule type** to **On demand** to allow for testing of your assessment configuration.
2. Generate the **assessable records** for the metric type you created.
3. Create the **metric category** required to evaluate the assessable records selected.
4. Create one or more assessment questions, or **metrics**, for each category.
5. **Publish the assessment.**
6. Perform an **on-demand assessment** to test your categories and metrics.
7. Analyze the assessment ratings in an **assessment scorecard** or **decision matrix**.

**On-demand assessments**

On-demand assessments can be generated for metric types with the Schedule type field set to On demand.

For the system to properly generate on-demand assessments, the metric type must be active and published. The metric type must also be associated to at least one metric category. That metric category must be associated to one or more of each of the following items:
- Assessable record
- Metric

By default, an assessment administrator can generate an on-demand assessment for one assessable record or **multiple assessable records**.

**Generate an on-demand assessment for one assessable record**

When you generate an on-demand assessment from the Assessable Record form, the resulting assessment contains questions from the categories associated to the assessable record.

Role required: assessment_admin or admin

1. Navigate to **Assessments > Assessable Records**.
2. Open an assessable record associated to a metric type that has the **On demand** schedule type.
3. On the Assessable Record form, click **Assign Assessment**.
The Select Assessor dialog box appears.
4. Select a user from the Recent Assessors list or select a different user.
5. Click OK.

The system generates an assessment instance assigned to the selected user.

Generate an on-demand assessment for multiple assessable records
When you generate an on-demand assessment from the Assessment Metric Type form, the resulting assessment contains questions from all categories associated to any assessable records for the metric type.

Role required: assessment_admin or admin

For example, if there are 15 assessable records associated to at least one category with assessment metrics, the assessment contains questions for all 15 assessable records.

1. Navigate to Assessments > Metric Definition > Types.
2. Open a metric type that has the On demand schedule type.
3. On the Assessment Metric Type form, click Assign Assessment.

The Select Assessor dialog box appears.
4. Select a user from the Recent Assessors list or select a different user.
5. Click OK.

The system generates an assessment instance assigned to the selected user.

Generate an assessment with the on-demand API
The Assign Assessment buttons call an API to generate on-demand assessments.

Role required: assessment_admin or admin

1. To generate an assessment, call the from any script in the system, such as a business rule or client script.
2. Use the sys_ids of these items:
   - An assessable record to evaluate. The assessable record must be associated with an on-demand type and at least one category that contains non-scripted metrics.
   - One or more users who should perform the assessment. The API generates a questionnaire about the specified assessable record for each user.
Schedule an assessment

After you have evaluated your questionnaires using on-demand assessments, edit your categories and metrics as needed, reset your metric type record, and select the users who are qualified to evaluate the assessable records.

Role required: assessment_admin or admin

1. Open the metric type you created for the on-demand assessment and set the Schedule type to Scheduled.
2. Make sure the categories and metrics you created for the on-demand assessment are correct.
3. Create category users who have special knowledge of your categories.
4. Create stakeholders by associating category users to specific assessable records.
5. Set a schedule for automatic assessment generation or generate the assessment manually. This procedure must be done by a system administrator.
6. Configure email notifications to remind users of their assigned assessments and to report to managers when an employee misses an assessment deadline.
7. Analyze the assessment ratings in an assessment scorecard or decision matrix.

Schedule types

You can schedule assessments for preconfigured users or send them to any user on demand.

On-demand assessments require less setup. Scheduled assessments define users, or stakeholders, who have specific knowledge of the records being evaluated, and automatically send out assessment questionnaires to those users at scheduled intervals. The best practice is to configure an on-demand assessment first to familiarize yourself with the process and test your questionnaires. When you are satisfied with your categories and questions, reconfigure for a scheduled assessment. These configuration paths are the easiest for both assessment types. Refer to Key Terms for definitions of the terms used in these procedures.

Set an assessment generation schedule

You can set assessment generation schedules. You must set a schedule for each metric type individually.

Role required: assessment_admin or admin

1. Navigate to Assessments > Metric Definition > Types.
2. Open the appropriate metric type record.
3. Click the reference icon next to the Scheduled job field to open the Schedule Item record.
4. Locate the Trigger type field and set a recurring schedule for the scheduled job.

   For example, if you want to generate assessment components each month, select the Interval or Repeat trigger type and specify a Repeat value of 30 days. Alternatively, select Day in Month and specify a Run time and Run day of month.

   The optimal frequency of assessment generation is subjective. When you set the schedule, keep in mind the number of records to evaluate, how often your organization requires updated assessment results, the time and effort required of users to complete assessments, and other relevant factors.

Publish a metric type

Before it is possible to generate assessments, an assessment administrator must publish the associated metric type.

Role required: assessment_admin or admin
The **State** field on the Assessment Metric Type form indicates whether the type is published. The default state is **Draft**, which disables the system from generating assessments.

1. Navigate to **Assessments > Metric Definition > Types**.
2. Open a metric type record, and click **Publish**.

   The **Publish** button is available only if the state is **Draft** and there is at least one metric associated with the type.

   **Note:** A metric type cannot be moved back to the **Draft** state after it has been published.

### Scheduled assessments

The system generates a unique scheduled job for each metric type with the **Schedule type** field set to **Scheduled**.

The system generates a unique scheduled job for each metric type with the **Schedule type** field set to **Scheduled**. Each scheduled job generates assessment components for the related metric type. By default, the scheduled job runs when an administrator executes it manually, but administrators can set a schedule to generate assessments automatically on a recurring basis.

For the system to properly generate scheduled assessments, the metric type must be active and **published**. The metric type must also be associated to at least one metric category. That metric category must be associated to one or more of each of the following items:

- **Assessable record**
- **Stakeholder** associated to one of the assessable records
- **Metric**

### Generate a scheduled assessment manually

Administrators can generate scheduled assessments manually.

Role required: assessment_admin or admin

Use this option, for example, if you have set a schedule but want to generate assessments before the next scheduled run date.

1. Navigate to **Assessments > Metric Definition > Types**.
2. Open the appropriate metric type record.
3. Click **Generate Assessments** to trigger the scheduled job immediately.

   **Note:** Be careful to click **Generate Assessments**, not **Generate Assessable Records**.

### Generate a vendor type assessment manually

The Vendor Performance feature provides a direct method of generating assessments for the Vendor metric type.

Role required: admin

1. Navigate to **Vendor Performance > Admin > Generate Assessments**.
2. Click **Generate Assessments** to execute the scheduled job for the **Vendor** type.

### Clean up assessment data

The assessment process generates a considerable amount of data, some of which is not useful after a short time.

Role required: assessment_admin or admin
The assessment process generates a considerable amount of data, some of which is not useful after a short time. Assessments include a scheduled job called **Remove Old Assessment Data** that is available to administrators only. The scheduled job removes these items if they are more than a year old:

- Assessment instance questions
- Assessment instances
- Metric results

By default, the scheduled job is executed manually. Administrators can configure the scheduled job to run automatically on a recurring schedule.

1. Navigate to **System Scheduler > Scheduled Jobs > Scheduled Jobs**.
2. Open the **Remove Old Assessment Data** record.
3. On the Schedule Item form, set the **Trigger type** field to run the scheduled job on a recurring schedule.
   
   It is recommended to set the scheduled job to run on a weekly or monthly basis.
4. Optional: Click **Execute Now** to run the scheduled job.

**Assessment instances**

An assessment instance represents one occurrence of a questionnaire assigned to one user.

The system generates assessment instances only when the required conditions are met, as described in **Scheduled assessments** and **On-demand assessments**, and there are non-scripted metrics in at least one category.

When the system generates scheduled assessments for a metric type, each assessment instance contains questions about assessable records and categories related to the stakeholder to which it is assigned.

**Example**: Recall that there can be multiple stakeholder records associated with one user record. Minh Leclare is a stakeholder for these items related to the **Vendor** metric type:

<table>
<thead>
<tr>
<th>Assessable record</th>
<th>Category</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amazon</td>
<td>User Satisfaction</td>
</tr>
<tr>
<td>Acme</td>
<td>User Satisfaction</td>
</tr>
<tr>
<td>Acme</td>
<td>Reliability</td>
</tr>
<tr>
<td>Cisco</td>
<td>Reliability</td>
</tr>
</tbody>
</table>

When the system generates a scheduled assessment, Minh is assigned one assessment instance. Minh must evaluate Amazon, Acme, and Cisco by answering questions from the categories for which she is a stakeholder. Assuming that there are three questions in the User Satisfaction category and six questions in Reliability, Minh’s questionnaire contains three questions about Amazon, nine questions about Acme, and six questions about Cisco.

When the system generates an on-demand assessment for a specific assessable record, the assessment instance contains questions about that assessable record and all its associated categories. When the system generates an on-demand assessment for a metric type, the assessment instance contains questions about all that metric type’s assessable records and their associated categories.

**View an assessment instance**
An assessment instance represents one occurrence of a questionnaire assigned to one user.

Role required: none

1. Navigate to Assessments > Assessments > Assessment Instances.
2. Click an assessment instance number to open the record.
3. View the record, which displays the following information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Auto-generated record number.</td>
</tr>
<tr>
<td>Metric type</td>
<td>Metric type of this assessment.</td>
</tr>
<tr>
<td>Assessment group</td>
<td>Assessment group to which this assessment belongs.</td>
</tr>
<tr>
<td>Due date</td>
<td>Date by which the assessment instance must be completed. The system populates the due date from the value in the metric type Assessment duration field. The system generates email notifications related to the due date.</td>
</tr>
<tr>
<td>State</td>
<td>State of the assessment. The possible states are Ready to take, In progress, Complete, and Canceled.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User this assessment is assigned to. This field becomes read-only when the state is In progress, Complete, or Canceled.</td>
</tr>
<tr>
<td>Signature</td>
<td>Name of the signature record attached to this assessment. A signature requires that assessment recipients acknowledge that they have read any assertions attached to a questionnaire.</td>
</tr>
<tr>
<td>Signature result</td>
<td>Verification provided by the recipient when a signature is required. This value is either the recipient's full name from the User (sys_user) table or checked, indicating that the recipient acknowledged reading the assertion by selecting a check box.</td>
</tr>
</tbody>
</table>

4. Click Take assessment to open the questionnaire.

This button is available if all the following conditions are true for the assessment instance:

- It is Assigned to you.
- The State is Ready to take or In progress.
- The associated metric type is Active.
Configure trigger conditions for an assessment

Trigger conditions specify when to send a particular assessment and who to send the assessment to.

Role required: assessment_admin or admin

1. Navigate to Assessments > Admin > Trigger Conditions.
2. Complete the fields as described in the table:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment</td>
<td>(Required) Metric type to generate assessment instances for. Triggered assessments only work if the metric type is set to the On demand schedule type.</td>
</tr>
<tr>
<td>Table</td>
<td>(Required) Table to run the trigger condition on. You can select only tables in the current application scope.</td>
</tr>
<tr>
<td></td>
<td>The table must have a connection to the assessable records for the selected Assessment. For example, you might want to send a vendor assessment when incidents close that are related to vendors you assess. In this case, select the incident (incident) table. After you select a table, ensure there is at least one option for the Assessable Record Field. If there is not, select a different table.</td>
</tr>
<tr>
<td>User field</td>
<td>(Required) Field that stores the users you want to send the assessment. You can select any field, on the selected Table or on a related table, that references the User (sys_user) table. Use the tree picker to select a field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Repeat Interval</td>
<td>Minimum period that must pass before the trigger condition can resend the assessment to the same user. For example, assume the repeat interval is set to 30 days. Even if the same user is eligible for multiple assessments from this trigger condition, the system can only send the user one assessment every 30 days.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this trigger condition is active (selected).</td>
</tr>
<tr>
<td>Business rule</td>
<td>(Admin only) Business rule the system creates to monitor the selected table. When the condition is met, the business rule sends the assessment to the correct user. No configuration is necessary for this business rule.</td>
</tr>
<tr>
<td>Trigger randomly</td>
<td>Check box that determines whether to send the assessment to the appropriate user every time the condition is met (cleared) or only a percentage of the time (selected), as specified in the Probability (%) field.</td>
</tr>
<tr>
<td>Probability (%)</td>
<td>Probability out of 100 that the assessment will be sent each time the condition is met. For example, if the probability is set to 50, the system sends the assessment approximately 50% of the time the conditions are met, assuming there are no repeat interval restrictions. This field is visible and required only when the Trigger randomly check box is selected.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Assessable Record Field</td>
<td>(Required) Field on the selected Table that determines which assessable record will be the subject of the assessment. Only appropriate reference fields on the selected Table are available to select. If there are no Assessable Record Field options available, you must select a different Table. If the selected Assessment evaluates records on the Company [core_company] table and the selected Table is Incident, the only Assessable Record Field options are fields on the Incident table that reference the Company table. For example, Company or, if vendor ticketing is enabled, Vendor. If you select Vendor, the trigger condition sends an assessment about the Vendor for the incident, assuming there is an assessable record for the associated company. The assessment contains questions from all metric categories associated with the assessable record. Note: This field is not available if the selected Assessment is a metric type used for surveys. See Survey trigger conditions.</td>
</tr>
<tr>
<td>Related Field 1 – Related Field 4</td>
<td>Field that contains a value you want to store for reporting purposes. You can pick any reference field on the selected Table. When the trigger condition generates an assessment instance, the system stores the value from the triggering record. Select up to four fields. For example, if you select the Incident table, you might select Caller and Vendor as related fields. That stores the caller and vendor associated with the incident as Related record 1 and Related record 2 in the assessment instance record. To view these fields, configure the Assessment Instance form.</td>
</tr>
<tr>
<td>Description</td>
<td>Summary information to identify the trigger condition.</td>
</tr>
<tr>
<td>Condition</td>
<td>(Required) Condition builder that defines the criteria that must be true to send the assessment. For example, if you want to send an assessment whenever an incident closes, create the condition (State) (is) (Closed).</td>
</tr>
</tbody>
</table>

**Assessment trigger conditions**

A trigger condition tells the system who to send a designated assessment to and when, based on specific conditions.
With trigger conditions, assessment administrators can configure the system to generate assessments each time a specific action occurs, such as when an incident or change request closes. The trigger condition sends the assessment to specified users who are related to the triggering record, such as incident callers or change request assignees. You can choose to send the assessment every time the condition is met, or set a probability for the system to send the assessment at random when the condition is met.

**Trigger condition configuration**

<table>
<thead>
<tr>
<th>Assessment</th>
<th>Vendor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Incident [incident]</td>
</tr>
<tr>
<td>User field</td>
<td>Assigned to</td>
</tr>
<tr>
<td>Repeat Interval</td>
<td>30 days</td>
</tr>
<tr>
<td>Active</td>
<td>true</td>
</tr>
<tr>
<td>Trigger randomly</td>
<td>false</td>
</tr>
<tr>
<td>Assessable Record Field</td>
<td>Vendor</td>
</tr>
<tr>
<td>Related Field 1</td>
<td>Caller</td>
</tr>
<tr>
<td>Related Field 2</td>
<td>Vendor</td>
</tr>
<tr>
<td>Condition</td>
<td>(State) (is) (Closed) and (Vendor) (is not empty)</td>
</tr>
</tbody>
</table>

**Trigger condition example**

Modesto Scroggie is the caller on an incident that is assigned to Boris Catino, a service desk technician. Boris contacts a vendor to resolve Modesto’s issue and sets the Vendor field to Microsoft. When the incident closes, the system creates an assessment instance assigned to Boris so he can evaluate Microsoft as a vendor.

Because two related fields were selected as part of the trigger condition, the assessment instance stores the following information from the incident:

- **Related record 1**: User: Modesto Scroggie
- **Related record 2**: Company: Microsoft

**Note**: Even though the trigger condition is set to be triggered every time the conditions are met, the Repeat Interval setting ensures that Boris does not receive another assessment if another vendor incident assigned to him closes within 30 days of the first one.

**Enable manager notifications**

Users with the assessment_admin role can enable the Notify manager assessment is overdue email notification.

Role required: assessment_admin or admin

This notification sends emails to assessors’ managers when assessors do not complete their assigned assessments on time. For more information, see the table of assessment notifications. You must enable or disable this email notification separately for each metric type.

1. Navigate to Assessments > Metric Definition > Types.
2. Open a metric type.
3. Select the Notify if overdue check box.
To disable manager notifications, clear the check box.

4. Save the record.

**Note:** The assessor’s user record must have a manager specified in the Manager field to use this notification. You might need to configure the form to use this field.

**Assessment notifications**

You can configure the system to send email notifications for assessments.

You can configure any of the following types of notification during the process of generating assessable records:

- **Notify assessment user:** This message notifies you of an assigned assessment and includes the type, the due date, and basic instructions. The message also contains a link to the record where you take the assessment.

  **Note:** If a user has a pending assessment, then the system will not generate another instance of the same assessment.

- **Remind assessment user:** This message reminds you of the due date if half the time passes and you have not completed the assessment. The message content is the same as the first notification.

- **Notify manager assessment is overdue:** If you do not complete an assessment by the due date, the system may send a notification to your manager, depending on configuration.

  **Note:** By default, the system runs a script every 30 days to cancel expired assessment and survey instances that are in the Work in progress or Ready to take states.

**Assessment notification workflow**

The system sends assessment notifications according to the Notify assessment user workflow. Users with the workflow_admin, workflow_creator, or workflow_publisher roles can view workflows.

1. To open the graphical workflow editor, navigate to Workflow > Workflow Editor.
2. In the activity menu, click the link to choose an existing workflow.
3. Select **Notify assessment user** from the Workflow Versions list.
   The workflow appears.
View a metric result

Metric results contain values that represent an evaluated record’s performance for a specific metric, based on a single evaluation from one user or from the execution of a script. Metric results contain actual values as well as calculated values. The system uses values from metric results to calculate category results.

Role required: assessment_admin or admin

If there is an active scripted metric when the assessment is generated, the system automatically produces a metric result for each associated assessable record. The system produces an additional metric result for each question a user answers on a completed assessment questionnaire. If multiple users complete questionnaires with the same questions on the same assessable records, the system produces metric results for each user's responses. For example, three users complete questionnaires that contain the same four questions about the Acme Corporation record. The system produces 12 metric results: one per user for each question.

1. Navigate to Assessments > Results > Metric Results.
2. Open the metric result record you want to view.
All fields on the form except **Updated** and **String value** are read-only.

### Metric Result form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment group</td>
<td><em>Assessment group</em> to which the metric result is associated.</td>
</tr>
<tr>
<td>Metric</td>
<td>Name of the metric to which these metric result values apply.</td>
</tr>
<tr>
<td>Data type</td>
<td>Data type of the metric.</td>
</tr>
<tr>
<td>Method</td>
<td><em>method</em> of the metric.</td>
</tr>
<tr>
<td>Updated</td>
<td>Date and time the metric result was last updated.</td>
</tr>
<tr>
<td>Source</td>
<td>Source record of the assessable record evaluated.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User who completed the assessment questionnaire. This field is blank when the method is Script.</td>
</tr>
<tr>
<td>Instance</td>
<td><em>Assessment instance</em> completed by the Assigned to user. This field is blank when the method is Script.</td>
</tr>
<tr>
<td>Actual value</td>
<td>Unscaled value from a user response or script, depending on the method:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Assessment</strong>: Value obtained from the user response to the assessment instance question. The actual value is determined by the metric data type:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Checkbox</strong>: The actual value is 0 if the check box is cleared and 1 if it is selected.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Choice</strong> or <strong>Likert Scale</strong>: The actual value is equal to the Value of the metric definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Date, Date/Time, or String</strong>: The actual value is -1 to indicate that these data types do not contribute to category result calculations.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Template</strong>: The actual value is equal to the Value of the <em>template definition</em> associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Yes/No</strong>: The actual value is 0 if the response is No and 1 if it is Yes.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Script</strong>: Value the script placed in the <em>actual_result</em> variable.</td>
</tr>
</tbody>
</table>

This field is hidden and left blank when the data type is **Duration**.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Duration value</td>
<td>Specific kind of actual value that is only applicable if the data type is Duration. The duration value is the value obtained by the script query from the actual_result parameter, such as the average duration of outages for a vendor.</td>
</tr>
</tbody>
</table>
| Scaled value        | Appropriate value from the scaled_result variable in the associated metric script. The code in a scripted metric defines a scaling scheme for the actual values it obtains. For example, a scripted metric queries the CMDB to return the number of configuration items (CIs) for a vendor. The code includes this scaling scheme, where actual_result is the number of CIs, and scaled_result is a representation of the quantity of CIs:  
```java
if (actual_result < 1)
    scaled_result = 0;
else if (actual_result < 1000)
    scaled_result = 1;
else if (actual_result < 10000)
    scaled_result = 2;
else if (actual_result < 25000)
    scaled_result = 3;
else if (actual_result < 100000)
    scaled_result = 4;
else
    scaled_result = 5;
```
If the script detects 315 CIs for the vendor, the Actual value is 315 and the Scaled value is 1 for this metric result.  
**Note:** Although this field is visible only when the method is Script, the system populates the field with the Actual value when the method is Assessment, as the scaled value is used in the Normalized value calculation. |
| Normalized value    | Adjusted value that accounts for weights, scale definition, minimum and maximum values, and other factors that impact the metric (like the survey responses or the input value—the actual value given by the user). See the example for Normalized value in View an assessment category result. |
Field | Description
--- | ---
String value | Value that displays the response as it appears on a questionnaire. In some cases this is the same as the Actual value, such as when the metric data type is Percentage. The string value is N/A for unanswered questions of certain data types. For the Attachment data type, the names of the attached files are displayed as comma-separated values.

**Assessment results**

In the Assessments application, when the system processes completed questionnaires or gathers values returned from scripted metric queries, it generates assessment result records called metric and category results.

Assessment administrators can view assessment results.

The system calculates **metric results** first, normalizes the scores, and then calculates **category results**. Each metric and category result record stores data from one assessment group, for a particular category and source record evaluated. Specifically:

- Metric results: store data calculated from one evaluation of one metric.
- Category results: store data calculated from a weighted average of all metrics in the category.

**Note:** Although results data is available to view in the form of metric and category result records, the most meaningful way to view results is in scorecards and decision matrixes. These tools display only the most pertinent data in graphical, comparative formats.

**Excluded Responses**

The system creates metric results for responses but does not include them in category result calculations if any of the following are true:

- The user selects the **Not Applicable** answer option on a questionnaire.
- The user does not answer the question and the **data type** is not Checkbox.
- The question data type is one of the following: Date, Date/Time, or String.
- The metric result **Actual value**, **Scaled value**, and **Normalized value** fields are set to -1.

**Metric Attachments**

After a survey or assessment is submitted, any attachments that have been added by a user are moved to the metric result record. The names of the attached files are added to the **String value** field on the Metric Result form.

**Note:** You cannot add or remove attachments from a metric result.

**Assessments overview module**

The assessment overview module is a type of homepage that displays various assessment reports, such as results by category and assessments by state.
Prerequisites

You can view the overview page and refresh, add, delete, and rearrange report widgets.
Role required: assessment_admin
To use the Assessments Overview module, navigate to Assessments > Overview and click elements within the reports to obtain more information.

The available reports are:

<table>
<thead>
<tr>
<th>Assessments overview module reports descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Report</strong></td>
</tr>
<tr>
<td>Assessable Records by Type</td>
</tr>
<tr>
<td>Assessment Instances by Assessment Group</td>
</tr>
<tr>
<td>Assessments by State</td>
</tr>
<tr>
<td>Answered Questions by Assigned User</td>
</tr>
<tr>
<td>Average Rating by Type</td>
</tr>
<tr>
<td>Category Result Ratings by Category</td>
</tr>
<tr>
<td>Metrics by Data Type</td>
</tr>
<tr>
<td>Stakeholders per Category</td>
</tr>
<tr>
<td>Top Rated Items</td>
</tr>
<tr>
<td>Total Metrics by Metric Type</td>
</tr>
<tr>
<td>Unanswered Questions by Assigned User</td>
</tr>
</tbody>
</table>

**Assessment results calculation**

For every assessment group, there are assessment results.

Data calculated from an evaluation of one metric is classified as a metric result. Data calculated from the weighted average of all metric results in a category is classified as a category result. The system calculates some assessment results when the assessment is generated, and others when users complete questionnaires.

**View a bubble chart for assessments**

Assessment administrators can view bubble charts to compare the relative standing of assessable records in three metric categories.

Role required: assessment_admin or admin

1. Navigate to Assessments > Admin > Bubble Charts.
2. Click a Name to open the bubble chart record.
3. Under Related Links, click View Bubble Chart.

**Note:** Demand managers and vendor managers can view bubble charts through the Demand Management and Vendor Performance applications. See Project Portfolio Suite for more information.

**Bubble charts for assessments**

A bubble chart is a dynamically updated graph that plots assessment results for multiple assessable records.

Assessment administrators can create and use bubble charts to compare the relative standing of assessable records in three metric categories. The X- and Y-axes each represent a different category. Assessable records are plotted on the chart as circular markers, or bubbles, which vary in size according to scores for the third category.

**Create a bubble chart**
Assessment administrators can create bubble charts to compare the relative standing of assessable records in three metric categories.

To create a bubble chart, navigate to **Assessments > Admin > Bubble Charts** and create a record (see table for field descriptions).

**Note:** For color fields, either HTML [color names](#) or [hexadecimal](#) (hex) values are acceptable. For hex values, the # character is optional. Values are not case-sensitive. For example, all of the following values are valid: LightGray, lightgray, #D3D3D3, d3d3d3.
**Bubble Chart form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Descriptive name for the bubble chart. Bubble Chart is appended to the name when you view the bubble chart.</td>
</tr>
<tr>
<td><strong>Top left label</strong></td>
<td>Label text for the top left, top right, bottom left, and bottom right quadrants, respectively. Choose labels that help interpret results. For example, a bubble chart that displays vendor assessment results might have the following quadrant labels, where vendors in the top right quadrant have the best scores:</td>
</tr>
<tr>
<td><strong>Top right label</strong></td>
<td>Top left label: Resource</td>
</tr>
<tr>
<td><strong>Bottom left label</strong></td>
<td>Top right label: Essential Partner</td>
</tr>
<tr>
<td><strong>Bottom right label</strong></td>
<td>Bottom left label: Poor Performer</td>
</tr>
<tr>
<td><strong>Top left color</strong></td>
<td>Bottom right label: Reevaluate</td>
</tr>
<tr>
<td><strong>Top right color</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Bottom left color</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Bottom right color</strong></td>
<td>Border colors for the top left, top right, bottom left, and bottom right quadrants, respectively. Bubbles are the color of the quadrant they are in.</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Metric type associated with this bubble chart. Only results for assessable records of the selected metric type are plotted on the bubble chart.</td>
</tr>
<tr>
<td><strong>X-Axis label</strong></td>
<td>Label text for the X-, Y-, and Z-axis categories of the bubble chart. These labels appear along the X- and Y-axes, if applicable, and in bubble score summary windows. The metric category name is usually a good label. If these fields are left empty, the bubble chart automatically displays the selected category names as the labels.</td>
</tr>
<tr>
<td><strong>Y-Axis label</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Z-Axis label</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Metric X category</strong></td>
<td>Metric category each axis represents. Results for the Z-axis category determine the size of each bubble. The Z-axis should generally represent the most important category out of the three.</td>
</tr>
<tr>
<td><strong>Metric Y category</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Metric Z category</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Quadrant label color</strong></td>
<td>Color of the label text for the quadrant borders.</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>Check box that enables (selected) or disables (cleared) the bubble chart as the default. There can be only one default bubble chart per metric type.</td>
</tr>
</tbody>
</table>

**Bubble chart components**

The X- and Y-axes each represent a different metric category. Assessable records are plotted on the chart as circular markers, or bubbles, which vary in size according to scores for the third category.

The bubble chart page has these components:

- **Bubble Chart**
- **X- and Y-axes**: Each axis represents a metric category.
• **Bubbles**: Each labeled bubble represents an average of category result data for an assessable record. Point to a bubble to view an assessable record score summary. Click a bubble or bubble label to view the scorecard for the assessable record.

• **Source record list**: List of all records defined by the Table and Condition fields for the associated metric type. Note that the bubble chart only plots records for which there are assessment results. The assessment results are actually associated with the assessable records for each of the listed source records.
### Vendor Quality Bubble Chart

Assessable record score summaries

Point to a bubble to display a score summary for the assessable record the bubble represents.

The summary displays the assessable record's average score for each category in the following order: X-axis category, Y-axis category, Z-axis category. The scores are based on data from the last 12 months.

![Bubble chart score summary](image)

**View an assessment scorecard**

The Assessments application prepares printable scorecards. A scorecard displays easy-to-interpret assessment results, in which the current calculated ratings for an assessable record are compared to previous ratings or to the ratings of other records.

Role required: assessment_admin or admin

Users can examine ratings over time, compare ratings for one assessable record with all assessable records in a table, or compare the ratings of two assessable records. All ratings are averages for the time range selected. The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed assessments and scripted metrics.

Administrators can display a scorecard for any table by creating a Related Link on assessable records. The system provides this link on the Company form by default when Vendor Performance is active.

The Vendor Performance application provides an enhanced scorecard view for vendors.

See Vendor Performance in **Project Portfolio Suite**.

1. Navigate to Assessments > Assessable Records.
2. Open a record.

**Create a link to a scorecard**

Users with the admin role can create UI actions that allow users to view scorecards from tables.
Role required: assessment_admin or admin

1. Generate **assessable records** you want to evaluate.
   For example, you might create a metric type called **Project** to assess project management records.

2. Navigate to **System Definition > UI Actions**.

3. Open the View Scorecard record.

4. Right-click the header bar and select **Insert and Stay** from the context menu to create a duplicate record.

5. Change the **Table** name to the table on which you want the UI action to appear.
   For example, you might select Project (pm_project).

6. Do not edit the **Action name** field or the **Condition** script.

7. Save the record.

8. Navigate to the table on which you created the UI action and open an assessable record.
   a) In this example, navigate to **Project > Projects > All**.
   b) Open any record in the list.
   c) Click **View Scorecard** under **Related Links** to open the scorecard for that assessable record.
The scorecard appears with the title in the form of `<table display name> Scorecard`. For example, a scorecard for an assessable record in the Project `[pm_project]` table is named `Project Scorecard`.

**Note:** Content does not appear in the scorecard unless the associated assessable record has assessment results or related live feed conversations.

9. Insert a new View Scorecard UI action record for each table where you want the related link to appear.

**Export a scorecard as an image**
You can export scorecards as images.

Role required: assessment_admin or admin

1. Click the menu icon and select Save as PNG or Save as JPEG as the download format.
2. When the export is complete, select Download to save the scorecard image to a storage location.

---

**Assessment scorecard averages**
The Averages view compares the current ratings for an assessable record in each metric category with the average, minimum, and maximum values from all assessable records in the filter. All ratings are from assessments generated over the trailing twelve months (TTM).
Select a filter option to compare the current record against all assessable records in that filter. An assessment administrator configures these options in the **Filter field** field in the Assessment Metric Type form.

Rating variances are highlighted as follows:

- **Red**: Ratings are below average in this category. The **Diff** value displays a negative number.
- **Green**: Ratings are above average in this category. The **Diff** value displays a positive number.
- **White**: Ratings are average in this category. The **Diff** value is 0.0.

In the following example, the ratings of the current group are compared against other groups for which Don Goodliffe is the manager.

![Group scorecard with ratings filter](image)

**Assessment scorecard categories**

The Categories view displays a bar chart showing the average ratings for each category in the selected time interval.

Select from these reporting periods:

- All History
- Last 3 Months
- Last 12 Months
Scorecard categories

*Assessment scorecard category metrics*

The Category Metrics view displays the weighted average results for each metric within a category. Use this view to learn how individual metrics affect the overall rating for the category.

Select a metric category from the choice list to display the chart.
Scorecard category metrics

Assessment scorecard head-to-head compare view
The Head to Head Compare view allows you to compare the ratings of two assessable records of the same type. Select an assessable record from the choice list to compare against the current record's trailing twelve month (TTM) ratings.

Head to head compare
The Diff column displays the difference between each assessable record's most recent TTM ratings. By default, the system selects the first assessable record in the list when you open this view. The scorecard displays three years of ratings for the comparison record. All ratings are expressed as averages.
Scorecard head to head compare

**Overall Rating**
The Overall Rating is calculated as:

\[
\frac{\text{sum of normalized values in category result}}{\text{number of assessment groups}}
\]

In the following example, the calculation is

\[
\frac{2.13 + 2.86 + 3.79 + 1.43 + 2.39 + 3.7}{2} = 8.15
\]
<table>

**Overall Rating on the Group Scorecard**

**Assessment scorecard history**

The History view compares the current ratings for each category with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the **Diff** column indicate the trend of the current assessment against the previous assessment.

- **3 Years**: To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The **Diff** column shows the discrepancy between the current ratings and the previous calendar year's ratings.
Scorecard history - 3 years

- **4 Quarters**: Quarterly assessments compare the average rating for each category in the current quarter against the average ratings from the previous four quarters. The Diff column shows the discrepancy between the current ratings and the previous quarter's ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the 3rd quarter of 2013, then the previous quarters appear as 2nd (2013), 1st (2013), 4th (2012), and 3rd (2012). All four of the previous quarters appear, whether or not there was any data for those quarters.

Scorecard history - 4 quarters

Live feed view of assessable records

The live feed view displays live feed conversations that apply to the assessable record. Users can view the group feed, including tagged comments, and add comments of their own.
To configure a live feed view, an assessment administrator selects the Live feed check box on the Assessable Record form. Live feed is available on the scorecard even if there are no category results for the other views.

The live feed view provides these viewing options:

- **My Feed**: Displays the user's My Feed preferences.
- **Company**: Displays the user's company feed.
- **Groups**: Displays all available groups and gives the logged in user the option to leave or join a group. Select a group to display that group’s conversations.
- **Tags**: Displays all the tags found in live feed comments. Click a tag to display the conversations containing that tag.

Assessment scorecard ratings
The scorecard ratings section displays various ratings for the assessable record.

Select one of several views that present different ratings:

- Averages
- Categories
- Category Metrics
- Head to Head Compare
- History
- Live Feed

Some views display an overall rating column, which lists categories used to evaluate the assessable record. Only categories in which the assessable record has been evaluated appear on the scorecard. If the ratings section does not display any data, the assessable record or category results associated to the assessable record have been deleted.

Click a category to view the category record. Point to a category to display a line chart that shows the rating trend for that category.

![Vendor scorecard trend chart](image)

Set up and administer quizzes
Set up and administer quizzes.

Role required: assessment_admin or admin

1. Optional: Create reusable question templates for quizzes.
2. Create the quiz using the Quiz Designer or with forms accessed from the navigation menu.
   
   The quiz record includes specifics such as duration, notification preferences, a questionnaire introduction, and ending notes displayed to recipients.
3. Edit the default category or create additional categories as needed.
   
   The system creates a category with the same name as the quiz.
4. Define users for each category.
   
   These are the recipients who answer the questions in a category. You can define different users for each category.
5. Create the questions for each category.
6. Create the answers for each question and determine if the questions are scored. You can create unique answers or select preconfigured answers from a template.

Publish and distribute the quiz. You can send the quiz to a single user or all users in each category. Review the results from the submitted quizzes in reports and scorecards.

Quizzes
Quizzes are questionnaires you can assign to one or more users to assess their knowledge of any subject. The quiz functionality is built on the assessment engine and provides many of the same features as assessments and surveys.

Each question is scored, and the overall score indicates the percentage of questions the user answered correctly. A quiz may have categories of questions that are assigned only to some users. You can assign weighting values to individual questions or categories of questions that make them more or less important when calculating the overall score. Quizzes require activation by a system administrator.

- An administrator can create a quiz for any purpose and assign it to a single user or multiple users.
- A quiz can contain one or more categories of questions. Each category can be assigned to users who answer only the questions in that category.
- The system can send email notifications to these users:
  - Recipients: The recipient can receive notification of an assigned quiz, a quiz whose allowed duration is at 50%, and a quiz that is overdue.
  - Recipient's manager: The recipient's manager can receive notification when a quiz is overdue.
  - Quiz manager: The quiz manager can receive notification of an overdue quiz to which he or she is assigned.

- Quizzes can contain questions that are scored or not scored. Unscored questions assess opinions or involve dates and are not counted in the final score. Scored questions specify correct answers and are scored either as 0% or 100%. You can apply a weighting scale to scored questions to establish their relative importance. You can designate questions with these data types as scored questions:
  - Checkbox
  - Choice
  - Duration
  - Likert Scale
  - Numeric Scale
  - Template
  - Yes/No

- A quiz question can be dependent on the response to any scored question. For example, you can create a dependent question requesting additional information that appears only if a recipient answers No to a specific question.

Important terms

The quiz application involves several terms.
Terms used in quiz application

<table>
<thead>
<tr>
<th><strong>Quizzes</strong></th>
<th>A quiz contains information such as duration, state, and notification controls and lists the existing categories. Text fields on the quiz form allow an administrator to create introductory content and end notes that are displayed to the recipient.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Categories</strong></td>
<td>A quiz category represents a theme for quiz questions. Each category contains one or more questions and names the recipients for the questions in that category. By default, the system creates one category with the same name as the quiz. You can create additional categories as needed. Categories can be weighted higher or lower to determine the importance of that category in the overall score.</td>
</tr>
<tr>
<td><strong>Questions</strong></td>
<td>A quiz question is a question configured for a category and sent only to the users for that category. Questions have a wide variety of data types and can be individually weighted higher or lower. Questions may be scored or unscored.</td>
</tr>
<tr>
<td><strong>Category user</strong></td>
<td>A category user is the recipient of questions for a specific category. You can select different users to answer the questions for each category.</td>
</tr>
<tr>
<td><strong>Templates</strong></td>
<td>A template is a question data type that provides reusable rating scales for answers to questions. For example, the answer template named Satisfaction contains a satisfaction scale ranging from Very Satisfied to Very Dissatisfied.</td>
</tr>
</tbody>
</table>

Quiz roles

The Quizzes application uses these roles. No role is required to take quizzes that are assigned to you.

**Quiz roles**

<table>
<thead>
<tr>
<th><strong>Role Title (Name)</strong></th>
<th><strong>Role Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>assessment administrator (assessment_admin)</td>
<td>Can administer the Assessments application and all quiz records. Can access all the modules of the Assessments application.</td>
</tr>
<tr>
<td>Administrator (admin)</td>
<td>Can access all aspects of the assessment and survey processes. Only administrators can modify survey notifications, create survey modules, and import surveys.</td>
</tr>
</tbody>
</table>

*Note: The itil_admin role and the survey_admin role contain the assessment_admin role*
Data types for quizzes
You need to choose a data type for each quiz question. Various data types helps you collect and analyze different kinds of data.

Available data types

<table>
<thead>
<tr>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attachment</td>
<td>Question with a Manage Attachments icon that allows users to attach one or more files.</td>
</tr>
<tr>
<td>Boolean</td>
<td>Question with a check box or a Yes/No list for user responses.</td>
</tr>
<tr>
<td>Choice</td>
<td>List of predefined options. For more information, see the definition for Choices Create quiz questions.</td>
</tr>
<tr>
<td>Date</td>
<td>Date field.</td>
</tr>
<tr>
<td>Date/Time</td>
<td>Time and date field.</td>
</tr>
<tr>
<td>Number</td>
<td>Number field with predefined minimum and maximum values. The default is 1-10.</td>
</tr>
<tr>
<td>Percentage</td>
<td>Percentage field with a prescribed range.</td>
</tr>
<tr>
<td>Scale</td>
<td>Predefined Likert scale. Answer options appear as radio buttons.</td>
</tr>
<tr>
<td>Numeric scale</td>
<td>Selectable number scale. The default is 1-5. Answer options appear as radio buttons.</td>
</tr>
<tr>
<td>String</td>
<td>Single or multi-line text field.</td>
</tr>
<tr>
<td>Template</td>
<td>Choice list of templates that provide a predefined scale of options. For details, see Configure a template question.</td>
</tr>
<tr>
<td>Reference</td>
<td>Choice list of fields from a specified reference table. This data type does not support reference qualifiers.</td>
</tr>
</tbody>
</table>

Activate the quiz designer
Administrators can activate the Quiz Designer plugin.
Role required: assessment_admin or admin

1. Navigate to System Definition > Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   If the plugin depends on other plugins, these plugins are listed along with their activation status.
   If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. Optional: If available, select the Load demo data check box.
   Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
You can also load demo data after the plugin is activated by clicking the **Load Demo Data Only** related link on the System Plugin form.

5. Click **Activate**.

**Quiz Overview module**
The Quiz Overview module is a homepage that displays various reports on data such as results for each category and quizzes that are complete, pending, or in progress.

Role required: assessment_admin or admin

Users with the **assessment_admin** role can view the overview page and refresh, add, delete, and rearrange widgets.

1. Navigate to **Quizzes > Overview**.
2. Click elements within reports to obtain more information. The available reports are:

<table>
<thead>
<tr>
<th>Report</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Quizzes by State</strong></td>
<td>Assessment Instance (asmt_assessment_instance)</td>
</tr>
<tr>

<tr>
<td><strong>Incorrect Answers by Assigned User</strong></td>
<td>Metric Results (asmt_metric_result)</td>
</tr>
<tr>
<td><strong>Number of Incorrect Answers</strong></td>
<td>Metric Results (asmt_metric_result)</td>
</tr>
</tbody>
</table>

**Quiz designer**
The quiz designer provides a single interface that users with the assessment_admin role can use to create, edit, and distribute quizzes.

You can also use it to edit existing quizzes and change scoring parameters.

Alternatively, you can use the modules of the **assessment engine** to create and edit the records that make up a quiz. All quiz records are stored in assessment tables and displayed in Quiz views of those tables. For details, see **Create quizzes with forms**.

**Tools on the Quiz designer**
The quiz designer includes a design canvas, a header bar, and many controls that you can use to create quizzes.

To open the quiz designer, navigate to **Quizzes > Quiz Designer**.

The designer contains the following elements:
- Controls
- Header bar
- Design canvas

**Controls**
Controls for the supported question data types are available in the Controls palette. Drag and drop a control onto the designer canvas to create a question of that type.
**Question controls**

<table>

<td></td>
</tr>
</tbody>
</table>

**Header Bar**

The header bar contains tabs that display different views and a menu of various functions.

Click one of the following tabs to change the view in the canvas:

- **Design**: Add categories and questions, and configure the properties of each. This is the default view of the canvas when you open the designer.
- **Configuration**: Create introductions and end notes for quizzes, and select a **signature**.
- **Availability**: Select the recipients for each category in the quiz.

Point to the menu icon (≡) in the upper right of the quiz designer to select the following options:

- **Save**: Saves the current quiz.
- **Preview**: Displays a preview of the quiz as it appears to the recipients.
- **Publish**: Distributes the quiz to the selected recipients.
- **Save and Publish**: Saves and distributes the quiz in one step.
- **New Quiz**: Opens a fresh canvas for a new quiz.
- **Load Quiz**: Opens a list of existing quizzes that you can select and edit.

The availability of each option depends on the status of the quiz that is opened in the quiz designer.

**Design Canvas**

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
New quizzes open in the **Design** view. The quiz **Name** field appears above first category in the canvas. A blank question field appears in the category container.

**Create a quiz**

When you create a quiz, you can create one or more categories and then add questions to each category.

Role required: assessment_admin or admin

Each category can be assigned to a different user or the same users. You can also customize each question and make it dependent on the response to another question.

Create a quiz using these procedures:

**Create quiz categories**

A category represents a theme for evaluating a specific element of the quiz topic and contains questions pertaining to that theme.

Role required: assessment_admin or admin

When you create a quiz, the system creates a default category, using the name of the quiz. You can use this category, modify it, or create additional categories as needed. To have any results, a category must contain scored questions.

1. Navigate either **Quizzes > Quiz Designer** or **Quizzes > Quizzes** and click **Quiz Designer** in the list header.
2. Enter the name of the quiz in the **Name** field. The system uses this name as the name of the quiz and the first category.
3. To configure the category, click the gear icon in its title bar.

   The **Properties** dialog box appears. You can change the name of the category, add a description for it, and enter text in the **Details** field that introduces or explains the category to the recipients. The system updates the category as you type.
4. Click the **X** icon to close the category properties dialog box and save your settings.
5. To add a new category, click the + icon in the title bar of an existing category.

Create quiz questions

You can create multiple questions for each category but each question can be associated with only one category.

Role required: assessment_admin or admin

The data type that you select for each question determines how it can be answered by quiz recipients.

You can designate questions to be scored. Only scored questions are shown in the quiz results and considered when calculating the category results. You must also specify a correct answer for scored questions.

Note:

To designate a question as scored, you must use Assessment forms. For instructions, see Configure a scored question.

1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.
2. To configure the question, click in the gear icon in its title bar. The Properties dialog box appears for the question.
3. Fill in the fields on the form, as appropriate.

**Question property fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>(Required) Name of the question. Create a concise and easily recognizable name for your question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as the question on quizzes. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Type</td>
<td>(Read-only) Data type selected for this question. See the table in controls for possible data types.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this question is available on a quiz. If a question is marked inactive, it does not appear on quizzes generated after the question becomes inactive.</td>
</tr>
<tr>
<td>Boolean option</td>
<td>Whether a check box or a Yes/No list appears as the option for the Boolean question.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box for requiring users to answer the question. Users cannot submit quizzes until they answer all mandatory questions, which are denoted by a red field status indicator. This field is available when the question does not have a dependency and the question controls is not Boolean with a check box option.</td>
</tr>
</tbody>
</table>
| String option       | Setting for the appearance of a string field in a question. This field is available when the question type is String. The string options are:  - **Single line**: Single line text field 40 characters in length that allows strings of any length.  - **String line wide**: Full page width text field that allows a single line entry of any length.  - **Multiline**: Full page width multi-line text field that allows word wrap and returns.  
<p>| Min                 | Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.                                                                                                                                                                                                                                           |
| Max                 | Highest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.                                                                                                                                                                                                                                                                                      |
| Allow not applicable| Check box for including Not Applicable as an option for this question. Users can select Not Applicable if they do not have sufficient information to respond to a question. User responses of Not Applicable are excluded from results calculations. This field is available when the question does not have a dependency and the question data type is not Boolean with a check box option.                                                                                                               |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Randomize answers</td>
<td>Check box for displaying answer options in a random order whenever the question appears in a quiz. Answer preference is sometimes influenced by the order in which options appear, which can result in biased results. Randomizing options can help prevent this bias. <strong>Note:</strong> Randomizing options for certain questions may make those questions confusing for users. In general, only randomize options that do not follow a logical order.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question that is displayed on the quiz. Include details that help users understand how to answer the question. You can also enter HTML text in this field with the WYSIWYG editor. For example, include HTML to embed links and images.</td>
</tr>
<tr>
<td>Correct answer</td>
<td>Answer option that you want to be selected by users. When you specify a correct answer for a question, the system scores the question. This field is available for all data types except <strong>Date</strong>, <strong>Date/Time</strong>, and <strong>String</strong>.</td>
</tr>
<tr>
<td>Choices</td>
<td>Options for a question with a data type of <strong>Choice</strong> or <strong>Scale</strong>. The system automatically adds text and values that you can edit for each option. Click the + icon to add an option, or click the X icon to delete an option. By default, the system arranges options in the order established by their values. To change the order, drag and drop the options.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displayed when</td>
<td>Condition builder that hides or displays the question depending on the answer to another question in the same category. Select an existing question from the list with a data type of Boolean, Choice, Scale, or Template. Create the condition that must exist for recipients to see the dependent question, using the is or is one of operator. The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.</td>
</tr>
</tbody>
</table>

4. To create any special conditions that must be met for a question to appear on the quiz, click the Dependency tab. Fill in the fields, as appropriate.

Dependent questions appear on the quiz when a recipient selects a specific answer or combination of answers to another question in the same category.

5. Select a question in the Displayed when field. The system selects the appropriate operator and displays the possible answers for the selected question.

6. Select the answers that satisfy the condition. Selected answers are indicated by a check mark.

7. Click X to close the question properties dialog box and save your settings.

8. To add a question with the same data type as an existing question in the category, click the + in the title bar of the existing question.
9. Drag questions to change their order within a category or move them between categories.
10. To delete a question, click the X in its title bar.

Configure a quiz
You can configure an entire quiz.
Role required: assessment_admin or admin
The values you enter and select on this page are applied to the entire quiz.
In the quiz designer, click **Configuration** and then fill in the fields as described in the table.

**Quiz designer configuration**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check box for enabling the distribution of this quiz to recipients.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of this configuration or the quiz to which it is attached.</td>
</tr>
<tr>
<td>Introduction</td>
<td>Introductory content to display on quizzes. You can add a welcome message or background information about the quiz.</td>
</tr>
<tr>
<td>Signature</td>
<td>(Optional) Acknowledgement by a quiz recipient of requirements, admonitions, or expectations related to a quiz.</td>
</tr>
<tr>
<td>Return URL</td>
<td>Destination address of a web page that is presented to users after they submit a completed quiz. When a return URL is configured, the End note content does not appear.</td>
</tr>
<tr>
<td>End note</td>
<td>Content that is displayed to recipients after they submit a completed quiz. You can add a thank you message, follow-up instructions, or other applicable information. End notes are not displayed if a Return URL is specified.</td>
</tr>
<tr>
<td>Duration</td>
<td>Amount of time that recipients are given to complete this quiz, starting from the time that the quiz is generated. The default duration is 14 days.</td>
</tr>
<tr>
<td>Manager</td>
<td>Assessment manager for this quiz. These users are only responsible for managing the quiz process and not the results. The system notifies the manager when submissions for this quiz are past due.</td>
</tr>
<tr>
<td>Notify manager if overdue</td>
<td>Check box for sending email notifications to a recipient's manager when that user fails to submit an assigned quiz before the due date.</td>
</tr>
</tbody>
</table>

Select a quiz recipient
When the system distributes a quiz, it sends email notifications to the category users and their managers.
Role required: assessment_admin or admin
A category can have one or more assigned users, and the same user can be assigned to more than one category.

The system also creates a link to the quiz in the recipients’ My Assessments & Surveys portal. Users can only answer questions in the categories that they are assigned to.

To select the recipients for each quiz category, click Availability and then fill in the fields as described in the table.

<table>
<thead>
<tr>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select category</td>
<td>Category for which the selected users are recipients.</td>
</tr>
<tr>
<td>Add users</td>
<td>Users selected as recipients for this category. The choice list shows all users in the system.</td>
</tr>
</tbody>
</table>

Publish a quiz

When you publish a quiz, the system sends email notifications to the recipients and to their managers. A card in each recipient’s My Assessments & Surveys portal displays a link to the quiz.

Role required: assessment_admin or admin

1. If you want to see the quiz as the recipients will see it, point to the menu icon in the upper right of the quiz designer and click Preview.

2. When you are satisfied with the quiz, click Save and Publish or Publish to distribute it.

Create quizzes with forms

As an alternative to the Quiz Designer, you can create a complete quiz using records in the Assessment application.

All the elements of a quiz, the categories, questions, and answers, are stored in tables used by the assessment engine and are displayed in quiz views of these tables. Users creating quizzes in the Assessment application must have the assessment_admin role.

Create a quiz using assessment forms by following the procedures in the order shown here:

- Create the quiz.
- Set up the categories.
- Create the questions for the quiz.
- Create the answers for the questions.
- Distribute the quizzes to recipients.

**Note:** The recommended method of creating and editing quizzes is to use the quiz designer, which provides a single, intuitive interface for creating and editing quizzes quickly. If you determine that you need to add specific features to your quiz not offered through the quiz designer, you can do so by using some of the specific procedures described here.

Set up a category

A category represents a theme for evaluating a specific element of the quiz topic and contains questions pertaining to that theme.

When you create a quiz, the system creates a default category with the name of the quiz. You can use this category, modify it, or create additional categories as needed. Categories are records in the Quiz view of the Metric Category table.
Categories have **weighting values** that contribute to the overall score for the quiz. By default, all categories are given a weighting value of 10. You can assign any weight to your categories. To have any results, a category must contain scored questions.

You can create a new category or edit an existing one from the **Metric Categories** related list of a quiz record.

![Metric Categories](image)

Select a user for a category

Category users are the recipients of the questions for each category.

A category can have one or more assigned users, and the same user can be assigned to more than one category. When the system distributes a quiz, it sends an email notification, if configured, to the category users and creates a link to the appropriate questionnaire in their assessments and surveys portal. Users can only answer questions attached to their assigned categories.

To select users for a category, select the **Users** related list in a category record, and click **Edit**.
Create questions

A category can have multiple questions associated with it.

Each question can only be associated with one category. Each question has an answer data type that determines how recipients answer the question. Questions are records in the Quiz view of the Assessment Metric table.

To create questions, open a category record and create a question record from the Assessment Metrics related list. Alternatively, you can navigate to Quiz Management > Questions and create a new record (see table).

⚠️ Warning: When you create a Choice or Likert Scale question, you must reopen the Assessment Metric form after you submit it to create answers. If you distribute a questionnaire without creating the answers for questions with these data types, recipients are unable to answer the questions. If the questions are mandatory, the recipients are unable to submit their questionnaires.
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>(Required) Name of the question.</td>
</tr>
<tr>
<td>Category</td>
<td>(Required) Category the question belongs to. The system populates this category if you create a new question from the Metric Category form.</td>
</tr>
</tbody>
</table>

**Note:** You cannot change the category if the **Depends on** field is set or if another metric depends on this metric.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Method** | Setting that determines how to use the question.  
  - **Assessment**: Makes the question available on a quiz distributed to users. The **Assessment** method is compatible with all data types except **Duration**.  
  - **Script**: Queries the database without user participation. Scripted questions are of limited value for quizzes, because they do not assess a user’s knowledge of a topic. |
| **Note**: If you select a **Data type** that is incompatible with the selected **Method**, the system automatically changes the **Method** to the correct value. |
| **Weight** | Numeric value that represents the importance of this question relative to other questions in the same category. By default, the weight is 10. For weighting suggestions, see [weight categories and metrics](#). This field is available and required unless the **Data type** is **Date**, **Date/Time**, or **String**. These data types are not included in results calculations. |
| **Order** | (Required) Numeric value that determines the order of the question in the category. The question with the smallest order value appears as the first question in the category’s section. By default, the order is 100.  
  
  **Note**: It does not matter which order value you use for metrics with the **Script** method, because they do not appear on questionnaires. |
| **Active** | Check box that determines whether this question appears on quizzes. If a question is inactive, it does not appear on quizzes generated after the question becomes inactive. |
| **Mandatory** | Check box for requiring users to answer the question. Users cannot submit questionnaires until they provide valid responses to all mandatory questions, which are denoted by a red field status indicator.  
  This field is available only if the **Method** is **Assessment**, the **Depends on** field is empty, and the **Data type** is not **Checkbox**. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow not applicable</td>
<td>Check box for including Not Applicable as a possible answer for this question. Users can select Not Applicable if they do not have sufficient information to respond to a question. User responses of Not Applicable are excluded from results.</td>
</tr>
<tr>
<td>Question</td>
<td>The question that is displayed in quizzes. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question and what it evaluates. Include details that help users understand how to answer the question or when you need HTML enhanced details for your question. You can create HTML text in this field with the WYSIWYG editor, such as embedding links and images.</td>
</tr>
<tr>
<td>Depends on</td>
<td>An existing question that this question is dependent on. You can select Checkbox, Choice, Likert Scale, Template, and Yes/No questions from the same category as this question. Then use the Displayed when field to set the conditions for displaying this question. The system prevents the creation of recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.</td>
</tr>
<tr>
<td>Question Type</td>
<td></td>
</tr>
<tr>
<td>Data type</td>
<td>(Required) Format of the expected response data. See the table of data types for details.</td>
</tr>
</tbody>
</table>

**Note:** You cannot change the data type if another question depends on this question.

| Randomize answers     | Check box for displaying the possible answers for this question in a random order whenever the question appears. Answer preference is sometimes influenced by the order in which answer options appear, which can result in biased results. Randomizing answer options can help prevent this bias. This check box is available only if the Data type is Choice or Likert Scale. |

**Note:** Randomizing answer options for certain questions may make those questions confusing for users. In general, only randomize answer options that do not follow a logical order.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scale definition</td>
<td>Setting that determines whether lesser or greater numerical values equate to a good score in quiz result calculations. Select <strong>Low</strong> if lesser numerical values are better. Select <strong>High</strong> if greater numerical values are better. The default value is <strong>High</strong>. This field is available and required unless the <strong>Data type</strong> is <strong>Date</strong>, <strong>Date/Time</strong>, or <strong>String</strong>. The results for these data types are not included in results calculations. When the <strong>Scored</strong> check box is selected, the scale value is set to <strong>High</strong> and the field is hidden.</td>
</tr>
<tr>
<td>Min</td>
<td>Lowest numerical value that can be used as an answer option. This field is available and required only if <strong>Data type</strong> is <strong>Number</strong>, <strong>Duration</strong>, or <strong>Percentage</strong>.</td>
</tr>
<tr>
<td>Max</td>
<td>Highest numerical value that can be used as an answer option or scaled value. This field is available and required if <strong>Data type</strong> is <strong>Number</strong>, <strong>Duration</strong>, or <strong>Percentage</strong>.</td>
</tr>
<tr>
<td>String option</td>
<td>Setting for the appearance of a string field in a question. This field is available when the question type is <strong>String</strong>. The string options are: • <strong>Single line</strong>: Single line text field 40 characters in length that allows strings of any length. • <strong>String line wide</strong>: Full page width text field that allows a single line entry of any length. • <strong>Multiline</strong>: Full page width multiline text field that allows word wrap and returns.</td>
</tr>
<tr>
<td>Scored</td>
<td>Check box for using answers in scoring the category results and showing them in the quiz results. Scored questions are available for these data types: • Choice • Likert Scale • Template • Checkbox • Yes/No Selecting this check box hides the <strong>Scale definition</strong> field and sets the value in that field to <strong>High</strong>.</td>
</tr>
<tr>
<td>Correct answer</td>
<td>(Required) Desired answer to a scored question. This field is available when the <strong>Scored</strong> check box is selected.</td>
</tr>
</tbody>
</table>
Create answers for questions

Questions with Choice or Likert Scale data types must have defined answer options, called metric definitions.

When you create a question with one of these data types, the Assessment Metric Definitions related list appears. Each metric definition appears as one answer option for a question on a quiz. For example, the question **What type of men's trousers are not permitted by company policy?** might have these three answers configured as metric definitions: Slacks, Jeans, and Casual cotton.

To create an answer option, open the question record you want to edit and click **New** in the Assessment Metric Definitions related list. Be sure to give each option a **Value**. The system uses this number to establish the order in which the answers appear in the quiz.

Distribute a quiz

When you finish configuring the answers for the quiz questions, you are ready to distribute the quiz.

You can send the quiz to all the category users configured for the quiz or to a single category user.

1. Navigate to **Quiz Management > Quizzes**.
2. Open the quiz record, and click **Publish**. The quiz is placed in the Published state, and it is sent to all its category users. You can edit and resend published quizzes. See **Modifying Published Quizzes** to learn how various modifications affect the quiz contents.
3. To resend a quiz, click the appropriate button:
   - **Assign Quiz**: Send the quiz to one category user.
   - **Send Quizzes**: Send the quiz to all of its category users.
Note: These buttons are hidden if there are no category users defined for the quiz.
Modify a published quiz
Post changes to existing questions immediately. Make new questions available to users who have not started the quiz.

You can edit a quiz even after it has been distributed, with these results:

- Added questions are available only on quizzes that are distributed after this change.
- Changes to existing questions are immediately available to users before the quiz is submitted or during the retake period. This includes changes to the answers, such as additional choices or changes to the data type.
- Deleted questions are also deleted from the distributed quizzes in users' queues.

Edit a quiz
You can update a quiz after the quiz has been distributed.

Role required: assessment_admin or admin

- Questions that you add are available only on quizzes that are distributed after the update.
- Before a quiz is submitted or during the retake period:
  - Changes to existing questions are immediately available to users. This includes changes to the answers, such as additional choices or changes to the data type.
  - Deleted questions are deleted from distributed quizzes in users' queues.

Open the quiz: Group the Service Details form with one of the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quizzes &gt; Quiz Designer</td>
<td>Point to the menu icon in the quiz header bar and select Load Quiz.</td>
</tr>
<tr>
<td>Quizzes &gt; Quizzes</td>
<td>Right-click a quiz in the list and select Quiz Designer.</td>
</tr>
<tr>
<td>Quizzes &gt; Quizzes</td>
<td>Open a quiz from the list and click Quiz Designer in the header of the Assessment Metric Type form.</td>
</tr>
</tbody>
</table>

Configure a scored question
Only scored questions are considered when calculating category and quiz results.

Role required: assessment_admin or admin

A question must have a correct answer specified to be scored. Only results for scored questions are displayed in the quiz scorecard.

1. Navigate to Quizzes > Quizzes.
2. Open the quiz containing the questions you want to mark as scored.
3. In the Metric Categories related list on the Assessment Metric Type form, select the category for the questions you want to mark as scored.
4. In the Assessment Metrics related list on the Metric Category form, select a question from the list.
5. In the Question Type section of the Assessment Metric form, select the Scored check box. This check box is not available if the question's data type is not supported for scoring.
6. Select the Correct answer for the question.
7. Click Update.
8. Repeat the process for all the questions in the category that you want the system to score.
9. Return to the list of metric categories, select another category, and configure scoring for the appropriate questions in that category.

Configure a template question

You can configure template questions when designing quizzes.

Role required: assessment_admin or admin

1. Drag the **Template** data type icon into a category container.
2. Click the gear icon in the question title bar to open the template properties dialog box.
3. Select a predefined scale from the list.

   ![Template properties dialog box](image)

   Question entry fields appear for that template.

4. Enter one or more questions that are appropriate for the template.
5. Click the arrow to the right of a question to configure its properties. You must provide a name for each question.
6. Click the up or down arrow to move between questions, or click the back arrow to return to the template properties dialog box.

7. Configure the properties for the remaining questions.

8. Click the X icon to close the template properties dialog box and save your settings.

Enable a quiz retake
You can configure a quiz to allow recipients to resubmit their answers as many times as they like, until the quiz’s due date.

Role required: assessment_admin or admin

Results are not calculated until the quiz’s configured duration has elapsed. The card in the user’s queue remains visible until the quiz’s due date and displays a button to allow retakes.

1. Navigate to Assessments > Metric Definition > Types.
2. Remove the Evaluation method = Assessment filter condition so you can see all the records in the list.
3. Open the quiz.
4. In the Assessment Metric Type form, select the Allow retake check box and save the record.
View a quiz result
You can view quiz results for each question and category, or view the quiz scorecard for a
detailed breakdown.

Role required: assessment_admin or admin

Quiz results are stored in the Metric Result (asmt_metric_result) table and display recipients’
answers to each question in a category.

Navigate to Quizzes > Quiz Results.

Quiz reports
Quizzes provide several global reports so that assessment administrators can view important
statistics.

You can share these reports with specific users or groups and change the display options
For detailed field information and reporting options, click the link for the chart Type. To sort a
column in ascending or descending order, click the arrow in the column heading

<table>

### View a quiz scorecard

You can view scorecards for a quiz record.

Role required: assessment_admin or admin

For detailed information about scorecards, see [Quiz scorecards](#).

1. Navigate to **Quizzes > Quizzes**.
2. Open a quiz record.
3. Under **Related Links**, select **View Scorecard**.

The scorecard link is hidden if there are no quiz results to report.

4. The scorecard contains a header that displays the name of the quiz and a section that displays results or a comparison of ratings. You can select from these principal views:

   - Category Results
   - Question Results
   - Average Ratings
   - History

### Quiz scorecards

The Quizzes application prepares printable scorecards.

A scorecard analyzes category and question responses and compares current ratings with previous ratings. You can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages for the time range selected.

The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed quizzes.

### Category results

The Category Results view is a stacked bar chart of responses to all questions in a category.
Select the category to display from the choice list above the chart. Category results are only calculated for scored questions.

This view displays responses that use the following data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

**Note:** The Checkbox and Yes/No data types are combined into the Boolean data type in the Quiz designer.
To view details about a specific response to a question, point to the colored segment representing a specific response. The chart displays the count for those responses and the percentage it represents of the total responses to that question.

![Chart example](image)

**Quiz category result details**

**Question results**

The Question Results view shows the results for all questions in a quiz. Select a question by name from the choice list to display the results in a pie chart or a bar chart, based on the data type.

**Pie chart**

The pie chart shows question results for these data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

**Note:** The Checkbox and Yes/No data types are combined into the Boolean data type in the Quiz designer.
Quiz Scorecard

Question Results

Office Supplies

Office Supplies

Quiz scorecard question results - pie chart
Bar chart

A bar chart appears when question results use this data type:

- Percentage

By default, all results for percentage questions use a report range of 20% segments. To configure a report range, navigate to Reports > Administration > Report Ranges.

Average ratings

The Average Ratings view displays a bar chart of the weighted average rating for each question in a category.

Use this view to learn how individual questions affect the overall rating for the category. Select a category from the second choice list above the chart. Ratings are only calculated for scored questions.
Average Ratings view

To view the effect of each question's ratings on the entire category's ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question's weighted average.
Quiz scorecard rating detail

Scorecard history

The History view compares the current ratings for the categories and their questions with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the Diff column indicate the trend of the current ratings against the previous ratings. Ratings are only calculated for scored questions questions.

Point to a category to display a line chart that shows the rating trend for that category. Click a category to view the Metric Category form containing the questions.

Scorecard trend chart

- **3 Years**: To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The Diff column shows the discrepancy between the current ratings and the previous calendar year's ratings.
Scorecard history - 3 years

- **4 Quarters**: Quarterly quizzes compare the average rating for each question and category in the current quarter against the average ratings from the previous four quarters. The **Diff** column shows the discrepancy between the current ratings and the previous quarter's ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the 3rd quarter of 2013, then the previous quarters appear as 2nd (2013), 1st (2013), 4th (2012), and 3rd (2012). All four of the previous quarters appear, whether or not there was any data for those quarters.
Scorecard history - 4 quarters

View an assessment category result

Category results contain values that represent an evaluated record’s performance in a specific metric category. Each category result record stores data from one assessment group. Category result values are calculated based on category and metric weights and from metric result values for the same category.

Role required: assessment_admin or admin

Note: The system does not include metric results from certain responses in category result calculations. To compensate, the system adjusts the weight of the other normalized metric result values within the same category.

1. Navigate to Assessments > Results > Category Results.
2. Click the reference icon ( büt) next to an assessment group number to open the category result record.
3. View the Assessment Category Result form.
   All fields on the form are read-only.

Assessment Category Result form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>Name of the metric category that the category result values apply to.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Rating | Rating is used on scorecards and decision matrixes. Rating is updated dynamically as users complete assessments. Rating is calculated as:  

\[
\frac{\text{Sum of all normalized values that share a particular assessment group, category, and assessable record}}{\text{Number of assessment instances for the assessment group}}
\]

For example: In the Assessment Category Results table example, the assessment group ASG0000801 with category Politeness from group NY_DB (the assessable record) has a Rating value 8.86.  

On the associated Metric Results table, you can see that there are 4 instances of this group: AINST0000801, AINST0000802, AINST0000803, and AINST0000804.  
The system calculated the rating using  

\[
\frac{5.14 + 5.14 + 1.43 + 5.71 + 5.14 + 4.29 + 4.29 + 4.29}{4} = 8.86
\]
### Field

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment group</td>
<td>Assessment group to which the category result is associated. The category result <strong>Rating</strong> and <strong>Normalized value</strong> are calculated from metric results in this assessment group only.</td>
</tr>
</tbody>
</table>
| Normalized value     | Calculated value that measures the **Rating** relative to the weights of categories used to assess the record evaluated. The normalized value is calculated as follows:  

\[
\text{Normalized value} = \text{Rating} \times \left(\frac{\text{Associated category weight}}{\text{Sum of weights of all categories the source record has category results for in this assessment group}}\right)
\]

Example: A source record has four associated category results in assessment group ASG0000907, one for each of these categories:  
- Importance Rating (weight = 10)  
- Product Reliability (weight = 9)  
- Company Alignment (weight = 9)  
- Compliance Score (weight = 9)  

If this source record's category result for Product Reliability has a Rating of 7.81, the normalized value calculation is:  

\[
7.81 \times \left(\frac{9}{10 + 9 + 9 + 9}\right) = 1.9
\]

<table>
<thead>
<tr>
<th>Weight</th>
<th>Weight of the associated category. You may need to configure the form to see this field.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source</td>
<td>Record evaluated as the assessment subject. You may need to configure the form to see this field.</td>
</tr>
</tbody>
</table>

### Create a decision matrix

The name and labels on a decision matrix are closely linked to the categories you choose for the axes. For that reason, first select the metric type and define the X and Y axes before you fill in other fields on the Decision Matrix form.

Role required: assessment_admin or admin

1. Navigate to **Assessments > Admin > Decision Matrixes**.
2. Click **New** and then select the metric **Type** to plot results for.
3. Right-click the form header and select **Save**.  
The X Axis and Y Axis related lists appear.
4. Define which metric categories the axes represent. Each axis can represent a single category or multiple categories. You must specify at least one category per axis in order for the decision matrix to render properly.

The available categories are limited to those associated to the metric type selected. To avoid confusion, always update the text for the axis and quadrant labels after editing or adding metric categories to an axis.
Decision matrix axes

5. Fill in the remaining fields on the Decision Matrix form (see table) and save the record.
## Decision Matrix

### Quadrant Design
- **Quadrant label color**: #333333
- **X-Axis label**: Importance
- **Y-Axis label**: User Satisfaction
- **Plotted item color**: #666666
- **Highlight item color**: Purple
- **Top left label**: Low importance, high satisfaction
- **Top right label**: High importance, high satisfaction
- **Bottom left label**: Low importance, low satisfaction
- **Bottom right label**: High importance, low satisfaction
- **Top left color**: #ECECEC
- **Top right color**: #ECECEC
- **Bottom left color**: #ECECEC
- **Bottom right color**: #ECECEC

</table>

**Related Lists**

| X Axis              | Lists categories that define the X-axis of the decision matrix.               |
| Y Axis              | Lists categories that define the Y-axis of the decision matrix.               |

**Decision matrixes**

Assessment results obtained by questionnaires and scripted metrics can be mapped to decision matrixes.

Assessment administrators can view and create these dynamically updated graphs, which make it possible to compare assessable records by category. Decision matrixes display data from a trailing twelve month (TTM) period.
Note: Assessment administrators can access decision matrixes through the Assessment application and vendor managers can access them through the Vendor Performance application.

Decision matrix components

The decision matrix page has these components:

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Options</td>
<td>Select the subset of assessable records you want to view. The filter options available vary by metric type, based on the Filter field and Filter condition field settings for each type.</td>
</tr>
<tr>
<td>Filter</td>
<td>Select the scale for the decision matrix. The greater the scale, the larger the decision matrix appears.</td>
</tr>
<tr>
<td>Scale</td>
<td>Select the scale for the decision matrix. The greater the scale, the larger the decision matrix appears.</td>
</tr>
<tr>
<td>Decision matrix</td>
<td>Each axis represents one or more metric categories. If multiple categories are used for an axis, their respective weights determine the positioning of the plotted items.</td>
</tr>
<tr>
<td>Component</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Plotted items</td>
<td>The labeled points you see on a decision matrix, called plotted items, represent averages of category result data for assessable records. Point to a plotted item label to view a rating summary for that assessable record. Click a plotted item label to view the scorecard for the assessable record.</td>
</tr>
</tbody>
</table>
Plotted item rating summaries

If you point to a plotted item label on a decision matrix, a rating summary appears. The summary displays the assessable record’s average ratings for each axis. If an axis represents one metric category, the ratings are calculated averages from results for that category. If an axis represents multiple categories, the ratings are calculated averages from weighted results for all of the categories.

The summary shows:

- Current rating
- Difference between the current rating and the rating from the previous year
- Ratings from each previous year, going back three years

Take an assessment

Assessments that are assigned to you appear in your assessment and survey queue as a card that displays the assessment name, state, due date, and the associated incident number. Click Take Survey when you are ready.

Role required: none

© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Overdue surveys and assessments are marked with a red icon and red due date. You must answer every required question, indicated by a red bar, before you can submit the assessment as complete. If you start to take an assessment but cannot complete it, save your responses and return to it later. When you have answered all the questions and are satisfied with the responses, submit the assessment.

By default, you cannot modify your answers to an assessment after submission. However, if the administrator has configured an assessment to allow retakes, you can edit your answers and resubmit the questionnaire. Completed assessments configured for retake remain in the queue until their due date and display the Modify Assessment button on the card.

1. Navigate to Self-Service > My Assessments & Surveys.

   **Note:** Users with the assessment_admin role can display other users’ assessments and surveys in addition to their own. Use the Show all and Show assigned to me related links to show and hide assessments and surveys. Click a card assigned to another user to open the associated metric type or survey definition.

2. On the assessment card, note the due date.

   **Note:** Depending on the configuration, you may receive email notifications to remind you of the due date.

3. Click Take Assessment to open the questionnaire.

   Assessment questionnaires are arranged in sections: first by record, then by category. Each record appears as a section title. Questions for the record appear below, grouped by category. Each category appears as a subsection below the record name. Click the collapse icon (��) or expand icon (視) to hide or show the questions in a category, or all the categories and questions for a record. Colored bars indicate the status of each question.
4. Answer each question to the best of your ability. Point to a question for more information.

If you are unsure of how to respond to a question or if a question does not apply to a particular record, select **Not Applicable**, if available.

5. Read any assertions present at the end of the assessment and acknowledge with a signature, if required.

A signature can require you to select a check box or authenticate your full name, which the system displays in a read-only field. You cannot submit your answers to the assessment until you provide the required signature.
6. Save or submit the assessment.
   - **Save**: Saves your responses without submitting them. You can close the questionnaire and access it later from your queue.
   - **Submit**: Submits the completed assessment when you are finished.

7. If prompted, enter your user name and password to verify your full name signature.
   If all the questions are answered with valid values, a success message appears. If the system detects an unanswered mandatory question or invalid response, the assessment is not submitted, and a message appears at the top of the questionnaire explaining the error. Questions with problems are temporarily highlighted.

8. You can modify your responses to the assessment until its due date. To update your answers and resubmit an assessment that permits retakes, click **Modify Assessment**.

**Assessment questionnaires**

In the assessment process, users complete assessment questionnaires on topics of interest to provide subjective data for future business decisions.
No special role is required to complete an assessment. You are eligible to complete assessments that are assigned to you. For example, you might be expected to evaluate vendors your organization works with, based on traits related to customer service. The system stores your responses so decision makers can compare the performance of the items you evaluate. You and your manager may receive email notifications as reminders of important assessment information.

**Metric types and assessable records**

In the Assessments application, assessment administrators create and administer metric types and assessable records.

A metric type defines a set of records an organization wants to evaluate, such as vendors, projects, or employees. For each type, the system generates unique assessable records that link the type to records that need to be evaluated, such as the individual records for the vendors Amazon and Intel. There may be multiple assessable records for the same source record if the source record meets the criteria for more than one type. For example, you might want to evaluate a record on the Company table, such as Intel, as a vendor and as a manufacturer, with different categories and metrics.

For configuration suggestions, see [Assessment Administrator tasks](#).

**Assessable records**

An assessable record links a source record you want to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees.

You use assessments to evaluate the assessable record. The system generates assessable records from the source records that match the table and conditions set on the Assessment Metric Type form. You evaluate the assessable records with metric categories and metrics, which define traits and values to assess. For metric types with the **On demand** schedule type, you can generate on-demand assessments from the Assessable Record form. This method of assessment generation makes it easy to create and preview short questionnaires or to quickly obtain assessment results for specific assessable records.

You can set up an assessment description that includes information from multiple fields on an assessable record and is displayed on multiple lines. This provides the user who is taking the assessment with a more detailed and understandable description of the information being requested on the assessment questionnaire. Create a multi-line description using table titles, which can be defined to use one or more fields from the selected table. See [Define a new smartphone table title](#) for more information.

**Delete an assessable record**

When you delete an assessable record, the system deletes any stakeholders for the record.

Role required: assessment_admin or admin

---

**Note:** If a source record is deleted, the system deletes the associated assessable record. To delete the source record, you must first delete all associated metric results and category results.

Delete the assessable record:

- To delete a single record, open the record and click **Delete**.
- To delete multiple records, use the Assessable Records list.
View an assessable record

View the Assessable Record form to edit preferences and perform various actions.

Role required: assessment_admin or admin

1. Navigate to Assessments > Assessable Records.
2. Open a record from the list.
   By default, the list displays only assessable records with Active metric types.
3. On the Assessable Record form, edit fields and perform other actions as necessary (see table).

Viewing Assessable Records

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>(Read-Only) Assessable record name based on the display value of the source record. The name appears on assessment questionnaires.</td>
</tr>
<tr>
<td>Source</td>
<td>(Read-Only) Source record the assessable record is linked to. The Source reflects the table name and source record display value. For example, if the Name field is the display value for the Company table, the assessable record for a company record named Amazon has the Source value Company: Amazon.</td>
</tr>
<tr>
<td>Live feed</td>
<td>Check box that, when selected, creates a live feed group for the assessable record, which appears on the scorecard. If you clear the check box after a live feed group has been created, the system deletes the live feed group and all its messages.</td>
</tr>
<tr>
<td>Type</td>
<td>(Read-Only) Metric type from which the assessable record was generated.</td>
</tr>
<tr>
<td>Decision matrix</td>
<td>Check box that, when selected, enables this assessable record’s results data to appear on decision matrices of the same metric type. Decision matrices are graphs that plot the assessment results for multiple assessable records. If you clear the check box, the assessable record still appears on the default decision matrices if you click the View Matrix related link on the assessable record’s scorecard.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
Live feed group | (Read-Only) Live feed group for this assessable record. When you select the Live feed check box and save the record, the system populates this field.

### Related Links
**View Scorecard**
Opens the scorecard for the assessable record.

### Related Lists
**Category**
All metric categories associated with the assessable record. An assessable record must be associated to a category to be evaluated. Click **Edit** to add or remove category associations. Note that it is often more efficient to **associate assessable records** to categories using the Metric Category form.

**Category users**
All stakeholders who can take assessment questionnaires about this assessable record. Click **Edit** to create and delete stakeholders. For more information about this and other methods of creating stakeholders, see **Stakeholders**.

This related list is available only when the associated metric type has the **Scheduled** schedule type.

### Approvals
Approvals can be defined for all tasks and allow users or groups to be associated with a task, for the purpose of either approving or rejecting that task. Approvals are defined by navigating to **System Policy > Approvals**.

The following information defines an approval:

#### Approval definition information

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approver</td>
<td>A reference to the user who is responsible for approving the related record. Choices are:</td>
</tr>
<tr>
<td></td>
<td>- Not Yet Requested (This state indicates that you are not yet asking your approvers to approve this request. Until you set the status to <strong>Requested</strong> they will receive no email notifications about the request.)</td>
</tr>
<tr>
<td></td>
<td>- Requested</td>
</tr>
<tr>
<td></td>
<td>- Approved</td>
</tr>
<tr>
<td></td>
<td>- Rejected</td>
</tr>
</tbody>
</table>
Field | Input value
--- | ---
Approving | A document_id reference field to the record being approved, on any table.
Comments | A journal field for storing comments regarding the approval.
Approval Summarizer | A *formatter* that displays key fields relevant to the approval from the referenced document. This summarizer will not display if there is no record referenced.

### Approval engines

The differences in the way that companies handle their approvals, as well as the differences between approvals for the various applications (such as Service Catalog Requests and Change Management), calls for supporting flexibility in setting up approvals within applications. This flexibility is provided through the selection of an "approval engine" that is used to manage the approvals for each of the Task tables (that is, all tables that extend the Task table).

There are three different approval engine options available for each Task table.

#### Approval engine options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval Rules</td>
<td>A simple set of rules that are evaluated until one matches for the Task table. The matching approval rule is used to create the users that are to approve the task. Set up approval rules by navigating to <a href="#">System Policy &gt; Approvals</a>.</td>
</tr>
<tr>
<td>Process Guides</td>
<td>A sequence of approval steps over which you may control how approvals and rejections are handled. This option is deprecated and should not be used.</td>
</tr>
<tr>
<td>Turn off Engines</td>
<td>Turn off both approval engines for this Task table. This option should be selected and is made read-only when a workflow is used to manage the approval process for the table. <strong>Caution:</strong> Not turning off the approval engines might have a performance or behavioral impact on your instance.</td>
</tr>
</tbody>
</table>

### Set up an approval engine

To manage the approvals for each of the Task tables in the system, set up an approval engine.

1. **Navigate to System Properties > Approval Engines.**

   The following page appears with the Approval Engine option for each Task table in the system. If the Approval Engine option is greyed out and shows Turn engines off, read the Notes in the same row. The most common reason an approval engine is turned off is that a workflow is managing the approvals on the table. Having the approval engine turned off prevents conflicts with the workflow that could cause a range of issues. If you want to use an approval engine on the table, set the workflow to inactive.
2. Select the **approval engine option** for each Task table from the choice list.
3. Click **Save**.

These preferences are saved as system properties that are named `glide.approval_engine.<table_name>`.
Approval rules

Many organizations rely on an approval process to ensure that requests are reasonable and fit an organization’s budget.

The service catalog can use these classes of approvals:

<table>
<thead>
<tr>
<th>Approvals</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
</tr>
<tr>
<td>-----------</td>
</tr>
<tr>
<td>Gating approvals</td>
</tr>
<tr>
<td>Process approvals</td>
</tr>
</tbody>
</table>

Note: To enable approval processes to operate smoothly, make sure that the appropriate users have the correct role, and that the role grants access to the necessary tables for users in all the relevant departments and domains.

Set automatic approval rules

Approval rules can automatically set the approval state to something other than Not yet requested. As a result, an approval rule can create a set of approvers. You can also start the approval process by setting the approval state to Requested.

Prerequisites

Role required: admin

Approval rules have two new fields:

- **Run rule before**: If true, the approval rule runs before the record is inserted/updated.
- **Set State**: If this rule applies, then the task record’s approval state is automatically set to this value.

Note: The Set State field only behaves as expected if the Run rule before check box is enabled.

- In the example below, this rule automatically sets the state of the task to Approved thereby auto-approving the task.
Approval Rules fields

Gating approvals

A gating approval acts as a gate through which a request must pass before it can start. Until all gating approvals are met, no notifications go out, no tasks get sent to technicians, and nobody starts working on the request in question.

Generate gating approvals with:

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval rules</td>
<td>Can apply to the service catalog as well as any other task table.</td>
</tr>
<tr>
<td>Item-based approvals</td>
<td>Flag specific catalog items as requiring specific approvals. Any requests for these items automatically require these approvals.</td>
</tr>
</tbody>
</table>

Set up a gating approval via an approval rule
You can set up a gating approval via an approval rule.

Role required: admin

1. From the left navigation pane, select **System Policy > Approval Rules**.
2. Click **New**.
Approval rules

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of this rule.</td>
</tr>
<tr>
<td>Table</td>
<td>Task table to which this rule applies. For most service catalog approvals, select Request.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The list shows only tables and database views that are in the same scope as the approval rule.</td>
</tr>
<tr>
<td>Active</td>
<td>Indicator of whether the rule is active (defaults to true).</td>
</tr>
<tr>
<td>Run Rule Before</td>
<td>Indicator of whether the rule runs before or after the request record is saved. For most approvals, select this check box.</td>
</tr>
<tr>
<td>User</td>
<td>User who must approve this request (can be empty).</td>
</tr>
<tr>
<td>Group</td>
<td>Group that must approve this request (can be empty).</td>
</tr>
<tr>
<td>Set State</td>
<td>Value of the approval field on the task in after this rule runs. In most cases, select Requested.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition under which the rule applies.</td>
</tr>
<tr>
<td>Script</td>
<td>An optional server script to programmatically specify who the approver should be. For example, for the one-line script current.requested_for.manager, ServiceNow checks the requested_for reference field on the current record. It then locates the manager field on the referenced record and assigns that person as the approver. For other examples, see the Script field on approval rules provided by ServiceNow.</td>
</tr>
</tbody>
</table>

Notes and limitations:

1. You can have as many rules as you want on a given table. If more than one rule applies, you'll get more than one approver.
2. You can't get duplicate approvers, for example, if two rules both want Fred Luddy to approve a particular request, the system will only create one approval entry for him.
3. By default all requests start out in a **Not yet requested** approval state. Approval notifications will not go out until the request's approval state is set to Requested. You can do that manually, or you can do it in script, but the easiest way to do it is to use the Set State field to automatically set the request to Requested.

*Set up a gating approval based on the item being ordered*

In addition to adding approvals via approval rules, you can also add approvals based on what kind of item is being ordered.
In addition to adding approvals via approval rules, you can also add approvals based on what kind of item is being ordered. We can, for example, specify that all Blackberrys need to be approved by David Loo.

To do so, navigate to the item in question and scroll to the related list of required approvers. There are two lists:

- **Approved By Group**: A list of groups that have to approve requests for this item
- **Approved By**: A list of users who have to approve requests for this item

In the example above, this request must be approved by all members of the Hardware group and by David Loo.

Notes and limitations:

1. As with approval rules, you are protected against duplicate entries. Thus if David Loo is a member of the hardware group, as well as being a standalone approver, he will only get one approval request.

2. Item-based approved work in addition to rather than instead of approval rules so you can (and probably will) use both.

**Process approvals**

Once a request has passed its gating approvals, any relevant execution plans are initiated. Those plans, in turn, create a sequence of required tasks. You can add an approval step to an execution plan, which is configured to occur at the appropriate point.

From the left navigation pane, select **Service Catalog > Execution Plans**, and then select the plan to which to add an approval step. Then click the **New Approval** button.
Add approval

The Approval Task screen appears. Just like a regular Service Catalog execution task, an approval execution task has:

- **Name**: The name of this task
- **Order**: Sequence of this task within the plan
- **SLA**: SLA to which this task applies
- **Delivery Time**: Time allowed for the completion of this task

After you create the task, right click the title bar and select **Save**. Two related lists appear at the bottom of the screen:

- **Approved By Group**: A list of groups that must approve the request before this task is complete
- **Approved By**: A list of users who must approve the request before this task is complete
Approval task

In the example above, this security approval task must be approved by Fred Luddy.

**Note:** When an in-process approval is rejected, that particular line item is canceled as well, but the request itself isn't necessarily canceled. Thus if one ordered a blackberry and a laptop, and the blackberry was rejected, the laptop request would continue being processed.

**Approve with a process guide**

Process guides work similarly to approval rules in that their execution is controlled via a condition. The default version of approval tasks allows you to specify that the approval in question be approved by:

1. One or more specific people
2. One or more groups of people
You can optionally use Process Guides instead of approval tasks. Process guides are more flexible in that they allow for:

1. "Any of" or "All of" approvals
2. Sequenced approvals

You can link a process guide to an execution task.

1. From the left navigation pane, select **System Policy > Process Guides**.
2. Create a new guide.
3. Set the table to **Catalog task**.
4. Fill in a condition under which this guide should attach.

**Example #1:** Apply to all "Capacity Review" tasks.

```
Add Condition
- + State
  is
  Open
- + and Delivery task
  is
  Capacity Review
```

**Example #2:** Apply to all "Capacity Review" tasks where the requester is in Atlanta.

```
Add Condition
- + State
  is
  Open
- + and Delivery task
  is
  Capacity Review
- + and Request Item, Requested For Location
  is
  Atlanta
```

**Process guide tips and tricks:**

1. All catalog tasks are generated when a request is first submitted, but tasks which aren’t active yet have a state of “pending”. So if you do not want to send out approval requests until a task has actually started, add "state=open" as part of your condition.

2. There is a “Default” process guide in the system for catalog tasks with a sequence number of 10,000. It behaves exactly the same way the old, pre-process guide code did in regards to approvals. Approvals are based on the execution of task-related lists.

**Schematic of a hypothetical approval process**

In the diagram below of a hypothetical approval process, the gating approval is color coded blue and an in-process approval is orange.
Approval process

Approval summarizer formatter

The approval summarizer formatter creates the summary at the bottom of an approval form. The approval summarizer displays different information depending on what is being approved, such as a change request or a service catalog request. Following are two examples.
Summary of Item being approved

Change Request

<table>
<thead>
<tr>
<th>Number</th>
<th>CHG0000001</th>
<th>Requested by</th>
<th>David Loo</th>
</tr>
</thead>
<tbody>
<tr>
<td>Affected CI</td>
<td>Sales Force Automation</td>
<td>Type</td>
<td>Normal</td>
</tr>
<tr>
<td>Planned start date</td>
<td>2016-07-27 16:00:00</td>
<td>Risk</td>
<td>High</td>
</tr>
<tr>
<td>Planned end date</td>
<td>2016-07-27 18:00:00</td>
<td>Impact</td>
<td>3 - Low</td>
</tr>
<tr>
<td>Short description</td>
<td>Rollback Oracle Version</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Description</td>
<td>Performance of the Siebel SFA software has been severely degraded since the upgrade performed this weekend. We moved to an unsupported Oracle DB version. Need to rollback the Oracle Instance to a supported version.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Summary of a catalog request

The **Deny** button allows the approver to deny one or more requested items in a multi-item request, before approving the overall request. If a requested item is denied, the workflow for that item never starts. The approver can then choose to **Accept** the item.

**Note:** When the overall request is approved, you must ensure this **Deny** button is hidden. If this button is used after request approval, the requested item workflow is canceled, leaving the stage in an inconsistent state. Similarly, the **Accept** button on requested items should only appear before the overall request is approved or rejected.

**Summarizers**

Approval summarizers are stored in the Macro (`sys_ui_macro`) table.

From the left navigation pane, select **System UI > UI Macros**. Summarizers use a naming convention of `approval_summarizer_<table_name>` (for example, `approval_summarizer_change_request` is the summarizer for change requests, while `approval_summarizer_sc_request` is the summarizer for service catalog requests).

Each summarizer is written in Jelly script, which is used to define internal forms. The script is stored in the large XML field at the bottom of the UI Macro form.

### Change an approval summarizer

You can modify existing approval summaries to include additional information. These are advanced customizations that might not be appropriate for all implementations, and require creating a custom form.

1. Navigate to **System UI > UI Macros**.
2. Open the summarizer you want to change.
3. Copy the script to another location before editing, in case you need to revert it.
4. Modify the script.
5. Click Update.

Create a new custom approval summarizer
After you add a new table that has approvals to an instance, you can add a custom activity formatter by creating a new UI macro and then add it to the appropriate form.

approval_summarizer can only be used on approval forms in the global scope.

1. Navigate to System UI > UI Macros
2. Click New.
3. Give the macro a name that follows the summarizer naming convention:
   approval_summarizer_<tablename>
4. Complete the rest of the form and click Submit.
5. Create an activity formatter and add it to the appropriate form.
   To learn more about activity formatters, see Activity formatter.

Approval with e-signature
Approval with e-signature allows users to approve requests by re-entering their login credentials.
Approval with e-signature supports the following authentication credentials:

- User name and password matching a user in the local database.
- User name and password matching a user authorized by an external identity provider as part of a SAML 2.0 single sign-on integration.

Activate Approval with e-Signature plugin
The Approval with e-Signature plugin (com.glide.e_signature_approvals) allows users to approve requests by re-entering their login credentials.

Role required: admin

1. Navigate to System Definition > Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   If the plugin depends on other plugins, these plugins are listed along with their activation status.
   If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. Optional: If available, select the Load demo data check box.
   Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
   You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.
5. Click Activate.

De-activate e-signatures
Use this procedure to de-activate e-signatures.
Although plugins cannot be removed, e-signatures can be disabled.

1. Navigate to System Definition > E-Signature Registry.
2. Set Enabled to False on any tables where e-signatures are no longer required.

Use e-signature approvals

Users can approve requests with an e-signature.

Users can approve requests with an e-signature by:

- Selecting the Approve or Reject option on a list context menu.
- Clicking the Approve or Reject button on a form.
- Changing a request record’s State to Approved in either the list-editor or form.

Selecting any of these options presents the user with an Approver Authentication window, which requests the user’s credentials again.

Installed with approval with e-signature

Installing approval with e-signature installs certain properties.

- Module - E-Signature Registry
- UI Action - Approve (on table sysapproval_approver, with no action name)
- UI Action - Approve (on table sysapproval_approver, with no action name)
- UI Action - Approve (on table sysapproval_approver, with the action name authenticated_list_approval)
- UI Page - form_login_validate_dialog
- UI Page - login_validate_dialog
- UI page: saml2_esignature_login, the re-authentication page that appears when an approver tries to approve a request.
- Properties: see E-signature SAML properties
- Client Script - Authenticate Approver
- Script Include - User
- Script Include - UserAuthentication
- Processor: eSigSaml2AssertionConsumer

Installing the plugin also disables the two out-of-the-box Approve UI Actions on the sysapproval_approver table.

Select an approval table

By default, activating the Approval with E-signature plugin enables e-signature for all tables for which a previous approval exists.

E-signature approvals can also be enabled on a table-by-table basis. To enable e-signatures for a table:

1. Navigate to System Definition > E-Signature Registry.
2. In Table name, use the drop-down list to select a specific table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>A table drop-down to select the table that requires e-signatures.</td>
</tr>
<tr>
<td>Field</td>
<td>Input Value</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Enabled</td>
<td>If selected, e-signature is required. Clear this option to remove the e-signature requirement.</td>
</tr>
</tbody>
</table>

**Set up an approval from a local database**

To set up Approvals with e-signature using credentials from a local database:

1. Activate the **Approval with e-signatures** plugin.
2. Create user records for approval users.

**Use Multi-Provider SSO to set up an SSO approval for a SAML 2.0 authentication**

An SSO approval with e-signature requires configuration on the SAML IdP and the ServiceNow instance.

The SAML IdP must support and honor the forceAuthn attribute in SAML assertion requests. E-signature does not function without this IdP setting. To set up an approval with e-signature using credentials from a SAML 2.0 authentication:

1. Activate or upgrade to SAML 2.0 with the [Integration - Multiple Provider Single Sign-On Installer plugin](https://service-now.com).
2. Activate the **Approval with E-Signature plugin**.
3. Navigate to Multi-Provider SSO > Identity Providers and verify your 2.0 SAML IdP configuration. Advanced tab shows the **Force AuthnRequest** attribute checked.
   
   Your SAML 2.0 IdP must support the **Force AuthnRequest** attribute, or e-signature is not supported.
4. On the eSignature Approval tab, enter the following e-signature SAML properties:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Assertion Consumer URL for eSignature authentication</strong></td>
<td>This property defaults to the appropriate URL. To configure this property, click the lock icon to make this field editable. After edits, click the icon to lock the field.</td>
</tr>
<tr>
<td><strong>Assertion Consumer Index for eSignature authentication</strong></td>
<td>If your Service Provider has more than one URL set for the AssertionConsumerURL, you can set the index to use for eSignature, starting with index 1 or more.</td>
</tr>
<tr>
<td><strong>AuthnRequest URL for eSignature Authentication</strong></td>
<td>You can enter the URL that points to the SAML 2.0 IdP AuthnRequest URL for eSignature authentication. If the URL is the same as the Assertion Consumer URL, you can leave this setting blank.</td>
</tr>
<tr>
<td><strong>Authentication Pop-up Dialog Width</strong></td>
<td>When a user approves a request using eSignature, a dialog opens and a user can enter credentials. This setting controls the width of that dialog box. The default is 500.</td>
</tr>
<tr>
<td><strong>Authentication Pop-up Dialog Height</strong></td>
<td>When a user approves a request using eSignature, a dialog opens and a user can enter credentials. This setting controls the height of that dialog box. The default is 300.</td>
</tr>
</tbody>
</table>
5. Click the **Generate Metadata** button underneath the tabs to regenerate the service provider metadata. Copy this data and update it on the SAML IdP.

### Set up e-signature approvals

The setup required depends on where user credentials are stored.

See the section that matches the source of your user credentials:

- Setting up approvals from a local database
- E-signature SAML properties

**Note:** ADFS 2.0 does not support re-authentication requests that E-Signature requires.

### Approval status

The approval status of a change request is determined by looking at the current status of all the approvers.

If any approver has rejected the change, the approval status will be Rejected. If all approvers have approved the change, the approval status will be Approved. If all approvers are in the Not Requested status or if there are no approvers, the change status will be Not Requested, otherwise the status will be Requested.

For added flexibility when creating approvals, including the ability to set up an “one of” approval where only one person of a group of approvers needs to approve, consider using **Workflows**.

### Generate an approval using approval rules

The system can automatically generate an approval request to individuals or groups when specific criteria are met. The automatic generation of approval requests is driven using the System Policy feature.
In the sample below, a change opened in the category **network** is assigned to the System Administrator:

![Approval Rules](image)

**Approval Rules**

When an approver is automatically added based on approval rules, the status of the approval automatically defaults to "Requested".

**Generate approvals using the approvers related list**

It is possible to manually add approvers to a request.

Additional approvers can be added by clicking the **Edit** button in the Approvers section near the bottom of a request. When an approver is added manually, the status for that approver defaults to "Not Requested". When the status of the approver is changed to 'Requested', the approver will be sent an email requesting approval action.

**Generate approvals using workflows**

Workflows are a powerful and flexible method of generating approvals. Use workflows to create group approvals and user approvals.

A variety of variables are available to fine-tune the approval process, including the actions that occur when approval or rejection take place. When a workflow activity generates an approval record, the system populates the **Workflow activity** field on the approval record with a reference to the activity. Do not use this field when creating business logic. For more information, see **Approval and Rollback Activities**.

**Note:** Conflicts can arise when the approval process for a table is managed by both the workflow engine and the approval engine. In general, if there is a workflow that manages the approval process for a table, the **approval engine** should be turned off for that table.

**Multiple approvers**

With multiple approvers, all approvers must authorize the request before the status will change to "Approved".

Should any approver reject the request, the status will immediately be set to "Rejected".

**Receive notifications**

Individuals who are designated approvers automatically receive approval notifications, including approval status updates.
Approval notifications will be sent at the following times:

- When an individual is assigned as an approver either automatically or manually. If a group is chosen, then all members of the group will be sent an email. By default, the email an approver receives will contain a "mailto" link that will allow the approver to either approve or reject the request directly from their email system.
- When the request reaches approved status, the person assigned to the request will receive an email indicating it has been approved.

The details contained in the emails and the points at which they are sent can be tailored using System Definition > Business Rules and System Policy.

Note for Blackberry users: In order to see the "mailto" links mentioned above to approve or reject a request (i.e. 'Click here to approve CHG55555' or 'Click here to reject CHG55555'), your Blackberry device must be using version 4.5 of their software which supports HTML emails. If your Blackberry device is using an earlier version, you will not be able to view or use the "mailto" links. However, as a workaround, users can reply to the email and add the statements state:approved or state:rejected within the body of the email before sending it to force the automatic approval/rejection functionality.

If you create an appropriate Inbound Email Action, you can let approvers respond to approval email notifications with a simple "yes" or "no" answer.

**Dynamic approval forms**

When you are looking at an approval request, the form has a context-appropriate summary of the item to be approved.

For example, if you're looking at a Change Management approval request, you'll see details from the relevant change request. For a Service Catalog approval request, you'll get details of the request.

---

---

**Summary of Item Under Review:**

**Rollback Oracle Version**

Performance of the Siebel SFA software has been severely degraded since the upgrade performed this weekend. We moved to an unsupported Oracle DB version. Need to rollback the Oracle instance to a supported version.

---

**Change request approval example**
Scripts and engines execution order

Scripts, assignment rules, business rules, workflows, escalations, and engines all take effect in relation to a database operation, such as insert or update. In many cases, the order of these events is important.

Note: Client-based code that executes in the browser, using Ajax or running as JavaScript, will always execute before the form submission to the server.

The order of execution is as follows:

1. Before business rules: Scripts configured to execute before the database operation with an order less than 1000.

2. Before engines. The following are not executed in any specific order:
   - Approval engine (for task and sys_approval_approver tables)
   - Assignment rules engine (for task tables)
   - Data policy engine
   - Escalation engine
   - Field normalization engine
   - Role engine - keeps role changes in sync with sys_user_has_role table (for sys_user, sys_user_group, sys_user_grmember, and sys_user_role tables)
   - Execution plan engine (for task tables)
   - Update version engine - creates version entry when sys_update_xml entry is written (for sys_update_xml table)
   - Workflow engine (for default workflows)

3. Before business rules: Scripts configured to execute before the database operation with an order greater than or equal to 1000.
4. The data base operation (insert, update, delete).
5. *After* business rules: Scripts configured to execute after the database operation with an order less than 1000.
6. *After* engines. The following are not executed in any specific order:
   - Label engine
   - Listener engine
   - Table notifications engine
   - Role engine - keeps role changes in sync with sys_user_has_role table (for sys_user, sys_user_group, sys_user_grmember and sys_user_role tables)
   - Text indexing engine
   - Update sync engine
   - Data lookup engine inserts or updates
   - Workflow engine (for deferred workflows)
7. Email notifications. The following are executed based on the weight of the notification record:
   - Notifications sent on an insert, update, or delete
   - Event-based notifications
8. *After* business rules. Scripts configured to execute after the database operation with an order greater than or equal to 1000.

**Geolocation**

The geolocation feature uses Google Maps to track users, plan efficient routes between locations, and assist in finding accurate travel times for applications that require this information, such as Work Management.

The system locates users from latitude and longitude information provided by their mobile devices or browsers. Tracking the location of certain users can improve business processes such as the completion of work order tasks. For example, in work management geolocation, the system updates an agent’s position each time that agent updates a task record. When the system updates an agent’s location frequently, agents and dispatchers can use features like auto-routing to create efficient schedules.

Geolocation features can be configured by users with the admin role.

**Activate geolocation**

An administrator can activate the Geolocation plugin.

1. Navigate to **System Definition > Plugins**.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the **Activate/Upgrade** related link.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
   - If the plugin has optional features that depend on other plugins, those plugins are listed under **Some files will not be loaded because these plugins are inactive**. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. Optional: If available, select the **Load demo data** check box.
Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.

You can also load demo data after the plugin is activated by clicking the **Load Demo Data Only** related link on the System Plugin form.

5. Click **Activate**.

### Installed with geolocation

The following components are installed with Geolocation:

#### Modified by Geolocation

The Geolocation plugin adds a field called **Geolocation tracked** to the User [sys_user] table. This field allows the system to track individual users by their geographical coordinates.

#### Business rules installed with geolocation

Business rules are added with activation of Geolocation.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GeoLocation Data updated</td>
<td>User (sys_user)</td>
<td>Populates the <strong>Latitude</strong> and <strong>Longitude</strong> fields on the Geolocation History (geo_history) table when the <strong>Latitude</strong> and <strong>Longitude</strong> fields are updated on the User (sys_user) table.</td>
</tr>
</tbody>
</table>

#### Client scripts installed with geolocation

Client scripts are added with activation of Geolocation.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update Geolocation on Task</td>
<td>Task (task)</td>
<td>Populates the <strong>Latitude</strong> and <strong>Longitude</strong> fields on a user record with GPS coordinates when that user loads any record on the Task table or a table that extends Task. This occurs only when geolocation tracking is enabled for the user.</td>
</tr>
</tbody>
</table>

#### Properties installed with geolocation

Geolocation provides the following configurable properties in **Geolocation > Administration > Geolocation Properties**.

The Google Maps plugin provides additional **map properties** that are used to implement and control specific geolocation features. You must have a **private key** for Google Maps API for Business to take advantage of the properties listed here.
### Properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.geolocation.allow.toll.roads</td>
<td>Allow toll roads to be used. Allows the system to use toll roads when auto-routing an agent's tasks.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> True/false</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value:</strong> True</td>
</tr>
<tr>
<td>glide.geolocation.default.start.time</td>
<td>Default start time for all agents when no schedule is set. This value sets the start time for a day other than the current day, when no scheduled task exists or is continued from the previous day. This property uses a 24 hour clock.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> String</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value:</strong> 08:00</td>
</tr>
<tr>
<td>glide.geolocation.evening.rush.hours</td>
<td>Evening rush hour span, formatted as 14:30-16:00. All times are expressed as a range, separated by a dash with no spaces. Times not using this format are ignored. This property must be used with the work.management.morning.rush.hours and work.management.rush.travel.buffer properties and uses a 24 hour clock.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> String</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default:</strong> 0</td>
</tr>
<tr>
<td>glide.geolocation.history.cleanup</td>
<td>Number of days to keep history data. ServiceNow keeps agent geolocation history records for the number of days specified by this value.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> Integer</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value:</strong> 30</td>
</tr>
<tr>
<td>glide.geolocation.morning.rush.hours</td>
<td>Morning rush hour span, formatted as 06:30-08:00. All times are expressed as a range, separated by a dash with no spaces. Times not using this format are ignored. This property must be used with the work.management.evening.rush.hours and work.management.rush.travel.buffer properties.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> String</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default:</strong> 0</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>glide.geolocation.proximity</td>
<td>Minimum distance an agent must move to be considered in a new location (in meters). This setting establishes a geolocation perimeter that prevents ServiceNow from creating unnecessary history records when an agent has multiple tasks in the same vicinity. An example of this might be when an agent has several tasks in one building. The system assumes that all task activity within the specified radius is part of a single record and does not create additional records when the agent moves from task to task around the building.</td>
</tr>
<tr>
<td></td>
<td>* Type: Integer</td>
</tr>
<tr>
<td></td>
<td>* Default value: 500</td>
</tr>
<tr>
<td>glide.geolocation.proximity.location</td>
<td>Maximum distance an agent can be from a specific location and still be placed at that location (in meters). This setting defines the maximum distance that an agent can be from a specified location and still be placed at that location by the system.</td>
</tr>
<tr>
<td></td>
<td>* Type: Integer</td>
</tr>
<tr>
<td></td>
<td>* Default value: 200</td>
</tr>
<tr>
<td>glide.geolocation.rush.travel.buffer</td>
<td>Percentage to add to all rush hour travel times. The system uses this percentage to calculate schedules when auto-routing an agent. Use this property when both morning and evening rush hour times are defined. An example of a valid time buffer percentage is 15.</td>
</tr>
<tr>
<td></td>
<td>* Type: Integer</td>
</tr>
<tr>
<td></td>
<td>* Default value: 0</td>
</tr>
<tr>
<td>glide.geolocation.tracking.frequency</td>
<td>Sets the length of the recurring interval, in seconds, that the system waits between attempts to update a user's geographic coordinates. The system updates geographic coordinates only for users who have geolocation tracking enabled. Minimum amount of time between updating the user's location (in seconds). This setting defines how long the system waits before updating an agent's location, regardless of task activity or travel. This prevents ServiceNow from creating unnecessary history records if an agent in one location views a task multiple times.</td>
</tr>
<tr>
<td></td>
<td>* Type: Integer</td>
</tr>
<tr>
<td></td>
<td>* Default value: 300</td>
</tr>
<tr>
<td>glide.geolocation.travel.buffer</td>
<td>Percentage to add to all travel times. An example of a valid percentage value is 15.</td>
</tr>
<tr>
<td></td>
<td>* Type: Integer</td>
</tr>
<tr>
<td></td>
<td>* Default value: 0</td>
</tr>
</tbody>
</table>
### Name Description

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.geolocation.work.spacing</td>
<td>Amount of time (in minutes) to add between the end of a task and the travel start of the next. An example of a valid time value is 10.</td>
</tr>
</tbody>
</table>
| | **Type**: Integer  
| | **Default value**: 0 |

### Script includes installed with geolocation

Script includes are added with activation of Geolocation.

#### Script Includes

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GeolocationAJAX</td>
<td>Utilities the system uses when making geolocation AJAX calls.</td>
</tr>
<tr>
<td>GeolocationUtils</td>
<td>Core utilities for geolocation functionality.</td>
</tr>
</tbody>
</table>

### Geolocation Google key

Geolocation requires a Google Maps API for Business license to enable the use of Google driving time estimates and to use Google Maps. Applications, such as Work Management, have functionality that requires this license.

If you are using auto-routing or auto-dispatch in Work Management, both the Google Maps API for Business private key and the client ID must be set for precise time estimates. Without these values, driving times for auto-routing and auto-dispatch are not available, and a rough estimate or fixed time is used. Use these properties, found in **System Properties > Google Maps** Google Maps, to enable the geolocation feature.

- **Client ID for Google Maps API for Business**: Google client ID for your organization. This ID is from Google and starts with `gme-`, such as `gme-mycompanyname`.
- **Private key for Google Maps API for Business**: Key required to get accurate driving time estimates from Google for some features of Geolocation. An example of an encoded key is: `vNIXE0xscrmjlyV-12Nj_BvUPaw=

### Geolocation history

The Geolocation History (geo_history) table contains the history of each tracked user’s location over time.

To view geolocation history, navigate to **Geolocation > Geolocation History**. The record list shows time stamped location data for all users configured for geolocation tracking.

The following system properties, located in **Geolocation > Administration > Geolocation Properties**, control the data that appears in this table.

- **Minimum distance an agent must move to be considered in a new location (in meters)**: Perimeter that defines a single location in which multiple tasks are present. This property prevents the system from creating unnecessary history records when multiple tasks are in the same general location.
- **Maximum distance an agent can be from a specific location and still be placed at that location (in meters)**: Distance that a user can be from a specified location and still be placed at that location when the system creates history data.
- Number of days to keep history data: Time period for which the system retains history data.
- Minimum amount of time between updating the user's location (in seconds): Time period the system waits before updating a user's location, regardless of how often the user accesses tasks.

Location tracking

Geolocation adds the **Geolocation tracked** field to the User form. In the default view of a user record, select the **Geolocation tracked** check box to enable location tracking for the user.

When a user has geolocation tracking enabled, the system updates the user's geographic coordinates whenever the user opens, or loads, a record from the Task (task) table or from a table that extends Task. After this initial update, the system continues to update the user's geographic coordinates at a recurring interval if the user does not close or reload the record. To edit the length of this interval, navigate to **Geolocation > Administration > Geolocation Properties** and change the setting for the **property** that regulates the update interval for the user's location. The default setting for this property is **300** seconds (5 minutes).

**Note:** The system can update geographic coordinates only for users who have location services enabled in their browsers. Even users who have the **Geolocation tracked** check box selected may be prompted by their browsers to share or withhold their location.

State flows

State flows enable an administrator to customize transitions from one state to another in tables derived from the Task (task) table and configure the system to perform work during transitions to specific states.

An example of a state transition is when the State field in an incident changes from **Active** to **Awaiting User Info**. An administrator might want to trigger an event during this transition or make a specific field mandatory when the incident reaches the end state.

State transitions in the Field Service Management application were reimplemented to use state flows. For information about customizing Field Service Management state flows, see **State flow customization**.

Installed with state flows

Several types of components are installed with state flows.

**Tables installed with state flows**

Tables are added with state flows.

**Tables**

State flows adds the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>State Flow (sf_state_flow)</td>
<td>Contains state flow definitions. This table contains all state flow definitions, including those for work orders and work order tasks.</td>
</tr>
</tbody>
</table>
### Table

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Work Order Flow (sf_work_order)</td>
<td>Contains state flow definitions for work orders. This table is installed when Field Service Management is activated.</td>
</tr>
<tr>
<td>Work Task Flow (sf_work_task)</td>
<td>Contains state flow definitions for work order tasks. This table is installed when Field Service Management is activated.</td>
</tr>
</tbody>
</table>

### Business rules installed with state flows

Business rules are added with state flows.

### Business rules

State flows adds the following business rules.

#### Business rules for state flows

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assert Field Uniqueness in State Flow</td>
<td>State Flow (sf_state_flow)</td>
<td>Ensures that business rules and UI actions are not accidentally copied to new state flows.</td>
</tr>
<tr>
<td>Check Client Script</td>
<td>State Flow (sf_state_flow)</td>
<td>Adds a client script to new records.</td>
</tr>
<tr>
<td>Check Event Rule</td>
<td>State Flow (sf_state_flow)</td>
<td>Adds or deletes event rules, as the event field is updated.</td>
</tr>
<tr>
<td>Check Work Notes Rule</td>
<td>State Flow (sf_state_flow)</td>
<td>Adds or deletes work note rules, as the work notes for a state flow are updated.</td>
</tr>
<tr>
<td>Create Business Rule</td>
<td>State Flow (sf_state_flow)</td>
<td>Automatically creates a business rule when automatic conditions or script are present.</td>
</tr>
<tr>
<td>Create script for Field controls</td>
<td>State Flow (sf_state_flow)</td>
<td>Create scripts for field controls, when they are in use.</td>
</tr>
<tr>
<td>Create UI Action</td>
<td>State Flow (sf_state_flow)</td>
<td>Automatically creates a UI action when manual conditions or script are filled in.</td>
</tr>
<tr>
<td>Delete Related Elements</td>
<td>State Flow (sf_state_flow)</td>
<td>When state flows are deleted, delete all related client scripts, business rules, UI actions and overrides.</td>
</tr>
<tr>
<td>Remove script for Field controls</td>
<td>State Flow (sf_state_flow)</td>
<td>If all field controls are disabled, see if any of the client scripts should be removed.</td>
</tr>
<tr>
<td>State Change</td>
<td>State Flow (sf_state_flow)</td>
<td>Get the correct state choice value when the state is changed.</td>
</tr>
</tbody>
</table>

## Business rule | Table | Description
--- | --- | ---
Update dependent records | State Flow (sf_state_flow) | When a state flow is made active or inactive, ensure the business rule and UI actions are made active or inactive as well.

### Script includes installed with state flows

Script includes are added with state flows.

### Script includes

State flows adds the following script includes.

#### Script includes for state flows

| Script include | Description |
--- | ---
StateFlow | Implements state flows and supports creation of state flow elements, such as business rules, UI actions, dictionary overrides, and client scripts. |
StateFlowAJAX | Allows access to state flow functionality from client scripts. |

### Use state flows

You can create custom state flows for any table that uses states.

Make state transitions occur in any order or skip specific states according to your business practices. State flows can manage the behavior of fields and field visibility on a task form. State flows can also trigger system events that perform work such as sending email notifications.

Administrators can configure state flows to:

- Limit the choice list for the State field to contain only those states that are valid for the flow.
- Define the behavior and visibility of specific fields using field controls on a task form when state transitions occur and for certain end states.
- Configure events that are triggered when a task changes states.
- Set up UI actions and business rules to implement certain state transitions, or while the task is in certain states.

The State Flow plugin installs records used by work management to control state transitions for work orders and work order tasks. For detailed information about using work management state flows, see State flow customization.

Creating and customizing state flows requires scripting knowledge. Users with the admin role can create state flow records.

### Dictionary overrides for state flows

A dictionary override in a state flow defines the starting state for all new records in a specific table.

You set an override in tables that extend a base table only, so that your customizations are applied only to the extended table.
1. In a state flow record, select an Ending state.
   This is the override value which becomes the starting state for all new records in the table named.

2. Click Create Default Value.
   The system populates the Dictionary override field with a value of state, which is the field in the task table affected by the override. The Dictionary override field is read-only. After the override is created, the system hides the Create Default Value button on all subsequent state flow forms for that table.

Events triggered on state changes

You can configure a state flow to trigger a registered system event when a task transitions from a starting state to a specified end state.

For example, you can use events to trigger email notifications and create script actions. When you attach an event to a state flow, the system creates a business rule called State Flow Events for <table name> for the table specified in the state flow. If you specify a start and end state, the business rule executes when the record transitions from the start state to the end state. If the state flow only specifies an end state, the business rule executes whenever that end state is reached. The system creates one business rule for all state flows containing events on a single table. When all events or all state flows on a table are deleted, the system deletes the business rule.

Field controls

You can define controls for individual fields that are enforced when a record transitions between states.

Settings in the Field Controls section of the State Flow form enable you to apply field controls when the system detects a specified state transition or when the end state is the current state when the form is opened. The control is applied only to existing fields on the form. State flows cannot add fields to the form.

For example, you might want the Problem field to be visible when an incident moves to the Awaiting Problem state. If the incident state changes to Awaiting User Info, you hide the Problem field and make the Caller field mandatory.

The best practice when creating field controls is to configure state flow records with an ending state only and to create the correct behavior for every ending state you want to control. This ensures that the field controls are set properly when the user selects a new state, and also when the user returns a record’s State field to the original state. Only specify a full state transition, with both a starting and ending state, when you want a particular behavior for that precise state transition.

**Note:** State flows use client scripts to enforce field controls. It is possible that your settings can be changed by existing UI policies, which execute after client scripts.

The system creates the following objects as needed to enforce field properties in state flows:
Field Controls

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Business rule</td>
<td>State Flow Notes for <code>&lt;table name&gt;</code></td>
<td>Enforces mandatory fields for the table on which that field behavior is defined.</td>
</tr>
<tr>
<td>Client script (onLoad)</td>
<td><code>&lt;table name&gt;</code> state flow</td>
<td>Sets possible states and initial mandatory, read-only, and visible properties when a record is loaded.</td>
</tr>
<tr>
<td>Client script (onChange)</td>
<td><code>&lt;table name&gt;</code> change state flow</td>
<td>Sets updated mandatory, read-only, and visible properties when a record is changed.</td>
</tr>
</tbody>
</table>

Rebuild state flows

You can rebuild state flows when a mismatch between existing and new sys_ids occurs.

When you use an XML file to import a state flow record into an instance, the system attempts to match the incoming states with existing states by comparing sys_ids. Because the sys_ids of items in a choice list can vary between instances, the system can fail to match the states, even though they are otherwise identical.

When matching fails, the start and end states of affected records are left blank or contain numeric values. To repair these records navigate to State Flows > Admin > Rebuild State Flows. This module runs a script that compares the numerical value of each item in the State field choice list until it finds a match in the imported state flow record.

Create a state flow

Creating State Flows.

2. Fill in the fields, as appropriate.

The system enforces the field controls with the same client script that filters the choice list for the State field.

Creating state flows

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

### Field Controls

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not read only</td>
<td>Makes the selected fields editable when this transition occurs, or when the end state is the current state.</td>
</tr>
<tr>
<td>Not visible</td>
<td>Hides the selected fields when this transition occurs, or when the end state is the current state.</td>
</tr>
</tbody>
</table>

3. Determine if you want the state transition method to be manual or automatic and open the appropriate section on the form.

   - **Manual:** Click **Create UI Action** to create a button on the task form that enables users to execute the transition manually. The system uses the value in the Name field as the label for the UI action. The UI action executes the script in the Manual Script field when the conditions are true. For example, a manual transition can create an **Activate** button when an incident is in the New state that enables a user to mark the incident as active.
   - **Automatic:** Click **Create Business Rule** to create the business rule. The business rule executes the script in the Automatic Script field when the conditions are true. For example, a business rule created by the system can set an incident state to Assigned when the Assigned to field is populated. Business rules are automatically deleted when the state flow record is deleted. For more information, see **Business Rules**.

4. Optional: Click **Create Client Script** to create the script that limits the values offered in a task record's State field to valid states for that transition.

5. Configure the fields in the Field Controls section to control how specific fields display when a task record changes states.

### State flow cleanup

The business rules, client scripts, and UI actions that the system creates automatically to perform custom transitions exist only while the state flow records that use them are present.

When all the state flows on a table are deleted, the system attempts to delete any unnecessary programming elements that were created on that table, using these criteria:

<table>
<thead>
<tr>
<th>Element</th>
<th>Deleted When</th>
</tr>
</thead>
<tbody>
<tr>
<td>UI action</td>
<td>The state flow that created it is deleted.</td>
</tr>
<tr>
<td>Business rule</td>
<td></td>
</tr>
<tr>
<td>Dictionary override</td>
<td></td>
</tr>
<tr>
<td>Business rule that processes events triggered by a state flow</td>
<td>All state flows for the table specified that have events configured are deleted.</td>
</tr>
<tr>
<td>Client script (onLoad)</td>
<td>All state flows for the table are deleted.</td>
</tr>
<tr>
<td>Client script (onChange)</td>
<td>All state flows with field controls are deleted.</td>
</tr>
<tr>
<td>Work notes business rule</td>
<td>All state flows with field controls or work notes are deleted</td>
</tr>
</tbody>
</table>

### Work notes

Work notes are an important part of the state flow process and are used to communicate information about state transitions.
The state flow adds these work notes to the Work notes field of any task making this transition. These rules apply to state flow work notes:

- For a state flow with no Starting state, the work note is added every time the task transitions to the Ending state.
- For a state flow with a Starting state and an Ending state, the work note is added only when the task transitions from that starting state to that ending state.
- If two state flows with work notes have the same Ending state, but only one has a Starting state, the system adds the work notes from the state flow with the starting state. This better matches the state flow work note to the more important transition between specific starting and ending states.

Survey Management

With the ServiceNow® Survey Management application you can create, send, and collect responses for basic surveys. If installed, you can also use the Survey widget to set up a survey within Service Portal.

Get started with Survey Management

Two versions of the application are supported, Survey Management, which is the latest version, and Legacy Surveys. Survey Management improves the user interface and extends the capabilities of the Legacy Surveys application.

Survey Management does not support domain separation.
Configuring surveys

There are many options for advanced configuration in Survey Management:

- Create a survey, add questions, and choose recipients, all in one interface.
- Create conditional questions, which appear only when users answer other questions a certain way.
- Restrict a survey so only specific survey users can take it, and send invitations to those users simultaneously. Alternatively, make the survey a public survey so that any user can take the survey, even users who have not logged in to the ServiceNow system.
- Set a schedule to automatically assign a survey to users and to limit how often the same user can take a survey.
- Customize the look and feel of survey questionnaires.
- Save anonymous survey responses.
- Convert survey responses to numerical scores and view them on scorecards.
- Deactivate a survey for maintenance or to retire it without deleting it.

**Note:** Because surveys use the same tables and other back-end components as assessments, you may see assessment elements such as table and field names in certain places throughout the survey feature.

Legacy Surveys

Survey administrators can continue to use legacy survey functionality and data, however, it is recommended that you migrate legacy surveys to the Survey Management application. Concurrent use of both survey applications can cause confusion and redundancy.

Survey wizards are not impacted and cannot be migrated.

**Note:** The Legacy Surveys application is not described in the documentation that you are viewing. It is documented on the ServiceNow wiki.

**Survey Management roles**

The Survey Management application uses the following roles.

No role is required to take assigned survey questionnaires.
## Survey Management roles

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey administrator</td>
<td>Create and administer surveys. Survey administrators know what types of surveys are necessary, when to send a survey, and to whom. Survey administrators can use all modules in the Survey application menu.</td>
<td>survey_reader, assessment_admin</td>
</tr>
<tr>
<td>Survey reader</td>
<td>View surveys and related information, such as survey responses, survey groups, scorecards, and reports.</td>
<td>none</td>
</tr>
</tbody>
</table>

## Key survey terms

These survey terms are used throughout the documentation to describe survey management functions and capabilities.

### Key survey terms

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey definition</td>
<td>Root record on which a survey is built. A survey definition contains information such as the survey name, state, and distribution schedule. Each survey definition has its own categories and questions. Survey definitions are comparable to legacy survey masters.</td>
</tr>
<tr>
<td>Public survey</td>
<td>Any user can take a public survey, even users who have not logged in to the ServiceNow system. For a completed survey, the Assigned to field value is Guest.</td>
</tr>
<tr>
<td>Survey category</td>
<td>Represents a theme for survey questions. Categories contain one or more questions. The system creates one category per survey by default. Additional categories are optional.</td>
</tr>
<tr>
<td>Survey question</td>
<td>A question that appears on a survey questionnaire for the associated survey definition. Survey questions are comparable to legacy survey questions.</td>
</tr>
<tr>
<td>Survey user</td>
<td>User who is authorized to receive invitations for a restricted survey.</td>
</tr>
<tr>
<td>Survey instance</td>
<td>Represents one survey questionnaire assigned to one user. Survey instances are comparable to legacy survey instances.</td>
</tr>
</tbody>
</table>

### Now Platform Capabilities

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trigger condition</td>
<td>Defines a rule that enables the system to send a survey when an action occurs on a table, such as when an incident closes. Trigger conditions are comparable to legacy survey conditions.</td>
</tr>
<tr>
<td>Scorecard</td>
<td>Visual representation of survey responses. Scorecards display a variety of data summaries for one survey definition.</td>
</tr>
</tbody>
</table>

### Survey questionnaires

All surveys that are assigned to you appear in your personal assessment and survey queue.

No special role is required to complete a survey but you must be logged in and the survey must be assigned to you. When you submit a survey, the system stores your responses.

### Survey notification

If the system is configured to send email, it sends you a notification when a survey is assigned to you. The message contains a link to the survey and instructions for viewing the assessment and survey queue.

**Take a survey**

Surveys that are assigned to you, and that are not complete, appear in your assessment and survey queue.

**Role required:** none

Each assessment or survey appears as a card in the queue. The card contains helpful information, including the survey name, state, and due date, and a button to launch the questionnaire. Overdue surveys are clearly marked with a red icon and red due date. You must answer every mandatory question, indicated by a red asterisk, before you can submit the survey. If you start to take a survey but cannot complete it, save your responses and return to it later. When you have answered all the questions and are satisfied with the responses, submit the survey.

1. Navigate to **Self-Service > My Assessments & Surveys**.

   Users with the assessment_admin role, including survey administrators, can display other users' assessments and surveys in addition to their own. Use the **Show all** and **Show assigned to me** related links at the bottom of the queue to show and hide assessments and surveys. Click a card assigned to another user to open the associated metric type or survey definition.

2. Click **Take Survey** on a survey card to open the questionnaire.

   If there is more than one survey category, you can click the collapse or expand icon to hide or show the questions in the category.

3. Answer each question to the best of your ability.

   If you are unsure of how to respond to a question or if a question does not apply to a particular record, select **Not Applicable**, if available.

4. Complete one of the following steps.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Save your responses without submitting them</td>
<td>Click <strong>Save</strong>. You can close the questionnaire and access it later from your queue. <strong>Note:</strong> The system does not save the survey if there are invalid responses, such as a letter in a date field. You must enter valid responses or remove invalid responses before you can save the survey.</td>
</tr>
<tr>
<td>Submit the survey after answering all questions</td>
<td>Click <strong>Submit</strong>. You cannot return to the questionnaire after submitting.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If there is an unanswered mandatory question or an invalid response, an error message appears and the problematic questions are temporarily highlighted.</td>
</tr>
</tbody>
</table>

**Survey responses and results**

There is a metric result record for each user response to each question on every survey instance. Survey results for each question and category are calculated automatically based on the metric result records.

If you use survey result calculations for results and scorecards, ensure that the **positive indicator** field for the question is set appropriately, based on the answer options. To have any results, a category must contain scored questions.

**Survey responses**

Survey responses are stored in the Metric Result (asmt_metric_result) table and display the recipients' answers to each question in a category. To view general results, navigate to **Survey > Survey Responses**. To view results for a particular criterion, use a filter on the Metric Result (asmt_metric_result) table. For example, to view results based on the assignment group, apply a filter condition for assignment group.
Category results

Category results are stored in the Assessment Category Result (asmt_category_result) table and display the overall ratings for each category based on the weighted value for each scored question. To view these results, navigate to Assessments > Results > Category results and filter the results using the (Type.Evaluation method) (is) (Survey) condition.
Assessment category results

Survey scorecards

A scorecard provides a visual breakdown of survey responses, based on the way questions were answered, by category. To access a scorecard, see View a survey scorecard.

View results for all surveys

You can view the survey responses that are stored on the Metric Result (asmt_metric_result) table.

Role required: survey_admin or survey_reader

1. Navigate to Survey > Survey Responses.

Do not confuse this module with Survey > Legacy Surveys > Survey Responses, which displays legacy survey responses.

The Type column displays the survey definition each response is associated with.
2. Select a response to view its details.

**View the results for a survey**

You can view the responses for one survey definition. Survey results are stored on the Metric Result (asmt_metric_result) table.

Role required: survey_admin or survey_reader

1. Navigate to **Survey > View Surveys**
2. Open a survey definition.
3. Under **Related Links**, click **View Responses**, which is available only if there are results.
   The results are grouped by metric, which is what questions are called in assessments.
4. Open a metric result to view more detail.
   The metric result contains the user's response and calculated values of interest to advanced survey administrators. Because the Metric Result table is also used by the assessment feature, many field names are not clear in the context of surveys.

**Metric result fields**

List of field descriptions for the Metric Result form.
# Metric Result form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment group</td>
<td>Assessment group to which the metric result belongs. An assessment group is a container for survey instances and results generated in a single occurrence. The system generates an assessment group every time at least one survey instance is created. If multiple survey instances are created at once, such as when a survey administrator sends invitations to a list of survey users, they are all stored in the same assessment group.</td>
</tr>
<tr>
<td>Metric</td>
<td>Question that the user answered.</td>
</tr>
<tr>
<td>Data type</td>
<td>Data type of the question the user answered.</td>
</tr>
<tr>
<td>Method</td>
<td>Assessment method. Always <strong>Assessment</strong> for surveys.</td>
</tr>
<tr>
<td>Updated</td>
<td>Date and time the metric result was last updated.</td>
</tr>
<tr>
<td>Source</td>
<td>Survey definition from which the associated survey instance was generated.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User who completed the survey questionnaire.</td>
</tr>
<tr>
<td>Instance</td>
<td>Survey instance completed by the <strong>Assigned to</strong> user.</td>
</tr>
<tr>
<td>Actual value</td>
<td>Value obtained from the user response to the question. The actual value is determined by the question data type:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Checkbox</strong>: The actual value is 0 if the checkbox is cleared and 1 if it is selected.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Choice</strong> or <strong>Likert Scale</strong>: The actual value is equal to the Value of the metric definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Date, Date/Time, or String</strong>: The actual value is -1 to indicate that these data types do not contribute to category result calculations.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Template</strong>: The actual value is equal to the Value of the template definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Yes/No</strong>: The actual value is 0 if the response is <strong>No</strong> and 1 if it is <strong>Yes</strong>.</td>
</tr>
<tr>
<td>Normalized value</td>
<td>Adjusted value that accounts for the scale definition setting, minimum and maximum values, and other factors.</td>
</tr>
<tr>
<td></td>
<td>The equation that generates the value and an example calculation appear in <strong>Example: calculate the normalized value for a survey metric</strong>.</td>
</tr>
<tr>
<td>String value</td>
<td>Value that displays the response as it appears on a questionnaire. In some cases this is the same as the actual value, such as when the question data type is <strong>Percentage</strong>. The string value is <strong>N/A</strong> for unanswered questions of certain data types.</td>
</tr>
</tbody>
</table>
Example: calculate the normalized value for a survey metric
The normalized value is calculated based on a linear equation and the scale definition of the metric.

Equation used to calculate the normalized value

\[
\text{Normalized value} = \frac{\text{Input Value} - \text{Min value defined in metric}}{\text{Max value defined in metric} - \text{Min value defined in metric}} \times \frac{\text{current metric weight}}{\text{sum of valid metric weight}} \times \text{scale_factor}
\]

**Note:** The normalized values are directly proportional to the scale definition of the metric. If the scale definition is low, that is, the lower scale values are better, then \(\text{Normalized value} = 1.0 - \text{Normalized value}\).

Example

Calculate the normalized value for the **Please rate the competency of the technician** metric. The metric has the following values:

<table>
<thead>
<tr>
<th>Values of the metric</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Input value</td>
<td>3</td>
</tr>
<tr>
<td>Minimum value</td>
<td>1</td>
</tr>
<tr>
<td>Maximum value</td>
<td>6</td>
</tr>
<tr>
<td>Current metric weight</td>
<td>10</td>
</tr>
<tr>
<td>Number of responses</td>
<td>6</td>
</tr>
<tr>
<td>· 4 of type=number</td>
<td></td>
</tr>
<tr>
<td>· 1 of type=yes/no</td>
<td></td>
</tr>
<tr>
<td>· 1 of type=string (invalid data type; value cannot be calculated)</td>
<td></td>
</tr>
<tr>
<td>Valid metric weight of each response</td>
<td>10</td>
</tr>
<tr>
<td>Scale factor</td>
<td>10</td>
</tr>
</tbody>
</table>

\[
\text{Normalized value} = \frac{3 - 1}{6 - 1} \times \frac{10}{(10 + 10 + 10 + 10 + 10) \times 10} = 0.8
\]

Several data types are ignored because the values cannot be calculated. These invalid data types include string, date, and datetime.

For reporting purposes, use the Metric Result (asmt_metric_result) table.

View a survey scorecard

A survey scorecard provides a visual breakdown of survey responses by category, based on the way questions were answered.

**Role required:** survey_admin or survey_reader

A scorecard displays charts for survey results, in which category and question responses are analyzed and current ratings are compared with previous ratings. Users can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages...
for the time range selected. The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed surveys.

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition.
3. Under **Related Links**, click **View Scorecard**.
   The scorecard link is hidden if there are no survey results to report.

The interactive scorecard displays the name of the survey and results or comparisons of the ratings. You can display results in the following views:

- Category Results
- Question Results
- Average Ratings
- History

**Survey scorecard category results**
The Category Results view is a stacked bar chart showing survey results for all questions in a category by respondent count.

Select a category from the list to display the questions from that category in the chart.

This view displays responses that use the following data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

**Note**: The **Checkbox** and **Yes/No** data types are combined into the **Boolean** data type in the Survey Designer.
Service Desk Satisfaction Survey

Survey Scorecard

Service Desk Satisfaction Survey

Metric Result Count

1 2 3 4 5 No Yes
To view details about a specific response, point to the colored bar to display the response, the number of responses, and the percentage it represents of all the responses to that question.

Survey scorecard category results detail

Survey scorecard question results
The Question Results view shows the results for each question in a category using different chart types, based on a data type.

Pie chart
The pie chart shows question results for these data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

Note: The Checkbox and Yes/No data types are combined into the Boolean data type in the Survey Designer.
Service Desk Satisfaction Survey

Survey Scorecard

How courteous and respectful was the technician who responded? (1=poor, 6=excellent)

- 2 = 2 (14.29%)
- 3 = 2 (14.29%)
- 4 = 9 (64.29%)
- 5 = 1 (7.14%)

Bar chart

A bar chart appears when question results use the Percentage data type.

By default, all results for percentage questions use a report range of 20% segments. To configure a report range, navigate to Reports > Administration > Report Ranges.

Survey scorecard average ratings

The Average Ratings view displays the weighted average rating for each survey question in a category.

Use this view to learn how individual questions affect the overall rating for the category. Select a survey category from the choice list to display the chart for that category.
To view the effect of each question's ratings on the entire category's ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question's weighted average.

![Graph showing Compare Plans and Benefit Satisfaction with Benefit Satisfaction weighted average of 0.88 (23.75%)]

**Average ratings detail**

**Survey scorecard history**

The History view compares the current ratings for the categories and their questions with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the **Diff** column indicate the trend of the current survey against the previous survey.

Point to a category to display a line chart that shows the rating trend for that category. Click a category to view the Survey Category form containing the survey questions.
Survey scorecard trend chart

3 years

To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The Diff column shows the discrepancy between the current ratings and the previous calendar year's ratings.

### Survey scorecard history - 3 years
4 quarters

Quarterly surveys compare the average rating for each question and category in the current quarter against the average ratings from the previous four quarters. The Diff column shows the discrepancy between the current ratings and the previous quarter's ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the 3rd quarter of 2015, then the previous quarters appear as 2nd (2015), 1st (2015), 4th (2014), and 3rd (2014). All four of the previous quarters appear, whether or not there was any data for those quarters.

#### Survey scorecard history - 4 quarters
Export a scorecard as an image
You can export a scorecard as an image to use in presentations or other documents.

Role required: admin or survey_admin

1. Click the menu icon ( ) and select Save as PNG or Save as JPEG and wait for the export to complete.

2. Click Download and save the scorecard image to a storage location.
Survey administration

Survey administrators—users with the survey_admin role—create and maintain surveys and configure how they are distributed and published. Surveys on Service Portal are also supported. Survey administration includes the following procedures.

- Create, customize, and publish surveys.
- Write and maintain survey questions.
- Define trigger conditions for when surveys are sent to users, such as when an incident closes.
- Maintain surveys and survey questions as the organization’s needs change.

To set up surveys in Service Portal, you must first install Service Portal and then configure the Survey widget on the page. The base system includes the Survey widget.

Surveys in Service Portal

If Service Portal is installed, you can use the Survey widget to set up surveys, quizzes, assessments, risk assessments, and attestations in Service Portal. Surveys for users on mobile devices are fully supported in Service Portal.

To create an intuitive interface for your users, you can set up surveys in Service Portal. You must first install Service Portal and then configure the survey widget on the page. To learn more about configuring a widget, see configure widget instances.
To configure a Survey widget on a page, CTRL + right-click the widget heading and select **Instance Options**.

### Service Portal: Instance options (properties) for the Survey widget

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max records</td>
<td>Number of surveys to list on the Service Portal homepage. The user can click the <strong>View all</strong> link to view all items. Default: 5</td>
</tr>
<tr>
<td>Title of the widget</td>
<td>Text that appears in the title bar of the surveys widget. Default: <strong>My Surveys</strong></td>
</tr>
</tbody>
</table>
Each survey on the My Surveys page contains a progress bar and a description. The color in the progress bar increases as a survey is completed. In the case of a triggered record, the table title is used for the survey description.

For mobile users, the *Pagination setting for Service Portal view* survey designer property is set to one question per page by default.
Survey designer

Users with the survey_admin role can use the survey designer. The survey designer lets you create survey categories and questions, configure the details, and publish the survey to specific users or groups.

You can assign a survey to individual users or groups who receive all the questions from all the categories. You can also customize each question and make it dependent on the response to another question. The following describes the procedures you follow to create and publish a survey.

- Create survey categories.
- Create questions within each category.
- Configure survey details, such as introductory and closing remarks and time limit.
- Select recipients for the survey.
- Publish the survey to the selected users or groups.

**Note:** The survey designer replaces the survey creator in the Legacy Surveys application. If you are using Internet Explorer version 8 or earlier, the system redirects you to the survey creator.

Survey designer elements
The survey designer is accessible from Survey > Survey Designer.

The survey designer contains controls, a header bar, and the design canvas.

Controls

To create a question, drag the appropriate data type control from the Controls palette and drop it onto the designer canvas.
The assessment engine provides a built-in result calculation feature that converts responses to scored question data types to a score from 0 through 10.

**Question data types**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Scored</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attachment</td>
<td>No</td>
<td>Question with a Manage Attachments icon that allows users to attach one or more files.</td>

<td>Yes</td>
<td>Choice list of templates that provide a predefined scale of options. For details, see <em>Quiz scorecards</em>.</td>
</tr>
<tr>
<td>Reference</td>
<td>No</td>
<td>Choice list of fields from a specified reference table. This data type does not support reference qualifiers. For example, a user could select a user name if you specify sys_user as the reference table.</td>
</tr>
<tr>
<td>Image Scale</td>
<td>Yes</td>
<td>Question with a choice of images that can be selected. A template can be used to apply the same images to multiple questions.</td>
</tr>
<tr>
<td>Multiple Selection</td>
<td>Yes</td>
<td>Question with multiple check boxes that can be selected.</td>
</tr>
<tr>
<td>Data type</td>
<td>Scored</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td>Ranking</td>
<td></td>
<td>Question with an order number to be selected for each option. One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.</td>
</tr>
</tbody>
</table>

**Header bar**

The tabs on the header bar display views and a menu of functions.

<table>
<thead>
<tr>
<th>Survey Designer</th>
<th>Design</th>
<th>Configuration</th>
<th>Availability</th>
</tr>
</thead>
</table>

Point to the menu icon (≡) to select an option. The list of options depends on the currently open survey:

- **Save**: Save the current survey.
- **Preview**: Display a preview of the survey as it appears to recipients.
- **Publish**: Distribute the survey to the selected recipients.
- **Save and Publish**: Save and distribute the survey in one step.
- **New Survey**: Open a fresh canvas for a new survey.
- **Load Survey**: View the list of existing surveys.
Design canvas

New surveys open in the canvas of the Design view. The survey Name field appears above first category in the canvas. A blank question field appears in the category container.

Initial appearance of the Survey Designer canvas

Configure a survey in the survey designer
Configuration settings apply to the entire survey.

Role required: admin or survey_admin

Select Configuration in the survey designer and complete the Survey Designer Configuration form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Select the check box to enable the distribution of this survey to recipients.</td>
</tr>
<tr>
<td>Anonymize responses</td>
<td>Select the check box to collect survey responses anonymously. Recipients are not listed with survey results. When a user submits a survey, the system clears the Assigned to field for the associated survey instance. Also, survey responses for anonymous surveys do not contain Assigned to values.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of this configuration or the survey to which it is attached.</td>
</tr>
<tr>
<td>Introduction</td>
<td>Introductory content to display on surveys. You can add a welcome message or background information about the survey.</td>
</tr>
<tr>
<td>Signature</td>
<td>Acknowledgement by a survey recipient of requirements, admonitions, or expectations related to a survey.</td>
</tr>
</tbody>
</table>

**Note:** The Assigned to field is cleared. However, each response record includes the Created By and Updated By fields that are accessible to users with the survey_admin role.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Return URL</td>
<td>Destination address of a web page that is presented to users after they submit a completed survey. When a return URL is configured, the End note content does not appear.</td>
</tr>
<tr>
<td>End note</td>
<td>Content that is displayed to recipients after they submit a completed survey. You can add a thank you message, follow-up instructions, or other applicable information. End notes are not displayed if a Return URL is specified.</td>
</tr>
</tbody>
</table>
| Pagination setting for Service Portal view | Specify how the user will see pages on the desktop or tablet view in Service Portal.  
• Category: Display each category on a separate page.  
• Question: Display each question on a separate page. This happens for mobile regardless of this setting.  
• None: All items on a single page—no pagination  
Default: **Category**  
**Note:** This field appears only when Service Portal is installed. |
| Duration                          | Amount of time that recipients are given to complete this survey, starting from the time that the survey is generated. The default duration is 14 days.  
**Note:** By default, the system runs the **Cancel Expired Assessments** script every 30 days to cancel expired survey and assessment instances that are in the **Work in progress** or **Ready to take** states. |

**Survey categories**  
Survey categories provide a way to group questions of a similar theme for a given survey.  
There must be at least one survey category per survey definition and every survey question must be associated with a category. When you create a survey, the system generates one category, which all the questions belong to.  
For simple surveys, one category is usually enough. Consider creating additional categories if you want to accomplish any of the following tasks.  
• Separate groups of questions into collapsible sections by category on the survey questionnaire.  
• Report on category scores, which are calculated based on responses for all questions within each category.

Create a category in the survey designer
A category represents a theme for evaluating a specific element of the survey topic and contains questions pertaining to that theme.

Role required: admin or survey_admin

When you create a survey, the system creates a default category, using the name of the survey. You can use this category, modify it, and create additional categories as needed. To have any results, a category must contain scored questions.

1. Navigate to Survey > Survey Designer.
2. Enter the name of the survey in the Name field.
   The system uses this name as the name of the survey and of the first category.
3. To configure the category, click the gear icon in its title bar and complete the following steps in the Properties dialog box.
   a) Enter a new name and a description for the category.
   b) Enter text in the Details field that introduces or explains the category to recipients.
   c) Click the X icon to close the Properties dialog box and save your settings.

4. To add a new category, click the + icon in the title bar of an existing category.
   The new category appears below the category that you selected to create it. You can click the X icon in a category header to delete a category that you added in error.

Create a survey category in a survey
You can modify an existing survey to add one or more survey categories.

Role required: admin or survey_admin

Only one category is required for each survey, but you can add additional categories as needed.

1. Navigate to Survey > View Surveys.
2. Open a survey definition.
3. In the Metric Categories related list, open a category or click New.
   Each survey category is stored as a record on the Metric Category (asmt_metric_category) table with a modified view for survey use.
4. Enter the survey category name and description.
   The category name appears on questionnaires when either of the following is true.
   • There is more than one category for the survey.
   • There is only one category and its name is different from the survey definition name. If you create a survey using the survey creator, the category name is the same as the survey definition name.

5. Right-click the form header and click Save.
   The Assessment Metrics and Users related lists appear.
6. Click Update.

Create a question in the survey designer
You can create multiple questions for each category in the survey designer, but each question can only be associated with one category.

Role required: admin or survey_admin

The data type that you select for each question determines how it can be answered by survey recipients.

1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.
2. To configure the question, click the gear icon in its title bar. The Properties dialog box opens.
3. Complete the form.

**Question property fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Concise name of the question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as the question on surveys. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Type</td>
<td>Data type selected for this question. See the table in Controls for the available data types.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this question is available on a survey. A question does not appear on surveys that are generated after the question becomes inactive.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box to require users to answer the question. Mandatory questions are denoted by a red field status indicator and must be answered before the survey can be submitted.</td>
</tr>
<tr>
<td>Boolean option</td>
<td>Whether a check box or a Yes/No list appears as the option for a Boolean question.</td>
</tr>
<tr>
<td>String option</td>
<td>Setting for the appearance of a string field in a question. This field is available when the question type is String. The string options include the following.</td>
</tr>
<tr>
<td></td>
<td>• Single line: Single-line text field 40 characters in length that allows strings of any length.</td>
</tr>
<tr>
<td></td>
<td>• String line wide: Full page width text field that allows a single-line entry of any length.</td>
</tr>
<tr>
<td></td>
<td>• Multiline: Full page width multiline text field that allows word wrap and returns</td>
</tr>
<tr>
<td>Min</td>
<td>Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.</td>
</tr>
<tr>
<td>Max</td>
<td>Highest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box for including <strong>Not Applicable</strong> as an option for this question. Users can select <strong>Not Applicable</strong> if they do not have sufficient information to respond to a question. User responses of <strong>Not Applicable</strong> are excluded from results calculations. This field is available when the question does not have a dependency and the question type is not <strong>Boolean</strong> with a check box option.</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box for displaying answer options in a random order. Answer preference is sometimes influenced by the order in which options appear, which can result in biased results. Randomizing options can help prevent this bias. <strong>Note:</strong> Randomizing options for certain questions may make those questions confusing for users. In general, only randomize options that do not follow a logical order.</td>
</tr>
<tr>
<td>Positive indicator</td>
<td>Setting that determines whether smaller or larger numerical values equate to a good score in result calculations. Select <strong>Low values</strong> if smaller numerical values are better, such as for a question that measures the number of incidents for a vendor. Select <strong>High values</strong> if larger numerical values are better, such as for a question that measures user satisfaction on a scale of one to five.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question that is displayed on the survey. Include details that help users understand how to answer the question.</td>
</tr>
</tbody>
</table>

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
4. To create any special conditions that must be met before the question appears on the survey, click the Dependency tab.
   The question must have a data type of Boolean, Choice, Scale, or Template.

5. Select a question in the Displayed when field.
   The system selects the appropriate operator and displays the possible answers for the selected question.

6. Select the answer that satisfies the condition.
   You can select more than one answer. Selected answers are indicated by a check mark.
   The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.

7. Click the X icon to close the question properties dialog box and save your settings.

8. To add a question with the same data type as an existing question in the category, click the + icon in the title bar of the existing question.

9. Drag and drop questions to change their order within a category or move them between categories.

10. To delete a question, click the X icon in its title bar.

**Survey question data types**

You must choose a data type for each survey question. The data type determines the format of the question and the kind of data that is collected on survey questionnaires.
The following data types are available for surveys:

### Attachment data type

On questionnaires, users can attach one or more files to a question. Users click the Manage Attachments icon and select one or more files in the Attachments pop-up window to attach to the question. From this window, users can:

- View a list of the attached files.
- View an attached file in a separate window.
- Rename an attached file.
- Add or delete files

Once a survey has been submitted, attachments cannot be updated or deleted. Any type of file supported by the platform can be attached to a question. One or more files can be attached to a question while taking a survey or completing an assessment. The assessment administrator can see the attachments associated with an individual question as well as those associated with the survey. See [Administering Attachments](#) for more information.

### Boolean data type

On questionnaires, users select a check box beside a statement or leave it cleared.

If you select **Boolean**, you must fill in the **Scale definition** field. Select **High** if it is best when users select the check box.

### Choice data type

On questionnaires, users select a value from a list of choices.

If you select **Choice**, you must fill in the **Scale definition** field and create answer options. Select **High** for the scale definition if the answer option with the largest metric definition **Value** is best.
Date and Date/Time data types

The Date and Date/Time data types are similar.

- **Date**: On questionnaires, users select a date.

![Calendar selecting a date](image)

- **Date/Time**: On questionnaires, users select a date and time.
Likert Scale data type

On questionnaires, users select a multiple choice value from a custom Likert scale. Each answer option is represented by a radio button on the scale. A Likert scale question that evaluates an application’s ease of use might have the answer options Easy, Average, and Difficult.

If you select Likert Scale, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

Note: The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

Number data type

On questionnaires, users enter a number.
If you select **Number**, you must fill in these additional fields:

- **Scale definition**: Select **High** if a larger number is better, such as for a question that measures the number of sales made in a quarter.
- **Min** and **Max**: Enter the smallest and largest numbers users can enter. State the range of acceptable answers in the question text.

### Percentage data type

On questionnaires, users enter a number.

If you select **Percentage**, you must fill in these additional fields:

- **Scale definition**: Select **High** if a larger percentage is better, such as for a question that measures the percentage of work an agent has completed.
- **Min** and **Max**: Enter the smallest and largest numbers users can enter. Generally 0 and 100 are appropriate minimum and maximum values. If you choose values other than 0 and 100, it is usually best to state the range of acceptable answers in the question text.

### Reference data type

On questionnaires, users select a value from a list that is generated from a specified reference table. The response field supports auto-completion.

**Note:** Reference qualifiers are not supported.

For example, a user could select a user name in response to a question if you specify User (sys_user) as the reference table.
String data type

On questionnaires, users enter text. When you select String, the String option field appears. Select one of the following options to determine how the string field appears on questionnaires:

- Single line
Template data type

On questionnaires, users select a value from a predefined series of answer options. To use this data type, a question template must be defined.

If you select Template, you must fill in these additional fields:

- **Template**: Select a template.
- **Scale definition**: Select High if the answer option with the largest template definition Value is best.

Yes/No data type

On questionnaires, users select Yes or No from a list.
If you select Yes/No, you must fill in the Scale definition field. Select High if Yes is the best answer.

**Image scale data type**

On questionnaires, users select an image from a predefined set of images as their response. Image scale questions can also be used in a template for better performance with surveys that have the same type of answer options.

Five emojis, similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Two images can be uploaded, one for selected case and another for unselected case. Larger size images are reduced to 64 x 64 pixels.

The result behavior depends on the presence of uploaded images. If no selected image is uploaded, then the question shows up blank.

<table>
<thead>
<tr>
<th>Selected image</th>
<th>Unselected image</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Unselected image loads. Clicking on the image changes it to the selected image.</td>
</tr>
<tr>
<td>Yes</td>
<td>No</td>
<td>Selected image loads with 50% opacity. Clicking on the image changes the opacity to 100%.</td>
</tr>
<tr>
<td>No</td>
<td>Yes</td>
<td>A blank placeholder box is displayed.</td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>A blank placeholder box is displayed.</td>
</tr>
</tbody>
</table>

**Note:** N/A option is not supported for image scale type question.

**Multiple selection data type**

On questionnaires, users can select multiple check boxes indicating all answers that apply. For instance, a user can be instructed to "Select all that apply" in a multiple selection question.
Ranking data type

On questionnaires, users can select a different order number for each option to rank them. Drag-and-drop functionality is also supported, which allows a user to either fill in the number, or simply drag an option.

One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.

Edit a survey in the survey designer
You can modify surveys using the survey designer.

Role required: admin or survey_admin
You can edit a survey even after it has been distributed, with the following results.

- Added questions are available only on surveys that are distributed after this change.
- Changes to existing questions are immediately available to users before the survey is submitted or during the retake period. This includes changes to the answers, such as additional choices or changes to the data type.
- Deleted questions are also deleted from the distributed surveys in user queues.

1. Navigate to Survey > Survey Designer.
2. Point to the menu icon in the survey header bar, and select Load Survey.
3. Select a survey from the list and modify it as needed.
4. Point to the menu icon in the survey header bar, and select Save or Save and Publish.

When you publish the edited survey, the system generates survey instances for any associated survey users.

Configure category weights for a survey

You can assign a weight to each category in a survey. The system calculates results from the weight that you configure.

Configure the Survey Category form to display the Weight field.

Role required: admin or survey_admin

Weights are set to a value of 10 by default but can be changed.

1. Navigate to Survey > View Surveys and select a survey from the list.
2. In the Survey Definition form, select a category from the Metric Categories related list.
3. Edit the default weight value.
4. Click Update.

View a survey instance

A survey instance represents one questionnaire assigned to one user. You view an instance to verify that survey instances were created, to check the state of a survey instance, or to reassign a survey instance.

Role required: admin or survey_admin

Navigate to Survey > Survey Instances and open a survey instance.

Each survey instance is stored as a record on the Assessment Instance (asmt_assessment_instance) table with a modified view for survey use.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Automatically generated record number.</td>
</tr>
<tr>
<td>Metric type</td>

### Survey users and groups

Survey users and survey user groups help survey administrators control who can take a survey.

Survey administrators can restrict a survey so that only specified users can access it unless a survey administrator manually assigns the survey to a different user. Survey user groups provide a way to quickly designate multiple survey users.
Administering survey users

The list of survey users for a survey is visible on the Survey Definition and Survey Category forms. You can add or remove users from the list of survey users at any point. Note that designating a survey user does not automatically generate a survey instance for that user unless both of the following conditions are true:

- The survey definition Schedule period is set to Daily, Weekly, Monthly, or Yearly. In this case the system assigns a new survey instance to each survey user at the beginning of each schedule period.
- The user has no instances of the survey that are incomplete or that have not yet reached their expiration date.

You can designate survey users from the Survey Designer, the Survey Definition form, or the Survey Category form.

**Note:** If there are trigger conditions for a survey, do not create survey users. Instead, use the Trigger Conditions form to assign users.

Create a survey user group

Survey user groups are groups that have the Type field set to survey and that display only the information most relevant to surveys. You can assign survey groups or any user group to surveys.

Role required: admin, user_admin, or survey_admin

Though it is possible to designate members of any group as survey users, one reason to create a survey group is to view it conveniently in the survey User Groups module.

1. Navigate to Survey > Administration > User Groups.
2. Click New.
3. Complete the Group form.
4. Right-click the form header and click Save.
   - The Group Members and Groups related lists appear.
5. To add group members, complete the following steps.
   a) In the Group Members related list, click Edit.
   b) Select users from the list on the left and add them to the Group Members List on the right.
   c) Click Save.

Select recipients for a survey in the Survey Designer

You can assign survey users while designing or modifying the survey.

Role required: admin or survey_admin

1. In the Survey Designer, click the Availability tab.
2. Under Accessible by:, select the Specific users option, then select users.
3. If desired, select the Survey groups only check box, then select survey user groups or other groups.
4. Click Save.

Designate a survey user

You can designate one survey user at a time from the Survey Definition form.

Role required: admin or survey_admin

1. Navigate to Survey > View Surveys.
2. Open a survey definition.
   There must be at least one category.

3. In the Survey Users related list, click New.
4. Select a User.
5. Click Submit.
   The Survey Definition form reopens.

6. Optional: To remove survey users, in the Survey Users related list, select the check box beside
   the user, and then select Delete from the action list below the list.

Designate or remove multiple survey users at one time
Use the Survey Category form to designate or remove multiple survey users at a time.
Role required: admin or survey_admin
1. Open a survey definition.
2. In the Metric Categories related list, open a category.
   You can choose any category. The system applies survey user changes to all the survey's
   categories automatically.
3. In the Users related list, click Edit.
4. Use the slushbucket to add or remove survey users.
5. Click Save to return to the survey category.
   The changes are also reflected in the Survey Users related list on the survey definition.

Allow recipients to retake a survey
You can configure a survey to allow recipients to resubmit their answers as many times as they like,
up to the survey's due date.

Configure the Survey Definition form to display the Allow retake field. For more information, see
Configure the form layout.
Role required: admin or survey_admin
Results are not calculated for the survey until the configured duration has elapsed. The card in
the user's queue remains visible until the due date of the survey, and a button is displayed to allow
retakes.
1. Navigate to Surveys > View Surveys.
2. Select a survey from the list.
3. Select the Allow retake check box.
4. Click Update.

Publish a survey
You must publish a survey to enable people to receive and complete survey instances.
Role required: admin or survey_admin
The State field on the Survey Definition form indicates whether the survey is in the Draft or
Published state.

Note: You cannot return a survey to the Draft state after it has been published. You do
have the option to deactivate a survey by clearing the Active check box.

1. Navigate to SurveyView Surveys and select a survey to publish.
2. Click Publish.
When you publish a survey, the system generates survey instances for any associated survey users. You can assign the survey to other users manually.

**Publish a survey in the Survey Designer**

You must save changes to a survey before you can publish it to the specified recipients or groups.

Role required: admin or survey_admin

1. In the Survey Designer, point to the menu and select Load Survey.
2. Select a survey to publish.
3. To preview the survey as a user, point to the menu icon and click Preview.
4. When you are satisfied with the survey, click either Save and Publish or Publish to distribute it.

When you publish a survey, the system sends email notifications to the recipients and to their managers. The system displays a link to the survey on a card in each recipient's My Assessments & Surveys portal.

**Customize the appearance of a survey**

Assessment and survey administrators can set properties to customize the color of various elements on the questionnaires.

Role required: admin or survey_admin

**Note:**
- For color properties, enter either an HTML color name or hexadecimal (hex) value. For hex values, the # character is required. Values are not case-sensitive.
- For example, all of the following formats are valid: LightGray, lightgray, #D3D3D3. A preview of the color appears next to the field.

Note that the customizations you make apply to all assessments and surveys.

1. Navigate to either of the following modules.
   - Assessments > Admin > Assessment Properties
   - Survey > Administration > Properties

2. On the properties page, edit the properties as needed.

Refer to the screenshot below to see what parts of assessment questionnaires are controlled by the properties.
3. Click **Save**.
You may need to clear the browser's cache to see updates.

**Assessment and survey properties**
You can configure a variety of properties to customize the appearance of assessment and survey questionnaires, require authentication for user signatures, open surveys in the service portal view from emails, and limit the number of items shown in a decision matrix field filter.

### Assessment and survey properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
</table>
| sn_portal_surveys.sp_survey.email_redirection | Allow survey link from email to open in service portal view (applies only for surveys) | When Yes is selected, a survey accessed from a link in an email opens in the Service Portal.  
- Default value: No |
| com.snc.assessment.signature_authentication | Require authentication for user signature. | When Yes is selected, this property requires credentials for a full name signature.  
- Default value: Yes |
| css.assessment.question.header.background.color | Assessment question header background color | Sets the background color of question headers on assessment and survey questionnaires.  
- Default value: #767676 |
| css.assessment.caption.background.color | Assessment caption background color | Sets the background color of the caption on assessment and survey questionnaires.  
- Default value: #eee |
### Survey definitions

A survey definition is the root record upon which a survey is built.

The survey designer generates a survey definition automatically when you save or publish the survey. Survey administrators may want to modify the survey definition to configure additional options for the survey, or to publish the survey when it is ready for distribution.

Survey administrators and survey readers can also send survey invitations directly to users from the survey definition.

**Modify a survey definition**

You can configure additional options for a survey definition.

Role required: admin or survey_admin

1. Navigate to Survey > View Surveys.
   
   Each survey definition is stored as a record on the Assessment Metric Type [asmt_metric_type] table with a modified view for survey use.
2. Open a survey definition.
3. Modify the fields on the Survey Definition form, as appropriate.

### Survey Definition form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the survey, which appears on the questionnaire.</td>
</tr>
<tr>
<td>Description</td>
<td>Helpful information about the survey.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to activate the survey definition. When the Active check box is</td>
</tr>
<tr>
<td></td>
<td>cleared, new survey instances cannot be generated and users cannot complete</td>
</tr>
<tr>
<td></td>
<td>existing survey instances. Use the Active check box to deactivate or</td>
</tr>
<tr>
<td></td>
<td>activate a published survey.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Anonymize responses</td>
<td>Check box to ensure that all responses for this survey are stored without the submitting user names. When a user submits a survey, the system clears the Assigned to field for the associated survey instance. Also, survey responses for anonymous surveys do not contain Assigned to values.&lt;br&gt;&lt;br&gt;Note: The Assigned to field is cleared. However, each response record includes the Created By and Updated By fields that are accessible to users with the survey.admin role.</td>
</tr>
<tr>
<td>Send notifications</td>
<td>Check box to send a notification that the survey has been taken.</td>
</tr>
<tr>
<td>State</td>
<td>Status of the survey: <strong>Draft</strong> or <strong>Published</strong>.</td>
</tr>
<tr>
<td>Signature</td>
<td>Acknowledgement by a survey recipient of requirements, admonitions, or policies related to the survey. The signature may require the recipient to select a check box or to type a full signature to verify having read these assertions. You can display assertions without requiring a signature. Select an existing signature from the list or click <strong>New</strong> to create a new one. The signature form contains these fields:&lt;br&gt;&lt;br&gt;• <strong>Name</strong>: Descriptive name for this signature.&lt;br&gt;• <strong>Signature type</strong>: Type of signature required. The selections are <strong>Check box</strong>, <strong>Full name</strong>, or <strong>Assertion only</strong>. If <strong>Assertion only</strong> is selected, no signature is required to submit the survey.&lt;br&gt;• <strong>Assertion</strong>: Text you want to display to recipients.&lt;br&gt;&lt;br&gt;By default, a property called <strong>Require authentication for user signature</strong> (com.snc.assessment.signature_authentication) requires users to authenticate when providing a full name signature.</td>
</tr>
<tr>
<td>Schedule period</td>
<td>Option that determines how often a user can take the same survey and whether the system generates survey instances on a schedule.</td>
</tr>
</tbody>
</table>

Note: If you use a trigger condition for a survey, ensure the schedule period is set to **No Limit**. Trigger conditions use a different method to regulate how often users can receive survey instances.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow retake</td>
<td>Check box that allows users to modify their answers to a completed survey. Users can resubmit a survey as many times as they want until the due date. After that date, the system removes the survey from the user's My Assessments &amp; Surveys page.</td>
</tr>
</tbody>
</table>
| Scheduled job                        | Scheduled job the system creates for this survey definition when the schedule period is a repeating interval. The system sets the scheduled job to run according to the selected schedule period. If you change the schedule period and save the survey definition:  
  - The system deletes the old scheduled job.  

If you selected a recurring schedule period:  
  - A new scheduled job is created.  

For example, if you change the schedule period from Daily to Weekly and save the record:  
  - The system deletes the daily scheduled job.  
  - Creates a weekly one set to run a week from the current date.  

This field is visible to administrators only if the schedule period is Daily, Weekly, Monthly, or Yearly. |
| Introduction                         | Introductory content to display on survey questionnaires. Consider adding a company logo, a welcome message, background information about the survey, or instructions.                                                                                                                                  |
| End note                             | Content to display on the screen that appears when someone submits a survey questionnaire. Consider adding a thank you message, follow-up instructions, or other applicable information.                                                                                                                   |
| Pagination setting for Service Portal view | The setting on which the pagination is based for desktop or tablet view in Service Portal.  
  - Category: default  
  - Question: 1 question per page (automatic for mobile)  
  - None: no pagination  

<p>| Note: This field is displayed only when Service Portal is installed. |</p>
<table>
<thead>
<tr>

<tr>
<td>Enable Public Access</td>
<td>Link that enables/disables the survey as a public survey. No login is required to take a public survey (including a survey with a trigger condition) and users or non-users can respond anonymously. For completed public surveys, the <a href="#">Assigned to</a> field value is Guest.</td>
</tr>
<tr>
<td>Remove Public Access</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You can use the <a href="#">View Survey URL</a> related link to share the URL with users.</td>
</tr>
<tr>
<td>View Responses</td>
<td>Link that opens the list of <a href="#">responses</a> for this survey. This related link is available only if there are results for the survey.</td>
</tr>
<tr>
<td>View Scorecard</td>
<td>Link that opens the <a href="#">scorecard</a> for this survey. This related link is available only if there are results for the survey.</td>
</tr>
<tr>
<td>View Survey URL</td>
<td>Link that opens a dialog box that displays a <a href="#">URL</a> for this survey. The URL is useful for sharing a public survey.</td>
</tr>
<tr>
<td></td>
<td>This related link is available only if the <a href="#">Active</a> check box is selected. The URL does not work until the survey definition is published.</td>
</tr>
<tr>
<td>Related Lists</td>
<td></td>
</tr>
<tr>
<td>Metric Categories</td>
<td>All <a href="#">survey categories</a> for this survey.</td>
</tr>
<tr>
<td>Survey Users</td>
<td>All <a href="#">survey users</a> who are authorized to take this survey. If no users are listed, any user can take this survey.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Assessment Instances</td>
<td>All survey instances for this survey. Configure the form to add this related list to see it.</td>
</tr>
</tbody>
</table>

**Note:** If you add a related list to the form, use list control to omit the New button. The system generates survey instances to produce functional surveys.

4. Save the record.

**Schedule periods**
The available schedule periods are **Only Once, No Limit, Daily, Weekly, Monthly, and Yearly**.

The default schedule period is **No Limit**. When you set the schedule period to anything except **Only Once or No Limit**, the system creates a corresponding scheduled job. The scheduled job performs the following actions:

- Ensures that a user can take one survey instance of the same survey per schedule period.
- Generates a new survey instance for each survey user at the beginning of the new schedule period, as long as the survey user does not have an incomplete instance of that survey. A survey instance is incomplete if the state is not **Complete**.

For example, if you set the schedule period to **Monthly** and someone attempts to send survey invitations twice in the same day, the system generates survey instances for the survey users the first time only. At the beginning of the next schedule period, the system generates another survey instance for each survey user who completed the previous one.

Schedule periods are enforced by the **Expiration date** field on the survey instance. As long as the survey instance expiration date has not passed, the assigned user cannot receive a new survey instance. When the system generates a survey instance and the schedule period is anything except **No Limit**, the **Expiration date** field is automatically set to the appropriate date. For example, if the schedule period is **Weekly**, the expiration date is a week after the survey instance is generated.

If you change the schedule period, the scheduled job updates automatically to the correct schedule. However, users who have survey instances for the survey cannot receive new survey instances until their existing survey instances expire, regardless of the new schedule period.

Consider the following example: Sal Pindell receives a survey instance when the schedule period is **Weekly**. The next day, a survey administrator changes the schedule period to **No Limit**. Sal cannot receive another survey instance until one of the following actions occurs.

- Seven days pass from the time Sal's survey instance was generated.
- A survey administrator deletes Sal's survey instance.

After one of these actions occurs, Sal can receive a new survey instance anytime, as long as he has no incomplete instances of the survey.

**Note:** If you use a trigger condition for a survey, ensure the schedule period is set to **No Limit**. Trigger conditions use a different method to regulate how often users can receive survey instances.

**Create a survey designer template question**
You can create a question that uses choice lists from a template.
Role required: admin or survey_admin

1. Navigate to Survey > Survey Designer and load a survey or create a new survey.
2. Drag the Template data type icon into a category container.
3. Click the gear icon in the question title bar to open the template properties dialog box.
4. Select a predefined scale from the list.
Question entry fields appear for that template.

5. Enter one or more questions that are appropriate for the template.
6. Click the arrow to the right of a question to configure its properties. You must provide a name for each question.
7. Click the back arrow to return to the template properties dialog box.
8. Configure the properties for the remaining questions.
9. Click the X icon to close the template properties dialog box and save your settings.

Survey questions

Survey questions appear on survey questionnaires for the associated survey definition.

The survey creator generates questions and answer options automatically. However, it provides only the basic configuration options for questions, such as the question text and the data type. You may want to create additional questions or set advanced configuration options for the questions, including making a question appear conditionally or making a question mandatory. You can also use question templates to define reusable sets of answer options.

Survey questions are available from Survey > Questions. The list displays information about each question, including the associated survey definition listed in the Type column, and the data type. Survey administrators can modify these questions.

Create or modify survey questions
You can create and administer survey questions.

Role required: admin or survey_admin
Changes to a survey, such as the addition of questions or the modification of question templates, do not apply immediately to the existing survey instances. However, the changes apply immediately to any new survey instances that are created after the changes are saved.

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition.
3. In the **Metric Categories** related list, open a category.
4. In the **Assessment Metrics** related list, open an existing question or click **New**.

   Each survey question is stored as a record on the Assessment Metric (asmt_metric) table with a modified view for survey use.

5. Complete the Survey Question form.

   The fields that appear depend on the selected **Data type**.

   **Survey Question form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the question. When you create a survey, the question name is the same as the text in the <strong>Question</strong> field.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to use for the question, which appears on survey questionnaires.</td>
</tr>
<tr>
<td>Data type</td>
<td>Data type of the question. The fields for the response depend on the data type.</td>
</tr>
<tr>
<td>Template</td>
<td>Question template to use for the answer options. This field is visible and required only if the data type is <strong>Template</strong>.</td>
</tr>
<tr>
<td>Scale definition</td>
<td>Setting that determines whether smaller or larger numerical values equate to a good score in result calculations. Select <strong>Low</strong> if smaller numerical values are better, such as for a question that measures the number of incidents for a vendor. Select <strong>High</strong> if larger numerical values are better, such as for a question that measures user satisfaction on a scale of one to five. This field is visible and required only when certain data types are selected.</td>
</tr>
</tbody>
</table>

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Randomize answers</td>
<td>Check box that determines whether to present the answer options for this question in a random order each time a user opens the survey. Answer preference is sometimes influenced by the order in which answer options appear, which can result in biased results. Randomize answer options to help prevent this bias. This field is visible only if the data type is Choice or Likert Scale.</td>
</tr>
<tr>
<td>Note: Randomizing answer options may make a question confusing. In general, only randomize answer options that do not follow a logical order.</td>
<td></td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box that makes the question mandatory (selected) or optional (cleared) on survey questionnaires. Users cannot submit questionnaires until they provide valid responses to all mandatory questions, which are denoted by a red field status indicator. This field is visible only when the Depends on field is empty and the data type is not Checkbox. Questions that depend on other questions and check box questions cannot be mandatory.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box that determines whether to include a Not Applicable answer option for this question on survey questionnaires. User responses of Not Applicable are excluded from results calculations. This field is visible only if the data type is Choice, Likert Scale, Template, or Yes/No.</td>
</tr>
<tr>
<td>Depends on</td>
<td>Setting used to make this a conditional question, meaning that it only appears when users answer another question a certain way. To make a question depend on another question, select an existing question from the list, which displays Checkbox, Choice, Template, and Yes/No questions of the same category as this question. Then, use the Displayed when field to set the conditions that cause this question to appear on surveys. The system prevents the creation of recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Displayed when</td>
<td>Answer options for the selected Depends on question which, when chosen on surveys, display this question. This field is visible and required only when the Depends on field is set.</td>
</tr>
<tr>
<td>Min</td>
<td>Smallest numerical value to be used as an answer option for this question. This field is visible and required only if the data type is Choice, Likert Scale, Number, or Percentage.</td>
</tr>
<tr>
<td>Max</td>
<td>Largest numerical value to be used as an answer option for this question. This field is visible and required only if the data type is Choice, Likert Scale, Number, or Percentage.</td>
</tr>
<tr>
<td>String option</td>
<td>Selection that determines what kind of response text box appears for this question on survey questionnaires. This field is visible and required only if the data type is String.</td>
</tr>
<tr>
<td>Related Lists</td>
<td>Assessment Metric Definitions</td>
</tr>
</tbody>
</table>

6. Save the record.
   Be sure to create answer options if you select the Choice or Likert Scale data type.

Survey question data types
You must choose a data type for each survey question. The data type determines the format of the question and the kind of data that is collected on survey questionnaires.

The following data types are available for surveys:

**Attachment data type**

On questionnaires, users can attach one or more files to a question.

Users click the Manage Attachments icon and select one or more files in the Attachments pop-up window to attach to the question. From this window, users can:

- View a list of the attached files.
- View an attached file in a separate window.
- Rename an attached file.
- Add or delete files

Once a survey has been submitted, attachments cannot be updated or deleted.

Any type of file supported by the platform can be attached to a question. One or more files can be attached a question while taking a survey or completing an assessment.

The assessment administrator can see the attachments associated with an individual question as well as those associated with the survey.

See Administering Attachments for more information.
Boolean data type

On questionnaires, users select a check box beside a statement or leave it cleared.

If you select **Boolean**, you must fill in the **Scale definition** field. Select **High** if it is best when users select the check box.

Choice data type

On questionnaires, users select a value from a list of choices.

If you select **Choice**, you must fill in the **Scale definition** field and create answer options. Select **High** for the scale definition if the answer option with the largest metric definition **Value** is best.

*Note:* The system sets the **Min** and **Max** fields automatically based on the **Value** settings for the associated metric definitions.

Date and Date/Time data types

The **Date** and **Date/Time** data types are similar.

- **Date:** On questionnaires, users select a date.
- **Date/Time**: On questionnaires, users select a date and time.
Likert Scale data type

On questionnaires, users select a multiple choice value from a custom Likert scale. Each answer option is represented by a radio button on the scale. A Likert scale question that evaluates an application's ease of use might have the answer options Easy, Average, and Difficult.

If you select Likert Scale, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

Note: The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

Number data type

On questionnaires, users enter a number.

If you select Number, you must fill in these additional fields:

- Scale definition: Select High if a larger number is better, such as for a question that measures the number of sales made in a quarter.
- Min and Max: Enter the smallest and largest numbers users can enter. State the range of acceptable answers in the question text.

Percentage data type

On questionnaires, users enter a number.

If you select Percentage, you must fill in these additional fields:
- **Scale definition**: Select **High** if a larger percentage is better, such as for a question that measures the percentage of work an agent has completed.
- **Min** and **Max**: Enter the smallest and largest numbers users can enter. Generally **0** and **100** are appropriate minimum and maximum values. If you choose values other than **0** and **100**, it is usually best to state the range of acceptable answers in the question text.

**Reference data type**

On questionnaires, users select a value from a list that is generated from a specified reference table. The response field supports auto-completion.

**Note**: Reference qualifiers are not supported.

For example, a user could select a user name in response to a question if you specify User (sys_user) as the reference table.

**String data type**

On questionnaires, users enter text. When you select **String**, the **String option** field appears. Select one of the following options to determine how the string field appears on questionnaires:
Template data type

On questionnaires, users select a value from a predefined series of answer options. To use this data type, a question template must be defined.

If you select Template, you must fill in these additional fields:

- **Template**: Select a template.
- **Scale definition**: Select High if the answer option with the largest template definition Value is best.

Yes/No data type

On questionnaires, users select Yes or No from a list.
If you select Yes/No, you must fill in the **Scale definition** field. Select **High** if Yes is the best answer.

**Image scale data type**

On questionnaires, users select an image from a predefined set of images as their response. Image scale questions can also be used in a template for better performance with surveys that have the same type of answer options.

Five emojis, similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Two images can be uploaded, one for selected case and another for unselected case. Larger size images are reduced to 64 x 64 pixels.

The result behavior depends on the presence of uploaded images. If no selected image is uploaded, then the question shows up blank.

<table>
<thead>
<tr>
<th>Selected Image</th>
<th>Unselected image</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Unselected image loads. Clicking on the image changes it to the selected image.</td>
</tr>
<tr>
<td>Yes</td>
<td>No</td>
<td>Selected image loads with 50% opacity. Clicking on the image changes the opacity to 100%.</td>
</tr>
<tr>
<td>No</td>
<td>Yes</td>
<td>A blank placeholder box is displayed.</td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>A blank placeholder box is displayed.</td>
</tr>
</tbody>
</table>

**Note:** N/A option is not supported for image scale type question.
Multiple selection data type

On questionnaires, users can select multiple check boxes indicating all answers that apply. For instance, a user can be instructed to “Select all that apply” in a multiple selection question.

<table>
<thead>
<tr>
<th>Equipment Usage Survey</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Multiple Selection</strong> +</td>
</tr>
<tr>
<td>What equipments do you use?</td>
</tr>
<tr>
<td>- Laptop</td>
</tr>
<tr>
<td>- Tablet</td>
</tr>
<tr>
<td>- Smart Phone</td>
</tr>
</tbody>
</table>

Ranking data type

On questionnaires, users can select a different order number for each option to rank them. Drag-and-drop functionality is also supported, which allows a user to either fill in the number, or simply drag an option.

1. Please rate following device in order of Importance.

   - Phone
   - Tablet
   - Laptop
   - MAC
One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.

Survey question template

Question templates define reusable sets of answer options for survey questions.

Question templates define reusable rating scales for answering questions, where each answer option on the scale is a template definition. For example, the template named Satisfaction represents a satisfaction scale and contains the following template definitions: Very Satisfied, Satisfied, Neutral, Dissatisfied, and Very Dissatisfied.

Template definition

Templates are available for survey questions that have Data type set to Template. The following question templates are available in the base system. You can create or update a template as described in Create a survey question template.

Default question templates

<table>
<thead>
<tr>
<th>Name</th>
<th>Template definitions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amount</td>
<td>None, Few or little, Average amount, Many, Quite a lot</td>
</tr>
<tr>
<td>Complexity</td>
<td>Very Complex, Complex, Moderate, Simple, Very Simple</td>
</tr>
<tr>
<td>Frequency</td>
<td>Never, Seldom, Sometimes, Most of the time, All of the time</td>
</tr>
<tr>
<td>Likert 5</td>
<td>Strongly Disagree, Disagree, Neutral, Agree, Strongly Agree</td>
</tr>
<tr>
<td>Quality</td>
<td>Very Poor, Poor, Average, Good, Very Good</td>
</tr>
<tr>
<td>Satisfaction</td>
<td>Very Dissatisfied, Dissatisfied, Neutral, Satisfied, Very Satisfied</td>
</tr>
<tr>
<td>Size</td>
<td>Very Small, Small, Average, Large, Very Large</td>
</tr>
</tbody>
</table>

Create a survey question template

You can create and administer question templates.

Role required: admin or survey_admin

Changes to a survey, such as the modification of question templates, apply to existing survey instances immediately. Templates that you create are available for use with both surveys and assessments.

1. Navigate to Survey > Templates.

Each template is stored as a record on the Assessment Metric Template (asmt_template) table.
2. Click **New**.
3. Enter a **Name**.
4. Right-click the form header and click **Save**.
5. In the **Assessment Template Definitions** related list, click **New**.
   Create a template definition for each answer option you want to appear on a question.
6. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>Enter the text to appear as the answer option.</td>
</tr>
<tr>
<td>Value</td>
<td>Enter a numeric value, greater than or equal to zero, to which the answer option equates. Values are used in results calculations. When you view questions that use templates, answer options appear in order from smallest to largest <strong>Value</strong>. Each template definition for a given template must have a unique <strong>Value</strong>.</td>
</tr>
</tbody>
</table>

7. Click **Update**.

**Update min and max values to match templates**

If you use survey result calculation data, ensure that the **Min** and **Max** values for a question that uses a template are equal to the smallest and largest template definition **Value**.

Role required: admin or survey_admin

When you create a question of the **Template** data type, the system sets the **Min** and **Max** fields based on the template definition values. The fields for existing questions are not updated if you add a new template definition to a template or if you update the **Value** of an existing template. If the new **Value** is less than the minimum value or greater than the maximum value of any questions that use the template, update the questions accordingly.

1. Navigate to **Survey > Questions**.
2. Configure the list to show the **Min** and **Max** columns.
3. Add the following list filter condition: (Template) (is) (<select the template you updated>).
4. Ensure the **Min** and **Max** values match the smallest and largest template definition **Value** for the selected template.
   If the values do not match, edit the **Min** and **Max** values directly from the list.

   **Note:** When the data type is **Template**, a UI policy prevents the editing of **Min** and **Max** from the form.

   **Create or modify answer options**

   You must create answer options, called metric definitions, for survey questions that have **Data type** set to **Choice** or **Likert Scale**.

   Role required: admin or survey_admin

   Changes to a survey, such as the addition or modification of answer options, apply to existing survey instances immediately.

   1. Navigate to **Survey > Questions**.
   2. Open a choice or Likert scale survey question.
   3. In the **Assessment Metric Definitions** related list, open a metric definition or click **New**.
Each answer option is stored as a record on the Assessment Metric Definition (asmt_metric_definition) table.

4. Complete the Assessment Metric Definition form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>Text to appear as the answer option.</td>
</tr>
<tr>
<td>Value</td>
<td>Numeric value, greater than or equal to zero, to which the answer option equates. Values determine the order in which answer options appear. See the example below. Values are also used to calculate survey results. Each metric definition for a given question must have a different Value.</td>
</tr>
</tbody>
</table>

5. Click Submit.

On survey questionnaires, the answer options for a question appear in order from smallest to largest Value. For example, consider the survey question How do you feel? with the answer options Good, Neutral, and Bad. The following table shows the answer option order based on the Value.

<table>
<thead>
<tr>
<th>Answer option</th>
<th>Value</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Good</td>
<td>1</td>
<td>First</td>
</tr>
<tr>
<td>Neutral</td>
<td>3</td>
<td>Second</td>
</tr>
<tr>
<td>Bad</td>
<td>5</td>
<td>Third</td>
</tr>
</tbody>
</table>

If you use survey result calculations, ensure the question Scale definition is set appropriately based on the answer options. In the previous example, if you want the answer option Good to earn the highest score, the scale definition should be Low because Good has the smallest value.

Change the order of survey questions
You can easily reorder survey questions at the category level or the question level.

Role required: admin or survey_admin

You can change the order in which the questions in one category appear relative to those in other categories for the same survey definition. If you add a new question manually after you create other questions, you may want to change the order of questions.

When you create questions using the survey creator, the system sets the Order field for the first question to 101, the second to 102, and so on. After you create a new question outside of the survey creator, the Order is set to 100 by default, which means it appears before all questions generated by the survey creator.

1. Navigate to Survey > View Surveys and open the appropriate survey definition.
2. In the Metric Categories related list, edit the values in the Order column.
3. To change the order of questions within a category, complete the following steps.
4. Click **Update**.

**Survey trigger conditions**

Trigger conditions specify when to send a particular survey and the persons to send it to.

Survey administrators can use trigger conditions to configure the system to generate a survey instance each time a specified action occurs on a specified table, for example, when an incident or change request closes. The system sends the survey to users that are related to the triggering record, for example, incident callers or change request assignees. You can choose to send a survey every time the condition is met, or you can set a probability for the system to send a survey at random when the condition is met.

Trigger conditions are ideal for sending transactional surveys. Transactional surveys generally measure satisfaction with a recent experience, such as closing an incident or purchasing an item.

**Note:** Trigger conditions are comparable to survey conditions in legacy surveys. If you migrate a legacy survey that has survey conditions, ensure that the survey conditions are deactivated before you recreate them as trigger conditions.

Configure a trigger condition for a survey

Configure trigger conditions to specify when to send a particular survey and the persons to send it to.

Role required: admin or survey_admin

1. Navigate to **Survey > Trigger Conditions**.
2. Click **New**.

**Note:** Do not specify particular users for a triggered survey because only the specified users are allowed to take the survey.

3. Complete the form.

**Trigger condition fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment</td>
<td>Survey to send.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to run the trigger condition on. You can select only tables in the current application scope. For example, to send a survey whenever an incident closes, select the Incident (incident) table.</td>
</tr>
<tr>
<td>User field</td>
<td>Field that stores the users you want to send the survey. You can select any field, on the selected table or on a referenced table, that references the User (sys_user) table. Use the tree picker to select a field.</td>
</tr>
</tbody>
</table>

**Note:** To avoid requiring users to log in to take a survey with a trigger condition, set the survey to **Public**.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Repeat interval</td>
<td>Minimum period that must pass before the trigger condition can resend the survey to the same user. For example, assume the repeat interval is set to 30 days. Even if the same user qualifies for multiple surveys from this trigger condition, the system can send only one survey every 30 days.</td>
</tr>
<tr>
<td>Note:</td>
<td>Ensure that the Schedule period of the selected survey definition is set to No Limit. If the schedule period is set to a different value, it prevents the trigger condition from sending surveys as expected.</td>
</tr>
<tr>
<td>Application</td>
<td>(Admin only) Application is set to Core.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this trigger condition is active (selected).</td>
</tr>
<tr>
<td>Business rule</td>
<td>(Admin only) Business rule the system creates to monitor the selected table. When the condition is met, the business rule sends the survey to the correct user. No configuration is necessary for this business rule.</td>
</tr>
<tr>
<td>Trigger randomly</td>
<td>Check box that determines whether to send the survey to the appropriate user every time the condition is met (cleared) or only a percentage of the time (selected).</td>
</tr>
<tr>
<td>Probability (%)</td>
<td>Approximate probability that the survey is sent each time the condition is met. For example, if the probability is set to 50, the system sends the survey approximately 50% of the time the conditions are met. There are no repeat interval restrictions is assumed. This field is visible and required only when Trigger randomly is selected.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Related Field 1-4   | Field that contains a value you want to store for reporting purposes. You can pick any reference field on the selected table. When the trigger condition generates a survey instance, the system stores the value from the triggering record. Specify up to four fields. For example, select the Incident table, **Assigned to** and **Problem** as related fields. The system stores the assigned user and problem associated with the incident as Related record 1 and Related record 2 in the survey instance record. To view the fields, configure the form for any survey instance.  

**Note:** You cannot use a related field for the ticket number because you cannot select the Number column. You can, however, use the trigger_id column of the table. |
| Description         | Summary information to identify the trigger condition.                                                                                                                                                        |

**Note:** For a triggered record, the table title is used for the survey description. |
| Condition           | Condition builder that defines the criteria that must be true to send the survey. For example, to send a survey whenever an incident closes, create the condition **(State) (is) (Closed)**.                                        |

You can also create a trigger condition directly from the survey creator. If you select **Certain users can take this survey, based on conditions** in the Survey User Access section, the Trigger Condition form opens automatically when you click **Save as Draft** or **Publish**.
<table>
<thead>

Trigger condition example
You can send out auto-triggered surveys when an incident is closed or resolved.

A trigger condition is configured as follows:
- **Assessment**: Service Desk Satisfaction Survey
- **Table**: Incident (incident)
- **User field**: Caller
- **Repeat interval**: 30 days
- **Active**: true
- **Trigger randomly**: false
- **Related Field 1**: Assigned to
- **Related Field 2**: Problem
- **Condition**: [State] (is) (Closed) (or) (State) (is) (Resolved)

Fannie Steese is the caller on incident INC00004305 that is assigned to Boris Catino, a service desk technician. Boris creates PRB010101 based on Fannie’s complaint and closes the incident. The system creates a survey instance assigned to Fannie so she can rate her satisfaction with the incident experience.

Because two related fields were selected as part of the trigger condition, the survey instance stores the following information from the incident:
- User (Related Field 1): **Boris Catino**
- Problem (Related Field 2): **PRB010101**
- Task (automatically created): **INC00004305**

Because the task field is automatically populated, UI-based filtering by dot-walking on incidents (or any task-based table) is supported when creating a report on survey results. For example, you can query all survey instances related to incidents assigned to a group (survey reports on all incidents assigned to **networking** group, for instance).

**Note:** Even though the trigger condition is set to be triggered each time that the conditions are met, the Repeat interval setting ensures that Fannie does not receive another survey for another of her incidents closes within 30 days of the first incident.

Survey report example based on task field

One of the most common use cases for Surveys is to send out an auto-triggered survey when an incident, request, or task is closed. Once you get the survey results back, you can filter the results by users and groups related to the ticket, such as Assignment Group, or Assignee.

Filtering the survey results provides more detail on how people and teams are performing based on ticket data. Since this information is automatically captured, you can dot-walk while filtering the data (instead of utilizing a related field on the Survey trigger condition form, as previously required).
To create a report on incident-triggered survey responses by Assignment group, set up the report on the Task Assessment Details by navigating to ReportsView/Run and clicking Create a report.

**Survey distribution**

There are several ways for survey administrators to distribute surveys to users. Surveys are distributed using any of the following methods.

- Send survey invitations to users
- Share a survey URL that opens the survey directly.
- Create a module that opens a survey.

*Send survey invitations to users*

You can send survey invitations using the **Assign Survey** or **Send Invitations** buttons on the Survey Definition form.

Role required: admin or survey_admin

Use the **Send Invitations** button to immediately assign survey instances to each survey user that is listed in the survey definition. Use the **Assign Survey** button to assign a survey instance to any one user at a time.

Each of the buttons generates survey instances assigned to the appropriate users. In addition, if the instance is configured to send email, the system generates survey notifications. For either button to be available, the survey definition must meet all of the following conditions.

- **Active** check box is selected.
- **State** is **Published**.
• Survey is associated with at least one question.

**Note:** You (or a trigger) can send more than one instance of a survey to a user at any time.

1. Navigate to Survey > View Surveys.
2. Select an active, published survey.
3. Complete one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assign a survey to users listed in the Survey Users related list</td>
<td>Click Send invitations.</td>
</tr>
<tr>
<td>Assign a survey to any user</td>
<td>Click Assign Survey and select one or more users, and then click OK.</td>
</tr>
</tbody>
</table>

The system creates a survey instance assigned to the user or users, assuming the user is eligible to receive a new survey instance. When you use the Assign Survey button, the selected user is not saved as a survey user.

**Survey URLs**
You can distribute a survey by giving survey users a survey URL.

Survey administrators can obtain one of the following types of URLs.

- A general URL for a survey, which users can open to take the survey questionnaire. The following process occurs.
  - When someone opens the URL, the system ensures that the person is logged in. It then searches for an instance of the associated survey that is assigned to the logged-in user.
  - If a survey instance is found, the appropriate action occurs based on the State of the survey instance (see table). If there are multiple active survey instances (Ready to take or In progress), the instance with the earliest due date opens.
  - If no survey instance is found, the system creates a new instance for the survey, assigns it to the user, and opens the survey questionnaire.

- A URL for a specific survey instance, which the assigned user can open to take the survey questionnaire. The following process occurs.
  - When someone opens the URL, the system ensures the person is logged in as the user the survey instance is assigned to. Only the assigned user can access the survey questionnaire.
  - The appropriate action occurs, depending on the State of the survey instance (see table).

**Survey states**

<table>
<thead>
<tr>
<th>Survey instance state</th>
<th>Action upon opening URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ready to take: User has not saved any responses.</td>
<td>The survey questionnaire appears for the user to begin. The user can save or submit responses.</td>
</tr>
<tr>
<td>In progress: User has saved at least one response.</td>
<td>The survey questionnaire appears for the user to continue. Any previously saved responses are displayed. The user can save or submit responses.</td>
</tr>
</tbody>
</table>
Obtain and distribute a general survey URL

You can distribute a general survey URL to allow any eligible user to open a survey questionnaire.

Role required: admin or survey_admin

The general URL is available on the Survey Definition form and on the survey creator. You can also email the URL for a public survey that is published.

1. Navigate to Survey > View Surveys.
2. Open a survey definition from the Assessment Metric Types list.
3. To view or copy the URL, click the View Survey URL related link.
   This related link is visible only if the survey definition is Active.
4. To distribute the URL to users, paste the copied URL as desired, or click the Email button to send via email.
   The Email button is visible only for a public survey that is published.

When a survey user clicks the general survey URL, the system creates a survey instance for the survey user as long as the user does not have an instance in the Ready to take state. The system is configured by default to send an email notification when a survey instance is generated.

As a result, the survey user receives a second notification in addition to the notification that you sent with the general survey URL. This may confuse the survey user. To avoid this issue, you can deactivate auto-notification.

Deactivate auto-notification for surveys

When you send a survey notification with a general survey URL to a survey user, the user may receive a second system-generated notification. To avoid this issue, you can deactivate auto-notification.

Role required: admin or survey_admin

1. Navigate to System Notification > Email > Notifications.
2. Open the Survey User Invite notification.
3. Configure the form to add the Send to event creator check box to the Who will receive section.
   The Send to event creator check box is selected by default.
4. Clear the Send to event creator check box.
   The system will no longer send auto-notification messages to survey users.

Obtain a survey instance URL

You can distribute a survey instance URL to allow the assigned user to open a survey questionnaire.

Role required: admin or survey_admin
The survey instance URL is available on the survey instance record.

1. Navigate to **Survey > Survey Instances**.
2. Open the instance for the survey.
3. To view or copy the URL, click **View Instance URL** related link.
   - The related link is available only when the survey instance **State** is **Ready to take** or **In progress** and the associated survey definition is **Active**.
4. In the dialog box, select and copy the URL then click **OK** or **Cancel**.
5. Distribute the URL to the assigned user.

**Test a survey URL**

When there are survey users associated with a survey, the survey is restricted so only those users can use the survey URL. You can test the survey URL to ensure it is restricted.

Role required: admin or survey_admin

1. Navigate to **Survey > View Surveys** and open a survey for which you are not a survey user.
2. Under **Related Links**, click **View Survey URL**.
3. Copy the URL and click **OK** or **Cancel**.
4. Navigate to the URL.
   - You see a message that you are not authorized to take the survey.

**Create a survey module**

You can create a module that opens a survey.

Role required: admin or survey_admin

When a user clicks a survey module, the system performs one of the following actions, depending on the configuration options for the survey and other factors.

- Creates a new survey instance
- Opens an existing survey instance
- Displays an error message.

1. Perform the appropriate action for your version of the UI:

<table>
<thead>
<tr>
<th>UI16</th>
<th>Point to the application menu that contains the module to which you want to add the survey module and click the edit application (pencil) icon.</th>
</tr>
</thead>
<tbody>
<tr>
<td>UI15 or UI11</td>
<td>Right-click the application menu you want to add the module to and select <strong>Edit Application Menu</strong>.</td>
</tr>
</tbody>
</table>

2. In the **Modules** related list, click **New**.
3. Complete the following fields.
   - **Link type**: Assessment
     - Do not select **Survey**, which is used for legacy surveys only.
   - **Assessment**: Select the survey you want the module to open.
4. Complete and save the form.

**Sharing surveys: export and import**

You can export a survey and then import it to a different ServiceNow instance.
### Export a survey

You can export a survey and then import it to another instance.

**Role required:** admin, survey_reader, or survey_admin

For information about update sets, see [System update sets](#).

1. Navigate to **Survey > View Surveys**.
2. Right-click the name of a record to show the context menu.
3. Select **Export Assessment**.
4. If applicable, follow the prompt in your browser to save the XML file.

### Import a survey

You can import a survey that has been exported as an XML file. The exported XML file does not contain result data.

**Role required:** admin or survey_admin

**Note:** Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see [System update sets](#).

1. Verify that the target instance has assessments enabled.
2. Follow the steps in [Import an XML file](#) to import the assessment.

### Use update sets for surveys and assessments

Use an update set to capture changes to surveys and assessments.

**Role required:** admin or survey_admin

When developing surveys and assessments, you can use an update set to capture the changes and move them from a development instance to a production instance. Once an update set is created and marked current, all of the updates to the following tables are recorded in the update set.

The following tables are now update set enabled and also extend the application file:

- Assessment Metric Templates (asmt_template)
- Assessment Template Definitions (asmt_template_definition)
- Assessment Metric Definitions (asmt_metric_definition): survey question answer options
- Schedule (sys_trigger): scheduled jobs associated with the survey
- Assessment Metric Categories (asmt_metric_category): survey categories
• Assessment Metrics (asmt_metric): survey questions
• Assessment Category Users (asmt_m2m_category_user): survey users
• Trigger Conditions (asmt_condition)

**Legacy survey migration**

Users with the survey_admin role can migrate legacy survey data to create copies of legacy surveys and their related records in assessment tables. The Survey Management application, which is built on the assessment engine, is available as an alternative to legacy surveys.

The following legacy survey components are migrated:

• Survey masters
• Supported survey questions and question choices
• Survey instances
• Survey responses

Legacy survey conditions are not migrated and must be recreated as trigger conditions.

**Note:** Survey wizards cannot be migrated.

*Migrate a legacy survey*

Migrate a legacy survey and its related records to take advantage of a more powerful feature set.

Role required: admin or survey_admin

To avoid timing out for very large surveys, you can disable the transaction quota. See [Transaction quotas](#).

1. Navigate to Survey > Legacy Surveys > Masters.
   The list of legacy survey masters appears. By default, the list shows only survey masters that have not been migrated. To show all survey masters, remove the **Assessment is empty** breadcrumb.

2. Open a survey and click the **Migrate to Assessment** related link.
   A dialog box describes what happens when you migrate the survey. Note that certain types of survey questions cannot be migrated.

3. Click **OK**.
   The system generates records on assessment tables based on the survey master, eligible questions and choices, results, and other related survey components. The original survey components are unaffected.

   System messages may appear at the top of the Survey form to notify you of questions that could not be migrated and to advise you to review migrated **Multiple Choice** questions.

4. Optional: Click the reference icon beside the **Assessment** field to view the new survey definition.

5. Optional: Remove survey users from the assessment survey if you want all users to be able to take it.
   When you migrate a survey, any users who have taken it are automatically associated with the assessment survey and become survey users. When there are survey users associated with an assessment survey, only those users can take it.

6. Deactivate any survey conditions associated with the survey by completing the following steps.
   a) Navigate to Survey > Legacy Administration > Survey Conditions.
   b) In the **Active** column, ensure the value is false for any survey conditions that reference the migrated survey.
7. Navigate to ServiceNow > Administration > Trigger Conditions to create new trigger conditions for the migrated survey.

The Migrate to Assessment related link on the legacy survey record becomes unavailable after the migration. However, if you delete the record referenced in the Assessment field, the related link reappears and you can migrate the legacy survey again.

Survey question migration
Before you migrate a legacy survey, understand that some legacy survey questions cannot be migrated due to incompatible question types.

Legacy survey questions are migrated from the Survey Question (survey_question_new) table to the Assessment Metric (asmt_metric) table. In legacy surveys, the Type field on the Survey Question table determines how the question renders on the survey questionnaire. In assessment surveys, the Data type field on the Assessment Metric table serves a similar purpose. Certain legacy survey types are not supported in assessment surveys.

The following table shows the conversion path for each legacy survey question type to an assessment data type, if there is one.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Migrated components
When you migrate a survey, the system maps records from survey tables to assessment tables.
To create a functional survey on the assessment framework, the system converts survey records to the most logical equivalent assessment survey records. This may mean multiple assessment survey records represent one legacy survey record.

**Migrated components**

<table>
<thead>
<tr>
<th>Survey component</th>
<th>Assessment survey components</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey master (survey_master)</td>
<td>• Survey definition (asmt_metric_type)</td>
</tr>
<tr>
<td></td>
<td>• Assessable record (asmt_assessable_record), for system use only</td>
</tr>
<tr>
<td></td>
<td>• Survey category (asmt_metric_category)</td>
</tr>
<tr>
<td>Survey question (survey_question_new)</td>
<td>• Survey question (asmt_metric)</td>
</tr>
<tr>
<td>Question choice (question_choice)</td>
<td>• Assessment metric definition (asmt_metric_definition)</td>
</tr>
<tr>
<td>Survey instance (survey_instance)</td>
<td>• Assessment group (asmt_assessment), for system use only</td>
</tr>
<tr>
<td></td>
<td>• Survey instance (asmt_assessment_instance)</td>
</tr>
<tr>
<td>Survey response (survey_response)</td>
<td>• Survey instance question (asmt_assessment_instance_question)</td>
</tr>
<tr>
<td></td>
<td>• Survey response (asmt_metric_result)</td>
</tr>
<tr>
<td></td>
<td>• Category result (asmt_category_result), for system use only</td>
</tr>
</tbody>
</table>

**Migrated question review**

To maintain accurate result calculations, you may need to make minor adjustments to some of the migrated survey records to ensure results are calculated correctly.

**Note:** The assessment engine provides a built-in result calculation feature that converts each survey response to a score between 0 and 10. The configuration required to maintain accurate result calculations is advanced and is not recommended for basic survey implementations. If you do not plan to use result calculation data, ignore the information in this section.

For each legacy question migrated, the system creates a survey question record on the Assessment Metric (asmt_metric) table. For legacy questions of the **Multiple Choice** and **Select Box** types, the system also creates a metric definition record, on the Assessment Metric Definition (asmt_metric_definition) table, for each legacy question choice.

**Comparable metric definitions and survey question choices**

<table>
<thead>
<tr>
<th>Survey question choice field</th>
<th>Related metric definition field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text</td>
<td>Display</td>
</tr>
<tr>
<td>Value (can be any string value)</td>
<td>Value (must be a numerical value)</td>
</tr>
<tr>
<td>Order</td>
<td>Value (metric definition with smallest <strong>Value</strong> is first)</td>
</tr>
</tbody>
</table>
When the system migrates legacy survey question choices, it uses the legacy **Order** to set each metric definition **Value**. For the legacy question choice with the smallest **Order**, the corresponding metric definition **Value** is set to 1. For the legacy question choice with the next smallest **Order**, the metric definition **Value** is 2, and so on.

The **Scale definition** field on the migrated Survey Question form determines whether smaller or bigger metric definition values equate to a good score in survey result calculations. By default, the scale definition is set to **High**, meaning bigger values are good. When you migrate a legacy survey, check that the default scale definition makes sense for each question.

For example, the following tables depict a sample migrated question and the metric definitions automatically created for it. Recall that the system uses the order of the legacy survey question choices to set the metric definition value. **Excellent** has the lowest **Order** value, so when the system creates a metric definition for this question choice, the **Value** is set to 1. In this case the default scale definition value, **High**, does not make sense, as the system will calculate the worst scores for responses of **Excellent**.

**Legacy question:** Please rate the overall quality of your service.

<table>

</tr>
<tr>
<td>Fair</td>
<td>C</td>
<td>300</td>
</tr>
<tr>
<td>Poor</td>
<td>D</td>
<td>400</td>
</tr>
</tbody>
</table>

**Migrated question:** Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Metric definition display</th>
<th>Metric definition value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>1</td>
</tr>
<tr>
<td>Good</td>
<td>2</td>
</tr>
<tr>
<td>Fair</td>
<td>3</td>
</tr>
<tr>
<td>Poor</td>
<td>4</td>
</tr>
</tbody>
</table>

If there are no **Order** values for the legacy survey question choices, the system sets each corresponding metric definition **Value** based on the alphanumeric order of the legacy **Text** value.

**Migrated question:** Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Metric definition display</th>
<th>Metric definition value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>1</td>
</tr>
<tr>
<td>Good</td>
<td>2</td>
</tr>
<tr>
<td>Fair</td>
<td>3</td>
</tr>
<tr>
<td>Poor</td>
<td>4</td>
</tr>
</tbody>
</table>

You may also need to change the **Scale definition** setting for other migrated questions. For details, see the scale definition recommendations for each survey question data type.
Quizzes

Quizzes are questionnaires you can assign to one or more users to assess their knowledge of any subject. The quiz functionality is built on the assessment engine and provides many of the same features as assessments and surveys.

Each question is scored, and the overall score indicates the percentage of questions the user answered correctly. A quiz may have categories of questions that are assigned only to some users. You can assign weighting values to individual questions or categories of questions that make them more or less important when calculating the overall score. Quizzes require activation by a system administrator.

- An administrator can create a quiz for any purpose and assign it to a single user or multiple users.
- A quiz can contain one or more categories of questions. Each category can be assigned to users who answer only the questions in that category.
- The system can send email notifications to these users:
  - Recipients: The recipient can receive notification of an assigned quiz, a quiz whose allowed duration is at 50%, and a quiz that is overdue.
  - Recipient’s manager: The recipient’s manager can receive notification when a quiz is overdue.
  - Quiz manager: The quiz manager can receive notification of an overdue quiz to which he or she is assigned.
- Quizzes can contain questions that are scored or not scored. Unscored questions assess opinions or involve dates and are not counted in the final score. Scored questions specify correct answers and are scored either as 0% or 100%. You can apply a weighting scale to scored questions to establish their relative importance. You can designate questions with these data types as scored questions:
  - Checkbox
  - Choice
  - Duration
  - Likert Scale
  - Numeric Scale
  - Template
  - Yes/No
- A quiz question can be dependent on the response to any scored question. For example, you can create a dependent question requesting additional information that appears only if a recipient answers No to a specific question.

Important terms

The quiz application involves several terms.

Terms used in quiz application

| Quizzes | A quiz contains information such as duration, state, and notification controls and lists the existing categories. Text fields on the quiz form allow an administrator to create introductory content and end notes that are displayed to the recipient. |

© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Categories

A quiz category represents a theme for quiz questions. Each category contains one or more questions and names the recipients for the questions in that category. By default, the system creates one category with the same name as the quiz. You can create additional categories as needed. Categories can be weighted higher or lower to determine the importance of that category in the overall score.

Questions

A quiz question is a question configured for a category and sent only to the users for that category. Questions have a wide variety of data types and can be individually weighted higher or lower. Questions may be scored or unscored.

Category user

A category user is the recipient of questions for a specific category. You can select different users to answer the questions for each category.

Templates

A template is a question data type that provides reusable rating scales for answers to questions. For example, the answer template named Satisfaction contains a satisfaction scale ranging from Very Satisfied to Very Dissatisfied.

Quiz roles

The Quizzes application uses these roles. No role is required to take quizzes that are assigned to you.

<table>
<thead>
<tr>
<th>Role Title (Name)</th>
<th>Role Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>assessment administrator (assessment_admin)</td>
<td>Can administer the Assessments application and all quiz records. Can access all the modules of the Assessments application.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The itil_admin role and the survey_admin role contain the assessment_admin role</td>
</tr>
<tr>
<td>Administrator (admin)</td>
<td>Can access all aspects of the assessment and survey processes. Only administrators can modify survey notifications, create survey modules, and import surveys.</td>
</tr>
</tbody>
</table>

Set up and administer quizzes

Set up and administer quizzes.

Role required: assessment_admin or admin

1. Optional: Create reusable question templates for quizzes.
2. Create the quiz using the Quiz Designer or with forms accessed from the navigation menu.
The quiz record includes specifics such as duration, notification preferences, a questionnaire introduction, and ending notes displayed to recipients.

3. Edit the default category or create additional categories as needed. The system creates a category with the same name as the quiz.

4. Define users for each category.
   These are the recipients who answer the questions in a category. You can define different users for each category.

5. Create the questions for each category.

6. Create the answers for each question and determine if the questions are scored.
   You can create unique answers or select preconfigured answers from a template.

Publish and distribute the quiz. You can send the quiz to a single user or all users in each category.
Review the results from the submitted quizzes in reports and scorecards.

Activate the quiz designer

Administrators can activate the Quiz Designer plugin.

Role required: assessment_admin or admin

1. Navigate to System Definition > Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   If the plugin depends on other plugins, these plugins are listed along with their activation status.
   If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. Optional: If available, select the Load demo data check box.
   Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
   You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.
5. Click Activate.

Quiz Overview module

The Quiz Overview module is a homepage that displays various reports on data such as results for each category and quizzes that are complete, pending, or in progress.

Role required: assessment_admin or admin

Users with the assessment_admin role can view the overview page and refresh, add, delete, and rearrange widgets.

1. Navigate to Quizzes > Overview.
2. Click elements within reports to obtain more information. The available reports are:
Quiz designer

The quiz designer provides a single interface that users with the assessment_admin role can use to create, edit, and distribute quizzes.

You can also use it to edit existing quizzes and change scoring parameters.

Alternatively, you can use the modules of the assessment engine to create and edit the records that make up a quiz. All quiz records are stored in assessment tables and displayed in Quiz views of those tables. For details, see Create quizzes with forms.

Tools on the Quiz designer

The quiz designer includes a design canvas, a header bar, and many controls that you can use to create quizzes.

To open the quiz designer, navigate to Quizzes > Quiz Designer.

The designer contains the following elements:

- Controls
- Header bar
- Design canvas

Controls

Controls for the supported question data types are available in the Controls palette. Drag and drop a control onto the designer canvas to create a question of that type.
Question controls

<td></td>
</tr>
</tbody>
</table>

**Header Bar**

The header bar contains tabs that display different views and a menu of various functions.

Click one of the following tabs to change the view in the canvas:

- **Design**: Add categories and questions, and configure the properties of each. This is the default view of the canvas when you open the designer.
- **Configuration**: Create introductions and end notes for quizzes, and select a **signature**.
- **Availability**: Select the recipients for each category in the quiz.

Point to the menu icon (≡) in the upper right of the quiz designer to select the following options:

- **Save**: Saves the current quiz.
- **Preview**: Displays a preview of the quiz as it appears to the recipients.
- **Publish**: Distributes the quiz to the selected recipients.
- **Save and Publish**: Saves and distributes the quiz in one step.
- **New Quiz**: Opens a fresh canvas for a new quiz.
- **Load Quiz**: Opens a list of existing quizzes that you can select and edit.

The availability of each option depends on the status of the quiz that is opened in the quiz designer.

**Design Canvas**

© 2020 ServiceNow, Inc. All rights reserved.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
New quizzes open in the **Design** view. The quiz **Name** field appears above first category in the canvas. A blank question field appears in the category container.

**Create a quiz**

When you create a quiz, you can create one or more categories and then add questions to each category.

**Role required:** assessment_admin or admin

Each category can be assigned to a different user or the same users. You can also customize each question and make it dependent on the response to another question.

Create a quiz using these procedures:

**Create quiz categories**

A category represents a theme for evaluating a specific element of the quiz topic and contains questions pertaining to that theme.

**Role required:** assessment_admin or admin

When you create a quiz, the system creates a default category, using the name of the quiz. You can use this category, modify it, or create additional categories as needed. To have any results, a category must contain scored questions.

1. Navigate either **Quizzes > Quiz Designer** or **Quizzes > Quizzes** and click **Quiz Designer** in the list header.
2. Enter the name of the quiz in the **Name** field. The system uses this name as the name of the quiz and the first category.
3. To configure the category, click the gear icon in its title bar.

   The **Properties** dialog box appears. You can change the name of the category, add a description for it, and enter text in the **Details** field that introduces or explains the category to the recipients. The system updates the category as you type.

4. Click the **X** icon to close the category properties dialog box and save your settings.
5. To add a new category, click the + icon in the title bar of an existing category.

Create quiz questions
You can create multiple questions for each category but each question can be associated with only one category.

Role required: assessment_admin or admin

The data type that you select for each question determines how it can be answered by quiz recipients.

You can designate questions to be scored. Only scored questions are shown in the quiz results and considered when calculating the category results. You must also specify a correct answer for scored questions.

Note:
To designate a question as scored, you must use Assessment forms. For instructions, see Configure a scored question.

1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.
2. To configure the question, click in the gear icon in its title bar. The Properties dialog box appears for the question.
3. Fill in the fields on the form, as appropriate.

**Question property fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td><em>(Required)</em> Name of the question. Create a concise and easily recognizable name for your question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as the question on quizzes. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Type</td>
<td><em>(Read-only)</em> Data type selected for this question. See the table in controls for possible data types.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this question is available on a quiz. If a question is marked inactive, it does not appear on quizzes generated after the question becomes inactive.</td>
</tr>
<tr>
<td>Boolean option</td>
<td>Whether a check box or a Yes/No list appears as the option for the Boolean question.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box for requiring users to answer the question. Users cannot submit quizzes until they answer all mandatory questions, which are denoted by a red field status indicator. This field is available when the question does not have a dependency and the question controls is not Boolean with a check box option.</td>
</tr>
<tr>
<td>String option</td>
<td>Setting for the appearance of a string field in a question. This field is available when the question type is String. The string options are:</td>
</tr>
<tr>
<td></td>
<td>- Single line: Single line text field 40 characters in length that allows strings of any length.</td>
</tr>
<tr>
<td></td>
<td>- String line wide: Full page width text field that allows a single line entry of any length.</td>
</tr>
<tr>
<td></td>
<td>- Multiline: Full page width multi-line text field that allows word wrap and returns.</td>
</tr>
<tr>
<td>Min</td>
<td>Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.</td>
</tr>
<tr>
<td>Max</td>
<td>Highest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box for including Not Applicable as an option for this question. Users can select Not Applicable if they do not have sufficient information to respond to a question. User responses of Not Applicable are excluded from results calculations. This field is available when the question does not have a dependency and the question data type is not Boolean with a check box option.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box for displaying answer options in a random order whenever the question appears in a quiz. Answer preference is sometimes influenced by the order in which options appear, which can result in biased results. Randomizing options can help prevent this bias. <strong>Note</strong>: Randomizing options for certain questions may make those questions confusing for users. In general, only randomize options that do not follow a logical order.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question that is displayed on the quiz. Include details that help users understand how to answer the question. You can also enter HTML text in this field with the WYSIWYG editor. For example, include HTML to embed links and images.</td>
</tr>
<tr>
<td>Correct answer</td>
<td>Answer option that you want to be selected by users. When you specify a correct answer for a question, the system scores the question. This field is available for all data types except Date, Date/Time, and String.</td>
</tr>
<tr>
<td>Choices</td>
<td>Options for a question with a data type of Choice or Scale. The system automatically adds text and values that you can edit for each option. Click the + icon to add an option, or click the X icon to delete an option. By default, the system arranges options in the order established by their values. To change the order, drag and drop the options.</td>
</tr>
</tbody>
</table>

![Choices](image)
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displayed when</td>
<td>Condition builder that hides or displays the question depending on the answer to another question in the same category. Select an existing question from the list with a data type of Boolean, Choice, Scale, or Template. Create the condition that must exist for recipients to see the dependent question, using the is or is one of operator. The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.</td>
</tr>
</tbody>
</table>

4. To create any special conditions that must be met for a question to appear on the quiz, click the Dependency tab. Fill in the fields, as appropriate.

Dependent questions appear on the quiz when a recipient selects a specific answer or combination of answers to another question in the same category.

5. Select a question in the Displayed when field. The system selects the appropriate operator and displays the possible answers for the selected question.

6. Select the answers that satisfy the condition. Selected answers are indicated by a check mark.

7. Click X to close the question properties dialog box and save your settings.

8. To add a question with the same data type as an existing question in the category, click the + in the title bar of the existing question.
9. Drag questions to change their order within a category or move them between categories.
10. To delete a question, click the X in its title bar.

**Configure a template question**
You can configure template questions when designing quizzes.

Role required: assessment_admin or admin

1. Drag the **Template** data type icon into a category container.
2. Click the gear icon in the question title bar to open the template properties dialog box.
3. Select a predefined scale from the list.

![Template properties dialog box](image)

Question entry fields appear for that template.
4. Enter one or more questions that are appropriate for the template.
5. Click the arrow to the right of a question to configure its properties. You must provide a name for each question.
6. Click the up or down arrow to move between questions, or click the back arrow to return to the template properties dialog box.
7. Configure the properties for the remaining questions.
8. Click the **X** icon to close the template properties dialog box and save your settings.

**Configure a scored question**

Only scored questions are considered when calculating category and quiz results.

Role required: assessment_admin or admin

A question must have a correct answer specified to be scored. Only results for scored questions are displayed in the quiz scorecard.

1. Navigate to Quizzes > Quizzes.
2. Open the quiz containing the questions you want to mark as scored.
3. In the Metric Categories related list on the Assessment Metric Type form, select the category for the questions you want to mark as scored.
4. In the Assessment Metrics related list on the Metric Category form, select a question from the list.
5. In the Question Type section of the Assessment Metric form, select the Scored check box.
This check box is not available if the question’s data type is not supported for scoring.

6. Select the Correct answer for the question.
7. Click Update.
8. Repeat the process for all the questions in the category that you want the system to score.
9. Return to the list of metric categories, select another category, and configure scoring for the appropriate questions in that category.

Configure a quiz
You can configure an entire quiz.

Role required: assessment_admin or admin

The values you enter and select on this page are applied to the entire quiz.

In the quiz designer, click Configuration and then fill in the fields as described in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check box for enabling the distribution of this quiz to recipients.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of this configuration or the quiz to which it is attached.</td>
</tr>
<tr>
<td>Introduction</td>
<td>Introductory content to display on quizzes. You can add a welcome message or background information about the quiz.</td>
</tr>
<tr>
<td>Signature</td>
<td>(Optional) Acknowledgement by a quiz recipient of requirements, admonitions, or expectations related to a quiz.</td>
</tr>
<tr>
<td>Return URL</td>
<td>Destination address of a web page that is presented to users after they submit a completed quiz. When a return URL is configured, the End note content does not appear.</td>
</tr>
<tr>
<td>End note</td>
<td>Content that is displayed to recipients after they submit a completed quiz. You can add a thank you message, follow-up instructions, or other applicable information. End notes are not displayed if a Return URL is specified.</td>
</tr>
<tr>
<td>Duration</td>
<td>Amount of time that recipients are given to complete this quiz, starting from the time that the quiz is generated. The default duration is 14 days.</td>
</tr>
<tr>
<td>Manager</td>
<td>Assessment manager for this quiz. These users are only responsible for managing the quiz process and not the results. The system notifies the manager when submissions for this quiz are past due.</td>
</tr>
<tr>
<td>Notify manager if overdue</td>
<td>Check box for sending email notifications to a recipient's manager when that user fails to submit an assigned quiz before the due date.</td>
</tr>
</tbody>
</table>
Select a quiz recipient
When the system distributes a quiz, it sends email notifications to the category users and their managers.

Role required: assessment_admin or admin

A category can have one or more assigned users, and the same user can be assigned to more than one category.

The system also creates a link to the quiz in the recipients' My Assessments & Surveys portal. Users can only answer questions in the categories that they are assigned to.

To select the recipients for each quiz category, click Availability and then fill in the fields as described in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select category</td>
<td>Category for which the selected users are recipients.</td>
</tr>
<tr>
<td>Add users</td>
<td>Users selected as recipients for this category. The choice list shows all users in the system.</td>
</tr>
</tbody>
</table>

Publish a quiz
When you publish a quiz, the system sends email notifications to the recipients and to their managers. A card in each recipient's My Assessments & Surveys portal displays a link to the quiz.

Role required: assessment_admin or admin

1. If you want to see the quiz as the recipients will see it, point to the menu icon in the upper right of the quiz designer and click Preview.
2. When you are satisfied with the quiz, click Save and Publish or Publish to distribute it.

Edit a quiz
You can update a quiz after the quiz has been distributed.

Role required: assessment_admin or admin

- Questions that you add are available only on quizzes that are distributed after the update.
- Before a quiz is submitted or during the retake period:
  - Changes to existing questions are immediately available to users. This includes changes to the answers, such as additional choices or changes to the data type.
  - Deleted questions are deleted from distributed quizzes in users' queues.

Open the quiz: Group the Service Details form with one of the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quizzes &gt; Quiz Designer</td>
<td>Point to the menu icon in the quiz header bar and select Load Quiz.</td>
</tr>
<tr>
<td>Quizzes &gt; Quizzes</td>
<td>Right-click a quiz in the list and select Quiz Designer.</td>
</tr>
<tr>
<td>Quizzes &gt; Quizzes</td>
<td>Open a quiz from the list and click Quiz Designer in the header of the Assessment Metric Type form.</td>
</tr>
</tbody>
</table>
Enable a quiz retake

You can configure a quiz to allow recipients to resubmit their answers as many times as they like, until the quiz's due date.

Role required: assessment_admin or admin

Results are not calculated until the quiz's configured duration has elapsed. The card in the user's queue remains visible until the quiz's due date and displays a button to allow retakes.

1. Navigate to Assessments > Metric Definition > Types.
2. Remove the Evaluation method = Assessment filter condition so you can see all the records in the list.
3. Open the quiz.
4. In the Assessment Metric Type form, select the Allow retake check box and save the record.

View a quiz result

You can view quiz results for each question and category, or view the quiz scorecard for a detailed breakdown.

Role required: assessment_admin or admin

Quiz results are stored in the Metric Result (asmt_metric_result) table and display recipients' answers to each question in a category.

Navigate to Quizzes > Quiz Results.

View a quiz designer scorecard

The quiz scorecard opens in the Category Results view.

For detailed information about scorecards, see Quiz Scorecards.

1. Navigate to Quizzes > Quizzes.
2. Open the quiz whose results you want to view.
4. The scorecard for the selected quiz opens in the Category Results view.
5. Select a category to view from the choice list above the chart.
View a quiz category result
Category results are stored in the Assessment Category Result (asmt_category_result) table and display the overall ratings for each category based on the weighted value for each scored question.

1. To view category results, navigate to **Quizzes > Category Results**.

2. The system calculates results from the weight configured for each category. Weights are set to a value of 10 by default but can be changed. To edit a category's weight:

3. Navigate to **Quizzes > Categories**, and select a category from the list.

4. In the Metric Category form, edit the default value in the **Weight** field.

5. Click **Update**.

   **Note:** You can also edit the weight of a question in the Quiz view of the Assessment Metric form.

Take a quiz

All available quizzes assigned to you appear in your personal assessment and survey queue. When you submit a quiz, the system stores your responses. If a quiz allows retakes, you can resubmit it as many times as you like until its due date.

Role required: none

No special role is required to complete a quiz, but you must be logged in and the quiz must be assigned to you.

If configured to send email, the system sends you a notification when a quiz is assigned to you. The message contains a link to the quiz and instructions for viewing the assessment and survey queue.

Each quiz assigned to you appears in your assessment and survey queue as a card that contains information about the quiz, including a launch button. Overdue quizzes are marked with a red icon and red due date.

You must answer every required question, indicated by a red star, before you can submit the quiz. If you start to take a quiz but cannot complete it, save your responses and return to it later. When you have answered all the questions and are satisfied with the responses, submit the quiz.

By default, you cannot modify your answers to a quiz after submission. However, if the administrator has configured this quiz to allow retakes, the quiz remains in your queue after you
finish it and the card shows a Modify Quiz button. You can retake the quiz as many times as you like before the due date.

1. Navigate to **Self-Service > My Assessments & Surveys**.
2. Click **Take Quiz** on a quiz card to open the questionnaire. If there is more than one quiz category, you can click the collapse or expand icon to hide or show the questions in the category.
3. Answer each question to the best of your ability. If you are unsure of how to respond to a question or if a question does not apply to you, select Not Applicable, if that choice is available.
4. Click **Save** at any time to save your responses without submitting them. You can reopen the quiz from your queue when you are ready to work on it again.
5. When you are ready to submit the completed quiz, read any assertions that require your attention.
6. If present, select the check box to acknowledge the assertion. If your full name is displayed, you are required to provide authentication to acknowledge the assertion after you submit the quiz.
7. Click **Submit**.
8. If prompted, enter your user name and password to verify your signature. If you provided valid answers for all mandatory questions, a success message appears, displaying any end note that was configured. If the quiz allows retakes, the card remains in your queue with a **Modify Quiz** button after submission. If retakes are not permitted, the card disappears from your queue.
9. If the system displays an error message indicating that a question has an invalid response or must still be answered, correct the error and resubmit the quiz.
10. To edit your answers and resubmit a quiz that permits retakes, click **Modify Quiz**. You can modify your responses to the quiz until its due date.

**Quiz scorecards**

The Quizzes application prepares printable scorecards.

A scorecard analyzes category and question responses and compares current ratings with previous ratings. You can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages for the time range selected.

The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed quizzes.

**Category results**

The Category Results view is a stacked bar chart of responses to all questions in a category.

Select the category to display from the choice list above the chart. Category results are only calculated for **scored questions**

This view displays responses that use the following **data types**:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No
Note: The Checkbox and Yes/No data types are combined into the **Boolean** data type in the Quiz designer.
To view details about a specific response to a question, point to the colored segment representing a specific response. The chart displays the count for those responses and the percentage it represents of the total responses to that question.

Quiz category result details

Question results
The Question Results view shows the results for all questions in a quiz.
Select a question by name from the choice list to display the results in a pie chart or a bar chart, based on the data type.

Pie chart

The pie chart shows question results for these data types:
- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

Note: The Checkbox and Yes/No data types are combined into the Boolean data type in the Quiz designer.
Quiz scorecard question results - pie chart

- (empty) = 3 (27.27%)
- Batteries = 2 (18.18%)
- Employees cannot take office supplies for personal use. = 3 (27.27%)
- Printer paper = 2 (18.18%)
- Staples, if they bring them right back = 1 (9.09%)
Bar chart

A bar chart appears when question results use this data type:

- Percentage

By default, all results for percentage questions use a report range of 20% segments. To configure a report range, navigate to Reports > Administration > Report Ranges.

Average ratings

The Average Ratings view displays a bar chart of the weighted average rating for each question in a category.

Use this view to learn how individual questions affect the overall rating for the category. Select a category from the second choice list above the chart. Ratings are only calculated for scored questions.
Average Ratings view

To view the effect of each question's ratings on the entire category's ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question's weighted average.
Quiz reports

Quizzes provide several global reports so that assessment administrators can view important statistics.

You can share these reports with specific users or groups and change the display options. For detailed field information and reporting options, click the link for the chart Type. To sort a column in ascending or descending order, click the arrow in the column heading.

**Wizards**

The Wizards functionality, which enabled administrators to create wizards that provide a step-by-step sequence of dialog boxes that lead the user through a procedure, was deprecated in the Eureka release. However, some users are still able to access this functionality if they enabled its plugin in previous releases.

For more information about this functionality, see [https://docs.servicenow.com/bundle/archive/page/archive/fuji-archive.html](https://docs.servicenow.com/bundle/archive/page/archive/fuji-archive.html).

**Survey wizards**

The Survey Wizard plugin creates surveys using wizards.

Advantages versus other survey functionality include the ability to:

- Ask different questions based on responses (dynamic surveys)
- Create multiple page surveys
- Record answers for partially completed surveys

This plugin integrates with the Best Practice - Task Survey Management plugin. Because the plugin relates to the Legacy Surveys application, the plugin is documented on the ServiceNow wiki.

**Configure the survey property**

How to configure the survey properties (apply to all survey wizards and surveys).

1. Navigate to **Survey Wizards > Survey Properties**.
2. Ensure the **Enable the enhanced task survey capabilities. Survey distribution is controlled by Survey Conditions** property is enabled (select the check box).

**Create a page**

How to create the survey pages (wizard panels) and add questions.

1. Navigate to **Survey Wizards > All** and open the survey wizard.
2. In the **Survey Panels** related list, click **New**.
3. Enter the **Name**, **Title**, and **Description**.
4. Right-click the header and select **Save**.
5. In the **Variables** related list, click **Edit**....
6. Using the **slushbucket**, select and arrange survey questions on the panel.
7. Repeat steps 1 – 6 for each page of the survey wizard.
Create a dynamic effect optional

Create dynamic effects, such as hiding or showing fields on a panel based on answers.

1. Navigate to Survey Wizards > Wizard Policy > Wizard UI Policy or Survey Wizards > Wizard Policy > Wizard Client Scripts
2. Click New.
3. Enter the UI policy or client script details.

Define a transition

Transitions define the logic used to move between pages (wizard panels) in a survey.

Use panels and transition logic to implement multiple page surveys and dynamic effects, such as skipping pages based on answers.

Define transitions:

1. Navigate to Survey Wizards > All and open the survey wizard.
2. Open a survey panel.
3. In the Wizard Panel Transitions related list, click New.
4. Enter the transition details and click Submit.
5. Repeat steps 1 – 4 for all transitions between pages in the survey wizard.

Create a survey condition

How to create a survey condition that controls when and to whom the survey wizard is sent.

Create a survey condition that controls when and to whom the survey wizard is sent:

1. Navigate to Survey Wizards > Survey Conditions.
2. Click New.
3. Select a Type of Survey Wizard. Only a survey or survey wizard is sent (determined by Type), even if both are defined for the condition.
4. Enter the condition details.
5. Click Submit.

Create the email notification

Create an email notification to deliver the survey wizard.

Role required: admin or survey_admin

1. Navigate to System Notification > Email > Notifications.
2. Filter the list to view notifications with an Event Name of task.send_survey, which is the event that is triggered when survey conditions are met.
3. Open a survey notification in the filtered list or click New.
4. Enter the email notification details. If you are creating a new notification, be sure to adjust conditions and weight to avoid conflicts with existing survey notifications (Event Name of task.send_survey)

5. Click Update or Submit.

Create the survey wizard

How to create the survey wizard.
The following steps provide an overview of building a survey wizard.

1. Activate the Survey Wizard plugin, if necessary.
2. Navigate to Survey Wizards > All.
3. Click New.
4. Enter the survey wizard Name.
5. In the Roles field, add the public role.
6. Right-click the header and select Save.

Define a question

How to define survey questions (wizard variables).

1. In the Wizard Variable related list, click New.
2. Enter the variable details.
3. In the Read roles field, add the public role.
   - Configure the form to add the Read roles field, if necessary.
4. Click Submit.
5. Repeat steps 1 – 4 for all questions in the survey.

Note: To learn more, see Define a Wizard Variable.

Installed components

Fields, tables, a business rule, a script include, an application, a survey wizard panel, and demo data (optional).

The following tables are modified:

<table>
<thead>
<tr>
<th>Display Name (Table Name)</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey Conditions (survey_conditions)</td>
<td>Add fields to determine which survey is sent when conditions are met:</td>
</tr>
<tr>
<td></td>
<td>• Type - either a survey or survey wizard</td>
</tr>
<tr>
<td></td>
<td>• Survey_wizard - reference to applicable survey wizard</td>
</tr>
<tr>
<td>Task Survey (task_survey)</td>
<td>Add fields to track which surveys were sent to users:</td>
</tr>
<tr>
<td></td>
<td>• Type - either a survey or survey wizard</td>
</tr>
<tr>
<td></td>
<td>• Survey_wizard - reference to applicable survey wizard</td>
</tr>
</tbody>
</table>
The following tables are added:

### New tables

<table>
<thead>
<tr>
<th>Display Name (Table Name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey Panel (expert_panel_survey)</td>
<td>Adds a survey panel to wizards. Extends the expert_panel table</td>
</tr>
<tr>
<td>Survey Wizard (expert_survey)</td>
<td>Stores survey wizards. Extends expert</td>
</tr>
</tbody>
</table>

The **SurveyUtils** script include is added to record responses during survey panel transitions.

The **Task Survey Events** business rule is modified to include logic for sending survey wizards. Customers who have modified this business rule can not install the updated version automatically.

For information about the link generated from the business rule script, see **Survey Wizard - Multiple Instances** on the ServiceNow Community.

The plugin adds **Survey** as a new type of wizard panel. Survey wizards are created using survey panels.

Survey wizard responses are saved when the user navigates between survey panels (clicks **Next** or **Previous**), as opposed to saving responses only at the end (surveys). This feature allows a logged in user to resume a survey that is in progress and allows survey readers to collect response data for partially completed surveys. To support the ability to resume surveys in progress, survey wizard answers are also temporarily stored in XML in the **expert_instance** table. When the user clicks **Done** on the last panel of the survey wizard, the record in the **expert_instance** table is deleted.

For information about having more than one instance of a given Wizard in play at a time, see **Survey Wizard - Multiple Instances** on the ServiceNow Community.

Demo data is available with this plugin. If you choose to install demo data, a sample survey wizard, called Customer Satisfaction Survey, is added to the database.

### Request survey wizard

Before activating this plugin, consider the installed components, dependencies, and impact.

- Installed Components - fields, tables, a business rule, a script include, an application, a survey wizard panel, and demo data (optional). For more details, see **Installed Components**.
- Dependencies - Best Practice - Task Survey Management (active by default)
- Impact - adds fields to existing tables, installs the Best Practice - Task Survey Management plugin, and modifies the Task Survey Events business rule. You may choose to install a demo survey with the plugin. The plugin integrates with standard survey functionality, so there is no need to transition existing surveys to survey wizards. However, survey administrators must specify a type (survey or survey wizard) for new survey conditions.

1. In the HI Service Portal, click **Service Requests > Activate Plugin**.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
</tbody>
</table>

Specify the date and time you would like this plugin to be enabled | Date and time must be at least 2 business days from the current time.

Note: Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.

Reason/Comments | Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows.

3. Click **Submit**.

**Test the survey wizard**

How to test the survey wizard.

1. Navigate to **Survey Wizards > All** and open the survey wizard.
2. Click **Try it**.
3. Answer survey questions and verify the transition logic based on answers, if applicable.
4. At survey completion, click **Done**.
5. Navigate to **Survey Wizards > Survey Instances**.
6. Search for and open the most recent instance of the survey wizard.
7. Verify that your survey answers are properly recorded.
8. Run through several scenarios to test transition logic and data collection.

**Create a survey wizard (demo)**

This example creates a survey using a survey wizard.

This example creates a survey using a survey wizard (requires the **Survey Wizard plugin**). The survey uses dynamic features that are available using wizards.

Create the survey wizard demo

Create the survey wizard.

1. **Activate the Survey Wizard plugin**, if necessary.
2. Navigate to **Survey Wizards > All**.
3. Click **New**.
4. In the Name field, enter **Software Needs Analysis**.
5. In the Roles field, add the **public** role.
6. Right-click the header and select **Save**.
**Define a survey question**
How to define survey questions (wizard variables).

1. In the Wizard Variable related list, click **New**.
2. Enter the variable details as listed in the table.
3. In the Read roles field, add the **public** role.
   
   Configure the form to add the Read roles field, if necessary.

4. Click **Submit**.
5. Repeat steps 1 – 4 for all variables in the table.

---

Create a survey page

Create the survey pages (wizard panels) and add questions.

1. Navigate to **Survey Wizards > All** and select **Software Needs Analysis**.
2. In the Survey Panels related list, click **New**.
3. Enter the Name, Title, and Description as listed in the table.
4. Right-click the header and select **Save**.
5. In the Variables related list, click **Edit**.
6. Using the **slushbucket**, select and arrange the variables as listed in the table.
7. Repeat steps 1–6 for all panels in the table.

### Panel variables table

<table>
<thead>
<tr>

**Test the survey wizard demo**  
How to test the survey wizard.

1. Navigate to **Survey Wizards > All** and select **Software Needs Analysis**.
2. Click **Try It**.
3. In the Business software you use (select all that apply) question, select: **Microsoft Office, Other**.
4. Verify that the Please specify field appears and is mandatory when Other is selected (UI policy created in **Dynamic Effects**).
5. Click **Next**.
6. Verify that the Office panel appears.
7. Enter test values for the questions and click **Next**.
8. Verify that the End Note panel appears (the transition logic skips the Adobe Creative Suite panel when the Adobe Creative Suite check box is not selected on the first panel).
9. Click **Done**.
10. Navigate to **Survey Wizards > Survey Instances**.
11. Search for and open the most recent instance of the Software Needs Analysis survey wizard.
12. Verify that your survey answers are properly recorded.
13. Run through several scenarios to test transition logic and data collection.
Configure the survey
How to configure the survey.

1. Navigate to Survey Wizards > Survey Properties.
2. Ensure the Enable the enhanced task survey capabilities. Survey distribution is controlled by Survey Conditions. property is enabled (select the check box).
4. Click New.
5. Enter the condition details and click Submit.

<table>
<thead>
<tr>
<th>Condition details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Type</td>
</tr>
<tr>
<td>Survey wizard</td>
</tr>
<tr>
<td>Active</td>
</tr>
<tr>
<td>Table</td>
</tr>
<tr>
<td>User field</td>
</tr>
<tr>
<td>Description</td>
</tr>
<tr>
<td>Condition</td>
</tr>
</tbody>
</table>

6. Navigate to System Policy > Email > Notifications.
7. Click New.
8. Enter the email notification details and click Submit.
### Email notification details

<table>
<thead>
<tr>
<th>Name</th>
<th>Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Software Survey</td>
</tr>
<tr>
<td>Event Name</td>
<td>task.send_survey</td>
</tr>
<tr>
<td>Table</td>
<td>Incident</td>
</tr>
<tr>
<td>User field</td>
<td>event.parm1</td>
</tr>
<tr>
<td>Active</td>
<td>select the check box</td>
</tr>
<tr>
<td>Conditions</td>
<td>Category is Software</td>
</tr>
<tr>
<td>Subject</td>
<td>Please take the software survey (Incident ${number})</td>
</tr>
<tr>
<td>Message</td>
<td>Please complete this survey to help us evaluate our ongoing software needs. &lt;a href=${event.parm2}&gt;Click here to take the survey.&lt;/a&gt;</td>
</tr>
</tbody>
</table>

9. Filter the Email Notifications list using the condition: Event Name is task.send_survey and Table is Incident.

10. If any other notifications exist, increase their Weight value so that only the Software Survey is sent when the incident category is software (the Software Survey has a Weight of 0, so it has the highest priority of any notifications for the incident table).

### Service Portal

Service Portal is a portal framework that allows administrators to build a mobile-friendly self service experience for users. It interacts with parts of the ServiceNow platform, so users can access specific platform features using Service Portal. It is an alternative to the Content Management System (CMS) based on more modern technologies.

Both expert developers and beginners can configure Service Portal.

Less technical users can make basic configuration changes to the UI using Branding Editor and other components of Service Portal. More advanced users can edit and extend portals, pages, and widgets. Expert users can use the Widget Editor tool to write scripts to power a portal, and even create rich web applications on the Now Platform.

### Explore

- Search the HI Knowledge Base for known error articles
Understanding Service Portal

The Service Portal is the engine that houses all of the references to content for your site. The portal record defines the URL extension for a site, as well as things like the knowledge base, catalog, and homepage. You can also use the portal record to define the header menu and the portal branding.
Containers

Containers are markup artifacts that are put on a page to contain the layouts that house the widgets.

You can view containers and how they make up a page in the Service Portal Designer (Service Portal > Service Portal Configuration > Designer). Open a page in the Service Portal Designer, then click anything on the page. In the top left corner, breadcrumbs appear to show you which element on the page you have selected. Use the breadcrumbs to select a container, then click the edit icon 🆓.

![Service Portal Designer breadcrumbs](image)

You can also edit a container by navigating to the Page Editor and selecting the container node in the tree view. In this view, you can:

- Change the layout of widgets on a page.
- Determine the number of columns on a page.
- Determine whether to scale with changes to the browser window.
- Add a background color to a portion of a page.
- Add an background image to a portion of a page.
• View the current layout of the widgets within the page.

Basic concepts

You should have a basic understanding of all the following components that make up a portal:

• Themes define the look and feel of the whole portal, but can be overridden by other style configurations.
• Pages control where and how you store portal content. Pages do not have a defined relationship to portal records, they simply exist. Pages are made up of containers, columns, rows, widgets, and widget instances. You can use the CSS defined in theme and branding as global definitions for the portal or you can configure the CSS of each component. If you do not define CSS in theme or branding, Bootstrap defaults are used.
• Components in Service Portal are called widgets.

Note: You can use HTML templates, CSS, client scripts, server scripts, and any JavaScript dependencies to define what a widget does. From an AngularJS standpoint, widgets are essentially a superset of an Angular directive.

• Most of the data in Service Portal is managed in different locations throughout the system. For example, if you are building a knowledge portal, the data exists in Service Portal, but the knowledge articles are authored and managed in the Knowledge application. Take time to understand which tables contain and control the data you are working with in Service Portal.

Who configures the Service Portal?

Several different kinds of users can configure a portal.

• Limited coding: Service Portal was designed so that even users with limited coding ability or knowledge of the platform UI could set up a portal.
• ServiceNow Experts: Users with an understanding of the ServiceNow platform can create portals, set up URL redirects, and view all the components of the portal in a table. Most portal configuration takes place in the Service Portal configuration page, but in specific circumstances, Service Portal administrators may need to do additional configuration directly within the platform.
• Developers: Advanced customizations and new widget creation should be done by a developer or someone who understands AngularJS and Twitter bootstrap.

In all cases, the user configuring a portal must have the admin or sp_admin role.

Navigate to a portal or a page using the URL

https://<instance name>/sp url suffix?id=<page id>&<page parameters>

Elements:

• Base Instance URL: Unique, secure web address for each instance. The default format is: https://<instance name>.service-now.com
• sp url suffix: Suffix established for the Service Portal
• id: The id of the Page to navigate to within the portal frame
• **page parameters**: Some pages require additional parameters to look up a record (table, sys_id)

For example, `https://<instance name>.service-now.com/sp?id=kb_view2`

**Additional resources**

Service Portal is built using several well known technologies. Use the following websites as resources to help you understand and configure your portal:

- [Twitter Bootstrap](#)
- [CSS 3 Flexbox](#)
- [AngularJS](#)

**Activate Service Portal**

You can activate the Service Portal for Enterprise Service Management plugin (com.glide.service-portal.esm) if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Role required: admin

Service Portal activates these related plugins if they are not already active.

- Service Portal - Knowledge Base (com.glide.service-portal.knowledge-base)
- Service Portal - Service Catalog (com.glide.service-portal.service-catalog)
- Service Portal - Service Status (com.glide.service-portal.service-status)
- Service Portal Configuration Pages (com.glide.service-portal.config)
- Service Portal Designer (com.glide.service-portal.designer)
- Service Portal Social QA (com.glide.service-portal.sqanda)
- Service Portal Surveys (com.glide.service-portal.survey)

1. Navigate to **System Definition > Plugins**.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the **Activate/Upgrade** related link.
   
   If the plugin depends on other plugins, these plugins are listed along with their activation status.

   If the plugin has optional features that depend on other plugins, those plugins are listed under **Some files will not be loaded because these plugins are inactive**. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).

4. Optional: If available, select the **Load demo data** check box.
   
   Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.

   You can also load demo data after the plugin is activated by clicking the **Load Demo Data Only** related link on the System Plugin form.

5. Click **Activate**.
Properties for Service Portal

The Service Portal properties page provides several configuration options for Service Portal. Administrators can access these properties by navigating to Service Portal > Properties.

### Properties for Service Portal

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Default 404 page (page ID or sp_page sys_id) for Service Portal  
*glide.service_portal.default_404_page* | The default page your users see whenever a page cannot load properly.  
- **Type:** string  
- **Default value:** 404  
The string must match the name of the page exactly. |
| Enable Social Q&A in Service Portal  
*glide.sp.socialqa.enabled* | Allow users to ask questions in a portal using the social Q&A widgets.  
- **Type:** true | false  
- **Default value:** true  
On the properties page this appears as a check box, which is selected by default. |
| Show a message to admin users in Service Portal pages if a browser error is encountered  
*glide.sp.show_console_error* |  
- **Type:** true | false  
- **Default value:** true  
On the properties page this appears as a check box, which is selected by default. |
| Maximum number of stream entries displayed in Service Portal (activity widget, conversation widget, and so on)  
*glide.service_portal.stream_entry_limit* | Limit the number of entries users can see in the ticket conversation widget. Users only see the most recent entries and won’t be able to go further back in the history than the max allowed amount.  
- **Type:** integer  
- **Default value:** 100 |

If user criteria (com.glide.service-portal.user-criteria) is enabled, the following properties also appear in the Service Portal properties page:

### User criteria properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Enable use of User Criteria records instead of Roles fields for Service Portal entitlements  
*glide.service_portal.user_criteria_enabled* | Defines permissions for Service Portal widgets, widget instances, pages, and search sources.  
- **Type:** true | false  
- **Default value:** true  
More information: User criteria for Service Portal |
### Service Portal Configuration

Users from any coding level can create a portal as long as they have the admin or sp_admin role. The configuration page allows you to take advantage of a real-time preview, while configuring portal settings. Use each of the tiles on the configuration homepage to assemble the different components of your portal.

### Requirements

Access the configuration options by navigating to Service Portal > Service Portal Configuration.
Service Portal

Create rich, engaging and modern experiences to help your business run better
Select one of the options below to continue

- **Branding Editor**
  - Customize your portal’s title, logo and theme colors.
  - Preview changes as you make them

- **Designer**
  - Create and layout pages with drag-and-drop functionality.
  - Preview pages as you make changes

- **Page Editor**
  - Configure the properties of pages, containers and widgets from a map view

- **Widget Editor**
  - Create widgets from scratch or customize an existing one. Write HTML, CSS, and Javascript with real-time preview

- **New Portal**
  - Create a new Service Portal

- **Get Help**
  - Browse guides, tutorials and videos to learn how to set up, configure and customize your portals
Before you begin

Consider the following before configuring Service Portal:

- Who are you building your site for and why?
- What information do you want to include in your site?
- What do you want the mobile experience to be for users?
- Which platform applications do you plan to use in your portal?

You can use parts of the platform, such as knowledge articles and catalog items, as the content for your portal.

For example, if you are building a knowledge portal, the content displays in Service Portal, but the knowledge articles are authored and managed in the Knowledge application. The same is true for any other type of content you plan to leverage. It is important to take time to understand the table structure of data to become acquainted with content.

- How customized is your service catalog? Catalog client scripts and UI policies only work in Service Portal if they use the mobile GlideForm API, so you may need to make some changes.

Create a service portal and its branding

Use the Branding Editor to give your portal its own look and feel. Service Portal is designed to allow customers to have control over the behavior of their portals. One of the main navigation controls for users is the header main menu. The menu options are determined by the assignment of a main menu to the portal, but the look and behavior of the menu is defined within the theme and associated header.

Role required: admin or sp_admin role.

Note: If you have experience with CSS and HTML you can configure these fields in the portal form directly as accessed through the portal UI. However, the Branding Editor provides a real-time theme preview.

The changes made in the Branding Editor are recorded in the portal record. Any changes made in the Branding Editor or to specific components of the portal (such as a widget or a page container) override any customizations made to the theme.

1. Create the portal.
   a) Navigate to Service Portal > Service Portal Configuration > Branding Editor.
   b) Select the Service Portal from the drop-down list.
   c) Complete the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Portal Title</td>
<td>The name of your portal. Changing the name of the portal in the Branding Editor also changes the title on the portal form field in the platform UI.</td>
</tr>
<tr>
<td>Logo</td>
<td>The logo that appears in the header for your portal.</td>
</tr>
</tbody>
</table>
### Logo padding

Where you want the logo to sit in location to the edge of the header. This information is stored in the CSS variables section on the portal form.

### Tag line & background

Fields defined by the JSON schema in the `Quick start config` field on the portal record in the platform UI. The sample Service Portal adds `Tag Line` and `Background` to the Branding Editor using the following schema:

```json
[
  {
    "tagline": {
      "table": "sp_instance",
      "sys_id": "34fe3d96cb20020000f8d856634c9cf4",
      "field": "title"
    },
    "hero_background": {
      "table": "sp_container",
      "sys_id": "be98a8d2cb20020000f8d856634c9c63",
      "field": "background_image"
    }
  }
]
```

### Tag line

Introduce your users to a portal page with a tag line. This text is stored in an instance of the homepage search widget.

### Tag line color

Select a color for the tag line.

### Homepage background color

Add a color for your background. You can type in a color name, hex color, decimal (r,g,b), or select from the color palate.

### Background image

Upload an image to appear in the background of your homepage. This image is stored in the container for the widget on your homepage.

---

**Note:** For any colors on the theme tab, you can use the standard color name, hex code, decimal (RGB) code, or select the color from the color palate. All the color definitions are stored in the CSS variables field of the portal form. The theme preview updates in real time as you make changes.

### Theme colors tab

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Navbar</td>
<td>Use the fields in this section to customize the colors for the header menu.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Brand</td>
<td>Use the fields in this section to customize the page colors. For example, the page background or the widget background.</td>
</tr>
<tr>
<td>Text</td>
<td>Use the fields in this section to customize the color of the text on a page.</td>
</tr>
</tbody>
</table>

2. Add a header or footer to a service portal.
   a) Navigate to the portal theme (Service Portal > Service Portal Configuration > Portal Tables > Themes) then click the theme you want to add the header or footer to.
   b) In the header or footer field, select the header or footer you want to use for your portal. If you are just getting started, you can reuse the out of box Stock Header or Sample Footer widgets.
   c) Select Fixed Header or Fixed Footer to lock the header or footer in one place so when users scroll up or down they remain in the same location on the page.
   d) To configure the appearance of the header, in the Service Portal configuration page, open the Branding Editor. Under the Theme Colors tab, use the color selectors in the Navbar section to control the colors in the header.

3. Create a portal homepage.
   The home page contains the major information and actions that your users see. When a portal is referenced by the URL suffix it lands on a home page. This homepage is often labeled index in website language.
   a) From any page in the Service Portal Designer, click Edit Portal Properties.
   b) From the Homepage list, select the page you want for your portal homepage and click Save.
4. Configure the service portal header menu.
   The header menu in a portal is actually comprised of two separate widgets: a header widget, which determines the style of the header, and the menu widget, which determines the actual items that appear in the header. You need to configure both before a header menu can appear and act like a header menu in your portal.
   a) In the Service Portal configuration page (Service Portal > Service Portal Configuration), navigate to Portal Tables > Instance with Menu, then click New.
   b) Complete the fields in the menu form.
Menu form
### Menu fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Name of the header menu. You need to know this when you associate the menu with your portal.</td>
</tr>
<tr>
<td>Additional options, JSON format</td>
<td>Advanced configuration options. For example, use this field to enable the shopping cart in the header menu with the following code:</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Application</td>
<td>The record scope. The header menu record and the source table must have the same application scope.</td>
</tr>
<tr>
<td>Widget</td>
<td>The widget that the header menu is based on. Select a menu-type widget from the list. For example, the header menu widget that is included as an out-of-box widget.</td>
</tr>
</tbody>
</table>

---

c) Save the form then click **Menu Items** from the related lists.
d) Click **New** and complete the menu item form.

### Menu item fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Name that appears for the item in the menu</td>
</tr>
<tr>
<td>Parent menu</td>
<td>This field should already contain the name of the menu you are adding items to. You can change the value as needed to other menus</td>
</tr>
<tr>
<td>Parent menu item</td>
<td>Use this field to nest menu items within other menu items</td>
</tr>
<tr>
<td>Order</td>
<td>Value that determines where the item appears in the menu in relation to other menu items</td>
</tr>
<tr>
<td>Type</td>
<td>The kind of page the item links to. For example, you can link to another page in the portal, or an external URL. Form fields vary depending on the option you select from this list. Select <strong>Scripted list</strong> for more advanced options.</td>
</tr>
<tr>
<td>Page</td>
<td>Name of the portal page the item links to. This option is available if you select <strong>Page</strong> as the menu item type.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Condition</td>
<td>Determines what conditions are required for menu items to show in the header. For example, the condition <code>gs.hasRole(&quot;sp_admin&quot;)</code> restricts access to menu items to users with the <code>sp_admin</code> role. Hide a menu item by setting this value to <code>false</code>. For more information on what conditions to use in the Condition field, see Restricting UI actions based on conditions in <a href="#">Create a UI action</a>.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Icon that appears beside the menu item</td>
</tr>
</tbody>
</table>

5. After you create a menu and menu items, add the menu to a portal.
   a) Navigate to **Service Portal > Portals**, then open the portal you want to add a menu to.
   b) From the main menu field, click the reference lookup icon, then select the appropriate menu by name. Click **Save**.
Create and edit a service portal page

Pages organize content, ensure responsive mobile optimization, and design meaningful portal user experiences for your customers. A page houses containers and rows, which then contain widgets. By manipulating the layout of the page, and the widgets within it, you can construct your desired user experience.

These steps are intended for users with little to no coding experience. The Service Portal Designer includes several layers of customization from simply adding widgets in a particular configuration on a page, to adding CSS classes.

To access the Service Portal Designer, navigate to Service Portal > Service Portal Configuration, and then click Designer.

1. Switch to the portal you want to design pages for by selecting the portal name in the header.

2. From the Service Portal Designer, select a page to customize or click Add a new page.
3. Under Layouts, select Container and drag it onto the page.
4. Drag one of the other layouts and drop it in the container.
   This layout defines the structure of your page and the space available to drop widgets. The structure of the layout aligns with the Bootstrap grid template and always adds up to 12.
5. Use the filter to search for a widget, then drag the widget to the layout.
   a) Click **Edit Page Properties**.
      The page record from the Pages table (sp_page) opens.
   b) Edit the form.

   **Page fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Internal name of the page. Use the title to search for a page in the Service Portal Designer.</td>
</tr>
<tr>
<td>ID</td>
<td>A unique ID for the page. The ID is what you use to assign a page to a portal. It also determines the URL for the page, for example <code>https://instance name.service-now.com/doc_portal/?id=doc_page</code>, where <code>doc_page</code> is the page ID.</td>
</tr>
<tr>
<td>Application</td>
<td>The application scope.</td>
</tr>
<tr>
<td>Public</td>
<td>Enables the page to be accessed without the need for authentication. If Public is selected, all users can view the page no matter the roles listed.</td>
</tr>
<tr>
<td>Draft</td>
<td>Mark a page as draft to limit user ability to view the page while you are still creating it. Only users with the admin role can view a page in draft, all other users see a 404 page.</td>
</tr>
<tr>
<td>Roles</td>
<td>Limit user access to a page by role.</td>
</tr>
<tr>
<td>Short description</td>
<td>Describes the portal page. This field is not public facing.</td>
</tr>
<tr>
<td>Page Specific CSS</td>
<td>Unless a page has Page Specific CSS, the page inherits CSS from the Theme and Branding. If you need a page to look different, the Page Specific CSS overrides the inheritance from the Theme and Branding.</td>
</tr>
<tr>
<td>Dynamic page title</td>
<td>Create variables to generate descriptive titles depending on the content loaded into a page.</td>
</tr>
<tr>
<td>Clone Page</td>
<td>Enables you to make a copy of a page that can be modified. If you clone a base system page, a new widget instance is created for each widget on the page.</td>
</tr>
</tbody>
</table>

7. Optional: Edit container properties.
   a) Click within the container you would like to edit, or select **Container** in the breadcrumbs.
   b) Click the edit icon ().
      The container record from the Containers table (sp_container) opens.
   c) Edit the form.

   **Container fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Internal name of the container.</td>
</tr>
<tr>
<td>Order</td>
<td>The order in which the containers appear on a page. To set a container to appear above all other containers, give the container the lowest number in the Order field.</td>
</tr>
<tr>
<td>Page</td>
<td>The page in which the container appears.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Screen reader title</td>
<td>The title used by a screen reader.</td>
</tr>
<tr>
<td>Application</td>
<td>The application scope.</td>
</tr>
<tr>
<td>Width</td>
<td>Width of the container. Options include:</td>
</tr>
<tr>
<td></td>
<td>· Fixed</td>
</tr>
<tr>
<td></td>
<td>· Fluid</td>
</tr>
<tr>
<td>Parent class</td>
<td>Parent CSS class for the container.</td>
</tr>
<tr>
<td>CSS class</td>
<td>The CSS classes for the container. Overwrites page-specific CSS.</td>
</tr>
<tr>
<td>Background color</td>
<td>The background color of the container.</td>
</tr>
<tr>
<td>Background image</td>
<td>Background image for the container.</td>
</tr>
<tr>
<td>Background style</td>
<td>The display style of a background image. Options include:</td>
</tr>
<tr>
<td></td>
<td>· Default</td>
</tr>
<tr>
<td></td>
<td>· Cover</td>
</tr>
<tr>
<td></td>
<td>· Contain</td>
</tr>
<tr>
<td></td>
<td>· Repeating</td>
</tr>
<tr>
<td>Bootstrap alternative</td>
<td>Selecting this field removes the standard Bootstrap grid classes and disables the Bootstrap grid system in the container. If selected, the following are not applied:</td>
</tr>
<tr>
<td></td>
<td>· The Width field in the container record.</td>
</tr>
<tr>
<td></td>
<td>· Standard Bootstrap class in the row record within the container.</td>
</tr>
<tr>
<td></td>
<td>· The Size - xs, Size - sm, Size - md, and Size - lg fields in column records within the container.</td>
</tr>
<tr>
<td></td>
<td>Only select this field if you plan to provide custom CSS classes and CSS for the container, row, and column records.</td>
</tr>
<tr>
<td>Move to header</td>
<td>If selected, the container sticks to the header and does not scroll. Use this option to create a subheader.</td>
</tr>
</tbody>
</table>

8. Optional: To switch to a different page, click the **Pages** tab in the left pane, then select the next page you want to configure.

9. Optional: Use the **Preview** button in the header to view your page as you design it. You can also use **Preview** to view your page in mobile or tablet mode through the controls presented in the header.
Designer tablet view
Include font icons on a page

Include font icons on a page so that all the widgets on the page have access to the font-icon set.

1. In the platform UI, navigate to Service Portal > Pages and click the page you want to add font-icons to.
2. Attach the font-icon file to the page record.
3. In the Page Specific CSS field for the page, add the CSS for the font-icon definition. Use the sys_id of the attachment as the src in the CSS.

```
/* fallback */
@font-face {
  font-family: 'Material Icons';
  font-style: normal;
  font-weight: 400;
  src: url('/42aed5e64f6dc32008a959a211310c748.woff2') format('woff2');
}

.material-icons {
  font-family: 'Material Icons';
  font-weight: normal;
  font-size: 24px;
  line-height: 1;
  letter-spacing: normal;
  text-transform: none;
  display: inline-block;
  white-space: nowrap;
  word-wrap: normal;
  direction: ltr;
  -webkit-font-smoothing: antialiased;
}
```

Result

You can select an icon from the icon set for any widget on this page. For example, in the HTML widget you can use the source code option to use an icon.
Create a new widget

Widgets are the power behind the portal. Widgets are customizable and can be used to provide an variety of experiences for your users. Anytime you add a widget to a page it becomes an instance of itself, which can be configured specifically for each use. Create a new widget to build a custom widget from scratch.

Role required: admin or sp_admin

You can add several Icon Link widgets to a page, configure them to link to different areas and with different icons, and none of them will be affected by the others. You can start by cloning an existing widget and making changes to your cloned version. Developers or people with an advanced understanding of AngularJS can create widgets from scratch.

1. Navigate to Service Portal > Service Portal Configuration > Widget Editor.
2. Click Create a new widget.
3. Enter a name for the new widget. The widget ID is created automatically based on the widget name. Optionally select Create test page to automatically create a page containing the widget.
Note: After completing development of a widget with a test page, delete the test page. Maintaining test pages can create clutter when managing pages.

4. Click Submit.

The widget HTML template, client script, and server script display in the widget editor. Basic script templates are included as a guide.
Clone a widget

Take advantage of existing code by cloning and editing an existing widget.

Role required: admin or sp_admin

**Note:** Base system widgets are read only so you can benefit from future updates. To make changes, you can clone base system widgets. However, cloned widgets are considered custom and do not benefit from future updates to the widgets they were cloned from.

1. Open the Widget Editor in the Service Portal Configuration page, then select an existing widget from the **Select a widget** list. For example, select **Hello World 2**.
2. From the list menu in the widget header, click **Clone "Hello World 2"**.
Clone a widget

3. Enter a name for the cloned widget. The widget ID is created automatically based on the widget name.
4. Optional: Select **Create test page** to automatically create a page containing the widget.
5. Use the check boxes to show or hide the different components of the widget editor as needed. Make changes to the HTML Template, CSS, client script, server script, or the link function.
Enter your name: mundo

function() {
    var name = input;
    if (name) {
        console.log('message');
        data.message = input;
    }
}

¡Hola, mundo!
6. In order to enable a preview of your widget, use **Enable Preview** from the menu. Use the eye icon that appears to show or hide a preview of your widget.

If you clone a widget that uses the Angular ng-template, you must manually clone the template and change the name of the template reference in the widget.

For example, the header menu widget uses the Angular ng-template `menuTemplate`. If you clone the header menu widget, you must also clone the `menuTemplate` and give the clone a unique name. When you open the clone of the header menu widget, you can see a reference to the `menuTemplate` in the HTML.

```html
menuTemplate in header widget HTML
```

**Define a search source**

A search source is a record that describes the behavior and source of searchable data. Configure a basic search source to query data from an instance table, or configure an advanced data fetch script to pull data from anywhere on the web.

A search source defines:

- Where search data is retrieved from.
- Whether search suggestions can populate the search field based on user input.
- How a search entry displays in the search result page.

Search sources have simple and advanced configurations.

**Simple**

Define a table within your ServiceNow instance as a source of searchable data.

**Advanced**

Define a data fetch script to return data. A data fetch script executes on the server and returns a result array to the search widget. This method is more complex, but offers complete power over how a search is executed. You are not limited to records and tables within ServiceNow and can define a script that fetches data from anywhere on the web. To learn more, review the [Tutorial: set up an external knowledge base search source](#).

Typeahead returns search results in real time as a user types in the search field. You can configure typeahead settings, or disable the feature entirely, within the search source record. Typeahead return search has simple and advanced configurations.

**Simple**

Define an icon to display beside typeahead results and the target page to display typeahead selections.
**Advanced**

Define a template for the typeahead result. See [Create an advanced typeahead template](#).

1. In the platform UI, navigate to **Service Portal > Portals** and select the portal you want to add search sources to.
2. From the **Search Sources** related list, click **New** to add a search source.
3. Define the fields on the **Search Source** form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The display value for the search category.</td>
</tr>
<tr>
<td>ID</td>
<td>The record ID. The value should be unique, and should not include any spaces or special characters.</td>
</tr>
<tr>
<td>Application</td>
<td>The scope of the search source.</td>
</tr>
<tr>
<td>Roles</td>
<td>If the Service Portal User Criteria Support plugin is not enabled, define user roles to access this search source.</td>
</tr>
<tr>
<td>Search page template</td>
<td>The HTML template that displays the search results. If defining a basic search source, you do not need to change the default template. For an example of a modified template, see <a href="#">Tutorial: set up an external knowledge base search source</a>.</td>
</tr>
</tbody>
</table>

4. Complete the fields on the **Data Source** tab.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Is scripted source</td>
<td>Select this option to add an advanced data fetch script. If configuring an instance table as the data source, do not check this option.</td>
</tr>
<tr>
<td>Data fetch script</td>
<td>A script defining the endpoint and API calls to fetch external data. This field is only visible when <strong>is scripted source</strong> is selected. For an example of a data fetch script, see <a href="#">Tutorial: set up an external knowledge base search source</a>.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table from the list that you want to draw your results from. You can select any table in the platform. For example, User (sys_user) or Knowledge (kb_knowledge). <strong>Note:</strong> Only indexed tables return search results. Learn more: <a href="#">Enable text indexing for a table</a>.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Apply a filter to the table if you don't want all the search results to display. For example, Active is True.</td>
</tr>
<tr>
<td>Primary display field</td>
<td>Select which field you want to display on the search results page. For example, Name.</td>
</tr>
<tr>
<td>Display fields</td>
<td>Select additional fields to display on the search results page. For example, User ID, Email, and City.</td>
</tr>
</tbody>
</table>
5. Configure **Typeahead** settings to allow search results to populate the search field based on user input.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable typeahead</td>
<td>Allows typeahead functionality. If you do not want to integrate typeahead into your search source, clear the check box.</td>
</tr>
<tr>
<td>Advanced typeahead config</td>
<td>Optionally add an advanced typeahead script to configure the way search results display. For more information, see <a href="#">Create an advanced typeahead template</a></td>
</tr>
<tr>
<td>Typeahead glyph</td>
<td>Adds an icon beside each typeahead result.</td>
</tr>
<tr>
<td>Page</td>
<td>Defines a service portal page to display the selected result. For example, if form is configured, a selected typeahead result opens in a form.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.

7. Configure the way typeahead results display with an advanced template.
   a) In the **Typeahead** tab of the **Search Source** record, select the **Advanced typeahead config** check box.
b) In the **Typeahead template** field, add an HTML template.

This example uses AngularJS bindings to display service catalog images in the typeahead results.

```html
<i class="ta-img" ng-if="match.model.type=='sc'" style="background-image:url('{{match.model.picture}}')"></i>  
<i class="ta-img" ng-if="match.model.type=='sc_guide'" style="background-image:url('{{match.model.picture}}')"></i>  
<i class="ta-icon fa fa-file-text-o" ng-if="match.model.type=='sc_content' && match.model.content_type == 'kb'"></i>  
<br ng-if="match.model.type=='sc_content' && match.model.content_type == 'external'">#</br>  
<span ng-bind-html="match.label | uibTypeaheadHighlight:query"></span>
```

c) Click **Update**.

Typeahead results display beside the image defined in the service catalog record.
User criteria for Service Portal

Administrators can control access to pages, widgets, widget instances, and search sources in a portal by creating and applying user criteria.

User criteria records define conditions that are evaluated against user records. When user criteria is defined, portal records are only visible to users who pass the defined conditions.

User criteria is a platform feature used in Service Portal.

Important: After making user criteria additions or changes, you may need to log out and back in to clear the prior configuration.
Converting role-based permissions to user criteria records

User criteria in Service Portal replaces role-based permissions. After activating the user criteria for Service Portal plugin, you must set the user criteria for Service Portal system property to true. When the system property is set to true, any existing roles defined for a page, widget, or search source are automatically converted into user criteria records. To disable user criteria and continue using role-based permissions, set the system property to false.

User criteria checks

User criteria uses the following checks in Service Portal to verify user access.

Page access user criteria

The following diagram shows how the system decides whether a user can access a page based on user criteria.
Widget access user criteria

The following diagram shows how the system determines whether a user has access to a particular widget or widget instance.
Activate the user criteria for Service Portal plugin

You can activate the Service Portal User Criteria Support plugin (com.glide.service-portal.user-criteria) if you have the admin role.

Role required: admin

1. Navigate to System Definition > Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
   - If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. Optional: If available, select the Load demo data check box.
   - Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
   - You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.
5. Click Activate.

Set the user criteria for Service Portal system property

After activating the Service Portal User Criteria Support plugin, you must set the system property to true.

Role required: admin

Setting the system property activates user criteria for Service Portal. When the system property is set to true, any existing roles defined for a page, widget, or search source are automatically converted into user criteria records. To disable user criteria and continue using role-based permissions, set the system property to false.

1. Navigate to Service Portal > Properties.
2. Click the check box to set the following property to true.

Enable use of User Criteria records instead of Roles fields for Service Portal

Defines permissions for Service Portal widgets, widget instances, search sources

☐ Yes | No

3. Click Save.

Create a user criteria record for Service Portal

Create a user criteria record to apply to items in Service Portal and control user access to pages, widgets, widget instances, and search sources.
You can **apply existing user criteria** to records in Service Portal through Service Portal configuration (**Service Portal > Service Portal configuration**). You can only create user criteria within the platform UI.

1. In the navigation filter, type **Service Portal**.
2. Select a page, widget, or widget instance record.
3. In the related list at the bottom of the record, select the **Can View** or **Cannot View** tab, then click **New**. If a user criteria record is already created, you can click **Edit** to apply user criteria to the page, widget, or widget instance.

User criteria records are stored in the `user_criteria` table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the criteria record.</td>
</tr>
<tr>
<td>Users</td>
<td>User records to match access criteria.</td>
</tr>
<tr>
<td>Groups</td>
<td>Group records to match access criteria.</td>
</tr>
<tr>
<td>Roles</td>
<td>Roles to match access criteria.</td>
</tr>
</tbody>
</table>

4. Complete the fields on the form, as appropriate.
### Field | Description
--- | ---
**Advanced** | Displays or hides the **Script** field.
**Script** | Defines any additional criteria, and returns **true** or **false**. This field is available only if **Advanced** is selected.
**Application** | Application scope for the user criteria record.
**Active** | Activate or deactivates this criteria record.
**Companies** | Companies to match access criteria.
**Locations** | Locations to match access criteria.
**Departments** | Departments to match access criteria.
**Match All** | Determines whether all elements from each populated criteria field must match. If selected, only users who match all criteria are given access. If cleared, the user must meet one or more of the set criteria to be given access.

By default, this check box is cleared so that any condition met provides a match.

For example, consider a user criteria record for the following:
- Locations A or B
- Company C or D

With **Match All** selected, only users meeting all these conditions are matched. For example, a user with a location A and a company C.

With **Match All** cleared, users meeting any of these conditions are matched. For example, a user with a location B.

*Note:* Because scripts are evaluated dynamically, including scripts in user criteria records can decrease performance.

5. Click **Submit**.

### Apply user criteria to a page, widget, or widget instance

Assign user criteria to pages, widgets, or widget instances to limit user access to content in a portal.
Activate the Service Portal User Criteria Support (com.glide.service-portal.user-criteria) plugin and set the `glide.service_portal.user_criteria_enabled` system property to `true`.

Role required: admin or sp_admin

You can apply several user criteria records to a single portal item.

1. In the Service Portal Configuration page (Service Portal > Service Portal Configuration), open the Page Editor.
2. Select a page from the list.
3. Select a page, widget, or widget instance node from the page tree.
4. Under related lists, click Who Can View or Who Cannot View.
5. Click New.
6. Select a criteria from the Can View or Cannot View list.

Selecting criteria from the Can View or Cannot View list applies user criteria records created in Create a user criteria record for Service Portal to the selected page, widget, or widget instance.

7. Click Save.
Apply user criteria to a search source

Assign user criteria to search sources to limit user access to content in a portal.

Role required: admin

You can add user criteria to custom or default Search sources.

1. In the Service Portal Configuration page (Service Portal > Service Portal Configuration), navigate to Portal Tables > Search Source in the header menu.
Service Portal
Create rich, engaging and modern experiences to help your business run.
Select one of the options below to continue.

- **Branding Editor**
  Customize your portal's title, logo and theme colors. Preview changes as you make them.

- **Designer**
  Create and layout pages with drag-and-drop functionality. Preview pages as you make changes.

- **Page Editor**
  Configure the properties of pages, containers and widgets from a map view.

- **Widget Editor**
  Create widgets from scratch or customize an existing one. Write HTML, CSS, and JavaScript with real-time preview.

- **Search Source**
  Service Portal
  Service Portal Documentation
  Service Portal Log Entry
2. Open the search source record that you would like to modify.
3. Under related lists, click Who Can View Search Sources or Who Cannot View Search Sources.
4. Click New.
5. Select a criteria from the Can View or Cannot View list.

Selecting criteria from the Can View or Cannot View list applies user criteria records created in Create a user criteria record for Service Portal to the selected search source.

6. Click Save.

Content Management and Service Portal

Service Portal is an alternative to the Content Management System (CMS). It does not duplicate CMS or platform UI functionality. Users transitioning from a CMS to the Service Portal, may require additional considerations especially if the CMS implementation includes complex and customized Service Catalog forms.
Service Portal compatibility with existing CMS sites

ServiceNow continues to support CMS in current and upcoming releases. If you have existing CMS sites and activate Service Portal on your instance, your CMS sites will continue to work, as CMS and Service Portal are separate applications.

Differences between Service Portal and CMS

Service Portal is an alternative to CMS based on more modern technologies. Major differences include:

Underlying technology
CMS uses Jelly, which is not a widely used technology. Service Portal instead uses AngularJS, server-side JavaScript, HTML, and CSS. Any scripts that use Jelly do not work in Service Portal. Building widgets in Service Portal requires knowledge of AngularJS.

Visual layer
CMS uses iFrames which can be difficult to work with, limited in terms of styling, and susceptible to upgrade issues. Service Portal, on the other hand, is a self-contained application that accesses data from other tables on the platform. This enables fine-tuned control over style and responsive design.

Mobile first
Unlike CMS, Service Portal is optimized for a mobile environment. For this reason, the following apply to the Service Portal environment:

- Any scripts used in Service Portal can only use APIs supported in a mobile environment. For example, some APIs used in your Service Catalog client scripts may not be supported. For a list of supported APIs, see Service Portal and client scripts.
- Service Portal forms support a maximum of two-columns. As a result, any highly customized Service Catalog forms, such as catalog items and record producers that use containers and variable sets, must be simplified to work in a two-column layout.

If transitioning to Service Portal, review the following resource: Mobile client GlideForm (g form) scripting and migration.

To understand how core CMS components are configured in Service Portal, refer to the following table.

<table>
<thead>
<tr>
<th>CMS component</th>
<th>Service Portal equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content site</td>
<td>Portal</td>
</tr>
<tr>
<td>Content page</td>
<td>Page</td>
</tr>
<tr>
<td>Content types</td>
<td>Content types link a table to a content page. In Service Portal, content types are no longer required. Record data is queried and displayed using base system widgets. You can add widgets to any number of Service Portal pages.</td>
</tr>
<tr>
<td>Layout and dropzones</td>
<td>In Service Portal, pages are made up of containers, rows, and columns.</td>
</tr>
</tbody>
</table>
### Table 1: CMS component vs. Service Portal equivalent

<table>
<thead>
<tr>
<th>CMS component</th>
<th>Service Portal equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content block</td>
<td>A content block is a reusable piece of content. In Service Portal, content blocks are replaced by widgets.</td>
</tr>
<tr>
<td>Service Catalog</td>
<td>Service Catalog pages are rendered using the SC Catalog Item widget in Service Portal. For this reason, Service Catalog forms such as catalog items and record producers are shared between your CMS implementation and Service Portal. If you have a highly customized Service Catalog, you may need to invest time in simplifying your Service Catalog items and client scripts so that they render as expected in Service Portal. Learn more: <a href="#">Service Catalog forms in Service Portal</a>.</td>
</tr>
<tr>
<td>Theme</td>
<td>Theme</td>
</tr>
<tr>
<td>CSS</td>
<td>CSS</td>
</tr>
</tbody>
</table>

### CMS and Service Catalog customizations

Service Portal comes with base system widgets to address common use cases and to display record data. Even though there is no direct migration path from CMS to Service Portal, there may be some items, such as catalog items or knowledge articles, that render as expected in Service Portal without any effort.

However, because Service Portal is supported in a mobile environment, you may need to modify any customized forms and scripts. This approach ensures that the items display well on a mobile device and present a better user experience. Before transitioning to Service Portal, you may need to:

- Refactor client scripts used in your CMS/Service Catalog to use supported mobile APIs and global objects. For a list of supported APIs, see [Service Portal and client scripts](#).
- Build widgets to replace UI Macros and other unsupported scripts. If using a UI Macro in a catalog item form and referencing values on the form, you can use the following workaround instead: [Replace a Service Catalog form script with a widget](#).
- Simplify any complex forms used in your Service Catalog to fit the Service Portal two-column form layout.
- Consider which release supports the required functionality. You may want to upgrade your instance before transitioning to ensure that you have the required base system features.

### CMS to Service Portal transition

Your CMS may include complex forms and customizations that do not render as expected in Service Portal. Use this guide to understand how best to modify your CMS and Service Catalog implementation for Service Portal adoption, and to understand how a conversion may affect your users.

If you are considering transitioning from CMS to Service Portal, make sure that you understand the impact of moving to a mobile environment. Review the [Mobile client GlideForm (g form) scripting and migration](#).
## Support level and transition actions

<table>
<thead>
<tr>
<th>CMS component</th>
<th>Service Portal support</th>
<th>Possible transition actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data lookups</td>
<td>The client-side component of a data lookup is not supported in Service Portal. However, the data lookup is applied in the platform when a record is submitted or updated in Service Portal.</td>
<td>While data lookups are not applied in the Service Portal, the record updates as expected in the platform UI when submitted or updated in the Service Portal. If your CMS is used by requesters only, this limitation may not affect your implementation.</td>
</tr>
<tr>
<td>Content blocks</td>
<td>Because Content blocks use Jelly, they are not supported in Service Portal.</td>
<td>In the Service Portal, content blocks are replaced by widgets. Widgets are highly customizable components that can query record data, display and update records, and gather user input. Base system widgets generally cover most use cases. Just as you add content blocks to a page in your CMS, you can add widgets to a page using the Service Portal Designer.</td>
</tr>
<tr>
<td>UI Macros</td>
<td>Because UI Macros use Jelly, they are not supported in Service Portal.</td>
<td>• In Service Portal, you can use widgets instead of UI Macros. Base system widgets generally cover most use cases, but for custom solutions, you can develop new widgets using AngularJS.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If your implementation includes UI Macros in Service Catalog forms that reference other fields or variables in the form, you can embed the widget inside a Service Catalog variable. Learn more: Replace a Service Catalog form script with a widget.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>UI actions</td>
<td>All server-side UI actions are supported in Service Portal, although setRedirectURL() operations are ignored because Service Portal forms handle redirection in a different way than the platform. The form widget ignores all UI actions marked as Client.</td>
<td>• Refactor any UI actions to remove setRedirectURL() operations.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Check that UI actions are not marked as client.</td>
</tr>
<tr>
<td>CMS component</td>
<td>Service Portal support</td>
<td>Possible transition actions</td>
</tr>
<tr>
<td>-------------------</td>
<td>----------------------------------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Catalog client scripts | Only UI Type options **Mobile / Service Portal** and **All** are supported. UI type **Desktop** is not supported in Service Portal. For a list of supported APIs, see [Service Portal and client scripts](#). | • Update your scripts to remove any unsupported client APIs.  
• Check that the script UI Type is set to **Mobile / Service Portal** or **All**. |

**Note:** Synchronous JavaScript calls are not supported in Service Portal and must be replaced by asynchronous calls. For example, the `getXMLWait()` method of the GlideAjax class is not supported in Service Portal. Instead, use one of the following supported asynchronous methods:

- `getXML(Function callback)`
- `getXMLAnswer(Function callback)`

For additional information on GlideAjax, refer to [GlideAjax](#).

To understand the impact of updating your CMS to work in a mobile environment, review [Mobile client GlideForm (g form) scripting and migration](#).

UI policies          | Scripted UI policies can only use APIs supported in Service Portal. For a list of supported APIs, see [Service Portal and client scripts](#). | Update your scripts to remove any unsupported client APIs. |
<table>
<thead>
<tr>
<th>CMS component</th>
<th>Service Portal support</th>
<th>Possible transition actions</th>
</tr>
</thead>
</table>
| Service Catalog variables | Service Catalog variables are supported in Service Portal with the following exceptions:  
  - UI Macros and UI pages variable types are not supported.  
  - Validation Scripts for variables are not supported. Supported validation types include:  
    - The Mandatory field on the variable form.  
    - Read-only variables.  
    - All fields in the Availability tab of the variable form.  
  - Default variable size is not supported.  
  - Expanding and collapsing help text is not supported. Rather, the Help text and Instructions fields defined in the Annotations tab on the variable form are always expanded. The Help tag does not display.  
  - The List Collector variable displays as a choice list instead of a slushbucket in the Service Portal. | - If embedding a widget in a catalog item form, you can use the UI Macro variable type. Learn more: [Replace a Service Catalog form script with a widget](#).  
- If using variable with annotations, make sure to test your catalog items in Service Portal to ensure that help text displays as expected. |
| Order guides        | Order Guides in Service Portal use the Order Guide widget.  
The following are not supported in Service Portal:  
  - Three-step checkout  
  - Uploading attachments | Upgrade to the Kingston release for a base system order guide widget that enables three-step checkout and uploading attachments. However, keep in mind that large order guides can cause performance issues in the Service Portal. If you have large order guides, you can:  
  - Break them into multiple order guides.  
  - Simplify variables used in the order guides.  
  - As a temporary solution, you can render the Service Catalog item using an iFrame. See [Service Catalog forms in Service Portal](#). |
| Record producers    | Record producers are used in Service Portal with the following differences:  
  - The sort order for catalog items in record producers is not honored.  
  - Date values do not honor time zone when the record producer submits a record. | Make sure to test all record producers used in Service Portal to make sure that they behave as expected. |
| Login scenarios and redirects | In CMS, you used the CMSEntryPage script include to define login scenarios. Instead, Service Portal uses the SPEntryPage script include and related system properties to define login scenarios. Redirects are not supported in Service Portal. | In Service Portal, define login behavior by modifying the SPEntryPage script include and setting system properties.  
For more information, see [Single sign-on, logins, and URL redirects](#). |
<table>
<thead>
<tr>
<th>CMS component</th>
<th>Service Portal support</th>
<th>Possible transition actions</th>
</tr>
</thead>
</table>
| Service Catalog forms  | Service Catalog forms such as catalog items and record producers are rendered within widgets in a two-column layout. Complex forms may not display as expected.  
- Only the top-level container settings are honored. If there are other containers within the top-level container, they are rendered as a single column. If there are container splits or nested containers within these additional containers, they are rendered as a single column. A top-level container is not a child of any other container.  
- There can be a maximum of two columns in Service Portal. If your implementation includes forms with more than two columns, the fields are reorganized into two-columns in Service Portal.  
- Variable sets are treated as containers. All previously listed rules apply to variable sets as well as any containers within them.  
- Default variable size is not supported in Service Portal. | - Simplify any complex forms in your Service Catalog.  
- As a temporary solution, you can render the Service Catalog item using an iFrame. See Service Catalog forms in Service Portal.                                                                                                                                                                                                                       |
| Shopping cart          | The Service Portal includes a base system Shopping Cart widget.                                                                                                                                                                                                                                                                                                                                                                               | Use the Shopping Cart widget.                                                                                                                                                                                                                                                                                                                                 |

**Service Catalog forms in Service Portal**

Service Catalog forms are rendered within Service Portal widgets in a two-column layout. Complex forms may not display as expected.

**Recommendations when creating Service Catalog forms**

Use the following recommendations as a guide to building scalable forms that can be used in both applications:

- Keep forms simple. Because forms with multiple containers, variable sets, and client scripts do not always display as expected in Service Portal, keep forms short to eliminate conversion and debugging issues.

- Think in mobile. Any support for Catalog Client Scripts or Catalog UI Policies is the same as in mobile. Review the following resource: [Mobile client GlideForm (g form) scripting and migration](#).
Form rendering in Service Portal

Containers and variable sets within Service Catalog forms are translated into a two-column layout when implemented in Service Portal. Service Catalog forms are rendered in Service Portal using the following rules:

- Only the top-level container settings are honored. If there are other containers within the top-level container, they are rendered as a single column. If there are container splits or nested containers within these additional containers, they are rendered as a single column. A top-level container is not a child of any other container.
- There can be a maximum of two columns in Service Portal. If your implementation includes forms with more than two columns, the fields are reorganized into two-columns in Service Portal.
- Variable sets are treated as containers. All previously listed rules apply to variable sets as well as any containers within them.
- Default variable size is not supported in Service Portal.

For other forms in the platform, the view determines how the form displays in Service Portal. For base system tables, the form opens in the Service Portal using the Service Portal table form view.

Example layout conversions

The following examples demonstrate how Service Catalog forms display in Service Portal.

Single-column form

A Service Catalog form with:

- Two containers.
- A single-column layout.
Service Catalog form

In Service Portal, the single-column layout renders as expected.
**Container1**

Variable1

Variable2

**Container2**

Variable3

Variable4

Service Portal result

**Two-column layout with subcontainers**

A Service Catalog form with:

- A container with a two-column layout.
- A subcontainer with a single-column layout.
- A subcontainer with a two-column layout.
In Service Portal, the two-column layout setting of the subcontainer is ignored. The subcontainer renders as a single column.
<table>
<thead>
<tr>
<th>Container1</th>
<th>Container2</th>
<th>Container3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable1</td>
<td>Variable5</td>
<td>Variable7</td>
</tr>
<tr>
<td></td>
<td>Variable6</td>
<td>Variable8</td>
</tr>
<tr>
<td></td>
<td>Variable3</td>
<td>Variable9</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Variable10</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Variable4</td>
</tr>
</tbody>
</table>

**Service Portal result**

**Two-column layout with variable sets and subcontainers**

A Service Catalog form with:

- Containers with single-column and two-column layouts.
- Variable sets with a two-column layout within containers.
In Service Portal, the two-column layout settings of the variable sets are ignored when inside a container column.
<table>
<thead>
<tr>
<th>Container1</th>
<th>Variable1</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>VariableSet1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable5</td>
</tr>
<tr>
<td>Variable6</td>
</tr>
<tr>
<td>Variable2</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Container2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable3</td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>VariableSet3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable9</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Variable10</th>
<th>Variable4</th>
</tr>
</thead>
</table>
Containers within variable sets

A Service Catalog form with:

- Variable sets with single-column layouts.
- A container with a single-column layout with a container split within a single-column variable set.
- A container with a two-column layout within a single-column variable set.

Service Catalog form

In Service Portal, the container split and two-column container settings are ignored when inside a single-column variable set.
Nested containers

A Service Catalog form with:

- Containers that contain variable sets.
- Variable sets that contain nested containers.

Service Catalog form

In Service Portal, nested container formatting is ignored and displays as a single-column.
<table>
<thead>
<tr>
<th>Container1</th>
<th>VariableSet1</th>
<th>VariableSet2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Container2</td>
<td>NestedContainer1</td>
<td>NestedVariable5</td>
</tr>

<td></td>
</tr>
<tr>
<td></td>
<td>NestedVariable9</td>
<td></td>
</tr>
<tr>
<td></td>
<td>NestedVariable10</td>
<td></td>
</tr>
</tbody>
</table>

Service Portal result
Render a complex form in Service Portal using an iFrame

Because complex forms do not display as expected in Service Portal, you can render catalog items, record producers, and order guides in Service Portal using an iFrame. This workaround is a temporary solution to enable your Service Portal to function as expected while you simplify any complex Service Catalog forms.

When rendering items in an iFrame in Service Portal, the following limitations apply:

- On catalog items and record producers, the attachment icon is not visible. As a result, users cannot attach any files during the submission. As a workaround, you can add the attachment button to your form.
- Click-through for the hover-over icon is not available.
- Forms are not optimized for a mobile environment.

Use the attached resources and follow the instructions detailed in the Community post: Service Catalog on Service Portal.

Note: Be sure to make changes in a test environment before updating your production instance.

Replace a Service Catalog form script with a widget

You can use widgets in Service Portal to replace UI Macros. If your Service Catalog form includes a UI Macro that references other fields or variables on the form, you can create a widget to hold reusable code and embed it within the Service Catalog form. Use special syntax to access any variable fields on the form.

Role required: admin or sp_admin

1. Create a widget that performs the action you would like to use in catalog item forms. See step 7 for a simple example widget that accesses another variable on the form.
2. Open a catalog item that previously used a UI Macro or other reusable component not supported in Service Portal.
3. In related lists, add a new variable to the catalog item.
4. Configure the variable form to add the Widget field.
5. In the Type field, select Macro.
6. In the Widget field, select a widget that performs the desired action.
7. Optional: Use the $scope.page.g_form() or $scope.page.field syntax in the embedded widget to access the catalog item values. This example shows how to modify the value of a single-line text variable with the name color associated with the catalog item.

**Widget HTML Template**

```html
<div>
    Data from catalog variable:
</div>
<h1>{{ c.data.message }}</h1>
```

**Widget client script**

```javascript
function($scope) {
    var c = this;
    //Watch for changes in the color variable
```
You can use the following to access variable or catalog item fields:

- `$scope.page.g_form()`: The g_form instance on the form. You can use all supported g_form methods described in Service Portal and client scripts. For example, `g_form.setValue('variable_name', 'new value');`.
- `$scope.page.field()`: The object that represents the variable.

When you open the catalog item in the Service Portal, the embedded widget accesses the variable fields associated with the catalog item.

**Unsupported features in Service Portal**

Service Portal is an alternative presentation layer for the platform. As such, not all features of the platform are extended to Service Portal. Consider your full application and the abilities of Service Portal before making considerable investments. ServiceNow will continue to enhance Service Portal over time.

**Not currently supported**

- Approvals with e-signature
- Domain separation at Levels 1-3. However, Service Portal does include support for domain separation at the Data only level. For more information, see Application support for domain separation.
No plans to support

- @ Mentions
- Click-through/pop-ups
- Embedded HTML outside of HTML fields
- Embedded lists
- UI macros
- Formatters
- UI actions marked as Client
- Nested container Catalog variables
- Survey wizards
- OpenFrame

Some client scripting globals are also unavailable in Service Portal. For more information, see Service Portal and client scripts.

Service Portal and client scripts

You can use client scripts and catalog client scripts in the Service Portal if the UI Type is set to Mobile/Service Portal or All. Client scripts and catalog client scripts are used with the Form widget and SC Catalog Item widget, as opposed to a widget client controller.

Before flagging a script as Mobile/Service Portal or All, make sure that you are only using the mobile APIs. Setting a client script to Mobile does not ensure that it will work, it simply flags that the script should be attempted by the mobile app or the Service Portal. Many of your existing client scripts can be set to All as long as the API calls are supported by the mobile client scripting environment.

The topics in this section require advanced coding knowledge and an understanding of Service Portal APIs.

Checking desktop vs mobile runtime

You might want to mark a client script compatible with both desktop and mobile, but still do something different depending on the runtime. You can use this script:

```java
if (window === null)
    // Write your mobile compatible code here
else
    // Write your desktop compatible code here
```

Unsupported client scripting globals

Widget client controllers are full Angular controllers and are not subject to the unsupported client script globals listed here. Use jQuery and Angular as needed.

The following globals and APIs are unavailable in client scripts and catalog client scripts used in the Service Portal:

- window
- document
- $
- jQuery
- $$
Embedded widgets & g_form

When using the Service Catalog variable type Macro and Macro with Label you can pick a widget to embed in a catalog item form. Within the client controller for the embedded widget you can access the field object and catalog item g_form instance using:

- $scope.page.field
- $scope.page.g_form()

Supported client side APIs

These are the supported client scripting APIs you can use in onLoad, onChange, and onSubmit client scripts.

For detailed class and method information, see the API reference.

• setFieldPlaceholder(fieldName, placeholder)  
• setLabel(fieldName, label)  
• setMandatory(fieldName, isMandatory)  
• setReadOnly(fieldName, isReadOnly)  
• setSectionDisplay(sectionName, isVisible)  
• setValue(fieldName, value, displayValue)  
• showErrorBox(fieldName, message, scrollForm)  
• showFieldMsg(fieldName, message, type: "info | error", scrollForm)  
• showRelatedList(relatedTableName)  
• showRelatedLists()  
• submit(submitActionName)                                                                 |

**Note:** Using the `variables.var_name` notation with the `g_form` API is not supported in Service Portal. `g_form` as a global object cannot be used in a widget client controller or in a UI script.
<table>
<thead>
<tr>
<th>Class</th>
<th>Available methods</th>
</tr>
</thead>
<tbody>
<tr>
<td>g_list</td>
<td>- get(fieldName)</td>
</tr>
<tr>
<td></td>
<td>- addItem(value, displayValue)</td>
</tr>
<tr>
<td></td>
<td>- removeItem(value)</td>
</tr>
<tr>
<td></td>
<td>- reset()</td>
</tr>
<tr>
<td></td>
<td>- setQuery(queryString)</td>
</tr>
<tr>
<td></td>
<td>- setDefaultOperator(operator)</td>
</tr>
<tr>
<td></td>
<td>- getDefaultOperator()</td>
</tr>
<tr>
<td>g_service_catalog</td>
<td>- isOrderGuide()</td>
</tr>
<tr>
<td>GlideAjax</td>
<td>- new GlideAjax(scriptIncludeName)</td>
</tr>
<tr>
<td></td>
<td>- addParam(name, value)</td>
</tr>
<tr>
<td></td>
<td>- getParam(name)</td>
</tr>
<tr>
<td></td>
<td>- getXML(callback)</td>
</tr>
<tr>
<td></td>
<td>- getXMLAnswer(callback)</td>
</tr>
<tr>
<td></td>
<td>- getJSON(callback)</td>
</tr>
<tr>
<td></td>
<td>- setErrorCallback(errorCallback)</td>
</tr>
<tr>
<td></td>
<td>- getURL()</td>
</tr>
<tr>
<td></td>
<td>- getParams()</td>
</tr>
<tr>
<td></td>
<td>- execute()</td>
</tr>
<tr>
<td></td>
<td>- successCallback(data, status, xhr)</td>
</tr>
<tr>
<td></td>
<td>- errorCallback(xhr)</td>
</tr>
<tr>
<td></td>
<td>- setScope(scope)</td>
</tr>
</tbody>
</table>

**Note:** Because the mobile platform does not allow synchronous GlideAjax calls, the getXMLWait() method in a GlideAjax call will not work in the Service Portal. Instead, use one of the following:
- getXML(Function callback)
- getXMLAnswer(Function callback)
### Usage examples

**g_list**

The `g_list` global helps you set the filter of a glide list element or a list collector variable. Use this API in place of the `g_filter` API on desktop client scripts.

```javascript
function onLoad() {
    var myListCollector = g_list.get("my_list_collector");
    myListCollector.reset();

    myListCollector.setQuery("active=true^category=8c7b22230b402200b0b02c6317673a62");
    myListCollector.addItem('3a700d39af5f4fc0aab978df90f4c692', 'Power Supply');
    myListCollector.addItem('1cb93419a3a248318da8f814140b42f6', 'Backpack');
}
```

**g_service_catalog**

`g_service_catalog` is only available in Service Portal service catalog item scripts. Use this API to know if your catalog item script is run as part of an order guide or on its own.

```javascript
function onLoad() {
    if (window) // if CMS, don't run this
        return;

    // g_service_catalog api for Service Portal and Mobile
    var isOrderGuide = g_service_catalog.isOrderGuide();
    g_form.setValue("is_order_guide", isOrderGuide ? "Yes!" : "Nope :(");
}
```
Unsupported form scripts for Service Portal

Because Service Portal doesn’t use Jelly, not all form customizations are available.

### Supported and unsupported form scripts

<table>
<thead>
<tr>
<th>Form script</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client scripts</td>
<td>Service Portal uses UI type set to All or Mobile/Service Portal. Client Scripts marked as Desktop rely on legacy APIs that aren’t supported by Service Portal. Before flagging a script as Mobile or All, make sure you are only using mobile APIs.</td>
</tr>
<tr>
<td>UI Actions</td>
<td>All server-side UI actions are supported in Service Portal, although setRedirectURL() operations are ignored because Service Portal forms handle redirection in a different way than the platform. Any UI Actions marked as Client are ignored by the form widget.</td>
</tr>
<tr>
<td>UI Policies</td>
<td>Supported, although you should use only declarative UI Policies. Avoid scripting unless the outcome cannot be achieved through the condition builder.</td>
</tr>
<tr>
<td>UI Macros</td>
<td>Not supported as UI macros use Jelly.</td>
</tr>
<tr>
<td>Formatters</td>
<td>Not supported as formatters use Jelly.</td>
</tr>
</tbody>
</table>

### Understanding Widgets

Widgets are what define the content in your portal. You can use the base system widgets provided with Service Portal, clone and modify widgets, or develop custom widgets to fit your own needs.

Out of box widgets are read-only so you can benefit from future updates, which means you can’t update their code. If you need to make major changes, clone the widget and give it another name and ID.

### Widget context menu

From any rendered Service Portal page you can CTRL+right-click a widget to see more configuration options in a context menu.

For example, navigate to Service Portal > Service Portal Home to open a sample portal page. CTRL+right-click Knowledge Base on that page.

© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Note: You must have the admin or sp_admin role to see the widget context menu. When you impersonate a user without one of those roles, you can still see the menu. However, a regular user signed in without those roles cannot see the menu.

<table>
<thead>
<tr>

<td>Opens the widget form in a pop up window so you can make quick changes to the widget.</td>
</tr>
<tr>
<td>Widget in Editor</td>
<td>Opens the widget in the Widget Editor. You can use the Widget Editor to configure HTML templates, CSS, client scripts, service scripts, and demo data for the widget.</td>
</tr>
<tr>
<td>Log to console: $scope.data</td>
<td>The $scope.data object passes data from the server to the client side controller. Instead of adding console.log messages or alerts into the controller code, you can just log the $scope.data object to the browser console and view the data there.</td>
</tr>
<tr>
<td>Log to console: $scope</td>
<td>Similar to the $scope.data object, except it logs everything in $scope to the console.</td>
</tr>
</tbody>
</table>

**Widget library**

Widgets included with Service Portal can be customized to suit your own needs or as a basic code sample for you to refer to as you are building your own widgets.

Due to the ever-changing number of widgets that exist at any given time in Service Portal, this is not a definitive list. More widget descriptions will be added as they become available.

Depending on your configuration, widgets that do not contain any information do not appear in your Service Portal page.

To view the instance options for a widget, use the widget context menu.

**Example widgets**

- Approvals widget
- Approval Info widget
- Approval Record widget
- Breadcrumbs widget
- Breakout Game widget
- Calculator widget
- Carousel widget
- Cool Clock widget
- Header menu widget
- Hello World widgets
- HTML widget
- Icon Link widget

**Service Catalog widgets**

- SP Variable Editor widget
- Catalog Content widget
- Request Fields widget
- Requested Items widget
- SC Catalog Item widget
- SC Categories widget
- SC Category Page widget
- SC Order Guide widget
- SC Popular Items widget
- SC Save Bundles widget
- SC Saved Carts widget

**Knowledge Management widgets**

- KB also in Category widget
- KB Article Comments widget
- KB Article Page widget
- KB Categories widget
- KB Category Page widget
- KB Most Viewed widget
- KB News widget
- KB Search widget
- KB Top Rated widget
- KB View widget
- KB View 2 widget
- My Favorite Tags widget
- Icon menu list widget
- Language Switch widget
- Link button widget
- Login widget
- My Requests widget
- Organization Chart widget
- Sample Footer widget
- Stock widget
- Ticket Attachments widget
- Ticket Conversations widget
- Ticket Location widget
- User Profile widget
- Weather widget

Service Status widgets
- Business Service Status widget
- Current Status widget
- Planned Maintenance widget
- Service History widget
- Service Status widget
- Service Status Legend widget
- Service Status Subscription widget

Service Portal configuration widgets
- Service Portal Config Overview widget
- Portal config widget
- SP Page Map widget
- SP Portal Map widget
- Theme Preview widget
- Widget Edit Panel widget

List and form widgets
- Simple List widget
- Data table from instance definition widget
- Data Table from URL definition widget
- Form widget

Search widgets
- Home Page Search widget
- Typeahead Search widget
- Contextual Search widget
- Search Page widget

Example widgets
All widgets in Service Portal can be used as example code for how scripts are used in a widget. However, several base system widgets have been included expressly for this purpose.

Use the example widgets to see how to use HTML, CSS, or client and server scripts in Service Portal. You can also clone and extend each widget to suit your needs.

Approvals widget
Users can approve or reject items directly within Service Portal. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

Using the widget
The Approvals widget displays data from the Approvals (sysapproval_approver) table. If the user has been assigned to approve a request, the approval record is displayed in the widget.
My Approvals

REQ0010001 - Dell Precision 690
Requestor ITIL User
Price $1,875.00

Options

Reject Approve

Note: Service Portal does not currently support Approvals with e-signature.

Instance options

Use the instance options to change the appearance of the approvals widget.
## Approvals widget instance options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap color</td>
<td>Color scheme for the widget. The default colors are defined by the portal theme, but if you want the instance to have a specific color, select the option from the list.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Add an icon to display beside the widget name.</td>
</tr>
<tr>
<td>Buttons stacked side by side</td>
<td>If this check box is selected, the Approve and Reject buttons appear horizontally beside each other. If this check box is cleared, the Approve and Reject buttons appear stacked vertically.</td>
</tr>
<tr>
<td>Max number of elements shown in the list</td>
<td>Limit the number of approvals users see on a page. The default number is 10. Only enter numbers greater than 0.</td>
</tr>
<tr>
<td>Who can view instances/who cannot view instances</td>
<td>Control who can or cannot view a widget instance with user criteria. User criteria must be enabled for this option to appear.</td>
</tr>
</tbody>
</table>
Approval Info widget

The Approval Info widget works in tandem with the Approval widget to display details about the approval request. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

![Approval Info widget](image)

Approval Info widget

Instance options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap color</td>
<td>Color scheme for the widget. The default colors are defined by the portal theme, but if you want the instance to have a specific color, select the option from the list.</td>
</tr>
</tbody>
</table>

Approval Record widget

The Approval Record widget shows the full record for an approval including the activity stream. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.
Approval Record widget

Instance options

The approval record widget does not include instance options.
**Breadcrumbs widget**

The breadcrumbs widget allows users to easily navigate around a portal. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

**Using the widget**

The breadcrumbs widget displays information based on where a page is located in a portal. For example, if you navigate to the Knowledge Base from the home page, then the breadcrumb reads as Home > Knowledge Base. Each subsequent page that you open expands the breadcrumb.

Click a page name on the breadcrumbs widget to navigate to that page. For example, to return to the home page, click Home.

You can customize this widget to change the breadcrumb path. For more information, see KB0719179.

**Instance options**

The breadcrumbs widget does not have instance options.

**Breakout Game widget**

The Breakout Game widget is a fun 404 interaction for pages that do not exist. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.
Breakout Game widget

Instance options

The Breakout Game does not have instance option. You can use it as an example of how to use the Link Function as part of an Angular Directive.

Calculator widget
The calculator widget does simple calculations. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

Use the calculator widget as an example of how to pass data between the client and server.
Calculator widget

Instance options

The calculator widget does not include instance options.

Carousel widget

The carousel widget displays a scrolling list of images. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

Use the carousel widget to showcase items on your portal page. For example, display items available in a service catalog at the top of the service catalog page.
Carousel widget

Add slides to the carousel widget

Use the related lists for an instance of the carousel widget to add images for the carousel widget to scroll through.

Role required: Admin or sp_admin

1. Navigate to **Service Portal > Widgets > Carousel**.
2. Open the **Carousel** widget record.
3. From the carousel form, on the **Instances** related list, under instances, open a carousel instance.
4. From the instance of carousel form, click **New** on the **Carousel Slides** related list.
5. Complete the form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the carousel slide. Use the name to differentiate the slide from other slide records.</td>
</tr>
<tr>
<td>Order</td>
<td>Where the slide appears in the list of slides</td>
</tr>
<tr>
<td>HREF/URL</td>
<td>Link to the item in the slide. For example, for a slide with a catalog item, link to page for the catalog item using the HREF <code>?id=&lt;page name&gt;&amp;sys_id=&lt;sys_id for item&gt;</code>. You can also link to other sites using the URL.</td>
</tr>
<tr>
<td>Background</td>
<td>Upload an image for the slides. Carousel images should be 1022x300 pixels.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Application</td>
<td>Automatically populated with the name of the application the portal falls under.</td>
</tr>
<tr>
<td>Carousel</td>
<td>Name of the instance of the carousel widget you are adding the slide to. This field is not automatically populated and you cannot select an instance of the carousel widget if it does not have a name.</td>
</tr>
</tbody>
</table>

Repeat this step for as many slides as you want to appear in the carousel widget.

**Cool Clock widget**

The Cool Clock widget uses instance options to show different times around the world. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

Cool clocks demonstrates how to use instance options in a widgets. The time zone is loaded using an instance option. If you do not select a time zone, the widget uses a default time zone.
Instance options

Cool clock widget instance options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Name of the clock, for example New York, NY. The name appears below the clock</td>
</tr>
<tr>
<td></td>
<td>so it helps to use a name related to the time zone.</td>
</tr>
<tr>
<td>Timezone</td>
<td>The location from which the time is displayed. Use the local full name, for</td>
</tr>
<tr>
<td></td>
<td>example, America/New York, instead of the abbreviated time zone. Using the</td>
</tr>
<tr>
<td></td>
<td>full name allows time zones to stay consistent with daylight savings time.</td>
</tr>
<tr>
<td></td>
<td>The default value is America/Los Angeles</td>
</tr>
<tr>
<td>Second hand color</td>
<td>Color of the second hand using the hex code, RGB, or color name. The</td>
</tr>
<tr>
<td></td>
<td>default value is red.</td>
</tr>
</tbody>
</table>

Data table from instance definition widget

Data table from instance definition displays a table that you define using the widget instance options. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

After you add the data table from instance definition widget to a page, use the instance options to configure the appearance of the table.
## Incidents

All > Active = true, priority=1 critical

<table>
<thead>
<tr>
<th>Number</th>
<th>Category</th>
<th>Short description</th>
<th>Priority</th>
</tr>
</thead>
<tbody>
<tr>
<td>INC0000001</td>
<td>Network</td>
<td>Can't read email</td>
<td>1 - Crit</td>
</tr>
<tr>
<td>INC0000004</td>
<td>Inquiry / Help</td>
<td>Forgot email password</td>
<td>1 - Crit</td>
</tr>
<tr>
<td>INC0000005</td>
<td>Hardware</td>
<td>CPU load high for over 10 minutes</td>
<td>1 - Crit</td>
</tr>
<tr>
<td>INC0000006</td>
<td>Software</td>
<td>Hang when trying to print VISIO document</td>
<td>1 - Crit</td>
</tr>
<tr>
<td>INC0000008</td>
<td>Inquiry / Help</td>
<td>Printer in my office is out of toner</td>
<td>1 - Crit</td>
</tr>
</tbody>
</table>

Rows 1 - 5 of 22

---

### Instance options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title of the widget. If you leave this field empty the name of the table displays as the widget name.</td>
</tr>
<tr>
<td>Table</td>
<td>The table that the widget displays records from.</td>
</tr>
<tr>
<td>Filter</td>
<td>Text field from the condition builder that you can use to limit the items returned in the table. To create a filter, use the context menu to open the widget instance in the platform. Then use the condition builder to create a filter.</td>
</tr>
<tr>
<td>Maximum entries</td>
<td>Limits the number of items displayed in the table. If there are more entries than allowed in the table, users can scroll to the next page.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Icon that displays beside the widget title</td>
</tr>
<tr>
<td>Fields</td>
<td>Columns to display in the table.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>Color scheme for the widget. The default colors are defined by the portal theme, but if you want the instance to have a specific color, select the option from the list.</td>
</tr>
<tr>
<td>Link to this page</td>
<td>Direct users to a specific page when they click a record. By default, clicking an entry in the table opens that entry in a form.</td>
</tr>
<tr>
<td>Enable Filter</td>
<td>Select this check box to allow users to create their own filter for the table. This option is currently only supported for the Data Table widgets.</td>
</tr>
</tbody>
</table>

**Data Table from URL definition widget**

The Data Table from URL definition widget displays the table you select from the list. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

![Data Table from URL definition widget](image)

**Instance options**

Complete the instance options to define the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title of the widget. Select the <strong>Use Instance Title</strong> check box to use this title instead of the name of the table.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Icon that displays beside the widget title</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>Color scheme for the widget. The default colors are defined by the portal theme, but if you want the instance to have a specific color, select the option from the list.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
Link to this page | Direct users to a specific page when the click a record. By default, clicking an entry in the table opens that entry in a form.
Fields | Columns to display in the table. For example, short description or priority.
Use Instance Title | Select to use the title in the Title field instead of the table title.
Enable Filter | Select this check box to allow users to create their own filter for the table.

If **Enable filter** is enabled in the instance options, users can add custom conditions to filter the results.

Data Table URL with condition builder

For more information on using the condition builder, see *[Create a filter in List v3]*.

**Note:** The condition builder is only available in the desktop view.
**Form widget**

The form widget is a platform form within the Service Portal UI with a few differences. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

**URL Parameters**

The form widget accepts the following parameters within the URL.
Form widget URL parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sys_id or sl_sys_id</td>
<td>Sys_id for the record to be displayed</td>
</tr>
<tr>
<td>table, sl_table, or t</td>
<td>Table for the record to be displayed</td>
</tr>
<tr>
<td>view or v</td>
<td>View used to display the record</td>
</tr>
</tbody>
</table>

In the following example, the URL would display an incident with a sys_id of 1c741bd70b2322007518478d83673af3 in the portal view.

https://example.service-now.com/sp?id=form&table=incident&sys_id=1c741bd70b2322007518478d83673af3&view=portal

Supported and unsupported form scripts

<table>
<thead>
<tr>
<th>Form script</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client scripts</td>
<td>Service Portal uses UI type set to All or Mobile/Service Portal. Client Scripts marked as Desktop rely on legacy APIs that aren’t supported by Service Portal. Before flagging a script as Mobile or All, make sure you are only using mobile APIs.</td>
</tr>
<tr>
<td>UI Actions</td>
<td>All server-side UI actions are supported in Service Portal, although setRedirectURL() operations are ignored because Service Portal forms handle redirection in a different way than the platform. Any UI Actions marked as Client are ignored by the form widget.</td>
</tr>
<tr>
<td>UI Policies</td>
<td>Supported, although you should use only declarative UI Policies. Avoid scripting unless the outcome cannot be achieved through the condition builder.</td>
</tr>
<tr>
<td>UI Macros</td>
<td>Not supported as UI macros use Jelly.</td>
</tr>
<tr>
<td>Formatters</td>
<td>Not supported as formatters use Jelly.</td>
</tr>
</tbody>
</table>

Header menu widget
The Header Menu widget controls which options appear in the page header. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

Unlike other widgets in Service Portal, the header menu widget is not something you drag onto a page. Instead you configure the header menu by associating the header menu with a portal.
Instance options

The header menu widget does not include instance options.

Hello World widgets
The Hello World widgets are included with Service Portal as examples of how to use and create widgets. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

All three Hello World widgets display the same way. The real difference between them is in their underlying code base. Each version of the widget uses a different method of using the server and client script.

To view the Hello World widgets, navigate to Service Portal > Service Portal Configuration then click Widget Editor. In the Widget Editor, click Check out the Hello World Example.
Hello world 1 displays how the HTML template and the client script communicate. For more information on using the client script in Service Portal, see Widget client script.

Use the widget list to switch to Hello World 2 or 3.

Hello World 2 includes an example of how the server script can be used as well.
For more information on Service Portal APIs, see the GlideSPScriptable API.

**HTML widget**

Use the HTML widget to directly inject HTML, text, lists, or content in general into a page. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

Because the HTML widget can contain content of any kind, any example may just appear as regular text. For example, the HTML widget appears as a box of text on the 404 page.
### HTML widget

### Instance options

**HTML widget instance options**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Name for the HTML text. Users do not see this information.</td>
</tr>
<tr>
<td>HTML</td>
<td>Text box for the HTML. Use the toolbar like most word processing tool bars. For more information on using the toolbar, see <a href="#">Formatting in the TinyMCE editor</a>.</td>
</tr>
</tbody>
</table>

**Icon Link widget**

Link to any other item. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

Configure Icon Link widgets to link to a specific URL, page within the portal, or another widget. The related list for this widget also allow you configure accessibility by user name or role.

</table>

**Icon menu list widget**  
A simple list with a glyph icon next to each link. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

Configure the icon information using the Menu Items related list.
Icon Menu list widget

1. From the instance options for the icon menu list widget, under Related Lists, click Menu Items.
2. Click New.
3. Use the fields on the New Menu Items form to configure the icons for the icon menu list widget.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Name or description of the icon</td>
</tr>
<tr>
<td>Parent Menu</td>
<td>The name of the menu that the icon appears in. This automatically populates with the name of the icon menu list widget that you created but you have the option to switch it to another menu.</td>
</tr>
<tr>
<td>Order</td>
<td>The order in which the icons appear in the icon menu list widget.</td>
</tr>
<tr>
<td>Parent menu Item</td>
<td>Nest menu items within a parent menu.</td>
</tr>
<tr>
<td>Page</td>
<td>The page within Service Portal that the icon links to. Select Page from the Type list to enable this option.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the type of link you want the icon to have. You can link to pages within Service Portal, external URLs, KB articles, Service Catalog, or lists. Different fields will appear on the form depending on the option you select from the list.</td>
</tr>
<tr>
<td>Condition</td>
<td>Determines what conditions are required for menu items to show in the header. For more information on what conditions to use in the Condition field, see Create a UI action.</td>

</table>
Language Switch widget

Add the Language Switch widget to a landing or homepage to allow your users to change the language of the page. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

![Language Switch widget](image)

Instance options

The Language Switch widget does not include any instance options.

Link button widget

The Link Button widget is a button you can nest in any other widget that links to another destination. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

![Link Button widget](image)

Instance options

**Instance option fields**

<table>
<thead>

</tr>
<tr>
<td>Maximum entries</td>
<td>The maximum number of entries allowed to appear in the widget.</td>
</tr>
</tbody>
</table>

Organization Chart widget

The Organization Chart widget shows employees in a tree structure relative to their manager. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

Using the widget

In the text input field, enter or select a user to see their manager and subordinates. The widget uses information from the User (sys_user) record to display the organization hierarchy relative to the selected user.
Click a card to open the profile page for that user. To reconfigure the card link, change the **URL** or **Page** in the widget instance options.

You can drag individual cards to rearrange the chart.

You can zoom in or out of the chart view by clicking the magnifying glass icons or by scrolling.

**Instance options**

Use the instance options to configure the Organization Chart widget for a portal page.
**Note:** There are no valid values for several instance options. By default, you can set only the following instance options:

- User Background Color
- Node Background Color
- URL
- Page

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data</td>
<td>Fields from the user record that appear on each card. By default, each card displays the name, title, department, email, phone, and location of each user.</td>
</tr>
<tr>
<td>Card Fields</td>
<td>There are no valid values that you can enter in this field.</td>
</tr>
<tr>
<td>Presentation</td>
<td></td>
</tr>
<tr>

</tr>
<tr>
<td>User Background Color</td>
<td>Color of the user card. Use color names or Hex codes. For example, you can enter red or #ff0000.</td>
</tr>
</tbody>
</table>

The user background color is **lightblue** by default.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Node Background Color</td>
<td>Color of cards that extend from the user card. Use color names or Hex codes. For example, you can enter yellow or #FFFF00.</td>
</tr>
<tr>
<td></td>
<td>The node background color is <strong>azure</strong> by default.</td>
</tr>
<tr>
<td>Table Layout</td>
<td>Size and margin of the content in each card.</td>
</tr>
<tr>
<td></td>
<td><strong>There are no valid values that you can enter in this field.</strong></td>
</tr>
<tr>
<td>Row Layout</td>
<td>Alignment of the text in the card. The text is left-aligned by default.</td>
</tr>
<tr>
<td></td>
<td><strong>There are no valid values that you can enter in this field.</strong></td>
</tr>
<tr>
<td>Line</td>
<td>Color of the lines that connect cards. The lines are black by default.</td>
</tr>
<tr>
<td></td>
<td><strong>There are no valid values that you can enter in this field.</strong></td>
</tr>
<tr>
<td>Tree Layout</td>
<td>Size, spacing, and alignment of the chart.</td>
</tr>
<tr>
<td></td>
<td><strong>There are no valid values that you can enter in this field.</strong></td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Picture Layout</td>
<td>Size of image space in each card. By default, the image space is 55x65 pixels. The user image is shrunk or stretched to fit the space. There are no valid values that you can enter in this field.</td>
</tr>
<tr>
<td>Behavior</td>
<td>Web address of the page that opens when you click a card. Use the part of the portal URL that references the page ID. For example, to navigate to the Service Catalog, enter ?id=sc_category. If left blank, clicking the card opens the page that is specified in the Page field. If the Page field is also blank, clicking the card opens the user profile page by default.</td>
</tr>
<tr>
<td>URL</td>
<td>Portal page that opens when you click a card. Use the page ID. If left blank, clicking the card opens the web address in the URL field. If the URL field is also blank, clicking the card opens the user profile page by default.</td>
</tr>
</tbody>
</table>

**Note:** The URL field overwrites the Page field. To specify a page rather than a URL, leave the URL field blank.

**Simple List widget**
The Simple List widget can be used to display any list in the system within Service Portal. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

**Sample Footer widget**

The Sample Footer widget is an example of a footer you can use in your portal. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

Unlike other widgets in Service Portal, you add a footer to your portal by configuring it in the Theme form. For more information on adding a footer to a portal, see [Create a service portal and its branding](#).
Sample Footer widget

Instance options

The Sample footer widget does not include instance options.

Stock widget
The Stock widget displays an example of how widgets communicate with data outside of the system. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

The Stock widget pulls information from an online data source for stock information.

Note: As of November 2017, the Yahoo Finance API has been discontinued. As the stock widget relies on this functionality, the widget is no longer supported, and has been removed as of the London release.
The Stock widget does not include instance options.

Ticket Attachments widget
Use the attachment widget to attach items to tickets. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

Attachments should be less than 24MB. You can drag files into the Attachments widget to add them to a record.
Ticket Attachments widget

</tr>
<tr>
<td></td>
<td>record for that table.</td>
</tr>
</tbody>
</table>

Ticket Conversations widget

Record of ticket items. Users can use this to communicate back and forth with the fulfiller and the receiver. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

The Ticket Conversations widget displays journal entries from the activity formatter of the target record. Journal entries are presented in chronological order, with the oldest entries appearing at the bottom of the widget. Entries made by the user that created the record appear on the right side of the center divider. Entries made by other users appear to the left.

The Ticket Conversations widget is intended only for tables that extend task.

Limit the number of journal entries that appears in the ticket conversation widget using the `glide.service_portal.stream_entry_limit` system property. The default number is 100. Change the number by navigating to Service Portal > Properties, and enter the new number in the Maximum number of stream entries displayed in Service Portal field.

**Instance options**

The Weather widget does not include instance options.

**Search widgets**

Several search widgets are provided with Service Portal. You can configure search in Service Portal using any of the search widgets.

**Contextual Search widget**  
Contextual Search is an embedded widget that can be added to a record producer. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

By default, the widget is included in the **Create Incident** record producer form to display items based on keywords entered in the description. These items can be knowledge articles, service catalog items, and social Q&A records. These search results appear as the user types the information.

KB Article Page widget

Use the Article page widget to view Knowledge Base articles within Service Portal. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

Any specialized font or formatting added in the text field for the knowledge article within the platform, appears the same way in the portal.
Getting Around in Windows

Windows 8.x

Windows 8.x is designed for using touch, mouse, and keyboard together, on hardware ranging from touch-enabled tablets and laptops to PCs and all-in-one computers, including those without touch capability.

Start screen and Desktop

- 8.1: Microsoft updated the Windows 8.1 interface by returning the Start button, providing its ease of access along with the option of the Metro interface. The intent is to provide a seamless experience on desktops, laptops, tablets, and phone devices. By default, the Start screen is displayed. Move your mouse pointer to the bottom left corner of the screen to make the Start button appear. Click it to display the desktop; click it again to display the Start screen.

- 8: The Start screen has a default application display you can customize:
  1. Right-click any app and the Application bar will appear at the bottom, with options for the application you have selected.
  2. To add an app to the Start screen, click Pin to Start.
    If an application is already on the Start screen, you’ll see Unpin from Start instead.

Power User menu

The Power User menu displays the most commonly used applications from the Control Panel, File Explorer, and Task Manager, as well as Restart, Run, Search, and Shutdown/Update. Access it in one of the following ways:

- Press Win + X
### Instance Options

<table>
<thead>

</tr>
<tr>
<td>Email</td>
<td>8</td>
</tr>
<tr>
<td>Suppliers</td>
<td>1</td>
</tr>
<tr>
<td>Operating Systems</td>
<td>12</td>
</tr>
</tbody>
</table>

**KB Categories widget**

Categories are determined by the list of Knowledge Categories provided for the Knowledge Base. To view a list of categories for a knowledge base, in the platform navigate to **Knowledge > Administration > Knowledge bases**, then select the name of the knowledge base, for example IT. Categories for the knowledge base appear in the related lists. If a category does not have any associated articles, it does not appear in the portal. For more information on defining categories for a knowledge base, see **Define a knowledge article category**.

The knowledge base a portal uses is determined in the portal form. On the Service Portal configuration page (**Service Portal > Service Portal configuration**) click **Portals** in the header menu. Select a portal from the list, then in the knowledge base list, select a knowledge base.

KB Category Page widget

Articles and article preview within a particular category. Categories are specified within the Knowledge Base module. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

The KB Category Page widget works together with the KB Categories widget. When you select a category in the KB Categories widget, the KB Category page widget lists articles within that category.

To have the KB Categories and KB Category Page widgets work in tandem, add the two widgets to the same page.
KB Categories widget

KB Category Page widget
If you add the KB Category Page widget to a page without adding the KB Categories widget, the KB Category Page widget displays an uncategorized list of all articles within the knowledge base.

Categories are determined by the list of Knowledge Categories provided for the Knowledge Base. To view a list of categories for a knowledge base, in the platform navigate to Knowledge > Administration > Knowledge bases, then select the name of the knowledge base, for example IT. Categories for the knowledge base appear in the related lists. If a category does not have any associated articles, it does not appear in the portal. For more information on defining categories for a knowledge base, see Define a knowledge article category.

The knowledge base a portal uses is determined in the portal form. On the Service Portal configuration page (Service Portal > Service Portal configuration) click Portals in the header menu. Select a portal from the list, then in the knowledge base list, select a knowledge base.

**KB Top Rated widget**

Lists Knowledge Base articles with the highest rating. Ratings are determined by user feedback. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.
KB Top Rated widget

KB View widget
The KB View widget is an example of how to structure a knowledge base page. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

Use the search filter to find a specific topic or article.
## KB View widget

### Instance options

The KB view widget does not have any included instance options.
KB View 2 widget
The KB View 2 provides an alternative structure to the KB View widget to show a different example of how to display knowledge articles. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

The KB View 2 widget displays each knowledge category as a card. Click a card to access the articles within that category.

![KB View 2 example](image)

**KB View 2**

Categories are determined by the list of Knowledge Categories provided for the Knowledge Base. To view a list of categories for a knowledge base, in the platform navigate to Knowledge > Administration > Knowledge bases, then select the name of the knowledge base, for example IT. Categories for the knowledge base appear in the related lists. If a category does not have any associated articles, it does not appear in the portal. For more information on defining categories for a knowledge base, see Define a knowledge article category.

The knowledge base a portal uses is determined in the portal form. On the Service Portal configuration page (Service Portal > Service Portal configuration) click Portals in the header menu. Select a portal from the list, then in the knowledge base list, select a knowledge base.
Instance options

The KB View 2 widget does not have any included instance options.

My Favorite Tags widget
The My Favorite Tags widget allows you to filter questions based on tags. By saving favorite tags, you only see questions that conform to that filter. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.
My Favorite Tags widget

Has anyone tried ordering accessories that are not listed on the catalog?

I want to order an ergonomic mouse but everything in the company catalog is pretty basic. Can I just order one online and expense it if it's the same price?

4mo ago • Asked by Abel Tuter

1 Answer

You can always consult with your manager and they may be already on the approved list of accessories. You can also submit a request and we'll let you know if you should order it and expense it.

4mo ago • Answered by System Administrator

Service Catalog widgets

Use the Service Catalog widgets to build a catalog for your portal.

The service catalog widgets are part of the Service Portal Service Catalog (com.glide.service-portal.service-catalog) plugin, which is activated automatically with the Service Portal for Enterprise Service Management (com.glide.service-portal.esm) plugin.

Most of the configuration for the Service Catalog widgets takes place in the Service Catalog application of the platform. For more information on Service Catalog, see Service Catalog.

SP Variable Editor widget

The Variable Editor widget allows you to change the specifications you chose for an item in the Service Catalog. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

You can embed the variable editor widget in the shopping cart widget, to allow users to edit and make changes to their cart items. The options included in the widget are determined by the specific catalog item and the variables that have been configured for it.

For more information on the service catalog variables that are available in Service Portal, see Types of service catalog variables.
### Variables

Allocated carrier
- Sprint Nextel

Monthly data allowance
- 500MB [S1 Monthly]

Contract duration
- 12 Months

Color
- Black

Storage
- 64GB

SC Catalog Item widget
Describe catalog items and add options for users to select from. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

Configure catalog items using the Service Catalog in the platform UI by navigating to Service Catalog > Catalog Definitions > Maintain items. Catalog items must have Availability set to Desktop or Desktop and Mobile.

Any specialized font or formatting added in the description field for the catalog item within the platform, appears the same way in the portal.

Catalog variables determine what information your users are allowed to pick from, for example, color, size, or price. For more information on defining the variables in the catalog item, see Create a service catalog variable.

Determine whether users can add this item to the shopping cart by selecting the Show Add Cart button check box in the widget instance options.
### iPhone 6

**iPhone 6s**

iPhone 6s offers a multitude of features packaged within cutting edge design. This phone will be part of the corporate mobile contract, and you will not be billed for its use. The device has the following technical specifications:

- iOS 9
- Retina display
- A9 chip
- Touch ID

**What color would you like?**

- Black

**How many GBs of storage?**

- 16

**Price:** $450  
**Recurring Price:** $50 Monthly

</thead>
<tbody>
<tr>
<td>Click event name</td>
<td>The name of the event that is emitted when a user clicks a catalog item. You can override the default behavior when clicking on a catalog item by providing a different event name. This would be in a situation where you embedded the category page in another widget. The default value is $sp.cat_item_list.click.</td>
</tr>
</tbody>
</table>
SC Order Guide widget

Standardized order guide for the catalog items. This widget compiles several commonly ordered items into an order guide for a specific purpose, for example, new hires. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

Service Overview:
The New Hire package includes all necessary tasks to enable your new employee to be productive on day one such as, hardware provisioning, software access, and account creation. Unless otherwise noted all new employees receive the standard package detailed below.

Services Include:
- Email account creation
- Lenovo Carbon x1
- One external monitor
- MS Office Suite:
  - Outlook
  - Word

<table>

### SC Save Bundles widget

### Instance Options

The Save Bundles widget does not have any included instance options.

**SC Saved Carts widget**

The Saved Carts widget shows previously created and saved bundles from the Service Catalog. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.
SC Saved Cart widget

When you add an existing cart bundle to a shopping cart, you have two options. You can:

- Replace the items in the shopping cart with the items in the bundle.
- Add the bundle in addition to the rest of the items in the cart.

### iPad + phone

**Replace Cart** will remove the current contents of your cart and replace it with the bundle.

**Add to Cart** will add the contents of the bundle into your cart without removing its current contents.

**Items In Bundle**

<table>
<thead>
<tr>
<th>Item</th>
<th>Price</th>
<th>Quantity</th>
<th>Total</th>
</tr>
</thead>

<td>$600.00</td>
<td>1</td>
<td>$600.00</td>
</tr>
</tbody>
</table>
Instance Options

The Saved Carts widget does not have any included instance options.

SC Shopping Cart widget
The shopping cart widget, used in combination with Service Catalog, stores all of your orders in one place. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.
Shopping cart widget

With the shopping cart widget, you can:

- Control the quantity of items going into the cart.
- Add items to a cart. This information gets stored in the sc_cart table.
- Define who the items are being requested for.
- Save specific items together as a bundle, which can be reloaded at a later time.
• Use the **Clear Cart** option to remove all the items from your cart.

If you want to add a bundle to your cart from the saved cart, you have the option of replacing all of the existing cart items with the bundle items, or including the bundle items with the cart items. The shopping cart respects most **Service Catalog properties**.

### Instance options

#### Shopping cart instance options fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap color</td>
<td>Color scheme for the widget. The default colors are defined by the portal theme, but if you want the instance to have a specific color, select the option from the list.</td>
</tr>
<tr>
<td>Cart template</td>
<td>Enter the name of an ng-template you want to use to provide a different template for the shopping cart. By default, two ng-templates are provided: small_shopping_cart.html and large_shopping_cart.html.</td>
</tr>
</tbody>
</table>

Enable the Shopping Cart widget

The shopping cart widget is enabled automatically for instances upgrading to Istanbul, however, there are several ways to manually enable or disable the widget.

To enable the shopping cart for a catalog item:

1. Navigate to a catalog item on the Service Catalog page in Service Portal.
2. CTRL+right-click a catalog item widget to open the **widget instance options**.
3. Select or clear the **Show Add Cart Button** option to enable or disable the shopping cart for that particular catalog item.
Catalog item cart option

To enable the shopping cart in the portal header:
1. From the Service Portal configuration page, select the Portal editor.
2. Select the SP Header Menu in the portal hierarchy.
3. In the Additional options section, make sure the enable cart value is set to true.

```json
{
    "enable_cart": {
        "displayValue": "true",
        "value": true
    }
}
```
Set the value to `false` to hide the shopping cart.
Shopping cart in the header menu

```json
{
  "enable_cart": {
    "displayValue": "true",
    "value": true
  }
}
```
Service Portal configuration page widgets

Service Portal uses widgets for configuration. When you configure a page or a widget for a portal in the Service Portal Configuration page, you actually use Service Portal widgets to do so.

Service Portal configuration widgets are internal only and cannot be extended.

Configuration page widgets are included as part of the Service Portal Configuration Pages plugin (com.glide.service-portal.config), which is activated automatically when you activate the Service Portal for Enterprise Service Management plugin (com.glide.service-portal.esm).

Navigate to Service Portal > Service Portal Configuration to view these widgets in action.

Service Portal Config Overview widget

The Service Portal Config Overview widget is the widget that appears on the sp_config homepage. Use this widget to navigate Service Portal Configuration. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

Portal config widget
The Portal Config widget is the left panel of the Branding Editor, which you use to configure themes for your portal. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.
Title and Logo

Portal title

Service Portal

Logo

© ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
**SP Page Map widget**
The Page Map widget works in the Page Editor to display any Service Portal page in a tree structure. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

**SP Portal Map widget**
The Portal Map widget displays your portal in a tree structure. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

**Theme Preview widget**
The Theme Preview widget appears in the Branding Editor and allows you to see any theme changes you make to your portal. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.
Theme Preview

Navbar

Brand

Text Primary - Nullam id dolor id nibh ultricies vehicula ut id elit.
Text Success - Duis mollis, est non commodo luctus, nisi erat porttitor ligula.
Text Info - Maecenas sed diam eget risus varius blandit sit amet non magna.
Text Warning - Etiam porta sem malesuada magna mollis euismod.
Text Danger - Donec ullamcorper nulla non metus auctor fringilla.
**Widget Edit Panel widget**

The Widget Edit Panel appears on the main page of the Widget Editor in Service Portal Configuration. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

Use the Widget Edit Panel to view widgets that have recently been updated, create a widget, or view an existing widget.

---

**Service Portal service status widgets**

Use the service status widgets to display current, planned, and historical outages for business services to your end users.

The service catalog widgets are part of the Service Portal Service Status (com.glide.service-portal.service-status) plugin, which is activated automatically with the Service Portal for Enterprise Service Management (com.glide.service-portal.esm) plugin.
**Business Service Status widget**

View how services are running on your system. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

The Business Service Status widget pulls information from the cmdb_ci_service table. You can change where the data comes from in a cloned version of the widget by adjusting the settings in the widget server script.

<td>Icon for the widget. This is not user-facing.</td>
</tr>
</tbody>
</table>
Current Status widget
The Current Status widget displays any issues reported in the system. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

The Current Status widget checks the Outages (cmdb_ci_outage) table to see if the system is experiencing any outages.

Service owners and service desk managers report planned or unplanned outages by creating outage records. Each outage record includes **Begin** and **End** fields to indicate the duration of the outage. If the **End** time is later or empty, then the outage is still ongoing. The Current Status widget displays all ongoing outages.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of Services</td>
<td>The number of services displayed in the widget. The default number is 250.</td>
</tr>
</tbody>
</table>

Current Status widget
The Current Status displays outages only for services, which are tracked in the Services (cmdb_ci_service) table.

**Instance options**
Use the instance options to configure the Current Status widget for a portal page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show outage details</td>
<td>Option to display details from the Outage (cmdb_ci_outage) record.</td>
</tr>
<tr>
<td>Standalone</td>
<td>Option to remove explanatory information. This option also adds a link to more information.</td>
</tr>
</tbody>
</table>

Planned Maintenance widget
Describes any planned system maintenance. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.
The widget gathers information from the cmdb_ci_outage table. Any planned maintenance within the following five days appears in the Planned Maintenance widget.

### Planned Maintenance

<table>
<thead>
<tr>
<th>We publish information on planned service availability below. This includes events occurring over the next 5 days.</th>
</tr>
</thead>
<tbody>
<tr>
<td>No service maintenance is planned over the next 5 days</td>
</tr>
</tbody>
</table>

**Planned Maintenance widget**

**Instance options**

The Planned Maintenance widget does not have any included instance options.

**Service History widget**

Displays the history of specific service's status. For example, if the Bond Trading widget has a history of planned outages or degradations, the widget displays those with a varied color scheme to differentiate the outage type. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.
Service History widget

Instance options

The Service History widget does not include any instance options.

Service Status widget

The Service Status widget provides a visual representation of service availability over the past three months. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

The Service Status widget displays the history of service availability for one service from the Services (cmdb_ci_service) table. The widget uses the page URL to determine which service to represent.
Service Status widget

Each pill represents one day. Each color correlates with a type of service availability.

<table>
<thead>
<tr>
<th>Color</th>
<th>Service availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>No issues</td>
</tr>
<tr>
<td>Blue</td>
<td>Planned maintenance</td>
</tr>
<tr>
<td>Yellow</td>
<td>Service degradation</td>
</tr>
<tr>
<td>Red</td>
<td>Outage</td>
</tr>
</tbody>
</table>

Instance options

The Service Status widget does not have any included instance options.

Service Status Legend widget

Use concurrently with the Status History widget to show what the icons in the Status History widget mean. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

Instance options

The Service Status Legend widget does not have any included instance options.
**Service Status Subscription widget**

Used in conjunction with the service status widget. Users subscribe to receive updates about the service status. You can customize this base system widget to suit your own needs or use it as a base code sample to build your own Service Portal widgets.

![Service Status Updates]

- **You are not subscribed to updates on this Service's status**
- **Subscribe To Updates**

**Instance options**

The Service Status Subscription widget does not have any included instance options.

**Configure widget instance options**

When you add a widget to a page using the Service Portal Designer, it creates a widget instance. A widget instance is a reference to a widget that contains a location, properties, and CSS specific to that instance. Adding the same widget multiple times to the same page creates multiple instances. Each instance of the widget you configure remains unique, so you can have several instances of the same widgets on a page. For example, each instance of the cool clock widget on a page shows a different time zone. Configure a widget on a page by adjusting the instance options.

Role required: admin or sp_admin

Each time you add a widget to a page it creates a record on the sp_instance table with the following information:

- Reference to the column where the widget is located
- Reference to a widget
- Configuration for a widget in the form of pre-defined form fields and an Additional Options field in JSON format

For example, the icon link widget displays as many different versions of itself as you add to a page.
Icon link widgets

All widget instances point to a widget. If you make changes in that specific widget, all of the widget instances receive that change as well. You can also make changes specifically to a widget instance and only the widget instance will be affected.

1. On a page in the Service Portal Designer, point to the Edit icon (Edit icon) in a widget to open the widget instance options. You can also access widget instance options using the control + right-click menu.

2. From the Instance Options window, make the selections you want to configure your widget. Instance options vary depending on which widget you select.

Configure widget instance options

Advanced users can configure the available options for a widget. For more information, see Widget option schema.

Widget developer guide

Develop custom widgets in the Service Portal using AngularJS, Bootstrap, and the ServiceNow API.

What to know before you begin

To develop widgets, you need ServiceNow API experience to:

- Run record queries on the server.
- Create and update records.

You need AngularJS experience to:

- Bind variables to client controllers.
- Access server objects in a widget.
- Gather user input.
Parts of a widget

Like Angular directives, widgets execute a specified behavior within a Service Portal page. A widget includes:

**HTML template**

A mandatory widget component.
The HTML template requires knowledge of AngularJS to display and gather data. Use the HTML template to:
- Render the dynamic view that a user sees in the browser using information from the model and controller.
- Bind client script variables to your markup.
- Gather data from the end user.

**Client script**

A mandatory widget component.
A client script requires knowledge of both the ServiceNow API and AngularJS to create a client controller. Use the client script to:
- Map server data from JavaScript and JSON objects to client objects.
- Process data before rendering it.
- Pass data to the HTML template.
- Pass user input and data back to the server for processing.

**Server script**

A mandatory widget component.
A server script requires knowledge of the ServiceNow API to work with record data. Use the server script to:
- Set the initial state of the widget.
- Send record data to the widget client script using the `data` variable.
- Run server-side queries.

**Link function**

An optional widget component.
The link function requires knowledge of AngularJS. Use a link function to directly manipulate the DOM.

**Option schema**

An optional widget component.
Allows a Service Portal admin to configure a widget. Use the option schema to:
- Specify the parameters for a widget.
- Allow admin users to define instance options for a widget instance.
- Develop flexible, reusable widgets.
An optional widget component.

Angular Providers require knowledge of AngularJS. Use Angular Providers to:

- Keep widgets in sync when changing records or filters.
- Share context between widgets.
- Maintain and persist state.
- Create reusable behaviors and UI components and inject them into multiple widgets.

**Dependencies**

An optional widget component.

A widget dependency is an external resource used by your widget such as JavaScript or CSS files.

**Global objects in widgets**

When a widget begins to render for the first time on a page, the server script executes first and accesses three global objects: `input`, `options`, and `data`. Because the `input` variable is a data object sent from the client script, this variable is undefined when first initialized.

---

When a widget is first instantiated, the server script:

1. Initializes an empty `data` object.
2. Initializes the `input` object with any data sent from the client controller, or the `options` object with any data used to initialize the widget.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
3. Sends the data object to the client controller as JSON.

The client script:

1. Accesses the server data object using c.data.

   **Note:** By default, widgets use the c variable to represent the controller instance using controller as syntax. You can change this variable when creating or cloning widgets.

2. Uses server.update() to post changes to the data model. This method updates the server script using the input object.

   **Note:** After calling server.update(), the client script data object is automatically overwritten by the server script data object.

3. Uses c.options to access the values used to invoke the widget on the server. This object is read-only.

**Using the Widget Editor**

When you create a widget, a record is created in the sp_widget table. However, you can use the Widget Editor in Service Portal Configuration as your scripting environment. The Widget Editor is a full page application similar to an IDE. You can show the parts of the widget you want to edit and hide the rest, while previewing your changes in real time.
Recommendations for developing widgets

When developing custom widgets, keep these recommendations in mind for optimal performance, scalable development, and a good user experience.

Create a default state that provides an example to the end user

When initially added to a page, a widget does not have instance options defined. If a default state is not provided, a widget can appear empty and can cause confusion. Instead of creating a widget that defaults to an empty state, give your widget default data to display when no other options are defined to:

- Clearly demonstrate the widget functionality to the user.
- Provide data when previewing the widget in the widget editor.

Learn more: Tutorial: Build a custom widget.

Create a directive instead of embedding a complex widget

When an embedded widget is called from the server, all the scripts associated with that widget are returned. If you only need to embed a subsection of a widget, embedding the entire widget creates unnecessary overhead. Instead, use directives to share lightweight code between widgets. Use a directive instead of an embedded widget to:

- Share scope or custom scope behavior with multiple widgets.
- Share a reusable, lightweight subsection of a widget.
- Share a common UI feature, such as a list or an avatar.
- Augment widget behavior.

Learn more: Reuse components with Angular Providers.

Use a service or factory to share data and persist state

Data services and factories maintain and persist state in a widget without requiring multiple server calls enabling you to:

- Keep widgets in sync when changing records or filters.
- Share context between widgets.
- Develop more performant widgets.

Learn more: Reuse components with Angular Providers.

Handle events with a publish/subscribe service

Avoid using $broadcast in the DOM. $broadcast dispatches the event name to all child scopes notifying registered listeners, which can be an expensive call that requires the use of the $rootScope global object.

Instead, use a publish/subscribe service to handle events. When using a publish/subscribe service, a clear relationship forms between your widgets through callback handlers. In this model, you can better control the state of your events.

Use REST calls to fetch data from the server

When you call server.update(), the entire widget is returned from the server. If your widget includes divergent code paths, multiple calls to update the server can affect performance. As a rule, use your server script to set up the initial state of your widget. For subsequent updates, use scripted REST APIs that call script includes on your instance. This practice:

- Separates business logic from the display.
- Centralizes your code, allowing changes to be made in one place.

**Develop with localization, accessibility, and UI in mind**

To create the best experience for your users, follow these guidelines:

- Consider the impact of your widget in a mobile environment. For example, avoid using mouseover and other events that do not translate to a mobile device.
- Use **SCSS variables** to reuse items.
- Use variable names when using colors.
- Wrap strings for translation in localization APIs. See [Internationalize a widget](#).

**Remove unused Angular Providers from client script**

For easier maintenance, remove any unused Angular Providers that were injected into the client script function statement.

**Avoid using `<script>` tags in HTML templates**

To lessen the likelihood of production issues in Service Portal, avoid using inline templates using `<script>` tags in a widget’s HTML template. Instead, create a related Angular `ng-template` record for the widget.

**Service Portal debugging tips**

*Create a new widget*

Widgets are the power behind the portal. Widgets are customizable and can be used to provide an variety of experiences for your users. Anytime you add a widget to a page it becomes an instance of itself, which can be configured specifically for each use. Create a new widget to build a custom widget from scratch.

Role required: admin or sp_admin

You can add several Icon Link widgets to a page, configure them to link to different areas and with different icons, and none of them will be affected by the others. You can start by cloning an existing widget and making changes to your cloned version. Developers or people with an advanced understanding of AngularJS can create widgets from scratch.

1. Navigate to [Service Portal > Service Portal Configuration > Widget Editor](#).
2. Click **Create a new widget**.
3. Enter a name for the new widget. The widget ID is created automatically based on the widget name. Optionally select **Create test page** to automatically create a page containing the widget.
Note: After completing development of a widget with a test page, delete the test page. Maintaining test pages can create clutter when managing pages.

4. Click Submit.

The widget HTML template, client script, and server script display in the widget editor. Basic script templates are included as a guide.
Clone a widget

Take advantage of existing code by cloning and editing an existing widget.

Role required: admin or sp_admin

Note: Base system widgets are read only so you can benefit from future updates. To make changes, you can clone base system widgets. However, cloned widgets are considered custom and do not benefit from future updates to the widgets they were cloned from.

1. Open the Widget Editor in the Service Portal Configuration page, then select an existing widget from the **Select a widget** list. For example, select **Hello World 2**.
2. From the list menu in the widget header, click **Clone "Hello World 2"**.
3. Enter a name for the cloned widget. The widget ID is created automatically based on the widget name.

4. Optional: Select **Create test page** to automatically create a page containing the widget.

5. Use the check boxes to show or hide the different components of the widget editor as needed. Make changes to the HTML Template, CSS, client script, server script, or the link function.
¡Hola, mundo!
6. In order to enable a preview of your widget, use **Enable Preview** from the menu. Use the eye icon that appears to show or hide a preview of your widget.

If you clone a widget that uses the Angular ng-template, you must manually clone the template and change the name of the template reference in the widget.

For example, the header menu widget uses the Angular ng-template `menuTemplate`. If you clone the header menu widget, you must also clone the `menuTemplate` and give the clone a unique name. When you open the clone of the header menu widget, you can see a reference to the `menuTemplate` in the HTML.

```
<ol class="nav navbar-nav">
  <div class="header-loader" ng-show="loadingIndicator">
    <div class="hidden-xs sp-loading-indicator la-sm"></div>
  </div>
</ol>
```

**menuTemplate in header widget HTML**

**Widget option schema**

Widget instances allow users to uniquely configure each widget they add to a page. Use the option schema to define the parameters for your widget.

**Storing instance options**

When developing a widget, you can edit the option schema to create parameters for your widget, or you can create a table to store instance options. If you edit the existing option schema, any instance options defined are stored in JSON format in the **Additional options, JSON format** field in the `sp_instance` table. The following field types are available:

- String
- Boolean
- Integer
- Reference
- Choice
- Field_list (depends on table)
- Field_name (depends on table)
- Glide_list

To use other field types not supported in the option schema, create an extension table to store your custom widget option schema. Using a table enables you to:

- Add any ServiceNow field type, including fields with advanced customization, to the option schema.
- Define a complex option schema.
- Search and filter instance options.
Using options in a widget

Access options in the widget from both the client script and the server script using the `options` global variable. You can access to any option value in your widget client script or server script using `options.optionName`.

**Client script**

```javascript
function() {
  /* widget controller */
  var c = this;
  console.log(c.options.text_color) //Outputs the text_color option for this instance
}
```

**Server script**

```javascript
(function() {
  $sp.log(options.text_color) //Logs the value of the text_color option to the browser console.
})();
```

**Define default options**

Before an option value is set on an instance, it appears as an undefined value when you access that option variable. Use the widget server script to specify default values for your options.

```javascript
(function() {
  options.text_color=options.text_color||"blue";
  options.maximum_entry_count=options.maximum_entry_count||5;
})
```

**Edit the widget option schema**

Widget instances allow users to uniquely configure each widget they add to a page. Edit the option schema to define basic parameters for your widget.

Role required: admin or sp_admin

1. Navigate to Service Portal > Service Portal Configuration > Widget Editor.
2. Select the widget you want to configure the option schema for.
3. Click the menu icon (≡) and select Edit option schema.
   This option only appears for users that have the right to edit the widget.
4. Click + to add a widget option.
5. Define a label, name, type, and hint. More fields appear depending on the type you select.

Adding flexible widget options allows you to create more reusable widgets. You can add default values to help users understand each widget option.
6. Click **Save**.
   The option schema you defined is stored in JSON format in the **Option schema** field in the `Option schema` field in the `sp_widget` table. Based on this option schema, each instance of the widget can use individually defined instance options.

7. Test the option schema by adding the widget to a page in the Service Portal Designer.
   a) Navigate to **Service Portal > Service Portal Configuration > Service Portal Designer**.
   b) Add the widget to a page and click the edit icon on the widget instance to view the instance options.
   c) **Configure the widget instance options**.
d) View the configuration by navigating to the instance record in the sp_instance table. The instance options are stored in JSON format in the Additional options, JSON format field.

**Store instance options in a table**
Create a table to store widget instance options instead of editing the existing option schema. When using a table as your widget option schema, you can define custom fields using any ServiceNow field type, add filters to fields, and search or query instance options.

Role required: admin or sp_admin

To define a custom option schema, add fields to an sp_instance extension table, then set your widget to use the extension table as a data source. Using an extension table enables you to:

- Add any ServiceNow field type, including fields with advanced customization, to the option schema.
- Define complex widget options.
- Search and filter instance options.

**Note:** While storing options in a table enables you to define more complex options, this method is more difficult to maintain than editing the option schema. To avoid creating unnecessary tables and adding additional server calls to your widget, edit the existing option schema when possible. Store options in a table only when complex or searchable options are required.

1. Create a table that extends an sp_instance table to store your custom option schema.
   a) Navigate to **System Definition > Tables**.
   b) Click **New**.
   c) Define a label and name.
   d) In the **Extends table** field, select an sp_instance table that provides the necessary fields.

<table>
<thead>
<tr>
<th>Instance table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance (sp_instance)</td>
<td>Includes base instance fields.</td>
</tr>
<tr>
<td>Instance with Table (sp_instance_table)</td>
<td>Includes sp_instance fields and fields to display table data such as Table and Filter.</td>
</tr>
</tbody>
</table>

e) Save the form.

2. Define custom fields in the extension table.
   You can define any field type to use in your option schema by adding new columns in the **Columns** list.

3. Update your widget to use the extension table as a data source.
   a) Navigate to **Service Portal > Widgets**.
   b) Open the widget you would like to create custom options for.
   c) In the **Data table** field, select your sp_instance extension table.
4. Configure the extension table form to display the desired fields. Fields configured on the form are available as instance options.
   a) Navigate to the extension table form: `<yourInstance>/<your_extension_table>.do`.
   b) Right-click the header menu and select **Configure > Form Layout**.
   c) Add the fields to the form.
   d) Click **Save**.

5. Configure the widget to display the desired fields as instance options.
   a) Navigate to **Service Portal > Widgets**.
   b) Open the widget that has the extension table set as the data source.
   c) Use the **Fields** slushbucket to select fields to display as instance options.
d) Save the form.

Test the option schema by adding the widget to a page in the Service Portal Designer. Click the edit icon on the widget instance to view the instance options. After configuring the widget instance options, view the configuration by navigating to the instance record in the sp_instance extension table.

Reuse components with Angular Providers

Angular Providers are reusable components that can be injected into multiple widgets. To ensure quick loading widgets and a high performing portal, create Angular Providers instead of overloading your client controllers with persistent data and additional logic. With Angular Providers, you can maintain data for the lifetime of your Service Portal and reuse components and data objects across multiple widgets.

Role required: admin or sp_admin

By creating an Angular Provider, you can:

- Keep widgets in sync when changing records or filters.
- Share context between widgets.
- Maintain and persist state.
- Create behaviors and inject them into multiple widgets.

To learn more, visit Angular Providers.

Tip: For easier maintenance and troubleshooting, remove any unused providers from the Angular Providers related list in the Widget (sp_widget) table.

   The Widget Angular Providers table opens.

2. Click New to create a new record.
3. Select the type of Angular Provider.
   - Directive
   - Factory
   - Service

   To facilitate migration to ECMAScript 6 in the future, consider using services over factories.

4. Define a name.
   You will use the name to associate the Provider with your widget.

5. Add a script in the **Client Script** field.

   A basic factory that formats a number in US currency.

   ```javascript
   function formatterFactory(){
       var myVal = Number;
       return {
           format: function(myVal) {
               // Function to format number
           }
       }
   }
   ```
6. Associate the Angular Provider with a widget.
a) Navigate to <yourInstanceURL>/sp_config?id=widget_edit.
b) Open the widget you would like to associate with the Angular Provider.
c) Under Related Lists, select Angular Providers.
d) In the Angular Providers list, click New.
e) In the Angular Provider field, select the appropriate Provider. Check the Widget field to ensure that you are associating the Angular Provider with the correct widget.

f) Click Save.

7. Update the appropriate scripts in your widget to inject the Angular Provider into the widget.
Inject the factory into your widget client script by passing the name of the factory as an argument in your client controller function. You can then access the object defined in the factory function in your widget client script.

```javascript
function(formatterFactory) {

    /* widget controller */
    var c = this;
    console.log(formatterFactory.format(300));
}
```

If defining a directive, use the directive in the widget HTML template.

8. To edit the Angular Provider after it is registered with your widget, open the Angular Provider client script in the widget editor.
   a) Navigate to Service Portal Configuration > Widget Editor.
   b) Under Edit an existing widget, select the widget associated with your Angular Provider.
   c) In the Show menu, open the Dependencies list and select the Angular Provider.

Note: Only Angular Providers associated with the widget are displayed in the Dependencies list. This list includes any external resources your widget depends on.

The Angular Provider client script displays in the widget editor. In the widget editor interface, you can edit and save your widget and Provider scripts at the same time.

To use an Angular Provider with multiple widgets, register your Provider with each widget and update the appropriate scripts.

Embedded widgets

Embed a widget in the HTML template, server script, or client script.

Embed a widget in an HTML template

Use the `<widget> </widget>` element to embed a widget in an HTML template. Pass in the ID of the widget you are trying to embed as a parameter.

```html
<div>
    <widget id="widget-cool-clock"></widget>
</div>
```

If a widget has an option schema, you can define instance options in JSON format.

```html
<widget id="widget-cool-clock" options='{"zone": "America/Los_Angeles","title": "San Diego, CA"}'>
</widget>
```
Alternatively, you can define options in the widget server script.

**HTML template**

```html
<widget id="widget-cool-clock" options='data.clockOptions'></widget>
```

**Server script**

```javascript
(function() {
  data.clockOptions = {
    "zone": "America/Los_Angeles","title": "San Diego, CA"};
}());
```

**Embed a widget in a client script**

Use `spUtil.get()` to get a widget model in the client script.

```javascript
spUtil.get("widget-sc-cat-item", {sys_id: "your_catalog_item_sys_id"}).then(function(response) {
  c.catalogItemWidget = response;
});
```

When using the `spUtil` class in a widget client script, you must inject the class into the client script function. The following example embeds the Cool Clock widget:

**Client script**

```javascript
function(spUtil) {
  var c = this;
  spUtil.get("widget-cool-clock").then(function(response) {
    c.myClockWidget = response;
  });
}
```

**HTML template**

```html
<sp-widget widget="c.myClockWidget"></sp-widget>
```

**Embed a widget in a server script**

Use `$sp.getWidget()` to get a widget model in the server script.

```javascript
data.catalogItemWidget = $sp.getWidget("widget-sc-cat-item");
```

The following example embeds the Cool Clock widget:

**Server script**

```javascript
(function() {
  var coolClockOptions = {
    "zone": "America/Los_Angeles","title": "San Diego, CA"};
  data.coolClockWidget = $sp.getWidget('widget-cool-clock', coolClockOptions);

```
HTML template

<sp-widget widget="data.coolClockWidget"></sp-widget>

Widget model properties

When a widget model is called from within another widget, the HTML template, client script, and link function are loaded just as they are in the sp_widget record. The data property is the result of the widget server script execution. Anything that you put on the data object on the server is available in the data object on the client.

<table>
<thead>
<tr>
<th>Property name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_script</td>
<td>string</td>
<td>Widget client script field.</td>
</tr>
<tr>
<td>css</td>
<td>string</td>
<td>Compiled CSS output from the SASS field for the widget.</td>
</tr>
<tr>
<td>data</td>
<td>object</td>
<td>Data object containing keys and values from the widget server script.</td>
</tr>
<tr>
<td>dependencies</td>
<td>array</td>
<td>Any third-party libraries to load before the widget executes.</td>
</tr>
<tr>
<td>options</td>
<td>object</td>
<td>Options used to initialize the widget.</td>
</tr>
<tr>
<td>template</td>
<td>string</td>
<td>HTML template field for the widget.</td>
</tr>
</tbody>
</table>

*Embed a widget multiple times with custom options*

Embed the cool clock widget multiple times using custom options.

*Role required: admin or sp_admin*

Create a widget that embeds multiple instances of the cool clock widget, each with a different time zone and title. Open the cool clock widget in the Widget Editor to see widget options referenced in the HTML template and the Client Script.
### Cool Clock widget with Options highlighted

1. Clone the Cool Clock widget with the name `Embedded clock`.
2. Replace the code blocks with the following:

```html
1. <div class="clock">
2.   <span>
3.     <div class="square">
4.       <svg viewBox="0 0 100 100" class="circle">
5.         <line ng-repeat="minor in c.minors track by $index" class="minor" transform="translate(50, 50)" y="40" />
6.       </svg>
7.   </span>
8.   <div class="clock-face" transform="rotate(360 * c.hours + c.minutes / 60) / 60" ng-attr-transform="rotate(360 + c.minutes / 60) / 60"
9.     <circle class="clock-face" transform="rotate(360 * c.hours + c.minutes / 60) / 60" />
10. <line class="hour" y="20" transform="rotate(360 * c.hours + c.minutes / 60) / 60" />
11. </div>
12. <div class="text:center text-muted m-t-sm">
13.   <div class="options">
14.     <div class="option">
15.       <div class="option-text">Embedded clock</div>
16.     </div>
17.   </div>
18. </div>
```
Each instance of the clock in the embedded clock widget appears with a different time zone.
Create a widget dependency

In Service Portal, you can link JavaScript and CSS files to widgets to create dependencies between widgets and third-party libraries, external style sheets, and angular modules.

Role required: admin or sp_admin

Dependencies are loaded asynchronously from the server when needed.

Widgets can have as many or as few dependencies as needed. However, the more you add, the more content a widget must download to render on the page. Keep dependencies as small as possible for more efficient load times.

1. Create a dependency package.

   A dependency package is a collection of Javascript and CSS files that can be then connected to a widget.

   a) Navigate to Service Portal > Dependencies.

   b) In the dependency record, define the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of your dependency. (Useful for selecting a dependency from a dropdown list)</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for the dependency record.</td>
</tr>
<tr>
<td>Include on page load</td>
<td>Select if you want your dependency to be loaded onto the page on initial page load of Service Portal, or leave unchecked to load the dependency only when the linked widget is loaded onto a page.</td>
</tr>
</tbody>
</table>
2. Add files to the dependency package

After you save the information for your dependency package, use the related lists to add JS and CSS Include files. For each related list, include the following information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display name</td>
<td>Name of the script include.</td>
</tr>
<tr>
<td>Source</td>
<td>Depending on whether you add a JS Include or a CSS Include, select one of these options from the list:</td>
</tr>
<tr>
<td></td>
<td>• URL</td>
</tr>
<tr>
<td></td>
<td>• UI script (for a JS Include) or Style Sheet (for a CSS Include)</td>
</tr>
<tr>
<td></td>
<td>For a JS Include, use the UI Script field to reference a UI Script found in System UI &gt; UI Scripts.</td>
</tr>
<tr>
<td></td>
<td>For the CSS Include, use the Style Sheet field to reference a record in the sp_css table.</td>
</tr>
</tbody>
</table>

3. Add a dependency package to a widget

After you have created a dependency package and added files, create a relationship between the dependency and a widget.

a) Navigate to Service Portal > Widgets and find the widget record you want to add the dependency to.

b) From the Dependencies related list, click Edit.

c) In the slushbucket, find the dependency you created and double-click to add it to the selected items column on the right. Save the page to return to the widget record.

Include a font icon in a single widget

If you only want one widget to have access to a font icon, include the font icon in a single widget.

Role required: admin or sp_admin

Adding an icon to a specific widget keeps the icon scoped and prevents it from interfering with other CSS on the page.

1. In the platform UI, navigate to Service Portal > Widgets, then click the widget you want to add an icon to.

2. Attach the individual icon file to the widget record.

3. In the HTML template, include something like the following:

```html
<div><i class='font-family'>icon_name</i> you did it!</div>
```
Make sure the class is exactly the same as the font family called out in the CSS. For example
\(<i\ class='material-icons'>\) should be the same as the .material-icons included in
the CSS. The icon_name should match the name of the file you attached.

4. In the CSS field for the widget, add the CSS for the font-icon definition. Most font-icon
sets include a CSS file similar to the material icons one used below. Use the sys_id of the
attachment as the src in the CSS.
Body HTML template

```html
<div>
  <i class='material-icons'>ic_check_circle</i> you did it!
</div>
```

CSS

```css
@font-face {
  font-family: 'Material Icons';
  font-weight: 400;
  src: url('/b5b212b13b27204b49358a12244b04f.iiix') format('svg');
}

.material-icons {
  font-family: 'Material Icons';
  font-weight: normal;
  font-style: normal;
  font-size: 24px; /* Preferred icon size */
  display: inline-block;
  line-height: 1;
  text-transform: none;
  letter-spacing: normal;
  word-wrap: normal;
  white-space: nowrap;
  direction: ltr;

  -webkit-font-smoothing: antialiased;
  font-feature-settings: 'liga';
}
```
An icon that you can select in the widget or widget instance.

To use custom font-icons across widgets, add the icon to a page or make it a widget dependency.

*Include font icons as a widget dependency*

You can include font icons wherever a widget is loaded by including them as a widget dependency.

**Role required:** admin or sp_admin

---

**Note:** CSS included as a widget dependency is not scoped and can disrupt other CSS on a page.

1. In the platform UI, navigate to **Service Portal > CSS** and create a new style sheet.
2. Attach the font-icon set to the sp_css record you created, and use the sys_id of the attachment as the src for the font icon.
3. Navigate to Service Portal > Dependencies and create a new dependency.
4. Attach the CSS record you created to the new dependency using the CSS Includes related list.
Internationalize a widget

Use the ${} or gs.getMessage() syntax in widgets to tag strings for translation so you can localize your Service Portal content.

The ${} or gs.getMessage() searches in the messages table (sys_ui_message) in the platform to see what the translation would be.
Use the HTML template to internationalize strings in a widget. Type the following in an HTML template.

```html
<div>
  <p>${This message will be internationalized.}</p>
  <p>However, this will NOT be.</p>
</div>
```

Writing text as `${message}` is the equivalent of writing `${gs.getMessage("message")}` in other parts of the system, but written as a more legible shorthand.

**Note:** In some cases, the translation might have quotes or double quotes on it. That could lead to JavaScript errors if you are using the ${()} syntax in the client script. The safest way to fetch a translated message is to do it in the server script. Then, assign the value to a client-side Angular binding.

### Translating strings in the client script

```javascript
function() {
  var c = this;
  c.message="${This message will be internationalized}";
}
```

HTML template:

```html
<div>
  <!-- The output of this text will be internationalized. -->
  <p>{{c.message}}</p>
</div>
```

### Translating strings in the server script

Use the server script to translate schema options and other values during server-side runtime.

Server script

```javascript
function() {
  data.message=gs.getMessage("this message contains 'quotes'");
  //You can also translate schema options using the server script
  //For example, data.message=gs.getMessage(options.title);
}
```

HTML template

```html
<div>
  <p>{{c.data.message}}</p>
</div>
```

### Tutorial: Build a custom widget

Follow this tutorial to build a custom widget that displays Service Catalog items. Use this tutorial as a model to help you understand the advanced scripting power of the Service Portal.

In this tutorial, you will create the Quick Order widget. This widget:

- Displays popular items to the user prior to any search.
ServiceNow Jakarta Now Platform Capabilities

- Queries the Service Catalog and displays available options to the user.
- Includes an embedded SC Catalog Item widget, allowing the user to view and order items within the Quick Order widget.
- Uses an Angular Provider to display a category icon beside each queried item.

**Tutorial: Create a widget**
Create the Quick Order widget to query items in the Service Catalog.

Role required: admin or sp_admin

1. Navigate to Service Portal > Service Portal Configuration and click Widget Editor.
2. Click Create a new widget.

![Widget Editor](image)

Widget Editor is a development tool that allows you to view an widgets, create new widgets from scratch, and update the vari

- Check out the Hello World Example
- Create a new widget
- Edit an existing widget

3. Define the following values.
- **Widget Name:** Quick Order
- **Widget ID:** quick_order
- **Create a test page:** Active
- **Page ID:** quick_order

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
adding a widget to a test page creates a record in each of the following tables:

- sp_page
- sp_container
- sp_row
- sp_column
- sp_instance
- sp_widget

note: you can use the page editor in service portal configuration to view the hierarchy of elements on your test page.

4. click submit.
5. from the widget editor, open the quick order widget.
6. add the following simple template to the html field.

   ```html
   <div class="panel panel-primary">
   <div class="panel-heading">Request an item from the catalog</div>
   <div class="panel-body">
   My catalog results
   </div>
   </div>
   
```

7. click save.
8. preview your test page in a new tab using the following url: `<yourInstanceUrl>/sp?id=quick_order`.

your widget template displays on the test page.
Tutorial: Add a server script to query an instance table

After adding your widget and creating a basic template, you can define more advanced scripts that enable the user to query data from an instance table. Using client and server scripts, you can pass the data model between the client and server by querying data from the database, displaying it to the user, and sending any updates back to the server.

Role required: admin or sp_admin

1. From the Widget Editor, open the Quick Order widget.
2. Select Server Script to open the server script script field.
3. Replace the default server script with the following custom script.

```javascript
(function() {
    if (input.keywords != null && input.keywords != '')
        data.items = getCatalogItems(input.keywords);

    function getCatalogItems(keywords) {
        var sc = new GlideRecord('sc_cat_item');
        sc.addActiveQuery();
        sc.addQuery('123TEXTQUERY321', keywords);
        sc.addQuery('sys_class_name', 'NOT IN', 'sc_cat_item_wizard,sc_cat_item_content');
        sc.addQuery('sc_catalogs', 'e0d08b13c3330100c8b837659bba8fb4');
        sc.setLimit(100);
        sc.orderByDesc('ir_query_score');
        sc.query();
        var results = [];
        while (sc.next()) {
            if (!$sp.canReadRecord(sc))
                continue;
            var item = {};
            $sp.getRecordDisplayValues(item, sc, 'name,price,sys_id');
            item.category = sc.getValue('category');
            results.push(item);
        }
        return results;
    }
})();
```

This script performs a keyword search on the sc_cat_item table using the 123TEXTQUERY321 query method.

4. Replace the HTML template with the following script:

```html
<div class="panel panel-primary">
    <div class="panel-heading">Request an item from the catalog</div>
    <div class="panel-body">
        <input class="form-control" type="search" placeholder="Start typing here to search the list of catalog items" ng-model="c.data.keywords" ng-change="c.server.update()" ng-model-options="{debounce: 250}" />
        <ul class="list-group result-container">
            <li class="list-group-item" ng-repeat="item in c.data.items">
                <a href>{{item.name}}</a><span class="pull-right">{{item.price}}</span>
            </li>
        </ul>
    </div>
</div>
```

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
This template adds a search field and displays the results of the query performed in the server script using the following Angular directives. To learn more about these directives, review the Angular API Reference.

Angular directives used in the template

<table>
<thead>
<tr>
<th>Angular directive</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ng-model</td>
<td>Automatically reads and writes value changes to the model variable c.data.keywords.</td>
</tr>
<tr>
<td>ng-model-options</td>
<td>Configures ng-model behavior. In this template, ng-model updates the model after a user has stopped typing for 250 milliseconds.</td>
</tr>
<tr>
<td>ng-change</td>
<td>Executes c.server.update() after the model value changes. This function posts the data object to the server script. After the script is executed, the data object is automatically updated with the new values from the server generated data object.</td>
</tr>
<tr>
<td>ng-repeat</td>
<td>Creates a template from the parent element and child elements. For each item in c.data.items, an instance of the template is created and the expressions {{item.name}} and {{item.price}} are replaced with the values from each item.</td>
</tr>
</tbody>
</table>

5. Add the following script to the CSS - SCSS field:

```css
.result-container {
  margin-top: 10px;
}
```

6. Refresh your test page preview to view the changes.

As you type in the search box, matching catalog items appear. Try searching for **ipad**.

![Request an Item from the catalog](image)

**Tutorial: Manage the empty state of a widget**

Display a list of popular items to the user before any search terms are entered.

Role required: admin or sp_admin

Because no search has been executed when the widget initializes, the server **input** variable is undefined. This empty state may cause confusion when a user first interacts with the widget. To
solve this issue, give your widget something to display when the **input** variable is empty. This initial data can guide your users when initially interacting with your widget.

1. From the **Widget Editor**, open the Quick Order widget.
2. Replace the existing server script with the following script:

   ```javascript
   (function() {
     if (input.keywords != null && input.keywords != '')
       data.items = getCatalogItems(input.keywords);
     else data.items = getPopularItems();

     function getCatalogItems(keywords) {
       var sc = new GlideRecord('sc_cat_item');
       sc.addActiveQuery();
       sc.addQuery('123TEXTQUERY321', keywords);
       sc.addQuery('sys_class_name', 'NOT IN',
                   'sc_cat_item_wizard,sc_cat_item_content');
       sc.addQuery('sc_catalogs', 'e0d08b13c3330100c8b837659bba8fb4');
       sc.setLimit(100);
       sc.orderByDesc("ir_query_score");
       sc.query();
       var results = [];
       while (sc.next()) {
         if (!$sp.canReadRecord(sc))
           continue;
         var item = {};
         $sp.getRecordDisplayValues(item, sc, 'name,price,sys_id');
         item.category = sc.getValue('category');
         results.push(item);
       }
        return results;
     }

     function getPopularItems() {
       var items = [];
       var count = new GlideAggregate('sc_req_item');
       count.addAggregate('COUNT', 'cat_item');
       count.groupBy('cat_item');
       count.addQuery('cat_item.sys_class_name', 'NOT IN',
                     'sc_cat_item_guide,sc_cat_item_wizard,sc_cat_item_content');
       count.addQuery('cat_item.sc_catalogs',
                     'e0d08b13c3330100c8b837659bba8fb4');
       count.orderByAggregate('COUNT', 'cat_item');
       count.query();
       while (count.next() && items.length < 9) {
         if (!$sp.canReadRecord("sc_cat_item",
                                 count.cat_item.sys_id.getDisplayValue()))
           continue; // user does not have permission to see this item
         var item = {};
         item.name = count.cat_item.name.getDisplayValue();
         item.category = count.cat_item.category.toString();
         item.price = count.cat_item.price.getDisplayValue();
         item.sys_id = count.cat_item.sys_id.getDisplayValue();
         items.push(item);
       }
        return items;
     }
   })();

   This script introduces a new function `getPopularItems()` to query the database and return popular items when the **input** variable is empty.
3. Replace the HTML template with the following script:

```html
<div class="panel panel-primary">
  <div class="panel-heading">Request an item from the catalog</div>
  <div class="panel-body">
    <input class="form-control" type="search" placeholder="Start typing here to search the list of catalog items" ng-model="c.data.keywords" ng-change="c.server.update()" ng-model-options="{debounce: 250}" />
    <h5 ng-if="!c.data.keywords">Showing the most popular items</h5>
    <ul class="list-group result-container">
      <li class="list-group-item" ng-repeat="item in c.data.items">
        <a href>{{item.name}}</a><span class="pull-right">{{item.price}}</span>
      </li>
    </ul>
  </div>
  <div class="panel-footer" ng-if="c.data.keywords">
    <ng-pluralize count="c.data.items.length" when="{'0': 'No items found for ',
          '1': 'One item matching ',
          'other': 'Found {} items matching '}">
      {{c.data.keywords}}
    </ng-pluralize>
  </div>
</div>
```

This script provides a template to display the popular items returned from the server script.

4. Refresh your test page preview to view the changes.

The widget displays popular items to the user prior to any search input.

---

**Tutorial: Embed an existing widget**

Enable the user to view and purchase Service Catalog items in the Quick Order widget by embedding the SC Catalog Item widget.

Role required: admin or sp_admin

Instead of duplicating code, you can embed widgets to leverage pre-existing functionality. The SC Catalog Item widget is a base system widget that enables the user to view and purchase Service Catalog items.

1. Inspect the SC Catalog Item widget.
Before embedding the SC Catalog Item widget, inspect the widget to understand what data it needs access to. You may need to update your Quick Order widget client or server script to make sure that the correct data is passed to the embedded widget.

a) Navigate to `<yourInstanceURL>/sp_config?id=widget_edit`.

b) Open the SC Catalog Item widget.

c) Note that the widget ID is `widget-sc-cat-item`. You will use this ID to embed the widget model in the client script.

d) Examine the server script.

Notice that the `data` object includes a `sys_id` property populated by either the `input` or `options` objects. If neither `input` nor `options` include a `sys_id`, the `$sp.getParameter()` method retrieves the `sys_id` from the request query string.

```
Server script
if (input)
    data.sys_id = input.sys_id;
else if (options.sys_id)
    data.sys_id = options.sys_id;
else
    data.sys_id = $sp.getParameter("sys_id") || $sp.getParameter('sl_sys_id');

if (!data.sys_id)
    return;

var validatedItem = new sn.sc.CatItem('' + data.sys_id);
if (!validatedItem.canView())
    return;

data.sc_cat_item = $sp.getCatalogItem(data.sys_id, true);
if (data.sc_cat_item.category) {
    var categoryJS = new sn.sc.CatCategory(data.sc_cat_item.category);
    data.category = {
        name: categoryJS.getTitle(),
        url: 'id=' + data.sc_category_page+ '&sys_id=' + data.sc_cat_item.category
    }
}

$sp.logStat('Catalog View', data.sc_cat_item.sys_class_name, data.sys_id, data.sc_cat_item.name);
```
To populate the **input** object, you can pass a catalog item sys_id from the Quick Order widget client script.

2. From the **Widget Editor**, open the Quick Order widget.
3. Replace the Quick Order widget client script with the following script.

```javascript
function($location, spUtil) {
  var c = this;

  c.select = function(item_id) {
    if (c.openItem == item_id) {
      c.openItem = null;
      return;
    }

    renderCatalogItemWidget(item_id);
  }

  function renderCatalogItemWidget(item_id) {
    c.catalogItemWidget = null;
    spUtil.get("widget-sc-cat-item", {sys_id: item_id}).then(function(response){
      c.catalogItemWidget = response;
      c.openItem = item_id;
    });
  }
}
```

This script uses `spUtil.get()` to retrieve the widget model by ID (**widget-sc-cat-item**) and define the `{sys_id: item_id}` object. This object posts to the server script as **input**.

4. Replace the HTML template with the following script:

```html
<div class="panel panel-primary">
  <div class="panel-heading">Request an item from the catalog</div>
  <div class="panel-body">
    <input class="form-control" type="search" placeholder="Start typing here to search the list of catalog items" ng-model="c.data.keywords" ng-change="c.server.update()" ng-model-options="{debounce: 250}" />
    <h5 ng-if="!c.data.keywords">Showing the most popular items</h5>
    <ul class="list-group result-container">
      <li class="list-group-item" ng-repeat="item in c.data.items">
        <a href ng-click="c.select(item.sys_id)">{{item.name}}</a><span class="pull-right">{{item.price}}</span>
        <div class="catalog-item" ng-if="item.sys_id == c.openItem">
          <sp-widget ng-if="c.catalogItemWidget" widget="c.catalogItemWidget" />
        </div>
      </li>
    </ul>
  </div>
  <div class="panel-footer" ng-if="c.data.keywords">
    <ng-pluralize count="c.data.items.length" when="{"0": 'No items found for ',
      '1': 'One item matching ',
      'other': 'Found {} items matching '}">
      {{c.data.keywords}}
    </ng-pluralize>
  </div>
</div>
```

This template:
- Adds on-click behavior using the ng-click directive.
- Displays the embedded SC Catalog Item widget using the sp-widget directive.

5. Replace the CSS with the following script:

```css
.result-container {
  margin-top: 10px;
}

catalog-item {
  background-color: #f5f5f5;
  padding: 10px;
  @include border-top-radius($panel-border-radius);
  @include border-bottom-radius($panel-border-radius);
}
```

6. Refresh your test page preview to view the changes.

When you select a search result, the item opens in the embedded SC Catalog Item widget.

---

**Tutorial: Create a reusable directive and add it to a widget**

Angular Providers are reusable components that can be added to multiple widgets. Using the Widget Angular Providers table, create a directive that shows a category icon next to each result in the Quick Order widget.

Role required: admin or sp_admin

Angular Providers let you build angular directives and services that can be injected into your client script controller. The code in a Provider differs from a typical Angular directive or service because it must be anonymous, without being appended to a specific module.

The Widget Angular Providers table opens.

2. Click **New** to create a new record.

![Widget Angular Providers Table](image)

3. Fill out the form.
   a) Add the type and name.
      - **Type**: Directive
      - **Name**: categoryIcon
   b) Add the client script.

   ```javascript
   function() {
     return {
       template: '<span class="fa fa-stack fa-lg"><i class="fa fa-circle fa-stack-2x"></i><i class="fa fa-{{::icon}} fa-stack-1x fa-inverse"></i></span>',
       restrict: 'E',
       replace: true,
     }
   }
   ```
This script associates the sys_id of the Category record with the Service Catalog item. The icon that displays is the icon defined in the Category record in the Service Catalog.
New Widget Angular Provider

Widget Angular Provider

Type
- Directive

Name
- categoryIcon

Client Script
```javascript
function() {
    return {
        template: '<i class="fa fa-stack fa-lg"><i class="fa fa-circle fa-stack-2x"></i><i class="fa fa-stack-1x fa-inverse"></i></i>',
        restrict: 'E',
        replace: true,
        scope: {} ||
            { category: '=' },
        link: function(scope, element) {
            var _iconMap = {
                "tablet": "tablet", // Tablets /
                "question": "question", // Can we help you? /
                "mobile-phone": "mobile-phone", // Mobiles /
                "print": "print", // Office and Print /
                "plug": "plug", // Peripherals /
                "desktop": "desktop" // Software /
            };
            scope.icon = _iconMap[scope.category] || "shopping-cart";
        }
    }
}
```

Application
- Global

Save (M + s)
c) Click **Save**.

4. Associate the new Angular directive with the Quick Order Widget.
   a) Navigate to `&lt;yourInstanceURL&gt;/sp_config?id=widget_edit`.
   b) Open the Quick Order widget.
   c) Under **Related Lists**, select **Angular Providers**.
   d) In the Angular Providers list, click **New** to associate an existing Angular Provider with the Quick Order widget.
   e) Add the following values to the form.
      - **Angular Provider**: `categoryIcon`
      - **Widget**: `Quick Order`

   ![Angular Providers](image)

   f) Click **Save**.

5. Add the `categoryIcon` directive to your Quick Order HTML template.
   a) From the **Widget Editor**, open the Quick Order widget.
   b) Replace the HTML template with the following script.

   ```html
   <div class="panel panel-primary">
     <div class="panel-heading">Request an item from the catalog</div>
     <div class="panel-body">
       <input class="form-control" type="search" placeholder="Start typing here to search the list of catalog items" ng-model="c.data.keywords" ng-change="c.server.update()" ng-model-options="{debounce: 250}" />
       <h5 ng-if="!c.data.keywords">Showing the most popular items</h5>
     </div>
   </div>
   ```
6. Refresh your test page preview to view the changes.
A category icon displays beside each result.

![Request an item from the catalog](image)

**Widget API reference**

The following client and server side APIs are supported in the Service Portal.

**Supported client side APIs**

These are the supported Service Portal APIs that can be used in a widget client controller.

For detailed class and method information, see the API reference on the developer portal.
### Supported server side APIs

These are the supported Service Portal APIs that can be used in a widget server script.

<table>
<thead>
<tr>
<th>Class</th>
<th>Available methods</th>
</tr>
</thead>
<tbody>
<tr>
<td>spUtil</td>
<td>· addInfoMessage(String message)</td>
</tr>
<tr>

<tr>
<td></td>
<td>· prompt(String message, String default).then(fn)</td>
</tr>
</tbody>
</table>

**Note:** `g_form` as a global object cannot be used in a widget client controller or in a UI script.

## Widget properties

Global variable and functions available in widget client and server scripts.
Server script global objects

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>An object containing client-side properties set under c.data. The value is undefined until the client controller calls c.server.update().</td>
</tr>
<tr>
<td>data</td>
<td>An object containing properties set during server-side execution.</td>
</tr>
<tr>
<td>options</td>
<td>An object containing the schema option properties.</td>
</tr>
</tbody>
</table>

Client script global functions

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>this.server.get([Object])</td>
<td>Calls the server and sends custom input. Returns Promise.</td>
</tr>
<tr>
<td>this.server.update()</td>
<td>Calls the server and posts this.data to the server script. Returns Promise.</td>
</tr>
<tr>
<td>this.server.refresh()</td>
<td>Calls the server and automatically replaces the current options and data from the server response. Returns Promise.</td>
</tr>
</tbody>
</table>

A promise represents the eventual result of an asynchronous operation. For more information on promises, see [https://promisesaplus.com/](https://promisesaplus.com/) or [AngularJS documentation](https://angularjs.org/).

Search sources

A search source is a record that describes the behavior and source of searchable data.

A search source defines:

- Where search data is retrieved from.
- Whether search suggestions can populate the search field based on user input.
- How a search entry displays in the search result page.

Search sources have simple and advanced configurations.

**Simple**

Define a table within your ServiceNow instance as a source of searchable data. To learn more, see [Define a search source](https://servicenow.com/).

**Advanced**

Define a data fetch script to return data. A data fetch script executes on the server and returns a result array to the search widget. This method is more complex, but offers complete power over how a search is executed. You are not limited to records and tables within ServiceNow and can define a script that fetches data from anywhere on the web. To learn more, review the [Tutorial: set up an external knowledge base search source](https://servicenow.com/).
Typeahead settings

Typeahead returns search results in real time as a user types in the search field. You can configure typeahead settings, or disable the feature entirely, within the search source record.

**Simple**

Define an icon to display beside typeahead results and the target page to display typeahead selections.

**Advanced**

Define a template for the typeahead result. See [Create an advanced typeahead template](#).

Search engine and custom settings

When a simple search source is defined, Service Portal uses the search engine settings configured on your instance. To learn more, see [Search administration](#).

Define a search source

A search source is a record that describes the behavior and source of searchable data. Configure a basic search source to query data from an instance table, or configure an advanced data fetch script to pull data from anywhere on the web.

A search source defines:

- Where search data is retrieved from.
- Whether search suggestions can populate the search field based on user input.
- How a search entry displays in the search result page.

Search sources have simple and advanced configurations.

**Simple**

Define a table within your ServiceNow instance as a source of searchable data.

**Advanced**

Define a data fetch script to return data. A data fetch script executes on the server and returns a result array to the search widget. This method is more complex, but offers complete power over how a search is executed. You are not limited to records and tables within ServiceNow and can define a script that fetches data from anywhere on the web. To learn more, review the Tutorial: set up an external knowledge base search source.

Typeahead returns search results in real time as a user types in the search field. You can configure typeahead settings, or disable the feature entirely, within the search source record. Typeahead return search has simple and advanced configurations.

**Simple**

Define an icon to display beside typeahead results and the target page to display typeahead selections.

**Advanced**

Define a template for the typeahead result. See [Create an advanced typeahead template](#).

1. In the platform UI, navigate to [Service Portal > Portals](#) and select the portal you want to add search sources to.
2. From the **Search Sources** related list, click **New** to add a search source.

3. Define the fields on the **Search Source** form.

### Search Source form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The display value for the search category.</td>
</tr>
<tr>
<td>ID</td>
<td>The record ID. The value should be unique, and should not include any spaces or special characters.</td>
</tr>
<tr>
<td>Application</td>
<td>The scope of the search source.</td>
</tr>
<tr>
<td>Roles</td>
<td>If the Service Portal User Criteria Support plugin is not enabled, define user roles to access this search source.</td>
</tr>
<tr>
<td>Search page template</td>
<td>The HTML template that displays the search results. If defining a basic search source, you do not need to change the default template. For an example of a modified template, see Tutorial: set up an external knowledge base search source.</td>
</tr>
</tbody>
</table>

4. Complete the fields on the **Data Source** tab.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Is scripted source</td>
<td>Select this option to add an advanced data fetch script. If configuring an instance table as the data source, do not check this option.</td>
</tr>
<tr>
<td>Data fetch script</td>
<td>A script defining the endpoint and API calls to fetch external data. This field is only visible when <strong>Is scripted source</strong> is selected. For an example of a data fetch script, see Tutorial: set up an external knowledge base search source.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table from the list that you want to draw your results from. You can select any table in the platform. For example, User (sys_user) or Knowledge (kb_knowledge). <strong>Note:</strong> Only indexed tables return search results. Learn more: Enable text indexing for a table.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Apply a filter to the table if you don’t want all the search results to display. For example, Active is True.</td>
</tr>
<tr>
<td>Primary display field</td>
<td>Select which field you want to display on the search results page. For example, Name.</td>
</tr>
<tr>
<td>Display fields</td>
<td>Select additional fields to display on the search results page. For example, User ID, Email, and City.</td>
</tr>
</tbody>
</table>
5. Configure **Typeahead** settings to allow search results to populate the search field based on user input.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable typeahead</td>
<td>Allows typeahead functionality. If you do not want to integrate typeahead into your search source, clear the check box.</td>
</tr>
<tr>
<td>Advanced typeahead config</td>
<td>Optionally add an advanced typeahead script to configure the way search results display. For more information, see <a href="#">Create an advanced typeahead template</a>.</td>
</tr>
<tr>
<td>Typeahead glyph</td>
<td>Adds an icon beside each typeahead result.</td>
</tr>
<tr>
<td>Page</td>
<td>Defines a service portal page to display the selected result. For example, if form is configured, a selected typeahead result opens in a form.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.

7. Configure the way typeahead results display with an advanced template.
   a) In the **Typeahead** tab of the **Search Source** record, select the **Advanced typeahead config** check box.
b) In the **Typeahead template** field, add an HTML template.

This example uses AngularJS bindings to display service catalog images in the typeahead results.

```html
<i class="ta-img" ng-if="match.model.type=='sc'" style="background-image:url('{{match.model.picture}}')"></i>
<i class="ta-img" ng-if="match.model.type=='sc_guide'" style="background-image:url('{{match.model.picture}}')"></i>
<i class="ta-icon fa fa-file-text-o" ng-if="match.model.type=='sc_content' && match.model.content_type == 'kb'"></i>
<span ng-bind-html="match.label | uibTypeaheadHighlight:query"></span>
```

c) Click **Update**.

Typeahead results display beside the image defined in the service catalog record.
Tutorial: set up an external knowledge base search source

Define an advanced search source to return data from any source on the Internet. To understand the power of search sources, follow this tutorial to set up an external knowledge base search source.

To create an advanced search source, you need an external resource that you can access via REST and basic knowledge of AngularJS.

In this integration, you will:

- Create a data fetch script that uses the ServiceNow Table API to query a knowledge base from another ServiceNow instance.
- Decode the JSON response and define the fields that the search widget expects.
- Update the search sources HTML template to open the search result in the external site.

1. In the platform UI, navigate to **Service Portal > Portals** and select the portal you want to add the search source to.
2. From the **Search Sources** related list, click **New**.
3. Create a name and ID for the search source. The ID should be unique, and should not include any spaces or special characters.
4. On the **Data Source** tab, select the **Is scripted source** check box.
5. Add content to the data fetch script field.
   a) Define the search function to be executed by the instance.
      
      This example uses a **recordless RESTMessage**, but you can modify this example to use a pre-configured **Outbound REST web service** if needed, or create a more secure authentication profile.

      ```javascript
      (function(query) {
        var results = [];
        /* Calculate your results here. */
        var url = "https://myInstance.service-now.com/api/now/table/kb_knowledge?sysparm_query=GOTO123TEXTQUERY321%3D" + encodeURI(query) + "&sysparm_fields=sys_id%2Cnumber%2Cshort_description%2Ccategory%2Ctext";
        var ws = new sn_ws.RESTMessageV2();
        ws.setBasicAuth("search_user", "search");
        ws.setHttpMethod("get");
        ws.setEndpoint(url);

        var jsonOutput = ws.execute();
        return results;
      })(query);
      
      Note: In the preceding example, `ws.setBasicAuth` requires a user and password for the remote instance. For more detail, see **RESTMessageV2**.

      b) Add an if statement to the data fetch script to decode the JSON object being returned, iterate over each result, and set expected fields.

      The final data fetch script:

      ```javascript
      (function(query) {
        var results = [];
        /* Calculate your results here. */
        var url = "https://myInstance.service-now.com/api/now/table/kb_knowledge?sysparm_query=GOTO123TEXTQUERY321%3D" + encodeURI(query) + "&sysparm_fields=sys_id%2Cnumber%2Cshort_description%2Ccategory%2Ctext";
        var ws = new sn_ws.RESTMessageV2();
        ws.setBasicAuth("search_user", "search");
        ws.setHttpMethod("get");
        ws.setEndpoint(url);

        var jsonOutput = ws.execute();
        if (jsonOutput) {
            var response = new JSON().decode(jsonOutput.getBody());
            results = response.result;
            results.forEach(function(result) {
                result.url = "https://myInstance.service-now.com/kb_view.do?sysparm_article=" + result.number;
            });
        }
      })(query);
      ```
result.target = "_blank";
result.primary = result.short_description;
})

return results;
})(query);

In this example, the following fields are set on the result object:

- **url**: If linking to an external site rather than opening the record in your ServiceNow instance, this defines where the link leads to.
- **target**: The target for the link. Set the target to `_blank` to open results in a new tab, otherwise leave it blank.
- **primary**: The primary field displayed in the search results.

6. Update the search page template to open the search results in the external site.

   <div>
   <a href="https://myInstance.service-now.com/kb_view.do?
   sysparm_article={{item.number}}" target="_blank" class="h4 text-primary
   m-b-sm block">
   <span ng-bind-html="highlight(item.primary, data.q)"/>
   </a>
   <span class="text-muted" ng-repeat="f in item.fields | limitTo: 4">
   <span class="m-l-xs m-r-xs" ng-if="!$first"> &middot; </span>
   {{f.label}}: <span ng-bind-html="highlight(f.display_value,
   data.q)"/>
   </span>
   </div>

7. Click **Update**.

Test the external search in your portal. Results display under the name field value defined in step three.
Each search result opens in the external site defined in the search page template.
Example: set up a GitHub search source

Illustrates advanced search source functionality.

To create an advanced search source, you need an external resource that you can access via REST and basic knowledge of AngularJS.

1. In the platform UI, navigate to Service Portal > Portals and select the portal you want to add search sources to.
2. From the Search Sources related list, click New.
3. Create a name and ID for the search source. The ID should be unique, and should not include any spaces or special characters.
4. On the Data Source tab, select the Is scripted source check box.
5. Add content to the data fetch script field.

To set up a GitHub integration:

```javascript
(function(query) {
  var results = [];
  /* Calculate your results here. */
  var url = "https://api.github.com/search/repositories?q=" + encodeURI(query);
  var ws = new GlideHTTPRequest(url);
  ws.setBasicAuth("YOUR_USERNAME_HERE", "YOUR_PASSWORD_HERE");
  var jsonOutput = ws.get();
  if (jsonOutput) {
    var response = new JSON().decode(jsonOutput.getBody());
    results = response.items;
    results.forEach(function(result) {
      result.url = result.svn_url;
      result.target = "_blank";
      result.primary = result.full_name;
    });
  }

  return results;
})(query);
```

6. Use the Search page template to customize the way the search results display.

```
<div>
  <div class="pull-right">
    <strong>{{item.language}}</strong>
    <a ng-href="{{item.svn_url}}/stargazers" target="_blank" class="m-l-sm"> softened</a>
    <span class="fa fa-star m-r-xs">{{item.stargazers_count}}</span>
    <a ng-href="{{item.svn_url}}/network" target="_blank" class="m-l-sm"> softened</a>
    <span class="fa fa-code-fork m-r-xs">{{item.forks}}</span>
  </div>
  <a ng-href="{{item.svn_url}}" target="_blank" class="h4 text-primary m-b-sm block">
    <span ng-bind-html="highlight(item.full_name, data.q)"></span>
  </a>
  <p>{{item.description}}</p>
  <p>Updated <sn-time-ago timestamp="item.updated_at"></sn-time-ago> ago</p>
</div>
```

Create an advanced typeahead template

Configure the way typeahead results display with an advanced template.

1. Complete the required fields in Define a search source.
2. In the Typeahead tab of the Search Source record, select the Advanced typeahead config check box.
3. In the **Typeahead template** field, add an HTML template.

This example uses AngularJS bindings to display service catalog images in the typeahead results.

```html
<i class="ta-img" ng-if="match.model.type=='sc'" style="background-image:url('{{match.model.picture}}')"></i>
<i class="ta-img" ng-if="match.model.type=='sc_guide'" style="background-image:url('{{match.model.picture}}')"></i>
<i class="ta-icon fa fa-file-text-o" ng-if="match.model.type=='sc_content' && match.model.content_type == 'kb'"></i>
<strong ng-if="match.model.type=='sc_content' && match.model.content_type == 'external'">#</strong>
<span ng-bind-html="match.label | uibTypeaheadHighlight:query"></span>
```

4. Click **Update**.

Typeahead results display beside the image defined in the service catalog record.
Set the default portal search source

Use the `glide.service_portal.default_search_sources` system property to define default search sources.

Role required: admin

If you don't define specific search sources for your portal, the system uses default search sources instead.
Default search source flow chart

1. In the Navigation filter, enter `sys_properties.list`. The entire list of properties in the System Properties (sys_properties) table appears.
2. On the list, find the system property `glide.service_portal.default_search_sources`, and then open the property record.
3. Copy the sys_ID of any search source you want to add into the Value field of the system property using a comma-separated list.

   To change the order in which the default search sources show in the Search List, change the order of the IDs in the property.

   You can remove the default search source behavior by deleting the property value or deleting the property altogether.
4. Click Update.

Configure contextual search

Use contextual search to limit search results for an instance of the typeahead search widget.

With contextual search enabled, users only see typeahead results for specific search sources. For example, searching on the Service Catalog page only shows results from the Service Catalog search source when contextual search is enabled.

1. In the Service Portal Designer (Service Portal > Service Portal Configuration > Service Portal Designer), find an instance of the typeahead search widget.

2. Point to the widget and click the edit icon ( ).
Alternatively, in any preview page containing the typeahead search widget, for example the Service Catalog homepage, control + right-click to open the widget context menu. Then click **Instance Options**.

3. In the Contextual Search Sources field, select search sources from the list.

Search sources listed for contextual search can be limited to just one, several, or all search sources.

Default search sources are defined in the `glide.service_portal.default_search_sources` property, so even if you don’t have search sources configured, typeahead search widget still shows typeahead suggestions. For more information on default search sources, see [Set the default portal search source](#).

### Service Portal security

Control user access to a portal.

Control who accesses your portal and what they can see in the following ways:

- **Authentication**: Configure login and single sign on for users
- **Limit page access by role**: Use roles to limit the users who can see a page.
- **Public pages**: Use the public check box on a page record to make the page publicly accessible.

**Note**: A number of portal pages that are installed by default are marked public. Filter your list of Service Portal pages for Public [is] true to identify these pages. Setting the Public value to false will prevent these pages from being publicly available.

- **User criteria**: For a more advanced way of limiting user access, create and apply user criteria to pages, widgets, widgets instances, and search sources.

### Single sign-on, logins, and URL redirects

Service Portal uses a combination of system properties and script includes to determine how the system handles URL redirects for users logging in to the portal.

Only users who understand SSO, URL redirects, and the ServiceNow platform should make any changes.

### Single sign-on and Service Portal

To use single sign-on with Service Portal, you must enable the Integration - Multiple Provider Single Sign-On Installer plugin (com.snc.integration.sso.multi.installer).

If you are using the system property to automatically redirect to your primary IdP, then Service Portal automatically redirects to that IdP. If you have multiple identity providers, Service Portal shows a link on the login page to **Use external login**. For more information on SSO and authentication in the platform, see [External single sign-on (SSO)](#).

### Require authentication for a Service Portal page

If you want to require authentication for a Service Portal page, ensure that the **Public** flag on the page record is not selected. For more information, see [Create and edit a service portal page](#).
a user navigates to a non-public page, they are redirected to the login page for the requested portal.

Because every page request is routed through the $sp page, this page must be public. The following values in the Public Pages `sys_public` table define the page as public:

- **Page**: $sp
- **Active**: true

### Configure the Service Portal login page

Administrators can configure a login page URL redirect for a portal.

1. In the `sys_properties` table, make sure these properties are set to the following:

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.entry.page.script</td>
<td>new SPEntryPage().getLoginURL()</td>
<td>Login page determination</td>
</tr>
</tbody>
</table>

2. It’s better to leave this alone, but if you do need to customize the actual entry page, from the Script Includes table, search for `SPEntryPage`.

   **Note**: If you make changes to the script include, it won’t be upgraded with future updates.

3. Edit the script on the `SPEntryPage` to change the assigned portal to the portal_suffix you want. `SPEntryPage` uses `/sp/` as the portal path to redirect to. Enter your own portal_suffix in place of sp.

   ```javascript
   SPEntryPage.prototype = {
     initialize: function() {
       this.logVariables = false; // for debugging
       this.portal = "/sp/"; // The URL suffix specified in the script
     },
   },
   
   **Note**: The slash character (/) after /sp may cause issues when configuring single sign-on. If you’re experiencing issues, try removing the character from the script.

### Redirect to Service Portal after login

Use system properties and script includes to conditionally redirect users to a page after logging in.

Follow these steps to redirect a user to Service Portal after they log in.

1. In the `sys_properties` table, **Add a system property**:

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.entry.first.page.script</td>
<td>string</td>
<td>new SPEntryPage().getFirstPageURL()</td>
<td>First page after authentication</td>
</tr>
</tbody>
</table>

   `getFirstPageURL` primarily does the following:
• Redirects to login_redirect.do in order to break out of the frameset (if there is one).
• Redirects to Service Portal if the user has no roles, or the full platform for everyone else.

2. Customize the after login behavior by navigating to the SPEntryPage script include.

   **Note:** If you make changes to the script include, it won’t be upgraded with future updates.

   **Note:** If you are using external authentication, ensure that your IdP supports the RelayState URL parameter. This parameter retains the originally requested URL while the user authenticates, and is necessary for redirection after login.

**Debug Service Portal URL redirects**

Debug the URL redirects for logging in to Service Portal and redirecting to the first page.

To view debug output from SPEntryPage and see the session variables it redirects based on:

1. Make sure the system property glide.entry.first.page.script has the value: new SPEntryPage().getFirstPageURL().
2. From the SPEntryPage script include, set this.logVariables = true.
3. In a separate browser, log in.
4. From the system navigator, view the log output by navigating to System Logs > System Log > All.

**Configure page security by role**

Set up pages to be public or filter them by role.

Role required: admin or sp_admin

Public pages won’t require a user login; anyone can access them. All other options require user authentication.

1. In the Service Portal configuration page (Service Portal > Service Portal Configuration), open the Page Editor.
2. In the Select Page list, search for the page to apply page security to.
3. Select the highest level node in the tree view.
4. Configure page security.

   • To make a page public, select the Public check box. All users can access pages marked as Public.
   • To limit access to a certain role, add roles in a comma separated list. Users without the role listed can see links to the page if they appear in the portal. Trying to open the page results in a “page not found” error.

   **Note:** If you select Public and add a list of roles, the page is still accessible by any user.

   • To create a draft page that only administrators can see while the page is still in development, select Draft. Users must have the admin role to see any pages in draft. Everyone else sees a “page not found” error.
5. Click **Save**.

Page with limited access by role

Follow the steps in **Configure widget security** to configure security for the widgets on your page.

**Configure widget security**

Configure widget security to ensure that your widget is being accessed only by the intended audience.

Role required: admin or sp_admin

There are several ways to configure widget security:

- Make the widget public to unauthenticated users
- Make the widget accessible to any user with a login
• Make the widget accessible to certain roles only

When you configure widget security, configure the page security accordingly so that users can access the widget via the page on which it appears. For more information, see Configure page security by role.

1. Navigate to Service Portal > Widgets.
2. Open the record of the widget to configure.
3. On the form, configure the widget security.

<table>
<thead>
<tr>
<th>Option</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Make the widget public to unauthenticated users</td>
<td>Select the Public check box.</td>
</tr>
</tbody>
</table>

**Note:** If you select Public and add a list of roles, the widget is still accessible by any user.

| Make the widget accessible to any user with a login | Clear the Public check box and leave the Roles field blank. |
| Make the widget accessible to certain roles only | 1. Clear the Public check box.                                  |
|                                                    | 2. Next to Roles, click the edit icon ( ).                      |
|                                                    | 3. On the Roles window, select a role by moving it from the Available list to the Selected list. |
|                                                    | 4. Click Done.                                                 |

4. Click Update.

**User criteria for Service Portal**

Administrators can control access to pages, widgets, widget instances, and search sources in a portal by creating and applying user criteria.

User criteria records define conditions that are evaluated against user records. When user criteria is defined, portal records are only visible to users who pass the defined conditions.

User criteria is a platform feature used in Service Portal.

**Important:** After making user criteria additions or changes, you may need to log out and back in to clear the prior configuration.

**Converting role-based permissions to user criteria records**

User criteria in Service Portal replaces role-based permissions. After activating the user criteria for Service Portal plugin, you must Set the user criteria for Service Portal system property to true. When the system property is set to true, any existing roles defined for a page, widget, or search source are automatically converted into user criteria records. To disable user criteria and continue using role-based permissions, set the system property to false.
User criteria checks

User criteria uses the following checks in Service Portal to verify user access.

Page access user criteria

The following diagram shows how the system decides whether a user can access a page based on user criteria.
Widget access user criteria

The following diagram shows how the system determines whether a user has access to a particular widget or widget instance.
Activate the user criteria for Service Portal plugin

You can activate the Service Portal User Criteria Support plugin (com.glide.service-portal.user-criteria) if you have the admin role.

Role required: admin

1. Navigate to System Definition > Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   If the plugin depends on other plugins, these plugins are listed along with their activation status.
   If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. Optional: If available, select the Load demo data check box.
   Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
   You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.
5. Click Activate.

Set the user criteria for Service Portal system property

After activating the Service Portal User Criteria Support plugin, you must set the system property to true.

Role required: admin

Setting the system property activates user criteria for Service Portal. When the system property is set to true, any existing roles defined for a page, widget, or search source are automatically converted into user criteria records. To disable user criteria and continue using role-based permissions, set the system property to false.

1. Navigate to Service Portal > Properties.
2. Click the check box to set the following property to true.

Enable use of User Criteria records instead of Roles fields for Service Portal

Defines permissions for Service Portal widgets, widget instances, search sources.

☐ Yes | No

3. Click Save.

Create a user criteria record for Service Portal

Create a user criteria record to apply to items in Service Portal and control user access to pages, widgets, widget instances, and search sources.
You can apply existing user criteria to records in Service Portal through Service Portal configuration (Service Portal > Service Portal configuration). You can only create user criteria within the platform UI.

1. In the navigation filter, type Service Portal.
2. Select a page, widget, or widget instance record.
3. In the related list at the bottom of the record, select the Can View or Cannot View tab, then click New. If a user criteria record is already created, you can click Edit to apply user criteria to the page, widget, or widget instance.

User criteria records are stored in the user_criteria table.

4. Complete the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the criteria record.</td>
</tr>
<tr>
<td>Users</td>
<td>User records to match access criteria.</td>
</tr>
<tr>
<td>Groups</td>
<td>Group records to match access criteria.</td>
</tr>
<tr>
<td>Roles</td>
<td>Roles to match access criteria.</td>
</tr>
<tr>
<td>Advanced</td>
<td></td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Advanced</td>
<td>Displays or hides the <strong>Script</strong> field.</td>
</tr>
<tr>
<td>Script</td>
<td>Defines any additional criteria, and returns <strong>true</strong> or <strong>false</strong>. This field is available only if <strong>Advanced</strong> is selected.</td>
</tr>
</tbody>
</table>

**Note:** Because scripts are evaluated dynamically, including scripts in user criteria records can decrease performance.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>Application scope for the user criteria record.</td>
</tr>
<tr>
<td>Active</td>
<td>Activate or deactivates this criteria record.</td>
</tr>
<tr>
<td>Companies</td>
<td>Companies to match access criteria.</td>
</tr>
<tr>
<td>Locations</td>
<td>Locations to match access criteria.</td>
</tr>
<tr>
<td>Departments</td>
<td>Departments to match access criteria.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Match All  | Determines whether all elements from each populated criteria field must match. If selected, only users who match all criteria are given access. If cleared, the user must meet one or more of the set criteria to be given access. By default, this check box is cleared so that any condition met provides a match. For example, consider a user criteria record for the following:  
  - Locations A or B  
  - Company C or D  
  With **Match All** selected, only users meeting all these conditions are matched. For example, a user with a location A and a company C.  
  With **Match All** cleared, users meeting any of these conditions are matched. For example, a user with a location B.  

**Note:** If you select **Match All**, ensure that you do not create contradictory conditions that can never be met. For example, if all users in location A work for company G, then the conditions in this example can never be met.

5. Click **Submit**.

**Apply user criteria to a page, widget, or widget instance**

Assign user criteria to pages, widgets, or widget instances to limit user access to content in a portal.
Activate the Service Portal User Criteria Support (com.glide.service-portal.user-criteria) plugin and set the `glide.service_portal.user_criteria_enabled` system property to `true`.

Role required: admin or sp_admin

You can apply several user criteria records to a single portal item.

1. In the Service Portal Configuration page (Service Portal > Service Portal Configuration), open the Page Editor.
2. Select a page from the list.
3. Select a page, widget, or widget instance node from the page tree.
4. Under related lists, click Who Can View or Who Cannot View.
5. Click New.
6. Select a criteria from the Can View or Cannot View list.

Selecting criteria from the Can View or Cannot View list applies user criteria records created in Create a user criteria record for Service Portal to the selected page, widget, or widget instance.

7. Click Save.
Apply user criteria to a search source

Assign user criteria to search sources to limit user access to content in a portal.

Role required: admin

You can add user criteria to custom or default Search sources.

1. In the Service Portal Configuration page (Service Portal > Service Portal Configuration), navigate to Portal Tables > Search Source in the header menu.
Service Portal

Create rich, engaging and modern experiences to help your business run. Select one of the options below to continue.
2. Open the search source record that you would like to modify.
3. Under related lists, click Who Can View Search Sources or Who Cannot View Search Sources.
4. Click New.
5. Select a criteria from the Can View or Cannot View list.

Selecting criteria from the Can View or Cannot View list applies user criteria records created in Create a user criteria record for Service Portal to the selected search source.

6. Click Save.

Service Portal components

View this video to learn more about the different pieces that make up a portal.

Service Portal SCSS Primer

SCSS is a subset of the Syntactically Awesome StyleSheets (Sass) specification and is an extension of CSS. Every valid CSS style sheet is valid SCSS.
SCSS variables

SCSS variables are a way to store information that you want to reuse throughout your style sheet. You can store things like colors, font stacks, or any CSS value you think you want to reuse. SCSS uses the $ symbol to make something a variable.

SCSS supports the follow data types:

- Numbers (including units)
- Strings (with quotes or without)
- Colors (name, or names)
- Booleans

Variables can also be arguments to or results from one of several available functions or mixins. During translation, the values of the variables are inserted into the output CSS document.

For example:

```scss
$font-stack:    Helvetica, sans-serif;
$primary-color: #333;

body {
  font: 100%$font-stack;
  color: $primary-color;
}
```

For more information on Sass, see the [Sass/SCSS reference](#).

SCSS functions

List of functions for Service Portal SCSS compiler.

### RGB functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rgb($red, $green, $blue)</td>
<td>Creates a Color from red, green, and blue values.</td>
</tr>
<tr>
<td>rgba($red, $green, $blue, $alpha)</td>
<td>Creates a Color from red, green, blue, and alpha values.</td>
</tr>
<tr>
<td>red($color)</td>
<td>Gets the red component of a color.</td>
</tr>
<tr>
<td>green($color)</td>
<td>Gets the green component of a color.</td>
</tr>
<tr>
<td>blue($color)</td>
<td>Gets the blue component of a color.</td>
</tr>
<tr>
<td>mix($color1, $color2, ($weight))</td>
<td>Mixes two colors together.</td>
</tr>
</tbody>
</table>

### HSL functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>hsl($hue, $saturation, $lightness)</td>
<td>Creates a Color from hue, saturation, and lightness values.</td>
<td>Yes</td>
</tr>
</tbody>
</table>
### Function

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>hsla($hue, $saturation, $lightness, $alpha)</td>
<td>Creates a Color from hue, saturation, lightness, and alpha values.</td>
<td>Yes</td>
</tr>
<tr>
<td>hue($color)</td>
<td>Gets the hue component of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>saturation($color)</td>
<td>Gets the saturation component of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>lightness($color)</td>
<td>Gets the lightness component of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>adjust-hue($color, $degrees)</td>
<td>Changes the hue of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>lighten($color, $amount)</td>
<td>Makes a color lighter.</td>
<td>Yes</td>
</tr>
<tr>
<td>darken($color, $amount)</td>
<td>Makes a color darker.</td>
<td>Yes</td>
</tr>
<tr>
<td>saturate($color, $amount)</td>
<td>Makes a color more saturated.</td>
<td>Yes</td>
</tr>
<tr>
<td>desaturate($color, $amount)</td>
<td>Makes a color less saturated.</td>
<td>Yes</td>
</tr>
<tr>
<td>grayscale($color)</td>
<td>Converts a color to grayscale.</td>
<td>Yes</td>
</tr>
<tr>
<td>complement($color)</td>
<td>Returns the complement of a color.</td>
<td>No</td>
</tr>
<tr>
<td>invert($color)</td>
<td>Returns the inverse of a color.</td>
<td>No</td>
</tr>
</tbody>
</table>

### Opacity functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>alpha($color)</td>
<td>Gets the alpha component (opacity) of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>opacity($color)</td>
<td>Gets the alpha component (opacity) of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>rgba($color, $alpha)</td>
<td>Changes the alpha component for a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>opacify($color, $amount)</td>
<td>Makes a color more opaque.</td>
<td>No</td>
</tr>
<tr>
<td>fade-in($color, $amount)</td>
<td>Makes a color more opaque.</td>
<td>No</td>
</tr>
<tr>
<td>transparentize($color, $amount)</td>
<td>Makes a color more transparent.</td>
<td>No</td>
</tr>
<tr>
<td>fade-out($color, $amount)</td>
<td>Makes a color more transparent.</td>
<td>No</td>
</tr>
</tbody>
</table>

### Other color functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>adjust-color()</td>
<td>Increases or decreases one or more components of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>scale-color()</td>
<td>Fluidly scales one or more properties of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
<td>Availability</td>
</tr>
<tr>
<td>-------------------</td>
<td>--------------------------------------------------</td>
<td>--------------</td>
</tr>
<tr>
<td>change-color()</td>
<td>Changes one or more properties of a color.</td>
<td>No</td>
</tr>
<tr>
<td>ie-hex-str()</td>
<td>Converts a color into the format understood by IE filters.</td>
<td>No</td>
</tr>
</tbody>
</table>

### String functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>unquote($string)</td>
<td>Removes quotes from a string.</td>
<td>Yes</td>
</tr>
<tr>
<td>quote($string)</td>
<td>Adds quotes to a string.</td>
<td>Yes</td>
</tr>
<tr>
<td>str-length($string)</td>
<td>Returns the number of characters in a string.</td>
<td>No</td>
</tr>
<tr>
<td>str-insert($string, $insert, $index)</td>
<td>Inserts $insert into $string at $index.</td>
<td>No</td>
</tr>
<tr>
<td>str-index($string, $substring)</td>
<td>Returns the index of the first occurrence of $substring in $string.</td>
<td>No</td>
</tr>
<tr>
<td>str-slice($string, $start-at, [$end-at])</td>
<td>Extracts a substring from $string.</td>
<td>No</td>
</tr>
<tr>
<td>to-upper-case($string)</td>
<td>Converts a string to upper case.</td>
<td>No</td>
</tr>
<tr>
<td>to-lower-case($string)</td>
<td>Converts a string to lower case.</td>
<td>No</td>
</tr>
</tbody>
</table>

### Number functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>percentage($number)</td>
<td>Converts a unitless number to a percentage.</td>
<td>Yes</td>
</tr>
<tr>
<td>round($number)</td>
<td>Rounds a number to the nearest whole number.</td>
<td>Yes</td>
</tr>
<tr>
<td>ceil($number)</td>
<td>Rounds a number up to the next whole number.</td>
<td>Yes</td>
</tr>
<tr>
<td>floor($number)</td>
<td>Rounds a number down to the previous whole number.</td>
<td>Yes</td>
</tr>
<tr>
<td>abs($number)</td>
<td>Returns the absolute value of a number.</td>
<td>Yes</td>
</tr>
<tr>
<td>min($numbers...)</td>
<td>Finds the minimum of several numbers.</td>
<td>Yes</td>
</tr>
<tr>
<td>max($numbers...)</td>
<td>Finds the maximum of several numbers.</td>
<td>Yes</td>
</tr>
<tr>
<td>random([$limit])</td>
<td>Returns a random number.</td>
<td>No</td>
</tr>
</tbody>
</table>
List functions

Lists in SCSS are immutable. All list functions return a new list rather than updating the existing list in-place.

All list functions work for maps as well, treating them as lists of pairs.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>length($list)</td>
<td>Returns the length of a list.</td>
</tr>
<tr>
<td>nth($list, $n)</td>
<td>Returns a specific item in a list.</td>
</tr>
<tr>
<td>set-nth($list, $n, $value)</td>
<td>Replaces the nth item in a list.</td>
</tr>
<tr>
<td>join($list1, $list2)</td>
<td>Joins two lists into one.</td>
</tr>
<tr>
<td>append($list1, $val)</td>
<td>Appends a single value onto the end of a list.</td>
</tr>
<tr>
<td>zip($lists...)</td>
<td>Combines several lists into a single multidimensional list.</td>
</tr>
<tr>
<td>index($list, $value)</td>
<td>Returns the position of a value within a list.</td>
</tr>
<tr>
<td>list-separator($list)</td>
<td>Returns the separator of a list.</td>
</tr>
</tbody>
</table>

Adding custom functions

Scss @function my-calculation-function($some-number, $another-number){ @return $some-number + $another-number }

SCSS nesting

SCSS lets you nest your CSS selectors in a way that follows the same visual hierarchy of your HTML.

For example:

```css
nav {
  ul {
    margin: 0;
    padding: 0;
    list-style: none;
  }
  li { display: inline-block; }
  a {
    display: block;
    padding: 6px 12px;
    text-decoration: none;
  }
}
```

The ul, li, and a selectors are nested inside the nav selector, which is a great way to organize your CSS and make it more readable. When the widget is rendered, the generated CSS looks something like the following code block:

```css
nav ul {
  margin: 0;
  padding: 0;
  list-style: none;
}
```
SCSS operators

SCSS has a handful of standard math operators like +, -, *, /, and %.
Use simple math to calculate widths for an aside & article. For example:

```css
.container { width: 100%; }
article[role="main"] { 
  float: left; 
  width: 600px / 960px * 100%; 
}
aside[role="complementary"] { 
  float: right; 
  width: 300px / 960px * 100%; 
}
```

The generated CSS looks like:

```css
.container { 
  width: 100%; 
}
article[role="main"] { 
  float: left; 
  width: 62.5%; 
}
aside[role="complementary"] { 
  float: right; 
  width: 31.25%; 
}
```

For more information on Sass, see the [Sass/SCSS reference](#).

SCSS mixins

A mixin lets you make groups of CSS declarations that you want to reuse throughout your site. You can pass in values to make your mixin more flexible.

The following code block is an example for border-radius.

```css
@mixin border-radius($radius) { 
  -webkit-border-radius: $radius; 
  -moz-border-radius: $radius; 
  -ms-border-radius: $radius; 
}
```
border-radius: $radius;

.box { @include border-radius(10px); }

The generated CSS looks like:

.box {
  -webkit-border-radius: 10px;
  -moz-border-radius: 10px;
  -ms-border-radius: 10px;
  border-radius: 10px;
}

For more information on Sass, see the Sass/SCSS reference.

Advanced resources for Service Portal

Advanced users with CSS and HTML understanding can configure fields in the portal form directly as accessed through the portal UI.

Single sign-on, logins, and URL redirects

Service Portal uses a combination of system properties and script includes to determine how the system handles URL redirects for users logging in to the portal.

Only users who understand SSO, URL redirects, and the ServiceNow platform should make any changes.

Single sign-on and Service Portal

To use single sign-on with Service Portal, you must enable the Integration - Multiple Provider Single Sign-On Installer plugin (com.snc.integration.sso.multi.installer).

If you are using the system property to automatically redirect to your primary IdP, then Service Portal automatically redirects to that IdP. If you have multiple identity providers, Service Portal shows a link on the login page to Use external login. For more information on SSO and authentication in the platform, see #unique_2312.

Require authentication for a Service Portal page

If you want to require authentication for a Service Portal page, ensure that the Public flag on the page record is not selected. For more information, see #unique_2313. If a user navigates to a non-public page, they are redirected to the login page for the requested portal.

Because every page request is routed through the $sp page, this page must be public. The following values in the Public Pages sys_public table define the page as public:

- **Page**: $sp
- **Active**: true

Configure the Service Portal login page

Administrators can configure a login page URL redirect for a portal.

1. In the sys_properties table, make sure these properties are set to the following:
### Redirect to Service Portal after login

Use system properties and script includes to conditionally redirect users to a page after logging in. Follow these steps to redirect a user to Service Portal after they log in.

1. **In the sys_properties table, **#unique 2316**:

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.entry.first.page.script</td>
<td>string</td>
<td>new SPEntryPage().getFirstPageURL()</td>
<td>First page after authentication</td>
</tr>
</tbody>
</table>

   `getFirstPageURL` primarily does the following:
   - Redirects to `login_redirect.do` in order to break out of the frameset (if there is one).
   - Redirects to Service Portal if the user has no roles, or the full platform for everyone else.

2. **Customize the after login behavior by navigating to the SPEntryPage script include.**

   **Note:** If you make changes to the script include, it won’t be upgraded with future updates.

   **Note:** If you are using external authentication, ensure that your IdP supports the RelayState URL parameter. This parameter retains the originally requested URL while the user authenticates, and is necessary for redirection after login.

### Debug Service Portal URL redirects

Debug the URL redirects for logging in to Service Portal and redirecting to the first page.

To view debug output from SPEntryPage and see the session variables it redirects based on:

---

2. It's better to leave this alone, but if you do need to customize the actual entry page, from the Script Includes table, search for **SPEntryPage**.

   **Note:** If you make changes to the script include, it won’t be upgraded with future updates.

3. Edit the script on the SPEntryPage to change the assigned portal to the portal_suffix you want. SPEntryPage uses `/sp/` as the portal path to redirect to. Enter your own portal_suffix in place of `sp`.

   **Note:** The slash character (/) after `/sp` may cause issues when configuring single sign-on. If you’re experiencing issues, try removing the character from the script.
1. Make sure the system property glide.entry.first.page.script has the value: `new SPEntryPage().getFirstPageURL()`.
2. From the SPEntryPage script include, set `this.logVariables = true`.
3. In a separate browser, log in.
4. From the system navigator, view the log output by navigating to System Logs > System Log > All.

Create a custom portal theme

If you need more customization than Branding Editor can provide, you can create your own custom theme.

Role required: admin or sp_admin role

Only users with an understanding of CSS should create custom themes.

1. Navigate to Service Portal > Themes, then click New.
2. Complete the form, as necessary.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of your theme. Use this name to associate the theme with your portal. This name is not visible to users, you should know it to apply the correct theme to a portal.</td>
</tr>
<tr>
<td>Application</td>
<td>The record scope. The header menu record and the source table must have the same application scope.</td>
</tr>
<tr>
<td>Header</td>
<td>List of headers and footers from the sp_header_footer table that you can associate with a portal theme. Headers and footers are widgets and can be configured the same way.</td>
</tr>
<tr>
<td>Footer</td>
<td>List of headers and footers from the sp_header_footer table that you can associate with a portal theme.</td>
</tr>
<tr>
<td>Fixed header</td>
<td>Locks the header at the top of the page so that when a user scrolls the header remains on the screen.</td>
</tr>
<tr>
<td>Fixed footer</td>
<td>Locks the footer at the bottom of the page so that when a user scrolls the footer remains on the screen.</td>
</tr>
</tbody>
</table>
### CSS variables
CSS custom properties that you can use to change the color and styles in a portal. For example, the stock theme uses some of the following variables:

- `$sp-logo-margin-x: 15px !default;`
- `$sp-tagline-color: $text-color !default;`
- `$navbar-inverse-bg: #3a3f51 !default;`

3. Click **Save**.
4. Optional: To add a style sheet to the theme, in the **CSS Include** related list, click **New**.

#### CSS include record

5. Optional: Complete the style sheet form fields, the click **Save**.

#### Style sheet form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the CSS include. Remember this name to associate the CSS include with the theme.</td>
</tr>
<tr>
<td>Application</td>
<td>The record scope. The header menu record and the source table must have the same application scope.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
Source | Select one of the following options:
- **Style Sheet**: Add an internal style sheet that has been uploaded to the CSS table (sp_css). For example, ng-sortable.min.css. Internal style sheets use standard CSS in the CSS field.
- **URL**: Link to an external style sheet. Use external style sheets to use the same CSS as a corporate website or other online resource.

Style sheet | Associate a style sheet or CSS file URL, depending on which option you select in the Source field.

6. Complete the style sheet form fields.

**Style sheet form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display name</td>
<td>Name of the CSS Include. Remember this name to associate the CSS Include with the theme.</td>
</tr>
<tr>
<td>Application</td>
<td>The record scope. The header menu record and the source table must have the same application scope.</td>
</tr>
</tbody>
</table>
| Source | Select one of the following options:
- **UI Script**: Add an internal UI script that has been uploaded to the UI script table (sys_ui_script). UI scripts allow you to create client-side JavaScript and reuse it in multiple locations. For more information on UI scripts, see [UI scripts](#).
- **URL**: Link to an external JavaScript file. Use external URLs to use the same JavaScript as a corporate website or other online resource. |
| UI Script or Java file URL | Associate an internal UI script or Java file URL, depending on which option you select in the Source field. |
| Updated | Date and time that the JS Include was last updated |
| Package | The Service Portal package that the JS include is associated with. For example, Service Portal Configuration Pages. This field is populated by default. |
Tutorial: set up an external knowledge base search source

Define an advanced search source to return data from any source on the Internet. To understand the power of search sources, follow this tutorial to set up an external knowledge base search source.

To create an advanced search source, you need an external resource that you can access via REST and basic knowledge of AngularJS.

In this integration, you will:

- Create a data fetch script that uses the ServiceNow Table API to query a knowledge base from another ServiceNow instance.
- Decode the JSON response and define the fields that the search widget expects.
- Update the search sources HTML template to open the search result in the external site.

1. In the platform UI, navigate to Service Portal > Portals and select the portal you want to add the search source to.
2. From the Search Sources related list, click New.
3. Create a name and ID for the search source. The ID should be unique, and should not include any spaces or special characters.
4. On the Data Source tab, select the Is scripted source check box.
5. Add content to the data fetch script field.
   a) Define the search function to be executed by the instance.
      This example uses a recordless RESTMessage, but you can modify this example to use a pre-configured Outbound REST web service if needed, or create a more secure authentication profile.

```javascript
(function(query) {
  var results = [];
  /* Calculate your results here. */
  var url = "https://myInstance.service-now.com/api/now/table/" + "kb_knowledge?sysparm_query=GOTO123TEXTQUERY321%3D" + encodeURIComponent(query) + "&sysparm_fields=sys_id%2Cnumber%2Cshort_description%2Ccategory%2Ctext";
  var ws = new sn_ws.RESTMessageV2();
  ws.setBasicAuth("search_user", "search");
  ws.setHttpMethod("get");
  ws.setEndpoint(url);

  var jsonOutput = ws.execute();

  return results;
})(query);
```

**Note:** In the preceding example, ws.setBasicAuth requires a user and password for the remote instance. For more detail, see RESTMessageV2.

b) Add an if statement to the data fetch script to decode the JSON object being returned, iterate over each result, and set expected fields.

The final data fetch script:

```javascript
(function(query) {
  var results = [];
  /* Calculate your results here. */
  var url = "https://myInstance.service-now.com/api/now/table/" + "kb_knowledge?sysparm_query=GOTO123TEXTQUERY321%3D" + encodeURIComponent(query) + "&sysparm_fields=sys_id%2Cnumber%2Cshort_description%2Ccategory%2Ctext";
  var ws = new sn_ws.RESTMessageV2();
  ws.setBasicAuth("search_user", "search");
  ws.setHttpMethod("get");
  ws.setEndpoint(url);

  var jsonOutput = ws.execute();

  var results = [];
  /* Decode the JSON response and define the fields that the search widget expects. */
  jsonOutput.forEach(function(result) {
    /* Set expected fields here. */
  });

  return results;
})(query);
```
encodeURI(query) + "&sysparm_fields=sys_id%2Cnumber%2Cshort_description%2Ccategory%2Ctext";
var ws = new sn_ws.RESTMessageV2();
ws.setBasicAuth("search_user", "search");
ws.setHttpMethod("get");
ws.setEndpoint(url);

var jsonOutput = ws.execute();
if (jsonOutput) {
  var response = new JSON().decode(jsonOutput.getBody());
  results = response.result;
  results.forEach(function(result) {
    result.url = "https://myInstance.service-now.com/kb_view.do?sysparm_article=" + result.number;
    result.target = "_blank";
    result.primary = result.short_description;
  });
}
return results;
})(query);

In this example, the following fields are set on the result object:

- **url**: If linking to an external site rather than opening the record in your ServiceNow instance, this defines where the link leads to.
- **target**: The target for the link. Set the target to `_blank` to open results in a new tab, otherwise leave it blank.
- **primary**: The primary field displayed in the search results.

6. **Update the search page template to open the search results in the external site.**

```html
<div>
  <a href="https://myInstance.service-now.com/kb_view.do?sysparm_article={{item.number}}" target="_blank" class="h4 text-primary m-b-sm block">
    <span ng-bind-html="highlight(item.primary, data.q)"></span>
  </a>
  <span class="text-muted" ng-repeat="f in item.fields | limitTo: 4">
    <span class="m-l-xs m-r-xs" ng-if="!$first"> &middot; </span>
    {{f.label}}: <span ng-bind-html="highlight(f.display_value, data.q)"></span>
  </span>
</div>
```

7. **Click Update.**

Test the external search in your portal. Results display under the name field value defined in step three.
Each search result opens in the external site defined in the search page template.

<table>

Importing Address Book From CSV File

Outlook 2010 - Importing Address Book From CSV File

This article explains how to import your address book from a CSV file into Outlook 2010.

2. Select the File menu.
3. Choose Open.
4. Click Import.
5. Select Import from another program or file, then Next from the Import/Export Wizard.
6. Select Comma Separated Values (Windows), then Next.
7. Choose Browse to navigate to the .csv file that you want to import, and then click Open to return to the Import a File window.
8. Select Next and choose Contacts as the destination folder, and click Next again.
9. Click Finish to import the Address Book.

Example: set up a GitHub search source

Illustrates advanced search source functionality.
To create an advanced search source, you need an external resource that you can access via REST and basic knowledge of AngularJS.

1. In the platform UI, navigate to Service Portal > Portals and select the portal you want to add search sources to.
2. From the Search Sources related list, click New.
3. Create a name and ID for the search source. The ID should be unique, and should not include any spaces or special characters.
4. On the Data Source tab, select the Is scripted source check box.
5. Add content to the data fetch script field.

To set up a GitHub integration:

```javascript
(function(query) {
    var results = [];
    /* Calculate your results here. */
    var url = "https://api.github.com/search/repositories?q=" + encodeURI(query);
    var ws = new GlideHTTPRequest(url);
    ws.setBasicAuth("YOUR_USERNAME_HERE", "YOUR_PASSWORD_HERE");
    var jsonOutput = ws.get();
    if (jsonOutput) {
        var response = new JSON().decode(jsonOutput.getBody());
        results = response.items;
        results.forEach(function(result) {
            result.url = result.svn_url;
            result.target = "_blank";
            result.primary = result.full_name;
        });
    }
    return results;
})(query);
```

6. Use the Search page template to customize the way the search results display.

```html
<div>
    <div class="pull-right">
        <strong>{{item.language}}</strong>
        <a ng-href="{{item.svn_url}}/stargazers" target="_blank" class="m-l-sm"><span class="fa fa-star m-r-xs"></span>{{item.stargazers_count}}</a>
        <a ng-href="{{item.svn_url}}/network" target="_blank" class="m-l-sm"><span class="fa fa-code-fork m-r-xs"></span>{{item.forks}}</a>
    </div>
    <a ng-href="{{item.svn_url}}" target="_blank" class="h4 text-primary m-b-sm block">
        <span ng-bind-html="highlight(item.full_name, data.q)"></span>
    </a>
    <p>{{item.description}}</p>
    <p>Updated <sn-time-ago timestamp="item.updated_at"></sn-time-ago> ago</p>
</div>
```

Subscription Management

With the ServiceNow® Subscription Management application, review and manage how your ServiceNow subscriptions are used on your production instance.
Subscription Management setup guide

Because Subscription Management is active for all production instances by default, you do not need to activate a plugin. To set up Subscription Management, you assign the usage_admin role to the users who will administer subscriptions. The admins allocate users to appropriate subscriptions, monitor usage of applications (both by subscribed users and by users who are not subscribed), and update subscription levels as needed.

What to do

Assign the Usage Admins

Before you (the admin user) do anything else, assign the usage_admin role to the persons who will manage subscriptions for your organization.

Admin responsibilities and activities are described in Allocating users to a Per-User subscription and Monitoring how subscriptions are allocated.

View the list of your subscription applications

See View your subscription applications and allocation levels.

If your organization purchased Per-User subscriptions, the usage_admin allocates users

Note: You perform this task only for Per-User subscriptions. Your instance auto-allocates and reports on monthly usage for all other subscription types.

With a Per-User subscription, a specified number of users is entitled to use the application. You perform the following tasks:

- Build user sets.
- Allocate users to appropriate subscriptions.
- Monitor whether you have allocated the right number of users.
- Monitor and manage how users are allocated.
See Allocating users to a Per-User subscription.

What to do next

Day-to-day administration: Monitor and manage subscriptions
See Monitoring how subscriptions are allocated.

Subscription Management admin guide

You use the ServiceNow® Subscription Management application to review and manage how purchased subscriptions are used on your production instance. You can monitor usage to update subscription levels and to make informed decisions about subscription purchases.

What is a subscription?

In contrast to companies that sell software licenses, ServiceNow sells subscription services.

- Your organization has purchased a subscription to an application family. The subscription entitles an agreed-upon number of users or resources in your organization to use the applications.
- For Per-User type subscriptions only, you allocate users to the subscription. As a result, the user is subscribed to the family of applications. For other subscription types, the instance auto-allocates users or resources to the subscription.
- For your organization to comply with its service contract, only subscribed users or resources should use a subscription application family.
- The Subscription Management application monitors your purchased subscriptions on production instances only.

How do you use Subscription Management?

The usage_admin can perform the following tasks:

- Receive and view subscriptions that your organization has purchased.
- Monitor and adjust allocation levels.
- Plan for renewing subscriptions.
- Determine which users (by role, by user group, or by some other criterion) should be subscribed to which Per-User subscription applications.
- Build user sets.
- Allocate users and user sets to each of the Per-User subscriptions.
- Manage user sets as users, roles, and groups change over time.

View your subscription applications and allocation levels

The Subscriptions page lists the subscriptions that your organization has purchased and indicates how many users or resources are allocated to each subscription.

Role required: usage_admin or admin

On your production ServiceNow instance, navigate to Subscription Management > Subscriptions.
The page lists all subscriptions that your organization has purchased. Some subscriptions do not appear in the list. See *Why a subscription might not appear in the list*.

A color code indicates the allocation level. You can click a subscription Name to open the Subscription form, where you can:

- View or update how users are allocated to a Per-User subscription. See *Subscription form*
- View the applications and plugins that are included with a subscription

Headings on the Subscriptions list are described in *Subscription form*.

**Subscription form**

Use the Subscription form to view the list of applications that are associated with the subscription and to view or update how resources are allocated to a subscription.

In any list of subscriptions, click a subscription Name to open the Subscription form. Some fields do not appear for ServiceNow Store apps.

**Note:** There are several reasons that a subscription might not appear in the list. See *Why a subscription might not appear in the list*.

**Fields on the Subscription form**

<table>
<thead>
<tr>
<th>Name</th>
<th>Name of the subscription.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Type of subscription: Per-User, Max User, PA Indicator, Capacity, or Unlimited.</td>
</tr>
<tr>
<td>Category</td>
<td>The source of the purchased subscription: ServiceNow or ServiceNow Store.</td>
</tr>
<tr>
<td><strong>Start date / End date</strong></td>
<td>Start and end of the subscription period as agreed in your service contract. This information appears in the General section of the service contract for the subscription.</td>
</tr>
<tr>
<td>----------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Display only</strong></td>
<td>A value of true indicates that user allocation or monitoring is not currently supported for the subscription.</td>
</tr>
<tr>
<td><strong>Cost</strong></td>
<td>Denotes whether the subscription is <strong>For-fee</strong> or <strong>Free</strong>. Some ServiceNow Store apps are free. You do not allocate resources to free subscriptions.</td>
</tr>
<tr>
<td><strong>Purchased</strong></td>
<td>Number of users or other resources that can be subscribed.</td>
</tr>
<tr>
<td><strong>Allocated</strong></td>
<td>Number of currently subscribed users or allocated resources for the subscription. The color codes indicate the percentage of the subscription that has been used. See Configure the color codes for subscription allocation levels.</td>
</tr>
</tbody>
</table>
| **Limit to purchased**     | Select the check box to ensure that you do not exceed the purchased subscription limit while attempting to allocate users. The setting affects whether you can use the **Allocate selected users** action for users in the Pending state. Behavior when allocation would result in exceeding the purchased subscription limit:  
  - Limit to purchased selected: You cannot apply the **Allocate selected users** action on the **Pending Users** related list.  
  - Limit to purchased not selected: You can apply the **Allocate selected users** action on the **Pending Users** related list. The color code on the **Allocated** field changes to red to indicate over-allocation. |
| **Auto-sync user sets**    | Select the check box to periodically check all associated user sets for updates (added or removed users) based on the user set membership settings and then update subscription allocation accordingly.  
  **Note:** If adding a user would exceed the subscription limit, then the following actions happen:  
  - The user is not subscribed  
  - The user is set to Pending status  
  - The user is listed on the Pending Users related list. |

</tr>
<tr>
<td>Subscription Line Items</td>
<td>Applications that require subscriptions.</td>
</tr>
</tbody>
</table>

### Types of subscriptions

The Subscriptions module lists all subscription types that your organization has purchased.

You allocate users only to Per-User subscriptions. Because the instance auto-allocates all other subscription types, no action is required on your part.

**Subscription types in the Subscriptions list**

<table>
<thead>
<tr>
<th>Subscription type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Capacity</td>
<td>Your ServiceNow instance auto-allocates resources such as users, devices, software, or nodes to Capacity subscriptions. For example, resources like each CI that Discovery finds or each password reset request.</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Max User</td>
<td>Your organization purchased a subscription for the anticipated maximum number of active ServiceNow users. To monitor overall usage, the instance auto-allocates each active user up to the limit of the Max User subscription.</td>
</tr>
<tr>
<td>PA Indicator</td>
<td>Your organization purchased a subscription for an application suite that uses Performance Analytics capabilities (for example, PA for ITSM or PA for Service Management). The PA admin creates indicators on tables that are used by the applications in the suite.</td>
</tr>
<tr>
<td>Per-User</td>
<td>Your organization purchased a subscription for the number of fulfiller users for subscription applications and capabilities. By default, the instance can monitor and report on usage of the application by both subscribed users and users who are not subscribed. See Allocating users to a Per-User subscription.</td>
</tr>
<tr>
<td>Unlimited</td>
<td>ServiceNow Store apps only. Your instance auto-allocates and tracks active users to an Unlimited subscription. There is no limit to the number of users that can be allocated. An active user is any user in the sys_user table that has a user id and has the Active field set to true.</td>
</tr>
</tbody>
</table>

**View the applications and plugins that are included with a subscription**

You can activate a plugin that is associated with a for-fee subscription only if your organization has purchased the subscription.

Role required: usage_admin or admin

1. On your production ServiceNow instance, navigate to Subscription Management > Subscriptions. The page lists all subscriptions that your organization has purchased.

   **Note:** If the subscription does not appear in the list, contact your ServiceNow account representative to purchase the subscription.

2. Click a subscription name and then, on the Subscription form, click an application name in the Subscription Applications related list. (A subscription can include multiple applications.) The page lists the plugins that are associated with the application.

**View Subscription Management history reports**

History reports give the usage_admin at-a-glance status and trends on subscription activity for an organization.

Role required: usage_admin or admin

1. Follow the How to instructions in the table.
History reports

<table>
<thead>
<tr>
<th>Report</th>
<th>Description</th>
<th>How to</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subscription histories</td>
<td>Concise data on subscription downloads and updates for your organization.</td>
<td>1. Navigate to Subscription Management &gt; Subscriptions and then click a subscription Name.&lt;br&gt;2. On the Subscription form, click the View Subscription History related link.&lt;br&gt;3. The Subscription History popup lists the operations on subscriptions for this ServiceNow instance. Click an Operation to view details.</td>
</tr>
<tr>
<td>Histories of subscription users</td>
<td>For each Per-User subscription, concise historical data on changes in subscription status for users: when users were subscribed and when they were unsubscribed, excluded, or unexcluded.</td>
<td>1. Navigate to Subscription Management &gt; Subscriptions and then click the Name of a Per-User subscription.&lt;br&gt;2. On the Subscription form, click the View User Subscription History related link.&lt;br&gt;3. The User Subscription History popup lists the operations on user subscription status for the specified subscription. Click a User State to view details of a change in subscription status for a user.&lt;br&gt;• User State: Lists the change in the user status: subscribed/unsubscribed and excluded/unexcluded.&lt;br&gt;• Allocation Source: Lists the name of the user set that acted as the source of the user.&lt;br&gt;• Allocation Type: Lists the method for allocating the user to the subscription: user set or individual.&lt;br&gt;• Operation time and Created by: Lists the timestamp of change and the admin who made the change.</td>
</tr>
<tr>
<td>Histories of subscription user sets</td>
<td>Data on when subscription user sets were created, updated, or deleted.</td>
<td>1. Navigate to Subscription Management &gt; Subscription User Sets and then click the Name of a user set.&lt;br&gt;2. On the Subscription User Set page, click the View User Set History related link.&lt;br&gt;3. The User Set History popup lists the operations on user sets for the specified subscription. Click an Operation to view details.</td>
</tr>
</tbody>
</table>

2.

Why a subscription might not appear in the list

The Subscriptions list displays the subscriptions that your organization has purchased. There are, however, several types of non-subscription items that do not appear in the list.
Why does my subscription not appear in the Subscriptions list?

- You might not see all subscription services that you have purchased because the Subscription Management application does not yet allow management of some subscription services.
- Subscription data arrives on production instances only.
- Self-hosted instances do not receive subscription information.
- Subscriptions that are marked as Display only do not currently support resource allocation or monitoring.

Why is the Subscriptions list empty?

- The subscription information might not yet have arrived. The data is downloaded daily.

Allocating users to a Per-User subscription

You, the usage admin, use the Subscriptions module to allocate users to the Per-User type subscriptions that your organization has purchased.

Example: allocate users to a Per-User subscription

In this example, your organization purchased a subscription for 200 fulfiller users. You can therefore specify the 200 users—the subscribed users—who have the right to use the subscription application and features on your production instance. You can allocate users either individually or by adding user sets to the subscription.

Note: User sets are the preferred automated method for managing the pool of users who are subscribed to an application. Once you configure and allocate a user set, the system regularly updates the list of members based on the conditions that you specified. You do not need to manage individual users.
The subscription admin allocates a mix of user sets and individual users to the 200-user subscription.

2 The 200 users that the admin allocated to the subscription are now subscribed to the application.
Guidelines for allocating users

- You allocate users only to Per-User subscriptions. The instance automatically reports on monthly usage for all other subscription types.
- When you add a user set to a subscription, the system allocates all users in the user set, up to the purchased subscription limit.
- In the case that adding the users in a user set would exceed the subscription limit, then none of the users in the user set are subscribed. Instead, all users in the user set are set to Pending status and are listed on the Pending Users related list. Users that are currently subscribed are not affected. See Manage users with Pending status.
- You can unsubscribe any user as needed.
- You can exclude users. Excluded users cannot be allocated to a subscription individually or through a user set. At any time, you can remove a user from the list of excluded users.

**Note:** If you unsubscribe a user who is a member of a user set that is associated with an auto-synced subscription, the user will be resubscribed in the next synchronization cycle. To remove such a user, exclude the user. See Exclude a user from a subscription.

Methods for allocating users

- Define user sets and then add user sets to the subscription
- Allocate individual users to the subscription (as many as are required)

Overview of the procedure for allocating users

1. Allocate users to the subscription using one or both of the following methods:
   - Build one or more user sets and add the user sets to the subscription
   - Allocate individual users

2. After you have allocated users to the subscription, you can add or remove user sets and individual users as needed. In addition, you can exclude individual users as needed.

Subscription user sets

You define the criteria for a user to become a member of a user set (for example, all fulfiller users in the IT department). When you add a user set to a subscription, the system attempts to subscribe all users in the user set.

Auto-sync

The system updates the members in a user set whenever a user update causes the user to meet or fail to meet the criteria for the user set. For example, if a user loses the "fulfiller user" role, the user is removed from the user set.

To make subscriptions self-maintaining, you can auto-sync a subscription. The system then regularly subscribes or unsubscribes users based on updates to the user sets that are assigned to the subscription. The option is described in Auto-sync a subscription to user set updates.
How users are subscribed and unsubscribed

- When you add a user set to a subscription, the system allocates all users in the user set to the subscription, up to the purchased subscription limit.
- You can add a user set to any number of subscriptions.
- Users that are allocated from multiple user sets are subscribed only one time.
- In the case that adding the users would exceed the subscription limit, then none of the users in the user set are subscribed. Instead, all users in the user set are set to Pending status and are listed in the Pending Users related list.
- When you remove a user set from a subscription, the system attempts to unsubscribe all users in the set. If a user is added from another user set, however, the user is not unsubscribed.
- Users that the usage admin has flagged as excluded are not allocated, even if other members of the user set are allocated. The usage admin can unexclude a user so that the user can be allocated.

Why a user is not subscribed when you add a user set

- The user set is empty (contains no users).
- The user had been excluded from the subscription.
- The user had already been directly allocated
- Another user set added the user (duplicate user)
- A user could not be allocated because adding the user would exceed the subscription limit. In this case, all users in the user set are set to Pending status. The names of the users are listed in the Pending Users related list.

Why a user is not unsubscribed when you remove a user set

- The user set is empty (contains no users).
- The user was already directly allocated
- The user is added from another user set

Build a subscription user set

You can create a user set using either of two methods: Configure a filter that selects particular users from the User (sys_user) table or specify a particular set of user groups from the Group (sys_user_group) table.

Role required: usage_admin or admin

1. Open the Subscription User Sets page: Navigate to Subscription Management > Subscription User Sets.
2. Click New and then enter a unique Name (for example, Fulfiller users in the IT department) and Description for the user set.
3. Use one of the following methods to specify the Source of the users that you will add to the user set:
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| User (sys_user) | The Conditions setting is a standard ServiceNow condition builder.  
1. Specify the filters that determine which users to extract from the table. The extracted users make up the user set. For example, filter for (role) (is) (itil).  
2. Click ![link] to view the number of users that the filter generates. |
| Group (sys_user_group) | Unlock the Groups box and add appropriate groups. |

4. When the list is correct, click Submit or Update.  
The user set that you created is available to add to any subscription.

Add a user set to a subscription  
When you add a user set to a subscription, all users in the user set are allocated to the subscription.  
Role required: usage_admin or admin  
1. Navigate to Subscription Management > Subscriptions.  
2. Click the Name of the Per-User subscription to allocate users to.  
3. On the User Sets related list, click Edit.  
4. The Add User Sets form displays the list of user sets that you can add. Move the desired user sets from the Collection list into the User Sets list and then click Save.  
The users in the list are allocated to the subscription and the number of subscribed users is updated.

Note: In the case that adding the users would exceed the subscription limit, then none of the users in the user set are subscribed. Instead, all users in the user set are set to Pending status and are listed in the Pending Users related list. Currently subscribed users who were individually subscribed or in other users sets are not affected. See Manage users with Pending status.

5. Optional: You can configure any subscription to check associated user sets for updates regularly and then update the list of subscribed users accordingly. On the Subscription form, select Auto-sync with user sets.  

Note: If you do not select the Auto-sync with user sets option, then the user sets that you add to the subscription are never updated and the list of subscribed users does not auto-update over time.

6. On the Subscription form, click Update.

Auto-sync a subscription to user set updates  
You can configure any subscription to check user sets regularly to find users who were added or removed. The system then regularly subscribes or unsubscribes users based on updates to user sets.  
Role required: usage_admin or admin
If the system cannot allocate a user because adding the user would exceed the subscription limit, the user is set to Pending status and is listed in the Pending Users related list.

1. Navigate to Subscription Management > Subscriptions.
2. Click the Name of the Per-User subscription to update.
3. On the Subscription form, select Auto-sync user sets.
4. Optional: On the Subscription form, click Sync Now to synchronize and update the list of subscribed users immediately.

Remove a user set from a subscription
When you remove a user set from a subscription, the system attempts to unsubscribe all users in the set. User sets are removed regardless of the Auto-sync with user sets setting.

Role required: usage_admin or admin
1. Navigate to Subscription Management > Subscriptions.
2. Click the Name of the Per-User subscription.
3. In the User Sets list, select all user sets to remove.
4. In the Actions on selected rows list, select Remove From Subscription. On the Remove User Set from Subscription pop-up, click Remove.
   All users in the selected user sets are unsubscribed. If users in the user sets are pending, then the users are removed from the Pending Users list.

Delete a subscription user set
You can delete a subscription user set only if no subscriptions use the user set.

Role required: usage_admin or admin

Note: Deleting a user set is a permanent action—the user set will no longer exist. In contrast, you can remove a user set from a subscription to unsubscribe all users in the user set—the user set will still exist.

1. Ensure that the user set is not used by any subscription.
2. Navigate to Subscription Management > Subscription User Sets and select the user set.
3. Click Delete.

Allocate an individual user from the Subscription form
In addition to adding user sets to a subscription, you can add individual users directly. Users that you allocate directly are subscribed immediately.

Role required: usage_admin or admin

Note: A user set, not individual allocation, is the preferred automated method for managing the pool of users who should be subscribed to an application. Once you configure and allocate a user set, you do not need to manage individual users.

1. Navigate to Subscription Management > Subscriptions.
2. Click the **Name** of the Per-User subscription to allocate users to.

3. Optional: To ensure that you do not exceed the purchased subscription limit, click **Limit to purchased**.

4. On the **Subscribed Users** related list, click **Edit**.

5. The form displays the list of users that you can add. Move the desired users from the **Collection** list into the **Subscribed Users** list and then click **Save**.

The selected users are allocated to the subscription and the **Allocated** value is updated. If allocating a user would exceed the subscription limit, the user is not subscribed. Instead, the user is set to Pending status and is listed in the Pending Users related list. See **Manage users with Pending status**.

6. Click **Update** on the **Subscription** form.

## Allocate an individual user from the User Record form

To simplify the process of setting up user capabilities, you can allocate or deallocate an individual user to a subscription while viewing the user data on the User form. Users that you allocate directly are subscribed immediately.

Role required: usage_admin or admin

**Note:** A user set, not individual allocation, is the preferred automated method for managing the pool of users who should be subscribed to an application. Once you configure and allocate a user set, you do not need to manage individual users.

1. Navigate to **User Administration > Users** and then click the **Name** of the user. The User form opens.

2. On the **Manage Subscriptions** related list, click **Edit**.
3. The Edit Members slushbucket lists the subscriptions that you can allocate the user to. To allocate the user, move a subscription from the Collection list into the Manage Subscriptions list and then click Save. The user is allocated to the subscription and the Allocated value is updated. If allocating a user would exceed the subscription limit, the user is not allocated. Instead, the user is set to Pending status and is listed in the Pending Users related list on the Subscription form. See Manage users with 'Pending' status.

To deallocate the user, move a subscription from the Manage Subscriptions list into the Collection list.

4. Click Update on the User form. The Subscriptions related list is updated to list all subscriptions that the user is allocated to and the applications that the user is subscribed to.

Manage users with 'Pending' status

Users are set to Pending status when adding the users would exceed the subscription limit (the Purchased value).

Role required: usage_admin or admin

Users are added to the Pending Users list when you attempt to allocate users in the following situations:

- User sets: If adding the user set exceeds the subscription limit, the user set is not added and all users in the set are set to Pending status.
- Individual user: If allocating a user directly would exceed the subscription limit, the user is not subscribed and is instead set to Pending status.

1. Navigate to Subscription Management > Subscriptions.
2. Click the Name of the Per-User subscription.
3. In the Pending Users related list, select all users to update.
4. In the Actions on selected rows list, select an action.

<table>
<thead>
<tr>
<th>Action</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allocate selected users</td>
<td>Allocates the users to the subscription and removes the user from the Pending Users list.</td>
</tr>
<tr>
<td></td>
<td>• If the Limit to purchased option is selected and adding the selected users would exceed the subscription limit (the Purchased value), then the action is not allowed.</td>
</tr>
<tr>
<td></td>
<td>• If the Limit to purchased option is not selected and adding the selected users would exceed the subscription limit (the Purchased value), then the system displays a popup to notify you.</td>
</tr>
<tr>
<td>Exclude from subscription</td>
<td>Excludes the user and removes the user from the Pending Users list.</td>
</tr>
<tr>
<td></td>
<td>Excluded users cannot be allocated to the selected subscription. The auto-sync process does not add excluded users.</td>
</tr>
<tr>
<td>Delete</td>
<td>Removes the selected users from the Pending Users list and performs no other action.</td>
</tr>
</tbody>
</table>
Unsubscribe a user

When you remove a user from a subscription, the user is unsubscribed.

Role required: usage_admin or admin

1. Navigate to Subscription Management > Subscriptions.
2. Click the Name of the Per-User subscription.
3. In the Subscribed Users list, select all users to unsubscribe.
4. In the Actions on selected rows list, select Remove from subscription and then click Remove on the pop-up.

Note: If you unsubscribe a user who is a member of a user set that is associated with an auto-synced subscription, the user will be resubscribed in the next synchronization cycle. To remove such a user, exclude the user.

Exclude a user from a subscription

You can exclude users. Excluded users cannot be allocated to a specified subscription. The auto-sync process does not add excluded users.

Role required: usage_admin or admin

1. Navigate to Subscription Management > Subscriptions.
2. Click the Name of the Per-User subscription.
3. In the Subscribed Users list, select all users to exclude.
4. In the Actions on selected rows list, select Exclude from subscription and then click Exclude on the popup.

Remove a user from the Excluded list

You can unexclude a user so that the user can be allocated to a subscription.

Role required: usage_admin or admin

1. Navigate to Subscription Management > Subscriptions.
2. Click the Name of the Per-User subscription.
3. In the Excluded Users related list, select all users to unexclude.
4. In the Actions on selected rows list, select Delete and then click Delete on the pop-up.

The selected users are no longer excluded and are removed from the Excluded Users related list. No other action is taken.

Note: The users are not yet allocated to the subscription. You must manually add the users or synchronize the associated update set. On the Subscription form, click Sync Now to synchronize and update the list of subscribed users immediately.

Monitoring how subscriptions are allocated

You, the usage admin, use the Subscriptions module to allocate users to the Per-User subscriptions that your organization has purchased.
Subscription life cycle

1. Receive and view subscriptions

2. Allocate users to subscriptions

3. Monitor and adjust subscribed users

4. Plan for renewing subscriptions

5. Review the subscriptions that your organization has purchased

Subscription Management tasks

<table>
<thead>

<td>Subscriptions module: <strong>View your subscription applications and allocation levels</strong></td>
</tr>
</tbody>
</table>

**Monitor how resources are allocated to subscriptions**

Use the Subscription Overview module to monitor how users and resources are allocated to subscriptions.

Role required: usage_admin or admin

The system displays one chart for each subscription. You can:

- Monitor how resources (for example, discovered nodes or password reset requests) use Capacity subscriptions.
- Plan and budget for upcoming or future subscription needs.
- Assess whether you have allocated too many fulfiller users to a Per-User subscription. You might deallocate some users or purchase a subscription for more users.
- Assess whether you have allocated too few fulfiller users to a Per-User subscription. You might allocate more users.
- Determine whether users who are not subscribed are accessing a subscription application.

Navigate to **Subscription Management > Subscription Overview**.

The **Expired Subscriptions** report lists all subscriptions where the service contract term has expired (the end date has passed). You should assess whether to renew any subscription that has expired.

Each **Subscription Metrics** chart displays the following data for a single subscription (at least one month of data is required):

- **Purchased**: The number of resources purchased for the subscription.
- **Allocated**: The average number of users for the month who have been allocated to the subscription.
- **Non-subscribed users**: The average number of individual users who performed fulfiller actions in the associated applications without being subscribed to the applications. Click a data point to view the application.

In the example, the organization updated the purchased subscription from 15 to 20 users in November 2015. Over the course of April 2016, the usage admin had allocated an average of about 19 users. In addition during the period, one user who was not subscribed performed fulfiller actions in an application associated with the subscription.
Monitor subscription compliance

Use the Compliance Overview module to monitor fulfiller actions by subscribed users and by users who are not subscribed to an application that your organization has purchased. In addition, a chart shows usage for applications where your organization has not yet purchased a subscription.

Role required: usage_admin or admin

Navigate to Subscription Management > Compliance Overview to view the charts:

- The Unique Application Users chart shows the number of individual subscribed users who performed fulfiller actions in the application. Each user is counted one time only, regardless of number of accesses.
- The Unique Out-of-Policy Users chart shows the number of individual users who performed fulfiller actions in the application without being subscribed to the application. Each user is counted one time only, regardless of number of accesses. This chart might alert you to users in the Pending state or users who are accessing the application without being subscribed.
- The Application Use Without a Purchased Subscription chart shows the number of users who performed fulfiller actions in an application even though your organization has not purchased a subscription for the application.

Configure the color codes for subscription allocation levels

On lists, forms, and charts, a configurable color code indicates the percentage of the subscription that has been allocated.

Role required: usage_admin or admin

In this example, you have not yet allocated users to the Financial Management application.

1. Navigate to Subscription Management > Properties.
2. Update the **Threshold for color codes** (subscription.used.thresh) property setting and then click **Save**.

   Specify a percentage value greater than 0 and less than 100. Default: 90% of the purchased subscription limit.

   - Subscription allocation levels below the specified threshold are marked with a green color code.
   - Allocation levels between the threshold and 100% are marked yellow.
   - Allocation levels above 100% are marked red.

## Survey Management

With the ServiceNow® Survey Management application you can create, send, and collect responses for basic surveys. If installed, you can also use the Survey widget to set up a survey within Service Portal.

## Get started with Survey Management

Two versions of the application are supported, Survey Management, which is the latest version, and Legacy Surveys. Survey Management improves the user interface and extends the capabilities of the Legacy Surveys application.

Survey Management does not support domain separation.

## Configuring surveys

There are many options for advanced configuration in Survey Management:
• Create a survey, add questions, and choose recipients, all in one interface.
• Create conditional questions, which appear only when users answer other questions a certain way.
• Restrict a survey so only specific survey users can take it, and send invitations to those users simultaneously. Alternatively, make the survey a public survey so that any user can take the survey, even users who have not logged in to the ServiceNow system.
• Set a schedule to automatically assign a survey to users and to limit how often the same user can take a survey.
• Customize the look and feel of survey questionnaires.
• Save anonymous survey responses.
• Convert survey responses to numerical scores and view them on scorecards.
• Deactivate a survey for maintenance or to retire it without deleting it.

>Note: Because surveys use the same tables and other back-end components as assessments, you may see assessment elements such as table and field names in certain places throughout the survey feature.

Legacy Surveys

Survey administrators can continue to use legacy survey functionality and data, however, it is recommended that you migrate legacy surveys to the Survey Management application. Concurrent use of both survey applications can cause confusion and redundancy.

Survey wizards are not impacted and cannot be migrated.

>Note: The Legacy Surveys application is not described in the documentation that you are viewing. It is documented on the ServiceNow wiki.

**Survey Management roles**

The Survey Management application uses the following roles. No role is required to take assigned survey questionnaires.
# Survey Management roles

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey administrator&lt;br&gt;(survey_admin)</td>
<td>Create and administer surveys. Survey administrators know what types of surveys are necessary, when to send a survey, and to whom. Survey administrators can use all modules in the Survey application menu.</td>
<td>· survey_reader&lt;br&gt;· assessment_admin</td>
</tr>
<tr>
<td>Survey reader&lt;br&gt;survey_reader</td>
<td>View surveys and related information, such as survey responses, survey groups, scorecards, and reports.</td>
<td>none</td>
</tr>
</tbody>
</table>

## Key survey terms

These survey terms are used throughout the documentation to describe survey management functions and capabilities.

### Key survey terms

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey definition</td>
<td>Root record on which a survey is built. A survey definition contains information such as the survey name, state, and distribution schedule. Each survey definition has its own categories and questions. Survey definitions are comparable to legacy survey masters.</td>
</tr>
<tr>
<td>Public survey</td>
<td>Any user can take a public survey, even users who have not logged in to the ServiceNow system. For a completed survey, the Assigned to field value is Guest.</td>
</tr>
<tr>
<td>Survey category</td>
<td>Represents a theme for survey questions. Categories contain one or more questions. The system creates one category per survey by default. Additional categories are optional.</td>
</tr>
<tr>
<td>Survey question</td>
<td>A question that appears on a survey questionnaire for the associated survey definition. Survey questions are comparable to legacy survey questions.</td>
</tr>
<tr>
<td>Survey user</td>
<td>User who is authorized to receive invitations for a restricted survey.</td>
</tr>
<tr>
<td>Survey instance</td>
<td>Represents one survey questionnaire assigned to one user. Survey instances are comparable to legacy survey instances.</td>
</tr>
<tr>
<td>Term</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Trigger condition</td>
<td>Defines a rule that enables the system to send a survey when an action occurs on a table, such as when an incident closes. Trigger conditions are comparable to legacy survey conditions.</td>
</tr>
<tr>
<td>Scorecard</td>
<td>Visual representation of survey responses. Scorecards display a variety of data summaries for one survey definition.</td>
</tr>
</tbody>
</table>

**Survey questionnaires**

All surveys that are assigned to you appear in your personal assessment and survey queue.

No special role is required to complete a survey but you must be logged in and the survey must be assigned to you. When you submit a survey, the system stores your responses.

**Survey notification**

If the system is configured to send email, it sends you a notification when a survey is assigned to you. The message contains a link to the survey and instructions for viewing the assessment and survey queue.

**Take a survey**

Surveys that are assigned to you, and that are not complete, appear in your assessment and survey queue.

Role required: none

Each assessment or survey appears as a card in the queue. The card contains helpful information, including the survey name, state, and due date, and a button to launch the questionnaire. Overdue surveys are clearly marked with a red icon and red due date. You must answer every mandatory question, indicated by a red asterisk, before you can submit the survey. If you start to take a survey but cannot complete it, save your responses and return to it later. When you have answered all the questions and are satisfied with the responses, submit the survey.

1. Navigate to **Self-Service > My Assessments & Surveys**.
   Users with the assessment_admin role, including survey administrators, can display other users’ assessments and surveys in addition to their own. Use the **Show all** and **Show assigned to me** related links at the bottom of the queue to show and hide assessments and surveys. Click a card assigned to another user to open the associated metric type or survey definition.

2. Click **Take Survey** on a survey card to open the questionnaire.
   If there is more than one survey category, you can click the collapse or expand icon to hide or show the questions in the category.

3. Answer each question to the best of your ability.
   If you are unsure of how to respond to a question or if a question does not apply to a particular record, select **Not Applicable**, if available.

4. Complete one of the following steps.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Save your responses without submitting them</td>
<td>Click Save. You can close the questionnaire and access it later from your queue.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The system does not save the survey if there are invalid responses, such as a letter in a date field. You must enter valid responses or remove invalid responses before you can save the survey.</td>
</tr>
<tr>
<td>Submit the survey after answering all questions</td>
<td>Click Submit. You cannot return to the questionnaire after submitting.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If there is an unanswered mandatory question or an invalid response, an error message appears and the problematic questions are temporarily highlighted.</td>
</tr>
</tbody>
</table>

**Survey responses and results**

There is a metric result record for each user response to each question on every survey instance. Survey results for each question and category are calculated automatically based on the metric result records.

If you use survey result calculations for results and scorecards, ensure that the *positive indicator* field for the question is set appropriately, based on the answer options. To have any results, a category must contain scored questions.

**Survey responses**

Survey responses are stored in the Metric Result (asmt_metric_result) table and display the recipients' answers to each question in a category. To view general results, navigate to Survey > Survey Responses. To view results for a particular criterion, use a filter on the Metric Result (asmt_metric_result) table. For example, to view results based on the assignment group, apply a filter condition for assignment group.
Category results are stored in the Assessment Category Result (asmt_category_result) table and display the overall ratings for each category based on the weighted value for each scored question. To view these results, navigate to Assessments > Results > Category results and filter the results using the (Type.Evaluation method) is (Survey) condition.
### Survey scorecards

A scorecard provides a visual breakdown of survey responses, based on the way questions were answered, by category. To access a scorecard, see [View a survey scorecard](#).

### View results for all surveys

You can view the survey responses that are stored on the Metric Result (asmt_metric_result) table.  

**Role required:** survey_admin or survey_reader

1. Navigate to [Survey > Survey Responses](#).  
   Do not confuse this module with [Survey > Legacy Surveys > Survey Responses](#), which displays legacy survey responses.  
   The *Type* column displays the survey definition each response is associated with.
2. Select a response to view its details.

**View the results for a survey**

You can view the responses for one survey definition. Survey results are stored on the Metric Result (asmt_metric_result) table.

Role required: survey_admin or survey_reader

1. Navigate to **Survey > View Surveys**
2. Open a survey definition.
3. Under **Related Links**, click **View Responses**, which is available only if there are results.
   The results are grouped by metric, which is what questions are called in assessments.
4. Open a metric result to view more detail.
   The metric result contains the user’s response and calculated values of interest to advanced survey administrators. Because the Metric Result table is also used by the assessment feature, many field names are not clear in the context of surveys.

**Metric result fields**

List of field descriptions for the Metric Result form.
## Metric Result form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment group</td>
<td>Assessment group to which the metric result belongs. An assessment group is a container for survey instances and results generated in a single occurrence. The system generates an assessment group every time at least one survey instance is created. If multiple survey instances are created at once, such as when a survey administrator sends invitations to a list of survey users, they are all stored in the same assessment group.</td>
</tr>
<tr>
<td>Metric</td>
<td>Question that the user answered.</td>
</tr>
<tr>
<td>Data type</td>
<td>Data type of the question the user answered.</td>
</tr>
<tr>
<td>Method</td>
<td>Assessment method. Always Assessment for surveys.</td>
</tr>
<tr>
<td>Updated</td>
<td>Date and time the metric result was last updated.</td>
</tr>
<tr>
<td>Source</td>
<td>Survey definition from which the associated survey instance was generated.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User who completed the survey questionnaire.</td>
</tr>
<tr>
<td>Instance</td>
<td>Survey instance completed by the Assigned to user.</td>
</tr>
<tr>
<td>Actual value</td>
<td>Value obtained from the user response to the question. The actual value is determined by the question data type:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Checkbox</strong>: The actual value is 0 if the checkbox is cleared and 1 if it is selected.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Choice</strong> or <strong>Likert Scale</strong>: The actual value is equal to the Value of the metric definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Date</strong>, <strong>Date/Time</strong>, or <strong>String</strong>: The actual value is -1 to indicate that these data types do not contribute to category result calculations.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Template</strong>: The actual value is equal to the Value of the template definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Yes/No</strong>: The actual value is 0 if the response is No and 1 if it is Yes.</td>
</tr>
<tr>
<td>Normalized value</td>
<td>Adjusted value that accounts for the Scale definition setting, minimum and maximum values, and other factors.</td>
</tr>
<tr>
<td></td>
<td>The equation that generates the value and an example calculation appear in Example: calculate the normalized value for a survey metric.</td>
</tr>
<tr>
<td>String value</td>
<td>Value that displays the response as it appears on a questionnaire. In some cases this is the same as the Actual value, such as when the question data type is Percentage. The string value is N/A for unanswered questions of certain data types.</td>
</tr>
</tbody>
</table>
Example: calculate the normalized value for a survey metric

The normalized value is calculated based on a linear equation and the scale definition of the metric.

Equation used to calculate the normalized value

\[
\text{Normalized value} = \frac{(\text{Input Value} - \text{Min value defined in metric})}{(\text{Max value defined in metric} - \text{Min value defined in metric})} \times \frac{\text{current metric weight}}{\text{sum of valid metric weight}} \times \text{scale_factor}
\]

Note: The normalized values are directly proportional to the scale definition of the metric. If the scale definition is low, that is, the lower scale values are better, then Normalized value = 1.0 – Normalized value.

Example

Calculate the normalized value for the Please rate the competency of the technician metric. The metric has the following values:

<table>
<thead>
<tr>
<th>Values of the metric</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Input value</td>
<td>3</td>
</tr>
<tr>
<td>Minimum value</td>
<td>1</td>
</tr>
<tr>
<td>Maximum value</td>
<td>6</td>
</tr>
<tr>
<td>Current metric weight</td>
<td>10</td>
</tr>
<tr>
<td>Number of responses</td>
<td>6</td>
</tr>
<tr>
<td>Valid metric weight of each response</td>
<td>10</td>
</tr>
<tr>
<td>Scale factor</td>
<td>10</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

\[
\text{Normalized value} = \frac{(3 - 1)}{(6 - 1)} \times \frac{10}{(10 + 10 + 10 + 10 + 10)} \times 10 = 0.8
\]

Several data types are ignored because the values cannot be calculated. These invalid data types include string, date, and datetime.

For reporting purposes, use the Metric Result (asmt_metric_result) table.

View a survey scorecard

A survey scorecard provides a visual breakdown of survey responses by category, based on the way questions were answered.

Role required: survey_admin or survey_reader
A scorecard displays charts for survey results, in which category and question responses are analyzed and current ratings are compared with previous ratings. Users can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages for the time range selected. The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed surveys.

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition.
3. Under **Related Links**, click **View Scorecard**.
   The scorecard link is hidden if there are no survey results to report.

The interactive scorecard displays the name of the survey and results or comparisons of the ratings. You can display results in the following views:

- Category Results
- Question Results
- Average Ratings
- History

**Survey scorecard category results**

The Category Results view is a stacked bar chart showing survey results for all questions in a category by respondent count.

Select a category from the list to display the questions from that category in the chart.

This view displays responses that use the following data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

**Note:** The **Checkbox** and **Yes/No** data types are combined into the **Boolean** data type in the Survey Designer.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
To view details about a specific response, point to the colored bar to display the response, the number of responses, and the percentage it represents of all the responses to that question.

Survey scorecard category results detail

Survey scorecard question results

The Question Results view shows the results for each question in a category using different chart types, based on a data type.

Pie chart

The pie chart shows question results for these data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

Note: The Checkbox and Yes/No data types are combined into the Boolean data type in the Survey Designer.
Service Desk Satisfaction Survey

Survey Scorecard

How courteous and respectful was the technician who responded? (1=poor, 6=excellent)

- 2 = 2 (14.29%)
- 3 = 2 (14.29%)
- 4 = 9 (54.29%)
- 5 = 1 (7.14%)

© 2020 ServiceNow, Inc. All rights reserved. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Bar chart

A bar chart appears when question results use the Percentage data type.
By default, all results for percentage questions use a report range of 20% segments. To configure a report range, navigate to Reports > Administration > Report Ranges.

Survey scorecard average ratings

The Average Ratings view displays the weighted average rating for each survey question in a category.
Use this view to learn how individual questions affect the overall rating for the category. Select a survey category from the choice list to display the chart for that category.
Service Desk Satisfaction Survey

Survey Scorecard

Average question rating in category: Service Desk Satisfaction Survey

- How courteous and... (Average Normalized value: 1.3)
- How satisfied are... (Average Normalized value: 1.2)
- How satisfied were... (Average Normalized value: 1.1)
- Please rate the t... (Average Normalized value: 1.0)
- Was technician ab... (Average Normalized value: 0.9)

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
To view the effect of each question’s ratings on the entire category’s ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question’s weighted average.

Average ratings detail

Survey scorecard history

The History view compares the current ratings for the categories and their questions with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the Diff column indicate the trend of the current survey against the previous survey.

Point to a category to display a line chart that shows the rating trend for that category. Click a category to view the Survey Category form containing the survey questions.
3 years

To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The Diff column shows the discrepancy between the current ratings and the previous calendar year's ratings.

4 quarters

Quarterly surveys compare the average rating for each question and category in the current quarter against the average ratings from the previous four quarters. The Diff column shows the discrepancy between the current ratings and the previous quarter's ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the 3rd quarter of 2015, then the previous quarters appear as 2nd (2015), 1st (2015), 4th (2014), and 3rd (2014). All four of the previous quarters appear, whether or not there was any data for those quarters.

Survey scorecard history - 4 quarters
Export a scorecard as an image

You can export a scorecard as an image to use in presentations or other documents. Role required: admin or survey_admin

1. Click the menu icon (⋯) and select **Save as PNG** or **Save as JPEG** and wait for the export to complete.

2. Click **Download** and save the scorecard image to a storage location.
**Survey administration**

Survey administrators—users with the survey_admin role—create and maintain surveys and configure how they are distributed and published. Surveys on Service Portal are also supported.

Survey administration includes the following procedures.

- Create, customize, and publish surveys.
- Write and maintain survey questions.
- Define trigger conditions for when surveys are sent to users, such as when an incident closes.
- Maintain surveys and survey questions as the organization's needs change.

To set up surveys in *Service Portal*, you must first install Service Portal and then configure the Survey widget on the page. The base system includes the Survey widget.

**Surveys in Service Portal**

If Service Portal is installed, you can use the Survey widget to set up surveys, quizzes, assessments, risk assessments, and attestations in Service Portal. Surveys for users on mobile devices are fully supported in Service Portal.

To create an intuitive interface for your users, you can set up surveys in *Service Portal*. You must first install Service Portal and then configure the survey widget on the page. To learn more about configuring a widget, see configure widget instances.
To configure a Survey widget on a page, CTRL + right-click the widget heading and select **Instance Options**.

**Service Portal: Instance options (properties) for the Survey widget**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max records</td>
<td>Number of surveys to list on the Service Portal homepage. The user can click the <strong>View all</strong> link to view all items. Default: 5</td>
</tr>
<tr>
<td>Title of the widget</td>
<td>Text that appears in the title bar of the surveys widget. Default: <strong>My Surveys</strong></td>
</tr>
</tbody>
</table>
Each survey on the My Surveys page contains a progress bar and a description. The color in the progress bar increases as a survey is completed. In the case of a triggered record, the table title is used for the survey description.

For mobile users, the *Pagination setting for Service Portal view* survey designer property is set to one question per page by default.
Survey designer

Users with the survey_admin role can use the survey designer. The survey designer lets you create survey categories and questions, configure the details, and publish the survey to specific users or groups.

You can assign a survey to individual users or groups who receive all the questions from all the categories. You can also customize each question and make it dependent on the response to another question. The following describes the procedures you follow to create and publish a survey.

- Create survey categories.
- Create questions within each category.
- Configure survey details, such as introductory and closing remarks and time limit.
- Select recipients for the survey.
- Publish the survey to the selected users or groups.

Note: The survey designer replaces the survey creator in the Legacy Surveys application. If you are using Internet Explorer version 8 or earlier, the system redirects you to the survey creator.

Survey designer elements

The survey designer is accessible from Survey > Survey Designer.

The survey designer contains controls, a header bar, and the design canvas.

Controls

To create a question, drag the appropriate data type control from the Controls palette and drop it onto the designer canvas.
The assessment engine provides a built-in result calculation feature that converts responses to scored question data types to a score from 0 through 10.

### Question data types

<table>
<thead>
<tr>
<th>Data type</th>
<th>Scored</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attachment</td>
<td>No</td>
<td>Question with a Manage Attachments icon that allows users to attach one or more files.</td>
</tr>
<tr>
<td>Boolean</td>
<td>Yes</td>
<td>Question with a check box or Yes and No choices for user responses.</td>
</tr>
<tr>

</tr>
<tr>
<td><strong>Save and Publish</strong></td>
</tr>
<tr>
<td><strong>Preview</strong></td>
</tr>
<tr>
<td><strong>New Survey</strong></td>
</tr>
<tr>
<td><strong>Load Survey</strong></td>
</tr>
</tbody>
</table>

Click a tab to change the view on the canvas:

- **Design**: Add and configure the properties of categories and questions. This is the default view.
- **Configuration**: Create introductions and end notes for surveys and select a **signature**.
- **Availability**: Select the recipients for each category in the survey.

Point to the menu icon (≡) to select an option. The list of options depends on the currently open survey:

- **Save**: Save the current survey.
- **Preview**: Display a preview of the survey as it appears to recipients.
- **Publish**: Distribute the survey to the selected recipients.
- **Save and Publish**: Save and distribute the survey in one step.
- **New Survey**: Open a fresh canvas for a new survey.
- **Load Survey**: View the list of existing surveys.
Design canvas

New surveys open in the canvas of the Design view. The survey Name field appears above first category in the canvas. A blank question field appears in the category container.

Initial appearance of the Survey Designer canvas

Configure a survey in the survey designer

Configuration settings apply to the entire survey.
Role required: admin or survey_admin

Select Configuration in the survey designer and complete the Survey Designer Configuration form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Select the check box to enable the distribution of this survey to recipients.</td>
</tr>
<tr>
<td>Anonymize responses</td>
<td>Select the check box to collect survey responses anonymously. Recipients are not listed with survey results. When a user submits a survey, the system clears the Assigned to field for the associated survey instance. Also, survey responses for anonymous surveys do not contain Assigned to values.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of this configuration or the survey to which it is attached.</td>
</tr>
<tr>
<td>Introduction</td>
<td>Introductory content to display on surveys. You can add a welcome message or background information about the survey.</td>
</tr>
</tbody>
</table>

Note: The Assigned to field is cleared. However, each response record includes the Created By and Updated By fields that are accessible to users with the survey_admin role.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Signature</td>
<td>Acknowledgement by a survey recipient of requirements, admonitions, or expectations related to a survey.</td>
</tr>
<tr>
<td>Return URL</td>
<td>Destination address of a web page that is presented to users after they submit a completed survey. When a return URL is configured, the End note content does not appear.</td>
</tr>
<tr>
<td>End note</td>
<td>Content that is displayed to recipients after they submit a completed survey. You can add a thank you message, follow-up instructions, or other applicable information. End notes are not displayed if a Return URL is specified.</td>
</tr>
</tbody>
</table>
| Pagination setting for Service Portal view | Specify how the user will see pages on the desktop or tablet view in Service Portal.  
- **Category**: Display each category on a separate page.  
- **Question**: Display each question on a separate page. This happens for mobile regardless of this setting.  
- **None**: All items on a single page—no pagination  
Default: **Category**  
**Note:** This field appears only when Service Portal is installed. |
| Duration                     | Amount of time that recipients are given to complete this survey, starting from the time that the survey is generated. The default duration is 14 days.  
**Note:** By default, the system runs the **Cancel Expired Assessments** script every 30 days to cancel expired survey and assessment instances that are in the **Work in progress** or **Ready to take** states. |

**Survey categories**

Survey categories provide a way to group questions of a similar theme for a given survey.  

There must be at least one survey category per survey definition and every survey question must be associated with a category. When you create a survey, the system generates one category, which all the questions belong to.  

For simple surveys, one category is usually enough. Consider creating additional categories if you want to accomplish any of the following tasks.  
- Separate groups of questions into collapsible sections by category on the survey questionnaire.
- Report on category scores, which are calculated based on responses for all questions within each category.

**Create a category in the survey designer**

A category represents a theme for evaluating a specific element of the survey topic and contains questions pertaining to that theme.

Role required: admin or survey_admin

When you create a survey, the system creates a default category, using the name of the survey. You can use this category, modify it, and create additional categories as needed. To have any results, a category must contain scored questions.

1. Navigate to **Survey > Survey Designer**.
2. Enter the name of the survey in the **Name** field.
   The system uses this name as the name of the survey and of the first category.
3. To configure the category, click the gear icon in its title bar and complete the following steps in the Properties dialog box.
   a) Enter a new name and a description for the category.
   b) Enter text in the **Details** field that introduces or explains the category to recipients.
   c) Click the X icon to close the Properties dialog box and save your settings.
4. To add a new category, click the + icon in the title bar of an existing category.
   The new category appears below the category that you selected to create it. You can click the X icon in a category header to delete a category that you added in error.

**Create a survey category in a survey**

You can modify an existing survey to add one or more survey categories.

Role required: admin or survey_admin

Only one category is required for each survey, but you can add additional categories as needed.

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition.
3. In the **Metric Categories** related list, open a category or click **New**.
   Each survey category is stored as a record on the Metric Category (asmt_metric_category) table with a modified view for survey use.
4. Enter the survey category name and description.
   The category name appears on questionnaires when either of the following is true.
   - There is more than one category for the survey.
   - There is only one category and its name is different from the survey definition name. If you create a survey using the survey creator, the category name is the same as the survey definition name.
5. Right-click the form header and click **Save**.
   The **Assessment Metrics** and **Users** related lists appear.
6. Click **Update**.

**Create a question in the survey designer**

You can create multiple questions for each category in the survey designer, but each question can only be associated with one category.

Role required: admin or survey_admin
The data type that you select for each question determines how it can be answered by survey recipients.

1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.
2. To configure the question, click the gear icon in its title bar. The Properties dialog box opens.
3. Complete the form.

### Question property fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Concise name of the question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as the question on surveys. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Type</td>
<td>Data type selected for this question. See the table in <a href="#">Controls</a> for the available data types.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this question is available on a survey. A question does not appear on surveys that are generated after the question becomes inactive.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box to require users to answer the question. Mandatory questions are denoted by a red field status indicator and must be answered before the survey can be submitted. This field is available when the question does not have a dependency and the question type is not <strong>Boolean</strong> with a check box option.</td>
</tr>
<tr>
<td>Boolean option</td>
<td>Whether a check box or a <strong>Yes/No</strong> list appears as the option for a Boolean question.</td>
</tr>
<tr>
<td>String option</td>
<td>Setting for the appearance of a string field in a question. This field is available when the question type is <strong>String</strong>. The string options include the following.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Single line</strong>: Single-line text field 40 characters in length that allows strings of any length.</td>
</tr>
<tr>
<td></td>
<td>- <strong>String line wide</strong>: Full page width text field that allows a single-line entry of any length.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Multiline</strong>: Full page width multiline text field that allows word wrap and returns</td>
</tr>
<tr>
<td>Min</td>
<td>Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is <strong>Number</strong>, <strong>Percentage</strong>, or <strong>Numeric Scale</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Max</td>
<td>Highest positive whole number that users can enter or select to answer the question. This field is available when the question type is <strong>Number</strong>, <strong>Percentage</strong>, or <strong>Numeric Scale</strong>.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box for including <strong>Not Applicable</strong> as an option for this question. Users can select <strong>Not Applicable</strong> if they do not have sufficient information to respond to a question. User responses of <strong>Not Applicable</strong> are excluded from results calculations. This field is available when the question does not have a dependency and the question type is not <strong>Boolean</strong> with a check box option.</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box for displaying answer options in a random order. Answer preference is sometimes influenced by the order in which options appear, which can result in biased results. Randomizing options can help prevent this bias.</td>
</tr>
<tr>
<td>Positive indicator</td>
<td>Setting that determines whether smaller or larger numerical values equate to a good score in result calculations. Select <strong>Low values</strong> if smaller numerical values are better, such as for a question that measures the number of incidents for a vendor. Select <strong>High values</strong> if larger numerical values are better, such as for a question that measures user satisfaction on a scale of one to five.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question that is displayed on the survey. Include details that help users understand how to answer the question.</td>
</tr>
</tbody>
</table>
### Field

<table>
<thead>
<tr>
<th>Choices</th>
</tr>
</thead>
</table>

- Options for a question with a data type of **Choice** or **Scale**. The system automatically adds text and values that you can edit for each option. You must have at least two options, and each option must have a unique value.

- Click the + icon to add an option, or click the X icon to delete an option. By default, the system arranges options in the order established by their values. To change the order, drag and drop the options.

**Note:** Value numbers also contribute to the calculations of survey response scores, which can be used by advanced survey administrators.

<table>
<thead>
<tr>
<th>Choices</th>
</tr>
</thead>
</table>

- D - Poor [ 4 ] 🔵 🔵
- A - Excellent [ 1 ] 🔵 🔵
- B - Good [ 2 ] 🔵 🔵
- C - Fair [ 3 ] 🔵 🔵
- [ ]

---

4. To create any special conditions that must be met before the question appears on the survey, click the Dependency tab.

   The question must have a data type of **Boolean**, **Choice**, **Scale**, or **Template**.

5. Select a question in the **Displayed when** field.

   The system selects the appropriate operator and displays the possible answers for the selected question.

6. Select the answer that satisfies the condition.

   You can select more than one answer. Selected answers are indicated by a check mark.

   The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.

7. Click the X icon to close the question properties dialog box and save your settings.

8. To add a question with the same data type as an existing question in the category, click the + icon in the title bar of the existing question.

9. Drag and drop questions to change their order within a category or move them between categories.

10. To delete a question, click the X icon in its title bar.

### Survey question data types

You must choose a data type for each survey question. The data type determines the format of the question and the kind of data that is collected on survey questionnaires.
The following data types are available for surveys:

**Attachment data type**

On questionnaires, users can attach one or more files to a question. Users click the Manage Attachments icon and select one or more files in the Attachments pop-up window to attach to the question. From this window, users can:

- View a list of the attached files.
- View an attached file in a separate window.
- Rename an attached file.
- Add or delete files

Once a survey has been submitted, attachments cannot be updated or deleted.

Any type of file supported by the platform can be attached to a question. One or more files can be attached a question while taking a survey or completing an assessment.

The assessment administrator can see the attachments associated with an individual question as well as those associated with the survey.

See [Administering Attachments](#) for more information.

**Boolean data type**

On questionnaires, users select a check box beside a statement or leave it cleared.

If you select **Boolean**, you must fill in the **Scale definition** field. Select **High** if it is best when users select the check box.

**Choice data type**

On questionnaires, users select a value from a list of choices.

If you select **Choice**, you must fill in the **Scale definition** field and create answer options. Select **High** for the scale definition if the answer option with the largest metric definition **Value** is best.
**Note:** The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

**Date and Date/Time data types**

The **Date** and **Date/Time** data types are similar.

- **Date:** On questionnaires, users select a date.

- **Date/Time:** On questionnaires, users select a date and time.
Likert Scale data type

On questionnaires, users select a multiple choice value from a custom *Likert scale*. Each answer option is represented by a radio button on the scale. A Likert scale question that evaluates an application’s ease of use might have the answer options *Easy*, *Average*, and *Difficult*.

If you select **Likert Scale**, you must fill in the **Scale definition** field and create answer options. Select **High** for the scale definition if the answer option with the largest metric definition Value is best.

*Note:* The system sets the **Min** and **Max** fields automatically based on the **Value** settings for the associated metric definitions.

Number data type

On questionnaires, users enter a number.
If you select **Number**, you must fill in these additional fields:

- **Scale definition**: Select **High** if a larger number is better, such as for a question that measures the number of sales made in a quarter.
- **Min** and **Max**: Enter the smallest and largest numbers users can enter. State the range of acceptable answers in the question text.

**Percentage data type**

On questionnaires, users enter a number.

If you select **Percentage**, you must fill in these additional fields:

- **Scale definition**: Select **High** if a larger percentage is better, such as for a question that measures the percentage of work an agent has completed.
- **Min** and **Max**: Enter the smallest and largest numbers users can enter. Generally 0 and 100 are appropriate minimum and maximum values. If you choose values other than 0 and 100, it is usually best to state the range of acceptable answers in the question text.

**Reference data type**

On questionnaires, users select a value from a list that is generated from a specified reference table. The response field supports auto-completion.

**Note**: Reference qualifiers are not supported.

For example, a user could select a user name in response to a question if you specify User (sys_user) as the reference table.
String data type

On questionnaires, users enter text. When you select String, the String option field appears. Select one of the following options to determine how the string field appears on questionnaires:

- **Single line**
On questionnaires, users select a value from a predefined series of answer options. To use this data type, a question template must be defined.

If you select **Template**, you must fill in these additional fields:

- **Template**: Select a template.
- **Scale definition**: Select **High** if the answer option with the largest template definition **Value** is best.

**Yes/No data type**

On questionnaires, users select **Yes** or **No** from a list.
If you select Yes/No, you must fill in the **Scale definition** field. Select High if Yes is the best answer.

### Image scale data type

On questionnaires, users select an image from a predefined set of images as their response. Image scale questions can also be used in a template for better performance with surveys that have the same type of answer options.

Five emojis, similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Two images can be uploaded, one for selected case and another for unselected case. Larger size images are reduced to 64 x 64 pixels.

![Image Scale Example](image)

The result behavior depends on the presence of uploaded images. If no selected image is uploaded, then the question shows up blank.

<table>
<thead>
<tr>
<th>Selected Image</th>
<th>Unselected Image</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Unselected image loads. Clicking on the image changes it to the selected image.</td>
</tr>
<tr>
<td>Yes</td>
<td>No</td>
<td>Selected image loads with 50% opacity. Clicking on the image changes the opacity to 100%.</td>
</tr>
<tr>
<td>No</td>
<td>Yes</td>
<td>A blank placeholder box is displayed.</td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>A blank placeholder box is displayed.</td>
</tr>
</tbody>
</table>

**Note:** N/A option is not supported for image scale type question.

### Multiple selection data type

On questionnaires, users can select multiple check boxes indicating all answers that apply. For instance, a user can be instructed to “Select all that apply” in a multiple selection question.
Ranking data type

On questionnaires, users can select a different order number for each option to rank them. Drag-and-drop functionality is also supported, which allows a user to either fill in the number, or simply drag an option.

One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.

Edit a survey in the survey designer

You can modify surveys using the survey designer.
Role required: admin or survey_admin

You can edit a survey even after it has been distributed, with the following results.

- Added questions are available only on surveys that are distributed after this change.
- Changes to existing questions are immediately available to users before the survey is submitted or during the retake period. This includes changes to the answers, such as additional choices or changes to the data type.
- Deleted questions are also deleted from the distributed surveys in user queues.

1. Navigate to Survey > Survey Designer.
2. Point to the menu icon in the survey header bar, and select Load Survey.
3. Select a survey from the list and modify it as needed.
4. Point to the menu icon in the survey header bar, and select Save or Save and Publish.

When you publish the edited survey, the system generates survey instances for any associated survey users.

### Configure category weights for a survey

You can assign a weight to each category in a survey. The system calculates results from the weight that you configure.

Configure the Survey Category form to display the **Weight** field.

Role required: admin or survey_admin

Weights are set to a value of **10** by default but can be changed.

1. Navigate to Survey > View Surveys and select a survey from the list.
2. In the Survey Definition form, select a category from the Metric Categories related list.
3. Edit the default weight value.
4. Click **Update**.

### View a survey instance

A survey instance represents one questionnaire assigned to one user. You view an instance to verify that survey instances were created, to check the state of a survey instance, or to reassign a survey instance.

Role required: admin or survey_admin

Navigate to Survey > Survey Instances and open a survey instance.

Each survey instance is stored as a record on the Assessment Instance (asmt_assessment_instance) table with a modified view for survey use.
## Field Description

### Due date
Date by which the survey instance should be completed. The system populates the due date based on the **Assessment duration** of the associated survey definition, which is set to 14 days by default.

The survey due date is not enforced in the base system. If you want to enforce the due date, consider using a workflow or other mechanism to send survey recipients reminders when a survey is overdue.

**Note:** By default, the system runs the **Cancel Expired Assessments** script every 30 days to cancel expired survey and assessment instances that are in the **Work in progress or Ready to take** states.

### State
State of the survey instance. The possible states are **Ready to take**, **In progress**, **Complete**, and **Canceled**.

### Assigned to
User this survey instance is assigned to. This field becomes read-only when the state is **In progress**, **Complete**, or **Canceled**.

### Expiration date
Date on which the assigned user can receive a new instance of the same survey definition. The system automatically populates the expiration date based on the **Schedule period** of the associated survey definition.

### Related Link
**View User’s Response**
Shows a read-only version of the survey responses completed by the user.

### Related List
**Assessment Instance Questions**
All instance question records, which store user response values for each question on the survey questionnaire. The following columns are relevant to surveys:
- **Category**: Displays the survey categories the questions belong to.
- **Metric**: Displays the survey questions.

## Survey users and groups
Survey users and survey user groups help survey administrators control who can take a survey.

Survey administrators can restrict a survey so that only specified users can access it unless a survey administrator manually assigns the survey to a different user. Survey user groups provide a way to quickly designate multiple survey users.
Administering survey users

The list of survey users for a survey is visible on the Survey Definition and Survey Category forms. You can add or remove users from the list of survey users at any point. Note that designating a survey user does not automatically generate a survey instance for that user unless both of the following conditions are true:

- The survey definition Schedule period is set to Daily, Weekly, Monthly, or Yearly. In this case the system assigns a new survey instance to each survey user at the beginning of each schedule period.
- The user has no instances of the survey that are incomplete or that have not yet reached their expiration date.

You can designate survey users from the Survey Designer, the Survey Definition form, or the Survey Category form.

**Note:** If there are trigger conditions for a survey, do not create survey users. Instead, use the Trigger Conditions form to assign users.

Create a survey user group

Survey user groups are groups that have the Type field set to survey and that display only the information most relevant to surveys. You can assign survey groups or any user group to surveys.

Role required: admin, user_admin, or survey_admin

Though it is possible to designate members of any group as survey users, one reason to create a survey group is to view it conveniently in the survey User Groups module.

1. Navigate to Survey > Administration > User Groups.
2. Click New.
3. Complete the Group form.
4. Right-click the form header and click Save.
   The Group Members and Groups related lists appear.
5. To add group members, complete the following steps.
   a) In the Group Members related list, click Edit.
   b) Select users from the list on the left and add them to the Group Members List on the right.
   c) Click Save.

Select recipients for a survey in the Survey Designer

You can assign survey users while designing or modifying the survey.

Role required: admin or survey_admin

1. In the Survey Designer, click the Availability tab.
2. Under Accessible by:, select the Specific users option, then select users.
3. If desired, select the Survey groups only check box, then select survey user groups or other groups.
4. Click Save.

Designate a survey user

You can designate one survey user at a time from the Survey Definition form.
Role required: admin or survey_admin

1. Navigate to Survey > View Surveys.
2. Open a survey definition.
   There must be at least one category.
3. In the Survey Users related list, click New.
4. Select a User.
5. Click Submit.
   The Survey Definition form reopens.
6. Optional: To remove survey users, in the Survey Users related list, select the check box beside the user, and then select Delete from the action list below the list.

Designate or remove multiple survey users at one time

Use the Survey Category form to designate or remove multiple survey users at a time.

Role required: admin or survey_admin

1. Open a survey definition.
2. In the Metric Categories related list, open a category.
   You can choose any category. The system applies survey user changes to all the survey's categories automatically.
3. In the Users related list, click Edit.
4. Use the slushbucket to add or remove survey users.
5. Click Save to return to the survey category.
   The changes are also reflected in the Survey Users related list on the survey definition.

Allow recipients to retake a survey

You can configure a survey to allow recipients to resubmit their answers as many times as they like, up to the survey's due date.

Configure the Survey Definition form to display the Allow retake field. For more information, see Configure the form layout.

Role required: admin or survey_admin

Results are not calculated for the survey until the configured duration has elapsed. The card in the user's queue remains visible until the due date of the survey, and a button is displayed to allow retakes.

1. Navigate to Surveys > View Surveys.
2. Select a survey from the list.
3. Select the Allow retake check box.
4. Click Update.

Publish a survey

You must publish a survey to enable people to receive and complete survey instances.

Role required: admin or survey_admin

The State field on the Survey Definition form indicates whether the survey is in the Draft or Published state.
Note: You cannot return a survey to the Draft state after it has been published. You do have the option to deactivate a survey by clearing the Active check box.

1. Navigate to SurveyView Surveys and select a survey to publish.
2. Click Publish.
   When you publish a survey, the system generates survey instances for any associated survey users. You can assign the survey to other users manually.

Publish a survey in the Survey Designer

You must save changes to a survey before you can publish it to the specified recipients or groups.

Role required: admin or survey_admin

1. In the Survey Designer, point to the menu and select Load Survey.
2. Select a survey to publish.
3. To preview the survey as a user, point to the menu icon and click Preview.
4. When you are satisfied with the survey, click either Save and Publish or Publish to distribute it.
   When you publish a survey, the system sends email notifications to the recipients and to their managers. The system displays a link to the survey on a card in each recipient's My Assessments & Surveys portal.

Customize the appearance of a survey

Assessment and survey administrators can set properties to customize the color of various elements on the questionnaires.

Role required: admin or survey_admin

Note:
- For color properties, enter either an HTML color name or hexadecimal (hex) value. For hex values, the # character is required. Values are not case-sensitive.
- For example, all of the following formats are valid: LightGray, lightgray, #D3D3D3. A preview of the color appears next to the field.

Note that the customizations you make apply to all assessments and surveys.

1. Navigate to either of the following modules.
   - Assessments > Admin > Assessment Properties
   - Survey > Administration > Properties
2. On the properties page, edit the properties as needed.
   Refer to the screenshot below to see what parts of assessment questionnaires are controlled by the properties.
3. Click **Save**.
   You may need to clear the browser's cache to see updates.

### Assessment and survey properties

You can configure a variety of properties to customize the appearance of assessment and survey questionnaires, require authentication for user signatures, open surveys in the service portal view from emails, and limit the number of items shown in a decision matrix field filter.

#### Assessment and survey properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sn_portal_surveys.sp_survey.email_redirection</td>
<td>Allow survey link from email to open in service portal view (applies only for surveys)</td>
<td>When Yes is selected, a survey accessed from a link in an email opens in the Service Portal.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> This property applies only to surveys.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Default value: No</td>
</tr>
<tr>
<td>com.snc.assessment.signature_authentication</td>
<td>Require authentication for user signature.</td>
<td>When Yes is selected, this property requires credentials for a full name signature.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Default value: Yes</td>
</tr>
<tr>
<td>css.assessment.question.header.background.color</td>
<td>Question header background color</td>
<td>Sets the background color of question headers on assessment and survey questionnaires.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Default value: #767676</td>
</tr>
<tr>
<td>Property</td>
<td>Label</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| css.assessment.caption.background.color | Assessment caption background color | Sets the background color of the caption on assessment and survey questionnaires.  
- Default value: #eee |
| com.snc.assessment.decision_matrix_filter_max_entries | Maximum number of items to show for a decision matrix field filter |  
- Default value: 1000 |
| css.assessment.caption.font.color | Assessment caption font color | Sets the font color of the caption text on assessment and survey questionnaires.  
- Default value: #ffffff |

Survey definitions

A survey definition is the root record upon which a survey is built.

The survey designer generates a survey definition automatically when you save or publish the survey. Survey administrators may want to modify the survey definition to configure additional options for the survey, or to publish the survey when it is ready for distribution.

Survey administrators and survey readers can also send survey invitations directly to users from the survey definition.

Modify a survey definition

You can configure additional options for a survey definition.

Role required: admin or survey_admin

1. Navigate to Survey > View Surveys.
   Each survey definition is stored as a record on the Assessment Metric Type [asmt_metric_type] table with a modified view for survey use.
2. Open a survey definition.
3. Modify the fields on the Survey Definition form, as appropriate.

Survey Definition form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the survey, which appears on the questionnaire.</td>
</tr>
<tr>
<td>Description</td>
<td>Helpful information about the survey.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to activate the survey definition. When the Active check box is cleared, new survey instances cannot be generated and users cannot complete existing survey instances. Use the Active check box to deactivate or activate a published survey.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Anonymize responses</td>
<td>Check box to ensure that all responses for this survey are stored without the submitting user names. When a user submits a survey, the system clears the Assigned to field for the associated survey instance. Also, survey responses for anonymous surveys do not contain Assigned to values.</td>
</tr>
<tr>
<td><strong>Note:</strong> The Assigned to field is cleared. However, each response record includes the Created By and Updated By fields that are accessible to users with the survey_admin role.</td>
<td></td>
</tr>
<tr>
<td>Send notifications</td>
<td>Check box to send a notification that the survey has been taken.</td>
</tr>
<tr>
<td>State</td>
<td>Status of the survey: Draft or Published.</td>
</tr>
<tr>
<td>Signature</td>
<td>Acknowledgement by a survey recipient of requirements, admonitions, or policies related to the survey. The signature may require the recipient to select a check box or to type a full signature to verify having read these assertions. You can display assertions without requiring a signature. Select an existing signature from the list or click New to create a new one. The signature form contains these fields:</td>
</tr>
<tr>
<td></td>
<td>• Name: Descriptive name for this signature.</td>
</tr>
<tr>
<td></td>
<td>• Signature type: Type of signature required. The selections are Check box, Full name, or Assertion only. If Assertion only is selected, no signature is required to submit the survey.</td>
</tr>
<tr>
<td></td>
<td>• Assertion: Text you want to display to recipients.</td>
</tr>
<tr>
<td></td>
<td>By default, a property called Require authentication for user signature (com.snc.assessment.signature_authentication) requires users to authenticate when providing a full name signature.</td>
</tr>
<tr>
<td>Schedule period</td>
<td>Option that determines how often a user can take the same survey and whether the system generates survey instances on a schedule.</td>
</tr>
<tr>
<td><strong>Note:</strong> If you use a trigger condition for a survey, ensure the schedule period is set to No Limit. Trigger conditions use a different method to regulate how often users can receive survey instances.</td>
<td></td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Allow retake</td>
<td>Check box that allows users to modify their answers to a completed survey. Users can resubmit a survey as many times as they want until the due date. After that date, the system removes the survey from the user’s My Assessments &amp; Surveys page.</td>
</tr>
</tbody>
</table>
| Scheduled job                             | Scheduled job the system creates for this survey definition when the schedule period is a repeating interval. The system sets the scheduled job to run according to the selected schedule period. If you change the schedule period and save the survey definition:  
  - The system deletes the old scheduled job.  
If you selected a recurring schedule period:  
  - A new scheduled job is created.  
For example, if you change the schedule period from **Daily** to **Weekly** and save the record:  
  - The system deletes the daily scheduled job.  
  - Creates a weekly one set to run a week from the current date.  
This field is visible to administrators only if the schedule period is **Daily**, **Weekly**, **Monthly**, or **Yearly**. |
| Introduction                              | Introductory content to display on survey questionnaires. Consider adding a company logo, a welcome message, background information about the survey, or instructions. |
| End note                                  | Content to display on the screen that appears when someone submits a survey questionnaire. Consider adding a thank you message, follow-up instructions, or other applicable information. |
| Pagination setting for Service Portal view | The setting on which the pagination is based for desktop or tablet view in Service Portal.  
  - Category: default  
  - Question: 1 question per page (automatic for mobile)  
  - None: no pagination  
**Note:** This field is displayed only when Service Portal is installed.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment duration</td>
<td>The length of time to complete assigned survey instances, starting from the time the survey instance is generated. The assessment duration sets the Due date for each survey instance. The default duration is 14 days. Configure the form to see this field.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> By default, the system runs the <strong>Cancel Expired Assessments</strong> script every 30 days to cancel expired survey and assessment instances that are in the <strong>Work in progress</strong> or <strong>Ready to take</strong> states.</td>

<td>This related link is available only if the <strong>Active</strong> check box is selected. The URL does not work until the survey definition is published.</td>
</tr>
<tr>
<td>Related Lists</td>
<td></td>
</tr>
<tr>
<td>Metric Categories</td>
<td>All survey categories for this survey.</td>
</tr>
<tr>
<td>Survey Users</td>
<td>All survey users who are authorized to take this survey. If no users are listed, any user can take this survey.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Assessment Instances</td>
<td>All survey instances for this survey. Configure the form to add this related list to see it.</td>
</tr>
</tbody>
</table>

**Note:** If you add a related list to the form, use list control to omit the New button. The system generates survey instances to produce functional surveys.

4. Save the record.

**Schedule periods**

The available schedule periods are **Only Once**, **No Limit**, **Daily**, **Weekly**, **Monthly**, and **Yearly**.

The default schedule period is **No Limit**. When you set the schedule period to anything except **Only Once** or **No Limit**, the system creates a corresponding scheduled job. The scheduled job performs the following actions.

- Ensures that a user can take one survey instance of the same survey per schedule period.
- Generates a new survey instance for each survey user at the beginning of the new schedule period, as long as the survey user does not have an incomplete instance of that survey. A survey instance is incomplete if the state is not **Complete**.

For example, if you set the schedule period to **Monthly** and someone attempts to send survey invitations twice in the same day, the system generates survey instances for the survey users the first time only. At the beginning of the next schedule period, the system generates another survey instance for each survey user who completed the previous one.

Schedule periods are enforced by the **Expiration date** field on the survey instance. As long as the survey instance expiration date has not passed, the assigned user cannot receive a new survey instance. When the system generates a survey instance and the schedule period is anything except **No Limit**, the **Expiration date** field is automatically set to the appropriate date. For example, if the schedule period is **Weekly**, the expiration date is a week after the survey instance is generated.

If you change the schedule period, the scheduled job updates automatically to the correct schedule. However, users who have survey instances for the survey cannot receive new survey instances until their existing survey instances expire, regardless of the new schedule period.

Consider the following example: Sal Pindell receives a survey instance when the schedule period is **Weekly**. The next day, a survey administrator changes the schedule period to **No Limit**. Sal cannot receive another survey instance until one of the following actions occurs.

- Seven days pass from the time Sal’s survey instance was generated.
- A survey administrator deletes Sal’s survey instance.

After one of these actions occurs, Sal can receive a new survey instance anytime, as long as he has no incomplete instances of the survey.

**Note:** If you use a trigger condition for a survey, ensure the schedule period is set to **No Limit**. Trigger conditions use a different method to regulate how often users can receive survey instances.
Create a survey designer template question

You can create a question that uses choice lists from a template.

Role required: admin or survey_admin

1. Navigate to Survey > Survey Designer and load a survey or create a new survey.
2. Drag the Template data type icon into a category container.
3. Click the gear icon in the question title bar to open the template properties dialog box.
4. Select a predefined scale from the list.
Question entry fields appear for that template.

5. Enter one or more questions that are appropriate for the template.
6. Click the arrow to the right of a question to configure its properties. You must provide a name for each question.
7. Click the back arrow to return to the template properties dialog box.
8. Configure the properties for the remaining questions.
9. Click the X icon to close the template properties dialog box and save your settings.

Survey questions

Survey questions appear on survey questionnaires for the associated survey definition.

The survey creator generates questions and answer options automatically. However, it provides only the basic configuration options for questions, such as the question text and the data type. You may want to create additional questions or set advanced configuration options for the questions, including making a question appear conditionally or making a question mandatory. You can also use question templates to define reusable sets of answer options.

Survey questions are available from Survey > Questions. The list displays information about each question, including the associated survey definition listed in the Type column, and the data type. Survey administrators can modify these questions.

Create or modify survey questions

You can create and administer survey questions.
Role required: admin or survey_admin

Changes to a survey, such as the addition of questions or the modification of question templates, do not apply immediately to the existing survey instances. However, the changes apply immediately to any new survey instances that are created after the changes are saved.

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition.
3. In the **Metric Categories** related list, open a category.
4. In the **Assessment Metrics** related list, open an existing question or click **New**.
   Each survey question is stored as a record on the Assessment Metric (asmt_metric) table with a modified view for survey use.
5. Complete the Survey Question form.
   The fields that appear depend on the selected **Data type**.

### Survey Question form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the question. When you create a survey, the question name is the same as the text in the <strong>Question</strong> field.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to use for the question, which appears on survey questionnaires.</td>
</tr>
<tr>
<td>Data type</td>
<td>Data type of the question. The fields for the response depend on the data type.</td>
</tr>
<tr>
<td>Template</td>
<td>Question template to use for the answer options. This field is visible and required only if the data type is <strong>Template</strong>.</td>
</tr>
<tr>
<td>Scale definition</td>
<td>Setting that determines whether smaller or larger numerical values equate to a good score in result calculations. Select <strong>Low</strong> if smaller numerical values are better, such as for a question that measures the number of incidents for a vendor. Select <strong>High</strong> if larger numerical values are better, such as for a question that measures user satisfaction on a scale of one to five. This field is visible and required only when certain data types are selected.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------************************************************************************</td>
</tr>
</tbody>
</table>
| Randomize answers          | Check box that determines whether to present the answer options for this question in a random order each time a user opens the survey. Answer preference is sometimes influenced by the order in which answer options appear, which can result in biased results. Randomize answer options to help prevent this bias.  
This field is visible only if the data type is **Choice** or **Likert Scale**.  

**Note:** Randomizing answer options may make a question confusing. In general, only randomize answer options that do not follow a logical order. |
| Mandatory                  | Check box that makes the question mandatory (selected) or optional (cleared) on survey questionnaires. Users cannot submit questionnaires until they provide valid responses to all mandatory questions, which are denoted by a red field status indicator.  
This field is visible only when the **Depends on** field is empty and the data type is not **Checkbox**. Questions that depend on other questions and check box questions cannot be mandatory. |
| Allow not applicable       | Check box that determines whether to include a **Not Applicable** answer option for this question on survey questionnaires. User responses of **Not Applicable** are excluded from results calculations.  
This field is visible only if the data type is **Choice**, **Likert Scale**, **Template**, or **Yes/No**. |
| Depends on                 | Setting used to make this a conditional question, meaning that it only appears when users answer another question a certain way.  
To make a question depend on another question, select an existing question from the list, which displays **Checkbox**, **Choice**, **Template**, and **Yes/No** questions of the same category as this question. Then, use the **Displayed when** field to set the conditions that cause this question to appear on surveys.  
The system prevents the creation of recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displayed when</td>
<td>Answer options for the selected Depends on question which, when chosen on surveys, display this question. This field is visible and required only when the Depends on field is set.</td>
</tr>
<tr>
<td>Min</td>
<td>Smallest numerical value to be used as an answer option for this question. This field is visible and required only if the data type is Choice, Likert Scale, Number, or Percentage.</td>
</tr>
<tr>
<td>Max</td>
<td>Largest numerical value to be used as an answer option for this question. This field is visible and required only if the data type is Choice, Likert Scale, Number, or Percentage.</td>
</tr>
<tr>
<td>String option</td>
<td>Selection that determines what kind of response text box appears for this question on survey questionnaires. This field is visible and required only if the data type is String.</td>
</tr>
<tr>
<td>Related Lists</td>
<td></td>
</tr>
<tr>
<td>Assessment Metric Definitions</td>
<td>Answer options for this question. This related list is available only if the Data type is Choice or Likert Scale.</td>
</tr>
</tbody>
</table>

6. Save the record.
   Be sure to create answer options if you select the Choice or Likert Scale data type.

Survey question data types

You must choose a data type for each survey question. The data type determines the format of the question and the kind of data that is collected on survey questionnaires.

The following data types are available for surveys:

Attachment data type

On questionnaires, users can attach one or more files to a question.

Users click the Manage Attachments icon and select one or more files in the Attachments pop-up window to attach to the question. From this window, users can:

- View a list of the attached files.
- View an attached file in a separate window.
- Rename an attached file.
- Add or delete files

Once a survey has been submitted, attachments cannot be updated or deleted.

Any type of file supported by the platform can be attached to a question. One or more files can be attached a question while taking a survey or completing an assessment.

The assessment administrator can see the attachments associated with an individual question as well as those associated with the survey.

See Administering Attachments for more information.
Boolean data type

On questionnaires, users select a check box beside a statement or leave it cleared.

If you select Boolean, you must fill in the Scale definition field. Select High if it is best when users select the check box.

Choice data type

On questionnaires, users select a value from a list of choices.

If you select Choice, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

Note: The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

Date and Date/Time data types

The Date and Date/Time data types are similar.

- Date: On questionnaires, users select a date.
**Date/Time:** On questionnaires, users select a date and time.
Likert Scale data type

On questionnaires, users select a multiple choice value from a custom Likert scale. Each answer option is represented by a radio button on the scale. A Likert scale question that evaluates an application's ease of use might have the answer options Easy, Average, and Difficult.

If you select Likert Scale, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

Note: The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

Number data type

On questionnaires, users enter a number.

If you select Number, you must fill in these additional fields:

- Scale definition: Select High if a larger number is better, such as for a question that measures the number of sales made in a quarter.
- Min and Max: Enter the smallest and largest numbers users can enter. State the range of acceptable answers in the question text.

Percentage data type

On questionnaires, users enter a number.

If you select Percentage, you must fill in these additional fields:
- **Scale definition**: Select **High** if a larger percentage is better, such as for a question that measures the percentage of work an agent has completed.
- **Min** and **Max**: Enter the smallest and largest numbers users can enter. Generally 0 and 100 are appropriate minimum and maximum values. If you choose values other than 0 and 100, it is usually best to state the range of acceptable answers in the question text.

**Reference data type**

On questionnaires, users select a value from a list that is generated from a specified reference table. The response field supports auto-completion.

**Note**: Reference qualifiers are not supported.

For example, a user could select a user name in response to a question if you specify User (sys_user) as the reference table.

**String data type**

On questionnaires, users enter text. When you select **String**, the **String option** field appears. Select one of the following options to determine how the string field appears on questionnaires:
Template data type

On questionnaires, users select a value from a predefined series of answer options. To use this data type, a question template must be defined.

If you select **Template**, you must fill in these additional fields:

- **Template**: Select a template.
- **Scale definition**: Select **High** if the answer option with the largest template definition **Value** is best.

Yes/No data type

On questionnaires, users select **Yes** or **No** from a list.
If you select Yes/No, you must fill in the Scale definition field. Select High if Yes is the best answer.

**Image scale data type**

On questionnaires, users select an image from a predefined set of images as their response. Image scale questions can also be used in a template for better performance with surveys that have the same type of answer options.

Five emojis, similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Two images can be uploaded, one for selected case and another for unselected case. Larger size images are reduced to 64 x 64 pixels.

The result behavior depends on the presence of uploaded images. If no selected image is uploaded, then the question shows up blank.

<table>
<thead>
<tr>
<th>Selected Image</th>
<th>Unselected image</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Unselected image loads. Clicking on the image changes it to the selected image.</td>
</tr>
<tr>
<td>Yes</td>
<td>No</td>
<td>Selected image loads with 50% opacity. Clicking on the image changes the opacity to 100%.</td>
</tr>
<tr>
<td>No</td>
<td>Yes</td>
<td>A blank placeholder box is displayed.</td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>A blank placeholder box is displayed.</td>
</tr>
</tbody>
</table>

**Note:** N/A option is not supported for image scale type question.
Multiple selection data type

On questionnaires, users can select multiple check boxes indicating all answers that apply. For instance, a user can be instructed to “Select all that apply” in a multiple selection question.

<table>
<thead>
<tr>
<th>Equipment Usage Survey</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Multiple Selection</strong></td>
</tr>
<tr>
<td>What equipments do you use?</td>
</tr>
<tr>
<td>☐ Laptop</td>
</tr>
<tr>
<td>☐ Tablet</td>
</tr>
<tr>
<td>☐ Smart Phone</td>
</tr>
</tbody>
</table>

Ranking data type

On questionnaires, users can select a different order number for each option to rank them. Drag-and-drop functionality is also supported, which allows a user to either fill in the number, or simply drag an option.

1. Please rate following device in order of Importance.

- Phone
- Tablet
- Laptop
- MAC
One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.

**Survey question template**

Question templates define reusable sets of answer options for survey questions. Question templates define reusable rating scales for answering questions, where each answer option on the scale is a template definition. For example, the template named **Satisfaction** represents a satisfaction scale and contains the following template definitions: **Very Satisfied**, **Satisfied**, **Neutral**, **Dissatisfied**, and **Very Dissatisfied**.

**Template definition**

Templates are available for survey questions that have **Data type** set to **Template**. The following question templates are available in the base system. You can create or update a template as described in [Create a survey question template](#).

<table>
<thead>
<tr>
<th>Name</th>
<th>Template definitions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amount</td>
<td>None, Few or little, Average amount, Many, Quite a lot</td>
</tr>
<tr>
<td>Complexity</td>
<td>Very Complex, Complex, Moderate, Simple, Very Simple</td>
</tr>
<tr>
<td>Frequency</td>
<td>Never, Seldom, Sometimes, Most of the time, All of the time</td>
</tr>
<tr>
<td>Likert 5</td>
<td>Strongly Disagree, Disagree, Neutral, Agree, Strongly Agree</td>
</tr>
<tr>
<td>Quality</td>
<td>Very Poor, Poor, Average, Good, Very Good</td>
</tr>
<tr>
<td>Satisfaction</td>
<td>Very Dissatisfied, Dissatisfied, Neutral, Satisfied, Very Satisfied</td>
</tr>
<tr>
<td>Size</td>
<td>Very Small, Small, Average, Large, Very Large</td>
</tr>
</tbody>
</table>

**Create a survey question template**

You can create and administer question templates.

Role required: admin or survey_admin

Changes to a survey, such as the modification of question templates, apply to existing survey instances immediately. Templates that you create are available for use with both surveys and assessments.

1. Navigate to **Survey > Templates**.
Each template is stored as a record on the Assessment Metric Template (asmt_template) table.

2. Click **New**.
3. Enter a **Name**.
4. Right-click the form header and click **Save**.
5. In the **Assessment Template Definitions** related list, click **New**. Create a template definition for each answer option you want to appear on a question.
6. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>Enter the text to appear as the answer option.</td>
</tr>
<tr>
<td>Value</td>
<td>Enter a numeric value, greater than or equal to zero, to which the answer option equates. Values are used in results calculations. When you view questions that use templates, answer options appear in order from smallest to largest Value. Each template definition for a given template must have a unique Value.</td>
</tr>
</tbody>
</table>

7. Click **Update**.

*Update min and max values to match templates*

If you use survey result calculation data, ensure that the **Min** and **Max** values for a question that uses a template are equal to the smallest and largest template definition **Value**.

Role required: admin or survey_admin

When you create a question of the **Template** data type, the system sets the **Min** and **Max** fields based on the template definition values. The fields for existing questions are not updated if you add a new template definition to a template or if you update the **Value** of an existing template. If the new **Value** is less than the minimum value or greater than the maximum value of any questions that use the template, update the questions accordingly.

1. Navigate to **Survey > Questions**.
2. Configure the list to show the **Min** and **Max** columns.
3. Add the following list filter condition: (Template) (is) (<select the template you updated>).
4. Ensure the **Min** and **Max** values match the smallest and largest template definition **Value** for the selected template.
   - If the values do not match, edit the **Min** and **Max** values directly from the list.

*Note:* When the data type is **Template**, a UI policy prevents the editing of **Min** and **Max** from the form.

**Create or modify answer options**

You must create answer options, called metric definitions, for survey questions that have **Data type** set to **Choice** or **Likert Scale**.

Role required: admin or survey_admin

Changes to a survey, such as the addition or modification of answer options, apply to existing survey instances immediately.

1. Navigate to **Survey > Questions**.
2. Open a choice or Likert scale survey question.
3. In the **Assessment Metric Definitions** related list, open a metric definition or click **New**.
   Each answer option is stored as a record on the Assessment Metric Definition (asmt_metric_definition) table.
4. Complete the Assessment Metric Definition form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>Text to appear as the answer option.</td>
</tr>
<tr>
<td>Value</td>
<td>Numeric value, greater than or equal to zero, to which the answer option equates. Values determine the order in which answer options appear. See the example below. Values are also used to calculate survey results. Each metric definition for a given question must have a different <strong>Value</strong>.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

On survey questionnaires, the answer options for a question appear in order from smallest to largest **Value**. For example, consider the survey question **How do you feel?** with the answer options **Good**, **Neutral**, and **Bad**. The following table shows the answer option order based on the **Value**.

<table>
<thead>
<tr>
<th>Answer option</th>
<th>Value</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Good</td>
<td>1</td>
<td>First</td>
</tr>
<tr>
<td>Neutral</td>
<td>3</td>
<td>Second</td>
</tr>
<tr>
<td>Bad</td>
<td>5</td>
<td>Third</td>
</tr>
</tbody>
</table>

If you use survey result calculations, ensure the question **Scale definition** is set appropriately based on the answer options. In the previous example, if you want the answer option **Good** to earn the highest score, the scale definition should be **Low** because **Good** has the smallest value.

**Change the order of survey questions**

You can easily reorder survey questions at the category level or the question level.

**Role required:** admin or survey_admin

You can change the order in which the questions in one category appear relative to those in other categories for the same survey definition. If you add a new question manually after you create other questions, you may want to change the order of questions.

When you create questions using the survey creator, the system sets the **Order** field for the first question to 101, the second to 102, and so on. After you create a new question outside of the survey creator, the **Order** is set to 100 by default, which means it appears before all questions generated by the survey creator.

1. Navigate to **Survey > View Surveys** and open the appropriate survey definition.
2. In the Metric Categories related list, edit the values in the Order column.
3. To change the order of questions within a category, complete the following steps.
   a) Open the Assessment Metrics related list.
   b) Edit the values in the Order column.
4. Click Update.

Survey trigger conditions

Trigger conditions specify when to send a particular survey and the persons to send it to.

Survey administrators can use trigger conditions to configure the system to generate a survey instance each time a specified action occurs on a specified table, for example, when an incident or change request closes. The system sends the survey to users that are related to the triggering record, for example, incident callers or change request assignees. You can choose to send a survey every time the condition is met, or you can set a probability for the system to send a survey at random when the condition is met.

Trigger conditions are ideal for sending transactional surveys. Transactional surveys generally measure satisfaction with a recent experience, such as closing an incident or purchasing an item.

**Note:** Trigger conditions are comparable to survey conditions in legacy surveys. If you migrate a legacy survey that has survey conditions, ensure that the survey conditions are deactivated before you recreate them as trigger conditions.

Configure a trigger condition for a survey

Configure trigger conditions to specify when to send a particular survey and the persons to send it to.

Role required: admin or survey_admin

1. Navigate to Survey > Trigger Conditions.
2. Click New.

**Note:** Do not specify particular users for a triggered survey because only the specified users are allowed to take the survey.

3. Complete the form.

**Trigger condition fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment</td>
<td>Survey to send.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to run the trigger condition on. You can select only tables in the current application scope. For example, to send a survey whenever an incident closes, select the Incident (incident) table.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>User field</td>
<td>Field that stores the users you want to send the survey. You can select any field, on the selected table or on a referenced table, that references the User (sys_user) table. Use the tree picker to select a field.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> To avoid requiring users to log in to take a survey with a trigger condition, set the survey to Public.</td>
</tr>
<tr>
<td>Repeat interval</td>
<td>Minimum period that must pass before the trigger condition can resend the survey to the same user. For example, assume the repeat interval is set to 30 days. Even if the same user qualifies for multiple surveys from this trigger condition, the system can send only one survey every 30 days.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Ensure that the Schedule period of the selected survey definition is set to No Limit. If the schedule period is set to a different value, it prevents the trigger condition from sending surveys as expected.</td>
</tr>
<tr>
<td>Application</td>
<td>(Admin only) Application is set to Core.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this trigger condition is active (selected).</td>
</tr>
<tr>
<td>Business rule</td>
<td>(Admin only) Business rule the system creates to monitor the selected table. When the condition is met, the business rule sends the survey to the correct user. No configuration is necessary for this business rule.</td>
</tr>
<tr>
<td>Trigger randomly</td>
<td>Check box that determines whether to send the survey to the appropriate user every time the condition is met (cleared) or only a percentage of the time (selected).</td>
</tr>
<tr>
<td>Probability (%)</td>
<td>Approximate probability that the survey is sent each time the condition is met. For example, if the probability is set to 50, the system sends the survey approximately 50% of the time the conditions are met. There are no repeat interval restrictions is assumed. This field is visible and required only when Trigger randomly is selected.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Related Field 1-4</td>
<td>Field that contains a value you want to store for reporting purposes. You can pick any reference field on the selected table. When the trigger condition generates a survey instance, the system stores the value from the triggering record. Specify up to four fields. For example, select the Incident table, <strong>Assigned to</strong> and <strong>Problem</strong> as related fields. The system stores the assigned user and problem associated with the incident as Related record 1 and Related record 2 in the survey instance record. To view the fields, configure the form for any survey instance. <strong>Note:</strong> You cannot use a related field for the ticket number because you cannot select the Number column. You can, however, use the trigger_id column of the table.</td>
</tr>
<tr>
<td>Description</td>
<td>Summary information to identify the trigger condition.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> For a triggered record, the table title is used for the survey description.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition builder that defines the criteria that must be true to send the survey. For example, to send a survey whenever an incident closes, create the condition <em>(State) (is) (Closed)</em>.</td>
</tr>
</tbody>
</table>

You can also create a trigger condition directly from the survey creator. If you select **Certain users can take this survey, based on conditions** in the Survey User Access section, the Trigger Condition form opens automatically when you click **Save as Draft** or **Publish**.
**Trigger condition example**

You can send out auto-triggered surveys when an incident is closed or resolved.

A trigger condition is configured as follows:

- **Assessment**: Service Desk Satisfaction Survey
- **Table**: Incident (incident)
- **User field**: Caller
- **Repeat interval**: 30 days
- **Active**: true
- **Trigger randomly**: false
- **Related Field 1**: Assigned to
- **Related Field 2**: Problem
- **Condition**: (State) is (Closed) (or) (State) is (Resolved)

Fannie Steese is the caller on incident INC00004305 that is assigned to Boris Catino, a service desk technician. Boris creates PRB010101 based on Fannie’s complaint and closes the incident. The system creates a survey instance assigned to Fannie so she can rate her satisfaction with the incident experience.

Because two related fields were selected as part of the trigger condition, the survey instance stores the following information from the incident:

- **User (Related Field 1)**: **Boris Catino**
- **Problem (Related Field 2)**: **PRB010101**
- **Task (automatically created)**: **INC00004305**

Because the task field is automatically populated, UI-based filtering by dot-walking on incidents (or any task-based table) is supported when creating a report on survey results. For example, you can query all survey instances related to incidents assigned to a group (survey reports on all incidents assigned to networking group, for instance).

> **Note:** Even though the trigger condition is set to be triggered each time that the conditions are met, the **Repeat interval** setting ensures that Fannie does not receive another survey for another of her incidents closes within 30 days of the first incident.

**Survey report example based on task field**

One of the most common use cases for Surveys is to send out an auto-triggered survey when an incident, request, or task is closed. Once you get the survey results back, you can filter the results by users and groups related to the ticket, such as Assignment Group, or Assignee.

Filtering the survey results provides more detail on how people and teams are performing based on ticket data. Since this information is automatically captured, you can dot-walk while filtering the data (instead of utilizing a related field on the Survey trigger condition form, as previously required).
To create a report on incident-triggered survey responses by Assignment group, set up the report on the Task Assessment Details by navigating to ReportsView/Run and clicking Create a report.

### Survey distribution

There are several ways for survey administrators to distribute surveys to users. Surveys are distributed using any of the following methods.

- Send survey invitations to users
- Share a survey URL that opens the survey directly.
- Create a module that opens a survey.

#### Send survey invitations to users

You can send survey invitations using the Assign Survey or Send Invitations buttons on the Survey Definition form.

**Role required:** admin or survey_admin

Use the Send Invitations button to immediately assign survey instances to each survey user that is listed in the survey definition. Use the Assign Survey button to assign a survey instance to any one user at a time.

Each of the buttons generates survey instances assigned to the appropriate users. In addition, if the instance is configured to send email, the system generates survey notifications. For either button to be available, the survey definition must meet all of the following conditions.

- **Active** check box is selected.
• **State** is Published.
• Survey is associated with at least one question.

**Note:** You (or a trigger) can send more than one instance of a survey to a user at any time.

1. Navigate to **Survey > View Surveys.**
2. Select an active, published survey.
3. Complete one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assign a survey to users listed in the Survey Users related list</td>
<td>Click <strong>Send invitations.</strong></td>
</tr>
<tr>
<td>Assign a survey to any user</td>
<td>Click <strong>Assign Survey</strong> and select one or more users, and then click <strong>OK.</strong></td>
</tr>
</tbody>
</table>

The system creates a survey instance assigned to the user or users, assuming the user is eligible to receive a new survey instance. When you use the **Assign Survey** button, the selected user is not saved as a survey user.

**Survey URLs**

You can distribute a survey by giving survey users a survey URL.

Survey administrators can obtain one of the following types of URLs.

- A general URL for a survey, which users can open to take the survey questionnaire. The following process occurs.
  - When someone opens the URL, the system ensures that the person is logged in. It then searches for an instance of the associated survey that is assigned to the logged-in user.
  - If a survey instance is found, the appropriate action occurs based on the **State** of the survey instance (see table). If there are multiple active survey instances (**Ready to take** or **In progress**), the instance with the earliest due date opens.
  - If no survey instance is found, the system creates a new instance for the survey, assigns it to the user, and opens the survey questionnaire.

- A URL for a specific survey instance, which the assigned user can open to take the survey questionnaire. The following process occurs.
  - When someone opens the URL, the system ensures the person is logged in as the user the survey instance is assigned to. Only the assigned user can access the survey questionnaire.
  - The appropriate action occurs, depending on the **State** of the survey instance (see table).

**Survey states**

<table>
<thead>
<tr>
<th>Survey instance state</th>
<th>Action upon opening URL</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Ready to take:</strong> User has not saved any responses.</td>
<td>The survey questionnaire appears for the user to begin. The user can save or submit responses.</td>
</tr>
<tr>
<td><strong>In progress:</strong> User has saved at least one response.</td>
<td>The survey questionnaire appears for the user to continue. Any previously saved responses are displayed. The user can save or submit responses.</td>
</tr>
</tbody>
</table>
If someone opens a URL for an unpublished or deactivated survey, an error message appears.

**Obtain and distribute a general survey URL**

You can distribute a general survey URL to allow any eligible user to open a survey questionnaire.

Role required: admin or survey_admin

The general URL is available on the Survey Definition form and on the survey creator. You can also email the URL for a public survey that is published.

1. Navigate to Survey > View Surveys.
2. Open a survey definition from the Assessment Metric Types list.
3. To view or copy the URL, click the View Survey URL related link.
   - This related link is visible only if the survey definition is Active.
4. To distribute the URL to users, paste the copied URL as desired, or click the Email button to send via email.
   - The Email button is visible only for a public survey that is published.

When a survey user clicks the general survey URL, the system creates a survey instance for the survey user as long as the user does not have an instance in the Ready to take state. The system is configured by default to send an email notification when a survey instance is generated.

As a result, the survey user receives a second notification in addition to the notification that you sent with the general survey URL. This may confuse the survey user. To avoid this issue, you can deactivate auto-notification.

**Deactivate auto-notification for surveys**

When you send a survey notification with a general survey URL to a survey user, the user may receive a second system-generated notification. To avoid this issue, you can deactivate auto-notification.

Role required: admin or survey_admin

1. Navigate to System Notification > Email > Notifications.
2. Open the Survey User Invite notification.
3. Configure the form to add the Send to event creator check box to the Who will receive section.
   - The Send to event creator check box is selected by default.
4. Clear the Send to event creator check box.
   - The system will no longer send auto-notification messages to survey users.

**Obtain a survey instance URL**

You can distribute a survey instance URL to allow the assigned user to open a survey questionnaire.

Role required: admin or survey_admin

<table>
<thead>
<tr>
<th>Survey instance state</th>
<th>Action upon opening URL</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Complete</strong>: User has submitted all required responses.</td>
<td>If the schedule period is No Limit or if the period restriction has expired, the survey questionnaire for a new survey instance appears for the user to begin.</td>
</tr>
<tr>
<td></td>
<td>If the schedule period restricts the number of times a user can take the same survey, and the period restriction has not expired since the user last completed survey, an error message appears.</td>
</tr>
</tbody>
</table>
The survey instance URL is available on the survey instance record.

1. Navigate to Survey > Survey Instances.
2. Open the instance for the survey.
3. To view or copy the URL, click View Instance URL related link.
   The related link is available only when the survey instance State is Ready to take or In progress and the associated survey definition is Active.
4. In the dialog box, select and copy the URL then click OK or Cancel.
5. Distribute the URL to the assigned user.

Test a survey URL
When there are survey users associated with a survey, the survey is restricted so only those users can use the survey URL. You can test the survey URL to ensure it is restricted.

Role required: admin or survey_admin
1. Navigate to Survey > View Surveys and open a survey for which you are not a survey user.
2. Under Related Links, click View Survey URL.
3. Copy the URL and click OK or Cancel.
4. Navigate to the URL.
   You see a message that you are not authorized to take the survey.

Create a survey module
You can create a module that opens a survey.

Role required: admin or survey_admin

When a user clicks a survey module, the system performs one of the following actions, depending on the configuration options for the survey and other factors.

- Creates a new survey instance
- Opens an existing survey instance
- Displays an error message.

1. Perform the appropriate action for your version of the UI:

<table>
<thead>
<tr>
<th>UI16</th>
<th>Point to the application menu that contains the module to which you want to add the survey module and click the edit application (pencil) icon.</th>
</tr>
</thead>
<tbody>
<tr>
<td>UI15 or UI11</td>
<td>Right-click the application menu you want to add the module to and select Edit Application Menu.</td>
</tr>
</tbody>
</table>

2. In the Modules related list, click New.
3. Complete the following fields.
   - **Link type**: Assessment
     Do not select Survey, which is used for legacy surveys only.
   - **Assessment**: Select the survey you want the module to open.
4. Complete and save the form.

Sharing surveys: export and import
You can export a survey and then import it to a different ServiceNow instance.
**Note:** Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see [System update sets](#).

The system exports a single XML file that contains a survey definition (asmt_metric_type) and the associated records, including the following:

- Assessment Metric Template (asmt_template)
- Assessment Template Definition (asmt_template_definition)
- Metric definitions (asmt_metric_definition) (survey question answer options)
- Scheduled Jobs associated with the Survey (sys_trigger)
- Survey categories (asmt_metric_category)
- Survey questions (asmt_metric)
- Survey users (asmt_m2m_category_user)
- Trigger Condition (asmt_condition)

**Export a survey**
You can export a survey and then import it to another instance.

Role required: admin, survey_reader, or survey_admin

For information about update sets, see [System update sets](#).

1. Navigate to **Survey > View Surveys**.
2. Right-click the name of a record to show the context menu.
3. Select **Export Assessment**.
4. If applicable, follow the prompt in your browser to save the XML file.

**Import a survey**
You can import a survey that has been exported as an XML file. The exported XML file does not contain result data.

Role required: admin or survey_admin

**Note:** Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see [System update sets](#).

1. Verify that the target instance has assessments enabled.
2. Follow the steps in **Import an XML file** to import the assessment.

**Use update sets for surveys and assessments**
Use an update set to capture changes to surveys and assessments.

Role required: admin or survey_admin

When developing surveys and assessments, you can use an update set to capture the changes and move them from a development instance to a production instance. Once an update set is created and marked current, all of the updates to the following tables are recorded in the update set.

The following tables are now update set enabled and also extend the application file:

- Assessment Metric Templates (asmt_template)
- Assessment Template Definitions (asmt_template_definition)
- Assessment Metric Definitions (asmt_metric_definition): survey question answer options
- Schedule (sys_trigger): scheduled jobs associated with the survey
- Assessment Metric Categories (asmt_metric_category): survey categories
Legacy survey migration

Users with the survey_admin role can migrate legacy survey data to create copies of legacy surveys and their related records in assessment tables. The Survey Management application, which is built on the assessment engine, is available as an alternative to legacy surveys.

The following legacy survey components are migrated:

- Survey masters
- Supported survey questions and question choices
- Survey instances
- Survey responses

Legacy survey conditions are not migrated and must be recreated as trigger conditions.

Note: Survey wizards cannot be migrated.

Migrate a legacy survey

Migrate a legacy survey and its related records to take advantage of a more powerful feature set.

Role required: admin or survey_admin

To avoid timing out for very large surveys, you can disable the transaction quota. See Transaction quotas.

1. Navigate to Survey > Legacy Surveys > Masters.
   The list of legacy survey masters appears. By default, the list shows only survey masters that have not been migrated. To show all survey masters, remove the Assessment is empty breadcrumb.

2. Open a survey and click the Migrate to Assessment related link.
   A dialog box describes what happens when you migrate the survey. Note that certain types of survey questions cannot be migrated.

3. Click OK.
   The system generates records on assessment tables based on the survey master, eligible questions and choices, results, and other related survey components. The original survey components are unaffected.

   System messages may appear at the top of the Survey form to notify you of questions that could not be migrated and to advise you to review migrated Multiple Choice questions.

4. Optional: Click the reference icon beside the Assessment field to view the new survey definition.

5. Optional: Remove survey users from the assessment survey if you want all users to be able to take it.
   When you migrate a survey, any users who have taken it are automatically associated with the assessment survey and become survey users. When there are survey users associated with an assessment survey, only those users can take it.

6. Deactivate any survey conditions associated with the survey by completing the following steps.
   a) Navigate to Survey > Legacy Administration > Survey Conditions.
b) In the **Active** column, ensure the value is false for any survey conditions that reference the migrated survey.

7. Navigate to **Survey > Administration > Trigger Conditions** to create new trigger conditions for the migrated survey.

The **Migrate to Assessment** related link on the legacy survey record becomes unavailable after the migration. However, if you delete the record referenced in the **Assessment** field, the related link reappears and you can migrate the legacy survey again.

### Survey question migration

Before you migrate a legacy survey, understand that some legacy survey questions cannot be migrated due to incompatible question types.

Legacy survey questions are migrated from the Survey Question (survey_question_new) table to the Assessment Metric (asmt_metric) table. In legacy surveys, the **Type** field on the Survey Question table determines how the question renders on the survey questionnaire. In assessment surveys, the **Data type** field on the Assessment Metric table serves a similar purpose. Certain legacy survey types are not supported in assessment surveys.

The following table shows the conversion path for each legacy survey question type to an assessment data type, if there is one.

<table>
<thead>
<tr>

</tbody>
</table>
Migrated components

When you migrate a survey, the system maps records from survey tables to assessment tables. To create a functional survey on the assessment framework, the system converts survey records to the most logical equivalent assessment survey records. This may mean multiple assessment survey records represent one legacy survey record.

<table>
<thead>
<tr>
<th>Survey component</th>
<th>Assessment survey components</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey master (survey_master)</td>
<td>• Survey definition (asmt_metric_type)</td>
</tr>
<tr>
<td></td>
<td>• Assessable record (asmt_assessable_record), for system use only</td>
</tr>
<tr>
<td></td>
<td>• Survey category (asmt_metric_category)</td>
</tr>
<tr>
<td>Survey question (survey_question_new)</td>
<td>• Survey question (asmt_metric)</td>
</tr>
<tr>
<td>Question choice (question_choice)</td>
<td>• Assessment metric definition (asmt_metric_definition)</td>
</tr>
<tr>
<td>Survey instance (survey_instance)</td>
<td>• Assessment group (asmt_assessment), for system use only</td>
</tr>
<tr>
<td></td>
<td>• Survey instance (asmt_assessment_instance)</td>
</tr>
<tr>
<td>Survey response (survey_response)</td>
<td>• Survey instance question (asmt_assessment_instance_question)</td>
</tr>
<tr>
<td></td>
<td>• Survey response (asmt_metric_result)</td>
</tr>
<tr>
<td></td>
<td>• Category result (asmt_category_result), for system use only</td>
</tr>
</tbody>
</table>

Migrated question review

To maintain accurate result calculations, you may need to make minor adjustments to some of the migrated survey records to ensure results are calculated correctly.

**Note:** The assessment engine provides a built-in result calculation feature that converts each survey response to a score between 0 and 10. The configuration required to maintain accurate result calculations is advanced and is not recommended for basic survey implementations. If you do not plan to use result calculation data, ignore the information in this section.

For each legacy question migrated, the system creates a survey question record on the Assessment Metric (asmt_metric) table. For legacy questions of the Multiple Choice and Select Box types, the system also creates a metric definition record, on the Assessment Metric Definition (asmt_metric_definition) table, for each legacy question choice.

**Comparable metric definitions and survey question choices**

<table>
<thead>
<tr>
<th>Survey question choice field</th>
<th>Related metric definition field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text</td>
<td>Display</td>
</tr>
<tr>
<td>Value (can be any string value)</td>
<td>Value (must be a numerical value)</td>
</tr>
</tbody>
</table>
When the system migrates legacy survey question choices, it uses the legacy **Order** to set each metric definition **Value**. For the legacy question choice with the smallest **Order**, the corresponding metric definition **Value** is set to 1. For the legacy question choice with the next smallest **Order**, the metric definition **Value** is 2, and so on.

The **Scale definition** field on the migrated Survey Question form determines whether smaller or bigger metric definition values equate to a good score in survey result calculations. By default, the scale definition is set to **High**, meaning bigger values are good. When you migrate a legacy survey, check that the default scale definition makes sense for each question.

For example, the following tables depict a sample migrated question and the metric definitions automatically created for it. Recall that the system uses the order of the legacy survey question choices to set the metric definition value. **Excellent** has the lowest **Order** value, so when the system creates a metric definition for this question choice, the **Value** is set to 1. In this case the default scale definition value, **High**, does not make sense, as the system will calculate the worst scores for responses of **Excellent**.

**Legacy question:** Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Question choice text</th>
<th>Question choice value</th>
<th>Question choice order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>A</td>
<td>100</td>
</tr>
<tr>
<td>Good</td>
<td>B</td>
<td>200</td>
</tr>
<tr>
<td>Fair</td>
<td>C</td>
<td>300</td>
</tr>
<tr>
<td>Poor</td>
<td>D</td>
<td>400</td>
</tr>
</tbody>
</table>

**Migrated question:** Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Metric definition display</th>
<th>Metric definition value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>1</td>
</tr>
<tr>
<td>Good</td>
<td>2</td>
</tr>
<tr>
<td>Fair</td>
<td>3</td>
</tr>
<tr>
<td>Poor</td>
<td>4</td>
</tr>
</tbody>
</table>

If there are no **Order** values for the legacy survey question choices, the system sets each corresponding metric definition **Value** based on the alphanumerical order of the legacy **Text** value.

**Migrated question:** Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Metric definition display</th>
<th>Metric definition value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>1</td>
</tr>
<tr>
<td>Good</td>
<td>2</td>
</tr>
<tr>
<td>Fair</td>
<td>3</td>
</tr>
<tr>
<td>Poor</td>
<td>4</td>
</tr>
</tbody>
</table>
You may also need to change the **Scale definition** setting for other migrated questions. For details, see the scale definition recommendations for each survey question data type.

### Timeline Visualizations

A timeline visualization is a representation of an organization’s activities over time.

Typically, timeline visualizations are useful for quickly assessing the impact of future strategic and operational activities such as change requests and projects. Timeline visualizations come in two varieties: a two-dimensional (2D) view where activities are grouped by month, and a three-dimensional (3D) view where activities are grouped in lanes. Both views are interactive, and the 2D view can be printed.

Timeline administrators, users with the timeline_admin role, can set up visualizations to represent ITSM-related activities, such as incidents, problems, changes, and projects. Timeline administrators or users with the timeline_user role can personalize their timeline visualizations from the Settings pane in the visualization.

Activating timeline visualizations adds the predefined CIO Roadmap timeline visualization, which shows your organization’s projects grouped by portfolios. Organizational leaders can use the CIO Roadmap to monitor and evaluate the status of current and upcoming projects.

#### Key terms for timeline visualizations

- **Lane**: A logical grouping of items on the 3D timeline visualization. For example, one lane might show pending projects while another lane shows open projects.
- **Panel**: A block that represents an item record in a 2D timeline visualization, or a block that represents one or more item records in a 3D timeline visualization.
- **Summary view**: A pop-up window that appears when a user clicks a panel in either the 2D or 3D timeline visualization. The summary view contains additional information about the record. Timeline administrators configure the information that appears in the summary view.
- **Marker**: A bar indicating the start of a month in a 3D timeline visualization.
- **Slider**: A tool used to control the time period seen in a 3D visualization.
- **Slider track**: An alternative view of the panels displayed in both the 2D and 3D timeline visualization.

Activate Timeline Visualization

An administrator can activate the Timeline Visualization plugin to access the functionality. The Project Management plugin is activated if it is not already active.

1. Navigate to System Definition > Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.

   If the plugin depends on other plugins, these plugins are listed along with their activation status.

   If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).

4. Optional: If available, select the Load demo data check box.

   Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.

   You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.

5. Click Activate.
Create a Timeline Visualization

Timeline administrators set up timeline visualizations for the organization's leaders by creating a timeline that provides visual representations of the organization's operational and strategic activities.

Additionally, they create timeline visualization views to define what data appears in the summary window when a user clicks a panel on the timeline.

- To create a timeline visualization, navigate to Timeline Visualization > Create New and create a new record.
### Timeline visualization configuration form

**Name:** CID Roadmap  
**Panel name:** Project Name  
**Panel table:** Project (an example)  
**Panel date:** Planned and actual  
**Filtering and Sorting**

- **Lane condition:**
  - Choose field:  
  - Oper:  
  - Value:  

- **Panel condition:**
  - Choose field:  
  - Oper:  
  - Value:  

**Order results by the following fields:**

## Timeline visualization configuration form field descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for the visualization.</td>
</tr>
<tr>
<td>Panel table</td>
<td>Table that provides the records displayed as lanes and panels in the timeline.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>The list shows only tables and database views that are in the same scope as the visualization.</td>
</tr>
<tr>
<td>Relationship field</td>
<td>Field on the table that contains values displayed as lane titles. Typically this field is a reference field or a field that contains a limited range of values.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>The CIO Roadmap timeline visualization is a ServiceNow customized visualization for the Project application that does not use the Relationship field.</td>
</tr>
<tr>
<td>Show slider</td>
<td>Check box that enables (selected) or disables (cleared) displaying the timeline slider that users move to change the dates shown.</td>
</tr>
<tr>
<td>Panel name</td>
<td>Field from the Panel table that contains the values displayed in the panel body.</td>
</tr>
<tr>
<td>Panel date</td>
<td>Field from the Panel table that contains the date values displayed in the panel head in 3D view and in the panel body in 2D view. These dates also determine placement of panels on a lane. Only date and date-time fields are available on the choice list.</td>
</tr>
<tr>
<td>Default</td>
<td>Check box that sets (selected) or removes (cleared) the default status of a visualization when you have more than one defined for a specific table. Applications that include a visualization use the default visualization.</td>
</tr>
<tr>
<td>Max items per lane</td>
<td>Maximum number of items that are displayed in a lane in 3D view. The default value is 500.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>The field is not visible on the form by default. Configure the form to add this field.</td>
</tr>
</tbody>
</table>
### Timeline visualization configuration filtering and sorting form field descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lane condition</td>
<td>Condition builder used to create filters and apply sorting to values that are used as lanes in 3D view visualizations. For example, if you set <em>(Name) (is not) (IT)</em> as a lane condition for the CIO Roadmap, then IT no longer appears as a lane in the roadmap, nor does it appear as a lane option in the Settings pane. Removing the filter restores the IT lane to the visualization and to lane options in the Settings pane. To order the results, specify sorting based on relevant field names. For example, to order the portfolio names so that they appear in reverse alphabetical order on the CIO Roadmap, set the sort fields to <em>(Name) (z to a).</em></td>
</tr>
<tr>
<td>Panel condition</td>
<td>Condition builder used to create filters and apply sorting to values that are used as panels in 2D and 3D view visualizations. For example, if you set <em>(State) (is one of) (Pending, Open, Work in Progress)</em> as the panel condition for the CIO Roadmap, only projects that are in one of those states appear on the roadmap.</td>
</tr>
</tbody>
</table>

### Timeline visualization configuration color options form field descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Panel color key</td>
<td>Field from the Panel table that contains values used for color coding the information displayed. The field selected here determines the values that are available in the Label fields on the form. The CIO Roadmap uses State, which is a field in the Project table. Panels on the CIO Roadmap are color coded according to the project state, which can be Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Skipped. Examples of other fields that are suitable for this selection include Priority, Risk, and Approval.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Label 1</th>
<th>Label 2</th>
<th>Label 3</th>
<th>Label 4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Values to be color coded. The values available are determined by the Panel color key field. For example, the CIO Roadmap is based on the Project table and has the Panel color key set to the State field, which contains the values Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped. You can set specific colors for up to four values from the selected field. Other values are shown in the Default color.</td>
<td>Values to be color coded. The values available are determined by the Panel color key field. ### Create a Timeline Visualization view

The timeline visualization view determines which record details appear in the pop-up summary window when a user clicks a panel.

You can create one timeline visualization view per table. For example, if your view shows incident records, you can create a view on the Incident table to show only certain information, such as the incident number, priority, and short description.

If no Timeline Visualization view exists, all panels use the default view that shows all the fields that currently appear on the default view of the form for that table. After you create a Timeline Visualization view for a table, all panels then use that view.

For example, to create a Timeline Visualization view using the Incident form:

1. Navigate to Incident > All.
2. Open an incident.
3. Right-click the form header and select Configure > Form Layout.
4. Under Form view and section, go to the View name field and select New.
5. Enter timeline visualization in the View name field.
6. Click Ok to create the timeline visualization view.
7. Add fields to or remove items from the timeline visualization view using the Available and Selected columns.
8. Click Save.

### Planning Your Timeline Visualization

Before creating a timeline visualization, you should have a clear idea of the information that you want to display.

This planning process helps you identify the required table and fields, and determine filtering and sorting requirements. Since users can personalize the visualization, avoid setting restrictive filters that may prevent users from finding categories that they are accustomed to seeing. You can use the CIO Roadmap as a starting point for creating your own timeline visualizations.
Use Timeline Visualization

Timeline Visualization provides a high-level view of an organization's strategic and operational activities over time.

Organizational decision makers can use the information in visualizations for activities such as planning future projects and estimating resource requirements. Users can personalize the information displayed with the visualization Settings pane.

Activating the Timeline Visualization application also installs the CIO Roadmap, a timeline visualization that displays an organization's IT projects and portfolios. This following sections use the CIO Roadmap to demonstrate features of timeline visualizations.

Lanes, markers, and panels

Lanes, markers, and panels are the fundamental elements of a timeline visualization. appear in the 3D view only.

Note: Lanes and markers are available in the 3D view only. A panel in the 2D view always represents a single record, while panels in 3D view may represent one or more records.

Lanes

A lane is a channel in which activities are grouped. A visualization can display up to eight lanes at a time. While viewing a visualization, you can use the Settings pane to show or hide individual lanes.

Note: The number of items displayed in a lane depends on the Max items per lane setting on Timeline Visualization form.

Markers

Markers are horizontal lines that cross all lanes and identify a transition to the next month.

Panels

Panels in both 2D and 3D views are color coded according to values that the administrator selects during the initial setup.
In 2D view, panels are grouped by month and stacked in chronological order, from the earliest date to the latest date. By default, the 2D view opens with the current month displayed on the left side of the visualization. You can print visualizations from the 2D view using the browser's print option. In 3D view, panels are grouped in lanes and ordered by date, from earliest to latest. The date that appears on the panel determines its placement in 2D and 3D view. The date displayed is based on a value the timeline administrator selects during initial setup.

Panels appear in the CIO Roadmap according to the planned completion date for the project. In 3D view, projects with the same planned date of completion are consolidated into a single panel. In 2D view, projects with the same planned date of completion are displayed as individual panels.

Panel headers in the CIO Roadmap are color coded based on project state. However, in 3D view, if a panel represents more than one project, the panel header is colored black. The Settings pane contains a key showing each available project state and the corresponding color.

To view additional information about a panel:

- Click a panel for a single record while in 2D or 3D view to open a summary window that contains additional information. Click the heading in the summary window to open the full record.
- Click a panel that represents multiple records to open a list of those records. Click a record number to open the full record.

The timeline administrator can configure the information that appears in summary windows.

**Personalize Timeline Visualizations**

You can configure settings for timeline visualizations like lane and panel conditions, colors, and labels.

**Personalization**

Open the Settings pane and click **Configure**. Complete the form as appropriate (see table).
Visualization personalization

Timeline visualization personalization form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lane conditions</td>
<td>Condition builder used to create filters and apply sorting to values that are used as lanes in 3D view visualizations. For example, if you set (Name) (is not) (IT) as a lane condition for the CIO Roadmap, then IT no longer appears as a lane in the roadmap, nor does it appear as a lane option in the Settings pane. Removing the filter restores the IT lane to the visualization and to lane options in the Settings pane. To order the results, specify sorting based on relevant field names. For example, to order the portfolio names so that they appear in reverse alphabetical order on the CIO Roadmap, set the sort fields to (Name) (z to a).</td>
</tr>
<tr>
<td>Panel conditions</td>
<td>Condition builder used to create filters and apply sorting to values that are used as panels in the visualization. For example, if you set (State) (is one of) (Pending, Open, Work in Progress) as the panel condition for the CIO Roadmap, only projects that are in one of those states appear on the roadmap.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Panel color key</td>
<td>Field from the Panel table that contains values used for color coding the information displayed. The field selected here determines the values that are available in the Label fields on the form. The CIO Roadmap uses State, which is a field in the Project table. Panels on the CIO Roadmap are color coded according to the project state, which can be Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Skipped. Examples of other fields that are suitable for this selection include Priority, Risk, and Approval.</td>
</tr>
<tr>
<td>Label 1</td>
<td>Values to be color coded. The values available are determined by the Panel color key field. For example, the CIO Roadmap is based on the Project table and has the Panel color key set to the State field, which contains the values Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped. You can set specific colors for up to four values from the selected field. Other values are shown in the Default color.</td>
</tr>
<tr>
<td>Default color</td>
<td>Color applied to values that are not selected for labels. For example, the CIO Roadmap color codes and creates labels for the values Pending, Open, Work in Progress, and Closed Complete. The additional values, Closed Incomplete and Closed Skipped, use the default color.</td>
</tr>
<tr>
<td>Color 1</td>
<td>Colors that correspond to each of the Label field values. For example, if Label 1 is the Pending state, and Color 1 is red, then panels for projects in the pending state are red.</td>
</tr>
</tbody>
</table>

**Note:**

If the **Max items per lane** field is set to more than 1000, you may observe a delay when displaying the timeline data using Internet Explorer (IE) as the browser.

### The Settings pane

Element names in the Settings pane vary based on the table and fields used to create the visualization.
The Settings pane contains the following elements:

**Settings pane elements**

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key</td>
<td>Identifies the type of information that is color coded on the timeline, such as state or priority. It also lists the color assigned to each possible value, such as pending state and open state.</td>
</tr>
<tr>
<td>Element</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Configure</td>
<td>Allows you to personalize a visualization by creating filters on lane information and panel information, specifying sort order for results, and reassigning panel colors. These changes affect your view of the visualization only.</td>
</tr>
<tr>
<td>View</td>
<td>Allows you to switch between 2D and 3D view.</td>
</tr>
<tr>
<td>View &lt;table&gt; List</td>
<td>Opens a separate browser tab showing the complete record list for the associated table.</td>
</tr>
<tr>
<td>Portfolio</td>
<td>Allows you to click lane names to add or remove them from the visualization. While the visualization is in 2D view, the Settings pane displays a Show all &lt;records&gt; button that allows you to override lane filters applied to the initial setup.</td>
</tr>
</tbody>
</table>

Use the slider and slider track

The slider and slider track are useful for quickly navigating to any point in time on a visualization.

For the CIO Roadmap, the slider track allows you to quickly view the distribution of projects over time and determine project states. While in 3D view, click and drag the slider to move the timeline forward or backward. In 2D view, click and drag the slider track right or left to move the timeline forward or backward.

The slider track provides an alternative view of panels on a visualization. For the CIO Roadmap, a colored dot in the slider track indicates the presence of one or more projects for a given day. The different dot colors correspond to different project states. This allows you to scan the slider track to identify projects of interest by their color, and then use the slider or slider track to quickly navigate to those projects. For example, if you are interested in projects that are in a pending state, you can use the slider to navigate to the colored dots that represent that state.

**Note:** Dots in the slider track do not correspond one-to-one with panels in a visualization. A dot represents the presence of one or more projects on a given date. In 3D view, if there is more than one project for a given day, all of the projects for that day are combined into a single panel on the roadmap. When the slider track is populated, projects in a multi project panel are analyzed for project state and then represented as appropriately colored dots in the slider track.

Similarly, you can use the slider or slider track in conjunction with the calendar to quickly navigate to any point in time. For example, if you are concerned about resource issues in April 2014 because you see a large cluster of dots during that time, dragging the slider or slider track to those dots brings those projects into view. Click the individual panels to view additional information.

View timeline visualization

You can view timeline visualizations from a project.

1. Navigate to **Project > Projects > All**.
2. Scroll to the bottom of the list and click the **Timeline Visualization** related link.

By default, the CIO Roadmap opens in three-dimensional (3D) view with the current date at the forefront of the timeline. You can use the Settings pane to change between two-dimensional (2D) and 3D view. As soon as you view a timeline visualization, it is considered...
personalized. After that, you see your personalized view even if the timeline administrator makes changes to the default visualization.

Timeline administrators can create timeline visualizations on other tables. If you are not sure whether a timeline visualization exists for a certain application, use the application navigator to open the application of your choice, and click **All**. If a timeline visualization exists for the application's table, a Timeline Visualization related link appears.

## Work with timeline visualizations

There are various tools that allow you to move visualizations backward and forward in time depending on whether you are in 2D or 3D view.

The following options are available for navigating between months.

### 2D views

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dragging</td>
<td>Hold down the left mouse button and drag the slider track right or left to view other months.</td>
</tr>
<tr>
<td>Left and right arrow keys</td>
<td>Press the left or right arrow keys on the keyboard to move the timeline forward or backward.</td>
</tr>
<tr>
<td>Mouse wheel button</td>
<td>Scroll the wheel to move the timeline forward or backward.</td>
</tr>
<tr>
<td>Right and left navigation arrows</td>
<td>Click the arrows to move from month to month. Arrows do not appear if there are no additional months to view.</td>
</tr>
</tbody>
</table>

The following options are available for navigating stacked panels.

### Navigating stacked panels

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dragging</td>
<td>Hold down the left mouse button and drag the stack up or down to view other panels.</td>
</tr>
<tr>
<td>Up and down navigation arrows</td>
<td>Click the arrows in a stack to view additional panels for the same month. Arrows do not appear if there are no additional panels to view.</td>
</tr>
</tbody>
</table>

The following options are available for navigating in 3D view.

### 3D view

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dragging</td>
<td>Hold down the left mouse button and drag the slider along the slider track to move the timeline forward or backward.</td>
</tr>
<tr>
<td>Mouse wheel button</td>
<td>Scroll the wheel to move the timeline forward or backward.</td>
</tr>
<tr>
<td>Up and down arrow keys</td>
<td>Press the arrow keys to move the timeline forward or backward.</td>
</tr>
</tbody>
</table>
Installed with Timeline Visualizations

Several components are installed with timeline visualizations.

Tables

Timeline visualization adds the following table.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timeline Visualization (roadmap_page)</td>
<td>Stores all available timeline visualizations.</td>
</tr>
<tr>
<td>Personalize Timeline (roadmap_user_page)</td>
<td>Stores timeline personalization settings for all timeline visualizations.</td>
</tr>
</tbody>
</table>

Plugins

Timeline visualization activates the following plugin, if it is not already active.

<table>
<thead>
<tr>
<th>Plugin Name</th>
<th>Plugin ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Project Management</td>
<td>com.snc.project_management_v3</td>
<td>Tools that aid in planning, organizing, and managing projects by applying basic task management processes.</td>
</tr>
</tbody>
</table>

UI Policies

Timeline visualization adds the following UI policy.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control Timeline Visualization configuration Page to enable/ disable certain fields</td>
<td>Timeline Visualization (roadmap_page)</td>
<td>Script that hides fields in the Timeline Visualization form when the form loads.</td>
</tr>
</tbody>
</table>

Script Includes

Timeline visualization adds the following script includes.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Roadmap2DUtil</td>
<td>Timeline Visualization - 2D API to generate data for lanes and panels.</td>
</tr>
<tr>
<td>RoadmapCommonUtil</td>
<td>Timeline visualization common utility to handle generic functions.</td>
</tr>
<tr>
<td>RoadmapConfig</td>
<td>Timeline visualization utility allowing configuration through the Timeline Visualization (roadmap_page) table.</td>
</tr>
<tr>
<td>RoadmapItems</td>
<td>Timeline visualization utility to get lane items.</td>
</tr>
</tbody>
</table>
### Client Scripts

Timeline visualization adds the following client scripts.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Roadmap Color Choice</td>
<td>Timeline Visualization (roadmap_page)</td>
<td>Sets color values for the color choice fields in the timeline visualization configuration page.</td>
</tr>
<tr>
<td>Roadmap Item Table</td>
<td>Timeline Visualization (roadmap_page)</td>
<td>Allows changing the color fields for the item_color_key whenever there is a change to the panel table.</td>
</tr>
<tr>
<td>Roadmap On Load</td>
<td>Timeline Visualization (roadmap_page)</td>
<td>Loads the personalized version of the roadmap/visualization.</td>
</tr>
<tr>
<td>Roadmap Panel Table Change</td>
<td>Timeline Visualization (roadmap_page)</td>
<td>Allows changing the field name for item_color_key whenever there is a change to the panel/visualization table.</td>
</tr>
</tbody>
</table>

### Business Rules

Timeline visualization adds the following business rule.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Check only one default</td>
<td>Timeline Visualization (roadmap_page)</td>
<td>Checks if another visualization is already set as default when user sets a new visualization as the default.</td>
</tr>
</tbody>
</table>

### Timeline visualizations roles

Timeline visualizations provides two roles.

**Roles**

<table>
<thead>
<tr>
<th>Role Title (Name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timeline administrator</td>
<td>Create and edit timeline visualization pages and view timeline visualizations.</td>
</tr>
<tr>
<td>Timeline user</td>
<td>View timeline visualizations. Timeline user access is also granted to users with the project_manager and project_user roles.</td>
</tr>
</tbody>
</table>
Visual Task Boards

Visual Task Boards (VTB) transform the navigation of lists and forms into an interactive graphical experience.

With Visual Task Boards, you can view and update multiple task records, which appear as cards that can be moved between lanes. An activity stream on the board displays recent activity so you can easily track changes to tasks. You can add task cards from any table that extends Task to intuitively and easily track updates and edit records directly from the board. Any user can use task boards, regardless of role, though access control rules (ACLs) may limit which cards each user can see. The Visual Task Board interface provides a graphic-rich environment suited for managing and collaborating on records. For example, a support manager might create a board for her team to track their assigned incidents by state in real time.

This video demonstrates how Visual Task Boards work.

Note: UI16 or UI15 is required to use Visual Task Boards.

The following podcast offers additional information on the use of Visual Task Boards.

Explore
- Upgrade to Jakarta
- Board structure

Set up
- Activate Visual Task Boards
- Supported browsers for Visual Task Boards

Administer
- Configure the task board
- Configure Visual Task Board labels
- Configure the task board card view

Use
- Create a freeform board
- Create a data driven board
- Task cards

Develop
- Developer training
- Developer documentation
- Installed with Visual Task Boards

Troubleshoot and get help
- Ask or answer questions in the Visual Task Boards forum
- Search the HI Knowledge Base for known error articles
- Contact ServiceNow Technical Support

Activate Visual Task Boards

Visual Task Boards are active by default on new instances. For upgraded instances, you can activate the Visual Task Boards plugin (com.glide.ui.vtb) if you have the admin role.

Role required: admin

For evaluation, you can activate the plugin for an application that requires a purchased subscription on a non-production instance. To activate the plugin on production instances, you must purchase the subscription. To purchase a subscription, contact your ServiceNow account manager. For details on purchasing a plugin, see Purchase a plugin.

Some plugins require activation by ServiceNow personnel. Request these plugins through the HI Customer Service System instead of activating them yourself. For details, see Request a plugin.

For plugins that you can activate yourself, continue with the following steps.

1. Navigate to System Definition > Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
If the plugin depends on other plugins, these plugins are listed along with their activation status.

If the plugin has optional features that depend on other plugins, those plugins are listed under **Some files will not be loaded because these plugins are inactive.** The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).

4. Optional: If available, select the **Load demo data** check box.

Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.

You can also load demo data after the plugin is activated by clicking the **Load Demo Data Only** related link on the System Plugin form.

5. Click **Activate**.

### Installed with Visual Task Boards

Several types of components are installed with Visual Task Boards.

### Tables installed with Visual Task Boards

Tables are added with activation of Visual Task Boards.

Visual Task Boards add the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Board Member (vtb_board_member)</td>
<td>Stores a record for each member of each task board.</td>
</tr>
<tr>
<td>Private Task (vtb_task)</td>
<td>Stores a record for each personal task on each freeform board.</td>
</tr>
<tr>
<td>Visual Task Board (vtb_board)</td>
<td>Stores a record for each task board.</td>
</tr>
<tr>
<td>Visual Task Board Card (vtb_card)</td>
<td>Stores a record for each task card on each task board.</td>
</tr>
<tr>
<td>Visual Task Board Card History (vtb_card_history)</td>
<td>Stores records for certain task card changes, such as lane or assignee changes. Each record indicates the previous value and the new value.</td>
</tr>
<tr>
<td>Visual Task Board Lane (vtb_lane)</td>
<td>Stores a record for each lane on each task board.</td>
</tr>
</tbody>
</table>

### Properties installed with Visual Task Boards

Properties are added with activation of Visual Task Boards.

Visual Task Boards add the following properties.
Note: To open the System Property (sys_properties) table, enter `sys_properties.list` in the navigation filter.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vtb.board.upload_limit</td>
<td>Sets the maximum file size in megabytes allowed for each task card attachment.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Type</strong>: integer</td>
</tr>
<tr>
<td></td>
<td>- <strong>Default value</strong>: 10</td>
</tr>
<tr>
<td></td>
<td>- <strong>Location</strong>: System Property (sys_properties) table</td>
</tr>
</tbody>
</table>

**Script includes installed with Visual Task Boards**

Script includes are added with activation of Visual Task Boards. Visual Task Boards add the following script includes.

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VisualTaskBoards</td>
<td>Provides general utilities for Visual Task Boards.</td>
</tr>
<tr>
<td>VTBBoardSecurity</td>
<td>Provides security utilities to control board access.</td>
</tr>
<tr>
<td>VTBGetBoardsByUser</td>
<td>Provides a method that retrieves all the boards a specified user owns or is a member of.</td>
</tr>
<tr>
<td>VTBTaskSecurity</td>
<td>Provides security utilities to control task access.</td>
</tr>
</tbody>
</table>

**Client scripts installed with Visual Task Boards**

Client scripts are added with activation of Visual Task Boards. Visual Task Boards add the following client scripts.

<table>
<thead>
<tr>
<th>Client script</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Kanban Choice</td>
<td>Visual Task Board (vtb_board)</td>
<td>Adds the -- Kanban Board -- option to the Lane field field. This option indicates that the task board is a flexible board.</td>
</tr>
</tbody>
</table>

**Business rules installed with Visual Task Boards**

Visual Task Boards add the following business rules.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add members to live group</td>
<td>Board Member (vtb_board_member)</td>
<td>If a Connect Chat conversation is created for a task board, this business rule adds the board members as conversation members.</td>
</tr>
<tr>
<td>Business rule</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Remove member from live group</td>
<td>Board Member</td>
<td>If a Connect Chat conversation exists for a task board and a user is removed from the board members, this business rule removes the user from the conversation members.</td>
</tr>
<tr>
<td>Remove member from VTB</td>
<td>Live Group Member</td>
<td>If a Connect Chat conversation exists for a task board and a user is removed from the conversation members, this business rule removes the user from the task board members.</td>
</tr>
<tr>
<td>Sync board name to Connect</td>
<td>Visual Task Board</td>
<td>If a Connect Chat conversation exists for a task board and someone updates the board name, this business rule updates the conversation name.</td>
</tr>
<tr>
<td>Sync chat name to VTB board</td>
<td>Live Group Profile</td>
<td>If a Connect Chat conversation exists for a task board and someone updates the conversation name, this business rule updates the board name.</td>
</tr>
<tr>
<td>Sync Members With VTB</td>
<td>Live Group Member</td>
<td>If a Connect Chat conversation exists for a task board and a user is added to the conversation members, this business rule adds the user as a board member.</td>
</tr>
<tr>
<td>Update Board on Card Change</td>
<td>Visual Task Board Card</td>
<td>Triggers the system to update the task board when changes occur to the cards.</td>
</tr>
<tr>
<td>Update Board on Lane Change</td>
<td>Visual Task Board Lane</td>
<td>Triggers the system to update the task board when changes occur to the lanes.</td>
</tr>
<tr>
<td>update board on lane change</td>
<td>Board Member</td>
<td>Triggers the system to update the task board when changes occur to the board members.</td>
</tr>
<tr>
<td>VTB Previous Additional</td>
<td>Private Task</td>
<td>Triggers the system to send an email notification to users when they are designated as additional assignees for cards.</td>
</tr>
<tr>
<td>Assignees</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Notifications installed with Visual Task Boards**

Notifications are added with activation of Visual Task Boards.

Visual Task Boards add the following notifications.

<table>
<thead>
<tr>
<th>Notification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VTB additional assignee notification</td>
<td>Sends an email notification to users when they are designated as additional assignees for tasks.</td>
</tr>
<tr>
<td>Notification</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>VTB assignee notification</td>
<td>Sends an email notification to users when they are designated as the primary assignees for personal tasks.</td>
</tr>
<tr>
<td>VTB lane change notification</td>
<td>Sends an email notification to a task's assignees when the task changes lanes.</td>
</tr>
</tbody>
</table>

**Supported browsers for Visual Task Boards**

The system supports Visual Task Boards on most modern browsers.

**Supported browsers**

- The latest public release of Firefox or Firefox ESR
- The latest public release of Chrome
- Safari version 9.1 and later
- Internet Explorer version 11
  - Edge mode is supported.
  - Compatibility mode is not supported.
  - Setting Security Mode to High (via the Internet Options > Security tab) is not supported.
  - Internet Explorer 11 is susceptible to memory leaks, which may impact performance, especially in Windows 7.
- Access Visual Task Boards on your mobile device using either a browser or the native mobile app. See [Support for ServiceNow Classic](#) for more information.

**Scripting support**

Visual task boards do not interact with client scripts. Use a UI policy or a data policy instead.

**Board structure**

There are different types of task boards for different kinds of task management. All types of boards share the same overall structure.

**Board types**

<table>
<thead>
<tr>
<th>Board type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Freeform boards</td>
<td>Display any kind of task record, including personal tasks. Members of freeform boards can add and remove task cards and lanes.</td>
</tr>
<tr>
<td>Flexible boards</td>
<td>Display tasks that match the configured filter against a particular table. Members of flexible boards can add task cards, which are removed automatically when the tasks no longer match the filter conditions. Members can define custom lanes, similar to a freeform board.</td>
</tr>
<tr>
<td>Board type</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Guided boards</td>
<td>Display tasks that match the configured filter against a particular table, like flexible boards. Members of guided boards can add task cards, which are removed automatically when the tasks no longer match the filter conditions. Guided board lanes correspond to field values and cannot be edited in most cases.</td>
</tr>
</tbody>
</table>

The icon beside the board name on the Task Boards page identifies the type of board. Freeform boards appear with a grid of four squares (□□□□); flexible boards appear with a vertical line beside two squares (□□); guided boards appear with two vertical lines (□□).
### Task Boards screen

All boards have these elements:
### Board elements

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quick panel</td>
<td>Displays labels and users associated with the board. Board members can use the quick panel to filter cards or to quickly label or assign tasks. Members can also configure what appears in the quick panel.</td>
</tr>
<tr>
<td>Lanes</td>
<td>Organize cards on a board into vertical groups. These groups often represent the status of the task, such as To Do, Doing, and Done. Each board is composed of one or more lanes. When using a guided board, each lane represents a possible field value. For example, a board on the Incident table can display one lane for each State value such as New, Active, or Resolved. Users can move cards from one lane to another to update the task that card represents.</td>
</tr>
<tr>
<td>Cards</td>
<td>Represent individual tasks. Users can add comments, attachments, and labels to cards and assign users to cards. Each card is tied to a task record; updating one immediately updates the other. For freeform boards, each card represents a personal task. For flexible and guided boards, each card represents a record from the list that board was created from.</td>
</tr>
<tr>
<td>Task board tools</td>
<td>Displays board information, a board members, the board activity stream, and board labels.</td>
</tr>
</tbody>
</table>
Visual Task Board use

Any user can create, view, and edit freeform, flexible, and guided visual task boards, and add users to these boards as members.

You can create a freeform board and add cards from multiple task tables, or create a flexible or guided board from an existing list of records.

Create a freeform board

You can create freeform task boards for tracking any kind of task or project.

Role required: none

2. Next to My Task Boards, click New, or if you have never created a task board before click Create New Visual Task Board.
3. From the Create New Board window, click Freeform.
   A new task board opens with the default freeform lanes, To Do, Doing, and Done.
4. Click the board name and enter a new name.

After the board is created, board members can:

- Add and modify lanes
- Create and modify task cards
- Add and remove members
- Configure the look and feel

Create a data driven board

You can create a flexible or guided task board for any table that extends Task, such as Incident or Change.

Role required: none

2. Next to My Task Boards, click New, or if you have never created a task board before click Create New Visual Task Board.
3. From the Create New Board window, click Data Driven Board.
4. From the Task Table list, select a base table of tasks on which to base your board, for example, an incident table.
5. Optional: From the Lane Field list, select the field you want to use for the lane headers. Create a Flexible board with editable lane headers by selecting None.
   The type of board that is created and the lanes that appear on the board depend on which type of column you select. If you select a reference or choice column, the board is a guided board. Each lane in a guided board represents one possible value for that column and the cards appear in the appropriate lane. For example, if you create a guided task board for incidents using the State column, the board shows one lane for each incident state, such as New or Closed. If you select a column that is not a reference or choice, the board is a flexible board and the board shows the default lanes, To Do, Doing, and Done, with all cards in the To Do lane.
6. Optional: Create a filter to show only the records you want to work with. For example, you might filter out incidents that are not assigned to you.
Any card that no longer fits the parameters of the filter is automatically removed from the task board.

7. Optional: Click the board name and enter a new name.

**Note:** For guided boards created from choice fields, such as State, the system creates a lane for each possible choice value. For guided boards created from reference fields, the system creates a lane only for each value in use by a task card. Lanes are added as needed if the reference field values change.

After the board is created, board members can:

- Add and modify lanes
- Create and modify task cards
- Add and remove members
- Configure the look and feel

**Delete a task board**

You can delete any task board you own.

Role required: none

Deleting a board does not impact the underlying task records. However, you cannot recover a board after you delete it.

2. Under Boards you own, point to a board and click the delete icon (X).
3. In the confirmation dialog, click Delete.

**Add or modify lanes**

Any board member can edit board lanes.

Role required: none

When you create a freeform or flexible task board, it includes the default lanes To Do, Doing, and Done. Any board member can change the names and add new lanes to accommodate the task workflow you want to track.

Unlike guided boards, the lanes on a freeform or flexible task board do not match possible field values.

**Note:** You cannot remove lanes from guided boards.

1. Open a task board.
2. Perform any of the following actions.
### Option Description

#### Create a new lane
1. Scroll past the last lane and click Add Lane.
2. Enter a title for the lane, then press the Enter key.

The Add Lane option is always available for freeform and flexible boards. It is available for guided boards only if the lanes are based on a reference field, such as Assigned to.

#### Rearrange lanes
Click a lane header and drag the lane to the desired drop zone. To cancel the move, press the Escape key while you drag the lane.

You can also change the lane order from the board configuration menu.

#### Hide a lane
1. Click the lane menu in a lane header.
2. Select Hide Lane.

You can restore hidden lanes from the board configuration menu.

#### Delete a lane
1. Click the lane menu in a lane header.
2. Select Delete Lane.
3. In the confirmation dialog box, click Delete.

When you delete a lane on a freeform or flexible board, all the cards in the deleted lane are archived.

The Delete Lane option is always available for freeform and flexible boards. It is available for guided boards only if the lanes are based on a reference field, and only for lanes that contain no cards.

### Task cards

A Visual Task Board task card can represent a personal task or a record on a table.

You can add task cards, edit task card details, add labels to cards, and access the underlying task record the card represents, depending on the board type.

**Note:** Each board can display up to 2,000 cards by default. When the number of tasks exceeds the maximum, a warning appears and the system determines which cards to show by most recent update time. Administrators can configure a different maximum card limit for freeform boards and for flexible and guided boards.

### Freeform board tasks

You can add personal task cards directly to lanes on a freeform board. You can also add other kinds of task cards to a freeform board from a list or form.
Add a personal task to a freeform board
You can add cards directly to a freeform board lane. These cards are called personal tasks and represent records on the Private Task (vtb_task) table.

Role required: none

1. In a lane header, click the lane menu ( ) and select Add Task. Alternatively, click Add Task at the bottom of a lane.
   A new task card appears in the lane.
2. Enter a short description for the new task card.
3. To save the card, click another area of the board or press Enter.

Add a task to a freeform board from a form
You can add a task card to a freeform board from any table that extends Task. These cards represent records on whichever table you add them from.

Role required: none

You can add cards from multiple task tables, such as Incident or Problem, to the same freeform board.

1. Open a task record, such as an incident.
2. Click the menu icon ( ) or right-click the form header to show the form context menu.
3. Select Add to Visual Task Board.
   A pop-up window appears with a list of freeform task boards.

4. Click the name of the board you want to add the card to.
   A confirmation message appears.
5. To view the board, click the board name in the confirmation message.
   The task appears in the first lane by default.
Add a task to a freeform board from a list
You can add a task card to a freeform board from any table that extends Task. These cards represent records on whichever table you add them from.

Role required: none
You can add cards from multiple task tables, such as Incident or Problem, to the same freeform board.

1. Navigate to a list of task records, such as Incident > Open.
2. Perform either of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add one task</td>
<td>Right-click a record and select Add to Visual Task Board</td>
</tr>
<tr>
<td>Add multiple tasks</td>
<td>Select the check box beside each record you want to add and select Add to Visual Task Board from the actions choice list</td>
</tr>
</tbody>
</table>

A pop-up window appears with a list of freeform task boards.

3. Click the name of the board you want to add the card to. A confirmation message appears.
4. To view the board, click the board name in the confirmation message. The task appears in the first lane by default.

Add a task to a flexible or guided board
You can add cards directly to a flexible or guided board lane. These cards represent records on whichever table the board is associated with.
Role required: none

1. In a lane header, click the lane menu ( keyCode) and select Add Task. Alternatively, click Add Task at the bottom of a lane.

A pop-up window appears with a new record. Fields are populated based on any filter conditions for the board and, for guided boards, the lane you add the card to.

Consider the example of a guided board that shows incidents with the Software category, with a lane for each assignee. If you add a card to the ITIL User lane, the new incident record Category and Assigned to fields are automatically set to Software and ITIL User.

2. Complete the form and click Submit.

A new task card appears in the lane.

Edit card details

When you click a card on a Visual Task Board, a pop-up window appears with additional details.

Role required: none

You can edit certain values from the card details. Updating these values also updates the underlying task record.
Card details

1. Click a card. The details for that card appear in a pop-up window.
2. Alternatively, you can click an entry in the activity stream to view the details for the associated card.
3. From the card details you can:
- Click the card title to rename the card.
- Modify the short description.
- Add comments or work notes in the activity stream.
- Edit the assignees.
- Click one or more of the available labels to add a label to the card.
- Add or remove file attachments.
- Create a checklist.
- Archive the card (freeform boards only).
- Move the card to a different board (freeform boards only).

**Label a task card**

Labels help categorize tasks and visually distinguish them on the task board.

*Enable* labels for the board.

Role required: none

You can filter the visible tasks to show only those with certain labels. Labels appear on cards as colored dots.

---

**My desk phone does not work**

![Labels](image)

**INC0000041**

*a day ago*

---

**Task card labels**

You can add one or more labels to a task card.

**Do one of the following actions.**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Add a label to a card from the quick panel</strong></td>
<td>1. Drag a label from the quick panel directly to a task card.</td>
</tr>
<tr>
<td></td>
<td>2. Drop the label in the drop zone.</td>
</tr>
<tr>
<td><strong>Add a label to a card from the card details</strong></td>
<td>1. Open the card details for a task.</td>
</tr>
<tr>
<td></td>
<td>2. Click the details tab (i).</td>
</tr>
<tr>
<td></td>
<td>3. Under <strong>Labels</strong>, select one or more labels. Point to a label to display its name.</td>
</tr>
<tr>
<td></td>
<td>4. Close the card detail pop-up window.</td>
</tr>
</tbody>
</table>
You can use configuration options to rename or disable labels or to hide labels altogether.

**Assign a task to a user**

Assignees represent ownership of task cards and the associated records. Each task card can have one primary assignee and multiple additional assignees.

You can filter the visible tasks on a board to show only tasks assigned to a certain user. Assignees appear on cards as avatars.

When a card changes lanes, all the assignees receive an email notification.

For flexible and guided boards, the primary assignee corresponds to the underlying task's **Assigned to** field. For example, on a board created from the Incident table, if you add Joe Employee as the primary assignee for a card, the associated incident is assigned to Joe. Note that assignment rules on the associated table may restrict who you can make the primary assignee of a card. If you attempt to assign a task card to a user in a way that violates an assignment rule, a notification appears and the assignment does not take place.
Note: Assignees are not automatically granted access to the board. Only members can access the board.

Do one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Add an assignee from the quick panel  | 1. Drag a user’s avatar from the quick panel directly to the task card.  
2. Drop the avatar in the Primary or Additional drop zone. |
| Add an assignee from the card details | 1. Open the card details for a task.  
2. Click the assignees tab (👥).  
3. Click Add Primary Assignee or Add Additional Assignee. The Add Primary Assignee option is not available if there is already a primary assignee.  
4. Select a user.  
5. Close the card detail pop-up window. |

The system sends an email notification to inform the new assignee of the change.

Add an attachment to a task card

You can add an attachment to a record within a task board.

Role required: none

Adding an attachment to a task card also adds the attachment to the underlying task record.
Add attachment

1. Click a card.
2. Click the attachment tab (  ).
3. Click Add Attachment and select a file to add as an attachment.

**Visual Task Board checklists**

Checklists help you track the progress of tasks on your Visual Task Board.

Checklists are available as a tab in the card details.
Sample checklist

You can add, remove, or rearrange checklist items. You can also save a checklist as a template for future use on other cards. Any user can create or edit a checklist. When the compact card view is disabled, the task card displays a progress bar to show how many items are complete.
You can also use checklists with task records in the standard interface. For more information, see [Checklists](#).

### Create a new checklist for a card

You can create a unique checklist for each Visual Task Board card.

**Role required:** none

1. Open the card details for a task.
2. Click the checklist tab (✓).
3. Click **Add Item**.
4. Enter text for the checklist item.
5. Press the Enter key to add the checklist item.
6. Create as many additional checklist items as desired.
7. To delete a checklist item, click the minus (-) icon.
8. Optional: To reorder checklist items, click the drag icon (_drag_) and drag a checklist item to a different position in the list.
9. Optional: Save the checklist as a template for easy reuse.
   a) Click the more icon (⋯) beside the Checklist formatter.
   b) Select **Save as Template**.
A dialog box appears.

c) Enter a descriptive template name to identify the checklist.

When a user creates a checklist from a template, all templates are listed in alphabetical order and there is no way to filter which templates appear. To provide a better user experience, consider implementing a naming system for checklist templates. For example, include the name of the table or another identifier to clarify how the checklist should be used.

d) Click **Save**.

10. Optional: To create a task from a checklist item:
   a) Point to a checklist item and click the create task icon (➕).
   b) Select the type of task you want to create.
      An administrator can configure which task types are available.
      The new task record appears in a pop-up window. The short description is automatically populated with the checklist item text.
   c) Fill in the form with additional detail as necessary.
   d) Click **Update**.

Create a checklist from a checklist template

In a Visual Task Board card, you can quickly create a checklist from a checklist template you previously created.

Create at least one checklist template.

Role required: none

A template saves time by creating checklist items automatically. You can add, edit, or remove checklist items without impacting the template.

1. Open a task card that does not already contain a checklist.
2. Click the checklist tab (✔).
3. Click the more icon (⋯).
   The more icon does not display unless you have added an item to the checklist, or if you have a pre-existing checklist template.
4. Under **Copy items from**, select a template.
   The checklist items appear automatically.

Delete a checklist from a card

You can remove a checklist from a Visual Task Board card.

Role required: none

1. Open a task card that contains a checklist.
2. Click the checklist tab (✔).
3. Click the more icon (⋯).
4. Select **Remove Checklist**.
   A confirmation dialog box appears.
5. Click **Delete**.

*Configure which types of tasks can be created from checklist items*

A system property controls which types of tasks you can create from a Visual Task Board checklist item.

Role required: admin

You might want to add custom tables or remove tables you do not use.

1. Navigate to `sys_properties.list`.
2. Locate the `glide.ui.create_task_type_option_list` property.
3. Edit the **Value** to add or remove tables.

You can add any table that extends Task (task). Use the table name, not the label. For example, you would enter `change_request`, not Change Request. Ensure the tables listed are separated by commas, with no spaces.

The property value populates the task type selection list users choose from when they create a task from a checklist item. Note that users can only see task types for which they have the appropriate access roles.

---

**Archive a card**

Archiving a card is a non-destructive way to remove a card from a freeform board.

Role required: none

You can archive cards you are no longer working on to reduce visual clutter. Note that it is only possible to archive cards on a freeform board.

1. Perform one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Archive one card from the lane view</strong></td>
<td>1. Point to a card and click the X icon that appears in the corner.</td>
</tr>
<tr>
<td></td>
<td>2. In the confirmation dialog, click <strong>Archive</strong>.</td>
</tr>
</tbody>
</table>
### Archive one card from the card details

1. Click a card and view the **Details** tab.
2. Under **Tools**, click **Archive**.
3. In the confirmation dialog, click **Confirm**.

### Archive all the cards in a lane

1. In the lane header, click the more options icon (🔍).
2. Select **Archive All Tasks**.
3. In the confirmation dialog, click **Archive**.

2. To see all archived cards for the current board, from the board navigation panel, open the board information menu (🔍) and click **View Archived Tasks**. The Archived Tasks window appears.
3. To restore an archived card, point to it and click **Restore**.

### Access a task record

You can open the form view of any task card. Viewing a task record on a form allows you to see all fields for that record, including fields that are not visible in the card details.

Role required: none

Do one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access the record from the task card</td>
<td>Click the record number on the task card.</td>
</tr>
</tbody>
</table>
| Access the record from the card details | 1. Open the card details for a task.  
2. Click the record number in the header. |

### Move a card to a different lane

You can move a card from one lane to another.

Role required: none

When you move a card to a different lane on a guided board, the field on which the lanes are based is updated to reflect the new lane value.

1. Open a Visual Task Board.
2. Select a card and drag it to a different lane.

To cancel the move, press the Escape key while you drag the card.

**Note:** All mandatory fields on a record must be filled in to move the associated card to a new lane. For example, assume you have a guided board based on the Incident (incident) table, with a lane for each State. The Close code and Close notes fields become mandatory when the State changes to Closed. If you attempt to move an incident card from the New lane to the Closed lane, a pop-up view of the form appears and prompts you to fill in the mandatory fields.
Move a card to a different board

You can move a card from one freeform board to another.

1. Open the card details.
2. In the details tab (i), click Move Card.
3. In the pop-up window that appears, select the board and lane to move the card to.
   The board selection list displays freeform boards only.

Task board tools

The task board tools area in a Visual Task Board contains several tabs, each represented by an icon.

Click an icon to open the tab. Click the same icon again to hide the tab. The tabs you see for each conversation depend on the conversation type and other conditions.

**Conversation tool tabs**

<table>
<thead>
<tr>
<th>Tab icon</th>
<th>Tab name</th>
<th>Description</th>
</tr>
</thead>
</table>
| ![Info icon](image) | Info | Contains the following information about the task board:
- Name
- Board type
- Table name and a link to open the table view (visible on data driven boards only)
- Filter conditions (visible on data driven boards only)
- Lane field (visible to the board owner, on data driven boards only)
- Owner
- Number of lanes
- Number of cards
- URL |
| ![Members icon](image) | Members | Lists all members and assignees of the board. You can add or remove board members, promote assignees to be members, and filter the board by member or assignee. |
| ![Labels icon](image) | Labels | Use labels to visually distinguish tasks on the task board. Filter board contents by toggling the label. You need to enable labels before being able to use this tab. |
### View board information

You can display key information about any task board.

Role required: none

<table>
<thead>
<tr>
<th>Tab icon</th>
<th>Tab name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Activity icon]</td>
<td>Activity</td>
<td>Displays all of the activity for cards on the board.</td>
</tr>
<tr>
<td>![Configuration icon]</td>
<td>Configuration</td>
<td>Configure the settings for the task board. This setting is only available for the board owner. For more information, see Configure the task board</td>
</tr>
</tbody>
</table>
Board owner’s view of board information

1. Open a task board.
2. Open the task board tools and click the board information icon (i).

Add a board as a favorite

Add boards you access frequently to the application navigator using the favorite option.

Role required: none
Adding a board as a favorite is only available in UI16.

1. Navigate to **Self Service > Visual Task Boards**.
2. From the board you want to favorite, select the information icon from the board tools. Then select the star.
3. Remove the board as a favorite by clearing the star icon.

**View a task board in a list**

You can view a task board in the list view using the board information option.

Role required: none

1. Open a task board.
2. Open the task board tools and click the board information icon (i).
3. Click **View List** at the bottom of the information panel.

The cards from the board open in the list view.

*Note:* The freeform board list view only shows cards made by the board and no other tasks that might be added manually.

**Add or remove a task board member**

You can add and remove task board members using the members tab of the activity stream. You can also promote assignees to board members.

Role required: none

Only members of a task board can access the board. Any board member can add or remove other members.

1. On a Visual Task Board, open the task board tools.
2. Click the members tab.

3. Perform one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Add a member</strong></td>
<td>1. In the Users section, click <strong>Add Members</strong>.</td>
</tr>
<tr>
<td></td>
<td>2. Enter a user’s name or select a user from the drop-down menu.</td>
</tr>
<tr>
<td><strong>Remove a member</strong></td>
<td>1. In the Members section, point to a user.</td>
</tr>
<tr>
<td></td>
<td>2. Click the remove icon (−).</td>
</tr>
<tr>
<td><strong>Promote an assignee to a member</strong></td>
<td>1. In the Assignees section, point to a user.</td>
</tr>
<tr>
<td></td>
<td>2. Click the upward arrow icon.</td>
</tr>
<tr>
<td><strong>Promote all assignees to members</strong></td>
<td>In the Assignees section, click <strong>Promote All</strong>.</td>
</tr>
</tbody>
</table>
Visual Task Board SLA indicators

SLA (service level agreement) indicators alert board members if any cards on the board have breached SLAs.

When SLA indicators are enabled, a status bar appears on each card that has an associated SLA. If any cards have breached SLAs, an alert appears at the top of the board and a filter option appears in the quick panel. The indicator displays the elapsed percentage of the SLA. If there are multiple SLAs associated with a task card, the indicator displays the status of the SLA with the greatest elapsed percentage.
Visual Task Board with SLA indicators enabled

ALERT! One or more tasks on this board require immediate attention

- **New (3 tasks)**
  - **SSL certification issue**
    - SLA: 52%

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Any board member can enable SLA indicators from the board configuration menu. The setting applies to the current user only.

**Share a Visual Task Board in a Connect conversation**

You can share a Visual Task Board in a Connect Chat or Connect Support conversation.

Role required: none

1. Navigate to **Self-Service > Visual Task Boards**.
2. Drag a task board to a Connect mini window.
   
   A link to the task board appears in the conversation. The task board is also listed in the conversation tools, which are visible in the Connect workspace. Only conversation members who are members of the board can access it. If you share a task board in a record conversation, it appears as a URL in the record activity stream.

**Create a Connect conversation from a Visual Task Board**

Create a Connect Chat conversation from a Visual Task Board to collaborate with board members and keep track of activity as it happens.

Role required: none

When you create a conversation from a task board, all the board members become members of the conversation. The members are synchronized between the task board and the conversation. For example, if you remove a user from the conversation, the system automatically removes the user from the board as well.

1. Navigate to **Self-Service > Visual Task Boards**.
2. Open a task board.
3. In the board header, click the connect with board members icon.

   The system automatically opens a record conversation for the board. Each board member becomes a member of the conversation.

**Configure the task board**

The board configuration menu provides several options that affect the look and feel of the board.

Role required: none

1. From the task board tools, click the menu icon.
2. In the **Background Color** section, select a background color from the palette.
   
   The background color surrounds the lane area of a board. It also appears as the color for the board on the My Task Boards page. Changes to the background color apply to all users.
3. In the **Quick Panel** section, toggle quick panel options as necessary.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show Panel</td>
<td>When enabled, the quick panel is visible.</td>
</tr>
<tr>
<td></td>
<td>This setting applies to the current user only.</td>
</tr>
</tbody>
</table>

</tr>
</thead>
<tbody>
<tr>
<td>User Names</td>
<td>When enabled, user names appear by user avatars in the quick panel. This setting applies to the current user only.</td>
</tr>
<tr>
<td>Show Labels</td>
<td>When enabled, labels appear on cards and in the quick panel. This setting applies to all users.</td>
</tr>
<tr>
<td>Label Names</td>
<td>When enabled, the label name appears beside the colored icon for that label in the quick panel. This setting applies to the current user only and is available only when Show Labels is enabled.</td>
</tr>
</tbody>
</table>

When all the options are enabled, a quick panel looks like this:

![Quick Panel Image]

4. In the **Configure Cards** section, toggle card options as necessary.
   Changes to the cards apply to the current user only.

**View options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compact Cards</td>
<td>When enabled, the lane width is decreased and card information and thumbnails do not appear on the card.</td>
</tr>
</tbody>
</table>
| Show Card Info    | When enabled, card information appears on each card. Card information typically includes details like the task state, date opened, and last user to update it. 
   This setting is available only when Compact Cards is disabled. |
| Show Card Thumbnail| When enabled, cards display the first image attached to that card as a thumbnail. 
   This setting is available only when Compact Cards is disabled. |
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show SLAs</td>
<td>When enabled, SLA status indicators appear on cards and alerts appear when one or more card has a breached SLA. SLA status indicators are hidden when Compact Cards is enabled. This setting is available only when there are SLAs associated with the tasks on the board.</td>
</tr>
</tbody>
</table>

5. In the **Configure Lanes** section, show or hide lanes by selecting or clearing the check box for each lane. Rearrange lanes by dragging and dropping them in the list.

**Configure Visual Task Board labels**

Labels help categorize tasks and visually distinguish them on the task board. You can disable or rename labels using the labels tab of the activity stream.

Role required: none

You can use up to five labels per board. Any board member can edit the labels on a board.

1. From the task board tools, open the activity stream.
2. Click the labels tab.
3. Toggle the **Show Labels** switch to the enabled position if it is not already enabled.
4. To change a label name, click the label text and enter a new value.
5. To disable or enable a specific label, toggle the switch by the label.
   - When a label is disabled, members cannot add that label to cards on the board. The label is hidden on cards that are already labeled.

**Modify the query or lane field for an existing board**

For flexible and guided boards, you can edit the board query or lane field. This ability enables you to change the board contents while preserving the member list, board configuration settings, and, if applicable, Connect Chat conversation history.

Inform the board members that you plan to change the board query or lane field. If you or any members have manually sorted cards within a lane, the order may be reset.

Role required: none but you must be the board owner

The board query consists of filter conditions that determine which tasks the board tracks. For example, you might edit the query so the board shows only active incidents, rather than all incidents.

The lane field is the field on the underlying table that defines the lanes. For example, you might change the lane field so the lanes represent incident states, rather than assignees. This change is called a lane field pivot. Lane field pivots also make it possible to convert a flexible board to a guided board or vice versa.

1. Open a task board.
2. Click the board information icon (i) by the board name.

3. Perform one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edit the board query</td>
<td>1. Under Board Filter, click Edit Filter to open the condition builder.</td>
</tr>
<tr>
<td></td>
<td>2. Add and remove conditions as needed to edit the query.</td>
</tr>
<tr>
<td></td>
<td>3. Click Save.</td>
</tr>
</tbody>
</table>

**Change the lane field**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1. Click the Lane Field picker and select a field or the None option. Guided boards have the Lane Field set to a field, such as State. Flexible boards have the Lane Field set to None. You can change the Lane Field value accordingly to change the board type.</td>
</tr>
<tr>
<td></td>
<td>2. In the confirmation dialog, click OK.</td>
</tr>
</tbody>
</table>

The board reloads to reflect the changes.

---

**Configure the card limit for freeform boards**

Freeform boards can display up to 2,000 cards by default. You can change the default card limit by adding a property.

Role required: admin

1. **Add a new system property** with the following field values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.vtb.freeform_max</td>
</tr>
<tr>
<td>Type</td>
<td>integer</td>
</tr>
</tbody>
</table>

2. Set the Value to the maximum number of cards allowed for each freeform board.

**Note:** Performance degradation may occur if you set the Value to a number greater than 1,000, especially on tablet devices.

---

**Configure the card limit for flexible and guided boards**

Flexible and guided boards can display up to 2,000 cards by default. You can change the default card limit by adding a property.

Role required: admin

1. **Add a new system property** with the following field values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.vtb.board_max</td>
</tr>
<tr>
<td>Type</td>
<td>integer</td>
</tr>
</tbody>
</table>
2. Set the **Value** to the maximum number of cards allowed for each flexible or guided board.

**Note:** Performance degradation may occur if you set the **Value** to a number greater than 1,000, especially on tablet devices.

**Configure the task board card view**

Configure the fields that appear in a card on a task board.

Role required: admin

1. Navigate to the form you want to configure fields for.
2. Right-click the header and select **Configure > Form Layout**.
3. Under the Form View section, select the VTB view.
   You may need to create a VTB view for the form. For more information, see [Create and delete views](#).
4. Select the fields to appear on the card by adding or removing the fields from the **Selected** column. You can also adjust the order they appear on the form by moving the fields up or down.

**Workflow**

Workflow provides a drag-and-drop interface for automating multi-step processes across the platform. Each workflow consists of a sequence of **activities**, such as generating records, notifying users of pending approvals, or running scripts. The graphical workflow editor represents workflows visually as a type of flowchart. It shows activities as boxes labeled with information about that activity and transitions from one activity to the next as lines connecting the boxes.

**Getting started with workflows**

The graphical workflow editor provides a drag-and-drop interface for automating multi-step processes across the platform.

Each workflow consists of a sequence of **activities**, such as generating records, notifying users of pending approvals, or running scripts.
The workflow starts when a triggering event occurs. Common triggers include a record being inserted into a specific table, or a particular field in a table being set to a specified value. For example, you might create a workflow that runs whenever a user requests approval for an item they want to order from the catalog.

When an activity completes, the workflow transitions to next activity. An activity might have several different possible transitions to various activities, depending on the outcome of the activity. Continuing the example above, if the user’s request is approved, the activity might transition to an activity that notifies someone to order the item; if the user’s request is denied, the activity might transition to notifying the user that their request has been denied.

The graphical workflow editor represents workflows visually as a type of flowchart. It shows activities as boxes labelled with information about that activity and transitions from one activity to the next as lines connecting the boxes.

At each step in a workflow:

1. An activity is processed and an action defined by that activity occurs.
2. At the completion of an action by an activity, the workflow checks the activity’s conditions.
3. For each matching condition, the workflow follows the transition to the next activity.

When the workflow runs out of activities, the workflow is complete.

**Workflow activities**

A workflow activity contains instructions that are processed by the workflow. Activities can include running scripts, manipulating records, waiting for a set period of time, or logging an event. Workflow conditions determine whether or not the activity is performed. Activities can be added, removed, or rearranged. Transitions can be drawn between activities.

This is an activity that triggers a notification:

![Sample activity](image)

For more information on available activities and their behaviors, see Workflow activities.

**Transitions**

After the workflow condition is evaluated, the workflow transition determines which activity is performed when the workflow condition is met.

This is a transition that always leads from the Change Approved script to the Change Task activity:
Exit conditions

After a workflow activity is performed, the workflow condition is evaluated to determine which transition is activated.

The condition determines behavior based on a change being approved or rejected:

Workflow example

During workflow editing or while an unpublished workflow is running, only the person who checked out the workflow can view the changes.

After a workflow is published, it is available to other users. The workflow moves through the process as defined in the Workflow Editor. The entire workflow is represented in one screen. For example, this is the Standard Change workflow:
Sample change workflow

Workflow editor

The Workflow Editor is an interface for creating and modifying workflows by arranging and connecting activities to drive processes.

You can manage multiple workflows in the same screen, create custom workflow activities, and use existing activities as data sources. Users with the workflow_creator role can create workflows. Users with the workflow_admin role can create, modify, delete, and publish workflows.

To open the Workflow Editor, navigate to Workflow > Workflow Editor. For information about using the editor, see Create a workflow.
Welcome screen

The editor opens with the Welcome page, which displays a list of active, published workflows. From this tab, you can open existing workflows, create new workflows, and open help resources related to workflow.
Published: Click to view list of published workflows
Checked Out: Click to view list of workflows checked out to current user
Help: Click to view links to help resources for workflow

New Workflow button
Click to create a new workflow

Palette tabs

Workflows: Workflow activities and workflows you can use as subflows.
Core: Available workflow activities appropriate for the selected workflow. Contents can include activities provided by the base system and those purchased with orchestration.
Packs: Orchestration activity packs downloaded from the ServiceNow® App Store, organized by vendor and scope. Custom activities and workflows that you scope also appear as packs. Only visible if the orchestration plugin is installed.
Custom: Orchestration custom activities available. Only visible if the orchestration plugin is installed.
Data: Activities in the current workflow that output data. You can use these activities as data sources for other activities. Only visible if the orchestration plugin is installed.

Note: If your workflow welcome page does not look like this example, you may have customized the workflow welcome page before upgrading to Jakarta. You can update the workflow welcome page to the latest version by editing the UI pages. Navigate to System UI > UI Pages > workflow editor welcome. In the UI page record for workflow_editor_welcome, scroll to the Versions related list. Select the row for the version corresponding to the upgrade to Jakarta, right-click and select Revert to this version.

Workflow canvas

After you open or create a new workflow, the system displays the workflow canvas. On the canvas you interact with the workflow editor through several different elements: the canvas itself, the canvas tabs, the title bar, the palette, and the palette tabs.

The drawing canvas is where you add activities and configure transitions for checked out workflows. Add an activity by dragging it from the palette to the workflow in the canvas. For more information, see Create a workflow.

- Canvas tabs: Contains tabs for accessing workflows being edited or created.
- Title bar: Displays the workflow name and status. Provides a menu and controls for configuring, testing, and validating workflows.
- Canvas: Provides the working surface for creating new workflows or editing existing ones.
- Palette tabs: Contains tabs for accessing activities being edited or created.
- **Palette**: Contains all available workflow activities and existing workflows you can use as subflows. Drag activities and subflows to the canvas to create new workflows or edit existing ones.

**Workflow user interface**

**Workflow palette**
The default workflow palette contains workflow activities and existing workflows you can use as subflows.

The basic workflow palette contains these tabs:

- **Workflows**: Displays existing workflows and provides controls for creating new ones.
- **Core**: Displays baseline workflow activities available to all systems and Orchestration activities (when Orchestration is activated).

### Workflows tab

The **Workflows** tab lists existing workflows that you can edit or use as subflows in other workflows. Double-click a workflow to open it in the canvas. To add a workflow as a subflow, drag it to another workflow in the canvas. Click the + icon to create a new workflow.

![Workflows tab in the palette](image)

### Core tab

The **Core** tab contains the standard activities available by default to all workflows and any activities purchased with Orchestration, organized by category. Click the arrow icons to expand or collapse the activity lists under each category. To add an activity to a workflow, drag it to the canvas. For more information, see *Add an activity to a workflow*. 
Workflow editor title bar

When a workflow is opened in the canvas, the title bar displays the workflow title and the workflow status in italics. Possible states are Checked out by <name> and Published.
Workflow editor title bar

Controls on the right side of the title bar manage the workflow.

- **Workflow Properties**: Opens the current workflow’s properties form.
- **Start**: Runs the workflow. This control is only available for workflows running on the Global table that are accessible from all application scopes. To test workflows that are on other tables, insert a record into that table that meets the condition of the workflow.
- **Validate**: Tests the workflow prior to publication. Validation detects potential problems that can prevent the workflow from publishing or cause the workflow to fail. For more information, see [Workflow Validation](#).
- **Help**: Opens documentation to help you create the workflow.

Workflow menu

Click the menu icon in the title bar for additional options to configure the workflow.
Accessing the workflow menu

These menu options are available:

**Workflow menu options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Workflow</td>
<td>Creates a new workflow.</td>
</tr>
<tr>
<td>Open Existing</td>
<td>Opens another existing workflow.</td>
</tr>
<tr>
<td>Copy</td>
<td>Creates a duplicate of the workflow. Give the copy a different name.</td>
</tr>
<tr>
<td>Publish</td>
<td>Makes the personal workflow version public, overwriting the current published workflow version. This option is only available for checked out workflows.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Checkout</td>
<td>Creates a personal version of the workflow for you, which you can edit. This option is only available for published workflows.</td>
</tr>
<tr>
<td>Delete</td>
<td>Deletes the workflow. You cannot delete workflows that have contexts associated with them.</td>
</tr>
<tr>
<td>Set Inactive</td>
<td>Inactivates the workflow so that it cannot be used.</td>
</tr>
<tr>
<td>Expand Transitions</td>
<td>Redraws the transitions so that they do not overlap when they leave the activity condition.</td>
</tr>
<tr>
<td>Start Workflow</td>
<td>Starts a test run of the current workflow.</td>
</tr>
<tr>
<td>Validate Workflow</td>
<td>Runs validation tests on your workflow prior to publication. Use this validation to detect potential problems that can prevent the workflow from publishing or cause the workflow to fail. For more information, see Work on workflows.</td>
</tr>
<tr>
<td>Collapse Transitions</td>
<td>Redraws the transitions so they overlap when they leave the activity condition.</td>
</tr>
<tr>
<td>Show Contexts</td>
<td>Displays all the contexts for the current workflow. You can use this option to troubleshoot a workflow.</td>

<td>Opens the Workflow Properties form, which defines the workflow's attributes.</td>
</tr>
<tr>
<td>Edit Inputs</td>
<td>Opens the Workflow Inputs list of variables that the workflow can accept when used as a subflow. For more information, see Pass a variable from a workflow to a subflow.</td>
</tr>
<tr>
<td>Edit Stages</td>
<td>Opens the Workflow Stages list. For more information, see Workflow stages. For tables with a column of Type = Workflow.</td>
</tr>
</tbody>
</table>

Managing workflows

Create, edit, validate, and publish workflows to automate multi-step processes across the platform. Understand workflow activities and variables and how to use them effectively. Take a deeper look at how workflows are constructed, validated, and used.

Create a workflow

Automate a multi-step process by creating a workflow with the workflow editor.

- You must have the workflow_admin or workflow_creator role to use the workflow editor.
- If you are designing the workflow as part of an update set process, see Workflow movement with update sets before creating the workflow.

1. Navigate to Workflow > Workflow Editor.
   The Welcome tab of the Workflow Editor opens.
2. On the Workflows tab in the palette, click New Workflow.
<table>
<thead>
<tr>

- Knowledge - Approval Retire
A simplified version of the New Workflow form opens.

3. Fill in the **Name** and **Table** fields

4. (Optional) Add a **Description**.

5. (Optional) Do one of the following:
   a) If the **Conditions UI** section is displayed, specify a **Condition** if needed and edit the fields. (The **Conditions UI** section shows only if the selected table supports conditions for launching workflows. For example, if you select the sc_req_item table, conditions are not applicable and the **Conditions UI** section is not displayed.)
   b) If the **Stages UI** section is displayed, check that the **State rendering** and **Stage order** fields contain the correct information. (The **Stages UI** section shows only if the selected table supports stages. For example, if you select the sc_req_item table, the **Stages UI** section is displayed.)

6. Click **Submit**.

   The new workflow is created with the **Begin** and **End** activities connected by a single transition.

7. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users.

   For more information, see *Work on workflows*.

8. To change advanced settings for the workflow, click the **Properties** icon. If you make changes, click **Update**.

### Workflow properties

In the properties of a workflow, you can configure settings such as its application scope, start conditions, schedule, inputs, stages, and run time metrics. You can also view information such as the workflow author, version, and history.

When you create a new workflow, the following fields are available in the dialog box:

- **Name**
- **Table**
- **Description**
- **If condition matches**
- **Condition**
If you click Diagrammer view in Related Lists, the following UI sections are available in the dialog box:

- General
- Conditions
- Inputs
- Activities
- Application
- Schedule
- Stages
- Estimated Runtime

### General

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A name to identify the workflow.</td>
</tr>
<tr>
<td>Table</td>
<td>The table for the workflow to run on. Workflows that run on specific tables can still interact with other tables. Select <strong>Global (global)</strong> to run the workflow on all tables.</td>
</tr>
<tr>
<td>Checked out</td>
<td>(Read-only) When the workflow was checked out. Automatically set by the Checkout action in the workflow menu.</td>
</tr>
<tr>
<td>Checked out by</td>
<td>(Read-only) The user who has this workflow checked out. This value is automatically set by the Checkout action in the workflow menu.</td>
</tr>
<tr>
<td>Published</td>
<td>(Read-only) Check box to indicate whether the workflow has been published. Automatically set by the Publish action in the workflow menu.</td>
</tr>
<tr>
<td>Description</td>
<td>The purpose of the workflow.</td>
</tr>
</tbody>
</table>

**Note:** The list shows only tables and database views that are in the same scope as the workflow. Also, all users who edit the workflow must have access to the necessary tables and domains.

### Conditions

Create conditions to trigger the workflow. The Conditions section does not appear if you select a table, such as sc_req_item, that does not require a condition.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If condition matches</td>
<td>When the condition evaluates to true, the workflow launches an active context:</td>
</tr>
<tr>
<td></td>
<td>- None: The workflow is not automatically started by the workflow engine. To run this workflow, write a script to start the workflow.</td>
</tr>
<tr>
<td></td>
<td>- Run the Workflow: The default value. The workflow engine starts the workflow if the information in the Condition field matches a record that is inserting into the table.</td>
</tr>
<tr>
<td></td>
<td>- Run if no other workflows match yet (deprecated): The workflow only runs if no other workflows are running on the execution thread that started this workflow. Avoid using.</td>
</tr>
<tr>
<td></td>
<td>- Run if no other workflows matched: The workflow only runs if no other workflows are running on a specific record. For example, there are four workflows inserted into the Incident table, which have a condition such as short_desc contains test. A new workflow, which has If condition matches is set to Run if no other workflows match yet, only runs if none of the four workflows have started running on the incident record.</td>
</tr>
</tbody>
</table>

**Condition**

A condition builder for specifying workflow conditions that trigger the behavior selected from the If condition matches list.

**Order**

Numeric value that determines the order of the workflow, relative to other workflows. Workflows are evaluated in order from the lowest order number to the highest. A workflow runs if it is the first to match conditions.

---

**Inputs**

The Inputs section lists all the activities in the current workflow that input data, the data type, and the default value. The Inputs section is only available after a workflow has been created. To create a variable, click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Displayed column label. Localized depending on user locale.</td>
</tr>
<tr>
<td>Reference</td>
<td>Input field from another table.</td>
</tr>
<tr>
<td>Type</td>
<td>Data type. For example, integer or string.</td>
</tr>
<tr>
<td>Default value</td>
<td>Value used if you do not provide a value.</td>
</tr>
</tbody>
</table>

**Activities**

The Activities section enables you to set activity pinning and maximum activity count.
### Field: Activity pinning

**Description:** List of options that control updates to custom activities at the workflow level. Pinning protects custom activities from being updated automatically when downloaded from the ServiceNow Store. For more information, see Workflow activity pinning. The possible options are:

- **Set by activity:** Allows all activities in the workflow to use their own pinning settings. This is the default pinning option.
- **Pin all activities:** Pins all activities in the workflow to their current version.
- **Unpin all activities:** Allows all activities in the workflow to be updated.

### Field: Max activity count

**Description:** The maximum number of activities performed by the workflow. This value is used to prevent infinite loops and is set to 100 by default. When the stated maximum count is reached, the workflow is canceled. If this field is blank, the maximum count is set to -1, and the workflow is canceled.

---

**Application**

The Application section enables you to see application scope and scope restrictions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>(Read-only) Scope of this activity. For more information, see Application Scope.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Scope restrictions for this workflow. Possible settings are:</td>
</tr>
<tr>
<td></td>
<td>• All application scopes: Workflow is accessible to all application scopes.</td>
</tr>
<tr>
<td></td>
<td>• This application scope only: Workflow access is limited to the scope named in the Application field.</td>
</tr>
</tbody>
</table>

For more information see Workflow scope.

---

**Schedule**

Use the Schedule section to create a schedule for this workflow using the schedule builder.
### Field | Description
---|---
**Delivery based on** | The schedule type for this workflow. Possible types are:
- **User-specified duration**: Duration based on a user-specified value. This is the default schedule type.
- **Relative duration**: Duration calculated from a preconfigured schedule, such as 8-5 weekdays.

**Expected time** | User-defined interval. This field is visible when the schedule type is **User-specified duration**.

**Schedule** | Preconfigured schedule that determines when this workflow runs.

**Timezone** | Time zone for this instance.

**Stages**

The Stages section appears if you select a table with **Type = Workflow**.

### Field | Description
---|---
**Stage** | Displays the workflow stage progress on the selected table. Optionally, select **Stage rendering** and **Stage orders** schemes to customize the appearance of the stage field. The default values cover typical scenarios.

**Stage rendering** | The renderer to use when displaying stage icons on a form or list view. For more information about renderers, see [Workflow stage renderers](#).

**Stage order** | The order of workflow stages when you view a workflow field in a list. Select **Computed** to let the workflow engine compute the stage order from the order of execution in the workflow. Select **User Specified** to use the **Order** field from that Workflow stages.

**Name** | The name of the stage as it appears in workflow fields.

**Duration** | Time allocated for the specific stage.

**Order** | The order of workflow stages when you view a workflow field in a list. Select **Computed** to let the workflow engine compute the stage order from the order of execution in the workflow. Select **User Specified** to use the **Order** field from that Workflow stages.

**Value** | The value of the stage when it is referenced from elsewhere in the system, such as in a script.
Estimated Runtime

The Estimated Runtime section opens the controls for configuring the ERT for the workflow. Core workflows included in the base system are not configured for estimated run time by default. All new workflows are configured with default ERT values automatically. You can edit existing run time estimates or configure new ones for any existing workflow. For details about how estimated run times are configured and calculated, see Workflow run time metrics.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requires ERT</td>
<td>Check box to indicate that this workflow requires an estimated runtime configuration. You can use the ERT calculations to determine if workflows are running longer or shorter than expected and to identify errors in workflow processing. By default, new workflows require an ERT.</td>
</tr>
<tr>
<td>Estimated Run Time</td>
<td>The initial estimate for the workflow’s run time.</td>
</tr>
<tr>
<td>Number of data points</td>
<td>(Read only) The number of times the system has compared the estimated run time to an actual run time result.</td>
</tr>
<tr>
<td>Outlier Percentage Threshold for ERT</td>
<td>(Required) The percentage deviation from the estimated run time that identifies an outlier workflow run time. The system uses a default value of 20. For more information, see Outlying workflow run times.</td>
</tr>
</tbody>
</table>

Create a workflow from a table

Automate a multi-step process by creating a workflow from the list view of any table that supports workflows.

- If you are designing the workflow as part of an update set process, see Workflow movement with update sets before creating the workflow.

1. Open a table, such as Incident or Problem, in list view. For example, navigate to Incident > Open.
2. Right-click in the column header and select Configure > Workflows.
The **Workflow Versions** on that table appear in a list.

3. Click **New**.
   The **Workflow Version** opens in **New Workflow** view. The **Table** field is filled in with the table you selected in step 1 and is read-only.

4. Enter **Name**.
5. (Optional) Enter **Description**.
6. (Optional) Edit conditions fields as necessary.
7. Click **Submit**.
   The new workflow is added to the **Workflow Versions** list.
8. Click the workflow **Name**.
   The new workflow is created with the **Begin** and **End** activities connected by a single transition.
9. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users.
   For more information, see Work on workflows.
10. (Optional) To change advanced settings for the workflow, click the Properties icon. If you make changes, click Update.

Create a workflow for a new service catalog item

When you create a new service catalog item, you can create a new corresponding workflow at the same time.

- If you are designing the workflow as part of an update set process, see Workflow movement with update sets before creating the workflow.

1. Navigate to Service Catalog > Catalog Definitions > Maintain Items.
2. At the top of the form, next to Catalog Items, click New

The Catalog Item form opens.

3. Add a Name.
4. Next to the Workflow field, click the lookup icon.
5. Next to Workflow at the top, click New.
The Workflow version dialog opens in the New Workflow View. The Table field is set to Requested Item (sc_req_item) and is read-only.

6. Add a Name.
7. (Optional) Add a Description.
8. (Optional) Change the stage information as necessary.
9. Click Submit.
The new workflow is created with the **Begin** and **End** activities connected by a single transition.

10. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users.
   For more information, see *Work on workflows*.
11. To change advanced settings for the workflow, click the **Properties** icon.
12. Click **Update**.
    If you close the workflow editor, you can see the Catalog Item record. Note that the workflow is added to the Workflow field. The Show Workflow and Information icons appear next to the **Workflow** field. Hover over the information icon to view a read-only summary of the workflow.

### Create a workflow for an SLA Definition

Automate a multi-step process by creating a workflow from an SLA definition.

- If you are designing the workflow as part of an update set process, see *Workflow movement with update sets* before creating the workflow.

1. Open a list of SLA definitions. For example **Facilities > SLA Definitions** or **Service Level Management > SLA Definitions**.
2. At the top of the form, next to **SLA Definitions**, click **New**.
3. Select **Contract SLA** or **Service Offering SLA**.
   The SLA Definition or Service Offering SLA form opens.
4. Next to the **Workflow** field, click the lookup icon.
5. Next to **Workflow** at the top, click **New**.
The Workflow Version dialog shows in the New Workflow view. The Table field is set to SLA Definition (contract_sla) or Service Offering SLA (service_offering_sla) and is read-only.

6. Enter Name.
7. (Optional) Enter Description
8. (Optional) Edit conditions fields as necessary.
9. Click Submit.

The new workflow is created with the Begin and End activities connected by a single transition.
10. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users. For more information, see Work on workflows.

11. (Optional) To change advanced settings for the workflow, click the Properties icon. If you make changes, click Update.

Ending workflows with multiple branches

A workflow is complete when it reaches the End activity, even if there are still active branches of the workflow in progress. To ensure that both branches are completed, add a Join activity to resolve the branches.

For example, the following figure shows a workflow with two branches that execute independently. When Task 1 and Task 2 of Branch B are completed, the workflow is marked complete even if the Branch A tasks are not completed.

![Workflow with uncompleted branch](image)

For both branches to complete, add a Join activity to resolve the branches. When one branch reaches the join, the workflow waits for the other branch. When both branches are complete, the workflow reaches the end. The Incomplete condition of the a Join activity is met only if one of the branches cannot be completed.
Workflow with completed branches

Work on workflows

To complete a workflow, you add workflow activities, validate the workflow, and publish it.

Add a workflow activity

Activities determine the functionality of the workflow.
When they are created, all workflows contain Start and End activities.
For more information, see Workflow activities.

1. Open a workflow.
2. Check out the workflow.
3. Drag a workflow activity from the Activities menu into the workflow body.
4. Populate the Workflow Activity form that appears.

Validate a workflow

You can manually validate a workflow from the Workflow Editor. You can generate a workflow validation report from the Workflow Version form.

Role required: workflow_admin, workflow_creator, or admin

Running a workflow on a new node automatically attempts to validate the workflow. If validation is successful, the system updates the workflow version record to indicate the workflow has been validated and marks the record as updated by the user who ran the workflow.

1. Open the workflow to validate in the workflow editor.

   When the workflow is loaded, the workflow validator icon appears in the toolbar.

2. Click the validator icon to run a series of validation tests on the current workflow version and generate a report.
3. Complete the following steps to generate a workflow validation report from the Workflow Version form
   a) Navigate to Workflow > Administration > Workflow Versions, and select a workflow to validate.
   b) Under Related Links, click Validate Workflow.

Publish a workflow

When a workflow is complete, publish the workflow so that it is available to all users.

Before you publish a workflow, validate it to test it for issues that might cause it to fail, such as missing subflows or disconnected transitions. For more information, see Workflow validation.
To publish a workflow:

1. Navigate to Workflow > Workflow Editor.
2. Open the workflow that you want to publish.
3. In the title bar, click the menu icon and select Publish.

If you published a new version of workflow, the changes are not applied to running workflow contexts. Any currently running workflow context continues using the workflow version that was available when the workflow started. The next time the workflow runs, it uses the new version.

**Determine whether a workflow can run**

A workflow can run only if a checked out version is available to the user who has it checked out, and a valid, published version is available for all users with permission to run it.

Role required: workflow_admin, workflow_creator, or admin

1. In the navigation filter, enter wf_workflow.list, and then open one of the workflows.
2. In the Versions related list, check for all of the following conditions:
   a) There is only one workflow version in a state of Checked out and Checked out by.
   b) There is only one version and it is not checked out. This version must be both Active and Published.
   You may need to personalize the list and add the Active column.
   c) If there are multiple versions, only one is Published.

These checks determine the only two conditions under which a workflow can run:

- A checked out version of a workflow is available for the user who has it checked out.
- A valid, published version of a workflow is available for all users who have permission to run the workflow.

Main flows containing subflows that do not meet one of these two conditions are not permitted to execute against a current record transaction. Instead, a critical log entry detailing the subflow state is added to the Workflow Context record. To enable the workflow to execute on the next appropriate transaction, remove the subflow from the main flow or modify the published and active states of the subflow.

**Edit a published workflow**

You can edit a published workflow after you check it out.

**Note:** You cannot check out or delete workflows that are associated with a read-only application file.

To check out a workflow:

1. Navigate to Workflow > Workflow Editor.
2. Open the workflow that you want to edit.
3. In the title bar, click the menu icon and select Checkout.

   A new version of the workflow is created and assigned to you.

   If you are in a different domain than the published workflow, the new workflow version is created in your domain.

After you finish editing the workflow, validate and publish the workflow to make the new version available to other users.
Workflows used as subflows

A workflow can launch another workflow as an activity.

The parent workflow triggers the subflow and then waits for the subflow to complete before continuing. Run the workflow validation tool prior to publishing to detect missing subflows and other dependency problems, such as those involving update sets.

The Workflows tab in the Workflow Editor contains a list of the workflows available for use as subflows.

![Workflows](image)

**Workflows available to use as subflows**

Make sure that the selected subflow is active. If the subflow is inactive, the main workflow will hang with a **Loading** message. If you place an inactive subflow into a workflow, the subflow appears with a red banner, indicating that it cannot run. An active subflow is highlighted in blue when selected.
Subflows and the Create Task activity

If a workflow contains a Create Task activity that has executed on the current record, additional task activities in the workflow might not execute as expected.

This can happen when the same subflow containing a Create Task activity runs more than once in a parent flow. When the subflow reruns and attempts to execute the Create Task activity again, the system reopens the first task activity instead and does not create an additional task.

Note: An alternative to creating duplicate subflows that use the Create Task activity is to add a Run Script activity to the workflow that creates a task with a script.
The same create task activity runs twice in a workflow

In this configuration, the workflow does not run the same subflow containing a **Create Task** activity more than once. This allows the workflow to create additional tasks.
Running different subflows containing the Create Task activity

Pass a variable from a workflow to a subflow

Use this process to pass variables from a parent workflow to a subflow.

**Note:** You can also use the Return Value activity in the subflow to return values to the parent workflow. Make sure to have a Return Value on every ending transition path.

1. Prepare the subflow to accept variables from the parent workflow by defining the inputs.
2. Include the subflow in the parent workflow and connect the inputs to the parent workflow variables.

**Note:** Subflows on the Requested Item (sc_req_item) table in the Service Catalog cannot accept variables from parent workflows.

**Define inputs for a subflow**

Define the input variables for a workflow to request from parent workflows when it is launched as a subflow.

All inputs are stored in the Variables (var_dictionary) table.

1. In the editor, open and check out the workflow.
2. In the title bar, click the menu icon and select Edit Inputs.
3. In the Workflow Inputs window, click New.
4. Populate the record with the definition of the variable, including the column name, the label that is displayed to the user, and the type of field.
5. Click Submit.

**Invoke a subflow in a workflow**

Use this procedure to add a subflow to a workflow.

1. In the Workflow Editor, open and check out the parent workflow.
2. Drag the subflow from the Workflows tab to the parent workflow.
3. In the New Activity dialog box, define the variables defined by the subflow’s Inputs.

   These fields can accept both static values or variables in the following format:

   ${variable_name}

4. Click Submit.

   The workflow triggers the subflow at the appropriate time and passes the variables as indicated by the Inputs definition.

**Prepare a subflow**

Review the process of preparing a subflow for use in a parent workflow, and for preparing the parent workflow to use a subflow.

1. In the editor, open and check out the workflow that you want to use as a subflow.
2. In the title bar, click the menu icon and select Edit Inputs.

   ![Menu with Edit Inputs option selected](image)

   In the Workflow Inputs window, click New in the Variables list.

   ![Workflow Inputs window with New option selected](image)
4. Add a new variable depending on the type of values that it is going to store. The following example sets up a string value.

5. Click Submit.
6. Close the Workflows Inputs dialog.
7. Create a Run Script activity on the subflow.
   - Set the value from the parameter to a field on the current form. This is important because the Notification activity can only pull values from the current variable and not from the newly added variable. The following example sets the value in the Description field.
     
     ```javascript
     current.description = workflow.inputs.bluesubvariable;
     ```
   - Create a new field on the request form but do not display the field. This serves as temporary storage.
8. Create a **Notification** activity on the subflow. Use `${description}` in the subject to return the value from the field.
This is what the subflow would look like:
Prepare a workflow to use a subflow
After you create a subflow, use this procedure to prepare the parent workflow.

1. On the parent workflow, create a variable similar to what you did on the subflow, but name it something different.

In the following example, the variable is named **Blue Main Variable**.

2. Click Submit.

3. Insert a Run Script activity to return the value from a field to the newly created variable.

   In this example, the value of the **Short Description** field is returned and given to the newly created variable.

   ```javascript
   workflow.scratchpad.bluemainvariable = current.short_description;
   ```
4. Click **Submit**.
5. In the subflow activity, set the **Blue Sub Variable** to pass the `bluemainvariable` to the `bluesubvariable`.

   \[\text{${workflow.scratchpad.bluemainvariable}$}\]

   This is what the main workflow looks like:
Using variables in a workflow

Within workflow there are several different types of variables that are available.

Some variables define, describe, or compose the pieces of the workflow (such as workflow activities). Some variables are available specifically to facilitate the execution of a workflow (such as scratchpad variables). Some variables define, describe, or compose the data records being manipulated by the workflow process (for example, the elements of a Glide Record that are defined in a dictionary.xml file describing a record, such as an incident).

Activity variables

Activity variables are properties specifically associated with a workflow activity. These are the inputs that appear on the activity definition when a specific activity is dragged onto the workflow canvas. These variables are properties that define, compose or describe the workflow activity, or the work it is designed to perform.

Activity variables are declared in a related list within the Workflow Activity Definition.

To add, view, or modify a variable:

1. Navigate to Workflow > Activity Definitions.
2. Select a workflow activity, such as Approval - User.
3. In the Activity Variables section or tab, add, view, or modify the variables. Activity variables are defined using the same fields as Dictionary records.

Note: If defining a new activity variable that is dependent on another activity variable, put the prefix 'vars.' before the name of the parent activity variable. For example, if the child field is dependent on a field named parent, put the value vars.parent in the Dependent field.

To control the visibility of an activity variable on the workflow canvas after the activity has been dragged to the canvas, use a UI policy on the wf_activity table.

To access the variables or assign values to these variables within the workflow activity, use the vars variable of the workflow activity.

```
activity.vars.variable_name = new_variable_value
```

Workflow input variables

Workflow variables are external values that are passed into and referenced by a workflow during its execution.

Workflow variables can be declared externally in a script and passed into a main workflow or they can be declared within a main workflow and passed as inputs to a subflow.

Note: There is a specific kind of input variable for any workflow that is declared against the table Requested Item (sc_request_item). To understand the use of these variables see Workflow catalog variables.

Workflow variables are declared in a form available from the Workflow Editor gear menu.

To add, view, or modify a variable:

1. Navigate to Workflow > Workflow Editor.
2. Edit and checkout a workflow.
3. Select the Workflow Activities menu and select Edit Inputs.
4. Select an existing variable or click **New**.

Note the **Column name** field. Use this value when accessing the variable from a script.

Workflow variables do not appear on the workflow canvas, they are only available for view from the Workflow Activity menu.

The input variables are available to use in scripts. To access an input variable from a script:

```javascript
var input = workflow.variables.variableName; // get the workflow variable identified by column name.
```

**Assigning values to variables from outside of workflow**

After being declared in a workflow, values can be assigned to the variables from where the workflow is kicked off.

The following example demonstrates how a workflow variable's value can be set in a script include, business rule, or UI action:

```javascript
// Declare an instance of workflow.js
var wf = new Workflow(); // Get the workflow id
var wfId = wf.getWorkflowFromName("Workflow Name");
// Start workflow, passing along name: value pair(s) for mapping to variable
// where input_var_name is the name of the variable declared in gear menu
// and input_var_value is whatever that value should be for this execution of workflow
wf.startFlow(wfId, null, "Workflow Name", {input_var_name: input_var_value});
```

Another example that demonstrates a more readable way of passing multiple variables involves declaring an object, adding the names/values to the object, and passing it:

```javascript
// Declare an instance of workflow.js
var wf = new Workflow(); // Get the workflow id
var wfId = wf.getWorkflowFromName("Workflow Name");
// Start workflow, passing along object containing name/value pairs mapping to inputs expected by the workflow
var vars = {};
vars.input_var_name1 = input_var_value1;
vars.input_var_name2 = input_var_value2;
// add as many variables as your workflow is expecting, then pass the object
wf.startFlow(wfId, null, "Workflow Name", vars);
```

**Assigning Values for Subflow Inputs from inside of a Main Workflow**

If a workflow that accepts inputs is called from within another workflow, those input values can be set from the workflow canvas within the UI of the workflow activity. Each input variable declared for a subflow will have a text box input area displayed on the activity. Within these text boxes, the variables can be set with any value either from the scratchpad or from within the current record.

For more information, see [Workflows used as subflows](#).
Reading the Value of a Workflow Input Variable

The value of a Workflow input variable is accessible anywhere within the workflow that accepts javascript by dot walking the current workflow object:

```
var readValue = workflow.inputs.variable_name;
```

Workflow scratchpad variables

The scratchpad in workflow is a space in the workflow context to store and share string based variables (as name:value pairs) between instances of activities within an executing instance of a workflow.

The scratchpad is global to the instance of the running workflow and as such, is available equally to all activities.

Declaration

The scratchpad itself is automatically available to an executing workflow and requires no specific declaration. Variables are declared and stored in the scratchpad simultaneously by referencing it. For example:

```
workflow.scratchpad.variableName = variableValue;
```

Display

There is no way to view the contents of the scratchpad.

Access and Assignment

As stated in the Declaration section:

```
workflow.scratchpad.variableName = variableValue;
```

or:

```
var myValue = workflow.scratchpad.variableName;
```

Current variables

Current is the database GlideRecord that kicked off the workflow, either by association to the table in the Workflow properties table or by being associated with a catalog item.

Declaration

Variables in current are the columns that are defined in the dictionary.xml file that support the database record. There is no way at runtime to add variables to the current record.
Display

Variables of a current record are displayed on the Glide Forms and Lists throughout the applications that use them.

Access and Assignment

To access the variables or assign values to the variables within the workflow activity, get the value from the current record by referencing the Glide Element.

```javascript
var myVarValue = current.getElement(nameOfTheField);
```
or
```
var myVarValue = current.fieldName;
```
or
```
current.variableName.setValue("A Variable Value");
```

Workflow catalog variables

Workflows that are associated with the Requested Item (sc_req_item) table have a specific type of workflow input.

The inputs into this workflow are essentially question:answer pairings that, when associated with a specific catalog task, become options on the task form. These options are generated by that catalog task activity within a workflow.

Scope

For the purposes of Service Catalog and workflow, a variable’s scope determines its availability to a catalog task activity within a workflow. You can define variables as global or catalog item-specific. When a variable is associated to a catalog item and the workflow generating the catalog task is associated to the catalog item, the variable scope determines which variables are available for mapping within the catalog task activity in a workflow. If a workflow is associated with Requested Item (sc_request_item), and is not specifically associated with a catalog item, any catalog variable with a blank Cat Item field value is available to all catalog task activities within the workflow.

Declaration

You can declare requested item catalog variables at the catalog item level or at a global level.

You can declare global catalog variables using the workflow editor context menu.

Also see, Global variable declaration option 2.

1. Navigate to Workflow > Workflow Editor.
2. Open and check out a workflow that runs against the Requested Item (sc_req_item) table.
3. Click the menu icon and select Edit Catalog Variables.
4. Click New to create a new variable or select an existing variable.
5. Select the Global check box.
6. Click Submit.
Global variable declaration option 2
You can declare global catalog variables using the Service Catalog.

1. Navigate to Service Catalog > Item Variables.
2. The list of variables that appears in the workspace has a default filter of Cat Item != <blank>. Change the filter to Cat Item = <blank> and run the query.
   The catalog variables that appear are available to any catalog task that is initiated from within a workflow.
3. Click New to create a new variable.
4. Leave the Cat Item field blank.
5. Select the Global check box.
6. Click Submit.
   Also see, Global variable declaration option 1.

Catalog item specific variable declaration option 1
You can declare a catalog item-specific variable.

These variables are only available to the catalog item referenced in the Cat Item field on the variable record.

1. Navigate to Service Catalog > Catalog Variables > Item Variables.
   Note the list of variables that appears in the workspace has a default filter of Cat Item != <blank>.
2. Enter or select a catalog item in the Cat Item reference field.
   Selecting a Cat Item restricts the scope and availability of the catalog variable to that specific catalog item.
3. Click Submit.
   Also see, Catalog item specific variable declaration option 2.

Catalog item specific variable declaration option 2
You can declare a catalog item-specific variable directly from a catalog item record.

Creating a catalog variable in this way automatically sets the Cat Item reference to the catalog item selected.

1. Navigate to Service Catalog > Catalog Definitions > Maintain Items.
2. Select or create an a catalog item.
   Note the Variables related list. All variables declared using this related list have a Cat Item reference value of the current catalog item.
3. From the Variables related list, click New.
4. Ensure that the Cat Item field correctly references the catalog item previously selected or created.
5. Go to or open the Question section or tab.
6. Add a Question.
7. Add a Name.
   Variable names should not include white space and cannot begin with a number.
8. Click Submit.
   Also see, Catalog item specific variable declaration option 1.

Display
Catalog specific item variables are visible in several places depending on where in the process the variable is viewed.
Declaration can happen and variables can be seen from within the menu, inside both the **Maintain Items** module and in the **Item Variable** modules of the Service Catalog.

Within a workflow, the Catalog Specific Item variables are available to the **Catalog Task** activity in the form of a slushbucket at the bottom of the **Catalog Task** activity. Item variables that are selected, are the question and answer pairs that will appear on the task that is generated by that instance of **Catalog Task** when executing that workflow.

If a workflow is associated with a specific catalog item, the association acts as a filter for item variables that appear in the slushbucket of the **Catalog Task** activity.

The last place the variables are seen is in the task form that is generated by the Catalog Task Item. The variables selected in the slushbucket are the question and answer pairs that appear to the user on the task form.

**Access and assignment**

The Catalog Item Variables are available and assigned to a specific **Catalog Task** activity (thereby to a specific task) using the slushbucket entry of a catalog task.

The user working the task enters the values of the variables.

To access the values of a Catalog Item Variable inside a script:

```javascript
var gr = current; // or create and query a new GlideRecord
var itemVariable = gr. variables [ variableName ]; //access the service catalog variable identified by the variable name.
var itemValue = itemVariable. getGlideObject (). getValue ();
var itemQuestion = itemVariable. getGlideObject (). getQuestion (). getLabel ();
```

**Workflow events**

The system employs two types of events: registered platform events and workflow events.

**Registered platform events**

Registered events are created in business rules and are used for such tasks as sending email notifications when records are inserted into the database. Workflow events are registered within workflows only and are not used anywhere else in the platform. Registered platform events can be triggered by a workflow for external use, but cannot be used within a workflow.

**Workflow events**

Workflow events follow different rules than platform events that are registered using the event registry. Platform events are entered into the Event Registration (sysevent_register) table and are available for platform processes to use. Workflow events are triggered exclusively for the workflow engine and are used only to direct the work of executing workflow contexts. When an event is registered in a workflow, it is attached to a currently executing activity in the **registered_events** column of the Workflow Executing Activity (wf_executing) table.

Workflow events also can be broadcast to a workflow from any scripting source that has access to the workflow context, such as a script include or a **Run Script** activity. In this case, the event, such as **cancel**, is passed to all records in the Workflow Executing (wf_executing) table for a specific context.

Whether by registry or by broadcast, an event is handled by the activity definition associated with the currently executing activity. Each activity definition comes with a set of handlers. For example,
most activities come with onExecute, onCancel, and onUpdate event handlers. As an example of a more specific event, the Approval - User activity also comes with onDetermineApprovalState, which is specific to the work of the approval activity.

**Multiple parallel events**

A single workflow can have multiple event threads running concurrently, such as when a workflow has timers that overlap on separate workflow branches. If any additional thread completes before the first thread, the system stores event information from the additional thread on the Workflow Queued Commands (wf_command) table. After the first thread completes, the system retrieves the information stored by the additional thread and proceeds through the workflow with the event information from each thread.

**Workflow events in the base system**

Several workflow events are available in the base system.

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
<th>Purpose</th>
<th>To use</th>
<th>Source</th>
<th>Thread</th>
<th>Listeners</th>
</tr>
</thead>
<tbody>
<tr>
<td>activityComplete</td>
<td>String value used by activity definitions to respond to the onActivityComplete event handler.</td>
<td>Informs records in the Workflow Executing Activity (wf_executing) about the completion of other activities in the same workflow context.</td>
<td>If the activity is allowed to set the boolean value for <code>wf_executing.notify_termination</code> then set the value to true during the onExecute event.</td>
<td>Workflow Engine, Process Terminations <code>wf_executing.notify_termination</code>.</td>
<td>Current thread, current mutex <code>join</code> activity</td>
<td></td>
</tr>
<tr>
<td>Event</td>
<td>Description</td>
<td>Purpose</td>
<td>To use</td>

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
<th>Purpose</th>
<th>To use</th>
<th>Source</th>
<th>Thread</th>
<th>Listeners</th>
</tr>
</thead>
<tbody>
<tr>
<td>execute</td>
<td>String value used by workflow activities to respond to a Timer activity that has expired.</td>
<td>Informs a record in the wf_executing table with the initial state of Executing to proceed with its primary work.</td>
<td>The workflow engine, for each transition executed, creates an executing record with a state of Executing. Once created, the executing record is put in a queue for processing. For each item in the queue, the Rhino globals are established, the activity definition that drives the executing record is instantiated, and the run() function is called. When the state of a record is Executing, this function always calls onExecute.</td>
<td>Workflow engine, via the WFActivity Handler</td>
<td>Current thread, current mutex</td>
<td>All activities, onExecute event handler</td>
</tr>
<tr>
<td>Event</td>
<td>Description</td>

<td>------------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
<td>----------------------------</td>
<td>-------------------------</td>
<td>--------------------------</td>
<td>---------------------------------------</td>
</tr>
<tr>
<td>execute (specific to Lock)</td>
<td>String value used by the Lock activity to respond to a waiting lock that is ready to make another attempt to obtain a specific lock. This execute is different than the previous execute because it is called on a separate thread, at specified intervals, and is treated as an outside event.</td>
<td>Informs a wf_executing record waiting to execute that the specified wait interval has passed and that it should attempt to get the lock again.</td>
<td>Lock activity schedules a job with a script that uses the workflow script include's fireEvent('execute') method.</td>
<td>Lock activity via a scheduled job</td>
<td>Worker thread, private mutex</td>
<td>Lock activity, onExecute event handler</td>
</tr>
<tr>
<td>determineApprovalState</td>
<td>String value used by approval activities to respond to a change in the overall approval status of the current record.</td>
<td>Informs wf_executing records for approval activities about an approval that completed and triggered the timer event.</td>
<td>Approval Coordinator both registers for the event and triggers the event. The child approvals have listeners that determine their approval state.</td>
<td>Approval Coordinator triggers the event during its onExecute</td>
<td>Current thread, current mutex</td>
<td>Approval Coordinator, Approval - User, and Approval - Group all have onDetermineApprovalState event handlers. If the state is anything but Requested, the activity is considered finished, and the approval state (Approved, Rejected, Cancelled) is set to the wf_executing.result column</td>
</tr>
<tr>
<td>Event</td>
<td>Description</td>
<td>Purpose</td>
<td>To use</td>
<td>Source</td>
<td>Thread</td>
<td>Listeners</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
<td>---------</td>
<td>--------</td>
<td>--------</td>
<td>--------</td>
<td>-----------</td>
</tr>
<tr>
<td>cancel (from within activity definitions)</td>
<td>String value used by workflow activities to respond to a request for cancellation.</td>
<td>Informs all wf_executing records in a context that the workflow is being canceled.</td>
<td>The End activity uses the global workflow.broadcastEvent('cancel') to interrupt the currently running wf_executing records. This changes the state of those records to <strong>Cancelled</strong>.</td>
<td>End activity</td>
<td>Current thread, current mutex</td>
<td>All activities, <code>onCancel</code> event handler</td>
</tr>
<tr>
<td>Event</td>
<td>Description</td>
<td>Purpose</td>
<td>To use</td>
<td>Source</td>
<td>Thread</td>
<td>Listeners</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
<td>---------</td>
<td>--------</td>
<td>--------</td>
<td>--------</td>
<td>-----------</td>
</tr>
<tr>
<td>cancel (outside current context)</td>
<td>String value used by workflow activities to respond to a request for cancellation.</td>
<td>This event is the same as the cancel event above and handled the same. However, the management of this event is subtly different. This event informs all wf_executing records in a context that the workflow is being canceled. The event is managed via the onCancel event handler of each executing activity definition, but the event is called differently. In particular, the call to cancel from outside an activity definition is blocked by the current mutex. This is a significant difference in that the event does not interrupt a currently executing activity that is still operating within the parameters of the current mutex.</td>
<td>Any script can call cancel on a known executing context via the workflow script include. For example, var w = new Workflow(); w.cancel(context); /*where context is a GlideRecord of the context to be canceled. */</td>
<td>Any script include, scheduled job, UI action, or other source</td>
<td>Current thread, private mutex</td>
<td>All activities, onCancel event handler</td>

<td>------------------------------------------------------------------------</td>
<td>---------------------------------------------</td>
<td>-------------------------------</td>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------</td>
</tr>
<tr>
<td>stop (see End activity)</td>
<td>The <em>End</em> activity checks for this event.</td>
<td>If the stop event is the current event, then the cancel operation of the <em>End</em> activity is bypassed.</td>
<td>Only in the <em>End</em> activity.</td>
<td>Any script can trigger or broadcast the stop event via a script include or workflow Run Script activity</td>
<td>Current thread, current mutex</td>
<td>This event is used by the <em>End</em> activity to exclude the <em>Cancel</em> activity and allow a workflow to end, even if canceled.</td>
</tr>
<tr>
<td>listener</td>
<td>String value that the workflow (subflow) activity triggers as an event.</td>
<td>When a main workflow calls a subflow, the workflow keeps the ID of the subflow's context in the scratchpad. When the subflow is complete, it triggers the listener event via a business rule.</td>
<td>The listener event is passed to the parent context on completion of a subflow and is managed by the onListener action of the workflow activity.</td>
<td>Business rule that is triggered by the update of a workflow that has a parent</td>
<td>Current thread, current mutex</td>
<td>This event is used by a subflow to inform it's parent flow that it is complete. The parent workflow will react to this event and continue.</td>
</tr>
<tr>
<td>probe_complete</td>
<td>String value triggered in the workflow by an Orchestration activity indicating that the MID Server has completed a task.</td>
<td>The <em>probe_complete</em> event is triggered from Orchestration sensor processors via the workflow helper function handleEventById.</td>
<td>Event used to restate a workflow that is waiting for the MID Server to process a task or activity</td>
<td>Worker thread, private mutex</td>
<td>Orchestration activities</td>
<td></td>
</tr>
<tr>
<td>pause</td>
<td>String value sent to a workflow from an SLA to pause the <em>Timer</em> activity.</td>
<td>When an SLA is paused, the SLA workflows must be paused if there is a timer running.</td>
<td>Use is exclusive to the SLA timer</td>
<td>SLA</td>
<td>Business rule thread, private mutex</td>

</tbody>
</table>

**Workflow event-specific functions**
There are several functions that relate specifically to workflow events.
## Workflow event-specific functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Purpose</th>
<th>Use</th>
<th>Thread</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>registerForEvent</td>
<td>Function in the workflow environment that writes events represented as strings to the wf_executing.registered_events field.</td>
<td>The workflow events are just strings. When an activity that has registered for an event executes, a comma delimited set of events is stored with the Workflow Executing Activity (wf_executing) record. When the event is triggered in the workflow context, the wf_executing table looks for all executing records that contain the string that represents the event in the wf_executing.registered_events field.</td>
<td>The global variable workflow that is available to all Workflow Activity (wf_activity) records is the source of the call. For example, from inside a Run Script activity, a designer can write: workflow.registerForEvent('myEventName');</td>
<td>Current thread, current mutex</td>
<td>Global variable workflow</td>
</tr>
<tr>
<td>unRegisterForEvent</td>
<td>Function in the workflow environment that removes a string value representing an event that has been written to the wf_executing.registered_events field.</td>
<td>The workflow events are just strings that are written to the wf_executing.registered_events field. When an activity unRegisters for an event, the comma delimited set of events stored with the Workflow Executing Activity (wf_executing) record is searched, and if that string is found, it is removed.</td>
<td>The global variable workflow that is available to all Workflow Activity (wf_activity) records is the source of the call. For example, from inside a Run Script activity, a designer can write: workflow.unRegisterForEvent('myEventName');</td>
<td>Current thread, current mutex</td>
<td>Global variable workflow</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
<td>Purpose</td>
<td>Use</td>
<td>Thread</td>
<td>Source</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
<td>---------</td>
<td>-----</td>
<td>--------</td>
<td>--------</td>
</tr>
<tr>
<td>fireEvent(eventName)</td>
<td>Function in the workflow environment that examines the contents of the workflow's registered events field, comparing its contents to the eventName passed in.</td>
<td>The workflow events are just strings that are written to the workflow's registered_events field. When a workflow activity is called by a workflow activity, the workflow engine queues up any executing records that contain the string in the registered field.</td>
<td>The global variable workflow that is available to all workflow Activity records is the source of the call. For example, from inside a Run Script activity, a designer can write: workflow.fireEvent('myEventName');</td>
<td>Current thread, current mutex</td>
<td>Global variable workflow</td>
</tr>
<tr>
<td>fireEvent(eventRecord, eventName)</td>
<td>Function in the workflow environment that sends an event to a specific Workflow Executing Activity (wf_executing) record. The eventRecord is a GlideRecord of the type wf_executing.</td>
<td>This event call expects an onMyEvent event handler in the activity represented in the event record (Workflow Executing Activity (wf_executing) table). When fireEvent(eventRecord, eventName) is called by a workflow activity, the workflow engine queues up the specific executing record with that event and passes the event into the activity definition for the on&lt;eventName&gt; handler to manage. This event is queued up in its own mutex, so the current queue completes before this event is processed.</td>
<td>The workflow script include contains the call for this. For example, from inside a Run Script activity, a designer can write: workflow.fireEvent('myEventName');</td>
<td>Current thread, current mutex</td>
<td>Workflow script include</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Purpose</th>
<th>Use</th>
<th>Thread</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>fireEvent</td>
<td>Function in the workflow environment that sends an event to a specific Workflow Executing Activity (wf_executing) record. The eventRecordSysId is the sys_id of a GlideRecord of the type wf_executing.</td>
<td>This is the same as the fireEvent above, except that it accepts an ID and returns the Workflow Executing Activity (wf_executing) record.</td>
<td>The Workflow script include contains the call for this. For example, from inside a Run Script activity, a designer can write: var w = new Workflow(); w.fireEvent(eventName);</td>
<td>Current thread, current mutex</td>
<td>Workflow script include</td>
</tr>
<tr>
<td>fireEvent</td>
<td>Function in the workflow environment that sends an event to a specific Workflow Executing Activity (wf_executing) record. The eventRecordSysId is the sys_id of a GlideRecord of the type wf_executing.</td>
<td>This is the same as the fireEvent above, except that it accepts a JSON object as a third parameter. This object can specify any data expressible as JSON. You can also specify additional functionality when creating a workflow activity.</td>
<td>The Workflow script include contains the call for this. For example, from inside a Run Script activity, a designer can write: var w = new Workflow(); w.fireEvent(eventName, JSONObject);</td>
<td>Current thread, current mutex</td>
<td>Workflow script include</td>
</tr>
<tr>
<td>broadcastEvent</td>
<td>Function in the workflow environment that sends an event to all currently running Workflow Executing Activity (wf_executing) records in a specified context, regardless of their state.</td>
<td>This is the same as the fireEvent above, except that it accepts an ID and returns the Workflow Executing Activity (wf_executing) record.</td>
<td>The Workflow script include contains the call for this. For example, from inside a Run Script activity, a designer can write: var w = new Workflow(); w.broadcastEvent(eventName, contextId);</td>
<td>Current thread, current mutex</td>
<td>Workflow script include</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
<td>Purpose</td>
<td>Use</td>
<td>Thread</td>
<td>Source</td>
</tr>
<tr>
<td>--------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
<td>-------------------------</td>
<td>-----------------------------</td>
</tr>
<tr>
<td>broadcastEvent (eventName)</td>
<td>Function in the workflow environment that sends an event to all currently running Workflow Executing Activity (wf_executing) records in the current context, regardless of their state.</td>
<td>This should not be confused with broadcastEvent above. This event is only available to current Workflow Executing Activity (wf_executing) records.</td>
<td>This is available only through the global workflow variable of the current context. The following is an example of its use from within an activity definition's script: <code>workflow.broadcastEvent(eventName)</code></td>
<td>Current thread, current mutex</td>
<td>Global variable workflow</td>
</tr>
</tbody>
</table>

Event-specific workflow activities
The following workflow activities trigger events.
## Event-specific workflow activities

<table>
<thead>
<tr>
<th>Activity Name</th>
<th>Description</th>
<th>Purpose</th>
<th>To Use</th>
<th>Source</th>
<th>Thread</th>
<th>Listeners</th>
</tr>
</thead>
</table>
| Create Event  | Requires an event from the event registry rather than a workflow event. This activity is located in the Notification category of the workflow tree. | Fires the notification event specified in the Workflow Activity (wf_activity) table. | 1. Navigate to System Policy > Events > Registry  
2. Create an event.  
3. Navigate to System Policy > Templates and create an email template  
4. Navigate to System Policy > Email > Notifications.  
5. Create a new notification that is triggered by the event you created and sends the template you created.  
6. On the workflow canvas, drag the Create Event activity onto the canvas and associate it with the newly registered event. | Event Registry | Triggered in the current thread and handled on the worker thread in notifications. Never processed by a workflow | On the notification thread, outside of workflow |

### Workflow Stages

Workflows can indicate workflow progress by updating any field designated as a stage field.

For example, the Incident (incident) table has an **Incident state** field that indicates progress, but the service catalog uses the **Stage** field.

To indicate the workflow’s progress through the possible stage values, the interface updates the **Stage field** selected in the workflow properties. Available fields depend on the table used by the workflow. If the field provides a choice list, then the choices are available as stage values for the workflow. If the field is a workflow field, it displays an icon to indicate the workflow’s progress, as with the Service Catalog’s **Stage field**.

![Service Catalog Stage field with icons](image)
After stages are added to the workflow, they can be assigned to each workflow activity. If an activity with an assigned stage is encountered when the workflow runs, the workflow engine assigns the stage to the record associated with the workflow context.

For workflows that use the Requested Item (sc_req_item) table, the stage field is automatically set to the **Stage** field of the table and cannot be changed. The stage state displayed for a workflow running on the Requested Item table is based on the state of the workflow activities.

- If an activity is active, then the stage is shown with the state of **In progress**.
- If an activity is in the **Pending** or **Completed** state, the stage reflects this state.
- If an activity is cancelled, **Request Cancelled** appears in the **Stage** field. The "Cancelled" label set in the wf_stage table is a reserved word, and does not display in the **Stage** field.

### How stage values are derived

Stage values are derived from various sources in the interface.

**Note:** An updated method for managing workflow stages as a set is also available. For information about grouping and reusing stages, see [Workflow stage sets](#).

Stage values are derived from the following sources:

- **Choices for Stage column**: Choices defined for the column selected as the **Stage** column for the workflow.
- **Default stages for table**: Stages defined in the Stage Default (wf_stage_default) table for the table selected.
- **Workflow-specific stages**: Applied only to the workflow for which they were defined in the Workflow Stage (wf_stage) table.
- **Stage values in existing records**: Values from the designated **Stage** column in the table assigned to the workflow are inherited from existing records.

If the stage field for a workflow is the table column named **Stage**, then the progress of the workflow appears in any list view containing the **Stage** column.
Stages in a list

Stage values shown in the list views are accompanied by the state, based on the workflow activities being executed. If an activity has a stage specified for it, and the activity is currently active in the workflow, then the stage is shown with a state of In progress. Similarly, if the activity is in the Pending or Completed state, the stage reflects this state.

Example

If the workflow table is Request Item (sc_req_item), then the stage field is automatically set to the Stage column of that table and cannot be changed. The following stage values for the request item are displayed in a choice list from the Dictionary Entry (sys_dictionary) table:

- Waiting for Approval
- Fulfillment
- Delivery

In addition, the Request Item table has the following default stages:

- Request Cancelled
- Completed
Note: If an activity is cancelled, Request Cancelled appears in the Stage field. The "Cancelled" label set in the wf_stage table is a reserved word, and does not display in the Stage field.

When you edit available activity stages in the Workflow Editor, the list displays the following stage values:

- Waiting for Approval
- Fulfillment
- Delivery
- Request Cancelled
- Completed

The following diagram depicts the process used to gather stage values from the Request Item table to populate the Stages list in workflow activities.
Note: If you are creating a workflow with a table other than Request Item (sc_req_item), you must select a Stage field in the workflow properties for the workflow to have stages.

Use workflow stages

You can add or modify workflow stages.

1. Navigate to Workflow > Workflow Editor.
2. Create a new workflow by clicking New or open an existing workflow.
3. In the Workflow Properties form, if the table is not the Requested Item (sc_req_item) table, select a field to display stages in the **Stage** field property. 

*Available fields* depend on the table selected for the workflow.

4. After assigning a list of stages to the workflow, you can set a stage value in any of the workflow activities that provide a **Stage** field in their dialog box.

Setting a stage value in a workflow activity tells the workflow engine to assign that stage to the record associated with the workflow context when the activity is encountered during a run.

When an activity starts with a specified stage, the platform updates the **Stage** field with the current value. In workflows run against the Requested Item (sc_req_item) table, the `sc_req_item.stage` field is defined as a workflow type field.

When displaying the stages for a workflow on the Requested Item (sc_req_item) table, the stage state is based on the state of the workflow activities. If an activity has a stage specified for it, and the activity is currently active in the workflow, then the stage is shown with an **In progress** state. Similarly, if the activity is in the **Pending** or **Completed** state, the stage reflects this state.

5. To edit the workflow-specific stages for an existing workflow, click the gear icon in the header bar and select **Edit Stages**. Again, these stage values are combined with the choices, defaults, and existing values.
Workflow stages

To optimize the use of stages, you can assign a stage to multiple activities in a workflow. For example, if your workflow uses the following activities to create tasks:

1. Get approval
2. Order equipment
3. Receive equipment
4. Add equipment to CMDB
5. Set up equipment
6. Install software
7. Configure software
8. Deliver to user

The following stages might be used:
- Approval
- Order
- Configure
- Deliver

A good practice is to assign stages to the activities as follows:

<table>
<thead>
<tr>
<th>Activity</th>
<th>Assigned stage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get approval</td>
<td>Approval</td>
</tr>
<tr>
<td>Order equipment</td>
<td>Order</td>
</tr>
<tr>
<td>Receive equipment</td>
<td>Order</td>
</tr>
<tr>
<td>Add equipment to CMDB</td>
<td>Order</td>
</tr>
<tr>
<td>Set up equipment</td>
<td>Configure</td>
</tr>
<tr>
<td>Install software</td>
<td>Configure</td>
</tr>
<tr>
<td>Configure software</td>
<td>Configure</td>
</tr>
<tr>
<td>Deliver to user</td>
<td>Deliver</td>
</tr>
</tbody>
</table>

When the Order equipment, Receive equipment, or Add equipment to CMDB activity is active, the Stage display shows that the Order stage is In progress.

Add and translate stages

You can add default stages to use for a table, and stages to existing workflow

Add default stages for a table

You can assign a stage set as a default set to any number of tables.

The stages in the assigned stage set pre-fill the workflow version stages when you create a new workflow for the associated table.

1. Navigate to Workflow > Default Stages (by table).
2. Click New.
3. Select a stage **Set**.
   You can create a new set by clicking **New**, typing a name, and clicking **Submit**.

4. Select a corresponding **Table**.

5. Click **Submit**.
   The stages in the selected stage set are automatically added to any new workflows that use the corresponding table.

### Add a stage to an existing workflow
If a stage required for a workflow has not been imported or is not in the stage set assigned to the workflow table, you can add it to the workflow manually.

1. Navigate to **Workflow > Workflow Editor**.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select **Edit Stages**.
4. In the Workflow Stages list, click **New**.
5. On the Workflow Stage form, fill in the fields as appropriate.
   Do not use a **Name** or **Value** field value that already exists in the base system.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the stage as it appears in workflow fields.</td>
</tr>
<tr>
<td>Value</td>
<td>The value of the stage when it is referenced from elsewhere in the system, such as in a script.</td>
</tr>
<tr>
<td>Duration</td>
<td>The default duration for the stage. Currently not used.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.
7. Publish the workflow.

### Add a stage to a workflow activity
After stages are added to a workflow, you can assign them to the workflow activities.

1. Navigate to **Workflow > Workflow Editor**.
2. Open and check out the workflow.
3. Double-click the activity.
4. In the **Stage** field on the Activity Properties form, find and select the stage to display when the workflow reaches the activity.
5. Click **Update**.

### Translate workflow stages
You can provide translations for workflow stage names so the names appear in the language selected for the instance.

The instance must already have **Internationalization support** installed.

Language-specific text appears in workflow fields displayed in a list, workflow stage sets, and the workflow editor for users with that language selected. Language-specific text does not automatically appear when displaying stages on a form. To translate stages on a form, add translated text to the workflow field choices.
You can add translated text for any language enabled on the instance. For example, to translate workflow stages into French:

1. Set the interface language to French.
2. Navigate to Workflow > Workflow Editor.
3. Open and check out a workflow.
4. In the title bar, click the menu icon and select Edit Stages.
5. Edit the Name field for each stage and enter the text to display to French users. Do not change the Value field.
6. Confirm that the workflow stages display the French text.

Alternatively, to translate stages for multiple workflows at once, you can directly edit the Workflow Stages [wf_stage] table. For example, to translate workflow stages from multiple workflows into French:

1. Set the interface language to French.
2. In the application navigation filter, enter wf_stage.list.
3. Edit the Name field for each stage and enter the text to display to French users. Do not change the Value field.

**Workflow stage sets**

Stage sets are named groups of workflow stages commonly used together. Create a stage set and assign it as a default set to any number of tables. You can import the choice list values of a workflow field as stages for a workflow, and export a stage set to create a new one.

A single stage set usually represents a process, such as the stages required to display the progress of a service catalog request. You can also assign a stage set as the default set for workflows on specific tables.

In an active context, workflow stages provide summary-level feedback about the progress of a workflow. Stage icons display the status of each activity as it is being driven by a workflow. The system updates a Stage field, defined in the workflow properties, to indicate the progress of the workflow through the possible stage values.

**Updates to workflow stage values**

During an upgrade, the system makes changes to the Value field of records in the Workflow Stage [wf_stage] table.

- All entries are made lowercase.
- All spaces and special characters are replaced with underscores.

These changes support Localization settings and enable workflows to display translated text in the Stage field.

*Create a new stage set*

You can create a new stage set by creating a stage set record and adding stage set entries manually.

Create a stage set record only when you want additional stages that are not available on the table by default.

1. Navigate to Workflow > Stage Sets.
2. Click New.
3. Enter a **Name** that indicates the purpose of the stage set. For example, you can create a Requested Item stage set to hold the stages commonly used by inventory tracking workflows or service catalog fulfillment workflows.

4. Click **Submit**.

5. Open the new stage set record.

6. In the **Stage Set Entries** related list, click **New**.
   Each stage set entry can be used as the **Stage** for an activity in a workflow that uses this stage set.

7. Enter a **Name** that indicates the stage name to appear in workflow fields.

8. Enter a **Value** to use when referencing the entry, such as in a script.

9. Click **Submit**.

10. In the **Stage Set Entries** related list, ensure that each entry has a unique **Order** value. Enter a low value for stages that should appear early in the workflow and a higher value for later stages.

The stage set can be added to a workflow or assigned as the default stage set for workflows that are created for a specific table.

*Import stages from a choice list*

You can import the choice list values of a workflow field as stages for a workflow.

Create a choice list as follows:
- Add a custom field of Type **Workflow** to the table.
- Configure the custom field to use a choice list.
- If you are creating a new field, set the **Choice List type** to **Display without --None--** and create the choices for the newly created field.

For more information, see [Create a workflow stage field](#).

1. Navigate to **Workflow > Workflow Editor**.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select **Properties**
4. In the Workflow Properties dialog box, click the **Stages** tab.
5. From the **Stage field** list, verify that the correct workflow field is selected.
6. In the Related Links section, click **Import Stages from Choice List**.
7. In the dialog box asking you to confirm that you want to import the choice list, click **OK**.
8. Click **Update**.

The stage set can be added to a workflow or assigned as the default set for workflows that are created for a specific table.

**Export a stage set from a workflow**
You can create a new stage set by exporting the stages from an existing workflow as a set, instead of manually adding stage set entries to a stage set record.

1. Navigate to **Workflow > Workflow Editor**.
2. Open and check out the workflow containing stages that you want to export as a new stage set.
3. In the title bar, click the menu icon and select **Edit Stages** to open the Workflow Stages dialog box.
4. In the Related Links section, click **Export to Stage Set**.
5. Enter a unique **Name** for the new stage set.
6. Click **OK**.

The stage set can be added to a workflow or assigned as the default set for workflows that are created for a specific table.

**Add a stage set to a workflow**
You can add any number of stage sets to an existing workflow.

When multiple stage sets have stage set entries with the same **Value**, the stage appears on the workflow only once.

1. Navigate to **Workflow > Workflow Editor**.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select **Edit Stages** to open the Workflow Stages dialog box.
4. In the Related Links section, click **Import from Stage Set**.
5. Select the stage set.
6. Click **Ok**.
7. Import additional stage sets as needed for the workflow.

After you add all necessary stage sets to the workflow, you can add them to the workflow activities. For more information, see [Add a stage to a workflow activity](#).

**Use a default stage set**
You can assign a stage set as a default set to any number of tables.
The stages in the assigned stage set pre-fill the workflow version stages when you create a new workflow for the associated table.

1. Navigate to Workflow > Default Stages (by table).
2. Click New.
3. Select a Table.
4. Select the Set you want to assign to the selected table.
5. Click Submit.

Create a workflow stage field

Workflows can provide a summary of workflow progress by updating any field of the Workflow type. If the field is a workflow field, it displays an icon to indicate the workflow stage progress.

Role required: admin

In a form, the workflow field displays the current stage as a choice list value.

In a list, the workflow field displays stage icons that represent the series of states, stages, phases, or tasks within a workflow. The stage icons are populated using the activity stages from the associated workflow. For more information, see Workflow stages.

To create a workflow stage field:

1. Navigate to Workflow > Default Stages (by table).
2. Right-click near a column header and select Configure > List Layout.
3. Create a new field in lower right.
4. On the form view of the table used by the workflow, create a field with the Type set to Workflow.
   
   For detailed steps, see Add and customize a field in a table.
5. Click Save.
6. Right-click the field label and select Configure Dictionary.
7. Open a dictionary entry.
8. In the Choice List Specification section of the Dictionary Entries form, select Dropdown with -- None-- from the Choice list.
9. Click Update.
10. To ensure that the workflow field properly displays stages on the form, define a choice for each workflow stage.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
- To create workflow stages using a choice list that already has choices, you can import the stages from the choice list. A stage is created for each choice defined for the Stage field selected in the workflow properties. For detailed steps about importing a choice list, see Import stages from a choice list.
- The Value of each choice must match the Value of the corresponding workflow stage.
- Do not use spaces in the Value field for either choices or stages. Use underscores in place of spaces.
- Make the choice list read-only. If a user changes the stage value for a record from the choice list rather than allowing the workflow to control the value, the workflow-driven, legacy, and linear renders may not work as intended. You can also use business rules or events to ensure the workflow progresses accordingly.

For detailed steps on defining choice lists, see Define an option for a choice list.

11. To see workflow stages as icons, add the field to the list layout of the workflow table. For detailed steps, see Configure the list layout.

After you create or update the workflow field:
- Unless the workflow uses the Requested Item (sc_req_item) table, ensure that the workflow field is selected from the Stage field list in the workflow properties. For detailed steps, see Select a stage field. If a workflow uses the Requested Item table, the stage field is automatically set to the Stage field of the table and cannot be changed.
- Work through the workflow. Any other updates made to the workflow field, such as updates from business rules or other scripts, can interfere with displaying workflow stages.

Select a stage field
A Stage field allows the workflow context to show additional workflow information, such as the stage name and the estimated completion time for an activity.

Ensure that the workflow field you want to use as the stage field is configured to properly display stages. For detailed steps, see Create a workflow stage field.

Unless the workflow uses the Requested Item (sc_req_item) table, you can specify which field from the workflow table is the stage field. For workflows that use the Requested Item (sc_req_item) table, the stage field is automatically set to the Stage field of the table and cannot be changed.

To add or edit a workflow stage field:
1. Navigate to Workflow > Workflow Editor.
2. Create or check out the workflow.
3. In the title bar, click the menu icon and select Properties.
4. In the Workflow Properties dialog box, click the General tab.
5. In the Table list, verify that the table containing the workflow field is selected.
6. Click the Stages tab.
7. From the Stage field list, select the workflow field.
8. Click Update.

Workflow stage field icons and tooltips
A workflow stage field displays icons to indicate the workflow stage.

Based on the stage renderer selected for the workflow, these icons may display a tooltip with additional information.
### Workflow field icons

<table>
<thead>
<tr>
<th>Icon</th>
<th>Workflow stage</th>
</tr>
</thead>
<tbody>
<tr>
<td>➡️</td>
<td>Current active step</td>
</tr>
<tr>
<td>🟢</td>
<td>Approval pending</td>
</tr>
<tr>
<td>🔴</td>
<td>Approval rejected</td>
</tr>
<tr>
<td>✔️</td>
<td>Complete</td>
</tr>
<tr>
<td>🔴</td>
<td>Late (Change/Request) or Canceled (Catalog)</td>
</tr>
<tr>
<td>🔄</td>
<td>Skipped (Catalog only)</td>
</tr>
</tbody>
</table>

#### Stage tooltips

Based on the stage renderer selected for a workflow, workflow stage icons may display tooltips with detailed information about a stage.
Stage renderers and tooltip behavior

<table>
<thead>
<tr>
<th>Renderer</th>
<th>Tooltip behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Legacy</td>
<td>When a user points to a stage, the tooltip displays the name of the stage. In the expanded view, the activity status appears in parentheses next to the stage.</td>
</tr>
</tbody>
</table>

- Waiting for Approval
  - Dept. Head Approval - 2 Days (Dept. Head Approval - 2 Days (Pending - has not started))
  - CIO Approval - 2 Days (CIO Approval - 2 Days (Pending - has not started))
  - Order Fulfillment - 4 Days (Order Fulfillment - 4 Days (Pending - has not started))
  - Deployment - 1 Day (Deployment - 1 Day (Pending - has not started))
  - Completed (Completed (Pending - has not started))
### Tooltip behavior

When a user points to a stage, the tooltip displays the name of the stage. If the stage is a gated approval, the tooltip also shows the name of the approver. In the expanded view, the activity status appears in parentheses next to the stage.

<table>
<thead>
<tr>
<th>Renderer</th>
<th>Tooltip behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Other renderers</td>
<td></td>
</tr>
</tbody>
</table>

If you do not want the approver’s name included in the tooltip, navigate to **System Properties** > **Service Catalog** and clear the **Show the current pending approver’s name in the stage widget mouseover** check box.

**Show the current pending approver’s name in the stage widget mouseover**

- [ ] Yes  
- [x] No

**Property for displaying pending approver’s name**

**Workflow stage renderers**

Workflow stage renderers determine how a workflow displays stages in a workflow field.

There are multiple renderers available.

**Note:** Most workflows should use the workflow-driven renderer. This renderer is used by default for all workflows. Use a different stage renderer only after careful consideration and to satisfy specific requirements for how the stages appear.
Workflow-driven

Use the workflow-driven renderer as much as possible. This renderer displays icons for stages using the stage state controlled by the workflow. Icons are displayed in a way that is meaningful for many situations. This renderer can display stages from a main workflow and subflows. The order of the icons is determined by the expected path of the executing workflow. As the workflow progresses, stages on paths that the workflow did not take are removed from the display. Stages from paths other than the expected path are not included unless the workflow follows that path.

The Stage order field on the Stages tab has two options:

- Computed uses the actual workflow path in order
- User-specified uses the order specified in the Order column on the Workflow Stages record

Main flow

The main flow renderer displays icons for stages defined in the main workflow only. Use this renderer when you do not want to expose the details of the subflows. For example, a single main workflow may run several subflows to handle implementation details. The stages in these subflows do not provide useful information for the user who starts the workflow, but are useful when editing the subflow. In this scenario, using the main flow renderer leads to the best user experience. The stage field displays the high-level process of the workflow without exposing unnecessary details.

The Stage order field on the Stages tab has two options:

- Computed uses the actual workflow path in order
- User-specified uses the order specified in the Order column on the Workflow Stages record

Note: If the workflow context for a request item has been deleted, the stages for that request item can no longer be rendered. This stage history is stored on the workflow context.

Linear

Linear rendering displays all stage icons from the main workflow and all subflows within a single workflow field on a list or form. It displays icons in a linear sequence regardless of the paths the workflow follows as it executes. This renderer uses stages defined in both the main workflow and any subflows that the main flow launches. The icons appear in the user-specified order. Skipped stages do not appear.

Use this renderer when the workflow stages must display in a consistent order and the actual details of how the workflow runs are less important. For example, a workflow may revisit or revert to previous stages based on one or more Condition Workflow activities. Displaying these loops in the stage field does not provide useful information to the user. In this scenario, using the linear renderer leads to the best user experience. The stage field displays the predefined process, including stages from subflows, in a consistent order.

For example, you can create a service catalog workflow that uses a subflow to complete delivery of the requested item. The following images illustrate the main flow and subflow for ordering corporate-branded supplies.
Linear main flow

The linear renderer displays all these stages in one workflow field. The parent workflow specifies the Waiting for approval, Fulfillment, and Completed stages. The subflow specifies the Delivery and Waiting for Task, and Delivery OK stages.

Progress bar

The progress bar renderer displays a single progress bar instead of a sequence of stage icons. This renderer is particularly useful when you want to display the general progress of the workflow as a percent. Each stage in the workflow controls an equal percentage of the progress bar. For example, if a workflow has 10 stages, reaching each stage causes the workflow field to display an additional 10% of the progress bar. Stage names do not appear in the progress bar.
The progress bar renderer provides a way to display the status of a workflow that has a large number of stages. Other rendering options may provide a better user experience when rendering fewer than four stages in a single workflow.

The **Stage order** field on the **Stages** tab has two options:

- Computed uses the actual workflow path in order
- User-specified uses the order specified in the **Order** column on the Workflow Stages record

**Legacy**

The legacy renderer displays stages in the same way as releases prior to Dublin. When an instance is upgraded from a release prior to Dublin, all existing workflows are set to use the legacy renderer. Whenever possible, use a different stage renderer instead. If you want your workflow to maintain pre-Dublin behavior, use the Legacy option. The legacy renderer sometimes assigns incorrect data to and/or reports incorrect data from the workflow stage field. If possible, we recommend all workflows use the Workflow-driven renderer.

With the legacy renderer, you can create and reference a custom workflow field icon set by setting the icons attribute to a new script include. For example, to use the `WorkflowIconsSCR` script include to define which icons to use, add the attribute `icons=WorkflowIconsSCR` to the Attributes field of the dictionary entry for the workflow field. To use the default icon display behavior, use the attribute `icons=WorkflowIconsStages`.

The legacy renderer works with all tables except the Requested item (sc_req_item) table. In this case, use the requested item renderer instead.

**Requested item**

The requested item renderer functions the same way as the legacy renderer, but is for use with the Requested item (sc_req_item) table.

Select a stage renderer

In most cases, the default workflow-driven renderer should be used. If you have specific requirements for displaying stages, you can select a different stage renderer.

Consider the following when selecting a stage renderer:

- Use the workflow-driven renderer if possible. This is the default renderer that should be used in most cases.
- Use the legacy renderer only if your instance was upgraded from a release prior to Dublin and you want your workflow to maintain pre-Dublin behavior.

To use linear, main flow, or progress bar rendering, satisfy the following requirements.
## Linear and progress bar renderer requirements

<table>
<thead>
<tr>
<th>Renderer</th>
<th>Requirements</th>
</tr>
</thead>
</table>
| Linear         | • The parent workflow and all subflows must modify the same current record.  
                 • In the properties for all subflows, the **Stage field** value for all subflows must match that of the parent workflow.  
                 • The parent flow and all subflows must contain the same stages. Use a stage set to ensure the parent flow and all subflows have the same stages.  
                 • On the workflow canvas, each workflow needs only the stages used directly by that workflow. It is not necessary to add stages from subflows to activities on the parent flow, or stages from the parent flow to activities on the subflows. |
| Main flow      | • The workflow contains subflows.  
                 • You do not want or need to reveal the details about the subflows.                                                                          |
| Progress bar   | • The workflow properties must have a **Stage ordering** value of **User-defined**  
                 • There must be workflow stages within the workflow.  
                 • Because stage names do not appear in a workflow field when using the progress bar renderer, you can simplify stage names to represent a percentage of the workflow. For example, if a process has four main steps, name the workflow stages as 25%, 50%, 75%, and 100%. Enter the numerical value of each stage, such as 25, in the **Value** and **Order** fields. |

To select a stage renderer:

1. Navigate to **Workflow > Workflow Editor**.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select **Properties**.
4. In the Workflow Properties dialog box, click the **Stages** tab.
5. From the **Stage rendering** list, select a stage renderer.
   - If you are using two workflows to update two unique workflow fields on a single record, both workflows must use a non-legacy renderer. You can select a different stage renderer for each workflow but do not select **Legacy** for either one.
   - If you want to use the linear renderer, make sure you select **Linear** in the properties for the parent workflow and all subflows.
6. Click **Update**.
Workflow fields with deleted records

Workflow fields may indicate when a record required by the workflow is deleted.

After a referenced record is deleted, the reference in the primary record is no longer valid. If the stage renderer detects a reference that is no longer valid, the stage field displays a message about the deleted record.

Administrators can restore deleted records. For more information, see Restore a deleted record and reference.

Workflows with missing records

The image shows a list with two workflows. The top request does not have an associated request item. The bottom request has an associated request item, but the item does not have an associated workflow context.

Workflow validation

Workflow validation examines different characteristics of a workflow to locate issues that might prevent the workflow from being published or cause it to fail. The validation report summarizes the results of each separate workflow validation.

Validation prevents workflows with critical flaws from executing and resulting in an unstable or incomplete state. There are a number of validators in the base system that notify workflow designers of potential problems. For example, multiple End activities, disconnected transitions, incorrect table references, missing subflows, and dependencies affected by update sets. A workflow validation report displays the results from each validator, including a message explaining what was found. The system automatically validates a workflow when you publish it. You can also run validation on a workflow directly from controls in the Workflow Editor.

Highlighting critical errors

The graphical Workflow Editor highlights critical errors when a workflow is loaded. In this example, a subflow is missing and is not available to the parent workflow for the current user. The graphical Workflow Editor indicates the error when the parent workflow loads by highlighting (in red) the activity that calls the subflow. To correct the error in the parent workflow, click the validate icon in the header bar and inspect the error description in the validation report.
Validations at publishing

If you attempt to publish an invalid workflow or a workflow with potential problems, the system displays an error message and blocks the operation, if necessary. When validation error messages appear, click the validate icon in the graphical Workflow Editor to see the error report.

Validation warning

A validation warning notifies you that a potential problem exists in a workflow but permits you to publish the workflow. Validation warnings appear when:

- You edit and then attempt to publish a workflow that is included as a subflow in another workflow. The system cannot determine how your changes will affect the parent workflow and alerts you of the relationship.
- A workflow activity uses a different table than the table assigned to the workflow. The system alerts you of the potential conflict.

Validate missing subflow

Validation failure
A validation failure notifies you that a critical error has occurred in the workflow that prevents you from publishing the workflow. An example of a critical error is a missing subflow.

Validation failure

**Workflow validation report**

Validators display three notification levels: CRITICAL, WARN, and INFO. The designer can publish a workflow that returns Warn or INFO level validation, but not a workflow that returns an overall validation level of CRITICAL.
Workflow Validation Report

Header summary

The header of the validation report summarizes the entire validation run against the specified workflow.

- **Validate Summary**: The overall score reflects the most severe notification level encountered during the validation.
- **Total checks performed**: The total number of validations run is also broken down to show the number at each notification level.

Report columns
The body of the report displays the results of each individual validation check that was performed. The columns are **Type**, **Level**, and **Message**. You can sort and filter these columns as you would any list.

**Workflow termination and external dependencies levels**

<table>
<thead>
<tr>
<th>Name</th>
<th>Implication</th>
</tr>
</thead>
<tbody>
<tr>
<td>Info</td>
<td>Provides information about the current workflow version. An example of an information level message is one that names the lowest common table in the workflow. Workflows at this validation level are considered valid and publishable.</td>
</tr>
<tr>
<td>Warning</td>
<td>Alerts the user that the validator detected anomalies in the workflow that might compromise its ability to execute. An example of a warning level message is one that alerts you to a missing activity input transition. Workflows at this validation level are considered valid and publishable.</td>
</tr>
<tr>
<td>Critical</td>
<td>Names a workflow element containing a critical error that prevents the workflow from executing successfully. Examples of this are missing or invalid subflows and missing transitions. Workflows at this validation level cannot be published or run in production.</td>
</tr>
</tbody>
</table>

**Message**

The validation message provides a detailed description of the results, including table names, update sets, and other specifics.

For the procedure to validate a workflow and generate a validation report, see [Validate a workflow](#).

**Workflow validator**

ServiceNow offers several workflow validators for workflow designers to test their workflows.

This page lists all available workflow validators. See [Workflow validation](#) for information on using workflow validators and the workflow validation report to see the type of information that is returned.

**Hanging workflows and update sets**

**ValidateTransitionOut**
The **ValidateTransitionOut** validator finds activity conditions with no exit transitions.

**Validation summary**

- **Risk**: Activity conditions might not transition to the next activity, which could cause the workflow to hang.
- **Severity Level**: Warning
- **Valid Result**: Valid
- **Valid Message**: All conditions have transitions.
- **Invalid Result**: Invalid
- **Invalid Message**: This workflow contains `<condition count>` activity conditions without an output transition.
- **Suggested Action**: If this is a conscious design decision, there is no corrective action. Otherwise, find the condition cited in the validator and add an appropriate transition to the next activity.
- **Publishable**: Yes
- **Runnable**: Yes
- **Related Information**: None

**Troubleshooting**

Design choices made when creating a workflow on the canvas might legitimately use an activity without an exit condition. In the first example, the **Notification** and **Timer** activities both execute at the start of the workflow. The **Timer** is the entity that decides when the workflow ends. In this situation, executing the **Notification**, but not transitioning away, keeps the design simple and adds no risk. The validator finds and reports the missing transition from the **Notification** activity as a **Warning** that the designer can ignore.
Condition with no valid transition

In the second example, the Notification activity has no exit transition. The designer missed this because of the layout. The transition from the Timer activity passes behind the Notification activity and appears to connect the exit from the Notification activity to the End. In workflows with more than 10 or 15 activities, it might be difficult to see all the transitions clearly. This workflow’s designer intended for the Notification activity to transition to the End.

No condition out

This validator directs the designer to the specific activity and condition that does not have an exit transition. The designer then makes the decision whether or not to respond to the warning.

ValidateTransitionIn

The ValidateTransitionIn validator finds activities that do not have inbound transitions and cannot execute in the workflow.

Validation summary

- **Risk**: Activities that do not have inbound transitions have no means of being executed in the workflow. If other logic builds from these activities, the workflow could hang, with no means of moving forward.
- **Purpose**: Find activities that do not have inbound transitions.
- **Severity Level:** Warning.
- **Valid Result:** Valid.
- **Valid Message:** All activities in this workflow have at least one inbound transition.
- **Invalid Result:** Invalid.
- **Invalid Message:** This workflow contains <activity count> activity conditions without an input transition.
- **Suggested Action:** Either remove the activities to reduce confusion and make the workflow easier to understand or provide the appropriate inbound transition.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** None

**Troubleshooting**

Although the activities detected in this validator do no harm to the execution of the workflow, the designer needs to know that there are activities on the canvas that cannot execute and serve no purpose, particularly in a production system. This error is typically caused by a visual misinterpretation of the drawing.

This example workflow appears to be perfectly valid. Under closer inspection, however, we see that the transition from **Set Values** does not stop at **Approval - User** (there is no arrow end). Instead, that transition goes directly to **End**. As a result, **Approval - User** cannot execute. Because there is an activity in the workflow based on the approval's condition routing, it appears that the designer intended for the approval to execute and that a correction is needed.

**TransitionIn invalid**

This validator directs the designer to the specific activity and condition that has no inbound transition. The designer should establish a transition or remove the activity.
**ValidateDanglingTransition**

The **ValidateDanglingTransition** validator finds and reports any transitions that do not terminate on an activity.

**Note:** These transitions are not drawn on the workflow canvas, but are still present in the database.

**Warning:** This is a critical error that prevents a workflow from running.

**Validation summary**

- **Risk:** A workflow with dangling transitions will silently hang a workflow with no recovery options.
- **Severity Level:** Critical
- **Valid Result:** Valid
- **Valid Message:** Valid
- **Invalid Result:** Invalid
- **Invalid Message:** Invalid
- **Suggested Action:** Remove or connect the offending transition. Get the source activity name from the validation report details and resolve the issue. Then, run the validation again to test your changes.
- **Publishable:** No
- **Runnable:** No
- **Related Information:** None

**Troubleshooting**

On rare occasions, the destination of a workflow transition becomes null. The workflow canvas shows no evidence of the transition, but at run time, the workflow hangs when it encounters one of these dangling transitions. If the **ValidateDanglingTransition** validator reports this condition at publishing time, it blocks the publication action until the issue is resolved. If this condition is detected on a runtime check, the workflow is not allowed to execute against a current record’s transaction. Instead, the system adds a critical log entry detailing the activity with the faulted transition to the current record’s workflow context. To enable the workflow to execute on the next appropriate transaction, remove the faulted transition from the workflow model.

To find and remove the faulted transition:

1. Make note of the workflow version and activity that contains the faulted transition as indicated in the validator details.
2. Navigate to **Workflow > Administration > Workflow Version**.
3. In the list of workflow versions, select the workflow that has the faulted transition.
4. On Workflow Version form, add the workflow activities related list. Click the menu icon, select **Configure > Related Lists**, move **Workflow Activity-->Workflow Version** from the **Available** list to the **Selected** list, and click **Save**.
5. In the **Workflow Activities** related list, select the activity cited in the validator.
6. In the Workflow Activity form, view the **Workflow Transitions** section or tab and identify the transition in that list that has no value or a null value in the **To** column.
7. Delete this transition.
8. Return to the workflow version and re-run the validation check.

The **Critical** warning should disappear. The workflow should execute as expected on the next appropriate transaction.

**ValidateSubflows**

The **ValidateSubflows** validator detects any workflows included as subflows that are either inactive, deleted, or not available as a published workflow for the current user.

Any of these conditions cause the workflow to hang when the workflow activity in the main flow is encountered.

⚠️ **Warning:** This is a critical error that prevents a workflow from running.

**Validation summary**

- **Risk:** A parent workflow that transitions to a deleted subflow hangs indefinitely, with no recovery options.
- **Severity Level:** Critical
- **Valid Result:** Valid
- **Valid Message:** This workflow contains `<count>` valid subflows.
- **Invalid Result:** Invalid
- **Invalid Message:** This workflow contains `<invalid count>` invalid subflow(s) of `<total subflow count>` total subflows.
- **Suggested Action:** Remove the link in the parent workflow to the questionable subflow, examine the subflow to ensure that it is valid and published, or that it is checked out to the current user. After making the correction to the state of the subflow, run the validation again to test your changes.
- **Publishable:** No
- **Runnable:** No
- **Related Information:** [Workflows used as subflows](#)

**Troubleshooting**

When a workflow runs, regardless of whether it is a subflow or a main flow, the script engine determines which version of a workflow should execute, given the current user and workflow conditions. When a workflow is checked out by the same user who is running the workflow, the checked out version is the version that executes. If the user is not the same person who has the workflow checked out, the published version of the workflow executes. If there is no published workflow, no workflow runs.

One scenario addressed by the **ValidateSubflows** validator is when a workflow:

- Is checked out to User A.
- Is a subflow in a parent workflow being run by User B.
- Has no published alternative to the subflow being run by User B.

When this occurs, the parent workflow runs to the execution of the unpublished subflow and then hangs at that activity, with no means to transition forward. Main flows that encounter this condition in a subflow are not permitted to execute against a current record's transaction. Instead, a critical log entry detailing the subflow's state is added to the current workflow's Workflow Context record. To correct the problem, remove the subflow from the main flow, or
publish the subflow so it is available to User B. This allows the workflow to execute on the next appropriate transaction.

Another scenario addressed by the ValidateSubflow validator is when a workflow:

- Is a subflow in a parent workflow being run by any user.
- Has no published alternative to the subflow, because the workflow has been deleted or all versions of the workflow are unpublished or inactive.

**Note:** You cannot delete a from a list or form workflow that is a subflow. However, you can create one of these unstable conditions with advanced scripting, SQL options, or incomplete update sets that contain main flows, but not the referenced subflows. When troubleshooting a workflow that triggered this validator, consider the history of the subflow while assessing the error condition.

ValidateScriptForCurrentDotUpdate

The ValidateScriptForCurrentDotUpdate validator finds workflow activities with scripts that use the current.update() function.

Calling current.update() causes significant performance delays in transaction processing and might cause an instance to hang.

**Validation summary**

- **Risk:** At best, a workflow that uses current.update() in scripts experiences degraded performance. In the worst case, the workflow enters an infinite, recursive loop that crashes the server.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** The JavaScript in this workflow has no instances of 'current.update()'.
- **Invalid Result:** Invalid
- **Invalid Message:** This workflow uses 'current.update()' in <count of current.update references> JavaScript statements.
- **Suggested Action:** Remove current.update() from the activity scripts cited by this validator. Workflows execute within a transaction, and current is updated, or possibly inserted, at the end of the transaction, as appropriate. There is no need to explicitly update the record during the transaction.
- **Publishable:** Yes
- **Runnable:** Yes

**Problems with current.update() in workflow scripts**

A workflow initiates execution in one of these ways:

- **Script Engine:** If a workflow is assigned to a specific table, and given a run condition, the workflow runs on INSERT.
- **Script:** Any business rule, script include, background script, or client script can initiate a workflow using the workflow script include and calling startFlow().

The workflow engine initiates a workflow based on the matched criteria of the current record being inserted. The transaction for current is managed by the script engine and not the workflow. Workflows that progress on the update() of the current record are not invoked via the workflow engine, but as a call from either a client script or business rule. In either case, the script engine is
invoked, and the current record is put in memory. Edits and modifications to any current fields are made and are available to other activities and scripts that are executed in the same transaction.

When appropriate, other engines that run in sequence with the workflow engine, such as the business rule engine or field normalization, are invoked against the same current record transaction. Any changes made to current through these scripts and activities modify the record in memory. These changing values are available for reference in any other transactions called from activities and scripts in the same INSERT transaction. When all expected changes are executed, the current record is inserted.

When one of these scripts calls `current.update()` on a record that has yet to be inserted, the action forces an unnecessary and error-prone database transaction. If a record is not yet in the database, it cannot be updated. Business rules that trigger on `update()` on a record that is in the process of being inserted can cause a very unstable and potentially infinite looping condition.

**Troubleshooting**

This validator detects the use of `current.update()` in any of the editable script fields. Do not call `current.update()` from within a workflow script. In the event of an INSERT or UPDATE of current, the changes made to current are available to all scripts executing in the same transaction, and the script engine stores all changes in the database. Leave the update of current to the engine. Use the scripts only for setting and referencing the current field values.

**ValidateLowestCommonTable**

The `ValidateLowestCommonTable` validator reports the lowest table in the Glide hierarchy that the workflow uses.

For example, the Requested Item (sc_req_item) table is the lowest table in a workflow containing a Catalog Task activity. This information is significant to a designer who wants to change the table against which an existing workflow runs after adding activities to the canvas.

> **Note:** This validator provides information only. It does not indicate an error or warning condition.

**Validation summary**

- **Risk:** This validator informs only and has no risk associated with it.
- **Severity Level:** Data/Information
- **Valid Result:** Valid
- **Valid Message:** The lowest common table in this workflow is <<table_name>>.
- **Invalid Result:** N/A (informational only)
- **Invalid Message:** N/A (informational only)
- **Suggested Action:** None
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** Tables and classes, Workflow activities

**ValidateTableChange**

The `ValidateTableChange` validator reports any activities in the workflow that are invalid given the table associated with the workflow version.

For example, a workflow version that is associated with the Change Request (change_request) table but has a Catalog Request activity on the canvas is invalid, since the activity is not compatible with the selected table.
Validation summary

- **Risk:** If the current record at runtime does not originate from the table specified by the lowest common table, the activities for the lowest common table cannot set specific values.
- **Severity Level:** Warning if the table that is associated with a workflow is higher in the table hierarchy than the lowest common table required for the workflow activities.
- **Valid Result:** Valid
- **Valid Message:** All activities are valid for the newly selected table
- **Invalid Result:** Invalid Activity
- **Invalid Message:** This workflow contains <count of invalid activities> invalid activities for the newly selected table.
- **Suggested Action:** Make one of these changes:
  - Change the workflow to not require the activities associated with the lowest table reported.
  - Modify the workflow to use a table that contains the lowest common table in its hierarchy.
  - Ensure that the current record meets the requirements of the at-risk activities.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** Workflow activities

Troubleshooting

Navigate to Workflow > Administration > Activity Definitions. Note the Table column in the list. Each activity that is not global is associated with a table.

When you select a table in the Workflow Properties form, the activity menu presents only activities that are compatible with the selected table. Associating a table with a workflow activity enables the system to make certain decisions about the activity that affect value comparison, condition routing, or the setting and getting of field values in the current record.

When a workflow is set to the Global (global) table, it is possible that the process executing the workflow ensures that the current record meets the requirements of the activities identified by this validator. In that case, the activity still works as expected. If that assurance cannot be guaranteed by the user process, do not use the activity identified by the validator without assigning a table that meets the requirements of all the activities on the canvas.

This validation check ensures that the table specified by all the activities in a particular workflow is included in the hierarchy of the table selected for the workflow.

ValidateParentFlow
The ValidateParentFlow validator reports any workflows that use the workflow as a subflow.

Validation summary

- **Risk:** There is no risk in a workflow being a subflow. This is only a warning that other workflows are at risk from dramatic changes to a subflow.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** Currently <workflow version name> is not a subflow.
- **Invalid Result:** None
- **Warning Message:** This workflow version (<workflow version name>) is required as a subflow in <workflow version count> other workflows.
• **Suggested Action:** Exercise caution when modifying things like input parameters and return values to assure that parent workflows are not adversely affected.
• **Publishable:** Yes
• **Runnable:** Yes
• **Related Information:** Workflows used as subflows

**Troubleshooting**

The system warns the workflow designer at publishing time and during validation that a workflow is a subflow. This warning reminds the designer that changes to the current workflow have the potential to affect workflows cited in the validation report or other workflows already running in production. Regardless of how simple the change to a workflow that is a subflow, thoroughly test all parent flows cited in this validation report before publication.

When a workflow is a subflow, changes that can cause it to become invalid include:

- Changing the data types of *input variables*. Verify that all parent workflows cited in this validation report can pass the correct value type.
- Adding input variables. Verify that all parent workflows cited in this validation report are able to pass all variable values into the subflow.
- Changing or removing the return value of a workflow. Verify that any changes to the return value of a workflow are compatible with the requirements of all the parent flows.
- Changing the table on which the workflow runs. Verify that the table selection is compatible with all parent flows.

**Note:** To delete a workflow that is a subflow, first remove the dependency by removing the subflow from all parent flows cited in this validation report. After the dependencies are cleared, a user with the proper role can delete the subflow.

**ValidateSingleEnd**

The **ValidateSingleEnd** validator finds and identifies multiple *End* activities in a single workflow.

Multiple *End* activities in a workflow might be intentional and have no affect on the workflow, or might be a mistake that the designer needs to correct.

**Validation summary**

- **Risk:** If the execution paths to the *End* activities are not mutually exclusive, then the first *End* encountered completes the workflow and cancels all other executing activities.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** This workflow contains 1 End activity.
- **Invalid Result:** Invalid Activity
- **Invalid Message:** This workflow contains <count of ends> End activities.
- **Suggested Action:** Remove extraneous *End* activities that are not intended as part of the design.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** None
Troubleshooting

As soon as an End activity is encountered in the workflow, the workflow completes even if there are other viable execution paths leading to a second End activity that is still executing. Those executing activities are canceled as part of the End activity’s clean up actions. Therefore, the results of designing workflows with multiple Ends must be carefully considered.

In the case of large workflows, it is often more intuitive to read the workflow when there are multiple End activities. In the following example, the paths to the two Ends are mutually exclusive execution paths. If this was a large workflow, with many activities between Branch and the second End, the value of the multiple ends becomes apparent. Tracing a No response from User is invalid to a single End behind 33 other activities would be significantly more difficult. There is no risk in this workflow design because there is no reason for other activities to execute if the End after the Notification activity terminates the workflow.

Mutually exclusive execution paths

The next example has multiple End activities in execution paths that are not mutually exclusive. A Yes response from User is valid causes the Set Values activity to finish immediately. By reaching its End activity first, this execution path cancels the Approval for Apps and the DB Task activities, which might not be the desired outcome. If the paths are all expected to complete before End, the activities should come to a Join (as in the previous example) that transitions to a single End.
Mutually inexclusive execution paths

**Note:** To add the second **End**, right-click to copy the original **End** activity and paste it onto the canvas. In most cases, a single **End** is the best and most reliable way to ensure that all activities expected to execute prior to workflow completion, do so successfully.

**ValidateUpdateSetDependencies**

The **ValidateUpdateSetDependencies** validator identifies all the subflows called in the current workflow and determines if any of those subflows are being edited in a different (in progress) update set.

This warning informs the user that this workflow and one or more of its dependencies are being actively modified in a way that will not deploy concurrently to another instance without additional effort.

For information about update sets, see [Create and select an update set](#).

**Validation summary**

- **Risk:** If a parent workflow is edited in one update set and its dependent subflow is edited in another, the two workflows might not be compatible when moved to a different instance. Making independent changes, such as to common or expected values, can make the two workflows incompatible.
- **Severity Level:** Warning
Valid Result: Valid
Valid Message: There were no Update Set dependency issues found.
Invalid Result: Invalid
Invalid Message: This workflow has dependent workflows that are in a different update set.
Suggested Action: Modify and deploy both workflows in the same update set. If you must modify dependencies in separate update sets, use one of these methods:
- Ensure that all update sets migrate concurrently.
- Prior to deploying the main flow update set, merge the dependencies into one update set before completing that update set.

Publishable: Yes
Runnable: Yes
Related Information: Workflow movement with update sets

Troubleshooting

A workflow is added to an update set only when the workflow is published. This validator issues a warning when either of the following conditions exist:
- A published subflow is in a different update set than the parent workflow and that update set is In progress.
- A subflow is checked out by another user, who is working in a different update set than the current user.

Note: This validator does not look for update sets that have been closed. It looks only at update sets that are In progress or at the update sets of all subflows being used by the current workflow that are checked out to users who are working in a different update set.

Example

Following is an example of an at-risk development scenario in which two users create dependencies between workflows in different update sets.

User A:
1. Sets Update Set A to the current update set.
2. Checks out Workflow A.
3. Changes the return value of the String type in Workflow A to a Reference/User type.
4. Publishes Workflow A, causing an entry into Update Set A.

User B:
1. Sets Update Set B to the current update set.
2. Checks out Workflow B.
3. Includes Workflow A as a subflow.
4. Uses the user reference return value from Workflow A as an approval assignment.
5. Publishes Workflow B, causing an entry into Update Set B.
Risks

- User B moves Update Set B to a different instance that has an older version of Workflow A. The return value is not a user reference, which causes the outcome of Workflow B to be different than it was when tested in development.
- User B moves Update Set B to a new instance that does not have a version of Workflow A. Workflow B experiences a validation failure at runtime and cannot execute. A log entry is added to the workflow log of the current record.

Possible solutions

Solution 1
Migrate the parent workflow and all dependent workflows to a new instance together using the same update set.

1. Set the update set to the one you want to migrate to new instances.
2. Check out and republish the workflows that need to be included.
   - This action forces an entry into the current update set.
3. Complete the update set with all dependencies.
4. Follow standard procedures for migrating update sets to local instances.

Solution 2
Move dependent workflows between update sets.

1. Identify the update set containing the main workflow to be migrated.
2. Navigate to System Update Sets > Local Update Sets.
3. Find and select the update set that contains the dependencies to the main workflow.
4. In the Customer Updates related list, select the workflow version of the subflow you want to move.
5. Select the update set containing the parent workflow in the Update set field.
   - If this field is not on the Customer Update form, configure the form and add the field.
6. Click Update.
   - The base system moves the dependent subflow to the update set selected.
7. Repeat steps 4-6 to add additional dependent subflows to the parent flow update set.

ValidateUpdateSetParentDependencies
The ValidateUpdateSetParentDependencies validator identifies all the workflows that call the current workflow as a subflow and determines if any of those parent workflows are being edited in a different update set that is in progress.

This warning informs the user that this workflow and one or more workflows that depend on this workflow are being actively modified in a way that will not deploy concurrently to another instance without additional effort.
Validation summary

- **Risk:** If a parent workflow is edited in one update set and its dependent subflow is edited in another, the two workflows might not be compatible when moved to a different instance. Making independent changes, such as editing common or expected values, can make the two workflows incompatible.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** There were no Update Set dependency issues found.
- **Invalid Result:** Invalid
- **Invalid Message:** This workflow has dependent workflows that are in a different update set.
- **Suggested Action:** Modify and deploy both workflows in the same update set. If you must modify dependencies in separate update sets, use one of these methods:
  - Ensure that all update sets migrate concurrently.
  - Prior to deploying the main flow update set, merge the dependencies into one update set before setting that update set to complete.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** Workflow movement with update sets

Troubleshooting

A workflow is added to an update set only when the workflow is published. This validator issues a warning when either of the following conditions exist:

- A published subflow is in a different update set than the parent workflow and that update set is In progress.
- A subflow is checked out by another user, who is working in a different update set than the current user.

**Note:** This validator does not look for update sets that have been closed. It looks only at update sets that are In progress or at the update sets of all parent workflows that call the current workflow and are checked out to users who are working in a different update set.

Example

Following is an example of an at-risk development scenario in which two users create dependencies between workflows in different update sets.

**User A:**
1. Sets Update Set A to the current update set.
2. Checks out Workflow A.
3. Changes the return value of the **String** type in Workflow A to a **Reference/User** type.
4. Publishes Workflow A, causing an entry into Update Set A.

**User B:**
1. Sets Update Set B to the current update set.
2. Checks out Workflow B.
3. Includes Workflow A as a subflow.
4. Uses the user reference return value from Workflow A as an approval assignment.
5. Publishes Workflow B, causing an entry into Update Set B.

Risks

- User B moves Update Set B to a different instance that has an older version of Workflow A. The return value is not a user reference, which causes the outcome of Workflow B to be different than it was when tested in development.
- User B moves Update Set B to a new instance that does not have a version of Workflow A. Workflow B experiences a validation failure at runtime and cannot execute. A log entry is added to the workflow log of the current record.

Possible solutions

Solution 1
Migrate the parent workflow and all dependent workflows to a new instance together using the same update set.

1. Set the update set to the one you want to migrate to new instances.
2. Check out and republish the workflows that need to be included.
   - This action forces an entry into the current update set.
3. Complete the update set with all dependencies.
4. Follow standard procedures for migrating update sets to local instances. For information about update sets, see System update sets.

Solution 2
Move dependent workflows between update sets.

1. Identify the update set containing the main workflow to be migrated.
2. Navigate to System Update Sets > Local Update Sets.
3. Find and select the update set that contains the dependencies to the main workflow.
4. In the Customer Updates related list, select the workflow version of the subflow you want to move.
5. Select the update set containing the parent workflow in the Update set field.
   - If this field is not on the Customer Update form, configure the form and add the field.
6. Click Update.
   - The base system moves the dependent subflow to the update set selected.
7. Repeat steps 4-6 to add additional dependent subflows to the parent flow update set.
ValidateInputVarUpdateSetDependencies
The ValidateInputVarUpdateSetDependencies validator examines update sets to ensure that workflow input variables for a given workflow have not been deleted in different update sets than those currently In progress.

Validation summary

- **Risk:** Workflows and their input variables are not moved together in a single update set. The deletion of input variables is captured in a different update entry. If these two entries are not in the same update set, the workflow execution can be unstable.
- **Purpose:** Determine whether input variables that belonged to this workflow were deleted in a different update set.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** There were no Input Variable Update Set dependency issues found.
- **Invalid Result:** Invalid
- **Invalid Message:** There are input variables that have been deleted and logged in a different update set.
- **Suggested Action:** If the deletion is not intended to be separate from the workflow, ensure that both update sets are committed concurrently to the new instance, or merge both payloads into a single update set.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** Workflow movement with update sets

Troubleshooting

Workflow input variables get individual entries in the Customer Update related list in the current user's update set. This validator reports to the user when workflow input deletions have happened in an update set other than the current user's update set.

Follow the instructions for Input variable removal when the validator issues this warning.

ValidateWorkflowEndStages
The ValidateWorkflowEndStages validator checks that in workflows with stages, the end activity of the workflow has a stage named Complete or Completed.

If the workflow has stages associated with it, but does not have the completed stage on the end activity, then the stage indicator will not show that the workflow completed.

Validation summary

- **Risk:** The stage indicator will not show the workflow is completed.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** Workflow end stages are valid.
- **Invalid Result:** invalid
- **Invalid Message:** End activity A found with invalid stage ‘S.’
- **Suggested Action:** If this is not by design, make the appropriate changes.
- **Publishable:** Yes
- **Runnable:** Yes

© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
- Related Information: Workflow activities

Troubleshooting

Check the workflow for an end activity. Ensure that this activity assigns a stage named Complete or Completed.

ValidateWorkflowStageColumn

The ValidateWorkflowStageColumn validator detects and reports when the stage field (stage column) for a workflow is not correct or is unusable.

Validation summary

- Risk: The stage indicators may not display appropriate information.
- Severity Level: Warning
- Valid Result: Valid
- Valid Message: Workflow stage values are valid.
- Invalid Result: Warning
- Info Summary: Stage warnings found.
- Invalid Messages:
  - Table T does not have a column named C.
  - Workflow for table T has stages, but no stage column.
  - Table T has a stage column ‘C,’ but no stages are set by activities.
  - Workflow on table T has stage column ‘C’ that is not type=workflow.

- Suggested Action: If this is not by design, make the appropriate changes.
- Publishable: Yes
- Runnable: Yes
- Related Information: Workflow activities, Workflow stages

Troubleshooting

To check the stage column:

1. Open and check out a workflow.
2. Open the workflow version properties dialog by clicking the menu icon and selecting Properties.
3. View the Stages tab or section.
4. Check that the assigned stage column is actually a column in the table to which the workflow is associated.
5. Check that the column is type=workflow.

Tip: Stage columns should not be choice lists. If they are, the list appears read-only in form views, since changing that column value outside the workflow engine does not ensure safe tracking of stage states.

ValidateWorkflowStateValues

The ValidateWorkflowStateValues validator checks a number of stage aspects in workflow activities for correctness.
This validator has multiple possible error messages.

Validation summary

- **Risk:** The stage indicators may not display appropriate information.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** Workflow stage values are valid.
- **Invalid Result:** invalid
- **Warning summary:** Stage warnings found.
- **Invalid Messages:**
  - Stage with empty name is not allowed.
  - Stage with empty value is not allowed.
  - Cannot have more than one stage with the same name: x.
  - Cannot have more than one stage with the same value: y

- **Suggested Action:** If this is not by design, make the appropriate changes.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** Workflow activities

Troubleshooting

Use the following procedure to troubleshoot this validator:

1. Open and check out a workflow.
2. Open the list of stages for the workflow by clicking the menu icon and selecting **Edit Stages**.
3. Check the names and values.
   
   Ensure that the names and values are unique and are not empty.

4. If the same stage name or value appears more than once, remove one of the rows. It is then very important to go through the workflow and reassign stages in the activities that used the removed stage.
Validating Workflow State Values

Tip: Make a list of which activities assign which stages.

**Workflow concepts**

You can do many things using the workflow editor.

- Modify core activities and exit conditions.
- Create custom activities and reuse the data for other workflows.
  
  See [Orchestration activity designer](#).
- Download activity packs from the ServiceNow Store and create packs for upload.
ServiceNow    Jakarta    Now Platform Capabilities

- **Edit workflows** graphically.
- **Define transitions** between workflow activities.
- For the table that corresponds to the workflow, customize business rules.
- Summarize workflow progress through **stages**.
- **Validate workflows** to identify potential problems.
- **Publish workflows** for other users.
- **Edit multiple tables** without needing to directly modify them.

**Workflow versions**

To prevent users from making changes to a workflow that affect other users of the system, workflows must be checked out before they can be edited.

Only one user can check out a workflow at a time. When a workflow is checked out, changes apply only to the user who has the workflow checked out. Other users can continue to use the published workflow. After the changes are complete, the workflow can be published so that it is available to all users.

**Note:** Because each workflow has a unique sys_id, different workflows can have the same name. This is typically expected in a domain-separated environment where users in different companies cannot see each other’s workflows because they are in different domains. However, this can lead to confusion in other environments. In general, give each workflow a unique name to prevent workflow designers from making changes to the wrong workflow.

When a new version of an existing workflow is published, the changes are not applied to running workflow contexts. Any currently running workflow context continues using the workflow version that was available when the workflow started. The next time the workflow runs, it uses the updated, published version.

**Workflow scope**

Workflow application scope determines the access that an application has to the information in a workflow, specifically to the data contained in the activities in that workflow.

When a workflow is created, it inherits the application scope from the gear menu for the logged in user. This scope cannot be changed in the workflow editor. When the workflow executes, it runs in this scope and can only be called from a different application if the workflow’s accessibility setting permits access to all scopes (public). Otherwise, the workflow’s application scope is private to the application.

**Note:** Any script that is created in the workflow editor, such as an advanced script in an If activity, runs in the scope of the workflow. All core activities provided in the base system or for Orchestration run in the scope of the workflow.

Custom activities run in their own scope, even if it is different from that of the workflow. The scope of a custom activity can be private or public. Any script that runs inside a custom activity with a scope can only access outside artifacts that are within the scope of that activity or artifacts that are configured to run in any scope. Conversely, an outside artifact can only access the script inside that private activity if the outside artifact is running in the same scope. Activities with public scopes can interact with outside artifacts in any application scope.

You can use private activities as part of a workflow that has a public application scope. These activities are protected from reaching outside of the workflow or from being reached from outside
the workflow. For details about setting application scoping for custom activities, see the field description table for the appropriate activity template.

**Note:** Custom activities uploaded to the ServiceNow Store must be configured as accessible to all application scopes.

### Workflow scope restrictions

There are some restrictions to public and private application scopes.

During runtime, publicly scoped workflows can access other application resources, as long as these resources are set to be accessible to all application scopes. Privately scoped workflows in a private application scope can only access resources private to its scope. Due to scope access boundaries, any privately scoped workflows that make calls out to other scoped resources fail with either an exception or a hung activity while waiting for returned results. This occurs when making calls to these common global resources:

- ECC queues
- Tasks
- Approvals
- Events
- SLA timers
- Timers
- Script includes
- Business rules
- Workflow APIs

As you design workflows, validate the visibility and accessibility of all resources prior to deployment.

See [Application scope](#).

For information on how to configure the scope for a workflow, see [Workflow properties](#).

### Workflows and domain separation

When domain separation is enabled, workflows and workflow activities inherit the domain of the user who publishes or creates them.

While workflows are managed by multiple tables, only the following tables are used for domain separation features:

- **Workflow (wf_workflow):** used for [delegated administration](#) or process separation.
- **Workflow Version (wf_workflow_version):** used for [delegated administration](#) or process separation.
- **Workflow Context (wf_context):** used for [data separation](#).

**Note:** The Workflow Version table (wf_workflow_version) table does not contain a domain field; Workflow Version records inherit their domain from the parent Workflow record.

The workflow editor displays a workflow’s domain in the title bar after the workflow name.
Workflows and delegated administration

Delegated administration allows child domains to inherit workflows from higher up the domain hierarchy and to override them with domain-specific versions if necessary.
Workflow and delegated administration

Workflow records in the Workflow (wf_workflow) and Workflow Version (wf_workflow_version) tables are considered processes. A user in a child domain may check out but not copy a workflow from a parent domain. When a user in a child domain checks out a workflow from a parent domain, the system creates a version of the workflow in that user’s domain. This new version is a unique record in the Workflow (wf_workflow) table. After the user publishes this new workflow, other users
in the child domain use the new workflow, which overrides the workflow from the parent domain. The original workflow in the parent domain is no longer visible to users in the child domain.

For example, a managed service provider (MSP) hosts ITSM services for several companies, including ACME and Initech, on a single instance. As administrators, the MSP creates a Change Request - Emergency workflow that applies to all domains because it was created in the TOP domain, which is the highest domain in the domain hierarchy. This workflow overrides the global Change Request - Emergency workflow and specifies that emergency change requests require approval from the CAB approval group. Because of delegated administration, every domain in the hierarchy sees and uses this workflow. Now suppose the ACME domain requires a different approval policy where emergency change requests require approval from the emergency CAB approval group. The MSP creates another version of the Change Request - Emergency workflow in the ACME domain. This workflow overrides the version in the TOP domain and only applies to users in the ACME domain.

Workflow permissions

When a user starts a new workflow, the workflow runs with that user's domain and credentials. The workflow preserves a user's domain and credentials until an activity causes the workflow to wait, such as an approval activity waiting for approval or rejection. When the stopped workflow resumes, such as when a user approves a request, the workflow uses the credentials of the approving user, but continues to run within the domain of the original user.

Workflows and data separation

Data separation restricts workflow contexts to users who are either in the same domain of the workflow or are members of a parent domain.
Workflow and data separation

Workflow records in the Workflow Contexts (wf_contexts) table are considered data. Data separation restricts workflow contexts to users who are either in the same domain of the workflow or are members of a parent domain. While a user in a parent domain can see running workflows
in a child domain, a user in a child domain cannot see running workflows in a parent domain. If necessary, administrators can use *visibility or contains domain* to expand who can see domain-specific data.

For example, when an ACME user requests something from the service catalog, a Service Catalog Request workflow context is created in the ACME domain. Similarly, a service catalog request from an Initech user creates a workflow context in the Initech domain. An MSP user in the TOP domain can see both workflow contexts because it is the parent domain for both the ACME and Initech domains. However when an ACME or Initech user logs in, data separation prevents them from seeing each other’s service catalog requests. This is expected behavior because each workflow context contains data specific to that domain, such as the item requested and the request’s approval history.

**Workflow engine operation order**

The workflow engine runs in a predefined order relative to business rules and database operations. It caches commonly-used published workflows to improve performance.

The *Run after bus. rules run* workflow property defines if a workflow is **Default** or **Deferred**.

The diagram below shows the workflow engine order of operations and when Default and Deferred flows are executed. For a more general overview of engine operation order, see *Execution order of scripts and engines*.
**Before** business rules (order <1000)
Do not use `current.update()` here

Default workflows
Do not use `current.update()`

**Before** business rules (order >=1000)
Do not use `current.update()`

Database operation
(insert, update, delete)

The current record is inserted or updated at the end of the database operation.

**After** business rules (order <1000)
Use `current.update()` if there is no deferred workflow

Deferred workflows
Do not use `current.update()`

Always use `current.update()`.
**Workflow caching**

The workflow engine caches commonly-used published workflows to improve performance. Caching significantly reduces the number of database queries per workflow. By default, the engine caches up to 300 unique workflow versions. Caching very large workflows may reduce this number as the cache size cannot exceed the Java Virtual Machine (JVM) heap size.

To change the maximum number of cached workflow versions, navigate to **Workflow > Administration > Properties** and modify the value of the **The max number of models that will be concurrently held in the LRU cache** (glide.workflow.model.cache.max) property. You must restart the instance to apply this change.

**Workflow tables**

For full flexibility, workflows store information over a number of different tables.

Usually tables containing workflow information are not edited one-by-one. Instead, use the Workflow Editor to edit workflows. The following lists are provided for reference purposes.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workflows</td>
<td></td>
</tr>
<tr>
<td>Column Renderer (column_renderer)</td>
<td>A renderer widget for a stage column. Stage renderers are written in Jelly as a UI Macro. The default is Workflow-Driven; it covers most workflow related stage scenarios.</td>
</tr>
<tr>
<td>Version (wf_versionable)</td>
<td>Tracks different versions of element definitions (wf_element_activity).</td>
</tr>
<tr>
<td>Workflow (wf_workflow)</td>
<td>The master records of workflows.</td>
</tr>
<tr>
<td>Workflow Context (wf_context)</td>
<td>Individual instances of a workflow being used.</td>
</tr>
<tr>
<td>Workflow Execution (wf_workflow_execution)</td>
<td>Synthetic “current” records for workflows that run on Global.</td>
</tr>
<tr>
<td>Workflow Instance (wf_workflow_instance)</td>
<td>Connections of workflows to subflows.</td>
</tr>
<tr>
<td>Workflow Version (wf_workflow_version)</td>
<td>Particular versions of a workflow, either published versions or versions that have been checked out.</td>
</tr>
<tr>
<td>Activities</td>
<td></td>
</tr>
<tr>
<td>Activity Designer (wf_element_activity)</td>
<td>Custom activity definitions.</td>
</tr>
<tr>
<td>Activity Variables (wf_activity_variable)</td>
<td>Variables for activities.</td>
</tr>
<tr>
<td>Workflow Activity (wf_activity)</td>
<td>Activities as they are being used in workflows.</td>
</tr>
<tr>
<td>Workflow Activity Definition (wf_activity_definition)</td>
<td>Definitions of activities that can be used in a workflow.</td>
</tr>
<tr>
<td>Workflow Executing Activity (wf_executing)</td>
<td>Individual instances of activities being performed in active contexts.</td>
</tr>
<tr>
<td>Workflow components</td>
<td></td>
</tr>
<tr>
<td>Element Provider (wf_element_provider)</td>
<td>Template definitions for custom activities.</td>
</tr>
<tr>
<td>Group approval (sysapproval_group)</td>
<td>Group-level approvals.</td>
</tr>
<tr>
<td>Variable (item_option_new)</td>
<td></td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Workflow Condition (wf_condition)</td>
<td>All of the defined conditions in workflows.</td>
</tr>
<tr>
<td>Workflow Element Definition (wf_element_definition)</td>
<td>Parent table for activity definitions.</td>
</tr>
<tr>
<td>Workflow Estimated Runtime Configuration</td>
<td>Runtime performance data for completed workflows.</td>
</tr>
<tr>
<td>Workflow Queued Command (wf_command)</td>
<td>Temporary internal storage for workflows that are currently executing.</td>
</tr>
<tr>
<td>Workflow SC Variable (wf_variable)</td>
<td>The Service Catalog variables for a workflow.</td>
</tr>
<tr>
<td>Workflow Schedule (wf_workflow_schedule)</td>
<td>Definitions of the times to run specific workflows.</td>
</tr>
<tr>
<td>Workflow Transition (wf_transition)</td>
<td>All of the defined transitions in workflows.</td>
</tr>
<tr>
<td>History</td>
<td></td>
</tr>
<tr>
<td>Workflow Activity History (wf_history)</td>
<td>The history of executed activities.</td>
</tr>
<tr>
<td>Workflow Log Entry (wf_log)</td>
<td>All of the events and history of the workflow.</td>
</tr>
<tr>
<td>Workflow Transition History (wf_transition_history)</td>
<td>The history of executed transitions.</td>
</tr>
<tr>
<td>Stages</td>
<td></td>
</tr>
<tr>
<td>Stage Default (wf_stage_default)</td>
<td>Definitions of default stage fields for tables to use.</td>
</tr>
<tr>
<td>Stage Set (stage_set)</td>
<td>A named set of stages that can be used to populate workflow stages for multiple workflows.</td>
</tr>
<tr>
<td>Stage Set Entry (stage_set_entry)</td>
<td>The stages that belong to a named stage set.</td>
</tr>
<tr>
<td>Stage Set for Table (stage_set_table)</td>
<td>Defines a relationship of a stage set to a table so that the stage set can be used as the default stages when a new workflow is created for the table. This replaces the wf_default_stage table and is the view that shows when you click Default Stages (by table) in the menu.</td>
</tr>
<tr>
<td>Workflow Stage (wf_stage)</td>
<td>Definitions of stages used by workflows.</td>
</tr>
</tbody>
</table>

**Workflow administration**

Tailor workflows exactly the way you want them.

**Workflow roles**

Certain roles are required to use workflows.

**Workflow roles**

<table>
<thead>
<tr>
<th>Role title (name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activity creator</td>
<td>Creates and edits custom workflow activities, reuses custom activity data, and manages activity packs downloaded from the ServiceNow Store.</td>
</tr>
<tr>
<td>(activity_creator)</td>
<td></td>
</tr>
<tr>
<td>Role title (name)</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Web service administrator</td>
<td>Accesses and uses REST and SOAP messages in the Orchestration activity designer. Creates and edits custom activities that use the REST web service and SOAP web service templates.</td>
</tr>
<tr>
<td>(web_service_admin)</td>
<td></td>
</tr>
<tr>
<td>Workflow administrator</td>
<td>Creates, edits, publishes, and deletes graphical workflows.</td>
</tr>
<tr>
<td>(workflow_admin)</td>
<td></td>
</tr>
<tr>
<td>Workflow creator</td>
<td>Creates new graphical workflows.</td>
</tr>
<tr>
<td>(workflow_creator)</td>
<td></td>
</tr>
<tr>
<td>Workflow publisher</td>
<td>Publishes graphical workflows.</td>
</tr>
<tr>
<td>(workflow_publisher)</td>
<td></td>
</tr>
</tbody>
</table>

**Administering workflow contexts**

The workflow context performs the activities and transitions defined in the workflow with the new record as current.

Workflow in ServiceNow names a running workflow a Workflow Context. The Workflow Context maintains the state of the overall process in the Workflow Context record. The Workflow Context maintains the state of the individual activities as they execute in a series of related lists. These lists maintain the state of currently executing activities, the result of finished activities, and the execution path the workflow took through the process model.

The Workflow Context canvas provides a visual representation of the execution path the workflow took through the process model. The state of each activity (finished, executing, cancelled, error) is represented using the color palette. The executed paths are represented in the color blue; the non-executed paths are represented in grey. Active and historic workflow contexts, as well as the activities within them, can be viewed using the Live Workflows section of the Workflow application menu.

**Viewing a workflow context**

Workflow contexts can be found in two places:

- From the Workflow Context related link on the form of the task being powered by the workflow.
- By navigating to Workflow > All Contexts and selecting an active context.

**Displaying workflow progress**

Two related links on the Workflow Context form allow you to view the progress of a workflow in different formats.

- **Show Timeline** displays the workflow context as a [timeline](#).
- **Show Workflow** displays the workflow context in the graphical workflow editor.
Graphical interface

To view the workflow context in the graphical workflow editor interface, click the Show Workflow link from either the workflow context record or the current record.

In the top right hand corner are two controls:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Refreshes the workflow context.</td>
</tr>
<tr>
<td></td>
<td>Displays a key of the colors used in the workflow to denote the state of activities and transitions:</td>
</tr>
</tbody>
</table>
Execution order

View tooltip text in the workflow context graphical view to see the execution order of individual activities.

In **Workflow > Live Workflows > Active Contexts** or **All Contexts**, Open the context you want to examine. Click **Show Workflow**, and point to a finished or executing activity. The tooltip shows error data, execution time, and the order in which the activity executed in the workflow. Use this data to help troubleshoot activities in an error state.
Cancel a workflow

Canceling a workflow stops the workflow from executing and sets the workflow context State to Canceled. To cancel an executing workflow, you can use the cancelContext(context) script. You can define an onCancel script to clean up unresolved workflow activities.

Canceling a workflow attempts to stop the workflow gracefully by injecting a cancel command into the workflow engine.

1. Navigate to Workflow > Active Contexts.
2. Select a workflow context record.
3. Select the Cancel related link.

A confirmation window appears.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
4. Click **OK**.

   The **Wait for Cancel** window appears. The workflow engine attempts to cancel the workflow gracefully.

   If the workflow does not respond to the cancel command, the **Force Cancel** window appears.
5. Click **Force cancel** to interrupt the thread the workflow is actively executing or click **Continue waiting** to continue waiting for the workflow to cancel gracefully.

**Warning:** Whenever possible, allow a workflow to cancel gracefully. Forcing a workflow to cancel can leave related workflows and scripts in an unresolved state. You can use an on-cancel script to clean up unresolved artifacts from a cancelled workflow.

---

**Cancel a workflow with the `cancelContext(context)` script**

To cancel an executing workflow, you can use the `cancelContext(context)` script. This script can be useful in cases where a workflow must be canceled in response to an event or where a user must manually cancel a workflow.

For more information, see the [API reference](#).

**Define an on-cancel script**

Canceling a workflow can leave records or scripts in an unresolved state. For example, canceling a service catalog workflow may leave catalog items in the requesting user's cart. An administrator can specify an On-cancel script that runs when the workflow transitions to the Canceled state. This script can notify users, log information, or resolve the state of any scripts run within a workflow activity. The sys_id of the workflow context is available in this script using the `context_sys_id` variable.

To define this script:

1. Navigate to **Workflow > Workflow Versions**.
2. Select a workflow version that you have checked out.
   
   Workflow versions that are not checked out are not editable.
3. Edit the **On-cancel script** field.
   
   You may need to **configure the form** to add this field.
4. Click **Update**.

   This example script adds a comment to a Requested Item (sc_req_item) record indicating the workflow for that request has been canceled.

```javascript
var grContext = new GlideRecord("wf_context");
grContext.get(context_sys_id);
var grReq = new GlideRecord("sc_req_item");
```
Scheduling a workflow

In addition to being run based on conditions, workflows can also be scheduled to perform at a particular time, similar to a scheduled job.

Scheduled workflows do not have a defined current record and do not run on specific records within a table. Due to this behavior, certain activities that depend on a current record, such as Create Task or Catalog Task are unavailable on scheduled workflows. If your workflow requires one of these activities, consider using a scheduled job that inserts a record to start the workflow instead of using a scheduled workflow.

To schedule a workflow, navigate to Workflow > Scheduled Workflows and click New. Populate the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the scheduled workflow.</td>
</tr>
<tr>
<td>Workflow</td>
<td>Select an existing published workflow to be triggered at the specified date, time, or interval.</td>
</tr>
<tr>
<td>Active</td>
<td>If selected, the scheduled workflow will be triggered at the appropriate time.</td>
</tr>
<tr>
<td>Application</td>
<td>Specifies the type of application, such as Global.</td>
</tr>
<tr>
<td>Run</td>
<td>A choice list to determine when the workflow should be triggered. Options are:</td>
</tr>
<tr>
<td></td>
<td>• Daily: At a particular hour every day.</td>
</tr>
<tr>
<td></td>
<td>• Weekly: On a particular day of the week.</td>
</tr>
<tr>
<td></td>
<td>• Monthly: On a particular day of the month</td>
</tr>
<tr>
<td></td>
<td>• Periodically: After every set duration.</td>
</tr>
<tr>
<td></td>
<td>• Once: At one specific date and time.</td>
</tr>
<tr>
<td>Time</td>
<td>For daily/weekly/monthly scheduled workflows, the time of day to run the workflow.</td>
</tr>
<tr>
<td>Day</td>
<td>For weekly scheduled workflow, the day of the week to run the workflow. For monthly scheduled workflows, the day of the month to run the workflow.</td>
</tr>
<tr>
<td>Repeat Interval</td>
<td>For periodical workflows, the interval between workflows, beginning from the Starting date and time.</td>
</tr>
<tr>
<td>Starting</td>
<td>For periodical workflows, the first date and time to run the workflow. For scheduled workflows run once, the date and time to run the workflow.</td>
</tr>
</tbody>
</table>

Workflow movement with update sets

The system tracks workflows in update sets differently than other records because workflow information is stored across multiple tables.

Changes made to a workflow version are not added to the update set until the workflow is published, at which point the entire workflow is added into the update set. Update sets store workflows as a single Workflow (wf_workflow) record and only retain the latest version with the update type of Workflow.

For information about update sets, see System update sets.

Workflow update set migration use case - simple

Create a new workflow with no dependencies and then migrate the workflow in an update set.

1. User A selects Update Set A.
2. User A creates a new workflow called Workflow A.
3. User A publishes Workflow A.
   
   A customer update set record is added to Update Set A containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.
4. User A completes Update Set A and migrates it to the production instance.
5. Update Set A commits successfully.
6. Workflow A works as expected.

Workflow update set migration use case - subflow dependency (success)

Successfully edit and migrate an existing workflow and its dependent subflow.

1. User A selects Update Set B.
2. User A checks out Workflow A.
3. User A adds a subflow called Workflow B to Workflow A.
   
   Assume that Workflow B was previously published and migrated to the production instance.
4. User A publishes Workflow A.
   
   A customer update set record is added to Update Set B containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.
5. User A completes Update Set B and migrates it to the production instance.
6. Update Set B commits successfully.
7. Workflow A works as expected with Workflow B as a subflow.

Workflow update set migration use case - subflow dependency (failure)

Edit and migrate an existing workflow from a test instance to a production instance that fails to run on the production instance because of a missing dependent subflow.

1. User A selects Update Set C.
2. User A checks out Workflow A.
3. User A adds a subflow called Workflow B to Workflow A.
Assume that Workflow B was previously published, but has not been migrated to the production instance.

4. User A publishes Workflow A.

A customer update set record is added to Update Set C containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.

Notably absent from Update Set C is the subflow called Workflow B. Workflow B was published before User A selected Update Set C.

5. User A completes Update Set C and migrates it to the production instance.

6. Update Set C commits with warnings.

7. Workflow A is invoked on the production instance with the following results:

   Workflow A fails the runtime validation check and is prevented from running on the production system. The system adds to the workflow context a workflow log entry detailing the cause of the failure, notably the absence of a dependent workflow.

To learn more about the validation checks on workflow dependencies and update sets see ValidateUpdateSetDependencies.

Workflow update set migration use case - subflow dependency (risk)

Multiple users migrate a workflow from a test instance to a production instance without proper coordination. This use case can succeed, but only when each user understands the dependencies and properly migrates the dependent parts of the workflow to the new instance.

This example does not represent an update set failure, although update sets are most often blamed in this use case. Validation increases the visibility of workflow dependencies across multiple update sets and provides designers with better information. In most cases, the warnings do not prevent an action, but only identify risk. The designer is responsible for taking action on advice given in the validation checks.

1. User A selects Update Set C.

2. User A checks out Workflow A.

3. User A adds a subflow called Workflow B that returns a User ID.

   
   Note: Assume that Workflow B was previously published and migrated to the production instance.

4. User A uses the return value of Workflow B to generate approvals.

5. User B selects Update Set D.

6. User B checks out Workflow B (the subflow in Workflow A).

7. User B modifies the return value of the workflow by changing it from a User ID to a String Message.

8. User A publishes Workflow A.

   
   Note: A dialog box displays warnings associated with Workflow A and encourages User A to validate the workflow before publishing.

9. User A cancels publishing and validates Workflow A.

10. User A is warned that Workflow B was modified by a user in a different update set.
11. User A ignores this warning and publishes Workflow A.

**Note:** A customer update set record is added to Update Set C containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.

12. User A completes Update Set C and migrates it to the production instance.

13. Workflow A is invoked on the production instance and runs successfully using the older version of Workflow B already on the system.

14. User B publishes Workflow B.

**Note:** User B is not warned of the Update Set C dependency, because the update set is no longer In progress. However, User B is informed via a dialog box that there are warnings associated with the workflow version and is instructed to validate Workflow B. If User B cancels publication and validates the workflow, User B is warned that there are workflows that use Workflow B as a subflow. Knowing the return value was changed, User B should test those workflows as well. See ValidateUpdateSetDependencies to understand the parameters of update set warnings.

15. User B finally publishes Workflow B.

**Note:** A customer update set record is added to Update Set D containing an XML payload, including the published Workflow B and all activity dependencies.

16. User B completes Update Set D and migrates it to the production instance.

17. Update Set D commits without warnings.

18. Workflow A is invoked on the production instance and fails to run successfully, because the return value of Workflow B no longer generates a User ID.

**Input variable movement**

You can add input variables to existing workflows and add them to update sets.

When you submit the new variables, an entry is made into the current update set that reflects the addition of a variable to the Variables (var_dictionary) table. Unlike the workflow version that only writes to the update set when the workflow is published, the variables write individual update entries into the currently selected update set immediately upon submission.

**Input variable movement use case - two input variables**

An existing workflow already contains two input variables.

1. User A checks out the workflow.

2. User A adds two input variables.

   ServiceNow adds to the current update set one customer update record for each new variable.

   The current workflow now has 4 input variables: the two that were present prior to check out and the two new ones.

3. User A publishes the workflow.

   There are now three related customer update records: two for new variables, and one for the published workflow. The XML payload of the new workflow version now includes all input.
variable database entries. So while the two original input variables do not have individual
customer update records, all four variables are migrated to the local instance with the
payload of the newly published workflow version.

4. Verify variables included in a specific workflow.
5. User A completes the update set.
6. Adding Input Variables - Success
   User A migrates and commits the update set to a local instance where the original workflow
   version had previously been committed.
   • The two existing input variables are already present because of the earlier version.
   • The system adds the two new input variables when the user commits the update set.
   • The system preserves the two legacy input variables on the instance receiving the update
     set. The update set does not overwrite these variables.
   • The new published workflow version uses all four variables.
   • The user tests the new workflow version and it runs as expected.

Verify variables included in a specific workflow
Follow the steps in this page to verify the variables that are included in a specific workflow.

1. Navigate to System Update Sets > Local Update Sets.
2. Select the active update set.
3. Select the customer update entry for the workflow.
4. View the XML Payload.
5. Search for the name of one of the columns or search for var_dictionary.

There is one var_dictionary entry for each input variable.

Input variable removal
Deleting workflow input variables, like insert and update actions, creates a customer update
record in a user’s current update set.

These deletions migrate to a new instance with the update set, regardless of whether the workflow
that owns the input variables is published in the same update set. Plan carefully and use caution
when editing a workflow and selecting update sets.

Input variable removal risk
An existing workflow already contains two input variables.

1. The workflow was migrated to a production instance with the two variables.
2. On a development instance, User A selects Update Set A and checks out the workflow.
3. User A removes one input variable and all references to it in the workflow.
   The system enters into Update Set A one customer update record reflecting the deletion of
   the input variable. No record is added for the new workflow version which no longer depends
   on the input. This does not happen until the workflow is published.
4. User A continues working on other features in Update Set A that need to be moved to
   production.
5. User A completes Update Set A and migrates it to the production instance without publishing
   the workflow.
The update set entry that deletes the workflow input variable now applies to the production instance. The prior version of the workflow is running on this instance and still references the missing variable.

**Input variable removal solution**

When editing workflows, particularly when deleting input variables, be sure to use a single update set for all variable editing and workflow publishing.

If necessary, merge the update set into a more general set targeted for deployment after the workflow is published. For information about update sets, see [System update sets](#).

**Note:** If a workflow version is already running on a production system and input variables are deleted from a newer version, those deletions could affect transactions already running against the earlier version. Use extreme caution when deleting workflow input variables and plan the migration carefully.

**Input variable removal prevention**

Prior to publishing a workflow version, the system validates the workflow model to assist the designer in planning for deployment.

This validation warns of critical errors that can prevent a workflow from running successfully, but also warns of dependencies and conflicts in update sets. See [ValidateUpdateSetDependencies](#) for more details.

**Avoiding duplicate workflows**

Update sets manage the published state of all versions of a workflow prior to committing the workflow version on a local instance.

The last version of a workflow committed as an Insert or Update using an update set becomes the currently published version, regardless of the publishing sequence for the workflow versions.

**Commit a workflow in an update set**

Follow the steps in this page to commit a workflow in an update set.

1. Workflow A - Version 1 is created and published in Update Set A.
2. Update Set A is completed and migrated to a local instance.
3. When the update set is committed, the system sets all prior versions of Workflow A to published = false.

   In the first migration, there are no prior versions.
4. Workflow A - Version 1 becomes the only published version of the workflow.

**Update set migration example**

It is not possible to have multiple published versions as a result of update set commits. However, this does not eliminate risk, and care should be taken when migrating update sets.

Consider this example:

1. Workflow A - Version 1 is migrated and committed to the production instance.
2. Update Set B is created.
3. Update Set C is created.
4. Workflow A - Version 2 is published in Update Set B.

   A customer update record is added to Update Set B with the Version 2 payload.

   A customer update record is added to Update Set B with the Version 1 workflow left unpublished.
5. Update Set B is completed.

6. Workflow A - Version 3 is published in Update Set C.
   A customer update record is added to Update Set C with the Version 3 payload.
   A customer update record is added to Update Set C with the Version 2 workflow left unpublished.

7. Update Set C is completed.

8. Update Set C is migrated and committed to the production instance.
   Workflow A - Version 1 is set to unpublished.
   Workflow A - Version 2 update is skipped since Update Set B, which contains Version 2, was never migrated.
   Workflow A - Version 3 is committed and becomes the only published version of the workflow.

Update set migration risk
Update Set B is migrated and committed to the production instance.

1. Workflow A - Version 3 is set to unpublished.

3. Workflow A - Version 2 is committed and becomes the only published version of the workflow.
   The workflow has gone back a version, perhaps unintentionally. The regressed version becomes the currently published version.

Workflow timelines
The system provides a timeline view of history activities associated with a workflow context.

Timelines display a linear calendar of activities, such as tasks and approvals, defined by their start and end dates. Each activity on the timeline is represented by a span, which is displayed as a horizontal, colored bar. Each span has a label and a tooltip that contains additional information about the activity. The left pane displays all the activities in the context (or contexts) in an expandable hierarchy. You can change the timeline's perspective for a more granular view of the data.

Important: Workflow timelines reflect context history only and are not real-time gauges of workflow activity.

Use a timeline
By default, the timeline displays all activities and transitions requested when first opened.

Collapse any part of the hierarchy in the activity pane and the timeline adjusts automatically.
Date/time and duration controls enable you to scale the timeline to view all the elements at once. To display a timeline, click a UI action within a Workflow Context record.

1. Navigate to Workflow > Live Workflows > Active Contexts.
2. Select a context.
3. In Related Links, click Show Timeline to display the timeline for the entire context.

   The timeline opens with all activities expanded and the view set to Max, which displays the entire timeline at the width of the pane. The title of the timeline is in the form Workflow context: <context name>, Requested Item: <requested item number>.
4. Use the Range Selectors at the top of the timeline to change the perspective.

The increments go from one day to one year. To limit the timeline to an increment between the start date of the first span and the end date of the last span, click **Max**.

5. Use the starting and ending calendar fields to select the timeline perspective.

These fields control the same perspective as the slider at the bottom of the timeline.

6. Use the pink slider at the bottom of the timeline to change the perspective.
1. Move the slider from right to left to view all the spans on a long timeline.

2. Adjust the end points of the slider to make arbitrary changes to the magnification.
   A narrow slider zooms in on the spans and provides a more detailed view of complex timelines. A wide slider pulls the view out and makes more of the timeline visible on the screen.

7. To focus the timeline view on selected activities, expand or collapse the activity tree.
   Spans not visible in the activity tree are not shown in the timeline pane.

8. Hover over an activity span to display a tooltip with information about the activity.
   This action highlights the activity in the activity pane.
9. Hover over the transition between two activities to highlight the activity and the predecessor activity in the activity pane.

10. Double-click a span to display a history record for that activity.
    History records shows information such as the State and the starting and ending times.
Timeline for a selected activity

You can display a partial workflow timeline.

1. Navigate to **Workflow > Live Workflows > Active Contexts**.
2. Open a Workflow Context record.
3. On the **Workflow Activity History** related list, select one or more individual activities.
4. Click **Show Timeline** from the action menu.

   The resulting view is a snapshot of the timeline, showing only the selected activities and their transitions, if any.

5. Collapse the tree to confine the view even further.
6. To view a timeline displaying activities from different contexts:
   You might use this feature to display a subflow's context with the parent workflow context.
   
   1. Navigate to Workflow > Live Workflows > History.
   2. Select individual history items from the list.
   3. Select the Show Timeline option from the actions menu.

   History items are arranged in a hierarchy in the activities pane under their contexts. The timeline title is Multiple Contexts. The timeline draws only the activities and relationships of the history items selected.

View subflows in a workflow timeline

In a workflow timeline, subflow spans appear as a different color than the activities of the main workflow.
Workflow timeline subflow

Workflow error handling

The personalized JavaScript that users create in workflow activity variables is vulnerable to runtime syntax errors. Available error information is available in a tooltip when you point to a workflow activity in an error state.

In the base system, workflow activities do not provide condition routing on the error state. As a result, the workflow progresses based on the state of the current record. For example, a workflow contains an Approval - User activity that uses an advanced script to add additional approvers. A syntax error in the script results in no approvers being added. Because a state of no approvers is a valid return, even without the syntax error, the approval activity is skipped and the workflow progresses along a positive path. However, this might not be a valid response for the workflow designer who does not want the workflow to progress along the positive path without approvers.

Workflow error handling detects and logs syntax errors and provides a state that the workflow designer can use to add error conditions to the workflow. Use error handling to locate syntax errors in advanced script fields for these workflow activities:

- Approval - User
- Approval - Group
- Catalog Task
- Create Task
- If
- Run Script
- Notification
Available error information

This table shows which activities support error exits.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Workflow log</th>
<th>Red error indicator</th>
<th>Activity state</th>
<th>Activity result</th>
<th>Fault description</th>
<th>Reroute on error</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval - User</td>
<td>Yes</td>
<td>Yes</td>
<td>Error</td>
<td>Skipped</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Approval - Group</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Catalog Task</td>
<td>Yes</td>
<td>No</td>
<td>Finished</td>
<td>none</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Create Task</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>

<td>Yes</td>
<td>Error</td>
<td>error</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Workflow error tracking features

Error handling provides visual cues within the workflow, such as error descriptions for activities in pop-ups, and detailed log records.

Banners

Look for an activity with a red banner, indicating that a syntax error has occurred in a script field. All activities that provide error handling, with the exception of Catalog Task and Create Task, display a red banner for this error.

![Switch]

Check assignment group

Always

Tooltips

Point to the activity displaying a red banner to view information about the error. A tooltip shows the State and Result of the activity and provides a brief Fault Description (except for task activities). Note that this approval continued as skipped despite the error given in the fault description. See Workflow error handling for the information available to each activity.
Execution order

Tooltip text in the Workflow Context graphical view displays the execution order of individual activities, which assists in troubleshooting.

To view the order in which a workflow activity was executed:

1. Navigate to Workflow > Live Workflows > Active Contexts or All Contexts.
2. Open the context you want to examine.
3. Click Show Workflow.
4. Hover the cursor over a finished or executing activity.

A tooltip appears showing error data, execution time, and the order in which that activity executed in the workflow. You can use this data to help troubleshoot activities in an error state.
Workflow log

View the log in the Workflow Context form for more information about the syntax error in the activity. Since task activities do not display a red banner when a syntax error has occurred, you must view the log if you suspect the workflow has not run properly. Examine the error description in the log, and then inspect the script in the activity named in the log.

To view the activity by name, navigate to Workflow > Administration > Properties and enable the Log workflow debug messages property.
In this example, an SSH activity named File Read specifies an invalid MID Server.

Error handling log

If the credentials used by an activity in the workflow fail, and the activity cannot authenticate on the target, a message describing the failure appears in the Workflow Log related list. The message displays the target IP address and the credential details.
Create an error condition exit

An administrator can reroute the workflow when a script error occurs by creating an error condition exit for specific activities within the workflow. This allows the workflow to process script errors in a predictable way and not create undesirable results.

1. Open and check out a workflow.
2. Right-click in the top portion of the activity for which you want to create an error exit.
3. Select **Add condition** from the context menu.
4. Add a condition exit with the following values:
   - **Name**: Error
   - **Condition**: activity.state=='faulted'

5. Click **Submit**.
The **Error** exit appears on the activity.

6. Connect the **Error** exit to another activity for handling the error state, such as **Notification** or **Log Message**.

---

**Reconfigure an approval condition**

Approval activities react differently to script errors than the other activities. Approval activity script errors can prevent an approval from being processed successfully. This, in turn, can cause the approval to complete as **Skipped**, which can appear to be an **Approved** state. To prevent this from happening, reconfigure the **Approved** exit as follows:

1. Open an approval workflow and make sure it is checked out.
2. On an approval activity, double-click the **Approved** exit.
3. Add the following script to the **Condition** field:
   ```
   && activity.state != 'faulted'
   ```
   This prevents the activity from continuing down the normal path in an error state and ensures that **Skipped** or **Approved** is the desired state.
4. Click **Update**.

---

**Workflow run time metrics**

You can enable the collection of workflow run time metrics to determine whether workflows are performing as expected or consuming additional resources.

Outlying run times for a workflow are identified by comparing actual run times to an outlier range calculated with the outlier threshold and estimated run time defined in the workflow properties.

You can monitor the results of these metrics on the Workflow Operations Dashboard and custom homepages with workflow gauges.

**Enable workflow run time metrics**

Provide an estimated run time that can be compared to actual workflow run times.
For baseline workflows, you must also manually enable the collection of run time metrics. The system automatically enables the collection of run time metrics for new workflows.

1. Navigate to **Workflow > Workflow Editor**.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select **Properties**.
4. In the Workflow Properties dialog box, click the **Estimated Runtime** tab.
5. To enable the collection of run time metrics, check that the **Requires ERT** option is selected.
6. Open a configuration from the **Estimated Run Time** column.
7. In **Estimated Run Time**, enter an initial estimate for the workflow’s run time.
   The system compares this initial estimate to actual run time results to create outlier reports. The system can automatically update this field in certain circumstances. Workflow designers can also manually update this field.
8. In the **Outlier Percentage Threshold for ERT** field, enter the percentage deviation from the estimated run time that identifies an outlier workflow run time.
   The system uses a default value of **20**.
9. Click **Update**.

**Outlying workflow run times**

Workflow run times are identified as outliers when they are longer or shorter than the outlier range that is computed for the workflow.

The outlier range is automatically computed with the **Estimated Run Time** and **Outlier Percentage Threshold for ERT** values in the workflow properties. These values are used in the following formulas.

**Formulas for computing workflow outlier ranges**

<table>
<thead>
<tr>
<th>Value computed</th>
<th>Computation used</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outlier Value</td>
<td><strong>Estimated Run Time</strong> * (Outlier Percentage Threshold for ERT / 100)</td>
<td>10 seconds * (20 / 100)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>10 seconds * 0.2 = 2 seconds</td>
</tr>
<tr>
<td>Outlier Range</td>
<td><strong>(Estimated Run Time - Outlier Value)</strong> to <strong>(Estimated Run Time + Outlier Value)</strong></td>
<td>(10 seconds - 2 seconds) to (10 seconds + 2 seconds) = 8 to 12 seconds</td>
</tr>
</tbody>
</table>

When a workflow runs within the outlier range, its estimated run time is automatically updated.

If a workflow has an outlying run time, it appears in any outlier workflow gauges on the Workflow Operations Dashboard and custom home pages.

**Workflow estimated run time updates**

When a workflow runs within the outlier range, its estimated run time is automatically updated.

The estimated run time is updated with the **cumulative moving average** of the latest run time value in relation to previous run times. The computed value is rounded to the nearest second and stored as a **GlideDateTime**.

For example:

<table>
<thead>
<tr>
<th>Data point</th>
<th>Latest value</th>
<th>Cumulative running average (CRA)</th>
<th>CRA after rounding to the nearest second</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>10 seconds</td>
<td>10 seconds</td>
<td>10 seconds</td>
</tr>
<tr>
<td>2</td>
<td>12 seconds</td>
<td>11 seconds</td>
<td>11 seconds</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Data point</th>
<th>Latest value</th>
<th>Cumulative running average (CRA)</th>
<th>CRA after rounding to the nearest second</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>9 seconds</td>
<td>10.333 seconds</td>
<td>10 seconds</td>
</tr>
</tbody>
</table>

**Note:** Because the system rounds to the nearest second, the calculation is less precise with short durations.

You can also manually update the estimated run time in the workflow properties.

**Troubleshoot workflows**

Troubleshooting tools for workflows enable administrators to isolate execution paths, compare contexts, and track incomplete activities.

The workflow timeline provides a visual representation of the workflow, including transitions and the elapsed time for each activity. A troubleshooting tool for highlighting execution paths helps users perform forensics on a workflow. The highlighting feature can group multiple execution paths in various colors and can isolate rollback processing. Use the workflow highlighter to isolate incomplete tasks and approvals. You can also enable a workflow performance timing feature to troubleshoot slow workflows.

**Execution path troubleshooting in timelines**

Use the controls in a workflow timeline to isolate specific execution paths or compare multiple execution paths over time.

Timelines show how the activities in the workflow progressed in relation to one another over time. Isolate execution paths and follow transition lines between subflows and the main flow. Processing times provide a view of the workflow that you cannot get from the workflow diagram. Tooltips give precise information about each activity, such as duration.
Workflow timeline troubleshooting

Execution history table

Highlight execution paths and rollbacks to locate activities that may have been left in an unresolved state.

Rollbacks, cancels, and deletions during the execution of a workflow can prevent some activities from fully completing. Use highlighting in the execution history table to determine which activities in the workflow were left in an unresolved state.

1. Run the workflow.
2. Navigate to **Workflow > All Contexts**.
3. Select a context to troubleshoot.
4. In the Workflow Context form, select the **Workflow Activity History** related list.
5. Right-click an activity and select **Workflow Debug > Toggle Execution Path Highlighting** from the context menu.

   All activities in that execution path are highlighted in a color selected by the platform. The debug path shows all activities that completed successfully during the workflow.
6. Right-click a rollback activity and select Workflow Debug > Toggle Rollback Highlighting from the context menu.

The platform highlights the rollback path (restarted activities) in a different color. Each color represents a group of activities that were part of the same rollback execution. The highlighting includes the activity that initiated the rollback. If you right-click an activity that was not part of a rollback, no rows are highlighted.

**Note:** The rollback activity itself appears in both execution path and rollback highlighting.
7. To remove highlighting, right-click in the list and select an option to clear execution path or rollback highlighting.

You can clear individual rollback paths or all rollback highlighting.

Use the Workflow Operations Dashboard

On the Workflow Operations Dashboard, view and add widgets to help you monitor workflows. Review the performance of workflows and determine which workflows must be improved.

Role required: workflow_admin

The different levels of access are:

- **View**: View the dashboard and refresh report widgets.
- **Customize**: Refresh, add, delete, and rearrange widgets.

On the Workflow Operations Dashboard, you can click widget elements to view the records they represent. You can also add new report widgets that are not displayed by default.

1. To view the Workflow Operations Dashboard, navigate to *Workflow > Operations > Workflow Operations Dashboard*.

The default reports on the dashboard include:

- Workflow contexts providing run time metrics
- Active workflows started during a specified time period
- Workflows run between yesterday and today
- Workflows by state for the current month
- Aged workflow contexts for the past month

2. To find and add more widgets, click the Add Content icon in the upper left corner of the dashboard.

If a workflow consistently appears as an outlier and there is no error causing the run time values, you can use its historical run time values to calculate a new estimated run time value. Then update the estimated run time in the workflow properties.

Workflow gauges

Multiple gauges are available to help you review the performance of workflows. You can add these gauges to the Workflow Operations Dashboard or custom homepages.

<table>
<thead>
<tr>
<th>Content</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ERT Dashboard Controls &gt;</td>
<td></td>
</tr>
<tr>
<td>ERT Outlier Workflows</td>
<td>Identifies workflows that finished, but did not finish within estimated runtime (ERT) values. Enter an outlier percentage to see workflows that ran outside the specified runtime range.</td>
</tr>
<tr>
<td>ERT Outlier Workflows</td>
<td>Displays workflows running longer than the configured runtime threshold.</td>
</tr>
<tr>
<td>Workflow Dashboard &gt;</td>
<td></td>
</tr>
<tr>
<td>Workflows Without Current Record</td>
<td>Displays workflow contexts that do not have an associated current record.</td>
</tr>
<tr>
<td>Gauges &gt; Workflow Context</td>
<td></td>
</tr>
<tr>
<td>Number of Active Workflows Started Hourly Over Time (Yesterday)</td>
<td>Displays the total number of running workflows per hour over a given time period. By default, it displays the number of workflows that ran per hour over the previous day (yesterday).</td>
</tr>
<tr>
<td>Outlier Workflows Not Cumulated to ERT</td>
<td>Displays workflow contexts that are finished outside the estimated runtime outlier value and not cumulated to estimated run time value.</td>
</tr>
<tr>
<td>Running Workflow Contexts</td>
<td>Displays the total number of running workflows.</td>
</tr>
<tr>
<td>Successfully Finished Workflows Cumulated to ERT</td>
<td>Displays the total number of successfully completed workflows whose running duration is cumulated to the estimated run time value.</td>
</tr>
<tr>
<td>Workflows by State (This Month)</td>
<td>Displays the total number of workflows run in a month grouped by the current state.</td>
</tr>
<tr>
<td>Aged Workflow Contexts (Running Since Last Month)</td>
<td>Displays the total number of workflow contexts running for a given period of time by workflow name. By default, it displays the total number of workflow contexts running over the last month.</td>
</tr>
<tr>
<td>Workflows Run Between Yesterday and Today (by Table)</td>
<td>Displays workflows that have run in the last day grouped by table name.</td>
</tr>
</tbody>
</table>
Workflow performance timing

The workflow engine can generate detailed performance timing data that is useful for troubleshooting slow workflows.

An administrator must enable this functionality.

When workflow performance timing is enabled, the workflow engine tracks key performance data, including various execution speed metrics. The Workflow Timing (wf_workflow_timing) table stores the data, with a record for each workflow context. The workflow timing record is updated when the workflow engine completes the workflow, waits for an activity to complete, or otherwise exits the workflow execution.

Workflow estimated run time properties

Administrators can enable the collection of workflow run time metrics by setting Estimated Run Time (ERT) properties.

Administrators can use ERT metrics to determine if workflows are running longer or shorter than expected and to identify errors in workflow processing. The system displays run time metrics on the Workflow Operations Dashboard.

Enable workflow performance timing

Workflow performance timing is disabled by default. You can create a system property to enable it.

Role required: admin

Add a system property with the following specifications.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.workflow.show_timing</td>
</tr>
<tr>
<td>Type</td>
<td>true</td>
</tr>
<tr>
<td>Value</td>
<td>true</td>
</tr>
</tbody>
</table>

Workflow activities

Workflow activity properties reference

Each activity performs a different task, such as running a script, sending notifications, or requesting approvals. Activities can succeed or fail, which can result in actions performed by other activities.

For information about configuring different types of activities, click an activity name in the list below or see Workflow activities reference.

Core activities provided in the base system

- Approval and rollback workflow activities
- Condition Workflow activities
- Notification workflow activity
- Notify workflow activities
- Subflow activities
• Task workflow activities
• Timer workflow activities
• Utility workflow activities

Activities provided with Orchestration

The following activities are included with Orchestration.
• Active Directory activity pack
• Orchestration activities
• PowerShell activities
• Puppet activities

Templates provided for creating custom activities

If Orchestration is active on your system, users with the proper roles can create custom activities using the ServiceNow Orchestration activity designer. For information about the templates Orchestration provides for creating custom activities that you can upload to the ServiceNow Store, see Orchestration custom activity templates.

Workflow activities reference

Workflow activity reference, organized by category.

Each activity performs a different task, such as running a script, sending notifications, or requesting approvals.

Approval and rollback activities

Approval and rollback activities generate and manage approvals. Not all workflows can include approval activities. For more information, read Approval and rollback workflow activities.

<table>
<thead>
<tr>
<th>Approval and rollback activities</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Activity</strong></td>
</tr>
<tr>
<td>Approval Action workflow activity</td>
</tr>
<tr>
<td>Approval Coordinator workflow activity</td>
</tr>
<tr>
<td>Approval - Group workflow activity</td>
</tr>
<tr>
<td>Approval - User workflow activity</td>
</tr>

<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rollback To workflow activity</td>
<td>The Rollback To activity transitions directly to the activity specified by the outgoing transition line arrow.</td>
</tr>
</tbody>
</table>

### Condition activities

Condition activities provide conditional branching and logical operation functionality for workflows.

### Condition activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If workflow activity</td>
<td>The If activity checks a condition or script to determine if a Yes or No transition should be taken.</td>
</tr>
<tr>
<td>Switch workflow activity</td>
<td>The Switch activity checks if the value of a passed field or variable is equivalent to one of several case values.</td>
</tr>
<tr>
<td>Wait for condition workflow activity</td>
<td>The Wait for condition activity causes the workflow to wait at this activity until the current record matches the specified condition.</td>
</tr>
<tr>
<td>Wait for WF Event workflow activity</td>
<td>The Wait for WF Event activity causes the workflow to wait at this activity until the specified event is fired.</td>
</tr>
</tbody>
</table>

### Notify activities

Notify activities manage calls and SMS messages in Notify.

### Notify activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Forward call workflow activity</td>
<td>The Forward Call activity forwards a Notify call to an E.164-compliant phone number.</td>
</tr>
<tr>
<td>Input workflow activity</td>
<td>The Input activity creates a phone menu by presenting a list of options on a Notify call.</td>
</tr>
<tr>
<td>Hangup workflow activity</td>
<td>The Hangup activity disconnects an active Notify phone call.</td>
</tr>
<tr>
<td>Play workflow activity</td>
<td>The Play activity plays a sound file on a Notify call.</td>
</tr>
<tr>
<td>Record workflow activity</td>
<td>The Record workflow activity records audio from a user on a Notify call.</td>
</tr>
<tr>
<td>Reject workflow</td>
<td>The Reject workflow activity rejects an incoming Notify call.</td>
</tr>
<tr>
<td>Say workflow activity</td>
<td>The say workflow activity allows you to play a message, using text to speech, on a Notify call.</td>
</tr>
<tr>
<td>Forward to notify client workflow activity</td>
<td>The forward to notify client workflow activity connects a phone call to a Notify WebRTC client.</td>
</tr>
<tr>
<td>Call workflow activity</td>
<td>The Call activity makes outbound phone calls using a Notify workflow.</td>
</tr>
<tr>
<td>Join conference call workflow activity</td>
<td>The Join Conference Call connects an incoming or outgoing call to a Notify conference call.</td>
</tr>
<tr>
<td>Activity</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Send SMS workflow activity</td>
<td>The send SMS workflow activity to send short text messages using Notify to users’ phones.</td>
</tr>
<tr>
<td>Queue workflow activity</td>
<td>The Queue activity places an active Notify call in a queue.</td>
</tr>
</tbody>
</table>

**Notification activities**

Notification workflow activities notify users of events that occur during the workflow.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Event workflow activity</td>
<td>The Create Event activity adds an event to the event queue, but does not immediately fire the event.</td>
</tr>
<tr>
<td>Notification workflow activity</td>
<td>The Notification activity sends an email or SMS message to specified users or groups.</td>
</tr>
</tbody>
</table>

**Timer activities**

Timer activities pause workflows for set periods of time.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SLA Percentage Timer workflow activity</td>
<td>The SLA Percentage Timer activity pauses the workflow for a duration equal to a percentage of an SLA.</td>
</tr>
<tr>
<td>Timer workflow activity</td>
<td>The Timer activity pauses the workflow for a specified period of time.</td>
</tr>
</tbody>
</table>

**Task activities**

Task activities create and modify workflow tasks.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Worknote workflow activity</td>
<td>The Add Worknote activity adds text to the Worknotes field of the current incident record.</td>
</tr>
<tr>
<td>Attachment Note workflow activity</td>
<td>The Attachment Note activity adds an attachment to the current record.</td>
</tr>
<tr>
<td>Catalog Task workflow activity</td>
<td>The Catalog Task activity creates a service catalog task record.</td>
</tr>
<tr>
<td>Create Task workflow activity</td>
<td>The Create Task activity generates a record on any of the tables that extend Task (task).</td>
</tr>
</tbody>
</table>
Utility activities

Utility activities provide controls over the path of the workflow, and other useful tools.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Branch workflow activity</td>
<td>The Branch activity splits the workflow into multiple transition paths from a single activity.</td>
</tr>
<tr>
<td>Join workflow activity</td>
<td>The Join activity unites multiple execution paths into one transition.</td>
</tr>
<tr>
<td>Lock workflow activity</td>
<td>The Lock activity prevents other instances of this workflow from continuing past this activity until the lock is released.</td>
</tr>
<tr>
<td>Log Message workflow activity</td>
<td>The Log Message activity writes a message to the workflow log.</td>
</tr>
<tr>
<td>Log Trace Message workflow activity</td>
<td>The Log Trace Message activity writes a trace message to the workflow log.</td>
</tr>
<tr>
<td>REST Message legacy workflow activity</td>
<td>The legacy REST Message activity enables an administrator to override the REST endpoint or supply the variables configured in the REST Message module.</td>
</tr>
<tr>
<td>Return Value workflow activity</td>
<td>The Return Value activity returns a value to a parent workflow, when run from a subflow.</td>
</tr>
<tr>
<td>Run Script workflow activity</td>
<td>The Run Script activity runs the specified script in the scope of the workflow version.</td>
</tr>
<tr>
<td>Set Values workflow activity</td>
<td>The Set Values activity sets values on the current record when the workflow quiesces or ends.</td>
</tr>
<tr>
<td>SOAP Message legacy workflow activity</td>
<td>The legacy SOAP Message activity uses SOAP messages defined in the System Web Services plugin and can call the messages using a MID Server.</td>
</tr>
<tr>
<td>Turnstile workflow activity</td>
<td>The Turnstile activity limits how many times a workflow can pass through the same point.</td>
</tr>
<tr>
<td>Unlock workflow activity</td>
<td>The Unlock activity releases a lock that was previously placed by the Lock activity.</td>
</tr>
</tbody>
</table>

Subflow activities

Subflow activities run and manage workflows from a parent workflow.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parallel Flow Launcher workflow activity</td>
<td>The Parallel Flow Launcher activity launches multiple subflows in parallel.</td>
</tr>
</tbody>
</table>

Activities provided with Orchestration

The following activities are included with Orchestration.

- Active Directory activity pack
ServiceNow Jakarta Now Platform Capabilities

- Orchestration activities
- PowerShell activities
- Puppet activities

**Templates provided for creating custom activities**

If Orchestration is active on your system, users with the proper roles can create custom activities using the Orchestration activity designer. For information about the templates Orchestration provides for creating custom activities that you can upload to the ServiceNow Store, see [Orchestration custom activity templates](#).

**Approval and rollback workflow activities**

Approval and rollback activities generate and manage approvals. Approval and rollback activities are not available in some workflows.

- With two exceptions, approval and rollback activities are only available when the workflow runs on a table that extends Task. The exceptions are the Approval - User and Approval Action activities, which are available globally.
- Approval and rollback activities are available only if approval engines are turned off for the table on which the workflow runs. If approval engines are enabled for the table, approval activities appear greyed out and cannot be selected. To learn more about how workflow and approval engines interact, read [Approval workflow activities and approval engines](#).

**Approval Action workflow activity**

The Approval Action activity performs an approval action on the current task.

Use this activity to mark the current task record as approved or rejected.

**Note:** When an Approval Action activity is used to mark a task approved, the activity marks all pending approvals as No Longer Required. This activity behaves differently from Set Values or Run Script when used to set the Approval field's value.

**Results**

The result value of the activity is the final approval disposition selected by the approver. The result value can be Approved or Rejected. A workflow designer can assign a result value using the `activity.result` variable from within a script field of the activity.

**Input variables**

Input variables determine the initial behavior of the activity.
Approval Action activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>The action to perform on the task. Options are:</td>
</tr>
<tr>
<td></td>
<td>• Mark task approved</td>
</tr>
<tr>
<td></td>
<td>• Mark task rejected</td>
</tr>
<tr>
<td></td>
<td>• Mark task requested</td>
</tr>
<tr>
<td></td>
<td>• Disregard pending approvals: the system sets approval records to no longer required and marks the activity as approved.</td>
</tr>
</tbody>
</table>

Conditions

The conditions determine which transition runs after this activity.

Approval Action activity conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Always</td>
<td>The event or condition that causes the approval to move to the next workflow step.</td>
</tr>
<tr>

<td>The event or condition that generates an error.</td>
</tr>
<tr>
<td>Skipped</td>
<td>The event or condition that allows a skipped approval.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.

Approval Action activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the execute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Approval Coordinator workflow activity

The Approval Coordinator activity creates an approval whose outcome depends on the outcome of one or more child activities, including one or more Approval - User, Approval - Group, and/or Manual Approval activities.
Note: This activity is only available when the workflow runs on a table that extends Task.

To create an Approval Coordinator activity, first drag the activity onto the workflow canvas, causing the activity form to display. On the activity form, fill in the appropriate fields, then click Submit.

After you click Submit, the activity appears on the workflow canvas. From there, specify the child activities by clicking the links that appear on the body of the activity.

When the Approval Coordinator activity completes, all pending approvals that were created by any of the Approval Coordinator approval activities are immediately set to No Longer Required. If a single user is called as an approver twice by the same workflow, such as when a single user is both a product approver and an executive approver, any approvals for that user after the first are skipped.

Results

The result value of the Approval Coordinator activity depends on the approval actions taken by the approvers and the approval conditions specified in the Wait for field. Possible result values are:

- Approved
- Rejected
- Deleted
- Cancelled

Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Approval Coordinator activity input variables</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>Wait for</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>
### When a rejection occurs

Only appears if **Wait for** is set to **All child activities to be approved** or **Any child activity to be approved**.

Specify what the coordinator should do when it sees a rejection from any one of the child activities. Options are:

- **Reject the approval**: Immediately complete the **Approval Coordinator** activity with a result of **rejected**.
- **Wait for other responses before deciding**: Wait until we get other responses from other child activities before making an approval or rejection decision.

This allows users to change their minds until a decision is made.

In addition, if **Wait for** is set to **Any child activity to approve** then a single child activity completion with a result of **approved** will cause the **Approval Coordinator** activity to complete with a result of **approved** even if other child activities have completed with a result of **rejected**.

### Approval script

Only appears if **Wait for** is set to **Condition based on script**.

If the **Wait for** variable is set to **Condition based on script** this script is called to determine how to handle an approval or rejection. The script needs to set the variable **answer** to 'approved' or 'rejected' to indicate the overall approval status for this approval. When called, the following variable is available to the script:

```plaintext
counts.total = total number of child approval activities that are part of this approval
counts.approved = # of child approval activities that approved so far
counts.rejected = # of child approval activities that rejected so far
counts.requested = # of child approval activities that are pending approval
```

### Conditions

The conditions determine which transition runs after this activity.

#### Approval Coordinator activity conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approved</td>
<td>The users from the groups have approved the request based on the <strong>Wait for</strong> rules.</td>
</tr>
<tr>
<td>Rejected</td>
<td>The users from the groups have rejected the request based on the <strong>Wait for</strong> rules.</td>
</tr>
</tbody>
</table>
States

The activity state tells the workflow engine what to do with the activity.

Approval Coordinator activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the <code>execute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Approval - Group workflow activity
The Approval - Group activity creates approval records for each member of a specified group.

Note: This activity is only available when the workflow runs on a table that extends Task.

The group approval is approved or rejected based on the user approvals, according to the logic specified in the Wait For field.

Results

The workflow designer can assign a result value using activity.result from within a script field of the activity. By default, the result value is the final approval disposition. This disposition depends on the approval actions taken by the approvers and the approval conditions specified in the Wait for or When Anyone Rejects fields. Possible result values are:

- Approved
- Rejected
- Deleted
- Cancelled

Input variables

Input variables determine the initial behavior of the activity.

Approval - Group activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval - Group When</td>
<td>Specify when this activity generates a group approval record.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions which, if met, cause the group approval to be generated. If the conditions are not met, the approval is skipped.</td>
</tr>
<tr>
<td>Approval - Group Approvers</td>
<td>Specify the groups whose approval will be requested.</td>
</tr>
<tr>
<td>Groups</td>
<td>The groups whose approval will be requested. To edit this field, click the lock icon. To select specific groups by name, use the lookup list. To select groups from field values on the current record at runtime, click the tree icon. Each member of the group will be assigned an individual approval record. If no group is selected, the activity automatically sets the approval to Approved.</td>
</tr>
<tr>
<td>Approval - Group Condition</td>
<td>Specify how the activity decides to approve or reject the group approval, based on the responses from individual members of the group.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Wait for</td>
<td>A choice between different approval logics to determine which individual approvals or rejections result in approval or rejection of the activity's approval. Options are:</td>
</tr>
<tr>
<td></td>
<td>- <strong>An approval from each group:</strong> Any user from each group can approve and the first approval from each group causes the activity to complete with a result of <strong>approved</strong> (see below for how a rejection is handled).</td>
</tr>
<tr>
<td></td>
<td>- <strong>An approval from any group:</strong> Any user from any group can approve and the first approval from any group causes the activity to complete with a result of <strong>approved</strong>.</td>
</tr>
<tr>
<td></td>
<td>- <strong>An approval from everyone from all groups:</strong> All users from all groups must approve to cause the activity to complete with a result of <strong>approved</strong> (see below for how a rejection is handled).</td>
</tr>
<tr>
<td></td>
<td>- <strong>First response from each group:</strong> The first approval or rejection from any user in each group is used to indicate the state of the group approval (see below for how a rejection is handled).</td>
</tr>
</tbody>
</table>

Indicate what happens when any user rejects their approval request. Options are:

- **Reject the approval:** Immediately complete the activity with a result of **rejected**.

- **First response from any group:** The first approval or rejection from any user in any group causes the activity to complete with a result of **approved** or **rejected**.

- **Condition based on script:** Each time a user approves or rejects, the Approval script is called to determine if the activity should complete.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval script</td>
<td>If the <strong>Wait for</strong> variable is set to <strong>Condition based on script</strong> this script is called to determine how to handle an approval or rejection. The script needs to set the variable answer to approved or rejected to indicate the overall status for this approval. This script is responsible for setting the approval state for each group that is part of this approval activity before returning the overall approval state for all of the groups. When called, the following variables are available to the script for all the groups that are part of this approval activity:</td>
</tr>
</tbody>
</table>
|                       | counts.total = total number of groups that are part of this approval  
|                       | counts.approved = # of groups that approved so far  
|                       | counts.rejected = # of groups that rejected so far  
|                       | counts.requested = # of groups that are pending approval  
|                       | counts.not_requested = # of groups that are not pending approval  
|                       | counts.not_required = # of groups that approval is not required  
|                       | And for each group:  
|                       | groups[group_id].total = total number of users that are part of this group's approval  
|                       | groups[group_id].approved = # of users that approved so far  
|                       | groups[group_id].rejected = # of users that rejected so far  
|                       | groups[group_id].requested = # of users that are pending approval  
|                       | groups[group_id].not_requested = # of users that are not pending approval  
|                       | groups[group_id].not_required = # of users that approval is not required  
|                       | groups[group_id].approvalIDs[state] = array of user ids that are at the specified approval state |
|                       | Note: Iterate the groups using:  
|                       | for (var id in groups) {  
|                       |   var group = groups[id];  
|                       |   ...  
|                       |   group.total ...  
|                       | }  
|                       | Note: Get group object using the following code (to get things like the group name being iterated on):  
|                       | var objGroup = fncGetGroupObj(id);  
|                       | var strGroupName = objGroup.name;  
|                       | function fncGetGroupObj(sidGroupApproval) {  
|                       |   var objGroupApproval = new GlideRecord('sysapproval_group');  
|                       |   objGroupApproval.get(sidGroupApproval);  
|                       |   var objGroup = new GlideRecord('sys_user_group');  
|                       |   objGroup.get(objGroupApproval.assignment_group.sys_id);  
|                       |   return objGroup;  
|                       | }  
|                       | Approval scripts also allow computations. For example, if only half of the approvals are required:  
|                       | if (counts.approved/counts.total > .49) {  
|                       |   answer = 'approved';  
|                       | } else if (counts.rejected/counts.total > .50) {  
|                       |   answer = 'rejected';  
|                       | }

<table>
<thead>
<tr>
<th><strong>Field</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
</table>
| When anyone rejects | A choice between different approval logics to determine which individual rejections result in rejection of the activity’s approval. Options are:  
  - **Reject the approval**: Immediately complete the activity with a result of rejected.  
  - **Wait for other responses before deciding**: Wait until we get other responses before making an approval or rejection decision. This allows users to change their mind until a decision is made.  

| **Note:** If **Wait for** is set to **Anyone to approve**, then a single approval causes the activity to complete with a result of **approved**, even if one or more users reject. |

| **Approval - Group Schedule** | Specify how workflow calculates the approval record’s expected start date and due date. Once you’ve made a selection for ‘Due date based on’, and ‘Schedule based on’, the appropriate fields will display. |

| **Due date based on** | Select how workflow determines the task’s duration, due date, and schedule.  
  - **A user specified duration**: The duration is based on a user specified value.  
  - **A relative duration**: The duration is calculated from a relative duration (such as End of Next Business Day).  
  - **A date/time or duration field**: The duration is based on the value of a field on the current record.  
  - **Script**: The duration is returned by a script. |

| **Duration** | The specific number of days and hours. |
| Only appears when **Due date based on** is set to **A user specified duration** |

| **Relative duration** | The general number and length of business days. |
| Only appears when **Due date based on** is set to **A relative duration** |

| **Due date field** | The date/time or duration field. |
| Only appears when **Due date based on** is set to **A date/time or duration field** |

<p>| <strong>Due date script</strong> | The script that sets ‘answer’ to the number of seconds for the duration. |
| Only appears when <strong>Due date based on</strong> is set to <strong>Script</strong> |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Schedule based on            | The basic schedule the timer uses to count working hours. If a schedule is specified, the duration will only be considered for times that are specified on the schedule. For example, if the duration is 2 hours and the workflow begins at 4:00pm on a schedule that is 8am - 5pm, then it ends at 9:00am the next day. The options are:  
  - **This workflow’s schedule**: The schedule uses workflow context date, time, and an optional **Time zone based on** value.  
  - **A specific schedule**: The schedule uses a pre-defined **Schedule** and an optional **Time zone based on** value.  
  - **A schedule field**: The schedule uses a value from a table and an optional **Time zone based on** value. |
| Schedule                     | The predefined **Schedule** from a list.                                                                                                                                                              |
| Schedule field               | A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog.                                               |
| Time zone based on           | The time zone for calculating the duration. The time zone may be based on:  
  - **No time zone**: Default. Workflow uses the GMT time zone.  
  - **A specific time zone**: A specific **Time zone** that you choose from a choice list.  
  - **A time zone field**: A **Time zone field** to track time duration from a field on the form. |
| Time zone                    | Select the time zone you want from the choice list.                                                                                                                                                  |
| Time zone field              | A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog.                                               |
| Approval - Advanced          | If desired, write a script for determining additional users to request approvals from.                                                                                                                   |
| Advanced                     | Select this check box to write a script for determining additional users to request approvals from. Use the **Additional groups script** to customize group approvals.                               |
### Conditions

The following conditions determine which transition runs after this activity.

**Approval - Group activity conditions**

<tr>
<td>Rejected</td>
<td>The users from the groups have rejected the request based on the <strong>Wait for</strong> rules.</td>
</tr>
<tr>
<td>Error</td>
<td>The event or condition that generates an error.</td>
</tr>
<tr>
<td>Skipped</td>
<td>The event or condition that allows a skipped approval.</td>
</tr>
</tbody>
</table>

### States

The activity state tells the workflow engine what to do with the activity.

**Approval - Group activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the <code>execute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Approval - User workflow activity**

The **Approval - User** activity creates one or more individual user approvals.
Results

The result value is the final approval disposition. This disposition depends on the approval actions take by the approvers and the approval conditions specified in the Wait for or When Anyone Rejects fields. Possible result values are:

- Approved
- Rejected
- Deleted
- Cancelled

Input variables

### Approval - User activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval - User When</td>
<td>Specify when this activity generates a user approval record.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions which, if met, cause the individual approval to be generated. If the conditions are not met, the approval is skipped.</td>
</tr>
<tr>
<td>Approval - User Approvers</td>
<td>Specify the users whose approval will be requested.</td>
</tr>
<tr>
<td>Users</td>
<td>The users for the approval. Use the tree icon to select user reference fields from the current record to create approvals, such as ${assigned_to}. If no user is selected, the activity automatically sets the approval to Approved.</td>
</tr>
<tr>
<td>Groups</td>
<td>Groups whose members should also receive approvals. Note that this is different than the Approval - Group activity, which creates a group approval in addition to the individual approvals. The tree icon can be used to select group reference fields from the current record to create approvals, such as ${assignment_group}.</td>
</tr>
<tr>
<td>Approval - User Condition</td>
<td>Specify how the activity decides to approve or reject the approval, based on the responses from individual approvers.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Wait for</td>
<td>A choice between different approval logics to determine which individual approvals result in approval of the activity’s approval. Options are:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Anyone to approve</strong>: Any user can approve and the first approval causes the activity to complete with a result of <strong>approved</strong>.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Everyone to approve</strong>: All users must approve (see below for how a rejection is handled).</td>
</tr>
<tr>
<td></td>
<td>- <strong>First response from anyone</strong>: The first approval or rejection from any user causes the activity to complete.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Condition based on script</strong>: Each time a user approves or rejects, the <strong>Approval script</strong> is called to determine if the activity should complete.</td>
</tr>
<tr>
<td>When anyone rejects</td>
<td>A choice between different approval logics to determine which individual rejections result in rejection of the activity’s approval. Options are:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Reject the approval</strong>: Immediately complete the activity with a result of <strong>rejected</strong>.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Wait for other responses before deciding</strong>: Wait until we get other responses before making an approval or rejection decision. This allows users to change their mind until a decision is made.</td>
</tr>
<tr>
<td>Note</td>
<td><strong>Note</strong>: Note that if <strong>Wait for</strong> is set to <strong>Anyone to approve</strong> then a single approval will cause the activity to complete with a result of <strong>approved</strong> even if one or more users reject.</td>
</tr>
<tr>
<td>Approval Column</td>
<td>A string field for the name of the approval field on the table the workflow is running on. The default value is approval, which is the field on the Task table.</td>
</tr>
<tr>
<td>Note</td>
<td><strong>Note</strong>: Use the field’s name, not its label.</td>
</tr>
<tr>
<td>Note</td>
<td><strong>Note</strong>: If using any custom approval column fields and approval column journals, use Set Value activities in the workflow to set the custom Approval column fields.</td>
</tr>
<tr>
<td>Approval Journal Column</td>
<td></td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Approval Script</td>
<td>If the <em>Wait for</em> variable is set to <strong>Condition based on script</strong>, this script is called to determine how to handle an approval or rejection. The script needs to set the variable <em>answer</em> to approved or rejected to indicate the approval status for this approval. When called, the following information is available:</td>
</tr>
</tbody>
</table>
|                           | counts.total = total number of users that are part of this approval  
 |                           | counts.approved = # of users that approved so far  
 |                           | counts.rejected = # of users that rejected so far  
 |                           | counts.requested = # of users that are pending approval  
 |                           | counts.not_required = # of users that approval is not required  |

**Approval - User Schedule**

Specify how workflow calculates the approval record's expected start date and due date. Once you've made a selection for 'Due date based on' and 'Schedule based on', the appropriate fields will display.

| Due date based on | Select how workflow determines the task's duration, due date, and schedule.  
 |-------------------|-----------------------------------------------------------------------------|
|                   | - **A user specified duration**: The duration is based on a user specified value.  
 |                   | - **A relative duration**: The duration is calculated from a relative duration (such as End of Next Business Day).  
 |                   | - **A date/time or duration field**: The duration is based on the value of a field on the current record.  
 |                   | - **Script**: The duration is returned by a script.  |
| Duration          | Only appears when *Due date based on* is set to **A user specified duration**  
 |                   | The specific number of days and hours.  |
| Relative duration | Only appears when *Due date based on* is set to **A relative duration**  
 |                   | The general number and length of business days.  |
| Due date field    | Only appears when *Due date based on* is set to **A date/time or duration field**  
<p>|                   | The date/time or duration field.  |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Due date script</td>
<td>The script that sets 'answer' to the number of seconds for the duration.</td>
</tr>
<tr>
<td>Schedule based on</td>
<td>The basic schedule the timer uses to count working hours. If a schedule is specified, the duration will only be considered for times that are specified on the schedule. For example, if the duration is 2 hours and the workflow begins at 4:00pm on a schedule that is 8am - 5pm, then it ends at 9:00am the next day. The options are:</td>
</tr>
<tr>
<td></td>
<td>- <strong>This workflow's schedule</strong>: The schedule uses workflow context date, time, and an optional <strong>Time zone based on</strong> value.</td>
</tr>
<tr>
<td></td>
<td>- <strong>A specific schedule</strong>: The schedule uses a predefined <strong>Schedule</strong> and an optional <strong>Time zone based on</strong> value.</td>
</tr>
<tr>
<td></td>
<td>- <strong>A schedule field</strong>: The schedule uses a value from a table and an optional <strong>Time zone based on</strong> value.</td>
</tr>
<tr>
<td>Schedule</td>
<td>The predefined <strong>Schedule</strong> from a list.</td>
</tr>
<tr>
<td>Schedule field</td>
<td>A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog.</td>
</tr>
<tr>
<td>Time zone based on</td>
<td>The time zone for calculating the duration. The time zone may be based on:</td>
</tr>
<tr>
<td></td>
<td>- <strong>No time zone</strong>: Default. Workflow uses the GMT time zone.</td>
</tr>
<tr>
<td></td>
<td>- <strong>A specific time zone</strong>: A specific <strong>Time zone</strong> that you choose from a choice list.</td>
</tr>
<tr>
<td></td>
<td>- <strong>A time zone field</strong>: A <strong>Time zone field</strong> to track time duration from a field on the form.</td>
</tr>
<tr>
<td>Time zone</td>
<td>Select the time zone you want from the choice list.</td>
</tr>
<tr>
<td>Time zone field</td>
<td>A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog.</td>
</tr>
<tr>
<td>Approval - Advanced</td>
<td>If desired, write a script for determining additional users to request approvals from.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to write a script for determining additional users to request approvals from.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
Additional approvers script | If the **Advanced** check box is selected, this script is called to determine any additional user approvals to be created. The script needs to set the variable `answer` to a comma-separated list of user ids and group ids or an array of user and group ids to add as approvers. For example:

```javascript
answer = [];
answer.push('id1');
answer.push('id2');
```

## Conditions

The following conditions determine which transition runs after this activity.

**Approval - User activity conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approved</td>
<td>The users approved the request based on the <strong>Wait for</strong> rules.</td>
</tr>
<tr>
<td>Rejected</td>
<td>The users rejected the request based on the <strong>Wait for</strong> rules.</td>
</tr>
<tr>
<td>Error</td>
<td>The event or condition that generates an error.</td>
</tr>
<tr>
<td>Skipped</td>
<td>The event or condition that allows a skipped approval.</td>
</tr>
</tbody>
</table>

## States

The activity state tells the workflow engine what to do with the activity.

**Approval - User activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the <code>execute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>
**Generate workflow activity**

The **Generate** activity immediately creates task or approval records from any task or approval activities placed after the **Generate** activity in the workflow path.

- **Note:** This activity is only available when the workflow runs on a table that extends Task.

By default, the workflow does not create any tasks or approvals until it reaches them in the workflow.

The **Generate** activity follows all transitions through the workflow to each activity. For each activity:

- If it is a task activity, creates the task and sets:
  - The **State** to **Pending**
  - The **Expected Start Date**
  - The **Due Date**

- If it is an approval activity, creates the approvals and sets:
  - The approval **State** to **Not Requested**
  - The **Expected Start Date**
  - The **Due Date**

Expected start dates and due dates are calculated based on the **Expected Duration** of all of the tasks and approvals between the **Generate** activity and the activity being updated. In the case of a branched path (between a **Branch** and **Join** activity), the longer duration will be used for any post-branch activities.

The **Generate** activity can be used more than once, and any tasks or approvals will be refreshed with updated information. This is useful in situations where the list of approvers or other important information is still editable while the workflow is in process and it may be necessary to update or correct the generated approvals or tasks.

To exclude a set of activities from the **Generate** activity, select the **Skip during generate** check box on any condition and its transitions will not be followed during the generate process. By default, the following conditions have the **Skip during generate** check box selected:

- **Rejected** (for any of the approval activities)
- **No** condition of **If** activity
- **Continue** condition of **Turnstile** activity
- **Incomplete** condition of **Join** activity

### Input variables

Input variables determine the initial behavior of the activity.

**Generate activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generate approvals</td>
<td>If selected, approvals are created when running the <strong>Generate</strong> activity. If cleared, the approvals are used to compute their estimated duration, but no approvals are created.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Generate tasks</td>
<td>If selected, tasks are created when running the Generate activity. If cleared, the tasks are used to compute their estimated duration, but no tasks are created.</td>
</tr>
</tbody>
</table>

**States**

The activity state tells the workflow engine what to do with the activity.

**Generate activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The activity is executing.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
</tbody>
</table>
Example

Generate workflow

In this example, the following approvals are generated:

- Approval-2
- Approval-3

Approval-4 is skipped since the **Rejected** condition of Approval-3 has **Skip during generate** selected.

Here is an example of using the **Generate** activity that describes the expected start and due dates:
Generate workflow start and due date

In this example, if the **Generate** activity is run on Jan 1, 2016, the following expected start dates and due dates would be set for the generated tasks.

<table>
<thead>
<tr>
<th>Task</th>
<th>Expected Start Date</th>
<th>Reason</th>
<th>Due Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task 2 (1 day)</td>
<td>Jan. 2, 2016</td>
<td>Task 1 is 1 day</td>
<td>Jan. 3, 2016</td>
</tr>
<tr>
<td>Task 4 (1 day)</td>
<td>Jan. 3, 2016</td>
<td>Task 3 is 2 days</td>
<td>Jan. 4, 2016</td>
</tr>
<tr>
<td>Task 5 (1 day)</td>
<td>Jan. 4, 2016</td>
<td>Task 4 ends the latest</td>
<td>Jan. 5, 2016</td>
</tr>
</tbody>
</table>

Notice that Task 5 starts on Jan. 4, 2016 since the longest path (based on due dates) to the **Join** is Task 3/Task 4.

**Manual Approvals workflow activity**

The **Manual Approvals** activity watches and manages any approvals that users add manually outside of the workflow process. This activity only selects approvals that are in the Not requested state.

**Note:** This activity is only available when the workflow runs on a table that extends Task.

If there are no pending manual approvals when this activity executes, the activity immediately completes with a result of **approved**. This activity does not create approval records. Use this activity to pause the workflow when a user adds a manual approval to a record with an associated workflow, and it is in the Not requested state. The workflow waits for the approval to be closed before proceeding.

**Results**

The workflow designer can assign a result value using **activity.result** from within a script field of the activity. By default, the result value of the activity is the final approval disposition determined by the approval actions take by the approvers. Possible result values are:

- Approved
• Rejected
• Deleted
• Cancelled
• Error

Input variables

Input variables determine the initial behavior of the activity.

Manual Approvals activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait for</td>
<td>Indicate what to wait for to indicate that the approval activity is approved or rejected. Options are:</td>
</tr>
<tr>
<td></td>
<td>• Any manual user or group approval: Any user can approve and the first approval causes the activity to complete with a result of approved.</td>
</tr>
<tr>
<td></td>
<td>• All manual user or group approvals: All users must approve (see below for how a rejection is handled).</td>
</tr>
<tr>
<td></td>
<td>• The first response from any manual approval: The first approval or rejection from any user causes the activity to complete.</td>
</tr>
</tbody>
</table>

When anyone rejects

Indicate what happens when any user rejects their approval request. Options are:

• Reject the approval: Immediately complete the activity with a result of rejected.
• Wait for other responses before deciding: Wait until we get other responses before making an approval or rejection decision. This allows users to change their mind until a decision is made.

In addition, if Wait for is set to Anyone to approve then a single approval will cause the activity to complete with a result of approved even if one or more users reject.

Conditions

The conditions determine which transition runs after this activity.

Manual Approvals activity conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approved</td>
<td>The users from the groups have approved the request based on the Wait for rules.</td>
</tr>
<tr>
<td>Rejected</td>
<td>The users from the groups have rejected the request based on the Wait for rules.</td>
</tr>
</tbody>
</table>
States

The activity state tells the workflow engine what to do with the activity.

**Manual Approvals activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the <code>execute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Rollback To workflow activity**

The **Rollback To** activity transitions directly to the activity specified by the outgoing transition line arrow.

*Note:* This activity is only available when the workflow runs on a table that extends Task.

**Rollback To** determines which activities to reset based on the actual workflow sequence (transition line attachments) of activities between itself and the transitioned to activity, not the execution order. **Rollback To** then marks all the approvals that have transitioned between the rollback and the transitioned to activity as **Not Yet Requested** and the tasks as either **Open** or **Pending**.

Use the **Rollback To** activity for all workflows in which multiple rollbacks are required. **Rollback To** has no variables.

Conditions

The conditions determine which transition runs after this activity.

**Rollback To activity conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Always</td>
<td>The event or condition that causes the approval to revert to the previous workflow step.</td>
</tr>
<tr>
<td>Error</td>
<td>The event or condition that generates an error.</td>
</tr>
<tr>
<td>Skipped</td>
<td>The event or condition that allows a skipped approval.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.
### Rollback To activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the <code>execute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

### Rollback To behavior

The **Rollback To** activity transitions directly to the activity specified by the transition line arrow. Use the **Rollback To** activity for all workflows that use multiple or nested rollbacks. **Rollback To** resets the targeted task (the direct transition) to **Open**. All tasks that have executed between the **Rollback To** activity and the targeted task (rolled back task) are set to **Pending**.

(0) Begin
(1) Log Message
(2) Task 1
(3) Task 3
(4) Task 2
(5) Timer
(6) Approval 1
(7) Roll back to first task
(8) Task 1
(9) Task 2
(10) Approval 1
(11) Log approval
(12) Join
(14) Send email
(15) End
The state of (3) Task 3 does not change, since this activity does not directly transition from the rollback target activity. To see what activities were rolled back, select the Workflow Transition History related list and look at the Rolled back column.

The Rollback To activity (7) updates the following activities:

(8) Task 1: reset to Open
(9) Task 2: reset to Pending
(10) Approval 1: reset to Not Yet Requested
Rollback To workflow transition

Rollback To activity

When conditions in a workflow trigger a Rollback To activity, the workflow moves processing backward to a specified activity in the workflow and resets certain activities that have already executed back to their original state. This is useful when handling an unexpected failure or as part of a programmed logical flow.

When an activity is reset during a workflow rollback, the following happens:

- Approvals are reset to Not Requested.
- Tasks are reset to either Open or Pending. A rollback workflow path cannot create new tasks.

Activities that perform external system operations, such as deleting a file or sending an email, are not rolled back. Only approval and task activity states are reset.

A workflow can contain a single rollback, multiple rollbacks, or nested rollbacks in more complex workflows. The Rollback To activity resets activities based on the actual workflow sequence.
Condition Workflow activities

Condition activities provide conditional branching and logical operation functionality for workflows.

*If workflow activity*

The *If* activity checks a condition or script to determine if a *Yes* or *No* transition should be taken.

If the workflow creator specifies both the *Condition* and the *Advanced* script, both must evaluate successfully for activity to take the *Yes* transition.

Results

The workflow designer can assign a result value using activity.result from within the *Script* field on the activity record. By default, the result value of the activity is the final result of the condition or script specified. Possible result values are:

- *Yes*
- *No*

Input variables

The following variables determine the behavior of the activity.

*If activity input variables*

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>If specified and the current record matches the condition, the <strong>Yes</strong> transition is taken.</td>
</tr>
<tr>
<td>Advanced and Script</td>
<td>To specify a script, select the <em>Advanced</em> check box. You may then enter a script that is evaluated. If your script sets the variable answer to <em>yes</em>, then the <strong>Yes</strong> transition is taken. Otherwise, the <strong>No</strong> transition is taken.</td>
</tr>
</tbody>
</table>

Conditions

The following conditions determine which transition comes after the activity.

*If activity conditions*

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Taken when the condition, if specified, matches and the <em>Advanced</em> script, if specified, returns yes.</td>
</tr>
<tr>
<td>No</td>
<td>Taken when either the condition does not match or the <em>Advanced</em> script, if specified, returns no.</td>
</tr>
</tbody>
</table>
States

The activity state tells the workflow engine what to do with the activity.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the <code>onExecute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Switch workflow activity

The **Switch** activity checks if the value of a passed field or variable is equivalent to one of several case values.

The switch activity behavior is similar to a switch statement in Java.

When creating a switch activity, select a **Variable** or **Field** to check against activity conditions for a matching field value. When the value passed in this variable or field matches the value defined in the **Condition** field of the activity condition, the workflow progresses through that activity condition.

Results

The variable or field selected in the **Variable** or **Field** activity variable determines the possible result values.

Input variables

The following variables determine the behavior of the activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select <strong>Variable</strong> or <strong>Field</strong> as the type of value to check against available conditions. This selection sets the label and available options for the other field.</td>
</tr>
</tbody>
</table>
### Field

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Variable or Field | Select the source of the value compared against the switch activity conditions. The field label and available options depend on the Type selection.  
  - Variable: select any service catalog variable.  
  - Field: select any field from the Table defined in the workflow properties. |

### States

The activity state tells the workflow engine what to do with the activity.

#### Switch activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the <code>onExecute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

### Example

You can create a switch activity that sets different field values on an incident based on the Assignment group of the incident record.
Switch activity example

The **Field** selected is the incident **Assigned to** field.
If the value of the **Assigned to** field of the workflow-triggering incident is **Service Desk** or **Field Services**, the workflow populates values on the incident record before continuing. If the **Assigned to** value is **Hardware**, the workflow continues without populating any field values.

Condition type (Standard, Else, or Error) is used. For more information, see *Manage workflow activity conditions*.

**Condition Properties**

### Hardware group condition

**Wait for condition workflow activity**

The **Wait for condition** activity causes the workflow to wait at this activity until the current record matches the specified condition.

The workflow evaluates the **Wait for condition** activity each time the current record is updated. Use this activity to pause a workflow indefinitely until a particular criteria is met by a record update. To pause a workflow for a timed duration see *Timer workflow activities*. 
For workflow to consider the condition met, all conditions specified – whether in the builder or in a script – must be true.

**Note:** A Wait for condition activity should only be used to wait for an external event such as a record update, and not one from a workflow setting a value. If you have a workflow setting a value and want to wait for that same field to be seen as 'changed,' try inserting a one-second timer.

**Results**

The workflow designer can assign a result value using `activity.result` from within a script field of the activity. The activity transitions when the result value is true.

**Input variables**

The following variables determine the behavior of the activity.

### Wait for condition activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>The workflow is paused at this activity until this condition matches the current record.</td>
</tr>
<tr>
<td>Condition script</td>
<td>If specified, the workflow is paused at this activity until this script sets the answer variable to true.</td>
</tr>
</tbody>
</table>

**States**

The activity state tells the workflow engine what to do with the activity.

### Wait for condition activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the <code>onExecute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Wait for WF Event workflow activity**

The Wait for WF Event activity causes the workflow to wait at this activity until the specified event is fired.

Use this activity to wait for another activity to fire an event. Events from other activities are fired in a script using the `workflow.fireEvent('eventName')` API call.
Results

The workflow designer can assign a result value using `activity.result` from within a script field of the activity. This activity transitions when the specified event fires.

Input variables

The following variables determine the behavior of the activity.

**Wait For WF Event activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait for Event</td>
<td>An event name to trigger the workflow.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.

**Wait For WF Event activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the <code>onExecute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Notify workflow activities

Notify activities manage calls and SMS messages in Notify.

All Notify workflows that manage a phone call must run on the `notify_call` table. Call-related Notify activities can be added only to workflows where the `Table` field value is `Notify Call (notify_call)`.

You can identify if an outbound call was answered by a human or by an answering machine from within a Notify workflow by evaluating the `current.is_human` variable, such as with an If workflow activity. This variable is set by the telephony provider when an outbound call is answered. This variable is always true for inbound calls.

**Note:** Do not add a Timer activity between multiple Notify activities that interact with active phone calls.

**Important:** When creating a Notify workflow, set the workflow If condition matches field to -- None --. Notify controls which workflow to run based on the configured number groups.
Forward call workflow activity
The **Forward Call** activity forwards a Notify call to an E.164-compliant phone number.

If the person receiving a forwarded call hangs up, the **forward call** activity completes and transitions to the next activity. Any further Notify activities in the workflow run for the caller only.

### Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Phone number to call</td>
<td>Enter the phone number to forward the call to.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait for the call to be answered before hanging up.</td>
</tr>
<tr>
<td>Record</td>
<td>Select this check box to record the conversation.</td>
</tr>
</tbody>
</table>

### Conditions

The conditions determine which transition comes after this activity. The **forward call** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the phone number to call is invalid.

**Input workflow activity**
The **Input** activity creates a phone menu by presenting a list of options on a Notify call.

### Input Variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of digits</td>
<td>Specify the maximum number of digits the caller can enter. A caller can enter fewer digits than the maximum and press the <strong>Finish key</strong> to complete the entry.</td>
</tr>
<tr>
<td>Finish key</td>
<td>Specify the key a caller can press on their phone when finished selecting a menu option.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Specify the amount of time to wait before closing the menu automatically when the caller does not select a menu option.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to build the phone menu, instead of using the activity conditions.</td>
</tr>
<tr>
<td>Variable</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Script</td>
<td>Define the script to build the phone menu. The script must specify an <code>answer</code> variable as a JavaScript object with the following format:</td>
</tr>
</tbody>
</table>

```javascript
answer = {
    1: {
        "say": "https://some_url.com/options/one.mp3",
        "myCustomData": "some data here"
    },
    2: {
        "say": "type 2 to speak to a representative",
        "language": "en-US",
        "myCustomData": "some more data here"
    }
};
```

The script may specify either a text-to-speech string and language code or the URL of a prerecorded message for each entry. You can also add optional attributes to store related information, such as `myCustomData` in the example above.

**Conditions**

The conditions determine the transition that comes after this activity.

The input activity does not specify any conditions by default. You must define conditions to build the phone menu. Each condition is one option on the phone menu. Notify reads the text from each condition Name to the caller, up to 100 characters per condition.

You can specify a language for each condition by prefixing the message with the language code, in the format `xx-XX:<Message>`. For example, add `fr-CA:` for Canadian French. Available languages are stored on the Notify Language (notify_language) table.

The condition that the activity transitions through depends on the digits entered by the caller. Set the condition `condition` value to `parseInt(workflow.scratchpad.digits) == <expected digits>`. For example, to transition through a condition when the caller presses the number 3, set the `condition` to `parseInt(workflow.scratchpad.digits) == 3`.

You can add an error condition to this activity. The activity transitions through the error condition if the advanced script returns an invalid value, or if the text to say for a condition is empty.

**Scratchpad Entries**

The activity uses the workflow scratchpad to write persistent values.

<table>
<thead>
<tr>
<th>Entry</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workflow.scratchpad.digits</td>
<td>The digits entered by the caller, as a string.</td>
</tr>
</tbody>
</table>
**Hangup workflow activity**

The **Hangup** activity disconnects an active Notify phone call.

You can use the **hangup** activity to disconnect only calls that have been answered. Use the **reject** activity to disconnect calls that have not been answered.

**Play workflow activity**

The **Play** activity plays a sound file on a Notify call.

**Input Variables**

Input variables determine the initial behavior of the activity.

**Input Variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>Enter the URL of a sound file to play. If the URL is inaccessible, or if the audio file mime type is not supported by the telephony provider, the <strong>play</strong> activity is skipped.</td>
</tr>
<tr>
<td>Loop</td>
<td>Enter the number of times the sound file should play.</td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition comes after this activity. The **play** activity does not specify any conditions by default.

You can create an error condition to handle errors with the sound file. The activity transitions through the error condition if the specified sound file is not available, or has an unsupported mime type. Supported mime types are listed on the Notify Audio MIME Types (notify_mime_type) table.

**Record workflow activity**

The **Record** workflow activity records audio from a user on a Notify call.
Input Variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max duration (in seconds)</td>
<td>Enter the maximum duration, in seconds, allowed for a recording.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait before ending a recording automatically when the caller is silent.</td>
</tr>
<tr>
<td>Finish Key</td>
<td>Specify the key a caller can press on their phone to end the recording.</td>
</tr>
</tbody>
</table>

Scratchpad Entries

The activity uses the workflow scratchpad to store persistent values.

The record activity adds the recording variable to the workflow scratchpad. This variable stores metadata about the recording, such as URI, ID, and duration. You can access the following values from this variable.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>recording.recordingDuration</td>
<td>The duration of the recording, in seconds.</td>
</tr>
<tr>
<td>recording.from_number</td>
<td>The caller’s phone number, including country code.</td>
</tr>
<tr>
<td>recording.notify_number</td>
<td>The Notify phone number used to respond to the call, including country code.</td>
</tr>
<tr>
<td>recording.recordingID</td>
<td>The ID used by the telephony provider to identify the recording.</td>
</tr>
<tr>
<td>recording.recordingURL</td>
<td>The URL from the telephony provider to access the recording.</td>
</tr>
</tbody>
</table>

Reject workflow

The Reject workflow activity rejects an incoming Notify call.

You can use the reject activity to disconnect only calls that have not yet been answered. Use the hang up activity to disconnect calls that have been answered.

Input variables

Input variables determine the initial behavior of the activity.
Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reason</td>
<td>Select a reason for rejecting the call, such as busy.</td>
</tr>
</tbody>
</table>

Say workflow activity
The say workflow activity allows you to play a message, using text to speech, on a Notify call.

Input variables
Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text to say</td>
<td>Specify the text to read.</td>
</tr>
<tr>
<td>Language</td>
<td>Select the language and locale to use when reading text.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to define the language and message, instead of using the Text to say and Language values.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script to set what text is read on the call. The script must return a string that defines the language and the text to read. For example, to play an English-language message, return {language: 'en-US', text: 'Text to read'}.</td>
</tr>
</tbody>
</table>

Forward to notify client workflow activity
The forward to notify client workflow activity connects a phone call to a Notify WebRTC client.

Input variables
Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>Select the user to connect the call to.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to determine which client to connect to, instead of using the User variable.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script that controls which client to connect to. This script should return a GlideRecord for a single User (sys_user) record.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait for the call to be connected before hanging up.</td>
</tr>
<tr>
<td>Record</td>
<td>Select this check box to record the call.</td>
</tr>
</tbody>
</table>
Conditions

The conditions determine which transition comes after this activity. The Forward to Notify Client activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if there is an issue with the Notify client.

Call workflow activity
The Call activity makes outbound phone calls using a Notify workflow.

Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notify Number</td>
<td>The Notify phone number to make the call from. When you initiate a call, the</td>
</tr>
<tr>
<td></td>
<td>outgoing call workflow for the number group associated with this number runs.</td>
</tr>
<tr>
<td>Phone number to call</td>
<td>The E.164-compliant phone number to call.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to determine number to call, and the Notify number to call from instead of using the Phone number to call and Notify Number variables.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script that controls which number to call. This script should return</td>
</tr>
</tbody>
</table>
|                        | a string listing the Notify number sys_id, as well as the phone number to call, such as `{notify_number: 'sys_id', phone_number: '+316...'}

Conditions

The conditions determine which transition comes after this activity. The call activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the call could not be set up due to invalid data returned by the advanced script.

Join conference call workflow activity
The Join Conference Call connects an incoming or outgoing call to a Notify conference call.

Notify includes the workflows Notify: (Re)join Conference Call and Notify: Join Conference Call Via SMS to demonstrate how to use the join conference call activity to connect inbound and outbound calls, and inbound SMS messages to a conference call.

Input variables

Input variables determine the initial behavior of the activity.
Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advanced</td>
<td>Select this check box to display advanced configuration options.</td>
</tr>
<tr>
<td>Script</td>
<td>Specify advanced configuration options using JavaScript, such as if the new participant should be muted upon joining the conference call. You can access values from the workflow scratchpad.</td>
</tr>
</tbody>
</table>

Conditions

The conditions determine which transition comes after this activity. The `join conference call` activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the `conference_call` scratchpad variable is not set.

Scratchpad entries

The activity uses the workflow scratchpad to read persistent values.

<table>
<thead>
<tr>
<th>Scratchpad variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workflow.scratchpad.conference_call</td>
<td>A GlideRecord for a single conference call record. A call processed by this activity is added to this conference call. If this value is not specified, the <code>join conference call</code> activity will log an error. When initiating an outgoing call workflow using the Notify API <code>call(String notifyPhoneNumber, String toPhoneNumber, GlideRecord conferenceCall)</code> method, this scratchpad value is set automatically to the conference call GlideRecord. For incoming call workflows, or workflows initiated using a different mechanism, you must explicitly set this scratchpad value.</td>
</tr>
</tbody>
</table>

Send SMS workflow activity

The `send SMS` workflow activity to send short text messages using Notify to users’ phones.

Input variables

Input variables determine the initial behavior of the activity.
### Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From</td>
<td>Select the Notify phone number to use to send the SMS message.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use JavaScript to determine which numbers to send the message to, and the Notify number to use to send the message.</td>
</tr>
<tr>
<td>To</td>
<td>Select any number of users to send the message to. The user record must have a E.164-compliant phone number or notification device configured for SMS messages.</td>
</tr>
<tr>
<td>To (groups)</td>
<td>Select any number of groups to send the message to. All members of that group with an E.164-compliant phone number or SMS notification device receive the message.</td>
</tr>
<tr>
<td>Message</td>
<td>Enter the message to send. You can add field values from the current record by using the <strong>Select variables</strong> box. You can also add values from the workflow scratchpad. If a field and a scratchpad variable have the same name, the field value is used. Because you can use variables in this message, it is not possible to determine the length of the message at design time. If the activity sends a message that is longer than supported by the telephony provider, the message is truncated and the instance logs a warning.</td>
</tr>
<tr>
<td>To (script)</td>
<td>Enter a script to determine which numbers to send the message to, and the Notify number to use to send the message. The script should return a JavaScript object with the format <code>{notify_number: '\'...sys_id...\', users: [...], groups: [...], numbers: [...]}</code>. Specify the users or groups to send the message to as an array of sys_id values. Specify other numbers as an array of E.164-compliant phone numbers. This field appears only if <strong>Advanced</strong> is selected.</td>
</tr>
</tbody>
</table>

### Conditions

The conditions determine which transition comes after this activity. This activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the Notify number used to make the call is not configured correctly or unable to send SMS messages, or if an error occurs while sending the SMS.

*Queue workflow activity*

The **Queue** activity places an active Notify call in a queue.
Add the **Queue** activity to a workflow on the Notify Call (notify_call) table to put the current call on hold. This activity does not specify any input variables. The queue that the call is added to is given a random ID.

**Workflow notification activities**

Notification workflow activities notify users of events that occur during the workflow.

**Create Event workflow activity**

The **Create Event** activity adds an event to the event queue, but does not immediately fire the event.

The event processor typically processes the event within one minute. This activity triggers any business rules or email notifications that would normally be triggered by the event.

**Results**

**Finished:** the activity added the event to the event queue.

**Input variables**

**Create Event activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event name</td>
<td>The name of the event to create. From the Event Name lookup list, select the event to add to the queue. If the event requires parameters, specify them in the Parameter script field.</td>
</tr>
<tr>
<td>Parameter 1</td>
<td>The first parameter of the event.</td>
</tr>
<tr>
<td>Parameter 2</td>
<td>The second event parameter.</td>
</tr>
</tbody>
</table>

**Note:** If this parameter is a string value, it must be within quotes (" ").

**Notification workflow activity**

The **Notification** activity sends an email or SMS message to specified users or groups.

**Input variables**

**Notification activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Addressees</td>
<td>The users who will be recipients of the email.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>To (groups)</td>
<td>The members of the groups that will be recipients of the email.</td>
</tr>
<tr>
<td>Advanced</td>
<td>If selected, the script in the To (script) field is called to specify additional recipients of the email.</td>
</tr>
<tr>
<td>To (script)</td>
<td>If Advanced is selected, this script is called and should set the variable answer to a comma-separated list of user or group sys_ids that you want to add as recipients of the email.</td>
</tr>
<tr>
<td>Message</td>
<td>The email body that is sent.</td>
</tr>
<tr>
<td>Subject</td>
<td>The subject line of the email.</td>
</tr>
<tr>
<td>Message</td>
<td>To include the value of a field in the message body, place the cursor at the point in the text where you want the field's value inserted. Then click the + icon next to Fields and select the field you want.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.

<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

*Timer workflow activity*

The **Timer** activity pauses the workflow for a specified period of time.

This duration can be an absolute time value or a relative value based on a defined **schedule**. It is best to adjust the **Duration** so the workflow can progress in a timely manner. To pause a workflow indefinitely until a condition is met, see **wait for condition**.
## Results

**Timer activity results**

<table>
<thead>
<tr>

<td>The activity or workflow was canceled before the timer reached the specified duration.</td>
</tr>
</tbody>
</table>

## Input variables

Input variables determine the initial behavior of the activity.

**Timer activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer Information</td>
<td>How the timer duration is computed. The options are:</td>
</tr>
</tbody>
</table>
| Timer based on         | • **A user specified duration**: The duration is based on the Duration fields, such as days and hours.  
                         | • **A relative duration**: The duration is based on the Relative duration (such as End of Next Business Day) and Wait fields.  
                         | • **A date/time or duration field**: The duration is based on the Field value and the Wait field.  
                         | • **Script**: The duration is based on a script that returns the number of seconds.  
| Duration               | The specific number of days and hours to wait before proceeding to the next activity in the workflow. |
| Relative duration      | The general number and length of business days to wait before progressing to the next workflow activity. |
| Wait                   | An additional timer adjustment when Timer based on is A relative duration or A date/time or duration field. The options are:  
                         | • **The full duration**: No modification of the calculated duration.  
                         | • **A % of the duration**: The duration is adjusted by multiplying the number of seconds by the (Percentage / 100).  
                         | • **Some time before**: The duration is shortened by the Time before days and hours.  
                         | • **Some time after**: The duration is lengthened by the Time after days and hours.  

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Percentage</td>
<td>The Wait percentage value when Timer based on is A relative duration or A date/time or duration field.</td>

<p>| Schedule field | A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Time zone based on | The time zone for calculating the duration. The time zone may be based on:  
  - No time zone: Default. Workflow uses the GMT time zone.  
  - A specific time zone: A predefined Time zone.  
  - A time zone field: A Time zone field to track time duration from a field on the form. |
| Time zone | Appears only when Time zone based on is A specific time zone. The predefined time zone. |
| Time zone field | Appears only when Time zone based on is A time zone field. A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog. |

### States

The activity state tells the workflow engine what to do with the activity.

#### Timer activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The Timer activity is in this state very briefly while initializing, after which it immediately changes to Waiting.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine waits until the timer reaches the specified duration. The engine then transitions the workflow to the next activity.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

### Example

You can use a Timer activity to pause the workflow until the end of the business day.
Timer example

In this example, the script evaluates the time between the `now` variable and the `eod` variable. The `eod` variable is defined, in 24 hour time, as 4:00 PM. The script then sets the `answer` variable to the difference between these variables, in seconds, and logs a message.

```javascript
// get now and calc end of day (4:00pm)
var now = new Date();
var eod = new Date();
eod.setHours(16);
eod.setMinutes(0);
eod.setSeconds(0);
answer = (eod.getTime() - now.getTime()) / 1000;
```
Task workflow activities

Task activities create and modify workflow tasks.

Task activities are only available when the workflow runs on a table that extends Task.

*Add Worknote workflow activity*

The **Add Worknote** activity adds text to the Worknotes field of the current incident record. A workflow must run on the Incident table to use this activity.

**Input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Work Note</td>
<td>The text to add to the incident record.</td>
</tr>
</tbody>
</table>

*Attachment Note workflow activity*

The **Attachment Note** activity adds an attachment to the current record.

*iNote:* This activity is only available when the workflow runs on a table that extends Task.

This activity allows the use of irregular HTML tags to reference attachments, specifically the `[code]` tag. Entries in a journal field that use irregular HTML do not work if the `glide.ui.allow_deep_html_validation` property is true. This property is set to false by default.

**Results**

- **Finished:** the activity added the attachment to the record.

**Input variables**

The following variables determine the behavior of the activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>General</td>

**Catalog Task workflow activity**

The **Catalog Task** activity creates a service catalog task record.

**Note:** This activity is only available when the workflow runs on a table that extends Task.

A user must complete the catalog task. This activity is available only for workflows running on the Catalog Request Item (sc_req_item) table.

**Results**

You can assign a result value using `activity.result` from within a script field of the activity. The final **State** value of the catalog task record determines the result value for the **Create Task** activity. Possible result values are:

- Closed complete
- Closed incomplete
- Closed skipped
- Deleted
- Cancelled

**Input fields**

The values you enter in the following fields determine the behavior of the activity.

**Catalog task activity information**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Catalog Task Activity Settings</td>
<td>The following fields specify the behavior of the Catalog Task Activity.</td>
</tr>
<tr>
<td>Task Table</td>
<td>The table on which this activity runs. In most cases, leave set to the default value: (sc_req_item).</td>
</tr>
<tr>
<td>Priority</td>
<td>The value you want assigned to the <strong>Priority</strong> field for the new task.</td>
</tr>
<tr>
<td>Wait for completion</td>
<td>If selected, the workflow activity waits for the task to complete before continuing. If cleared, the task is created but the workflow proceeds.</td>
</tr>
<tr>
<td>Catalog Task Record Settings</td>
<td>The following fields specify the field values that this activity sets for the catalog task it creates.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Task value from | Specify how you want to populate fields on the new task.  
   - **Fields**: a predefined set of fields including Fulfillment group, Assigned to, Short description and Instructions.  
   - **Template**: an existing template for the selected task table.  
   - **Values**: values that you specify using a Set Values widget.  
   
   After you select a value for Task value from, additional fields specific to that value appear on the form. |
| Fulfillment group | The group that is responsible for completing the task. Populates the Assignment group field on the new task. |
| Assigned to    | The user who is responsible for completing the task. Populates the Assignment to field on the new task. |
| Short description | A short description for the task. Populates the Short description field on the new task. |
| Instructions   | The task instructions for the user to complete prior to closing the task. Populates the Description field on the new task. |
| Template       | The values in the task will be populated from the values in the template you select. |
| SetValues      | Select any field on the task record to a value you specify here. |
| Advanced       | Check Advanced if you want to use a script to assign values on the catalog task. When you check Advanced, a text box appears where you can enter your script.  
   
   Set additional values for the task in this script. This script is run after the task values are set using the Fields, Template or Values you have specified.  
   
   Use the variable task when setting additional values, for example:  
   task.short_description = current.short_description; |

<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Create Task workflow activity

The Create Task activity generates a record on any of the tables that extend Task (task).

Note: This activity is only available when the workflow runs on a table that extends Task.
If the **Wait for completion** check box is selected, the workflow context waits for a user action on the task, such as Complete or Incomplete, and then progresses based on the user action.

**Results**

You can assign a result value using `activity.result` from within a script field of the activity. By default, the final **State** value of the task record determines the result value for the **Create Task** activity. Possible result values are:

- Closed complete
- Closed incomplete
- Closed skipped
- Deleted
- Cancelled

**Input variables**

The following variables determine the behavior of the activity.

**Create Task activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Create Task Activity Settings</strong>&lt;br&gt;The following fields specify the behavior of the Create Task Activity.</td>
<td></td>

</tr>
</tbody>
</table>

Utility workflow activities

Utility activities provide controls over the path of the workflow, and other useful tools.

Branch workflow activity

The Branch activity splits the workflow into multiple transition paths from a single activity.

To add a transition path, drag the Branch activity onto the canvas. When the Branch activity properties form displays, click Submit to add the activity to the canvas. Once the activity is on the canvas, right click in the activity body, then click Add Condition.

All transitions from this activity execute concurrently. This activity provides a single Always condition. You can draw any number of transitions from this condition. Using this activity is equivalent to drawing multiple transitions from a single condition of another activity.

Branching can affect the behavior of rollback activities. See Rollback To activity for more information.

Join workflow activity

The Join activity unites multiple execution paths into one transition.

Use this activity to cause a workflow to wait for all activities in multiple paths to finish before continuing. If multiple concurrent workflow paths meet without a Join activity, any subsequent activities execute twice.

To add Join to the canvas, click Submit. On the canvas, connect incoming transitions from each activity you want to act as a predecessor to the Join activity. Then connect outgoing transitions to the two exit conditions: Complete and Incomplete.

Results

Provide an Incomplete transition out of a Join whenever it is possible for any predecessor activities to follow a transition path that does not lead to the Join activity.

Join activity results

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete</td>
<td>Join exits along the Complete path when the system has determined that all predecessor activities have completed and transitioned to the Join.</td>
</tr>
<tr>
<td>Result</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Incomplete</td>
<td>Join exits along the Incomplete path when the system determines that at least one predecessor activity completed but transitioned along a path that bypassed the Join activity.</td>
</tr>
</tbody>
</table>

Lock workflow activity

The **Lock** activity prevents other instances of this workflow from continuing past this activity until the lock is released.

Several instances of the same workflow may run concurrently. For example, if a workflow is triggered when a record is added to a particular table and multiple records are added one after the other, that workflow will be triggered multiple times: once by each record insertion. In such cases, you can use the lock activity to ensure that this instance of the workflow has completely finished one or more activities before any other instance of the workflow can proceed.

A workflow can explicitly release a lock with the **Unlock** activity. The lock may also be released when the **Max duration** is reached.

When an instance of the workflow reaches the **Lock** activity, it attempts to obtain a lock using the key specified in the lock activity. If another instance has already obtained the lock and has not yet released it, this lock attempt fails. The instance continues trying to obtain the lock until **Max attempts** has been reached.

**Note:**

We recommend placing a one-second timer activity before the lock activity. This helps prevent a rare condition in which the lock activity may not be able to distinguish one workflow instance from another. This condition can occur because the entity owning the lock is not the specific workflow instance, but rather the code-execution thread in which that instance is running. In most cases, each workflow instance runs on a different thread, but adding a timer activity ensures that this is the case.
Since a **Lock** activity can only temporarily prevent processing of other workflow instances, do not add activities that cause the workflow to wait between a **Lock** and **Unlock** activity block. This
may cause the **Unlock** activity to be unable to acquire the lock to release it and instead take 60 seconds to complete. Restricted wait activities include:

- Approval activities
- Task activities
- Timer activities
- Wait for condition activity
- Wait for WF Event activity

### Results

**Lock activity results**

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The activity successfully obtained a lock. This instance of the workflow can proceed past this point, but other instances cannot until the lock is released.</td>
</tr>
<tr>
<td>Failure</td>
<td>After attempting to obtain the lock <strong>Max attempts</strong> times, the activity could not obtain the lock.</td>
</tr>
</tbody>
</table>

### Input variables

Input variables determine the initial behavior of the activity.

**Lock activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key</td>
<td>A unique mutex key. The <strong>Unlock activity</strong> activity uses this key to release the lock.</td>
</tr>
<tr>
<td>Duration</td>
<td>The maximum time the lock persists. The lock is released after it reaches this duration. Releasing a lock this way is equivalent to running the <strong>Unlock</strong> activity.</td>
</tr>
<tr>
<td>Max. duration</td>
<td>The maximum time the lock persists. The lock is released after it reaches this duration. Releasing a lock this way is equivalent to running the <strong>Unlock</strong> activity.</td>
</tr>
<tr>
<td>Lock attempts</td>
<td>Specify how the activity behaves if the lock attempt is denied. If the final lock attempt fails, the activity state will be set to ‘timeout’ and the activity result will be set to ‘failed’.</td>
</tr>
<tr>
<td>Max. attempts</td>
<td>Specify the maximum number of times the activity may attempt to obtain the lock.</td>
</tr>
<tr>
<td>Delay between attempts</td>
<td>The amount of time required after a failed lock attempt before another lock attempt is allowed.</td>
</tr>
</tbody>
</table>

### States

The activity state tells the workflow engine what to do with the activity.
Lock activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Waiting</td>
<td>The workflow engine is waiting to obtain a lock.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity successfully obtained the lock.</td>
</tr>
<tr>
<td>Timeout</td>
<td>The activity could not obtain a lock within the number of attempts specified by the Max. attempts input variable.</td>
</tr>
</tbody>
</table>

Log Message workflow activity
The Log Message activity writes a message to the workflow log.

Use this activity to add entries to the workflow’s log for debugging or tracing purposes.

Input variables

Input variables determine the initial behavior of the activity.

Log Message activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message</td>
<td>The message to log. This variable can be a string or a JavaScript expression that evaluates to a string.</td>
</tr>
</tbody>
</table>

Log Trace Message workflow activity
The Log Trace Message activity writes a trace message to the workflow log.

The trace message includes the activity name, the event that invoked the workflow, and the table of the current record. There are no variables or conditions. To log other data, use the Log Message workflow activity activity.

REST Message legacy workflow activity
The legacy REST Message activity enables an administrator to override the REST endpoint or supply the variables configured in the REST Message module.

This activity is deprecated in the Jakarta release and no longer shows up in the Workflow canvas for new workflow development. New workflows should use the Orchestration REST Activity templates instead.

Existing workflows using it will continue to work as designed. To edit this activity in an existing workflow, you must re-activate the activity.

The REST Message activity executes a dead link REST function (POST, PUT, GET, or DELETE) on an endpoint using values defined in the function record.

Note: If you want to use a MID Server to send the REST message, the MID Server must be accessible by the instance and configured to use SSH.
## Input variables

### REST Message activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rest Message</td>
<td>Name of the REST message to run. This is a reference field to the REST Message (sys_rest_message) table (System Web Services &gt; Outbound &gt; REST Message).</td>
</tr>
<tr>
<td>REST Message Function</td>
<td>Function to call that is defined in a REST message function. This is a reference field to the HTTP Method (sys_rest_message_fn) table (System Web Services &gt; Outbound &gt; REST Message). Available functions are put, post, get, or delete. You can edit functions in the HTTP Methods related list in each REST Message record.</td>
</tr>
<tr>
<td>REST Endpoint</td>
<td>REST endpoint to use instead of the Endpoint defined in the HTTP Method record. Leave this field blank to use the defined endpoint in the REST Message Function record.</td>
</tr>
<tr>
<td>Rest Message Variables</td>
<td>Values to use for variables defined in the HTTP Method record. Use the following format for the string: name1=value1, name2=value2, ... For example, use name=${nameValue}, id=${idValue} where name and id are function variables. If either the variable name or value contains a comma or equal sign, escape those characters with a backslash.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>Check this box if you want to use a MID Server to send the REST message. A MID Server might be necessary to reach an endpoint within a firewall or a subnetwork that is not visible from the instance. If this check box is selected, but no MID Server is defined in the MID Server field, the workflow automatically attempts to find a MID Server based on IP range and the REST capability.</td>
</tr>
<tr>
<td>MID Server</td>
<td>Name of the MID Server to use. This field is available when Use MID Server is selected. The workflow ignores this parameter if the use_midserver parameter is disabled.</td>
</tr>
<tr>
<td>Sensor Script</td>
<td>The script to execute after the request has been made and a response has been received. You can access the full response body from the activity.output variable.</td>
</tr>
</tbody>
</table>
Return Value workflow activity
The **Return Value** activity returns a value to a parent workflow, when run from a subflow.

This activity has no variables or conditions. For more information, see [Workflows used as subflows](#).

Use this activity within a subflow to store data that the parent flow can access. The **Return Value** activity adds the data from the subflow’s `value` variable to the parent workflow’s scratchpad.

### Scratchpad entries

The activity uses the workflow scratchpad to read and write persistent values.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>The activity writes the value from the subflow <code>value</code> variable to the parent scratchpad. The parent workflow activity that runs the subflow includes a <code>Map return value to variable</code> that defines where the parent workflow stores the returned data. This data can be scalar, a stringifiable JavaScript object, or an expression that evaluates to a stringifiable JavaScript object.</td>
</tr>
</tbody>
</table>

Run Script workflow activity
The **Run Script** activity runs the specified script in the scope of the workflow version.

ℹ️ **Note:** All changes to current are automatically updated. There is no need to call `current.update()`

### Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Script</td>
<td>Script to execute.</td>
</tr>
</tbody>
</table>

Set Values workflow activity
The **Set Values** activity sets values on the current record when the workflow quiesces or ends.

### Input Fields

The values you enter in the following fields determine the behavior of the activity.
Set Values Activity Input Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set these values</td>
<td>From the list on the left, select the field on the current record whose value you want to set when the workflow quiesces or ends. In the user-input field to the right, select or enter the value to which you want that field set.</td>
</tr>
</tbody>
</table>

**Note:** Avoid setting the same fields from different Set Value activities. The workflow only sets the value specified by the last Set Values activity run before quiescing or ending.

**Note:** Using the Set Values activity to set the Approval field on a task does not cancel pending approvals. To approve a task in a workflow, use the Approval Action activity instead.

SOAP Message legacy workflow activity
The legacy SOAP Message activity uses SOAP messages defined in the System Web Services plugin and can call the messages using a MID Server.

This activity is deprecated in the Jakarta release and no longer shows up in the Workflow canvas for new workflow development. New workflows should use the Orchestration SOAP Activity templates instead.

Existing workflows using it will continue to work as designed. To edit this activity in an existing workflow, you must re-activate the activity.

**Input variables**

SOAP Message activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAP Message</td>

<tr>
<td>-------------------</td>
<td>----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Variables</td>
<td>variables</td>
<td>Variables to substitute into the SOAP Envelope defined in the SOAP Message Function record. Use this format for the string: name1=value1, name2=value2, ... If either the name or value contains a comma or equal sign, escape these characters with a backslash.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>use_midserver</td>
<td>Check box for using a MID Server to send the SOAP message. A MID Server might be necessary to reach an endpoint within a firewall or a sub-network that is not visible from the instance. If this check box is selected (true), but no MID Server is defined in the MID Server field, Workflow automatically attempts to find a MID Server.</td>
</tr>
<tr>
<td>MID Server</td>
<td>midserver</td>
<td>Name of the MID Server to use. This field appears when you select the Use MID Server check box. The workflow ignores this parameter if the use_midserver parameter is disabled.</td>
</tr>
<tr>
<td>Sensor Script</td>
<td>sensor_script</td>
<td>The script to execute after the request has been made and a response has been received. You can access the full XML response body from the activity.output object.</td>
</tr>
</tbody>
</table>

Turnstile workflow activity

The Turnstile activity limits how many times a workflow can pass through the same point.

Use this activity to prevent infinite loops. This activity is useful alongside the Rollback To workflow activity.

Results

You can assign a result value using the activity.result variable from within a script field of the activity. By default, the activity script evaluates if the activity should continue to iterate or stop.

Turnstile activity results

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Continue</td>
<td>The Allowed iterations value is greater than the number of times the workflow accessed this activity.</td>
</tr>
<tr>
<td>Result</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td>Cancel</td>
<td>The workflow accessed this activity more times than the <strong>Allowed iterations</strong> value.</td>
</tr>
</tbody>
</table>

### Input variables

Input variables determine the initial behavior of the activity.

**Turnstile activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allowed iterations</td>
<td>Number of times the workflow can pass through this activity before the turnstile ends the loop.</td>
</tr>
</tbody>
</table>

### Conditions

The conditions determine which transition comes after this activity.

**Turnstile activity conditions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Continue</td>
<td>If the workflow has returned to this point an amount of times less than the allowed iteration.</td>
</tr>
<tr>
<td>Cancel</td>
<td>If the workflow has returned to this point an amount of times more than the allowed iteration.</td>
</tr>
</tbody>
</table>

### States

The activity state tells the workflow engine what to do with the activity.

**Turnstile activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the <code>onExecute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is triggered.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Unlock workflow activity**

The **Unlock** activity releases a lock that was previously placed by the **Lock** activity.
To release a lock, specify the same lock key that was specified in the **Lock** activity. If the **Lock** activity had a **Duration** specified, and that duration has already passed, the lock will already be released.

**Input variables**

Input variables determine the initial behavior of the activity.

**Unlock activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lock key</td>
<td>The Mutex key that releases the lock. This key must match the key specified by a <strong>Lock</strong> activity. For more information, see <strong>Lock activity</strong>.</td>
</tr>
</tbody>
</table>

**States**

The activity state tells the workflow engine what to do with the activity.

**Unlock activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Finished</td>
<td>The activity successfully released the lock.</td>
</tr>
</tbody>
</table>

**Subflow activities in workflow**

Subflow activities run and manage workflows from a parent workflow.

The **Parallel Flow Launcher** subflow activity is available.

**Parallel Flow Launcher workflow activity**

The **Parallel Flow Launcher** activity launches multiple subflows in parallel.

Workflows running in parallel execute simultaneously and may complete in any order. The activity can launch a single subflow or multiple subflows as needed. You can manage the input values and values returned for each subflow.

**Note:** The Parallel Flow Launcher activity waits until all subflows are completed before proceeding. If any subflow does not finish, the activity waits indefinitely.

**Note:** Do not launch a large number of subflows with the Parallel Flow Launcher activity. If overused, this activity can overburden the instance. For launching very large numbers of subflows, consider putting the Parallel Flow Launcher inside a loop controlled by a turnstile or other conditional activity and having it do batches of no more than 500 at a time.

**Activity variables**

Activity variables determine the initial behavior of the activity.
## Parallel Flow Launcher activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Parallel Flow Launcher configuration</strong></td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>A unique name for the activity.</td>
</tr>
<tr>
<td>Stage</td>
<td>The stage to display when the workflow reaches the activity.</td>
</tr>
<tr>
<td><strong>Inputs</strong></td>
<td>Inputs to the subflows to run. Specify an array of name: value pairs for each input defined in the workflow being launched. The name and data type of each input variable entered must match those used by the subflow that this activity launches. For a detailed example, see <a href="#">Parallel Flow Launcher Example</a>.</td>
</tr>
<tr>
<td><strong>Parallel Flow Launcher selection</strong></td>
<td></td>
</tr>
<tr>
<td>Workflow</td>
<td>The workflow to run.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Check <strong>Advanced</strong>, to enter a script that uses a WorkflowCoordinator object to manage the subflows. When you check Advanced, a text box appears where you can enter a script that specifies a unique workflow for each set of input variables. See <a href="#">WorkflowCoordinator object</a> for more information.</td>
</tr>
<tr>
<td><strong>Parallel Flow Launcher Iteration</strong></td>
<td>Specify parameters to tune the performance of batched workflows.</td>
</tr>
<tr>
<td>Count</td>
<td>If not specified by an input set, <strong>Count</strong> determines the number of subflows executed in parallel from this activity. If the <strong>Advanced</strong> option is not selected, ensure that this field is populated with a valid number.</td>
</tr>
<tr>
<td>Max flows</td>
<td>The maximum number of workflows this activity can launch. If this value is a positive integer, it overrides the max parameter used in the WorkflowCoordinator constructor.</td>
</tr>
<tr>
<td>Max simultaneous</td>
<td>The maximum number of parallel workflows this activity can run at one time. If this value is a positive integer, it overrides the poolsize parameter used in the WorkflowCoordinator constructor.</td>
</tr>
<tr>
<td><strong>Parallel Flow Launcher Process</strong></td>
<td></td>
</tr>
<tr>
<td>Process flow complete</td>
<td>To specify a script that runs after each subflow completes, check <strong>Process flow complete</strong>. If you check this field, a text box labelled <strong>Flow complete</strong> appears, where you can enter the script to run.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Flow complete | The script that runs each time a subflow finishes. This field is available when the **Process flow complete** option is selected. The same script functions and variables available in other workflow scripts, such as those in the Run Script activity, are available here. For more information, see [Completed subflow values in scripts](#). The variable “flow” is available to this script. It is an object that contains the following information about the flow that is finishing:
|               | - **flow.output (String)**: The value that the subflow returns to the parent if it executed a Return Value activity before ending.
|               | - **flow.index (Number)**: The zero-relative index of the subflow that finished.
|               | - **flow.contextId (String)**: The sys_id of the workflow context for the completed subflow.
|               | - **flow.inputs (Object)**: The inputs that were passed to the subflow when its context was created and started.
|               | - **flow.status (String)**: The final state of the context. This corresponds to the **state** column in the subflow context record, which has possible values of **executing**, **finished**, **cancelled**, or **faulted**. (Since the flow is completed, it cannot be **executing** at this point.)                                                                                                                                 |
| Parallel Flow Launcher Split |                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Process finished | To specify a script that runs after all subflows have finished, check **Process finished**. If you check this field, a text box labelled **Finished Script** appears where you can enter the script to run. The ‘coordinator’ variable is made available to this script and is an object that allows access to any of the finished subflows using the `getFlow(index)` method. For example:
|               | ```javascript
for (var i = 0; i < coordinator.getNumFlows(); i++)
writeFlowResultsToTable(i, coordinator.getFlow(i));
```                                                                                                                                                                                                                                                                                                                                                      |
### States

The activity state tells the workflow engine what to do with the activity. To view an activity's state, point to the activity. A pop-up window shows the **State** and **Result** of the activity. If the activity is in an error state, the pop-up window provides a brief **Fault Description**.

**Parallel Flow Launcher activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Waiting</td>
<td>The activity is waiting for all subflows to finish. All subflows have started and some may have finished.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity successfully completed all of the subflows.</td>
</tr>
<tr>
<td>Error</td>
<td>The activity encountered an error.</td>
</tr>
</tbody>
</table>

**WorkflowCoordinator object**

A *WorkflowCoordinator* object specifies which subflows to run and the input variables to pass to those subflows.

When using a *WorkflowCoordinator* object, you can create a **Parallel Flow Launcher** activity that launches multiple subflows. When using the activity without a *WorkflowCoordinator* object, you can only launch a single subflow multiple times. Use one of the following methods to specify a *WorkflowCoordinator* object for the activity when the **Advanced** activity input variable is selected.

- Reference a workflow scratchpad variable that contains an existing *WorkflowCoordinator* object. To save a *WorkflowCoordinator* object to the scratchpad, call the `save(variableName)` function on the *WorkflowCoordinator* object. You can reference the object using the value passed in the `variableName` parameter. For example, you can create a *WorkflowCoordinator* object in a **Run Script** activity, save the object using `<object>.save('coord')`, and then call this object by entering `coord` in the **Workflow** activity variable of a subsequent **Parallel Flow Launcher** activity.
- Define the WorkflowCoordinator within the **Workflow** activity variable. Add the `javascript:` identifier at the beginning of the script. The [Parallel Flow Launcher example](#) shows how to use a WorkflowCoordinator object in this way.

- Create a factory class to define the WorkflowCoordinator object. The system does not provide a factory class for WorkflowCoordinator by default.

### Completed subflow values in scripts

The **Parallel Flow Launcher** activity exposes additional variables you can use in scripts.

#### Additional variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>coordinator</strong></td>
<td>The WorkflowCoordinator used when running the subflows. You can use this variable in the <strong>Finished script</strong> to perform any final operations. Additionally, you can use the WorkflowCoordinator in a later workflow activity by passing the activity name or sys_id to the <code>WorkflowCoordinator.load('&lt;Activity&gt;')</code> function. For example, to load the WorkflowCoordinator object from a <a href="#">Parallel Flow Launcher</a> activity called <code>Launch Subflows</code>, enter <code>var coord = WorkflowCoordinator.load('Launch Subflows');</code> in a later activity.</td>
</tr>
</tbody>
</table>
| **flow** | The subflow launched by the activity that completed most recently. You can use this variable in the **Flow complete** script to perform any post-processing operations on each subflow. To get a complete subflow from a coordinator object, use `var flow = coord.getFlow(I);` where `I` is the numeric index of the subflow based on the order it was launched. These values are available from the completed subflow:  
  - **index**: the numerical index of this subflow based on the order it was launched  
  - **workflow**: the sys_id or name, depending on which you passed to the WorkflowCoordinator constructor, of the workflow used for this subflow  
  - **inputs**: any input values provided to the launched subflow  
  - **status**: status of the subflow context  
  - **output**: the value returned by the subflow  
  - **contextId**: the sys_id of the workflow context for the subflow |

### Parallel Flow Launcher example

This example shows how to use the **Parallel Flow Launcher** activity with an array of input values and with a WorkflowCoordinator object.
Sample workflow

This example shows a SQL-based web server with four application nodes. A single subflow runs to provision the database, and multiple parallel subflows each configure an application node. Finally, a separate set of parallel subflows configures the nodes to use a load balancer and sets up the server DNS.

Parallel flow launcher business case

Provision the application nodes

The first Parallel Flow Launcher activity launches the Provision Node subflow four times. The activity passes a unique IP address to each subflow from an array in the Inputs variable. The scripts defined in the Flow complete and Finished script variables write log messages regarding the status of the subflows.
Activity Properties: Parallel Flow Launcher

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Provision application nodes</td>
</tr>
<tr>
<td>Stage</td>
<td></td>
</tr>
<tr>
<td>Inputs</td>
<td>[u_host: '192.168.0.10], [u_host: '192.168.0.20], [u_host: '192.168.0.30],</td>
</tr>
<tr>
<td>Workflow</td>
<td>Provision Node</td>
</tr>
<tr>
<td>Count</td>
<td></td>
</tr>
<tr>
<td>Max flows</td>
<td>25</td>
</tr>
<tr>
<td>Max simultaneous</td>
<td>5</td>
</tr>
<tr>
<td>Process flow complete</td>
<td></td>
</tr>
</tbody>
</table>

Flow complete:
```
1 // To access the flow that completed, use the 'flow' variable.
2 // var flowOutput = flow.output;
3 //
4 workflow.debug("Provision Node Finished. Context: " + flow.contextId);
```

Process finished:
```
1 // To access the set of completed workflows use the 'coordinator' variable.
2 // var flowResult = coordinator.getFlow(1).output;
3 //
4 workflow.debug("All Nodes Provisioned");
```

Update
Add nodes to the load balancer

The second Parallel Flow Launcher activity uses WorkflowCoordinator objects to specify which subflows to run. The coordinator variable stores the completed flow information from the previous Provision Nodes activity. The script then retrieves the IP address and port for each node that was provisioned. The coord2 WorkflowCoordinator object runs the Add Node to Load Balancer subflow once for each node, using the retrieved IP address and port information as input variables. Finally, the coord2 WorkflowCoordinator object runs the SetupDNS subflow once to configure the load balancer.

```javascript
var coordinator = WorkflowCoordinator.load('Provision Nodes');
var coord2 = new WorkflowCoordinator({'
  workflow: 'Add Node to Load Balancer'
});
for (var i = 0; i < coordinator.getNumFlows(); i++) {
  var ip = coordinator.getInput(i).ip;
  var port = coordinator.getName(i);7
  coord2.add({
    ip: ip,
    port: port
  });
}
var loadBalancerIP = '10.0.20.10';
coord2.add({ ip: loadBalancerIP, hostname: 'www.snow1.net', 'SetupDNS';
coord2;
```

Specifying which subflows to run

Workflows used as subflows

A workflow can launch another workflow as an activity.

The parent workflow triggers the subflow and then waits for the subflow to complete before continuing. Run the workflow validation tool prior to publishing to detect missing subflows and other dependency problems, such as those involving update sets.

The Workflows tab in the Workflow Editor contains a list of the workflows available for use as subflows.
Workflows available to use as subflows

Make sure that the selected subflow is active. If the subflow is inactive, the main workflow will hang with a Loading message. If you place an inactive subflow into a workflow, the subflow appears with a red banner, indicating that it cannot run. An active subflow is highlighted in blue when selected.
Subflows and the Create Task activity

If a workflow contains a Create Task activity that has executed on the current record, additional task activities in the workflow might not execute as expected.

This can happen when the same subflow containing a Create Task activity runs more than once in a parent flow. When the subflow reruns and attempts to execute the Create Task activity again, the system reopens the first task activity instead and does not create an additional task.

Note: An alternative to creating duplicate subflows that use the Create Task activity is to add a Run Script activity to the workflow that creates a task with a script.
The same create task activity runs twice in a workflow

In this configuration, the workflow does not run the same subflow containing a Create Task activity more than once. This allows the workflow to create additional tasks.
Running different subflows containing the Create Task activity

**View workflow activity descriptions**

Tooltips are available for workflow activities to help you understand how to use each activity.

1. To view an activity description in the workflow editor, point to the icon for the activity in the palette.
2. To modify activity descriptions, navigate to **Workflow > Administration > Activity Definitions** and edit the **Description** field.

**Note:** To view more information about an activity, double-click the activity on the canvas and then click the help icon in the title bar of the **Activity Properties** window.

**Elements in workflow activity definitions**

Each activity can specify a number of elements that control the behavior of the activity or are controlled by the activity.

Not all activities specify all possible elements. See **Workflow activities** for links to the activities provided by default. Each activity description includes a detailed explanation of the specific elements offered by that activity.
Workflow activity elements

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Results</td>
<td>The possible activity.results value. The activity result usually determines which condition the activity transitions through.</td>
</tr>
<tr>
<td>Scratchpad entries</td>
<td>Scratchpad variables the activity depends on to run, or variables the activity writes to the scratchpad.</td>
</tr>
<tr>
<td>Input variables</td>
<td>Values that control the behavior of the activity. Fields to set these values appear on the Activity Properties form when a new activity is added to a workflow. See Activity variables for more information.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Determines which transition the activity follows after completing. See Manage workflow activity conditions for more information.</td>
</tr>
<tr>
<td>States</td>
<td>Determines how the workflow handles the record being executed.</td>
</tr>
</tbody>
</table>

Add an activity to a workflow

Available activities are displayed in the Core, Packs, and Custom tabs in the Workflow Editor palette.

1. In the Workflow Editor, check out a workflow.
2. To add a workflow activity, drag it from the Core, Packs, or Custom tab to the canvas and drop it on a transition line in the workflow body.

The transition turns blue when it is connected to the new activity. The designer adds the activity to the flow at that point and displays the property form for the new activity.

If an activity is greyed out, approval engines are enabled for the table on which the workflow runs. To use the activity, turn approval engines off for the table.
Unavailable activities and approval engines

3. Create any additional conditions needed for the activity and ensure that *all exits are connected*.

4. Run the *workflow validation* tool prior to publishing to detect missing or disconnected transitions that can cause a workflow to hang.

**Note:** All *activity descriptions* have a *Table* value. If this value is *Global*, the activity is available for use with any workflow regardless of the table selected in the workflow properties. Activities that identify a specific table appear in the palette only if the table configured for the workflow matches or extends the table identified in the activity.
Duplicate a workflow activity

You can duplicate an activity used in a workflow, including all the configured properties.

1. Right-click the activity and select **Copy Activity** from the context menu.
   The system automatically duplicates the activity, but does not create transitions.
2. Double-click the copy and configure the properties appropriately.
3. Drag the activity to a location in the workflow.
4. Add **transitions**.
Manage transitions between workflow activities

Transitions define the processing path of the workflow, depending on conditions defined in each activity.

All conditions in an activity must have a transition and all transitions must have a connection to another activity or to the End activity.

**Note:**

Run the workflow validation tool prior to publishing to detect missing or disconnected transitions that could cause a workflow to hang.

1. Add transitions to the workflow using either of these methods:
   - Drag and drop an activity directly onto a transition line to connect it to the adjacent activities. The transition line turns blue when the connection is made. The system updates the transitions automatically to reflect the new sequence.
- Drag the activity to an open area in the canvas and create the transitions manually. Click the yellow square on the right side of the activity condition and drag a connector to the next task.
2. You can draw multiple transitions from the same activity condition if the activity executes concurrently.

3. To remove a transition, click to highlight it, and then press **Delete**.

**Custom activity transitions**

Controls on the **Approval - User** activity enable an administrator to add additional workflow transitions to the activity other than the default transitions of **Approved** or **Rejected**.

Transitions defined using this method do not become a permanent feature of the **Approval - User** activity. After a new transition is configured, that transition must be applied manually to subsequent instances of the activity, where desired.

**Manage workflow activity conditions**

Activities contain default conditions that determine which transitions are followed.

For example, the **Approval - User** activity has two conditions, **Approved** and **Rejected**.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
You can use a JavaScript condition check to create custom conditions on Core workflow activities. (Custom activities do not support this feature.)

1. Right-click the activity and select Add Condition from the context menu.
2. In the New Workflow Condition dialog box, fill in the fields as appropriate (see table).

New Workflow Conditions form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The label that is displayed on the workflow.</td>
</tr>
<tr>
<td>Activity</td>
<td>Name of the activity for which this condition is submitted. This value is populated automatically by the system.</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of this condition.</td>
</tr>
<tr>
<td>Condition</td>
<td>A JavaScript condition check. The following variables are available:</td>
</tr>
<tr>
<td></td>
<td>• current: Current record that the workflow is running against.</td>
</tr>
<tr>
<td></td>
<td>• activity.result: Result value set by the activity upon completion.</td>
</tr>
<tr>
<td></td>
<td>• activity: Workflow Executing Activity (wf_executing) record. Used for advanced condition checks.</td>
</tr>
<tr>
<td></td>
<td>• activity.vars: Variables associated with the Workflow Executing Activity record. Used for advanced condition checks.</td>
</tr>
<tr>
<td>Skip during generate</td>
<td>If selected, the Generate activity does not follow this transition to generate approvals or tasks.</td>
</tr>
</tbody>
</table>

3. Click Submit.
4. To change the order in which conditions appear on the workflow activity, right-click the activity and select Reorder Conditions.

A dialog box appears, with a list of the available conditions.
List of conditions in the current activity

5. Drag the conditions to a new position in the list.
6. Click OK.

Activity result value

The result value specified by an activity controls the condition through which the activity transitions.

Use the result value as part of the Condition field in the activity. For example, if the Condition field of an Approval - User activity contains 

```
activity.result == 'rejected'
```

the activity transitions through that condition when a rejection is received from the approver. Result values are set in the Script field of the activity definition.

Edit the workflow activity properties form

Customize which workflow variables appear on an activity properties form and how the variables are arranged on the form.

1. Navigate to Workflow > Administration > Activity Definitions.
2. Scroll to the activity that you want to work with and click the activity name.
3. On the Workflow Activity Definition form, click the Edit Variables Layout related link.
4. On the Form Design page for the Activity Properties form, add and remove activity variables.

The activity variables appear as separate items that you can rearrange on the form.

For more details on using the form design interface, see Using the form designer.
Using workflow approval activities and rolling back workflows

When you work with approvals, you need to understand how approval activities interact with approval engines, how to correct a skipped approval workflow activity, and how rollbacks work.

Approval workflow activities and approval engines

Approvals can be managed by approval activities or approval engines, but not both. Approval activities can be used if approval engines are not turned on for the table associated with the workflow.

Approvals can be managed by approval activities or approval engines, but not both. Trying to use both can cause a range of issues. Approval activities are not available (greyed out) in the palette if approval engines are used on the specified table. If you hover over a greyed out approval activity in the palette, a comment with more information is provided. For more information about approvals and approval engines, see Approvals.

Unavailable approval activities

To turn approval engines off for the table, navigate to the System Properties > Approval Engines and change the setting for the table to Turn engines off.
## Turn off approval engines

## Correct a skipped workflow approval activity

While a workflow is in an active context, an approval activity can skip to the next activity.
An approval activity might skip for the following reasons:

- The approval user or group is missing or invalid (for example, sys_id).
- The approval user or group became inactive after the approval record was created.
- The activity is a dot-walked field, such as current.opened_by.department.manager, and it has a missing or invalid approval user or group.
- The business rule on the table that is associated with the workflow is invalid.

To correct a missed approval activity:

1. Navigate to Workflow > Live Workflows > All Contexts.
2. Click the date and time in the Started column for the workflow that is incorrectly processing approval activities.
3. In Related Links, click Show Workflow.
4. Review the portion of the workflow that executed, and then do one or more of the following:
   - Verify that after approval, the workflow progressed to the next activity. If a workflow failed to progress, check the business rules. For more information, see Debugging business rules.
   - Point to each processed approval activity to find activities where the State is Finished and Result is Skipped.
5. Navigate to Workflow > Workflow Editor and open the workflow.
6. Double-click the skipped approval activity.
7. Click Users or Groups.
8. Assign an active user or group for the approval activity. For more information, see Workflow error handling.

Rollback To activity

When conditions in a workflow trigger a Rollback To activity, the workflow moves processing backward to a specified activity in the workflow and resets certain activities that have already executed back to their original state. This is useful when handling an unexpected failure or as part of a programmed logical flow.

When an activity is reset during a workflow rollback, the following happens:

- Approvals are reset to Not Requested.
- Tasks are reset to either Open or Pending. A rollback workflow path cannot create new tasks.

Activities that perform external system operations, such as deleting a file or sending an email, are not rolled back. Only approval and task activity states are reset.

A workflow can contain a single rollback, multiple rollbacks, or nested rollbacks in more complex workflows. The Rollback To activity resets activities based on the actual workflow sequence (transition line attachments) of activities between itself and the transitioned to activity, rather than using the execution order to determine where processing should restart.

Rollback To behavior

The Rollback To activity transitions directly to the activity specified by the transition line arrow.

Use the Rollback To activity for all workflows that use multiple or nested rollbacks. Rollback To resets the targeted task (the direct transition) to Open. All tasks that have executed between the Rollback To activity and the targeted task (rolled back task) are set to Pending.

(0) Begin
(1) Log Message
(2) Task 1
(3) Task 3
(4) Task 2
(5) Timer
(6) Approval 1
(7) Roll back to first task
(8) Task 1
(9) Task 2
(10) Approval 1
(11) Log approval
(12) Join
(14) Send email
(15) End
The state of (3) Task 3 does not change, since this activity does not directly transition from the rollback target activity. To see what activities were rolled back, select the Workflow Transition History related list and look at the Rolled back column.

The Rollback To activity (7) updates the following activities:

(8) Task 1: reset to Open
(9) Task 2: reset to Pending
(10) Approval 1: reset to Not Yet Requested
Rollback To workflow transition

Using variables in Notify workflow activities

Certain Notify workflow activities support variable substitution for reading text to callers.

Certain Notify workflow activities allow you to use variables, such as those from the workflow scratchpad, to determine the activity behavior. Each activity supports a maximum of 20 variables. The following activities allow variable substitution:

<table>
<thead>
<tr>
<th>Activity</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Say</td>
<td>Supports variable substitution in the Text field only.</td>
</tr>
<tr>
<td>Input</td>
<td>Supports variable substitution in the Text field only.</td>
</tr>
<tr>
<td>Play</td>
<td>Supports variable substitution in the URL field only.</td>
</tr>
</tbody>
</table>
### Scratchpad variables

You can call variables from the workflow scratchpad or the activity scratchpad using the syntax `${variable_name}`. You do not need to include either `workflow.scratchpad` or `activity.scratchpad` before the variable name. For example, to use the variable `activity.scratchpad.langCode = 'en-US'`, call `${langCode}` within the activity. If the scratchpad does not contain the specified variable, the variable evaluates to an empty value.

You can get values from objects on the scratchpad using the format `${object.value}`. For example, you can get the name of a user object, such as `workflow.scratchpad.user = {name: 'john.smith'}` by calling `${user.name}`.

### The digit variable

The **Input** activity exposes the `${digit}` variable. Use this variable in each condition presented by the activity. The number read to the user is determined automatically by each condition. The caller can press that number to cause the activity to transition through that condition.

### Use multiple timer activities in one workflow

Workflow timer activities store data independently of each other in an activity-specific scratchpad.

Previously, all timer activities in a workflow accessed a single, shared scratchpad, which could lead to conflicts when adding multiple timer activities to one workflow.

Timer scratchpads entries hold these values:
- `workflow.scratchpad.endTime`
- `workflow.scratchpad.realStartTime`
- `workflow.scratchpad.retroactiveSecsLeft`

### Publish a custom workflow activity

When a user creates a custom activity and saves or submits it, that activity appears in the Custom and Packs tabs of the designer palette, but is only visible to the user who created it.

When configuration is complete, the user clicks **Publish**, which makes the activity accessible to other users on the instance with the workflow_admin or activity_creator role. Published activities are available for upload to the ServiceNow Store, can be added to workflows, and can be edited by any user with the proper roles.

To edit a published activity, click **Checkout**. When an activity is checked out by a user, only that user can modify it. The fields of a checked out activity are read-only for all other users. When the checked out activity has been modified successfully, the user publishes it again. The system adds a new version of this activity to the Custom tab in the workflow editor palette.

---

**Note:** Activities you create and publish are only visible in the Packs tab if they were created in the current application scope.
Locked versions

Problems can arise if an activity version is checked out by a user and not checked back in, for example, when the user is sick or leaves the company. An activity in this state cannot be checked out for update.

A user with the admin role can return a locked activity to a published state. The administrator opens the locked activity from the Custom tab of the workflow editor, selects the checked-out version, and selects Force Checkout, and then Publish.

Workflow activity pinning

Workflow administrators can pin a custom activity to prevent the system from automatically updating that activity when a new version is downloaded from the ServiceNow Store.

You can pin or unpin individual activities or set pinning within workflow properties that controls the versions used for all the activities in that workflow. This can result in two workflows using different versions of the same activity.

Note: Activity pinning and unpinning applies to the custom activities downloaded from the ServiceNow Store only, and does not apply to newly published activity definitions made locally on your instance. To make use of these locally updated custom activities, you must check out your workflow and manually add the activities.
