Now Platform Capabilities

The Now Platform® delivers a system of action for the enterprise. Using a single data model, it makes it easy to create contextual workflows and automate business processes.

Connect

ServiceNow® Connect is a real-time messaging platform that connects you to your coworkers, bypassing email and static documents.

Connect integrates with other features within the system, such as Visual Task Boards, Human Resources Management, and Customer Service Management. The Connect interface overlays the standard interface, which allows users to participate in conversations while they work.

Connect contains the following features:

- Connect Chat: Enables users to chat with individuals and groups, quickly share files, and collaborate on any record by connecting with the right people instantly.
- Connect Support: Enables support agents to provide real-time assistance to end users, using queues. Requires the Connect Support plugin.

UI16 or UI15 is required to use Connect.

Note:
- Connect does not replace legacy chat but offers some of the same functionality. Do not use these features concurrently.

Explore

- Upgrade to Kingston
- Connect interface
- Connect Chat
- Connect Support

Set up

- Activate Connect
- Activate Connect Support
- Supported browsers for Connect

Administer

- Properties for Connect
- Connect actions
- Configure the fields on a record card in Connect
- Properties for Connect Support

Use

- Start a direct or group conversation
- Follow a record in Connect
- Create an incident from a Connect Support conversation

Develop

- Developer training
- Developer documentation

Troubleshoot and get help

- Ask or answer questions in the Connect forum
- Search the HI Knowledge Base for known error articles
- Contact ServiceNow Technical Support

Supported browsers for Connect

The system supports Connect Chat and Connect Support on most modern browsers.

- The latest public release of Firefox or Firefox ESR
- The latest public release of Chrome
- Safari version 9.1 and later
• Internet Explorer version 11
  • Edge mode is supported.
  • Compatibility mode is not supported.
  • Setting Security Mode to High (via the Internet Options > Security tab) is not supported.
  • Internet Explorer 11 is susceptible to memory leaks, which may impact performance, especially in Windows 7.

Activate Connect

Connect is active by default on new instances. For upgraded instances, you can activate the Connect plugin (com.glide.connect) if you have the admin role.

Role required: admin

If you used Collaboration in the Fuji release, the Connect plugin is activated automatically.

1. Navigate to System Definition > Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   If the plugin depends on other plugins, these plugins are listed along with their activation status.
   If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. Optional: If available, select the Load demo data check box.
   Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
   You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.
5. Click Activate.

Properties installed with Connect

Connect adds the following system properties.

Note: To open the System Property (sys_properties) table, enter sys_properties.list in the navigation filter.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| collaboration.email_interval | Sets the number of minutes the system waits before sending a Connect notification email to an inactive user.  
• **Type**: integer  
• **Default value**: 3  
• **Location**: Collaborate > Administration > Properties  
• **Learn more**: Configure the email notification interval                                                                                                                                                                                                                                                                 |
| collaboration.frameset       | Determines whether the Connect overlay is visible (enabled). This property also impacts Connect Support.  
• **Type**: true | false  
• **Default value**: true  
• **Location**: Collaborate > Administration > Properties  
• **Learn more**: Disable the Connect overlay                                                                                                                                                                                                                                                                 |
| collaboration.polling_interval | Sets the number of seconds the system waits between polling for new Connect messages. This property also impacts Connect Support.  
• **Type**: integer  
• **Default value**: 10  
• **Location**: System Property (sys_properties) table                                                                                                                                                                                                                                                                 |
| connect.notification.audio_alert | Specifies the audio file to play to notify users of new messages, support conversation transfers, and @mentions in Connect. This property's value must point to the Name field of a record in the Audio File (db_audio) table. This property also impacts Connect Support.  
• **Type**: string  
• **Default value**: connect_alert.mp3  
• **Location**: Collaborate > Administration > Properties  
• **Learn more**: Customize the Connect audio notification sound                                                                                                                                                                                                                                                                 |
| connect.retrieve_external_link_content | Enables Connect to render URLs for external sites as links. When this property is disabled, URLs that point anywhere outside the instance appear as plain text. This property also impacts Connect Support.  
• **Type**: true | false  
• **Default value**: true  
• **Location**: Collaborate > Administration > Properties                                                                                                                                                                                                                                                                 |

Activate Connect Support

You can activate the Connect Support plugin (com.glide.connect.support) if you have the admin role. This plugin includes demo data.

Role required: Admin

If you are currently using the legacy chat feature to provide help desk support, close any open help desk chats before activating Connect Support. Legacy chat and Connect Support should not be used concurrently. When you activate Connect Support, the system automatically sets the state of all Chat Queue Entry (chat_queue_entry) records to Closed Complete. This ends any open help desk chats. For more information, see Migrate from legacy chat to Connect Support.

1. Navigate to System Definition > Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
   - If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. Optional: If available, select the Load demo data check box.
   - Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
   - You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.
5. Click Activate.

Properties installed with Connect Support

Connect Support adds the following system properties.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>connect.support.conversation_limit</td>
<td>Determines how many support conversations an individual agent can have at one time. When the value is set to -1, an agent can participate in an unlimited number of conversations.</td>
</tr>
<tr>
<td></td>
<td>Type: integer</td>
</tr>
<tr>
<td></td>
<td>Default value: -1</td>

### Name

glide.connect.support.reflect_system_messages

### Description

Controls whether Connect Support reflects system messages in records created from a support chat, for example, transfer notices, automated queue messages, etc.

- **Type**: true | false
- **Default value**: false
- **Location**: System Property (sys_properties) table

---

### Additional plugins for Connect Support

Additional plugins are available for Connect Support. These plugins integrate Connect Support with other features and provide capabilities to track performance metrics.

You must have the admin role to activate these additional plugins. For details, see [Activate a plugin](#).

#### Additional plugins for Connect Support

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connect Support Manager's Dashboard</td>
<td>Provides a homepage for Connect Support, and all required configuration records. Though the plugin name contains the term dashboard, the plugin does not provide functionality related to Performance Analytics dashboards. Homepages are similar to dashboards, but do not require Performance Analytics roles to view.</td>
</tr>
<tr>
<td>Human Resources Application: HR Connect</td>
<td>Sets up a human resources (HR) chat queue and makes it available on the HR Service Portal.</td>
</tr>
</tbody>
</table>

**Note:** The Connect Support Manager's Dashboard plugin does not activate Connect Support automatically. You must activate Connect Support to collect data for the homepage.

**Note:** This plugin does not appear in the System Definition>Plugins list. Contact ServiceNow personnel to activate it.

If not already active, the Human Resources Application: HR Connect plugin activates these related plugins:

- **Human Resources Application: Core** (com.snc.hr.core): Provides basic HR features.
### Performance Analytics - Content Pack - Service Desk Chat
(com.snc.pa.chat)

Provides the **Service Desk Chat Monitor** dashboard, which analyzes key Connect Support metrics and indicators.

The Performance Analytics - Content Pack - Service Desk Chat plugin activates these related plugins if they are not already active:

- **Connect Support Manager's Dashboard**
  (com.glide.connect.managers_dashboard): See description in this table.

### Performance Analytics - Context Sensitive Analytics for Chat
(com.snc.pa.chat.context_sensitive_analytics)

Provides in-form analytics for Connect Support. These analytics are available as a related link on the Chat Queue Entry (chat_queue_entry) form, and also as the **Context Sensitive Analytics - Chat** dashboard.

The Performance Analytics - Context Sensitive Analytics for Chat plugin activates these related plugins if they are not already active:

- **Performance Analytics - Content Pack - Service Desk Chat**
  (com.snc.pa.chat): See description in this table.

## Connect Interface

Users can work in a compact view of Connect, which overlays the standard user interface, or in a full-screen workspace.

Connect Chat and Connect Support share the same interface, so support agents can keep track of all their conversations in one place.

## Connect Overlay

The Connect overlay appears over the standard user interface. It consists of the Connect sidebar, which is the primary interface for Connect Chat and Connect Support, and any Connect mini windows that are open. Each mini window contains a header, a conversation area, and a message field.
Note: An administrator can disable the Connect overlay so users can only use the Connect workspace, a full-screen interface with additional Connect tools.

Connect sidebar

The Connect sidebar is the primary interface for Connect Chat and Connect Support. It lists your conversations and provides access to create conversations.

The sidebar is collapsed by default. Click the toggle Connect sidebar icon (   ) in the banner frame to expand or collapse the sidebar, which appears on the right edge of the interface.

Connect Chat

The chat view of the sidebar is available to all users. If Connect Support is enabled, users must click the chat tab of the sidebar, which is represented by a speech bubble icon. If Connect Support is not enabled, there are no tabs in the sidebar and the chat view displays by default.

The chat view of the sidebar lists all your current Connect Chat conversations. It also contains a filter tool and a button to create conversations.
Chat view of the Connect sidebar

If you have unread messages in a conversation, a number appears by the conversation in the sidebar. Point to a conversation and click the x icon to remove the conversation from the sidebar.

**Connect Support**

The support view of the sidebar is available when Connect Support is activated. The support view is visible only to users who are agents for at least one support queue. Users must click the support tab of the sidebar, which is represented by a headset icon.

The support view displays **Queues** to which you belong. It also displays your open support conversations under **Cases**.
If you have unread messages in a conversation, a number appears by the conversation in the sidebar.

Support view of the Connect sidebar

**Connect mini windows**

When you open a Connect Chat or Connect Support conversation in the Connect overlay, it opens in a Connect mini window. Each mini window contains a header, a conversation area, and a message field.

Several icons appear in the mini window header and by the message field.

*i*  **Note:** The icons you see for each conversation depend on the conversation type and other conditions.
## Chat mini window icons

<table>
<thead>
<tr>
<th>Icon</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>Add user</td>
<td>Add a user to the conversation. This icon is visible for group and record conversations only. Administrators can enable this icon for Connect Support conversations.</td>
</tr>
<tr>
<td>![View document icon]</td>
<td>View document</td>
<td>View the record associated with the conversation. This icon is visible for record and support conversations only.</td>
</tr>
<tr>
<td>![New window icon]</td>
<td>New window</td>
<td>Open the conversation in the Connect workspace, a full-screen window with additional Connect tools.</td>
</tr>
<tr>
<td>![Collapse/Expand conversation icon]</td>
<td>Collapse/Expand conversation</td>
<td>Hide or show the conversation. Alternatively, click anywhere in the mini window header to the left of the icons.</td>
</tr>
<tr>
<td>![Close window icon]</td>
<td>Close window</td>
<td>Close the mini window. The conversation remains in the Connect sidebar and the history is preserved when you reopen the conversation. You can also close a mini window by pressing the Escape key.</td>
</tr>
<tr>
<td>![Connect actions icon]</td>
<td>Connect actions</td>
<td>Open the Connect actions menu, which contains options like Transfer and Create Incident. This icon is visible only when Connect actions are available for the conversation. By default, this icon is visible for support conversations only. Administrators can add options to this menu by creating Connect actions.</td>
</tr>
<tr>
<td>![Message type icon]</td>
<td>Message type</td>
<td>Choose whether messages are added to the associated record as comments or work notes. This icon is visible only for record and support conversations.</td>
</tr>
<tr>
<td>![Attach file icon]</td>
<td>Attach file</td>
<td>Attach and send a file. Select one or more files and click Open. You can also add an attachment by dragging and dropping it directly in the conversation.</td>
</tr>
</tbody>
</table>
Connect workspace

The Connect workspace is a full-screen view of all your Connect Chat and Connect Support conversations in one place. It contains the conversation pane, which displays the conversation header and an expanded version of the mini window, and the conversation tools area.

To open the Connect workspace, navigate to Collaborate > Connect Chat or click the new window icon ( ) in a Connect mini window. If you do not have any recent conversations, a screen appears with helpful information about Connect.

The Connect workspace is composed of the following elements.

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sidebar</td>
<td>Provides access to conversations. The Connect sidebar behaves the same way in the workspace as it does in the Connect overlay. The only difference is that the sidebar appears on the left edge of the Connect workspace. For more information about using the sidebar, see Connect sidebar.</td>
</tr>
<tr>
<td>Conversation pane</td>
<td>Displays the currently selected conversation.</td>
</tr>
<tr>
<td>Conversation tools</td>
<td>Provides quick access to key information, conversation members, attachments, and notification preferences for the currently selected conversation. Some of the conversation tools vary depending on the type of conversation.</td>
</tr>
</tbody>
</table>
Connect workspace
Conversation pane
The conversation pane of the Connect workspace displays the conversation header and an expanded version of the mini window.

The header displays basic conversation details like the avatar and name. You can edit these details for group or record conversations.

Below the header, messages appear in chronological order. You can enter messages in the text entry field at the bottom of the window.

Connect conversation tools
The conversation tools area in the Connect workspace contains several tabs, each represented by an icon.

Click an icon to open the tab. Click the same icon again to hide the tab. The tabs you see for each conversation depend on the conversation type and other conditions.

<table>
<thead>
<tr>
<th>Tab icon</th>
<th>Tab name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>![i]</td>
<td>Info</td>
<td>Contains the following sections, each of which appears only if it contains information.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>Record</strong>: Lists details about the record the current conversation follows, such as record number, state, assignee, and short description. The fields displayed in this section vary by the type of record. This section is available only for record conversations.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>Related Records</strong>: Lists Visual Task Boards and task records that have been referenced in the conversation, such as incidents, problems, or changes. When you send a record number as a message or drag a record in a conversation, it appears as a link. The list displays the short description for each task. Click a task to open the record in a new browser tab. Only conversation members who have rights to view the tasks can access them.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>Links</strong>: Lists URLs that have been referenced in the conversation. Click a link to open the destination page in a new browser tab. This tab is not available for support conversations.</td>
</tr>
<tr>
<td>![folder]</td>
<td>Record</td>
<td>Displays a compact form view of a record created from the current conversation, such as an incident. If more than one record has been created from the conversation, there is a separate record tab for each one. These tabs are available only for support conversations.</td>
</tr>
<tr>
<td>![knowledge]</td>
<td>Knowledge Base</td>
<td>Displays a compact view of the knowledge homepage. For more information, see Share knowledge in a Connect Support conversation.</td>
</tr>
<tr>
<td>![person]</td>
<td>Members</td>
<td>Lists all members of the current conversation. You can add or remove conversation members for group and record conversations.</td>
</tr>
<tr>
<td>![attachment]</td>
<td>Attachments</td>
<td>Lists all attachments in the conversation. Click an attachment to open it. Click Add Attachment to upload an attachment.</td>
</tr>
<tr>
<td>![bell]</td>
<td>Notification preferences</td>
<td>Contains settings to control which notifications you receive for the current conversation. For more information, see Edit which notifications you receive for a conversation.</td>
</tr>
</tbody>
</table>

Enable or disable Connect notifications globally

You can edit your Connect notification settings globally to enable or disable mobile, desktop, email, or audio notifications for all your Connect Chat and Connect Support conversations.

Role required: none

By default, Connect mobile, email, and audio notifications are enabled globally. You must enable desktop notifications.

An administrator can customize the sound used for audio notifications.

Note: You receive mobile notifications only if you have installed the ServiceNow mobile app.

1. In the banner frame, click the gear icon (⚙️) to open the system settings.
2. In the system settings window, click the Notifications tab.
3. In Notifications by Category, navigate to Connect.
4. Enable or disable Connect mobile, desktop, email, or audio notifications.
5. Optional: Configure the following system notifications. For more information on how to configure system notifications, see Apply notification conditions.

<table>
<thead>
<tr>
<th>Notification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activity Stream @Mention Email</td>
<td>Sends an email alert to a user anytime they get @mentioned in an activity stream</td>
</tr>
<tr>
<td>Collaboration Offline Group Message(s)</td>
<td>Sends email to offline users who are members of a group conversation after a certain number of minutes determined by the collaboration.email_interval property to limit spam.</td>
</tr>
<tr>
<td></td>
<td>Note: It takes 90 seconds after a user logs out for the system to register that the user is offline. If a message is sent to the user within 90 seconds of them logging out, then the user does not receive the notification.</td>
</tr>
<tr>
<td>Collaboration Offline Message Bundle</td>
<td>Sends email to offline users after a certain number of minutes determined by the collaboration.email_interval property to limit spam.</td>
</tr>
<tr>
<td></td>
<td>Note: It takes 90 seconds after a user logs out for the system to register that the user is offline. If a message is sent to the user within 90 seconds of them logging out, then the user does not receive the notification.</td>
</tr>
<tr>
<td>ConnectMessagePushNotification</td>
<td>Uses a push notification to inform users when there are new messages in a conversation</td>
</tr>
<tr>
<td>Notification</td>
<td>Description</td>

<tr>
<td>--------------</td>
<td>-------------</td>
</tr>
<tr>
<td>ConnectNotificationPushNotification</td>
<td>Uses a push notification to inform a user when they have been @Mentioned in a record</td>
</tr>
</tbody>
</table>

Edit which notifications you receive for a specific conversation.

**Connect notification browser support**

The following browsers support Connect chat notifications.

<table>
<thead>
<tr>
<th>Connect chat browser support</th>
</tr>
</thead>
<tbody>
<tr>
<td>Browser</td>
</tr>
<tr>
<td>Chrome</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>Mozilla Firefox (starting with version 44)</td>
</tr>
<tr>
<td>Safari (starting with OS X Mavericks)</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>Microsoft Edge</td>
</tr>
</tbody>
</table>

Note: Internet Explorer does not support Connect notifications out of box.

**Edit which notifications you receive for a conversation**

You can control which types of Connect notifications you receive for each conversation and when you receive them.

Role required: none

Connect can send mobile, desktop, email, and audio notifications to inform you of messages and other activity, when you are not actively viewing Connect. You can edit your notification preferences in each conversation to control which notifications you receive for the conversation and under what circumstances. For example, if you are a member of a large group conversation, you might want to receive mobile, desktop, and email notifications for all activity, and audio
notifications only when someone *mentions* you. You might also want to disable a certain type of notification entirely for a conversation.

By default, you receive mobile, email, and audio notifications for all activity in every conversation you belong to. You must enable desktop notifications manually. Not all browsers allow desktop notifications. For more information, see *Enable or disable Connect notifications globally*.

An administrator can *customize the sound* used for audio notifications.

---

**Note:** You receive mobile notifications only if you have installed the ServiceNow mobile app.

1. Open a conversation in the Connect workspace.
2. In the conversation tools to the right of the conversation, click the notification settings tab (הודעה).  
3. Edit the following settings according to your preferences.

---

**Note:** If a notification type is *disabled globally*, a link to enable that type appears. You must click the link before you can edit conversation-specific notification settings.

<table>
<thead>
<tr>
<th>Mobile Notification Settings</th>

</tr>
</tbody>
</table>
| - For all activity  
- Only when @ mentioned (this option is not available for direct conversations)  
- Never |
| System Message Notifications |
| Enable or disable system message notifications, which are automatically generated by events like conversation membership changes and Visual Task Board updates. This option is not available for direct conversations. |

### Upload a profile picture

You can upload a profile picture in your Live Feed profile to use as an avatar in Connect Chat and Connect Support conversations.

**Role required:** none

Users who do not have profile pictures are represented by an avatar with their initials. Administrators can upload a profile picture in a user record which displays if there is no Live Feed photo.

1. Navigate to **Collaborate > Live Feed.**
2. Click the tile with your picture or initials and title.

3. Use one of the following actions to add your photo.
   - Locate the photo file you want to use and drag it over the existing photo.
   - Point to the existing picture (or tap the photo in the smartphone or tablet interface) to display the **Upload a picture** link. Click the link, navigate to the location of the photo you want to use, and click **Open**.
Drag a file into a Connect conversation

Drag and drop functionality in Connect Chat and Connect Support provides an easy way to share external attachments and links or items from within your instance.

Role required: none

You can drag several things from within an instance, including items from the application navigator, records or breadcrumbs from lists, and Visual Task Boards from the My Task Boards page.

- Drag an item in a Connect mini window.
- To drag a record from a list, drag the reference icon, the record number, or a reference column value.
- Connect accepts the same file extensions as the platform. For more information, see Add and manage attachments.

Share a Visual Task Board in a Connect conversation

You can share a Visual Task Board in a Connect Chat or Connect Support conversation.

Role required: none

2. Drag a task board to a Connect mini window.
   A link to the task board appears in the conversation. The task board is also listed in the conversation tools, which are visible in the Connect workspace. Only conversation members who are members of the board can access it. If you share a task board in a record conversation, it appears as a URL in the record activity stream.

Mention a user in a Connect conversation

You can get someone's attention in a group conversation by mentioning them.

Role required: none
Users can set their notification preferences so they receive notifications only when they are mentioned. Mentioning a user creates a shortcut to view their basic information and send them a direct message.

1. Open a Connect group conversation.
2. In the message field, type the @ character.
   A suggestion menu appears with the names of the conversation members.
3. Select the person you want to mention and send the message.

**Connect administration**

Administrators can configure various performance settings and features that impact both Connect Chat and Connect Support.

**Note:** There are also administrative options specifically for Connect Chat or Connect Support. For more information, see Connect Chat administration and Connect Support administration.

**Domain separation in Connect Support and Connect Chat**

This an overview of how domain separation works in Connect Support and Connect Chat, and the expected interactions across domains to support multiple tenants. Domain separation allows
you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

Support: Level 1

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

Connect Support adheres to the standard domain separation patterns within ServiceNow, with some exceptions. Most notably, Connect Support allows for users in a parent or top-level domain to interact with chat_queue_entry records generated from child domains. Users can then pose questions in specifically-labeled chat_queues directly to the primary administrators of the instance.

Connect Chat supports data separation within domain separated instances. Delegated administration—the ability to override configuration settings and logic in domains—is not supported.

How domain separation works in Connect Support

Connect Support supports data separation within domain-separated instances. Delegated administration—the ability to override configuration settings and logic in domains—is not supported.

Configuration

Connect Support is configurable by system administrators only. Configuration settings apply to all domains. Overrides for configuration details and process logic in domains are not supported.

After domain separation has been enabled, the following Connect Support-related tables are not domain-separated in the base system:

- chat_queue
- connect_action

Records created from users in a child domain remain in the child domain to both the agent and the user initiating the chat. Any of the following tables represent records that support the conversation.

Records from conversations

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chat_queue_entry</td>
<td>Holds the initial question from the end user, and other metrics to determine overall support efficiency, such as wait_time.</td>
</tr>
<tr>
<td>live_group_profile</td>
<td>Represents the conversation itself</td>
</tr>
<tr>
<td>live_group_member</td>
<td>Each individual member of the support conversation</td>
</tr>
<tr>
<td>Incident and other task-based records</td>
<td>Any record generated from connect_actions.</td>
</tr>
</tbody>
</table>
How domain separation works in Connect Chat

Configuration

Connect Chat is configurable by system administrators only. Configuration settings apply to all domains. Overrides for configuration details and process logic in domains are not supported.

Actions may be made available to specific domains based on condition filters set by system administrators.

Data Management

Connect Chat messages are not assigned to a domain. Rather, visibility is restricted to conversation participants.

Usage scenarios

Chat with users in the same domain (Supported)
- Domain visibility allows users to see other users in the same domain.
- Examples:
  - Service Provider user may chat with another Service Provider user
  - ACME user may chat with another ACME user

Parent domain user initiates chat with child domain user (Supported)
- Domain visibility allows users to see users in child domains.
- Examples:
  - Service Provider user may initiate a chat with a Service Provider sub-contractor user
  - ACME user may initiate a chat with ACME EMEA user

Domain user initiates chat with user in a domain where visibility has been granted (Supported)
- Domain visibility allows the user initiating a chat to see users in the target domain.
- Examples:
- Service Provider sub-contractor user may initiate a chat with an Initech user, given domain visibility
- Service Provider users may initiate a chat with any domain user, given the contains relationship with the TOP domain

Sub-domain user initiates chat with Parent domain user (Not supported)
- Domain visibility does not allow users in child domains to see users in parent domains. This means they are unable to initiate a chat session.

Configuration
Administrators may configure multiple Chat Queues. Support Queues are not assigned to a domain. Assignment groups may exist in any domain.

Any user with the appropriate link can enter a queue, regardless of the user’s domain. Exposure of links to specific queues through the default user interface may be controlled using domain-specific overrides. Exposure of links to specific queues through the Service Portal may be controlled using conditions or custom coding logic.

The Reporting Dashboard contains statistics related to all queues and all agents. Statistics are not filtered according to domain. Therefore, it is not appropriate to expose this page to users within child domains.

Data management
Connect Support Queues are global. No domain field exists on this table and it is not suitable for domain separation.

Connect Support messages are assigned to a domain based on the domain of the user entering the queue. Members of the Assignment group for the queue must have domain visibility to the user entering the queue to participate in chat sessions.

Records generated from chat sessions display based on the agent’s home domain. However, once the record is saved with a Company value, business rules assign the newly created record to the corresponding domain.

Usage scenarios

In the illustration above:
- The ACME support queue is configured to be available from 8-5 on weekdays. The ACME Support group in the ACME domain provides first-level support. If more advanced support is required, users are escalated to the Service Provider’s Service Desk queue.
- The Service Desk queue is configured to be available 24x7 and is staffed by the Service Desk Group in the Service Provider domain. If more advanced support is required, users are escalated to the Tier 2 Support queue in the same domain.

Properties for Connect

The Connect Properties page provides several configuration options for Connect. These properties are available for Connect.

Users with the admin role can access these properties by navigating to Collaborate > Administration > Properties.

Note: Many of the properties also impact Connect Support.

### Properties for Connect

<table>
<thead>
<tr>

- **Location**: Collaborate > Administration > Properties  
- Learn more: Configure record conversations |
| Disable the legacy chat 'Create or Join Chat Room' link on the Incident form (Must have Chat plugin enabled to see link) glide.connect.enabled | Hides the Create or Join Chat Room related link, which appears on the incident form when legacy chat is enabled. Legacy chat and Connect Chat should not be used concurrently and this property should not be modified.  
- **Type**: true | false  
- **Default value**: true  
- **Location**: Collaborate > Administration > Properties |

---

**Configure the polling interval**

The polling interval determines how frequently the system polls for new Connect messages.  
Role required: admin  
The default interval is 10 seconds. You can change this value. The shorter the polling interval, the more frequently the system checks for new messages and the greater the impact on performance.

**Note**: This setting impacts Connect Chat and Connect Support.

1. Navigate to sys_properties.list.  
2. Locate the collaboration.polling_interval property.  
3. Set the Value to a different number of seconds.  
   Setting the polling interval to a value smaller than 2 is likely to tax the system too heavily, while a value greater than 10 is likely to result in a poor user experience.

**Disable the Connect overlay**

The Connect overlay is enabled by default and is integrated with the standard user interface. You can disable the Connect overlay.  
Role required: admin
To disable the Connect overlay and remove the toggle Connect sidebar icon from the banner frame, set the `collaboration.frameset` property to `false`.

1. Navigate to **Collaborate > Administration > Properties**.
2. Locate the property called **Enable Connect in the frameset (collaboration.frameset)** and clear the check box.
3. Click **Save**.

When the frameset is disabled, any Connect chats open in the Connect workspace. For more information on completely disabling Connect Chat, see [Disable Connect Chat](#).

### Customize the Connect audio notification sound

You can replace the default Connect audio notification sound with an audio file of your choice. **Upload the audio file** you want to use as the notification sound.

Role required: admin

The audio notification sound is used for all Connect conversation types, including Connect Support conversations.

1. Navigate to **System UI > Audio Files**.
2. Locate the audio file you want to use as the notification sound and copy the **Name** value.
3. Navigate to **Collaborate > Administration > Properties**.
4. Locate the property called **Audio file to play to notify users of new messages, support conversation transfers and @mentions in Connect (connect.notification.audio_alert)** and replace the default value with the name of the audio file.
5. Click **Save**.

End users receive audio notifications when sending and receiving support chats. Support agents only receive audio notifications for inbound chats when the chat window is not in focus.

### Administer Connect actions

You can create or modify Connect actions to provide custom functionality in Connect Chat or Connect Support conversations.

If you want to customize the icon for a Connect action, navigate to **Collaborate > Administration > Action Icons** to view the available icons and their class names. Note the class name of the icon you want to use.

Role required: admin

The Connect action menu appears by the message entry field when one or more Connect actions are available for a conversation, based on defined conditions. When a user selects a Connect action, the system runs the script defined for that action.

1. Navigate to **Collaborate > Administration > Actions**.
2. Click **New** or open an existing Connect action.
3. Complete the Connect Action form, as appropriate.
## Connect Action form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Condition</strong></td>
<td>JavaScript condition statement that must return true for the action to be available in a conversation. For example, to show the action in Connect Support conversations only, enter <code>conversation.type === &quot;support&quot;</code> or <code>conversation.table === 'chat_queue_entry'</code>. For information about the <code>conversation</code> object, see the API reference documentation.</td>
</tr>
<tr>
<td><strong>Hint</strong></td>
<td>This field is not used.</td>
</tr>
<tr>
<td><strong>Icon Class Name</strong></td>
<td>Class name of icon to use. To view all available icons and their class names, navigate to Collaborate &gt; Administration &gt; Action Icons.</td>
</tr>
<tr>
<td><strong>Order</strong></td>
<td>Order of the action relative to other items in the Connect action menu.</td>
</tr>
<tr>
<td><strong>Script</strong></td>
<td>Script to execute when the action is run. For example, to create a new incident based on the conversation, enter the following code:</td>
</tr>
</tbody>
</table>
|                | ```javascript
response.newRecord("incident",
    {
        short_description:
        conversation.document.short_description || ","
        ,
        caller_id:
        conversation.document.opened_by
    });
```                                                                                                                                                                                                                                                                                                                                 |
|                | For information about the `response` object, see the API reference documentation.                                                                                                                                                                                                                                                           |
| **Shortcut**   | Text that triggers the action when entered after the `/` character in a conversation.                                                                                                                                                                                                                                                     |
| **Title**      | Text that appears in the Connect action menu. The title for each Connect action should be unique.                                                                                                                                                                                                                                         |
Configure the fields on a record card in Connect

When a record is either linked to or create from a Connect conversation, the details of the record display as a card in the chat window.

The card view only applies to the full Connect page and the end user view of Connect Support conversations.

Role required: admin

1. Navigate to the form you want to configure fields for.
2. Right-click the header and select Configure > Form Layout.
3. Under the Form View section, select the Connect view.
You may need to create a Connect view for the form. For more information on creating a form view, see Create and delete views.

4. Select the fields to appear on the card by adding or removing the fields from the Selected column. You can also adjust the order they appear on the form by moving the fields up or down.

You cannot remove the Author or the Updated fields from the card regardless of whether they are on the view or not. The card always shows the Short Description field in the top even if it is in a different order in the list.

**Connect Chat**

Connect Chat is a real-time messaging tool that enables users to chat with individuals and groups, quickly share files, and collaborate on any record by connecting with the right people instantly.

Connect Chat animates communication around records, Visual Task Boards, topics of interest, or groups of people.

Features include:

- Direct conversations between two users.
- Group conversations between three or more users.
- Conversations linked to records. Comments and work notes appear in conversations in real time and users can update the record directly from the conversation.
- Drag-and-drop sharing of links, files, and records.

UI16 or UI15 is required to use Connect Chat.

This video demonstrates how to use Connect Chat.

This video demonstrates how to use Connect Support.

**Note:**

- Connect Chat does not replace legacy chat but offers some of the same functionality. The features should not be used concurrently.

**Connect Chat use**

All users have access to Connect Chat, a convenient way to stay updated on all the people and documents you work with in a familiar chat interface.

You can start using Connect Chat right away with virtually no setup. Connect Chat supports a few different types of conversations so you can use it as a social tool or a quick way to follow specific records.

**Start a direct or group conversation**

You can start a conversation with one or more users in Connect Chat.

Role required: none

A conversation between two users is called a direct conversation. A conversation between three or more users is called a group conversation.

1. In the chat view of the Connect sidebar, click the plus icon (⁺) by the filter.

   A Connect mini window appears.
2. In the To field, enter the name of the user you want to chat with. Suggestions appear as you type.

3. Optional: Enter additional names to create a group conversation. You can add or remove group conversation members later. You cannot add members to a direct conversation after you create it.

4. Press the Enter key to shift focus to the message field.

5. Send a message to create the conversation. The conversation is added to the Connect sidebar for quick access.

---

### Follow a record in Connect

You can follow a record in Connect Chat to track activity as it happens, in a familiar chat interface. When you follow a record, you become a member of a record conversation.

Role required: whichever role is required to access the record you want to follow in Connect

You must first activate the Connect (com.glide.connect) plugin to complete this task.

Any record conversation you create in Connect becomes a record feed in live feed, and vice versa. Unlike direct or group conversations, all messages in record conversations are comments or work notes.

**Note:** By default, record conversations are enabled for all tables that extend Task (task). Administrators can enable record conversations for additional tables or disable them if desired.

---

1. Navigate to a task record.

2. Do one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Follow the record</td>
<td>1. In the form header, click <strong>Follow</strong>. The system adds you as a member of the record conversation, but does not open the conversation. You can open the conversation from the Connect sidebar.</td>
</tr>
<tr>
<td>Follow the record and open a chat mini window</td>
<td>1. In the form header, click the down arrow in the <strong>Follow</strong> button. 2. Select <strong>Open Connect Mini</strong>. The system adds you as a member of the record conversation and opens it in a Connect mini window.</td>
</tr>
<tr>
<td>Follow the record and open the Connect workspace</td>
<td>1. In the form header, click the down arrow in the <strong>Follow</strong> button. 2. Select <strong>Open Connect Full</strong>. The system adds you as a member of the record conversation and opens it in the Connect workspace, the full-screen view.</td>
</tr>
</tbody>
</table>

The **Follow** button is relabeled **Following**.

3. Add comments or work notes to the record directly from Connect.
Any comments or work notes added to the record appear in the record conversation. Likewise, comments and work notes you add to the conversation appear on the record.

a) In the record conversation, by the text entry field, click the message type icon.

b) Select Comment or Work Note.

c) Enter a message.

By default, record conversation messages are added as work notes.

Note: If you add an attachment to a record conversation, it is attached to the underlying record as well.

Edit your notification settings for the record conversation.

Edit basic conversation details

In Connect Chat, you can customize the avatar, name, and description for a group or record conversation.

Role required: none

These details are not editable for direct conversations.

Note: The name and description for a record conversation default to the record name and short description. However, editing the name or description for a record conversation does not change anything on the underlying record.

1. Open the a group or record conversation in the Connect workspace.
2. Click anywhere in the conversation header to the left of the icons. A pop-up appears to edit conversation details.
3. Edit the conversation image, name, and description as needed.
4. Click Save.

Add or remove conversation members

In Connect Chat, any member of a group or record conversation can add or remove other conversation members. In a direct conversation with only two people, you cannot add members to the conversation after you create it.

Role required: none

1. Open a group or record conversation in the Connect workspace.
2. In the conversation tools to the right of the conversation pane, click the member list tab.
3. Do one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add a member</td>
<td>1. Click Add Member to Group.</td>
</tr>
<tr>
<td></td>
<td>2. Use the search field to find and select a user.</td>
</tr>
</tbody>
</table>

Create a Connect conversation from a Visual Task Board

Create a Connect Chat conversation from a Visual Task Board to collaborate with board members and keep track of activity as it happens.

Role required: none

When you create a conversation from a task board, all the board members become members of the conversation. The members are synchronized between the task board and the conversation. For example, if you remove a user from the conversation, the system automatically removes the user from the board as well.

2. Open a task board.
3. In the board header, click the connect with board members icon ( ).
   The system automatically opens a record conversation for the board. Each board member becomes a member of the conversation.

Connect Chat administration

Administrators can configure various performance settings and features of Connect Chat.

Note: There are also settings that apply to both Connect Chat and Connect Support. For more information, see Connect administration.

Configure the email notification interval

The email notification interval determines how long the system waits before sending a Connect Chat email notification to an inactive user.

Role required: admin

The default interval is 3 minutes. You can change this value.

1. Navigate to Collaborate > Administration > Properties.
2. Locate the property called Number of minutes to wait before collecting unread messages and sending an email to offline users. (collaboration.email_interval) and set the value to a different number of minutes.
3. Click Save.

When an offline user is sent a Connect message, the collaboration.new_offline_message event fires. The system waits the amount of time provided in the collaboration.email_interval property, then triggers the collaboration.notify_offline_user and collaboration.notify_offline_user.group events (depending on if the conversation was peer to peer or a group conversation). The sysevent_email_action record listens for collaboration.notify_offline_user(.group) then builds an email notification containing all the messages from the last collaboration.email_interval minutes that the user has received in that conversation.
Enable record conversations for a table

Record conversations are enabled for all tables that extend Task (task) by default. You can configure record conversations for additional tables that extend Task.

Role required: admin

To create record conversations, users must have access to the Follow button in the form header. To show the button and thus enable record conversations for a table, the following conditions must be true.

- The live_feed dictionary attribute must be set to true for the table.
  - By default, live_feed=true for all tables that extend Task (task).
- The glide.live_feed.task_header_button property must be set to both or collaboration.
  - By default, glide.live_feed.task_header_button is set to collaboration.

1. Navigate to the list view of a table for which you want to enable record conversations.
2. Perform the appropriate action for the list version.

<table>
<thead>
<tr>
<th>Version</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>List v3</td>
<td>1. Click the list title menu and select Configure.</td>
</tr>
<tr>
<td></td>
<td>2. In the Configure window, click Dictionary.</td>
</tr>
<tr>
<td>List v2</td>
<td>Right-click any column header and select Configure &gt; Dictionary.</td>
</tr>
</tbody>
</table>

The list of dictionary entries for the table appears.

3. Open the dictionary entry that has Type set to Collection.
   The Dictionary Entry form appears.
4. In the Attributes related list, click New.
   The Dictionary Attribute form appears.
5. In the Attribute field, enter Live feed.
6. In the Value field, enter true.
7. Click Submit.
8. Navigate to Collaborate > Administration > Properties.
9. Locate the property called Determine whether or not a button is shown in task forms to view the Collaboration document conversation or Live Feed Record Feed related to the task (glide.live_feed.task_header_button).
10. Ensure the property is set to both or collaboration.
    The glide.live_feed.task_header_button property also controls whether the show live feed icon appears. If the property is set to collaboration, the show live feed icon does not appear on form headers.

Prevent users from following records in Connect for all tables

Users can follow records in Connect for any table that extends Task (task) by default. You can disable this functionality for all tables.

Role required: admin
To disable record conversations for all tables, prevent the Follow button from appearing in all form headers by editing the glide.live_feed.task_header_button property.

1. Navigate to sys_properties.list.
2. Locate the glide.live_feed.task_header_button property.
3. Set the Value to live_feed.

Prevent users from following records in Connect for a specific table

Users can follow records in Connect for any table that extends Task (task) by default. You can disable this functionality for a specific table.

Role required: admin

To disable record conversations for a specific table, prevent the Follow button from appearing in form headers for the table. To do so, set the live_feed dictionary attribute to false for the table.

1. Navigate to the list view of a table for which you want to disable record conversations.
2. Perform the appropriate action for the list version.

<table>
<thead>
<tr>
<th>Version</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>List v2</td>
<td>Right-click any column header and select Configure &gt; Dictionary.</td>
</tr>
<tr>
<td>List v3</td>
<td>Open the list title menu and select Configure, and then select Dictionary.</td>
</tr>
</tbody>
</table>

The list of dictionary entries for the table appears.

3. Open the dictionary entry that has Type set to Collection.
   The Dictionary Entry form appears.
4. In the Attributes related list, locate the Live feed dictionary attribute.
5. Set the Value to false.

Setting the dictionary attribute to false also removes the show live feed icon ( ) for the table.

Disable Connect Chat

You can disable Connect Chat to prevent users from being able to chat within the platform.

Role required: admin

Disabling Connect Chat hides the Connect Chat sidebar icon. Users who try to access Connect Chat from the navigation pane receive a message that says Connect has been disabled.

1. In the navigation filter, type sys_properties.list and press Enter.
2. Search for the glide.connect.chat.disabled property.
3. Set the property value to true.

Connect Support

Connect Support is a real-time messaging tool that enables support agents to easily keep track of their support cases, quickly find solutions, and resolve problems quickly.

Connect Support builds on the messaging platform provided with Connect. For general information about the Connect interface, setup, and administration, see Connect. When Connect Support is enabled, users designated as support agents have access to the support tab of the Connect sidebar.
Using Connect Support:

- Administrators can create chat queues and enable users to access live support.
- Support agents can monitor the queues to provide instant support.
- Users can share links, files, and records using drag-and-drop.

UI16 or UI15 is required to use Connect Support.

**Note:**
- Connect Support does not replace legacy chat but offers some of the same functionality. Do not use the features concurrently.

**Monitor incoming Connect Support conversations**

In the support tab of the Connect sidebar, you can monitor the queues for which you are an agent and accept incoming conversations.

Role required: none

**Note:** The support tab is visible only if you are an agent for one or more queues.

1. Navigate to **Collaborate > Connect Support**.
   The Connect workspace opens in a new tab.

2. Click the support tab of the Connect sidebar, indicated by a headset icon (📞).
   The support tab displays **Queues** to which you belong. It also displays your open support conversations under **Cases**. When a user starts a support conversation or an agent transfers a conversation to a queue, any agent who belongs to the associated queue can accept the conversation. An agent can also request to transfer a conversation directly to you.
3. Accept a conversation in one of the following ways.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accept a conversation from a queue</td>
<td>Under Queues, click Accept by the queue. The conversation opens in the conversation pane and an entry appears in the Cases section of the sidebar.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Accept a transfer request</td>
<td>Under <strong>Cases</strong>, click <strong>Accept</strong> by a transfer request.</td>
</tr>
</tbody>
</table>

![Transfer request image](image)

The conversation opens in the conversation pane. The agent who transferred the conversation can stay in the conversation.

4. **Respond to the user and help resolve the issue.**
   By default, your messages are added to the conversation record as comments and are visible to the user.

**Share knowledge in a Connect Support conversation**

The support view of the Connect workspace has a built-in knowledge tool that makes it easy to search for knowledge articles and share them in a conversation.

**Role required:** none

Use the knowledge tool to research user questions and provide solutions quickly and easily.

1. **Open a support conversation in the Connect workspace.**
   The knowledge tool is not available in Connect mini windows.

2. **In the conversation tools area to the right of the conversation pane, click the knowledge base tab, which is represented by an open book icon.**

![Knowledge tool image](image)

The knowledge homepage appears in the conversation tools pane.
3. Search for articles related to the user’s issue.  
   For more information about finding knowledge, see Knowledge search.

4. To share an article in the conversation, drag a knowledge article link to the conversation pane and drop it anywhere in the drop zone that appears.

**Transfer a Connect Support conversation to a different agent or queue**

You can transfer a Connect Support conversation to a different agent in the queue or to a different queue.

Role required: none

1. Open a Connect Support conversation.
2. At the bottom of the conversation, click the menu icon (≡) to open the Connect actions menu.

3. In the Connect actions menu, select **Transfer**. A transfer dialog box opens.

4. Do one of the following actions.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Transfer the conversation to an agent | 1. To start the transfer request, click **Transfer** by an agent's name.  
Be sure to choose an agent who is online. A green dot on their avatar indicates that a user is online.  
You can cancel the transfer any time before it is accepted.  
2. When the transfer is accepted, select one of the following options in the dialog box that appears.  
- **Stay**: Remain in the conversation, which is also known as a warm transfer. This option is ideal if you want to provide the new agent with background information or introduce the user to the new agent.  
- **Leave**: Exit the conversation, which is also known as a cold transfer. |
| Transfer the conversation to a queue | Click **Transfer** by a queue.  
The system automatically removes you from the conversation and the conversation enters the queue you selected. |

**Add a user to a Connect Support conversation**

You can add additional users to a Connect Support conversation.

An administrator must enable the `glide.connect.support.add_members` property before users can be added to conversations.

Role required: none

1. Open a group or record conversation in the Connect workspace.
2. In the conversation tools to the right of the conversation pane, click the member list tab.
3. Do one of the following actions.
### ServiceNow    Kingston    Now Platform Capabilities

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Add a member** | 1. Click Add Member to Group.  
2. Use the search field to find and select a user. |
| **Remove a member** | 1. Point to a member name.  
2. Click the minus icon (−).  

The assigned support agent cannot be removed from a Connect Support conversation.

**Note:** Only the assigned support agent can create an incident from the Connect Support conversation.

### Escalate a Connect Support conversation

If an escalation path is defined for a Connect Support conversation, you can use a shortcut to escalate a Connect Support conversation to a different queue.

Define an escalation path for the queue, using the Escalate to field on the Chat Queue (chat_queue) table. For more information, see [Administer Connect Support queues](#).

1. Open a Connect Support conversation.
2. At the bottom of the conversation, click the menu icon (≡) to open the Connect actions menu.
3. In the Connect actions menu, select Escalate.
   - A confirmation dialog box appears.
4. In the dialog box, click Escalate.
   - The system automatically removes you from the conversation and the conversation enters the escalated queue.

### Create an incident from a Connect Support conversation

You can use a shortcut to create an incident on behalf of a user, directly from a Connect Support conversation.

**Role required:** none

You might want to create an incident if you cannot resolve the user’s issue over chat or if you want to create a record of the conversation to share with the user. When you create an incident from a support conversation, the system copies the conversation history to the incident activity stream as comments and work notes. Future messages are tracked in the incident as well.

**Note:** Administrators can customize the behavior of the Create Incident Connect action. For more information, see [Administer Connect actions](#).

1. Open a Connect Support conversation.
2. At the bottom of the conversation, click the menu icon (≡) to open the Connect actions menu.
3. In the Connect actions menu, select Create Incident.
In the conversation tools area to the right of the conversation, a new incident form opens in a record tab. The system automatically sets the Caller field to the user who opened the support conversation.

4. Complete the form as necessary and click Submit.

Any comments or work notes in the record conversation appear as comments on the incident form. Work notes do not appear in the chat for the ESS user. The chat agent can select whether a message is a Comment or Work Note in the conversation.

a) In the record conversation, by the text entry field, click the message type icon ( ).
b) Select Comment or Work Note.
c) Enter a message.

By default, record conversation messages are added as comments.

Note: If you add an attachment to a record conversation, it is attached to the underlying record as well.

The system automatically shares the record in the conversation, copies the conversation to the record activity stream, and references the record on the Chat Queue Entry (chat_queue_entry) table. Any new journal fields added to the record do not appear in the chat. The system also changes the document ID for the conversation to reference the incident number instead of the entry in the Chat Queue Entry table.

**Connect Support chat states**

Connect Support chats move through specific states.
Connect Support chat states

<table>
<thead>
<tr>
<th>Composite state</th>
<th>State</th>
<th>Definition</th>
</tr>
</thead>
</table>
| Active          | Waiting        | • Requester/end user enters a queue by sending a message. Agent has not yet accepted it.  
• Requester/end user rejoins a session that is in a Reopenable state. |
| Reopenable      | Closed Abandoned| Requester/end user clicks End Chat button before agent accepts the request.                                                                 |
| Permanently     | Closed by Client| • Requester/end user clicks End Chat button after agent accepts the request.  
• Requester/end user times out. |
| Closed          | Escalated      | Agent escalates an ongoing conversation by performing the Escalate action from the menu icon.                                               |
| Closed          | Complete       | Agent ends the session.                                                                                                                   |

Connect Support administration

Administrators can configure various performance settings and features of Connect Support.

**Note:** There are also settings that apply to both Connect Chat and Connect Support. For more information, see [Connect administration](#).

Migrate from legacy chat to Connect Support

Connect Support is an extension of Connect. Users designated as support agents have access to the support tab of the connect sidebar. Do not use Connect Support concurrently with legacy chat.

Before you activate Connect Support, inform your support agents to close out any existing chats.

Legacy chat uses a different field to determine which state a help desk chat is in. A fix script is included in the Connect Support plugin that circumvents this issue by closing out any existing help desk chat sessions. Manually closing out any existing chats before allowing this script to run helps prevent any loss of chat information.

If you do not close out existing help desk chats, your metrics and chat queue will not work accurately.

1. Activate the Connect Support plugin.
   When you activate the Connect Support plugin, the `glide.connect.support.enabled` property redirects the legacy chat URL to Connect Support.
   For more information, see [Activate Connect Support](#).
2. Hide the Social IT application.
Activating Connect Support does not completely eliminate the legacy chat module. To prevent users from using the legacy chat, hide the Social IT application menu. For more information, see Enable or disable an application menu or module.

Properties for Connect Support

The Connect Support Properties page provides several configuration options specifically for Connect Support.

These properties are available for Connect Support.

Properties for Connect Support

Users with the admin role can access these properties by navigating to Collaborate > Support Administration > Properties.

Note: The Connect Properties page contains many general Connect properties that impact Connect Support.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Should Connect be used for handling chat queue entries glide.connect.support.enabled | Disables or enables Connect Support. When the property is enabled, the Service Desk Chat button in the Employee Self-Service portal opens the conversation in Connect Support, rather than legacy chat. Additionally, the Support tab appears in the Connect sidebar.  
  • Type: true | false  
  • Default value: true  
  • Location: Collaborate > Support Administration > Properties |
| Number of support conversations an individual agent can have at one time (-1 is unlimited) connect.support.conversation_limit | Determines how many support conversations an individual agent can have at one time. When the value is set to -1, an agent can participate in an unlimited number of conversations.  
  • Type: integer  
  • Default value: -1  
  • Location: Collaborate > Support Administration > Properties |
| Show agent avatar in Connect Support conversations. connect.support.show_agent_avatar | Determines whether an agent’s avatar is shown in a support conversation (enabled). When the property is disabled, users see the agent’s name only.  
  • Type: true | false  
  • Default value: true  
  • Location: Collaborate > Support Administration > Properties |
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Number of seconds to wait (without user interaction), before presenting end users with an idle countdown timer. <br>connect.support.idle.delay | Determines how many seconds a user must be inactive in a support conversation before an idle countdown timer appears.  
- **Type**: integer  
- **Default value**: 120  
- **Location**: Collaborate > Support Administration > Properties |
| Number of seconds to count down from before marking end user as having left their support session <br>connect.support.idle.count_down | Determines how many seconds the idle countdown timer remains open after it appears. If the idle user does not dismiss the timer before the countdown completes, the system closes the support session.  
- **Type**: integer  
- **Default value**: 60  
- **Location**: Collaborate > Support Administration > Properties |
| Limits the number of closed conversations that the support user can see. (0 = unlimited) <br>connect.support.user.closed.conversation_limit | Determines how many closed conversations appear in a user’s support conversation history. When the value is set to 0, all previous conversations appear in the history.  
- **Type**: integer  
- **Default value**: 0  
- **Location**: Collaborate > Support Administration > Properties |

### Administer Connect Support queues

You can define the support agents, default messages, schedule, and escalation path for each Connect Support queue.

**Role required**: admin

**Note**: Both Connect Support queues and legacy chat queues are stored on the Chat Queue (chat_queue) table. Do not use Connect and legacy chat concurrently.

1. Navigate to **Collaborate > Queues**.
2. Click **New** or open an existing queue from the list.
3. Complete the Chat Queue form, as appropriate.

#### Chat Queue form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>Active</td>
<td>Not used in Connect.</td>
</tr>
<tr>
<td>Assignment group</td>
<td>User group that contains the support staff for the queue. Any user in the group can view the queue in the Connect sidebar and accept chats. No other users can access the queue. This field must be populated.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Average wait time</td>
<td>Average time it takes for an agent to accept a chat in the queue. This value is automatically calculated. Do not manually edit.</td>
</tr>
<tr>
<td>Confirm problem</td>
<td>Not used in Connect.</td>
</tr>
<tr>
<td>Escalate to</td>
<td>Different queue to which an agent can escalate a chat. For example, there is a queue for high priority support chats. When a queue is defined in this field, agents can access the Escalate option in conversations.</td>
</tr>
<tr>
<td>Initial agent response</td>
<td>Message that users see when an agent accepts their chat. For example, Thank you for contacting support. We are looking into your question now and will be with you shortly.</td>
</tr>
<tr>
<td>Not available</td>
<td>Message that users see when they attempt to start a chat outside the defined queue Schedule. You can use HTML to format the message and include links or media.</td>
</tr>
<tr>
<td>Question</td>
<td>Initial phrase that users see when they start a new chat in the queue. For example, How can I help you?</td>
</tr>
<tr>
<td>Schedule</td>
<td>Schedule that defines when the queue is available. Leave the field blank to make the queue available all the time. Users cannot start a new conversation in the queue outside the schedule hours.</td>
</tr>
</tbody>
</table>

4. To review conversations associated with the queue, add the Chat Queue Entries related list and review the records for the following information.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>How long the user waited and the result</td>
<td>Review information in the State and Wait time columns.</td>
</tr>
<tr>
<td>Who is actively helping employees in the queue</td>
<td>Review the names of agents in the Assigned to column.</td>
</tr>
</tbody>
</table>

### Make a Connect Support queue accessible to end users

To make a Connect Support queue accessible to end users, use the accepted URL format.

Create a queue. Create agents for the queue by assigning users to the assignment group associated with the queue.

Role required: admin

For example, you might create a module or add a link to a portal. The accepted URL format is https://<instancename>.service-now.com/$chat_support.do?queueID=<sys_id>.

1. Navigate to Collaborate > Administration > Queues.
2. Right-click the name of the queue to which you want to link.
3. In the context menu, select Copy sys_id. Follow browser instructions to copy the sys_id if browser security measures restrict this function.
4. Preview the support queue by navigating to https://<instancename>.service-now.com/$chat_support.do?queueID=<sys_id>.
5. Create a module or other link to the queue using the URL.

**Configure the add support users property**

To enable support agents to add users to a Connect Support conversation, add the `glide.connect.support.add_members` property.

Role required: admin

When the `glide.connect.support.add_members` property is added and enabled, support agents can add users to a support conversation. Any added user can also add other users. Only the assigned agent can create an incident from the chat. When non-support agents are added to a chat, the chat appears in their chat tab.

**Note:** Make sure you are in the Global scope when adding this property.

1. Enter `sys_properties.list` in the navigation filter. The entire list of properties in the System Properties (`sys_properties`) table appears.
2. Verify that the property does not exist by searching for the property name. If it does exist, update the property with the information in the following table.
3. Click **New**.
4. Complete the form as follows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.connect.support.add_members</td>
</tr>
<tr>
<td>Type</td>
<td>true</td>
</tr>
<tr>
<td>Value</td>
<td>true</td>
</tr>
</tbody>
</table>

**Connect Support metrics**

Optional plugins provide a homepage and Performance Analytics dashboards, which contain helpful Connect Support metrics.

The reporting homepage is ideal for support managers who want a simple solution to track the recent performance of the support organization. The Performance Analytics dashboards provide a more full-featured solution for support managers who want to analyze trends over time.

Users with the admin role can activate the following plugins to use these features.

**Connect Support homepage and dashboard plugins**

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connect Support Manager's Dashboard</td>
<td>Provides a homepage for Connect Support, and all required configuration records. Though the plugin name contains the term dashboard, the plugin does not provide functionality related to Performance Analytics dashboards. Homepages are similar to dashboards, but do not require Performance Analytics roles to view.</td>
</tr>
<tr>
<td>(com.glide.connect.managers_dashboard)</td>
<td></td>
</tr>
<tr>
<td>Performance Analytics - Content Pack - Service Desk Chat</td>
<td>Provides the <strong>Service Desk Chat Monitor</strong> dashboard, which analyzes key Connect Support metrics and indicators.</td>
</tr>
<tr>
<td>(com.snc.pa.chat)</td>
<td></td>
</tr>
<tr>
<td>Plugin</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Performance Analytics - Context Sensitive Analytics for Chat</td>
<td>Provides in-form analytics for Connect Support. These analytics are available as a related link on the Chat Queue Entry (chat_queue_entry) form, and also as the Context Sensitive Analytics - Chat dashboard.</td>
</tr>
</tbody>
</table>

**Note:** For more information about these plugins, including which other plugins they activate, see Additional plugins for Connect Support.

**Use the Connect Support homepage**

Use the Connect Support homepage to view key indicators and metrics related to support conversations, queues, and agents.

Activate the Connect Support Manager’s Dashboard plugin (com.glide.connect.managers_dashboard) to view this homepage.

Role required: chat_admin

The homepage is called Service Desk - Chat.

1. Navigate to Collaborate > Support Administration > Reporting Dashboard.

   **Note:** Though the module name contains the term dashboard, the module does not provide functionality related to Performance Analytics dashboards. Homepages are similar to dashboards, but do not require Performance Analytics roles to view.

   The Connect Support homepage, which is called Service Desk - Chat, opens.

2. Click a widget to drill down into its data.

**Use the Connect Support dashboards**

Use the Connect Support dashboards in Performance Analytics to understand trends in your support organization’s performance over time.

Activate one or both of the following plugins, according to your analytics needs:

- Performance Analytics - Content Pack - Service Desk Chat (com.snc.pa.chat)
- Performance Analytics - Context Sensitive Analytics for Chat (com.snc.pa.chat.context_sensitive_analytics)

Role required: both chat_admin and pa_viewer

The Performance Analytics - Content Pack - Service Desk Chat plugin (com.snc.pa.chat) includes the Service Desk Chat Monitor dashboard, which contains the following tabs:

- **Chat Monitor By State**: Contains metrics related to closed support conversations.
- **Overview**: Contains several metrics related to support conversations, queues, and agents.
- **KPI Process**: Contains metrics that are key performance indicators (KPIs) of the Connect Support process, including the average queue response time, the average duration of support conversations, and the number of new support conversations per day.

The Performance Analytics - Context Sensitive Analytics for Chat plugin (com.snc.pa.chat.context_sensitive_analytics) includes the Context Sensitive Analytics - Chat dashboard. The dashboard contains additional metrics related to support queues, including the number of support conversations closed.
**Out-of-the-box Service Desk Chat Performance Analytics Solutions**

Performance Analytics Solutions contain preconfigured best practice dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

**Performance Analytics Solutions**

Use the Performance Analytics widgets on the dashboard to visualize data over time, analyze your business processes, and identify areas of improvement. With solutions, you can get value from Performance Analytics for your application with minimal setup.

**Activate Connect Support for Service Portal**

Activate the Connect Support and Service Portal integration plugin so you can add the Connect Support widget to a portal page.

**Role required:** admin

Activating the Connect Support and Service Portal integration plugin automatically activates the Connect Support plugin.

1. Navigate to **System Definition > Plugins**.
2. Search for and activate the Connect Support and Service Portal integration plugin (com.glide.connect.support.service-portal).

After activating the plugin, the Connect Support widget appears in the list of widgets under Service Portal > Widgets. Use Connect Support in a portal by adding the widget to any page within the portal. For more information on adding a widget to a page, see Create and edit a page using the Service Portal Designer.

Configure Connect Support widget instance options

You can control the appearance of your widget and how it functions by configuring the instance options.

Role required: admin
1. Navigate to Service Portal > Service Portal Configuration and open the Service Portal Designer.
2. From the Service Portal Designer, select the page you added the Connect Support widget to. If you have not yet added the widget to a page, see Create and edit a page using the Service Portal Designer for more information.
3. Click the edit icon in the corner of the widget to open the instance options menu.
4. Complete the fields using the following table. Depending on the functionality you want to add, you may not need to add all these fields. For example, if you include the Queue ID, you do not also need to include the Queue Name or the Queue URL.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap color</td>
<td>Select a color for your widget from a list of common bootstrap colors. Themes control the overall color of a widget, but if you want your widget to be a specific color, you can select it from the list.</td>
</tr>
<tr>
<td>Queue URL</td>
<td>The URL for the Connect Support chat queue that you want questions to be directed to. For example, https://&lt;instancename.service-now.com/$chat_support.do?queueID=&lt;sys_id&gt;</td>
</tr>
</tbody>
</table>
### ServiceNow Now Platform Capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Queue Name</td>
<td>The name of the queue you want the questions to be directed to. You can find a list of queue names in Collaborate &gt; Connect Support &gt; Queues.</td>
</tr>
<tr>
<td>Queue ID</td>
<td>The sys_id of the queue you want questions to be directed to. You can find this ID by going to the support queue and either copying the queue ID from the support link, or by selecting Copy sys_id from the context menu.</td>
</tr>
<tr>
<td>Message</td>
<td>The text for the button in the Connect Support widget</td>
</tr>
<tr>
<td>Window</td>
<td>Use this option to open the chat in another tab rather than in a new window.</td>
</tr>
<tr>
<td>Title</td>
<td>The name in the widget header</td>
</tr>
</tbody>
</table>

### Legacy: Chat

Chat is deprecated in the Istanbul release.

**Note:** The Connect feature provides an updated instant messaging platform, which is activated by default for new instances. The legacy chat and Connect features should not be used concurrently. There is no migration path from legacy chat to Connect.

Chat a provides real-time communication via instant messaging between users in a ServiceNow instance. Features include:

- One-to-one chats (instant messaging) between users.
- Chat rooms for conversations with multiple users. Chat rooms may be public (any user can join) or private (only invited users can join).
- Chat rooms linked to task records. Users can work together to solve issues, and conversation history can be shared by everyone who needs to reference it.
- Help desk chat. End users can access live support via instant messaging. Service desk staff can resolve basic issues in real-time or create incidents directly from chat requests for more extensive issues.
Legacy: Get started with Chat

Get started with legacy chat.

Role required: admin

1. Establish use guidelines. Social media can improve communication and aid productivity. To get the most out of these tools, establish clear and simple social media guidelines that foster information sharing and a comfortable work environment.

2. Activate the Chat plugin to enable the legacy chat and legacy Help Desk Chat features.

3. Configure security settings. Users must log in to use the legacy chat features in the base system. The standard system security settings and Social IT-specific security settings are available. To learn more about setting up these features, refer to the plugin activation pages.
   - Chat rooms may be Public (any user can join) or Private (only invited users can join).
- Administrators can limit who can read chat messages on tasks and who can create chat rooms.

**Legacy: Installed with Chat**

What components are installed with legacy chat.

Demo data is available for legacy chat. The demo data creates a chat queue called Help Desk Chat that is supported by the assignment group Chat Support. Additionally, the Help Desk Chat link is added to the header of the Employee Self-Service portal. To learn more, see [Set Up Chat Queues for Help Desk Chat](#).

**Other:**
- Event: A new event called `chat.invite` is registered to trigger an email notification when users are invited into a chat room.
- Email Notification: An email notification called Chat Room Invite is added to send when users are invited to a chat room.

**Legacy: Fields installed with legacy chat**

Legacy chat adds the following fields.

<table>
<thead>
<tr>
<th>Display name (Table name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header</td>
<td>Adds the Help Desk Chat link to the ESS portal page.</td>
</tr>
<tr>
<td>(content_block_header)</td>
<td></td>
</tr>
</tbody>
</table>

**Legacy: Properties installed with legacy chat**

Legacy chat adds the following properties.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.chat.invite_fields</td>
<td>Comma-separated list of fields used to generate the invites when creating a chat room from a task. The user is presented with check boxes for each of the specified fields to select the invites for the chat room. The fields should be references or glide_lists of sys_user or sys_user_group.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: string</td>
</tr>
<tr>
<td></td>
<td>Default value: assignment_group.watch_list</td>
</tr>
<tr>
<td></td>
<td>Location: Social IT &gt; Chat Administration &gt; Properties</td>
</tr>
<tr>
<td>glide.chat.show_emoticons</td>
<td>Setting that determines whether to display emoticons in conversations.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: true</td>
</tr>
<tr>
<td></td>
<td>Default value: true</td>
</tr>
<tr>
<td></td>
<td>Location: Social IT &gt; Chat Administration &gt; Properties</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| glide.chat.sound.message_received.mp3 | Sound played when a message is received in chat (mp3).  
  - **Type**: string  
  - **Default value**: media/rcvmsg.mp3  
  - **Location**: Social IT > Chat Administration > Properties |
| glide.chat.sound.message_received.ogg | Sound played when a message is received in chat (ogg).  
  - **Type**: string  
  - **Default value**: media/rcvmsg.ogg  
  - **Location**: Social IT > Chat Administration > Properties |
| glide.chat.sound.queue_beep.mp3 | Sound played when a new user enters the chat queue (mp3). Both this property and glide.chat.sound.queue_beep.ogg must be defined for either property to work.  
  - **Type**: string  
  - **Default value**: media/button_toggle_on.mp3  
  - **Location**: Social IT > Chat Administration > Properties |
| glide.chat.sound.queue_beep.ogg | Sound played when a new user enters the chat queue (ogg).  
  - **Type**: string  
  - **Default value**: media/button_toggle_on.ogg  
  - **Location**: Social IT > Chat Administration > Properties |
| glide.chat_room.create_roles | Comma-separated list of roles that are allowed to create chat rooms.  
  - **Type**: string  
  - **Default value**: itil  
  - **Location**: Social IT > Chat Administration > Properties |
| glide.short_poll_delay | Short polling delay for XMPP requests. Enter a value in milliseconds. The minimum value is 250. With short polling, the browser sends a request to the server in fixed intervals defined by the property. To minimize performance impact, it is recommended that this value is set greater than or equal to the default value.  
  - **Type**: integer  
  - **Default value**: 1000 (one second)  
  - **Location**: Social IT > Chat Administration > Properties |
Legacy: Script includes installed with legacy chat

Legacy chat adds the following script includes.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ChatUtils</td>
<td>Provides utilities for chat conversations.</td>
</tr>
</tbody>
</table>

Legacy: Tables installed with legacy chat

Legacy chat adds the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chat Actions (chat_actions)</td>
<td>Defines additional chat window menu items. Access at Social IT &gt; Chat Administration &gt; Actions (administrator and chat_admin).</td>
</tr>
<tr>
<td>Chat Channel (chat_channel)</td>
<td>Stores chat channels, which are chats between members. This table is extended by Chat thread (chat_thread) (a one-to-one chat) and chat_room (a multi-user chat). Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Chat Channel Member (chat_channel_member)</td>
<td>Relationship table that associates channels and members. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Chat Message (chat_message)</td>
<td>Stores instant messages sent from any chat window. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Chat Presence (chat_presence)</td>
<td>Stores presence (status) information for a user. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Chat Queue (chat_queue)</td>
<td>Stores the groups and schedules for providing support via instant message. Defined at Social IT &gt; Chat Administration &gt; Queues (administrator and chat_admin).</td>
</tr>
<tr>
<td>Chat Queue Entry (chat_queue_entry)</td>
<td>Stores user requests for live support. Extends Task (task). On a chat queue record, the Chat queue entries related list displays the entries that are associated with that chat queue. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Chat Room (chat_room)</td>
<td>Stores chat rooms (multi-user chat). Extends Chat channel (chat_channel). Can be modified if necessary (such as to change a chat room from public to private), but should almost always be managed by system functionality.</td>
</tr>
<tr>
<td>Chat Roster (chat_roster)</td>
<td>Maintains users that are associated with a user's My Friends list. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Chat Roster Member (chat_roster_member)</td>
<td>Tracks users that are members of a chat room. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Chat Thread (chat_thread)</td>
<td>Stores one-to-one chats. Extends Chat channel (chat_channel). Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Live Headline (live_headline)</td>
<td>Sends system messages. For example, the system may send a message when a user enters or leaves a chat room. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Live Poll Message (sys_live_message)</td>
<td>System table that stores and manages chat messages. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Live User (sys_live_user)</td>
<td>System table that stores and maintains chat users. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Stores the last live sequence number (sys_live_last_sequence)</td>
<td>Stores the last sequence ID. Extending or modifying data in this table is not recommended.</td>
</tr>
</tbody>
</table>

**Legacy: Business rules installed with legacy chat**

Legacy chat adds the following business rules.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chat Queue (Task.active) Updater</td>
<td>Chat Queue Entry (chat_queue_entry)</td>
<td>Sets the chat queue entry Action field to Waiting when the action changes.</td>
</tr>
<tr>
<td>SNC - Chat Queue Average Wait Time</td>
<td>Chat Queue Entry (chat_queue_entry)</td>
<td>When a chat queue entry is accepted, calculates the average wait time for the queue by averaging the last 20 chat queue entries.</td>
</tr>
</tbody>
</table>

**Legacy: Chat use**

Legacy chat allows you to interact and collaborate through real-time instant messages with other users in an instance.

Use legacy chat to:

- Initiate or participate in chat conversations with one or multiple users.
- Initiate or participate in chat conversations that are attached to task records (such as an incident).
- See when other users are available to chat.

To open the chat desktop, navigate to **Social IT > Chat**.

**Note:** Service desk staff may also provide live support to other users via help desk chat.
Legacy: Update your profile

Your profile identifies your contributions to legacy chat conversations. It is created automatically the first time you use chat and consists of:

<table>
<thead>
<tr>
<th>Profile</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>From your user account in ServiceNow. Your name appears on your messages and in the member list of any chat room you join.</td>
</tr>
<tr>
<td>Title</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Picture</td>
<td>Select any picture. Your picture appears beside your name in other users’ favorites list and at the top of your favorites list.</td>
</tr>
</tbody>
</table>

To update your profile picture:

1. Click your picture in the top of the favorites list.
2. Browse to the desired picture file and click **Open**.

**Note:** Changes to your profile picture affect legacy chat and live feed if the Live Feed plugin is activated.

---

**Legacy: Update your status**

In legacy chat, your status lets other users know whether you are available to chat.

Your status lets other users know whether you are available to chat. Your current status is indicated by the color of the icon in the upper right of your favorites list, beside your name. View the status of other users in your favorites list.

To change your status:

1. Click the status icon beside your name.
2. Select a status (see table).

---

Chat offline |

**Legacy: Use your favorites list**

In legacy chat, your favorites list appears on your chat desktop and provides certain functions.
Favorites list

- Users:
  - Add another user in the system to your favorites list.
  - See if your favorite users are available to chat. Users are organized alphabetically and in sections by status.
  - Start a conversation by double-clicking a name.
  - Expand or collapse a section by clicking Online or Offline.

- Rooms:
  - See the list of your favorite chat rooms.
  - Join a chat room by double-clicking its name.

- Favorites list toolbar:
  - Options (Chat window menu):
    - access a menu with options to add a favorite user, view online users, create a chat room, and view chat rooms.
  - Add User (Add friend):
    - add a favorite user.
  - Create Room (Add room):
    - create a chat room.
  - Invitations (Chat invitation):
    - respond to invitations to join chat rooms.

To expand or collapse a section in the favorites list, click the section header or click the arrows ( ) on the section header.
Legacy: Add a favorite user
How to add a user to your favorite users list in legacy chat.
1. Click the Add User button.

2. Begin typing a user name and select a user from the list, or click the reference lookup and select a user from the table.

3. Click OK.

Legacy: Remove a favorite user
How to remove a favorite user in legacy chat.
To remove a user from your favorite users list, right-click the user’s name and select Remove From List.

Legacy: View an online user
How to view a list of all users who are available to chat (status of Online) in legacy chat.
1. Right-click the Users section header or click Options on the toolbar.

2. Select Show Online Users.
   - Start a one-to-one chat with a user on the list by double-clicking a name.
   - Send Message or Add To Friend List by right-clicking a name.
Legacy: View a room

How to view a list of all public chat rooms in legacy chat.

1. Right-click the **Rooms** section header or click **Options** on the toolbar.

   ![Chat window menu](image)

2. Select **Public Rooms**.
   - To join a room, double-click a name or right-click and select **Join Room**. See **Joining Chat Rooms**.
Legacy: Start a one-to-one chat

How to start a one-to-one chat in legacy chat:

- To start a chat with one user in your favorites list, double-click the user's name or right-click and select **Send Message**.
- To start a chat with one available user, double-click the user's name on the online users list. See [Viewing Online Users](#).

  Send a message to start a conversation.

Legacy: Create a chat room

How to start a chat with multiple users from the legacy chat desktop.

To start a chat with multiple users from the chat desktop (requires access rights):

1. Click **Create Room** on the favorites list toolbar.

   ![Add room](image)

2. Enter the room details (see table).

3. Click **Create Room**. An invitation appears in the favorites list of all invited users and a new chat window opens on your chat desktop.
Create Room

Room name: Chat Room for INC0000003

Description: Wireless access not available on floor 3

Password: ********

Room avatar:

Features:
- Public
- Members Only
- Temporary

Invite:
- Fred Ludy
- Beth Anglin
- ITIL User

</tbody>
</table>

Legacy: Create a chat room for a task

How to start a legacy chat with multiple users from a task record.

Note: This procedure is not possible if the Connect feature is enabled.

1.  Open the record (example, an incident on which you are working).
2. Click the **Create or Join Chat Room** related link.

3. If a chat room already exists, click a name to join the existing chat room. If no chat room exists, continue to the next step to create a new room.

4. Click the **create** link at the bottom of the window.

5. Enter the room details as you would for a **chat room**.

6. Click **Create Room**. An email notification is sent and appears in the favorites list for all invited users (the assignment group and the watch list, if selected, and additional invited users).

7. In the New Room Created message, click **Join Room**. 
   - A new chat window opens on your chat desktop.
• All invited users are listed in the chat member list. Invited users that are not currently participating in the chat are listed in gray.

**Legacy: Join one-to-one chats**

In legacy chat, when another user starts a chat by sending a message to you, a chat window opens on your chat desktop. To join the chat, click the window.

**Legacy: Join a chat room**

How to join a chat room in legacy chat.

1. If another user invites you to join a chat room, an invitation appears in your favorites list.

   ![Chat invitation](image)

   Chat invitation

2. To respond, click the invitation.

   A window opens that displays the room name, room description, and the name of the user who invited you.

   • To join the chat, click **Join**. When the chat window opens on your chat desktop, click the window.
   • To ignore the invitation, click **Decline**.

   ![View invitations](image)

   View invitations

   To rejoin a favorite chat room that you have left, click the chat room name in the Rooms section of the favorites list.

   To join a public chat room without an invitation, right-click the Rooms section header and select **Public Rooms**. Double-click a room name on the list.

**Legacy: Join a chat room for a task**

In legacy chat, if another user invites you to join a chat room from a task record, you receive an email notification.

1. Click the link in the email notification.
2. If a prompt for a password appears, enter the password listed in the email notification.
3. When the chat window opens on your chat desktop, click the window.

Legacy: Join a chat room from a task record without an invitation

How to join a chat room in legacy chat without an invitation.

**Note:** This procedure is not possible if the Connect feature is enabled.

1. Open the task record.
2. Click the Create or Join Chat Room related link.
3. Click a chat room name.
4. If a prompt for a password appears, contact the person who created the chat room for the password.
   - If a chat room has a password, only users with the password can join the chat.
5. When the chat window opens on your chat desktop, click the window.

Legacy: Chat windows

In legacy chat, a chat window appears on your chat desktop for each chat conversation that you start or join.
Legacy: Send messages in legacy chat

How to send messages in legacy chat.

To chat with other users that have joined the conversation, enter your message in the text field at the bottom of the window and press Enter. The message appears in the other users' chat windows.

To send a link, type the full URL (example, http://www.service-now.com). When the message is sent, the text appears blue and any user in the conversation can click it to follow the link.

To send a smiley face, type a colon followed by a close parentheses (:) ). When the message is sent, a smiley face 😊 appears in place of the text. For more emoticons, see Sending Emoticons in Messages (Smileys).

Chat activity is indicated with the following alerts:

- When a new message is posted to an inactive browser tab, the tab name blinks.
- When a new message is posted to an inactive chat window, the window header appears in yellow and blinks.
• When a user joins or leaves a room, a message appears in the other room members’ chat windows.

**Legacy: Send emoticons in legacy chat messages (smileys)**

How to send emoticons (smileys) in legacy chat.

To send an emoticon (smiley), type text from the following table. When your message is sent, the emoticon appears in place of the text. For example, enter colon followed by a close parentheses (;) and a smiley face 😊 appears in your message.

**Emoticons**

<table>
<thead>

**Legacy: Change the display**

How to change the display of legacy chat.

To view the chat window menu, click the gear button (⚙️)

Chat window menu

- To show or hide timestamps, select **Show Timestamps** from the chat window menu or press **F2**.
- To show or hide the chat member list, select **Show Members** from the chat window menu or press **F4**.
To resize the window, point to the lower corner (left or right). When the pointer changes shape, drag the window to the desired size.

To move the window, point to the header. When the pointer changes shape, drag the window anywhere on your chat desktop.

To close a chat window, click the X in the upper right corner.

**Legacy: Invite a user into a chat**

How to invite another user into a chat in legacy chat.

1. Select **Invite User** from the chat window menu.

   ![Chat window menu]

2. Begin typing a user name and select a user from the list, or click the reference lookup and select a user from the table.

   ![Search icon]

3. Click **OK**.

   An invitation is sent to the selected user. One-to-one chats are automatically converted into temporary chat rooms.

**Legacy: Add a favorite room**

How to add a favorite room in legacy chat.

To add a room to your favorites, click the chat window and select **Add To Favorites** from the chat window menu.

![Chat window menu]

**Legacy: Remove a favorite room**

How to remove a favorite room in legacy chat.

To remove a room from your favorites, right-click the room name and select **Remove From List**.

**Legacy: Set your chat preferences**

Use the Chat Window Preferences to set audio notifications and default chat window display options in legacy chat.

Use the Chat Window Preferences to set audio notifications and default chat window display options. The default display options control how a chat window looks when you first open it. You can still control the display options for an individual window as described in [Changing the Display](#).

To view your chat preferences, click your name in the upper left corner of the chat desktop and select **Chat Preferences**.
Chat preferences

To set your preferences, select or clear the check boxes next to the options, then click **Update**.

<table>
<thead>

<td>Set default options for showing timestamps members in chat rooms.</td>
</tr>
</tbody>
</table>

**Legacy: Delete a chat room**

You can delete chat rooms in legacy chat.

Role required: chat_admin

Note that when you delete a chat room, the system also deletes the records for any chat members and messages.

1. In the application navigator filter, enter `chat_room.list`.
2. Delete multiple chat rooms from the list or open a chat room record and click **Delete**.

**Legacy chat administration**

Users with the chat_admin role can administer various aspects of legacy chat.

**Define chat room access rights**

Control the access rights for creating a chat room so that not all users can create a chat room.

Role required: chat_admin
To define the access rights for creating chat rooms:
1. Navigate to Social IT > Chat Administration > Properties.
2. Locate the property Comma-separated list of roles that are allowed to create chat rooms.
3. Enter user roles. A user must have one of the specified roles to create a chat room.

**Change chat room message read access**

In legacy chat, you can associate a chat room with a record, such as an incident, and add the chat messages to a Chat Activity journal field on the form.

Role required: admin

By default, a user can read the chat messages for a room if either of the following is true:

- The room is public
- The user is a member of the room

To change chat room message read access:

- Modify the Chat message access control rule or create a new rule.
- Read access to the messages displayed is handled by the access control list security operation chat_messages_read on the Chat room (chat_room) table.

**View a legacy chat message as a journal field**

You can view all chat messages in one place by viewing them as a journal field.

Chat rooms can be linked to any task record in the following ways:

- Create a room from the record.
- Create a record from a chat room, such as creating an incident from a Help Desk Chat.

To view the chat messages as a journal field:

- Configure the task record form to select the Chat Activity field.
- The maximum number of chat messages that are displayed by this field is 1000.
Chat Activity

Chat actions

Chat actions are additional items that appear in the chat window menu (requires the Chat plugin). Administrators and users with the chat_admin role can define chat actions.
Add actions to the legacy chat window menu

You can create new actions and add them to the chat window menu.

1. Navigate to Social IT > Chat Administration > Actions.
2. Select an action to edit or click New.
3. Enter the chat action details and click Update or Submit.

The following example demonstrates how to add a chat action that appears only on windows where the user is a Help Desk Agent. The action appears on the menu as **Show User Type** and opens a popup window that indicates a current user of `queue_agent`.

- **Action Name:** Show User Type
- **Active:** Select the check box.
- **Order:** 100
- **Client Show Condition:**

```javascript
answer = g_chat.getChatType() == 'queue_agent';
```

- **OnClick Action Script:**

```javascript
alert('The current user is: ' + g_chat.getChatType());
```
Chat action details

You can define a chat action name and the script that runs when the action is selected.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Name</td>
<td>Enter a label for the action as it appears in the menu.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to activate or clear the check box to deactivate the action. Only active actions may appear in the menu.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter the order in which the action appears in the menu. Standard menu items (such as Show Timestamps) always appear at the top of the chat menu, followed by chat actions in order.</td>
</tr>
<tr>
<td>Client Show Condition</td>
<td>Define the conditions under which this menu option appears. The show condition must set the pre-defined answer variable to a boolean value.</td>
</tr>
<tr>
<td>OnClick Action Script</td>
<td>Enter the JavaScript code that runs when the menu item is selected.</td>
</tr>
</tbody>
</table>

Available methods associated with the g_chat variable

The g_chat variable is a legacy chat window object that is available in the Client Show Condition and OnClick Action Script of a chat action definition.

The following table defines the available methods associated with this object.

<table>
<thead>
<tr>
<th>Return Object</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>getActiveUsers()</td>
</tr>
<tr>
<td></td>
<td>Returns the active users.</td>
</tr>
<tr>
<td></td>
<td>Returns:</td>
</tr>
<tr>
<td></td>
<td>Array - Returns the active users.</td>
</tr>
<tr>
<td>String</td>
<td>getChannelJID()</td>
</tr>
<tr>
<td></td>
<td>Returns the channel JID, which is a sys_id for a record chat_channel table.</td>
</tr>
<tr>
<td></td>
<td>Returns:</td>
</tr>
<tr>
<td></td>
<td>String - Returns the channel JID.</td>
</tr>
<tr>
<td>String</td>
<td>getChatType()</td>
</tr>
<tr>
<td></td>
<td>Determines the chat window type.</td>
</tr>
<tr>
<td>Return Object</td>
<td>Details</td>
</tr>
<tr>
<td>---------------</td>
<td>---------</td>
</tr>
<tr>
<td>String</td>
<td><strong>getChatQueueAgent()</strong>&lt;br&gt;Returns the <code>sys_id</code> for agent that is administering this thread.&lt;br&gt;Returns:&lt;br&gt;String - Returns the <code>sys_id</code> of the chat queue agent.</td>
</tr>
<tr>
<td>String</td>
<td><strong>getChatQueueUser()</strong>&lt;br&gt;Returns the <code>sys_id</code> for end user of the chat queue.&lt;br&gt;Returns:&lt;br&gt;String - Returns the <code>sys_id</code> of the chat queue user.</td>
</tr>
<tr>
<td>String</td>
<td><strong>getThreadID()</strong>&lt;br&gt;Returns the thread ID. This returns the same value as <code>g_chat.getChannelJID().getID()</code>.&lt;br&gt;Returns:&lt;br&gt;String - Returns the thread ID.</td>
</tr>
</tbody>
</table>

### Legacy: Help desk chat

Communicate with service desk staff using instant messaging.

**Note:** The [Connect Support](https:// servicenow.com) feature provides an updated messaging platform similar to help desk chat. The help desk chat and Connect Support features should not be used concurrently. There is no migration path from help desk chat to Connect Support.

Users can communicate directly with service desk staff using instant messaging in a ServiceNow instance (requires the Chat plugin.)

- Users access live support from the Employee Self-Service portal.
- Service desk staff provide support from the chat desktop.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Legacy: Use help desk chat to get support

You can contact service desk staff.

2. Log in to your ServiceNow account. Only logged in users can use chat.
3. In the upper right, click the **Service Desk Chat** button. A chat window opens.
4. Enter your question in the text field at the bottom of the window and press **Enter**.
   1. A message confirms that you have entered the chat queue and indicates your position and estimated wait time.
   2. When a service desk staff member accepts your chat and begins working on your question, another message appears.
5. Chat with your service desk agent via instant messaging.
   service desk staff may lead you through troubleshooting, ask clarifying questions, or create an incident record to address your question.

**Note:** Administrators can configure Service Desk Chat to be accessible on content management (CMS) pages.

Service Desk Chat Window

Legacy: Use help desk chat to provide support

Staff who are assigned to chat support can provide live support via instant messaging. Administrators and users with the chat_admin role can assign chat support staff (see Set Up Chat Queues for Help Desk Chat).
To provide users with live support using chat:

1. **Navigate to Social IT > Chat** to open your chat desktop.
   - A chat queue agent window appears on your chat desktop for each chat queue you are assigned to. If no agent windows appear, ask an administrator to add you as a member of the assignment group for a chat queue.
   - The chat queue agent window displays the number of users in the queue and how long they have been waiting.
   - Every member of the assignment group sees the associated chat queue agent window.

2. **Click Answer Next User** to answer the next user or click **Answer** beside a specific user in the queue. A chat window opens.
   - Only the agent and the user can see the chat window.

Provide support via instant messaging. Chat queue agents can access additional support functions in the chat window menu:

- **Invite User**: invite another expert to assist with a support chat. An invitation appears in the favorites list of an invited user.

- **Create Incident from Chat**: create a new incident record with the initial question as the short description and the support chat as a linked chat room (accessible from the **Create or Join Chat Room** related link on the Incident form).

**Note:** Administrators can edit this action or add additional actions to the chat window menu.
Legacy: Set up chat queues for help desk chat

Help desk chat allows users to communicate directly with Service Desk staff via instant messaging in an instance.

Chat queues define the schedules, staff, and system messages for help desk chat. Administrators and users with the chat_admin role can set up chat queues.

Define a chat queue for legacy chat

How to define a chat queue for legacy chat.

Note: The Chat Queue (chat_queue) table is also used by Connect Support. Legacy chat and Connect Support should not be used concurrently.

1. Navigate to Social IT > Chat Administration > Queues.
2. Select a chat queue to edit or click New.
3. Enter the chat queue details and click Update or Submit.

Chat queue details

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name that end users see as a title for the queue.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to activate or clear the check box to deactivate the chat queue.</td>
</tr>
<tr>
<td>Assignment group</td>
<td>Select the group that contains the support staff for the chat queue. Every agent sees the chat queue on their chat desktop and can answer any user that is waiting in the queue. To assign staff members to the group, see Assign Service Desk Staff to a Chat Queue.</td>
</tr>
<tr>
<td>Schedule</td>
<td>Select a schedule that defines when a queue is available (see Use Schedules). If the queue is always available, clear the field.</td>
</tr>
<tr>
<td>Question</td>
<td>Enter the initial question that end users see when they open a new Help Desk Chat. For example, How can I help you?</td>
</tr>
<tr>
<td>Confirm problem</td>
<td>(Optional) Enter the confirmation message that end users see when they enter an initial question. For example, Thank you for contacting support. Your problem has been submitted and an agent will be with you shortly.</td>
</tr>
<tr>
<td>Initial agent response</td>
<td>(Optional) Enter the message that end users see when an agent accepts their chat. For example, Thank you for waiting. I am looking into your question now and will be with you shortly.</td>
</tr>
<tr>
<td>Not available</td>
<td>Enter the message that end users see when a Help Desk Chat request is not accepted because the queue is outside its scheduled availability (defined by the Schedule field).</td>
</tr>
</tbody>
</table>

**Assign service desk staff to a chat queue**

Chat queue agents are Service Desk staff that are members of a chat queue’s assignment group.

To assign agents to a chat queue:

1. Navigate to **User Administration > Groups**.
2. Select an existing assignment group or click **New**.
3. Enter or modify the group details (see Create a Group).
4. Right-click the header and select **Save**.
5. In the Group members related list, click **Edit**.
6. Using the slushbucket, add support staff to the group.
7. Navigate to **Social IT > Chat Administration > Queues**.
8. Select the chat queue for which the group provides support.
9. In the Assignment Group field, select the group.
Chat queue group

Make help desk chat accessible to an end user

Users access live support from the Employee Self-Service Portal (ESS Portal).

Users access live support from the Employee Self-Service Portal (ESS Portal). To make a Help Desk Chat queue accessible to end users, add a link to the ESS Portal (requires the Content Management Plugin).

To change the default link in the ESS header:

1. Navigate to Content Management > Headers.
2. Open Portal - Header.
3. In the Chat queue field, enter the chat queue that users access by clicking the link in the ESS header. Clear the field to remove the chat queue link.
4. Click Update.
Add a custom link elsewhere on the ESS portal

How to add a custom help desk chat link on the ESS portal.

1. Navigate to **Content Management > Static HTML**.
2. Click **New**.
3. Enter a Name.
4. In the Static content field, click **Toggle HTML Source** to edit the field in HTML source mode.

5. Create a link to the desired Help Desk Chat queue (see **Link Syntax**).
6. Click **Submit**.
7. Add the new content block to the desired location on the portal (see **Adding Content to the Page**).

**Link syntax**

To open a Help Desk Chat queue from a custom link on the ESS Portal, you must call the `CustomEvent.fire` method using appropriate arguments.

API Call:

```java
CustomEvent.fire(LiveEvents.LIVE_EVENT,
                 LiveEvents.LIVE_WINDOW_JOIN_QUEUE_QUERY, CHAT_QUEUE_SYS_ID,
                 CHAT_QUEUE_SYS_NAME);
```

where the variables are:

- **CHAT_QUEUE_SYS_ID**: Specifies the sys_id for the chat queue.
• CHAT_QUEUE_SYS_NAME: Specifies the name of the chat queue (must match the value the Name field of the chat queue record).

Example: This example creates an anchor link that opens the Help Desk Chat queue.

```html
<a href="#" onclick="CustomEvent.fire(LiveEvents.LIVE_EVENT,
  LiveEvents.LIVE_WINDOW_JOIN_QUEUE_QUERY,
  'c54f0abf0a0b452db84664f409c79c',
  'Help Desk Chat'); return false;">
  Help Desk Chat
</a>
```

Monitor chat queues
Chat queues can yield useful Key Performance Indicators (KPI) for evaluating support effectiveness.

• Queue Wait Time: amount of time a user waits in the queue before a help desk agent accepts the request.
• Percentage of Chats Abandoned: users that exit the queue before an agent responds (user stopped waiting).
• Percentage of Chats Accepted: requests that are answered by an agent.

Note: This information is not calculated automatically. Administrators may calculate these values based on data collected by chat queues.

Monitor help desk chat tasks
Help Desk Chat requests are tracked in the Chat queue entries table, which appears as a related list on the associated chat queue record.

Help Desk Chat requests are tracked in the Chat queue entries table, which appears as a related list on the associated chat queue record. Because this table extends the Task table, administrators can take advantage of core task functionality. For example, administrators can attach Service Level Agreements (SLAs) to chat queue entries to evaluate the response time of Help Desk Chat support.

Live Feed

Live Feed is a social IT application that provides a place to post and share content in a ServiceNow instance.

Live Feed content forms a searchable knowledge source for sharing information within an organization. Main features include the following:

• Users can post, reply to, and rate messages, including links and images.
• Administrators can set up automatic messages that are generated when specific records are updated throughout the system.
• Users can subscribe to receive email notifications when new messages are posted.

Live feed includes different types of feeds.
<table>

- WM Approver added as an approver
- Like • Copy Link • Comment
**Note:** Live Feed v2 is active for all new instances by default. If you are upgrading from an earlier version of ServiceNow, you need to activate live feed v2 to use these features.

Live feed can be domain separated at the data level only. For more information on live feed and domain separation, see [Domain separation in Live Feed](#).

**Live Feed browser support**

The Live Feed v2 plugin does not support Internet Explorer 7 through 9.

Users who access the instance from those browser versions can use Live Feed v1 functionality. Users who access the instance from browsers that are compatible with HTML5 can use Live Feed v2 functionality.

**Activate Live Feed**

Live Feed is active for all instances. An administrator can activate the Live Feed plugin if it is not already active.

1. Navigate to **System Definition > Plugins**.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the **Activate/Upgrade** related link.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
   - If the plugin has optional features that depend on other plugins, those plugins are listed under **Some files will not be loaded because these plugins are inactive**. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. Optional: If available, select the **Load demo data** check box.
   - Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
   - You can also load demo data after the plugin is activated by clicking the **Load Demo Data Only** related link on the System Plugin form.
5. Click **Activate**.

**Administer live feed**

Administrators and users with the live_feed_admin role can configure live feed security and provide access to live feed from content management pages. Administrators can also set up live feed table notifications.

**Document feeds**

A document feed is a live feed group that is associated with a record, such as an incident or change.

Document feeds allow users to work on tasks and other records through the live feed interface. Users can post messages in live feed that are automatically maintained as comments or work notes on the record, if the record has these journal fields.
The benefits of using document feeds include the following.

- Improving communication between users working on the same record.
- Improving visibility into progress for end users.
- Providing a single place to see updates on multiple records.
- Saving conversation history in the record so that knowledge is not lost in an email chain.

To use document feeds, activate the Live Feed Document plugin, which is active by default in new instances. See Use live feed to work on records to learn how to use this feature.

The system automatically creates a document group for the feed when a user follows or shows a record on live feed. The system also creates a document group when a user creates a new record on a table that has live feed enabled.

The following list describes features of the document feed group.

- Is unlisted; it does not appear when users view all groups on live feed.
- Automatically approves membership for every user who can access the record.
- Uses the record number as the group name.
- Uses the record short description as a group description.
- Maintains all messages posted to live feed on the record, if the record has a journal field for comments. If the record has a standard text field for comments, each live post overwrites the field value.
- Maintains all messages posted on the record in live feed if the record has a journal field for comments. When the group is created, existing messages are added to the document feed.

A user who participates in live feed becomes a member of the group.

**Add a live feed UI action on a table**

You can add UI actions on a table to allow users to follow records in live feed.

Role required: ui_action_admin or admin

1. Navigate to System Definition > UI Actions.
2. Open one of the live feed UI actions, for example, the Follow on Live Feed list UI action.
3. In the Table field, select the table name.
4. Right-click the header and select Insert to create a copy of the UI action for the desired table.
5. Repeat steps 1 – 4 for all live feed UI actions.

**Configure document feeds**

You can configure a table to support document feeds.

Role required: personalize_dictionary or admin

Configuring a table to support document feeds includes the following steps:

1. Add live feed to a form header.
2. Add Follow on Live Feed and Show Live Feed as list and form UI actions.

**Security configuration for document feeds**

Document feeds honor the access control rules (ACLs) for the associated record. Users can only view messages on the document feed if they have access to the same information on the record.

Consider the following examples.
If an ACL allows a user to read and create comments on an incident, then the user can view and add messages posted as comments on the incident feed.

If an ACL restricts a user from reading work notes, then the user cannot view messages posted as work notes on the incident feed.

**Note:** Access control rules are only checked when a user first accesses the document feed. After users view the feed, an administrator must remove them manually to change their access.

**Disable a record feed**

You can disable live feed functionality from the form of any table.

Role required: personalize_dictionary or admin

1. Navigate to **System Definition > Dictionary**.
2. Open the dictionary entry for the table.
3. Add `live_feed=false` in the **Attributes** field.
4. Click **Update**.

**Note:** If the Collaboration feature is activated, you can remove the show live feed icon ( _) from all form headers. Set the `glide.live_feed.task_header_button` property to `collaboration`.

**Disable a document feed**

You can disable a document feed from the form of any table.

Role required: personalize_dictionary or admin

1. Navigate to **System Definition > Tables**.
2. Open the table record.
3. Clear the **Live feed** check box.
4. Click **Update**.

**Business rule installed with Live Feed Document**

This business rule is installed with Live Feed Document. There are no tables, roles, or notifications installed with it.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Live Feed integration</td>
<td>Writes journal comments to the live feed if there is a group for this record.</td>
</tr>
</tbody>
</table>

**Record feeds**

A record feed is a live feed group that is associated with a record, such as an incident or change.

Record feeds allow users to work on tasks and other records through the live feed interface. Users can post messages in live feed that are automatically maintained as comments or work notes on the record if the record has these journal fields.
You can use record feeds to:

- Improve communication between users working on the same record.
- Improve visibility into progress for end users.
- Provide a single place to see updates on multiple records.
- Save feed history in the record so that knowledge is not lost in an email chain.

**Live feed document**

*Note:* Many of these features are part of live feed v2.

**Activate live feed document**

The Live Feed Document plugin is active by default.

Administrators can enable record feeds in an instance by activating the Live Feed Document plugin, which activates the Live Feed plugin, if it is not active. For upgrades, administrators must activate the plugin.

1. Navigate to **System Definition > Plugins**.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the **Activate/Upgrade** related link.

If the plugin depends on other plugins, these plugins are listed along with their activation status.

If the plugin has optional features that depend on other plugins, those plugins are listed under **Some files will not be loaded because these plugins are inactive**. The optional features are...
not installed until the listed plugins are installed (before or after the installation of the current plugin).

4. Optional: If available, select the **Load demo data** check box.

Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.

You can also load demo data after the plugin is activated by clicking the **Load Demo Data Only** related link on the System Plugin form.

5. Click **Activate**.

### Configure record feeds

Configure a table to support record feeds. You can add the Show Live Feed button in the form header and add the UI actions Follow on Live Feed and Show Live Feed as List and Form.

By default, the Show Live Feed icon appears on the form header for all tables that extend task, including the Incident, Change Request, and Problem tables, and in the list and form context menus for all task tables.

**Add live feed to a form header**

Add the **Live Feed** button in the form header for a table.

1. Type `sys_properties.list` in the Application Navigator.
2. Open the record for `glide.live_feed.task_header_button`.
3. In the **Value** field, change the value to **both**.

   **Note:** By default, the value is `collaboration` so that the property is supported in the Collaboration (com.glide.collaboration) plugin. Changing the value to **both** allows the system property to be supported in Collaboration and Live Feed.

4. Click **Update**.
5. Navigate to **System Definition > Tables**.
6. Open the table record.
7. If the **Live feed** check box does not appear on the form, **configure the form layout** to add the **Live feed** field.
8. On the form, select the **Live feed** check box.
9. Click **Update**.

   Alternatively, you can add `live_feed=true` to the **Attributes** field in the dictionary entry for the table.

The **Live Feed** button appears on the overflow menu of the form header.
Add live feed to a context menu
Add live feed UI actions on a table.

1. Navigate to System Definition > UI Actions.
2. Open one of the live feed UI action, for example, Follow on Live Feed.
3. In the Table field, select the table name.
4. Right-click the header and select Insert to create a copy of the UI action for the desired table.
5. Repeat steps 1 – 4 for all live feed UI actions.

Disable a record feed
You can disable live feed functionality from the form of any table.

Role required: personalize_dictionary or admin

1. Navigate to System Definition > Dictionary.
2. Open the dictionary entry for the table.
3. Add live_feed=false in the Attributes field.
4. Click Update.

Note: If the Collaboration feature is activated, you can remove the show live feed icon ( ) from all form headers. Set the glide.live_feed.task_header_button property to collaboration.

Configure security
Record feeds honor the access control rules (ACLs) for the associated record.
Users can only view messages on the record feed if they have access to the same information on
the record. For example:

- If an ACL allows a user to read and create comments on an incident, then the user can view
  and add messages posted as comments on the incident feed.
- If an ACL restricts a user from reading work notes, then the user cannot view messages posted
  as work notes on the incident feed.

**Note:** Access control rules are only checked when a user first accesses the record feed.
After users view the feed, an administrator must remove them manually to change their
access.

### Live feed table notifications

Live feed table notifications generate automatic live feed messages. The Live Feed plugin must
be activated to use table notifications.

When a record is inserted or updated on a specific task table and the notification conditions are
met, a message is generated and posted to the specified group or to the company feed. Table
notifications are supported for all task tables and all task types by default.

Administrators and users with the `live_feed_admin` or `chat_admin` roles can set up table
notifications for any table in an instance.

### Set up table notifications for task tables

You can set up a table notification for a task table to enable automatic live feed messages.

**Role required:** `live_feed_admin` or `chat_admin`

1. Navigate to **Collaborate > Feed Administration > Table Notifications.**
2. Click **New** or select a notification to open it.
3. Complete the form.

#### Live Table Notification fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select the table for which notifications are generated.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The list shows only tables and database views that are in the same scope as the table notification.</td>
</tr>
<tr>
<td>Post to chat rooms</td>
<td>Select the check box to generate the notification in chat rooms that are associated with the record, This applies to task records only and requires that the Chat plugin is active.</td>
</tr>
<tr>
<td>Post to live feed</td>
<td>Select the check box to generate the notification on live feed. If record feeds are not set up and the Feed group field is blank, the notification is posted to the company feed.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Record Feeds</td>
<td>Select the fields to post for record feeds. This field is available only if <strong>Post to live feed</strong> is selected.</td>
</tr>
<tr>
<td>Application</td>
<td>Select the application that contains this record.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to enable the notification.</td>
</tr>
<tr>
<td>Insert</td>
<td>Select the check box to generate the notification when a record is inserted into the database.</td>
</tr>
<tr>
<td>Update</td>
<td>Select the check box to generate the notification when a record is updated.</td>
</tr>
<tr>
<td>Feed</td>
<td>Select the live feed team to which you want to post messages. This field is available only if <strong>Post to live feed</strong> is selected. Clear the field to post notifications on the company feed.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Create the condition that must be met to generate the notification. If you add a condition statement, the system evaluates the condition first and parses the <strong>Before script</strong> field only if the condition is met. You may choose to leave this field blank and include conditions in the script.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description of the table notification.</td>
</tr>
<tr>
<td>Message</td>
<td>Construct the automatic message you want to generate. You can include field values as variables and a link to the record. To add a variable, position the cursor in the text and then click the field name in the <strong>Select variables</strong> field. To add a link to the record, enter <strong>${URI}</strong> in the message text as shown in the following example.</td>
</tr>
</tbody>
</table>

```plaintext
High priority incident opened: ${URI}
Short description: ${short_description}
```

Note: For security reasons, any HTML code is automatically stripped out of a message before it is posted.
### Before script

Create a script that runs before a notification is generated. The script runs only if the condition evaluates to true or is empty. The following variables are available in the script:

- `current`: the GlideRecord object that triggered the notification.
- `changedFields`: an ArrayList of fields changed on submit. Use `changedFields.contains("fieldname")` to check for change.
- `answer`: set answer to false to cancel the notification.
- `profileSource`: set to a valid GlideRecord object to define the profile that is posting the message.
- `profileID`: set to a live_profile sys_id to define the profile that is posting the message; by default it is the current record. Overrides `profileSource` if both are specified.

Any custom variable created in the script is also exposed to the message in the form of `${myVariableName}`.

#### Set up table notifications for non-task tables

Table notifications are supported for all task tables by default, and you can set up a table notification for any other table.

**Role required:** `live_feed_admin` or `chat_admin`

1. Navigate to **System Definition > Business Rules**.
2. Open the **live feed events** business rule.
3. In the Advanced section, select and copy the text in the **Script** field.
4. Click the back arrow on the top left to exit the record and return to the Business Rules list.
5. Click **New**.
6. Enter the following values at the top of the form.
   - **Name**: Enter a name, such as `live feed events for my table`.
   - **Table**: Select the table for which you are setting up a notification.
   - **Active** and **Advanced**: Select these check boxes.
7. In the **When to run** section, enter the following values.
   - **When**: Select **before**.
   - **Insert**, **Update**, and **Delete**: Select the check boxes.
8. In the **Advanced** section, paste the script from the `live feed events` business rule into the script box.
9. Click **Submit**.
The **live feed events** business rule runs on the non-task table. It fires the **live_feed.update** event, which is associated with the **Live Feed Update** script action. The script action sets up variables and processes the table notifications.

After saving the business rule, create a **live feed table notification record** for the new table as you would for a task table.

**Live feed table notification examples**

The following examples demonstrate how to set up different types of table notifications that are useful for live feed.

*Workaround posted*

This example demonstrates a table notification that generates an automatic message on live feed whenever a workaround is added to an open problem.

- **Table**: Problem (problem)
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to live feed**: Select the check box.
- **Conditions**: (State) (is) (Open)
- **Description**: Workaround Posted
- **Message**:

  ```
  ${sys_updated_by} posted a workaround for ${URI}. 
  Short description: ${short_description}
  ```

- **Before script**:

  ```
  // only post to live feed when the Workaround field changes 
  answer  = changedFields. contains ( "work_around" ) ;
  ```
Example workaround message

Problem resolved (advanced)
This advanced example demonstrates a table notification that generates an automatic message on live feed whenever a problem is closed.

It also adds a message about the assigned user and posts the message from the assignment group profile instead of the problem record.

- **Table**: Problem (problem)
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to live feed**: Select the check box.
- **Conditions**: (Problem State) (is) (Closed/Resolved)
- **Description**: Problem Resolved
- **Message**: Problem $\{\text{number}\} - \{\text{short\_description}\}$ has been resolved. $\{\text{fixed\_by\_msg}\}$

- **Before script**:

  ```
  //cancel if we didn't just change the problem state if ( !changedFields.
  contains ( "problem\_state" ) )
  answer = false ;
  ```
//if we have an assigned_to value add a comment about who it was //create a new variable fixedByMsg that we can access from the message
fixedByMsg  ="" ; if ( !current. assigned_to. nil() )
fixedByMsg  = " Thank you " + current. assigned_to. getDisplayValue();

//make the message appear to come from the assignment group if we have one if ( !current. assignment_group. nil() )
profileSource  = current. assignment_group. getRefRecord(); //need GlideRecord object

Example problem resolved message

Opportunity won (non-task)
This example demonstrates a table notification on a non-task table. It generates an automatic message on live feed whenever a sales opportunity is won, if you have activated the Sales Force Automation plugin.
Create a business rule on the Opportunity (sales_opportunity) table that matches the live feed events business rule on the task table.

Create a table notification with the following values:

- **Table**: Opportunity (sales_opportunity)
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to live feed**: Select the check box.
- **Conditions**: (State) (is) (Closed Won)
- **Description**: Opportunity won
- **Message**:

```
${owner} closed a sale with ${account}!
```

- **Before script**:

```
//make the message appear to come from the assigned salesperson if there is one if ( !current. owner. nil() )
profileSource = current. owner. getRefRecord(); //need GlideRecord object
```

Example opportunity won message

Related feeds table notification
This example demonstrates table notifications to be sent out to related feeds.
For this example, whenever the status of a story changes to **Complete**, a table notification message is sent to the related sprint, release, or epic. Messages are posted only if the related feed already exists; this notification does not create a new feed.

- **Table**: Story (rm_story)
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to live feed**: Select the check box.
- **Record feeds**: Move Sprint, Release, and Epic to the **Selected** column.
- **Conditions**: (State) (changes to) (Complete)
- **Description**: Story is done; message to Epic, Release, and Sprint
- **Message**:

  \[\text{${URI}$ status changed to } \text{${state}$} \]

**Live feed security and table access**

By default, administrators and users with the live_feed_admin role can configure live feed security and view all live feed tables.

You can also modify the following live feed tables.

- **Live Table Notification** (live_table_notification): set up automatic messages that are generated when specific records are updated throughout the system.
- **Live Feed Message** (live_message): modify only if necessary, such as to delete an inappropriate message or restore a message that a user accidentally deleted. This table is typically managed by system functionality.

Extending or modifying data in any live feed chat table is not recommended.

**Domain separation in Live Feed**

This is an overview of domain separation and Live Feed. Domain separation allows you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

**Overview**

Domain separation in this application is supported at the **Data only** level, meaning it supports the data security model of separating visibility of data from one domain to another. To learn more, see Application support for domain separation.

Parent and child domains define the live feed content that can be viewed and shared with other users.

- A user in a parent domain can see users and content within their domain and within all child domains that are lower in the domain hierarchy.
- A user in a child domain can see users and content within their domain but cannot see the parent domain or other child domains at the same level in the domain hierarchy.

**Enable domain separation for live feed**

Domain separation for the Live Feed application is available starting with the Eureka release. For users upgrading to Eureka, a sys_domain column is added to existing live feed-related database
tables. For existing database records, the value of the sys_domain field is set to empty (global). This allows the domain separation feature to work with existing live feed records.

**Show or hide the live feed application for a domain**

The administrator can live feed visibility for a domain. This includes:
- Displaying live feed in the application navigator.
- Following a document feed for a record.
- Viewing live feed from a record.

**Use live feed with domain separation**

All of the live feed features are available to users within a domain and work the same way, with some exceptions to visibility.

- **Posting and sharing content**
  - Users in a child domain can interact with other users in the same domain. This includes posting and replying to messages, deleting messages, attaching files and links, and rating content.
  - Users in a parent domain can interact with other users in the same domain and with users in any child domains. Messages that are added to child threads by parent users are given the visibility of the child domain, not the parent domain.

- **Viewing content**
  - Users in a child domain can view content that resides within their domain. This includes filtering by feed, sorting, searching, and viewing older messages.
  - Users in a parent domain can view content that resides within their domain and within any child domains.
  - My Feed shows messages, teams, and hashtags based on the user's domain. Showing another user's feed only shows posts visible in the current user's domain.

- **Using hashtags**
  - Hashtags are separated by domain. Users in a child domain can use all of the hashtag functions within their domain. This includes tagging messages, viewing available hashtags, changing hashtag names, and searching and filtering by hashtag.
  - Users in a parent domain can use all of the hashtag functions within their domain and can see hashtags in any child domains.

- **Using teams**
  - Teams are separated across domains. Users in a child domain can join and follow teams within their domain, and can invite other users within their domain to join teams.
  - Users in a parent domain can join and follow teams that belong to their domain or to any child domains.

- **Exceptions to teams**
  - New teams are created in the user's domain. However, if the team has a record associated with it, the team is created in record's domain.
  - New threads in an existing team are created in the domain of the existing team.
  - When a user is creating a new team from a document, if the document domain is not empty or global, the team domain needs to be changed to be the document's domain.
For a document-generated team, when the domain of the document changes, the domain of all related live feed records changes as well.

- Subscribing to email notifications
  - Users can subscribe to email notifications from users and teams within their domain only.

**Limit live feed access by role**

All active users in the instance have access to live feed by default.

*live_feed_admin* and *admin*

1. Complete the following steps to define the roles that allow users to see the Live Feed module.
   a) Perform the appropriate action for your version of the UI:
      - UI16: Navigate to **System Definition > Application Menus > Collaborate** and select **Live Feed**.
      - UI15: Right-click the icon beside the Live Feed module and select **Edit Module**.
   b) Enter the roles that have access in the **Roles** field.
   c) Click **Update**.

2. Complete the following steps to define the roles that allow users to see live feed from a mobile device.
   a) Navigate to **System Definition > Applications (Mobile)**.
   b) Click **Live Feed**.
   c) Enter the roles that have access in the **Roles** field.
   d) Click **Update**.

3. Use the following settings in the Access Control form to create access control rules to limit who can view the live_feed pages.
   - **Type**: ui page
   - **Operation**: read
   - **Name**: create one access control rule record for each of the following pages
     - live_feed
     - live_feed_small
     - $live_feed
     - $live_feed_small
   - **Requires role**: in this related list, add roles to define who can access the live feed pages.
     Users who do not have these roles cannot access live feed.

**Manage live feed message content**

Users can remove their own messages from feeds. If necessary, administrators can remove inappropriate messages that are posted by any user.

*live_feed_admin* and *admin*

For security reasons, any HTML code is automatically stripped out of a message before it is posted. This measure ensures that users cannot modify any page settings by posting a message.

1. Navigate to **Collaborate > Feed Administration > Messages**.
2. Open the message to be removed.
3. In the State field, select deleted. You may need to configure the form to add this field.
4. Click Update.

**Live feed team security**
You can restrict who can create teams by modifying an access control rule.
Modify the following access control rule.
- **Table**: Live Group Profile (live_group_profile)
- **Operation**: create

**Restrict hashtag renaming**
You can restrict who can rename hashtags.
You restrict hashtag rename by modifying the following access control rule:
- **Table**: Live Tag (live_tag)
- **Operation**: write

**Provide access to live feed from CMS pages**
You can provide access to live feed from pages built in the Content Management System (CMS).
For example, allow an end user to access your company feed via the ESS portal.
Role required: content_admin or admin
The ESS Portal template includes the **Portal - Live page** and **Live Feed** dynamic blocks. To provide access to live feed from CMS pages, add the Live Feed dynamic block to a CMS page or include **Portal - Live page** in a site.
1. Navigate to **Content Management > iFrames**.
2. Click **New**.
3. Enter the iFrame block details.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name such as <strong>Live Frame</strong>.</td>
</tr>
<tr>
<td>Frame Name</td>
<td>Enter a frame name, such as <strong>live_frame</strong>.</td>
</tr>
<tr>
<td>URL</td>
<td><a href="https://INSTANCE/live_feed.do?sysparm_doctype=true">https://INSTANCE/live_feed.do?sysparm_doctype=true</a></td>
</tr>
<tr>
<td></td>
<td>where INSTANCE is your instance URL (example, .service-now.com)</td>
</tr>
<tr>
<td>Application</td>
<td>Displays scoping information.</td>
</tr>
<tr>
<td>Sizing</td>
<td>Select <strong>Fixed Size</strong> and enter height and width pixel dimensions according to the page where you plan to display the feed (for example, width of 1024 and height of 768).</td>
</tr>
</tbody>
</table>

4. Click **Submit**.
5. Add the block to a page.
Components installed with live feed

Several types of components are installed with Live Feed.
Demo data is available with Live Feed.

Tables installed with live feed

Live Feed plugin installs the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link attachments (live_link)</td>
<td>Stores links and attachments that are added to messages.</td>
</tr>
<tr>
<td>Live Favorite (live_favorite)</td>
<td>Stores the favorite conversations, user groups, and messages.</td>
</tr>
<tr>
<td>Live Feed Searches (live_feed_search)</td>
<td>Stores live feed text searches. Access at Collaborate &gt; Feed Administration &gt; Search Log.</td>
</tr>
<tr>
<td>Live Follows (live_follow)</td>
<td>Maintains users’ follow preferences for user feeds.</td>
</tr>
<tr>
<td>Live Group Profile (live_group_profile)</td>
<td>Stores conversation properties, including name, description, and public status. Also stored are user group properties, such as name, description, and public status.</td>
</tr>
<tr>
<td>Live Group Member (live_group_member)</td>
<td>Maintains the member lists for conversation and user group.</td>
</tr>
<tr>
<td>Live Mention (live_mention)</td>
<td>Stores the profiles mentioned in a message. References sys_user table.</td>
</tr>
<tr>
<td>Live Message Tag (live_message_tag)</td>
<td>Stores messages associated with user-created tags. Appears as a related list on Live Tag records.</td>
</tr>
<tr>
<td>Live Poll (live_poll)</td>
<td>Stores a poll question.</td>
</tr>
<tr>
<td>Live Poll Cast (live_poll_cast)</td>
<td>Stores profiles of users who voted for a particular option in a poll.</td>
</tr>
<tr>
<td>Live Poll Options (live_poll_option)</td>
<td>Stores poll options.</td>
</tr>
<tr>
<td>Live Table Notification (live_table_notification)</td>
<td>Generates automatic table notifications, such as when a user reads live feed for the first time and when a high priority incident is opened. Access at Collaborate &gt; Feed Administration &gt; Table Notifications.</td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Live Tag</td>
<td>Maintains user-created tags. Access at <strong>Collaborate &gt; Feed Administration &gt; Tags.</strong></td>
</tr>
<tr>
<td>(live_tag)</td>
<td></td>
</tr>
<tr>
<td>Live Tag Follows</td>
<td>Maintains users’ follow preferences for tags.</td>
</tr>
<tr>
<td>(live_tags_follow)</td>
<td></td>
</tr>
<tr>
<td>Messages Liked by</td>
<td>Maintains like ratings for posts. Access at <strong>Collaborate &gt; Feed Administration &gt; Likes.</strong></td>
</tr>
<tr>
<td>(live_message_like)</td>
<td></td>
</tr>
</tbody>
</table>

**User roles installed with Live Feed**

Live Feed plugin installs the following user roles.

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>live_feed_admin</td>
<td>Can manage live feed functions. For example, users with the <code>live_feed_admin</code> role can:</td>
</tr>
<tr>
<td></td>
<td>· <strong>Set up table notifications for task tables.</strong></td>
</tr>
<tr>
<td></td>
<td>· <strong>Set up table notifications for non-task tables.</strong></td>
</tr>
<tr>
<td></td>
<td>· <strong>Limit live feed access by role.</strong></td>
</tr>
<tr>
<td></td>
<td>· <strong>Manage live feed message content.</strong></td>
</tr>
<tr>
<td>chat_admin</td>
<td>Can manage chat functions (if the Chat plugin is activated). For example, users with the <code>chat_admin</code> role can:</td>
</tr>
<tr>
<td></td>
<td>· <strong>Change chat room message read access.</strong></td>
</tr>
<tr>
<td></td>
<td>· <strong>Define chat room access rights.</strong></td>

## Email notifications installed with Live Feed

Live Feed plugin installs the following email notifications.

<table>
<thead>
<tr>
<th>Email notification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Live Feed Feed Member Accepted</td>
<td>Sends an email to the administrator when a user has accepted to join the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Declined</td>
<td>Sends an email to the administrator when a user has declined to join the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Invited</td>
<td>Sends an email to a user when they have been invited to join a feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Left</td>
<td>Sends an email to the administrators when a user has left the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Removed</td>
<td>Sends an email to user when they have been removed from the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Request</td>
<td>Sends an email to administrators when an user requests to join a feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Request Accepted</td>
<td>Sends an email to the user when their request to join a feed is accepted.</td>
</tr>
<tr>
<td>Live Feed Feed Request Rejected</td>
<td>Sends an email to the user when their request to join a feed has been rejected by an administrator.</td>
</tr>
<tr>
<td>Live Feed MsgReply Subscription</td>
<td>Sends an email when a reply or reply_to_reply message is inserted into the thread of a message in a feed.</td>
</tr>
<tr>
<td>Live Feed Team Member Accepted</td>
<td>Sends an email to administrators when a user accepts an invitation to join a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Declined</td>
<td>Sends an email to administrators when a user declines an invitation to join a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Invited</td>
<td>Sends an email when a user is invited to join a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Left</td>
<td>Sends an email when a user leaves a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Removed</td>
<td>Sends an email when an administrator has removed a user from a team.</td>
</tr>
<tr>
<td>Email notification</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Live Feed Team Member Request</td>
<td>Sends an email when a user requests to join a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Request Accepted</td>
<td>Sends an email when a user's request to join a team is accepted.</td>
</tr>
<tr>
<td>Live Team Member Request Rejected</td>
<td>Sends an email when a user's request to join a team is rejected.</td>
</tr>
<tr>
<td>Live Message All Subscription</td>
<td>Sends an email to subscribed users when any message (new or reply) is posted.</td>
</tr>
<tr>
<td>Live Message Feed Subscription</td>
<td>Sends an email when a new message is inserted into a feed.</td>
</tr>
<tr>
<td>Live Message Liked</td>
<td>Sends an email to the creator of a message when another user likes the message.</td>
</tr>
<tr>
<td>Live Message Mention</td>
<td>Sends an email to a user when that user is mentioned in a message.</td>
</tr>
<tr>
<td>Live Message New Posts Subscription</td>
<td>Sends an email to subscribed users when a new (not reply) message is posted.</td>
</tr>
<tr>
<td>Live Message Reply</td>
<td>Sends an email to all users in a feed thread when a user posts a reply (live_message.replied event).</td>
</tr>
</tbody>
</table>

**Use Live Feed**

Live Feed provides many methods you can use to share content with others in your organization. Depending on your role, there are several different types of feeds you can access, teams you can join and share information with, and hashtags you can use for categorizing messages.
<table>
<thead>
<tr>
<th>Company Feed -</th>
</tr>
</thead>
<tbody>
<tr>
<td>Share your thoughts</td>
</tr>
<tr>
<td>User: System Administrator</td>
</tr>
<tr>
<td>23 minutes ago</td>
</tr>
<tr>
<td>#MacBook tag testing</td>
</tr>
<tr>
<td>Like · Copy Link · Hashtags (1) · Comment</td>
</tr>
<tr>
<td>User: System Administrator</td>
</tr>
<tr>
<td>23 minutes ago</td>
</tr>
<tr>
<td>now it is working fine</td>
</tr>
<tr>
<td>Like · Copy Link · Comment</td>
</tr>
<tr>
<td>User: System Administrator</td>
</tr>
<tr>
<td>2 years ago</td>
</tr>
<tr>
<td>We’re considering using Live Feed to replace #Lync for collaboration. Thoughts?</td>
</tr>
<tr>
<td>Like · Copy Link · Hashtags (1)</td>
</tr>
<tr>
<td>User: Ramon Amaral</td>
</tr>
<tr>
<td>Excellent idea! So much easier to use and we already use it for everything else.</td>
</tr>
</tbody>
</table>

Example image
Note: Live Feed v2 is active for all new instances by default. If you are upgrading from an earlier version of ServiceNow, you need to activate Live Feed v2 to use these features.

Use hashtags in Live Feed

Hashtags are words marked with a hash symbol (#) in messages. Hashtags are a way to categorize messages by keyword or topic for improved search results.

For example, to identify messages associated with VPN questions, add the hashtag #VPN in the message text.

Note: Many of these features are part of live feed v2. If you are using live feed v1, or have not activated live feed v2, see Legacy Live Feed.

Tag messages

To tag a keyword or topic in a message, enter a # symbol before the word. A link to the hashtag is added beneath the message and all feed users can search and filter by the hashtag to find the message.

Tips for using hashtags effectively include:

- Limit the number of hashtags per message (no more than 3 is a good guideline).
- Use hashtags only in messages that are relevant to the tagged topic.
- Write a message first, and then add hashtags only if they add value. Answer the question, "What are you working on?", rather than "What hashtags apply to what you are working on?"
- Use camel case to create a hashtag that is more than one word long. For camel case, remove the space and use an uppercase letter to start each word. For example, to create a topic about the service desk, use #ServiceDesk.
Tag

View an available hashtag

View a hashtag from any feed.

1. Navigate to Collaborate > Live Feed.
2. Click Hashtags in the sidebar.

Any hashtags already defined are displayed. Up to 36 hashtags can be displayed, and options are available for searching and sorting the hashtags. When searching, you do not need to include the hash symbol (#).
3. Click a hashtag to view all messages containing that hashtag.

Change a hashtag name and merge a hashtag

Over time, users may create many hashtags with similar names, such as competitive, competitor, and competition. To combine hashtags for better searching and filtering, change the names of similar hashtags to a standard name.

Administrators can restrict who can rename hashtags.

1. Navigate to Collaborate > Live Feed.
2. Click Hashtags in the sidebar to reveal the currently defined hashtags.
3. Turn off the filter to show all hashtags.
4. Point to the hashtag you want to change. If you have the rights to edit hashtags, an edit tag appears.
5. Click the edit tag icon.

### Hashtags

<table>
<thead>
<tr>
<th>Hashtag</th>
<th>Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>Competitive</td>
<td>1</td>
</tr>
<tr>
<td>Competitor</td>
<td>1</td>
</tr>
<tr>
<td>joined</td>
<td>3</td>
</tr>
<tr>
<td>Email</td>
<td>4</td>
</tr>
<tr>
<td>WiFi</td>
<td>1</td>
</tr>
<tr>
<td>Lync</td>
<td>2</td>
</tr>
<tr>
<td>VPN</td>
<td>1</td>
</tr>
<tr>
<td>SAP</td>
<td>1</td>
</tr>
<tr>
<td>SSO</td>
<td>1</td>
</tr>
<tr>
<td>MacBook</td>
<td>1</td>
</tr>
<tr>
<td>Excel</td>
<td>1</td>
</tr>
</tbody>
</table>

**Edit tag**

6. Enter a new hashtag name.
7. Press Enter.
   - If the new name is different than the other hashtags, the new hashtag name replaces the old hashtag name on the list and in the text of any messages that include the hashtag.
   - If the name is the same as one of the existing hashtags, the hashtags will be merged. For example, if you have two hashtags called Competitive and Competitors, and you change the name of Competitors to Competitive, all of the messages previously tagged Competitors are changed to Competitive and the Competitors hashtag is removed.

**Note:** If a hashtag is removed from the message, renaming that hashtag does not change the message text.

### Add an image to a hashtag

You can add an image at the domain level of already defined hashtags if you have the admin role.

1. Click Hashtags in the sidebar.
2. Select the appropriate hashtag.

3. Do one of the following:
• Locate the image in your file system, and then drag-and-drop the image onto the add an image icon ( ![Add Image Icon](https://example.com/addimageicon.png)).

• Click the add an image icon ( ![Add Image Icon](https://example.com/addimageicon.png)), select the image file, and click Open.

4. To change the image, simply drag-and-drop a new image onto the old one, or click on the existing one and select a new image.

When you view a message that contains a hashtag with an image, that image appears in the hashtag heading bar.

Follow and unfollow a hashtag

You can view all postings assigned a specific hashtag by following the hashtag. You can also unfollow the hashtag if you no longer want to view those postings.

1. Navigate to Collaborate > Live Feed.
2. Click Hashtags in the sidebar.
3. Select the hashtag you want to follow.
4. Click Follow.
Follow tag

A confirmation message appears.

5. Click X to dismiss the message.
   To unfollow a hashtag, repeat the same steps and click Unfollow.

Bookmark hashtags

The live feed interface uses the standard bookmarking functionality for hashtags.

In UI15, the live feed interface uses the standard bookmarking functionality for hashtags. You can drag-and-drop group feeds and hashtags from the Feed Summary section to the Edge for quick access.
Remove a hashtag from a posted message

As a participant in a conversation, you can remove hashtags from messages that have already been posted.

1. Navigate to the posted message.
2. Click Hashtags in the message posting.

The hashtags associated with the message are displayed, along with the removal icon.
3. Click the removal icon.

**Use teams in Live Feed**

Users can be combined into teams for the purpose of subscribing to specifically-focused feeds. Teams can be created based on any criteria that makes sense for your organization. For example, you can create a team called IT Developers and subscribe the team to feeds such as Coding Standards, AngularJS Development, and ServiceNow Customization Best Practices. When a new developer is added to the IT Developers team, that user automatically has rights to participate in all of the feeds followed by the team.

**Create a live feed team**

When you create a team, you become the team administrator. As team administrator, you can:

- Modify team properties
- Accept or reject membership requests
- Remove members from the team
- Delete the team

1. Navigate to **Collaborate > Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. Click **Create Team**.

4. Enter a **Name** to appear at the top of the feed and in messages posted to the team. This name links to the team feed.
5. Enter a **Description** to appear at the top of the feed and under the team name in the list of all teams.

6. Select the access level for the team:

   - **Public Team**: In the list of all teams, any user can see the name of this team. Any user can also see the feed and join the team. Messages in a public team appear in the Company Feed with a link to the team feed.
   - **Private Team**: In the list of all teams, any user can see the name of this team, but not the feed. Messages in private teams do not appear on the Company Feed.

   When **Private Team** is selected, the **Show this team for anyone to find and request to join** check box is displayed. Select this check box to allow any user to search for this team and request to join it. Clear the check box to allow only invited users to see the feed and join the team.

7. Click **Create**.
   The team is created with you as the team administrator.

**Note**: A team administrator can create one or more group feeds specifically for the members of this team by clicking the **Group Feeds** tab and **Create Group Feed**. Additionally, the team can be invited to join a feed. Having multiple feeds for the team facilitates focused discussions on topics of interest to the team and allows the team to selectively invite other teams and members to collaborate on specific feeds.
Automatic team creation

If you create a record on a table that has live feed enabled, such as the Incident table, and click Follow/Show Live Feed for the record, a record feed is created for the record.

The record feed name is based on the table name.

Join a team

You can join a public team, accept an invitation, or request access to a team.

As a team member, you can:

- View messages posted to the team (team feed). Non-members can also view the feed for a public team.
- View a list of team members.
- Invite another team to join the team.
- Subscribe to team email notifications.
- Leave the team.

1. Navigate to Collaborate > Live Feed.
2. Click Teams and click All Teams.
   - If you received an invitation, click Accept. You can Decline the invitation if you do not want to join the team.
   - If the team is public, click Join.
   - If the team is private, click Request. The team administrator receives an email notification and must accept your request before you can join the team.

View a team feed

View a team feed to see messages belonging to that team.

1. Navigate to Collaborate > Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
   - To view a team you belong to, select the team name.
   - To view a public team you do not belong to, select All Teams and then click the team name.
     You must be a member to view the feed for a private team.

View a team member

View a list of members belonging to a live feed team.

1. Navigate to Collaborate > Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. From the team list, select the team name.
   You must be a member of the team to view the members.
4. Click Members.
   The list of team members appears, organized by team administrators and team members.

Invite a new member

You can invite another user to join a team.

1. Navigate to Collaborate > Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. From the team list, select the team name.
4. Click the Pending members tab.
5. In the Add User field, enter the name of the user you want to invite. The invited member's picture appears.

Remove a member

If you are team administrator, you can remove any member from the team.

1. Navigate to Collaborate > Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. From the team list, select the team name.
4. Click the Members tab.
5. Click **Remove** below the member name.
6. Click **Remove** again in the confirmation box that opens.

**Note:** You can remove members regardless of their current state. That is, you can remove members who have already joined the team or whose membership is pending.

**Subscribe to team and email notification**

Users can subscribe and unsubscribe to receive email notifications generated by feeds the team participates in.

Email notifications are generated whenever actions such as posting messages, replies, likes, polls, and @mentions are performed.

All notifications related to a top-level message, such as replies, mentions, and likes, are sent out with the same subject. The subject line defaults to **Live Feed** followed by the beginning of the subject line from the top-level message. For example, if the subject of the feed is **IT Support**, the email notification’s subject will be **Live Feed IT Support**.

1. Navigate to **Collaborate > Live Feed**.
2. Click **Teams** and select the team name.
3. Click the subscribe icon ().
You can click the unsubscribe icon ( ) to stop receiving email notifications.

Subscribe a team to feed notification
A team administrator can subscribe a team to specific feeds so the members of the team receive email notifications.

1. Navigate to Collaborate > Live Feed.
2. Click Teams and select the team name. You can use the advanced search to locate team of which you are the administrator.
3. Click Feeds.
4. Click the subscribe icon ( ) beside the feed name.

You can click the unsubscribe icon ( ) to stop receiving email notifications.

Reply to email notifications using email
After receiving an email about a posted message or a reply, you can reply to live feed with your email client.

The body of the reply email becomes a reply to the live feed message. Any attachments included in your reply email are included in the live feed reply.

Leave a team
You can give up membership to a team by leaving that team.

1. Navigate to Collaborate > Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. Click Leave beside the team name.

Modify a team
If you are team administrator, you can modify an existing team.

1. Navigate to Collaborate > Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. From the team list, select the team name.
4. Click the edit icon ( )
5. Modify the team properties as needed.
6. Click Save.

Manage a membership request
When a user requests membership to a private team, the team administrator receives an email.

If you are the team administrator, you can manage membership requests.

1. Navigate to Collaborate > Live Feed.
2. Click Teams and select the team name.

If one or more users have been invited to the team, the Pending members tab shows the number of invitations sent.
Pending members

3. Click **Pending members**.

This shows the users who have received invitations, but who have not yet accepted.
invited members

4. You can cancel a user's invitation by clicking **Remove**.
5. You can invite another user to the team by entering their name in the **Add user** field and clicking the Invite member (_person_ ) button.

**Delete a team**

If you are the team administrator, you can delete a team.

1. Navigate to **Collaborate > Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. From the team list, select the team name.
4. Click the edit icon ( _person_ )
5. Click **Delete**.
6. Click **Yes** to confirm deletion. The team is deleted from live feed. Messages posted to a private team are deleted; messages posted to a public team remain on the company feed without a team link. 

If you delete a team that is associated with an active record, such as an incident that has not yet been closed, the team becomes active again when any user modifies that record or follows the record on live feed. The first user who modifies the record becomes the team administrator. The previous messages that existed as part of the record feed are not deleted.

**Use live feed to work on records**

A record feed is associated with a record, such as an incident or change.

Record feeds help users collaborate on records by providing a place for anyone who can access the record to share messages and post attachments specific to that record.

With record feeds, users can:

- Follow record feeds and post messages in live feed. These messages can also be automatically maintained in the comments or work notes journal fields on records.
- View live feed from records.
- Work on multiple records from **My Feed**.
- Access live feed team functions, such as sending invitations and subscribing to email notifications.

Any users with access to the record can also use the record feed. By default, record feeds are available on the incident, change, and problem tables. Administrators can configure record feeds for additional tables.
Live Feed Document

How Document Feeds Work

The Live Feed application creates a document group for each document feed. The document group:

- Automatically approves membership for every user who can access the record.
- Uses the record number as the group name.
- Uses the record short description as a group description.
• Maintains all messages posted on the record in live feed (if the record has a journal field for comments). When the group is created, existing messages are added to the document feed.
• Lists the group when users select **View all groups** on their live feed interface, unless the record associated with the document feed has been closed. When the state of the record is closed, the live feed group becomes inactive and unlisted.
• Automatically adds users to the document group when they view the record.

**Document Group Creation**

When a user follows or shows a record on live feed, a live feed group is automatically created and associated to the record (if one does not already exist). The user becomes a member of the group and can use live feed to work on the record. If the user can access work notes on the record, the user also becomes a group administrator.

A live feed group is also automatically created when a user creates a record on a table that uses document feeds, such as the Incident table. The user who creates the record becomes the administrator of the group, and any other user who modifies the same record automatically joins the group.

**Add Live Feed to a homepage**

Add live feed to a homepage so it is the first thing you see when you log in.

1. Click **Add** content at the top of the homepage.
2. Select **Live Feed** in the left panel.
3. On the bottom of the window, click **Add here** in the appropriate layout position, then close the window.

**Note:** Administrators can add live feed to a global homepage to make it available for all homepage users by default. By default, users with any role can add live feed to their homepage. Administrators can restrict this ability.
Modifying and deleting document feeds

The user who creates a record feed becomes the group administrator, which allows the user to modify the following record feed properties.

- **Name**: default value is the record number.
- **Description**: default value is the record short description.
- **Picture**: default value is a thumbnail image of the record.

Feed administrators can also delete the feed. When deleted, the feed is removed from live feed but messages remain in the journal field of the associated record.

Viewing Live Feed from records

Interact with the record feed in any form that has live feed enabled.
The record feed appears in a pop-up window. The record feed also appears on the record form's activity formatter if the administrator enables the record feed system property (glide.ui.show_live_feed_activity).

To access a record feed from the form, do one of the following:

- Click the **Show Live Feed** button in the form header. This displays the live feed pop-up.
- Right-click the form header and select **Show Live Feed**. This also displays the live feed pop-up.
- Scroll down to the activity formatter area on the form. Click one of the following tabs:
  - **Live Feed**: click to show a text box to type in the feed.
  - **Activity**: click to show the activity summary. The activity filter determines the content in the activity summary.
If the activity formatter or the Live Feed and Activity tabs are not visible, administrators can do the following:

- Configure the form layout and add Activities (filtered) to the form. This adds the activity formatter.
- Personalize the form layout and add Activities (filtered) to the form. This adds the activity formatter.
• Go to **System Definition > Tables**, access the table associated with the record, and verify that the live_feed dictionary attribute is set to true on the form. This adds live feed to the activity formatter.

• Go to **Collaborate > Feed Administration > Properties** and enable the following property: **Toggle the display of the live feed tab in the activity formatter**

**Working with record feeds**

When a user follows a record, the user becomes a member of a private group for the record.

Team members can:

- View the record feed from live feed.
- View a list of group members (other users who are following the record).
- Invite another user to join the group. Only users who have access to the record have access to the record feed.
- Subscribe to email notifications.
- Leave the team to stop following the record.

*Follow a record feed from a form*

You can follow records that have a record feed associated with them from within the record form.

1. Navigate to the record in a list or form.
2. Click the **Show on Live Feed** icon in the header.
Follow Task

Follow a record feed from a list
You can follow records that have a record feed associated with them when viewing a list of records. This method allows you to select multiple records to follow.

1. Navigate to a list of records (for example, Assigned to me).
2. Select the Action check box beside each record to follow.
3. In the Actions choice list, select Follow on Live Feed.
Follow My Tasks

Post a message to a record feed
Use live feed to post a message to a record feed.

1. Open the record feed in one of the following ways:
   - From your homepage (must already be following the record)
   - As a team in live feed (must already be following the record)
   - From My Live Feed (must already be following the record)
   - From the Live Feed pop-up window
   - From the Live Feed tab on the activity formatter
   - Click the Show Live Feed button (💬) in the form header.

2. Compose the message and add images and links.
3. (My Live Feed only) In the To list, select the record where you want to post the message.
4. (Optional) Select the Work Notes check box to post the message as a work note. Only users with access to work notes on the record can post and see work notes. This option is only available for records that have a journal field.
5. Click Post.

Note: If the record has journal fields for comments or work notes, your message is automatically added to the appropriate field on the record. If the record has a standard text field for comments on the activity formatter, each live post overwrites
Use feeds in Live Feed

Feeds allow users to create focused discussions in Live Feed.

Live feed includes different types of feeds. The user who creates a group or record feed becomes the feed administrator. This user configures the access level for the feed:

- **Public**: any user can see the name on the list of all feeds, view the feed, and join it. Messages appear on the company feed with a link to the public feed.
- **Private**: any user can see the name on the list of all feeds, but only invited members can view the feed and join. Messages do not appear on the company feed.

**Note**: The concept of groups has changed in live feed v2 (starting with the Fuji release).

Create a group feed

Group feeds are created by users so that members with similar interests can find that information in one place. Individual users or teams can join group feeds.

1. Navigate to **Collaborate > Live Feed**.
2. Click **Group Feeds** and click **All Feeds**.
3. Click **Create Group Feed**.
4. Enter the feed name and description. These will appear in the list of group feeds.
5. Indicate how members can join the feed:
   - **Public Feed**: Select this to allow anyone to view and join the group feed.
   - **Private Feed**: Select this to restrict membership to only members invited by the administrator.
When Private Feed is selected, the Show this feed for anyone to find and request to join check box is displayed. If it is selected, any user can search for this group feed and join it. If the check box is not selected, only users who are invited can see the feed and join the group feed.

6. Click Create.

Create record feeds

When a user views a record on a table that has live feed enabled, such as the Incident table, the user can click the Show live feed button at the top of the form to automatically create a record feed.

When a user who has write access to a record’s work_notes journal field clicks the Show live feed button, that user becomes the record feed administrator. If, for example, a customer calls technical support to report an incident and the customer clicks Show live feed on a record, a record feed is created, but the customer is not the record feed administrator. When a support representative later opens the incident and participates in the record feed, the user becomes the feed administrator.

Record feeds are, by default, private unlisted. That is, only invited members can see the name of the record feed in the list of feeds, and join it. Record feed administrators, however, have the ability to change the access level at any time. This can be helpful if, for example, a user is working on a sales opportunity and wants customers to be able to participate in a record feed without granting them access to the records.

Control how live feed is enabled for records

A property called glide.ui.show_live-feed_activity controls whether live feed is automatically enabled for all records.

This glide record is disabled by default. If the property is enabled, a record feed is automatically created whenever a record is viewed, and you become a member of that feed.

A second property, glide.live-feed.auto_join_document_group, enables automatic membership to a record feed whenever the associated document is visited and the user clicks Show Live Feed.

View the activity stream in record feeds

When you view record feeds, live feed displays the activity stream for the document.

For example, for an incident feed, the screen displays recent activity for the incident. The activity stream is updated whenever anything is changed in the associated record.
Live feed activity stream

Note: The information in the activity stream is subject to the same ACL rules as those for viewing the underlying document.
**Participate in a feed**

When you join a feed, you become a feed member.

Feed members can:

- **View messages** posted to the feed. Non-members can also view the messages for a public feed.
- **View a list of feed members.**
- Invite another user to join the feed.
- Subscribe to feed email notifications.
- **Leave the feed.**

1. **Navigate to Collaborate > Live Feed.**
2. **Click either Group Feeds or Record Feeds, and then click All Feeds.**
All feeds

- If you received an invitation, click Accept. You can Decline the invitation if you do not want to join the feed.
- If the feed is public, click Join.
- If the feed is private, click Request. The feed administrator receives an email notification and must accept your request before you can join the feed.

Mark a feed as a favorite

Top-level messages in feeds can be marked as favorites on a per user basis only.
You can also search for messages marked as favorites, and remove the favorite designation as needed.

1. Navigate to Collaborate > Live Feed.
2. Click either Group Feeds or Record Feeds, and then click All Feeds.
3. In the list of feeds, click the star icon (🌟) adjacent to the feed name you want to mark as a favorite.

To unfavorite a message, click the star icon (🌟) of a message that is already a favorite.

View a feed

You have several options for viewing a feed.

1. Navigate to Collaborate > Live Feed.
2. Click either Group Feeds or Record Feeds.
   This displays a list of feeds you belong to and an option to view all feeds.
   - To view a feed you belong to, select the feed name.
   - To view a public feed you do not belong to, select Show All and then click the feed name.
     You must be a member to view the feed for a private feed.

   **Note:** If you navigate away from the live feed application and then back again, the system displays the feed you last visited if you are a member of it.

View a feed member

View a specific member of a group feed.

1. Navigate to Collaborate > Live Feed.
2. Click either Group Feeds or Record Feeds.
   This displays a list of feeds you belong to and an option to view all feeds.
3. Click the feed name.
   The list of feed members appears, organized by feed administrators and members.

Invite a new member to a group feed

The feed administrator can invite another user or a group to join a feed.

When a team is added to a feed, all members of the team also indirectly become members of the feed. Only users, and not teams, can be the feed administrators. A team member who is following a feed can become administrator by directly inviting another user to the feed.

1. Navigate to Collaborate > Live Feed.
2. Click either Group Feeds or Record Feeds, and then select the feed name.
3. Click the Pending members tab.
4. In the Add user or team field, begin entering a user or team name and select a user or team from the suggestion list.
   The invited user or team members receive an email notification.

Invite a new member to a record feed

The feed administrator can invite another user or a team to join a record feed.
When a team is added, each of the individual members of the team become members of the feed. That is, if Team ABC is added to a feed, the feed does not show that Team ABC is a member. Instead, the feed shows each of the individual members of Team ABC as members of the feed.

When users are invited, their membership state is initially **Invited**. When they accept the invitation, the system checks their access to the **work_notes** journal field. If they have write access, they become administrator members; otherwise, they become active members.

1. Navigate to Collaborate > Live Feed.
2. Click Record Feeds and select the record feed name.
3. Click the Pending members tab.
4. In the Add user or team field, begin entering a user or team name and select a user or team from the suggestion list.

   If you invite a team, the individual members of the team are invited.

   The invited users receive an email notification.

**Remove a member from a feed**

The feed administrator can remove any member from the feed.

1. Navigate to Collaborate > Live Feed.
2. Click either Group Feeds or Record Feeds, and then select the feed name.
3. Click the Members tab.
4. Locate the member you want to remove and click Remove.
Remove member

Note: You can remove members regardless of their current state. That is, you can remove members who have already joined the feed or whose membership is pending.

Subscribe to a feed

Direct members of a feed can subscribe and unsubscribe to the feed in order to receive email notifications whenever any activity in the feed occurs, such as new messages being posted, replies, likes, polls, and @mentions.

Individual indirect members—that is, members of a team that is participating in a feed—cannot subscribe or unsubscribe from a feed directly. If the team administrator subscribes the team to a feed, the individual members receive an email notification for activities in the feed such as new messages being posted, replies, likes, polls and @mentions.

All notifications related to a top-level message, such as replies, mentions, and likes, are sent out with the same subject. The subject line defaults to Live Feed followed by the beginning of the subject line from the top-level message. For example, if the subject of the feed is IT Support, the email notification's subject will be Live Feed IT Support.

1. Navigate to Collaborate > Live Feed.
2. Click either Group Feeds or Record Feeds, and then select the feed name.
3. Click the subscribe icon ( ).

You can click the unsubscribe icon ( ) to stop receiving email notifications.

**Note:** If a team is subscribed to receive email notifications for a feed, but a member of the team did not subscribe to the team, that member does not receive the email notifications.

### Navigate between live feed and other modules

If you are participating in a feed and navigate to another module, when you return to live feed it displays the feed you were previously viewing if it is public or if it is a private feed that you are a member of.

For example, assume you are viewing a public feed and then navigate to a particular incident record. Upon returning to live feed, the feed you were previously viewing opens. If you were last viewing a private feed that you are not a member of, returning to live feed opens the Company Feed.

### Leave a feed

Members can choose to leave a group feed.

1. Navigate to Collaborate > Live Feed.
2. Click either Group Feeds or Record Feeds, and then select the feed name.
3. Click Leave.

**Note:** If you leave a feed associated with a record, such as an incident, you automatically rejoin that feed if you modify the associated record again.

### Delete a feed

If you are a feed administrator, you can delete the feed.

1. Navigate to Collaborate > Live Feed.
2. Click either Group Feeds or Record Feeds, and then select the feed name.
3. Click Delete.
4. Click Yes to confirm deletion.

The feed is deleted from live feed. Messages posted to a private feed are deleted. Messages posted to a public feed remain on the Company Feed without a feed link.

### Live Feed UI overview

The Live Feed user interface provides many methods you can use to share content with others in your organization.

### Update your Live Feed profile

Your profile information includes a photo or image, and tabs for different types of information including messages, feeds, teams, followers, and those who are following you. You can update your profile information and picture at any time.
1. Navigate to Collaborate > Live Feed.
2. Click your name or title displayed below your picture.

The profile record opens.
3. Click the pencil icon next to About Me and type a short description about yourself that you want to share with others who view your profile. This is text that you might not necessarily want to change on a regular basis.

4. You can change your profile photo using either of the following two methods:
   - Locate the photo file you want to use, and drag-and-drop it over the existing photo.
   - Hover over the existing picture (or tap the photo in the case of the smartphone or tablet interface) to display the Upload a picture link. Click the link, navigate to the location of the photo you want to use, and click Open.
Upload a picture

Note: Your profile picture is used by the Connect and legacy chat features as well if they are activated.

Work with Live Feed messages

This portion of the UI gives the user access to various types of messages and tools for grouping and categorizing messages. Also included are methods for identifying which user feeds you are following and which users are following you.
Tools for working with live feed messages

<table>
<thead>
<tr>
<th>Menu section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>My Live Feeds</td>
<td>These are custom feeds that allow you to customize live feed to view the content that is most important to you.</td>
</tr>
<tr>
<td>Company Feed</td>
<td>This feed displays all posts, except those posted to private or unlisted groups.</td>
</tr>
<tr>
<td>Group Feeds</td>
<td>These feeds are created by users. Record Feeds: These feeds are associated with a record, such as an incident or change.</td>
</tr>
<tr>
<td>Record Feeds</td>
<td>These feeds help users collaborate on records by providing a place for anyone who can access the record to share messages and post attachments specific to that record.</td>
</tr>
<tr>
<td>People</td>
<td>This option displays people who are following the current user and people the current user is following.</td>
</tr>
<tr>
<td>Teams</td>
<td>This option is used to combine users into groups for the purpose of subscribing to specifically-focused conversations.</td>
</tr>
<tr>
<td>Hashtags</td>
<td>Hashtags are words marked with a hash (#) symbol in messages. Hashtags are used to categorize messages by keyword or topic for improved search results messages filtered from all conversations that include specific hashtags.</td>
</tr>
</tbody>
</table>

View another Live Feed user

When a requester user, one that has no ServiceNow role, is viewing a feed and points to another user’s picture, information for the user appears from the Business Card view of the User (sys_user) table.

You can customize ACLs to increase the amount of information you want displayed for users with different roles.
If you click a user's name or title, the user’s profile appears. Click the tabs to view different types of information for the user.
Follow other Live Feed users

As you use Live Feed, you can follow the message threads of other users.

1. Navigate to a thread that the user you want to follow is engaged in.
2. Click that user's name or point to the user's picture.
   - A Follow link appears in the user's profile.
3. Click **Follow**.
4. To stop following the user, navigate to **People > Following**.
5. Click **Unfollow**.
6. To view people who are following you, navigate to **People > Followers**.

### Select feeds

A feed is a stream of related messages. You can use the feed selector to switch between feed types and to view specific group feeds and record feeds.

1. Use the **Search** field to locate any type of feed. As you type in the **Search** field, the results are dynamically displayed. For example, if you type INC, records that are incidents are forced to the top of the results list.
2. You can also select the following types of feed information.

**Feeds types**

<table>
<thead>
<tr>
<th>Feed</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>My Live Feeds</td>
<td>Displays the following posts:</td>
</tr>
<tr>
<td></td>
<td>- messages from users you follow</td>
</tr>
<tr>
<td></td>
<td>- messages with hashtags you follow</td>
</tr>
<tr>
<td>Company Feed</td>
<td>Displays all posts, except those posted to private or unlisted groups.</td>
</tr>
<tr>
<td>Add Group Feed</td>
<td>Allows you to add a group feed.</td>
</tr>
</tbody>
</table>
Follow feeds

You can view users who are following you or other users you are following.
To view users who are following you or other users you are following, click People in the sidebar.
The system shows 10 most recent followers or users you are following.

![People](image)

If either list contains more than 10 users, a Show More link appears.

**Note:** If you are following a particular user whose profile changes, that user moves to the front of the Following list. This alerts you to changes in the profile of a user you are following.

Bookmark feeds and hashtags

The live feed interface uses the standard bookmarking functionality for feeds and hashtags.
In UI15, you can drag-and-drop group feeds and hashtags from the Feed Summary section to the Edge for quick access.
Bookmark a hashtag

Add Live Feed to your homepage

You can add Live Feed to your own homepage or to a global homepage.

1. Navigate to a homepage.
2. Click the add content icon (➕) in top left corner of the homepage.
3. Select Live Feed in the left panel.
4. On the bottom of the window, click Add here in the appropriate layout position, then close the window.
Post content in Live Feed

In Live Feed, you can post new messages and replies to existing messages for all users in the feed. You can also send a reply message to a team or record.

Post a live feed message

You can post a message to open a new feed.

1. Navigate to Collaborate > Live Feed.
2. Click the feed to which you want to post your message, for example My Live Feed, Company Feed, and so on.
3. Enter a message in the Share your thoughts field. Use hashtags, if you want.
4. As needed, click , , or to add a poll, attachment, or screenshot image, respectively.
5. Click Post.

Reply to a live feed message

To participate in an existing thread of a feed, you can compose and submit a reply message. By default, the message is visible to all members of the feed.

1. Navigate to Collaborate > Live Feed.
2. Locate the message you want to reply to.
3. Type your reply in the message box and click Reply.
4. To limit who can view the reply to a single individual, select a user from the To choice list.
5. Click Reply.
6. By default, 7 replies are visible for each message. To view additional replies, click Show all replies. Any reply to a reply includes a Threads link.
7. Click Threads to view all of the replies within the selected reply in reverse chronological order within the Message Thread pop-up window, similar to an email thread.
Message Thread

Navakanth Reddy #suggestion(s) A common black vertical line just before the bars would help with this. Also, line spacing between two options should be more than single-spaced.

Also, the bar says 5 people voted and it shows up 5 people and 1 more. Is this a #bug?

8 days ago • in reply to Nirupam Biswas • Like (1) • Reply • Share • Tags (2)

Nirupam Biswas I guess we need some visual distinction between the poll question and the options. After voting, I got confused for some moments why there are four options in result. See screenshot.

8 days ago • Like (1) • Reply • Share • Tags

Shouvik Goswami We have enabled polls in Live Feed. Please review and provide #suggestions and #feedbacks

How do you like the poll in Live Feed?

- Exactly what I was looking for
- Wanted something more
- Did not visualize it this way

8 days ago • Like (1) • Reply • Share • Tags (2)
Attach files, links, images, and knowledge articles to messages

In addition to entering text, you can attach files, such as images, documents, and spreadsheet files in any ServiceNow supported file type to live feed messages.

Administrators can manage attachment file settings, such as supported file types and maximum attachment file size, by editing system properties.

You can also include links to user-defined URLs and knowledge articles contained in your instance’s knowledge base.

**Note:** The functionality described here applies to HTML5-compliant browsers, such as Chrome, Firefox, Safari and Internet Explorer 10 and above. Significant differences while using different browsers are highlighted.

Attach a file to a post or reply

You can attach files to a post by dragging a file into a post or pasting an image from the clipboard.

Use the paperclip icon ( ![paperclip](https://example.com/paperclip.png)) to drag files into a post. Additionally, you can paste images into a post or reply from the clipboard.

1. Do one of the following:
   - While composing a post or reply (see *Reply to a Message*), locate one or more images or other supported types of files, and drag them into the message box.
   - Click the paperclip icon ( ![paperclip](https://example.com/paperclip.png)) in the message box, navigate to the location of the files you want to attach, select them, and click Open.

2. To add more files, drag-and-drop additional files into the text box below the displayed files or images, or click the plus sign.
Attaching files

3. If you want to delete an attachment before posting the message, click the trashcan icon adjacent to the attachment.
4. Enter a comment to share your thoughts about the image.

Note: The Post button is enabled only after you add the comment.

5. Click Post or Reply.
6. If you added files that do not contain previews and then posted the message, they will be listed in the message box with a Download link.
7. Click the link to download the files.

**Copy an image from the clipboard**

In addition to adding files to a message, you can also copy images to the clipboard and paste them into a message or reply.

1. Click into the **Comment** box and add a comment.

   Here is how to drag-and-drop tags in order to bookmark them.

2. Click the **Add an image** button.
   The **Screenshots** dialog box opens.

3. Right-click the **Paste an image here** box and select **Paste** to paste the image from the clipboard.
4. To add another image, repeat the previous steps.
5. When you finish pasting images into the message, click Done.
6. To change the link text, click Pasted Image and enter a new label.
7. When you finish, click Post or Reply.
8. To remove an image, click the trash can icon adjacent to the link.
9. To make changes to an existing image, click the edit icon ( ).
Add a link to a post or reply

Add or modify a link to a live feed post.

1. Click into the Comment box. The Add a link button appears.
2. Click the Add a link button. The URL and Link text fields appear.

3. Enter the URL and the text you want to appear as the link.
4. To add another link, click the link icon under the URL field.
5. When you have finished entering your message, click Post or Reply.
To remove a link, click the trash can icon adjacent to the link. To make changes to an existing link, click the edit (✏️) icon.

**Add a knowledge article link to a post or reply**

Use the ID of a knowledge article to post it as a reply to a live feed conversation.

1. While composing a post or reply, type the ID of the knowledge article you want to link to. You do not need to identify the knowledge article ID as a hyperlink; live feed recognizes it as such and automatically converts it into a link when the message is posted.
2. When you are finished entering your message, click Post or Reply.

**Add a poll to a message**

When you are posting a message, you have the option of creating a poll in order to record your viewers’ opinions. As users take the poll, their feedback statistics are displayed within the feed.

1. Open the feed where you want to create a message with a poll.
2. Enter the message with an invitation to take the poll in the Share your thoughts box.
3. Click the poll (📊) icon.
Poll

4. In the **Question** field, enter the question on which you are soliciting opinions.
5. In the **Option** fields, enter possible responses to the query.
6. To add more response options, click **Add more options**.
7. Click **Post**.

After the poll is posted, users who view the message can vote. After they vote, their pictures appear next to their response, with others who have voted for the same option.

**Note:** Only the poll creator can view results without casting a vote. Other members can see results only after casting a vote or if the poll is closed.
An email notification with the poll result is sent to all participants of the poll informing them that the poll is closed.

**Add mentions to a message**

An @mention is any posted update that contains @username anywhere in the body of the message.

The user's name, with a link to that user's feed, is inserted into the message. Additionally, the mentioned user receives an email notification about the mention. This is a great way of bringing attention to other members in a conversation. All @mentions are included in the logged-in user's My Feed.

**Note:** If an @mention is used by a member of a team, only members of that team appear in the auto-suggest list.

1. While entering a message or reply in a conversation, type @username anywhere in the message. As you type, an auto-suggest list appears with names and pictures of users that
match your entries. For example, if you type @t, the auto-suggest list shows the pictures and names of all users with names that start with T.

2. Click the user you want to add. That user's name is inserted into the @mention in the body of the message.

Note: My Feed displays @mentions of you and the teams you are a member of. Profile feeds for another user display only @mentions of that user.

Like a message
Like a message to provide feedback to the author.

1. Navigate to Collaborate > Live Feed.
2. Click Feeds.
3. Locate the feed that contains the message you want to like.
4. Under the message title, click Like.
   If the message has previously been liked, the number of likes for a message displays next to the Like link.
   For a top-level message, the profile pictures of the first 5 users who liked a message are displayed. Any additional users who liked the message can be viewed by hovering over the # more link. If the logged-in user has liked the message, that user's image will appear first, followed by the image of the user who last liked the message.
   For a reply, you must hover your mouse pointer over the count link to view the users who liked the message.

Note: After a message has been liked, it cannot be unliked.
Delete a message

Users can delete any of their own posts or replies. A conversation administrator can also delete messages.

1. Hover over the message you want to delete.
2. Click the trash can icon in the upper-right-hand corner of the message box.
3. Click Delete in the confirmation box.
   The message disappears from the feed.

Notifications

Notifications keep users informed of events that concern them. The system can notify users by email, SMS text message, or push notification.

Email and SMS notifications

Use email notifications to send selected users email or SMS notifications about specific activities in the system, such as updates to incidents or change requests.

Email notifications allow administrators to specify:
- When to send the notification
- Who receives the notification
- What content is in the notification
- Whether the notification can be delivered in an email digest and if so, the digest content

Additional email notification options are available. Users can subscribe to notifications, and administrators can make some notifications mandatory.

Administrators also have the option of converting existing email notifications to a rich HTML format. This format provides several advantages, including:
- Raw HTML content is converted into a WYSIWYG format.
- The content can be edited in a feature-rich HTML editor.
• Mail scripts are condensed into a single, easy-to-read line that can be reused in multiple email notifications.
• To prevent broken links, items like images and incidents, that are linked with URLs relative to an instance are converted to absolute links. For example, if an incident is linked using a relative URL, the link is converted to an absolute link.

**Note:** The rich HTML format is the default for all new email notifications.

**Note:** Instances cannot send or receive encrypted email messages. The system strips out the body of the encrypted email because it cannot process the encrypted content in plain text or HTML.

An email notification can also send as an SMS notification if the recipient has subscribed to the notification on an SMS channel. The system uses the subject line of the email notification and converts it to an SMS message. If the administrator doesn't want to use the email notification subject for the SMS notification, they can define an alternate SMS message in the email template form or email notification form. For more information, see [Create an email notification](#).

For more information on creating an SMS channel, see [Create notification channels](#).

If you want to change how the instance processes incoming email, see [Inbound email actions](#). See [System email log and mailboxes](#) for examples of messages the system displays when notifications or inbound email actions are not processed.

**Email setup**

All email notifications use the email properties that you define and the email accounts that you set up. Your email service can also affect the successful transmission of incoming and outgoing email.

**Email accounts**

Email administrators set up email accounts to allow the system to connect to external mail services such as POP3, SMTP, or IMAP servers. You can use the ServiceNow-provided email accounts or create your own accounts for your own email services.

**Email properties**

Use Email Properties to configure settings for inbound and outbound email. Email properties apply to all email accounts.

**Email service size restrictions**

Your email service, whether you are using a standard ServiceNow email configuration or an alternate email configuration, determines the successful transmission of incoming or outgoing emails based on a maximum email size. An email configuration consists of your instance, email server, and email client.

- **Standard email configurations** – For instances that use the standard email configuration, the ServiceNow mail servers cannot send or receive emails larger than approximately 50 MB (before encoding), including the email header, body text, and attachments. Email messages are encoded by an email client, which increases total email message size. The maximum
ServiceNow mail server size restriction is 75 MB (after encoding). The maximum email size limit is enforced regardless of any configured attachment size limits.

- **Alternate email configurations** – If your email service uses a company-owned or third-party server, the approximate size restriction of 50 MB (including the email header, body text, and attachments) may still apply. However, your service might support different maximum total file sizes for inbound and outbound emails. Check with the email administrator of your email service to verify email size limits.

For details on how encoding can affect email message size and email transmission, see [KB0521772](#).

**Email service availability**

Email service is intentionally shut down on instance clones to prevent resending already delivered email. Upgrades no longer require an extended interruption of email service. Instances continue to process email during an upgrade. For a possible explanation for undelivered emails, see the blog post [Whitelisting emails sent from the ServiceNow infrastructure](#) by a ServiceNow Technical Support Engineer in the Now Community.

For instructions on creating and sending custom emails when events on the instance occur, see the tasks in [Email and SMS notifications](#).

**Instance-to-instance communication via email**

Use [Web services](#) to communicate between two instances.

**Basic email setup**

All production instances can send and receive email using ServiceNow-provided resources. The instance has an email address of instance@service-now.com.

Basic email services and features

- Mail servers maintained by ServiceNow.
  - Encrypt mail with opportunistic TLS (Transport Layer Security) if supported by your mail servers.
  - If your internal mail servers send and receive messages via a TLS-encrypted channel, ServiceNow mail servers support that communication.
  - Provide a dedicated mailbox for your instance.
- Pre-configured email accounts to connect to ServiceNow mail servers.
  - An SMTP account sends email to your primary Mail Exchange (MX) server from your instance email address of instance@service-now.com.
  - A POP3 account receives email sent to your instance email address of instance@service-now.com.
- High availability features from ServiceNow datacenters.
- Spam detection for incoming email.

Administrators who want to use basic email services can do so by enabling the email properties for sending and receiving email.

**Enable basic email**
Enable basic email to use ServiceNow-provided email servers and accounts.

Role required: admin

1. Navigate to **System Properties > Email**.
2. Configure these email properties and click **Save**.

**Advanced email setup**

With an advanced email setup, you can use your own SMTP server, POP3 server, or both.

Setting up your own email environment can be useful if you want to use existing filtering, retention, or compliance aspects of your internal email architecture. You can set up email in several ways:

- Use your own SMTP server to forward email to ServiceNow servers.
- Use your own SMTP server to send email.
- Use your own POP3 server to receive email.
- Use your own SMTP and POP3 servers to send and receive email.
- Use an OAuth 2.0-enabled SMTP server to send email from a third-party service.
- Use an OAuth 2.0-enabled IMAP server to receive email from a third-party service.

The following procedures assume that you enabled basic email properties.
**Enable using your own SMTP server**
Enable using your own SMTP server so that you can leverage the existing filtering, retention, or compliance aspects of your own SMTP server while also using the ServiceNow POP3 server.

- Role required: admin
- Email server required: SMTP
- **Basic email properties:** enabled

You can combine your own internal email architecture with the ServiceNow email architecture to handle email. The following diagram demonstrates how you would use your own SMTP server alongside the ServiceNow POP3 server.
1. Navigate to System Mailboxes > Administration > Email Accounts.
The system displays the list of available email accounts.

2. Locate the record for ServiceNow SMTP and change Active to false.

3. Click New.
4. Create an email account record for your SMTP server where the Type is SMTP.
5. From Related Links, click Test Connection.
   If the email account is valid, the system returns a success message.

Configure the SMTP server in your internal email architecture to forward email from the custom email address to the instance email address. Implement a spam filter on the custom email address.

Enable using your own POP3 server
You can use your own POP3 server to store and receive email for the instance.
- Role required: admin
- Email server required: POP3
- **Basic email properties:** enabled

1. On your POP3 server, create a mailbox for your instance that has a custom email address. For example, create a mailbox for `service-desk@company.com`.
2. Navigate to **System Mailboxes > Administration > Email Accounts.**
   The system displays the list of available email accounts.
3. Optional: If you do not want to receive email sent to the instance@service-now.com mailbox, locate the record for **ServiceNow POP3** and change **Active** to **false**.
   An instance can receive email from multiple POP3 accounts at the same time. Leaving the **ServiceNow POP3** account active allows the instance to receive email sent to the instance default email address.

4. **Click New.**
   The system displays a blank **Email Account** form.
5. Create an email account record for your POP3 server where the **Type** is **POP3**.
6. From **Related Links**, click **Test Connection**.
   If the email account is valid, the system returns a success message.
Connection Test

Connection Successful
Enable using your own SMTP and POP3 servers
You can use your own SMTP and POP3 servers to send email from the instance and to store and receive email for the instance.

- Role required: admin
- Email servers required:
  - SMTP
  - POP3

- **Basic email properties**: enabled

1. On your POP3 server, create a mailbox for your instance. For example, create a mailbox for service-desk@company.com.
2. Navigate to **System Mailboxes > Administration > Email Accounts**. The system displays the list of available email accounts.
3. Locate the record for **ServiceNow SMTP** and change **Active** to **false**.

4. Optional: If you do not want to receive email sent to the instance@service-now.com mailbox, locate the record for **ServiceNow POP3** and change **Active** to **false**.

An instance can receive email from multiple POP3 accounts at the same time. Leaving the **ServiceNow POP3** account active means that the instance receives email sent to its default email address.
5. Click **New**.
The system displays a blank Email Account form.
6. Create an email account record for your SMTP server where the **Type** is SMTP.
7. From **Related Links**, click **Test Connection**.
   If the email account is valid, the system returns a success message.

8. Click **New**.
The system displays a blank Email Account form.
9. Create an email account record for your POP3 server where the **Type** is POP3.
10. From **Related Links**, click **Test Connection**.
    If the email account is valid, the system returns a success message.
Connection Test

Connection Successful
OAuth email authentication

OAuth enables your instance to receive and send email through a third-party email account.

Open Authentication (OAuth) is an open standard for authorization that provides administrators with an authorization method when connecting to incoming IMAP and outgoing SMTP servers. OAuth enables an instance to receive and send email from a third-party account, such as Gmail, without having to enter the credentials for that account.

The OAuth 2.0 implementation requires you to obtain an access and refresh token from your third-party email provider for each third-party email account. The tokens are automatically saved to the instance database. They provide authorization for all email communication between the instance and the authorized third-party account. A scheduled job regularly checks to see if email access tokens are valid. If the access token is not valid, but the refresh token is, the instance automatically regenerates a new access token.

OAuth 2.0 support is available starting with the Geneva release. The OAuth implementation supports IMAP and SMTP accounts only. POP3 is not supported. OAuth 1.0 is no longer supported.

Note: Customer email accounts configured to use OAuth 1.0 authentication with Gmail cease to function as of April 20, 2015. See KB0546976 for more information.

Activating the Email - OAuth support for IMAP and SMTP plugin allows you to use OAuth with email. If you upgrade to Geneva or later instances and are already using OAuth 1.0, activate the plugin again.

See Outbound REST with OAuth 2.0 profile tutorial - integrating with Google Contacts API for an example of using an OAuth 2.0 profile to authenticate an outbound REST message with Google to retrieve contact information. Also see OAuth 2.0 for more information on OAuth 2.0 support in the instance.

Activate the OAuth email authentication plugin

OAuth email authentication requires the Email - OAuth support for IMAP and SMTP plugin.

Role required: admin

1. Navigate to System Definition > Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
   - If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. Optional: If available, select the Load demo data check box.
   - Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
   - You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.
5. Click Activate.

Enable OAuth 2.0 for email

Setting up OAuth 2.0 for email requires you to obtain access and refresh tokens from your email provider.
Role required: admin
Plugin required: Email - OAUTH support for IMAP and SMTP

1. Log in to your third-party email account, such as Gmail, and enable OAuth 2.0.
2. Obtain the following from your third-party email account:
   - client ID
   - client secret
   - authorization URL
   - token URL
   - redirect URL
   - token revocation URL

3. Navigate to System OAuth > Application Registry.
4. Click New.
5. Click Connect to a third party OAuth Provider to create an application registry record that email uses.
6. Use the information you obtained from your third-party email account to fill in the fields on the form. See Use a third-party OAuth provider for instructions. Create the OAuth application registry record and its associated OAuth Entity Profile and OAuth Entity Scope records.
7. Click Submit.
8. Navigate to System Mailboxes > Administration > Email Accounts.
The system displays the list of available email accounts.
9. Optional: If you do not want to receive email sent to the default instance email address, locate the record for ServiceNow POP3 and change Active to false.
The system can receive email from multiple POP3 and IMAP email accounts.
10. Locate the records for ServiceNow SMTP and change Active to false.

11. Click New.
The system displays a blank Email Account form.
12. Create an email account record for your OAuth 2.0 SMTP server where the Type is SMTP.
13. For Authentication, select OAuth 2.0.
14. For **OAuth Profile**, select the application registry record you created.

15. Click **Authorize Email Account Access** to obtain the access and refresh tokens.

   Another browser window opens asking you to authorize the account access on the third-party email account.

16. Authorize the access.

   After the authorization is successful and the tokens are saved to the instance, the **Authorize Email Account Access** button no longer appears on the Email Account form.

17. Click **New**.

   The system displays a blank Email Account form.

18. Create an email account record for your OAuth 2.0 IMAP server where the **Type** is **IMAP**.

   Use the same **Authentication** and **OAuth profile** settings as the OAuth SMTP email account.

### Email accounts

Email accounts store the connection details and credentials the system uses to access external email servers and services.

By default, instances come with email accounts for ServiceNow-managed SMTP and POP3 servers to send and receive email. These accounts cannot be modified, but can be deactivated if you do not want to use them. To connect to other email servers and services you must create email accounts for them. You can create email accounts for servers and services that use these protocols:

- SMTP
- POP3
- IMAP

**Note:** The system only allows one SMTP email account to be active at a time and sends all email through this account. You can however receive email from multiple POP3 or IMAP accounts.

The system stores individual email accounts in the `sys_email_account` table. Create separate email accounts to send and receive email. Use **email properties** to define how the system processes email for all email accounts.

By default, the ServiceNow POP3 server provides each instance with its own mailbox at the address `instance@service-now.com`. Likewise, the ServiceNow SMTP server sends email from the address `instance@service-now.com`. To create another mailbox, provision your own POP3 or IMAP server and create an email account to the server on the instance. To change the sent from email address, update the address in the email account you use for sending email.
A ServiceNow configured email account

Configure an email account
You can create email accounts in addition to the accounts provisioned for you.

- Role required: admin
- Email server: a compatible email server
  - SMTP
  - POP3
  - IMAP

1. Navigate to System Mailboxes > Administration > Email Accounts.
2. Click New.
3. Fill in the fields on the form (see table).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to identify this Email Account.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Type                   | Mail server type. The choices are:  
  - Email Reader  
  - POP3  
  - IMAP  
  - Email Sender  
  - SMTP (only one active account permitted) |
<p>| Authentication         | The type of authentication used for the email account to connect to the email server. The choices are Password, OAuth, and OAuth 2.0. The Email - OAuth support for IMAP and SMTP plugin must be active for the OAuth options to be visible. |
| OAuth Provider         | Select the OAuth application registry record for this account. This field appears if you selected OAuth 2.0                                      |
| Server                 | Remote Server to which this account connects.                                                                                                 |
| Active                 | Determines if this Email Account is active.                                                                                                  |
| ServiceNow Configured  | Indicates if this account is provisioned by ServiceNow. This field is read-only. If you create an account, this option is not selected.           |
| Email user label       | A display value used for outgoing messages. This field is for SMTP type accounts only.                                                                 |
| User name              | The user name or ID to authenticate an email address. The value in this field is also the From address when the instance sends email. If you are using SMTP, this must be a full email address. The value in the From field can override this (for SMTP accounts). |
| Note: The address in the From field on the Notification form takes precedence over this field. |
| Password               | Password when Authentication type is Password.                                                                                               |
| Note: You may need to increase the size of this field to accommodate longer passwords. By default, this field has a size of 40. |
| From                   | (SMTP only) The from address used for notifications sent with this account. This address takes precedence over the User name field. If nothing is present in this field, the User name is used as the return address for notifications sent from the instance. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable SSL</td>
<td>Option to upgrade an insecure connection to a secure connection using SSL encryption.</td>
</tr>
<tr>
<td>Enable TLS</td>
<td>Option to upgrade an insecure connection to a secure connection using the TLS encryption protocol, if your email server supports TLS.</td>
</tr>
<tr>
<td>Port</td>
<td>Connection TCP port.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.
5. Click the test connection link at the bottom to test the SMTP, POP3, or IMAP account.
   The system displays a pop-up window with the results of the connection test.
If the test succeeds, click **Close** to return to the email account record. If the test fails, click **View Logs** to display more information about the test results.

The system uses the email account to send or receive email.
Enable the system to send or receive email.

**Email properties**

The Email Properties page is where you can configure settings for inbound and outbound email.

Email properties are available from either of these modules:

- **System Mailboxes > Email Properties**
- **System Properties > Email Properties**
### Email Properties

Email accounts can be created or modified in the Email Accounts table. Email account connection status and diagnostics information can be found on the Email Diagnostics page.

</tbody>
</table>

**Note:** The case of the reply prefix in the email, for example RE:, must exactly match the case of the prefixes defined in this property. If, for example, an email contains the Re: prefix and only RE: is defined in the property, the email will not be recognized as a reply. Therefore, it is a best practice to define multiple versions of the prefix, including mixed-case versions, such as RE:, Re:, and so on.
<table>
<thead>

<td></td>
<td>Note: The case of the forward prefix in the email, for example fw:, must exactly match the case of the prefixes defined in this property. If, for example, an email contains the Fwd: prefix and only fwd: is defined in the property, the email will not be recognized as a forward. Therefore, it is a best practice to define multiple versions of the prefix, including mixed-case versions, such as FWD:, Fwd:, and so on.</td>
</tr>
<tr>
<td>glide.pop3.reply_separators</td>
<td>Discard everything below this text if found in a reply body</td>
<td>Specifies the comma-separated list of separators that cause the instance to disregard everything below the text string in the message body. This list is case sensitive.</td>
</tr>
<tr>
<td></td>
<td>(comma separated, case sensitive)</td>
<td>• Type: string</td>

</thead>
</table>
| glide.pop3readerjob.create_caller | Automatically create users for incoming emails from trusted domains | Controls the behavior when an instance receives an email from an email address not associated with a user record. If this property is set to **true**, the instance creates a new user record for the email address and places that new user in the **Caller** field of any tickets created. If the property is set to **false**, the instance places **Guest** in the **Caller** field of any tickets created.  
- **Type:** true | false  
- **Default value:** false  
- **Learn More:** Enabling Automatic User Creation |
| glide.user.default_password | Default password for users created from email sent from trusted domains. (must reset upon login) | Specifies the password for new users created from incoming email. Users must reset the password at first login.  
- **Type:** string  
- **Default value:** password  
- **Learn More:** Enabling Automatic User Creation |
| glide.user.trusted_domain | Trusted domains when creating users from incoming email (Ignore mail from untrusted domains unless from an existing user; use * for all domains) | Comma-separated list of trusted domains for which the instance automatically creates a user based on incoming emails. Use an asterisk (*) to trust all domains. If an email is not from a trusted domain, the instance processes the inbound email as a 'guest user' but it does not create a guest user in the instance.  
- **Type:** string  
- **Default value:** asterisk (*)  
- **Learn More:** Enabling Automatic User Creation |

**Email image filtering properties**  
Use email image filtering properties to control how inbound email images attach to a target record.  
When a user sends an email to the system, email images (such as logos or email signatures) attach to the target record by default. These images are also visible in the activity stream of the target record. The system then replicates these images, which can cause duplicate image attachments to the target record and also duplicate images in the activity stream.  
To filter images from emails and reduce duplicate image attachments to target records, configure the following properties in the System Properties (sys_properties) table. Use these properties to:
• Specify the email image sizes eligible for filtering.
• Choose an action that controls image attachment behavior and image visibility in the activity stream.

**Note:** These properties do not delete attachments. You can verify attachment records in the Attachments (sys_attachment) table.

### Email image filtering properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Type</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.inbound.image_sys_attachment.filter.minimum_bytes</td>
<td></td>
<td>Integer</td>
<td>0</td>
</tr>
<tr>
<td>glide.email.inbound.image_sys_attachment.filter.action</td>
<td>Specifies the image filtering behavior.</td>
<td>Choice list</td>
<td>AttachTarget</td>
</tr>
</tbody>
</table>

- **Note:** Regardless of the action you select, the image is visible when you choose to **Preview HTML Email** or **Show Email Details** in the activity formatter.

- **Type:** Choice list
  - AttachTarget - Associate the image to the target record. The image is visible in the activity formatter and in the attachment to the target record.
  - AttachEmail - Attach the image to the email record. The image is not visible in the activity formatter of the target record nor in the attachment to the target record.
  - AttachNone - Do not attach the image to a record. You can select this option to attach the image manually at a later time.

  - **Default value:** AttachTarget

### Email digest properties

Several properties are available to manage digest intervals for email digests.

The following properties are available for the **email digest feature**.

**Note:** To open the System Properties (sys_properties) table, enter `sys_properties.list` in the navigation filter.
## Properties for email digest intervals

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.email.digest.default_interval | The sys_id of the default email digest interval available to users.  
- **Type**: string  
- **Default value**: 28d157e07f1332007f005212bdaf9116  
- **Location**: System Property (sys_properties) table |

| glide.email.digest.max_intervals | The maximum number of email digest intervals that can be defined.  
- **Type**: integer  
- **Default value**: 100  
- **Location**: System Property (sys_properties) table  
- **Learn more**: For details on digest intervals, see [Create or modify email digest intervals](#). |

## Additional email properties

There are several advanced email properties that you can use to fine tune the way your instance sends or receives email.

You must add these properties to the System Property (sys_properties) table before they can be used to overwrite the defaults.

### Additional properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| com.glide.email.max_body_bytes | Sets the maximum body size in bytes allowed per inbound email.  
- **Type**: integer  
- **Default value**: 1048576 |

| com.glide.email.max_read | Specifies the maximum number of emails a POP3 reader should process concurrently.  
- **Type**: integer  
- **Default value**: 20 |

| com.snc.on_call_rotation.reminders.showtz | Specifies whether to show a user's timezone.  
- **Type**: true | false  
- **Default value**: false |

| glide.email.allow_duplicate_message_ids | Allows storing of emails with duplicate message IDs and adds error message "Duplicate message-id encountered, prevented loop."  
- **Type**: true | false  
- **Default value**: false |

</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| glide.notification.recipient.include_logging.subscription | Logs recipients because they are subscribed via User Notification Preferences.  
- Type: true | false  
- Default value: true |
| glide.pop3.parse_start | Specifies the text that indicates the beginning of the email body section. The instance parses name:value pairs within this section to set or update field values when processing inbound email actions.  
- Type: string  
- Default value: none |
| glide.pop3.parse_end | Text indicating the end of the email body section where the instance should parse name:value pairs to update field values when processing inbound email actions.  
- Type: string  
- Default value: none |
| glide.smtp.dateformat | Specify the date format to use for outgoing email notifications.  
- Type: string  
- Default value: date format listed in email sender's user record [sys_user.date_format] |
| glide.smtp.precedence_bulk | Specifies whether outbound email includes the header "Precedence: bulk". Some spam filters flag bulk email as spam. Set the value to false to remove this header from outbound email.  
- Type: true | false  
- Default value: true |
| glide.smtp.timeformat | Specify the time format to use for outgoing email notifications.  
- Type: string  
- Default value: time format listed in email sender's user record [sys_user.time_format] |
| glide.ui.activity.email.use_display | Specifies whether to display email addresses or user IDs (display value from the User table) in email headers. If true, the instance searches for a user record with a matching email address. If it cannot find a matching user record, it displays the email address.  
- Type: true | false  
- Default value: false |
### Property Description

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.ui.email_client.email_address.disambiguator | Sets the columns from the User [sys_user] table that the autocomplete list displays. Separate each column name with a semicolon character (;).  
- Type: string  
- Default value: name  
- Learn more: Displaying Additional Information in the Email Client Autocomplete |
| glide.ui.incident_activity.max_addresses | Specifies the maximum number of addresses to list in an email audit record. If the number of addresses exceeds this limit, the instance truncates the list after the maximum value and displays an ellipsis character (...).  
- Type: string  
- Default value: 5 |
| NotifyAffectedCI.max_rel_level | Sets a value used by the **Affected ci notifications** business rule, which notifies subscribers when configuration items (CIs) are affected by tasks. The business rule generates notifications for parent CIs up to the level defined by this property. You might need to adjust the property value according to the complexity and depth of your CI relationships.  
- Type: integer  
- Default value: 5 |

### Email size limits

To prevent issues with large email messages, the system enforces configured limits on the maximum allowed email body size, total attachment file size, and number of attachments per email.

An email or attachment that exceeds the system capacity may not be processed as expected. To ensure that your emails and attachments are processed as expected, you can configure properties that limit the size of emails and attachments.

#### Message body size limit properties

Several properties enforce the maximum email body size allowed for inbound and outbound email messages.

### Properties

By default, the system processes up to 1MB worth of information in the email **body** and **body_text** fields (524kB each).

You can add and configure system properties `com.glide.email.max_body_bytes` and `glide.email.outbound.max_body_bytes` to increase or decrease the email body size limits, but note that the system truncates the body text for emails that exceed the configured limit. For example, if you configure the body size limit of `com.glide.email.max_body_bytes` to 2MB but receive an inbound email that is 3MB, then the system cuts 1MB worth of information from the email body.
Also note that the system cannot process emails larger than 16MB. Even if you configure the email body size limits to a value larger than 16MB, emails larger than 16MB are truncated.

Message body size limit properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>com.glide.email.max_body_bytes</strong></td>
<td>Sets the maximum body size in bytes allowed per inbound email. Ensure that the sum of this property and the glide.email.inbound.max_total_attachment_size_bytes property is well below the maximum total inbound email size (50MB).</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 1048576</td>
</tr>
<tr>
<td><strong>glide.email.outbound.max_body_bytes</strong></td>
<td>Sets the maximum body size in bytes allowed per outbound email. Ensure that the sum of this property and the glide.email.outbound.max_total_attachment_size_bytes property is well below the maximum total outbound email size (25MB).</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 1048576</td>
</tr>
</tbody>
</table>

**Note:** A different property, **com.glide.attachment.max_size**, sets the maximum file size allowed for any attachment in the system and overrides any larger values of **glide.email.inbound.max_total_attachment_size_bytes** and **glide.email.outbound.max_total_attachment_size_bytes**.

Inbound email body processing

For inbound emails, the system enforces the maximum body size as set by the **com.glide.email.max_body_bytes** property. When the body size exceeds the configured value:

- The system does not run inbound email actions that would otherwise be triggered by the email.
- The system truncates the Body text on the Email form.
- The system logs a warning and sets the Error string field on the Email form. The log message for such an email might look like this:

   Email set to receive-ignored because its size exceeds the value set in **com.glide.email.max_body_bytes**. 1995 character(s) were truncated from the body field.

Outbound email body processing

For outbound emails, the system enforces the maximum body size as set by the **glide.email.outbound.max_body_bytes** property. When the body size exceeds the configured value:

- The system does not send the email.
- The system truncates the Body text on the Email form.
• The system logs a warning and sets the Error string field on the Email form. The log message for such an email might look like this:

    Email set to send-ignored because its size exceeds the value set in `glide.email.outbound.max_body_bytes`. 1337 character(s) were truncated from the body field.

Attachment limit properties
Several properties control email attachment limits.

Properties
All the properties are located in the System Property (sys_properties) table. Setting any of the following properties to an excessively large value may cause performance issues.

Attachment limit properties

<table>
<thead>
<tr>
<th>Name</th>

<tr>
<td><code>glide.email.outbound.max_total_attachment_size_bytes</code></td>
<td>Sets the maximum total attachment size in bytes allowed per outbound email. For an email, the system must encode the contents of the email. This process may significantly increase the size of the email, including any attachments. It is best to set this property to a value well below the maximum email size.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type</strong>: integer</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value</strong>: 18874368</td>
</tr>
<tr>
<td></td>
<td>• <strong>Learn more</strong>: Outbound Email Attachment Processing</td>
</tr>
</tbody>
</table>
Inbound email attachment processing

For inbound emails, the system enforces the maximum number and size of attachments as set by the \texttt{glide.email.inbound.max_attachment_count} and \texttt{glide.email.inbound.max_total_attachment_size_bytes} properties. When the attachments for an inbound email exceed either value, the system logs a warning and discards the excess attachments. The order in which the system processes the attachments determines which attachments are discarded. This order may not be consistent from email to email.

Outbound email attachment processing

For outbound emails, the system enforces the maximum number and size of attachments as set by the \texttt{glide.email.outbound.max_attachment_count} and \texttt{glide.email.outbound.max_total_attachment_size_bytes} properties. Email records are created from various sources and may exceed the configured attachment limits.

Emails that are ready to be sent from the Email (sys_email) table are subject to the outbound attachment limits. Emails that exceed either limit trigger a warning in the email system log and are sent with attachments up to the maximum number or total file size.

The log message for such an email might look like this:

Maximum combined attachment size exceeded. (max:15728640 bytes). One or more attachment records ignored.

Emails for notifications, scheduled reports, and exported tables

Notifications can be set to include all the attachments from the record that triggers the notification. If the attachments exceed either of the outbound email attachment limits, the system excludes the excess attachments from the email and logs a warning message.

Reports can be scheduled for email distribution as attachments. Large reports may exceed the outbound attachment size limit. In this case, the system sends the scheduled report email without the report attached and logs a warning message. To avoid the issue, send links to large reports instead of sending the reports as attachments.

If a user attempts to export numerous records from a list that exceeds a configured warning threshold, a dialog box offers the option to email the exported records as an attachment. If the attachment exceeds the outbound attachment size limit, the system sends the email without the exported record list attached and logs a warning message.

Domain separation in Notifications

This is an overview of domain separation and Notifications. Domain separation allows you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.
Overview

Support: Level 2

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

How domain separation works in Notifications

There are two basic components of domain separation and Notifications.

- Notifications are process-separated (not data-separated).
- Notifications are triggered in two main ways:
  1. When a record is Inserted or Updated
     a. Notifications with matching conditions AND in the same domain as the inserted/updated record are processed.
  2. When an event defined in the notification is triggered
     a. Events typically have a target record. For example, (incident.inserted) event references the incident record being inserted.
     b. When an event is fired, notifications configured for that event in the same domain as the event’s target record are processed.

Domains and email accounts

Domain separation is not supported on email accounts for these reasons:

1. Sending mail: There is only one SMTP sender per account. This prohibits providing domains for each account, and they are not configurable.
2. For receiving Inbound mail: You can set up multiple email accounts but cannot meaningfully set the domain of an inbound email action. Inbound Actions are processed in the domain of the user who sent the email. For example: User_A in Domain A sends an email to a ServiceNow email account which executes the “Create an incident” inbound email action. The resulting new incident created by the inbound action is in Domain A.

To learn more see Inbound email actions.

**Note:** If the number of email accounts exceeds 20, reception of email slows down.

Use case

- If an instance is using the Domain separation setup plugin and a new email notification is defined for a domain that has the same event as the notification on the global domain, the user receives two emails for the same event.

  Solution: Set the (sys_overrides) field on the notification that belongs to the domain so it overrides the setting on global. For more information, see Delegated administration.
Next steps after enabling email

After enabling email on your instance, consider performing several of these important tasks.

- Test the email configuration by routing all email to a single user (set the `glide.email.test.user` property).
- Review the baseline notification categories, email notifications, and templates to determine if they meet your business needs.
- Review the baseline inbound email actions to determine if they meet your business needs.
- Determine if you want to use email layouts to add consistent content elements.
- Determine if you want to use email filters to restrict the email the instance receives.
- Determine if you want to implement a retention policy to archive and destroy email at certain intervals.
- Determine what kind of watermarks outbound email uses to associate records with email messages.
- Determine if you want to create users when the instance receives an email from an unrecognized user.
- Set the precedence of outgoing mail. By default, the instance sends email with a precedence of bulk (set the `glide.smtp.precedence_bulk` property).
- Consider preventing untrusted users from triggering inbound actions to prevent unwanted email from affecting your instance.
- Implement a spam filter to restrict unwanted messages sent to your custom email addresses.

Create notification categories

You can create notification categories to identify and group related notifications that are listed in the notification settings for your users.

Role required: admin

Before adding new categories, review the base system notification categories in the Notification Categories (sys_notification_category) table to determine if you need a new category.

1. Navigate to System Notification > Email > Notification Categories.
2. Click New.
3. Enter the Name of the category to identify the family of notifications. Provide a category name that is meaningful to your users, so that they can easily find their notifications under the appropriate category in their notification settings.
4. Enter a Short description to identify the category.
5. Click Submit.

The system adds the new category to the Notification Categories (sys_notification_category) table. After you create at least one, active notification that uses the new category, the category and notification are listed in the notification settings for users (Notifications tab in the System Settings window).

Create an email notification

Creating an email notification involves specifying when to send it, who receives it, what it contains, and if it can be delivered in an email digest.

Role required: admin

Consider the following items when you create or update a notification:

- Your notification recipients must be active users and have a valid email address defined.
ServiceNow users or members of groups must be defined as active users in the User [sys_user] table. They must also have a valid email address defined for their primary channel (device) in the Notification Device [cmn_notif_device] table. If users do not have an active profile and a valid email address, they will not receive notifications.

- Your notification recipients must have the appropriate notification preferences enabled.
  
  If the notification is subscribable, each ServiceNow user or group member must have the notification and channels (devices) for the notification enabled in their notification preferences. Admins can impersonate users to review and configure their notification preferences.

- To have your email notification also send as an SMS notification, recipients must subscribe to the notification on an SMS channel. For more information on creating an SMS channel, see Create notification channels.

- After you create or update the notification, use the Preview Notification option to examine it. For example, you can test links that you may have added and verify the notification recipients. For details, see Preview email notifications.

Use the following tabs in the Notification form to configure an email notification:

- **When to send** — Conditions required to send the notification.
- **Who will receive** — Recipients of the notification.
- **What it will contain** — Contents of the notification.
- **What Digest will contain** — Contents of the email digest if the notification can be delivered in a digest.

**Note:** If you do not see all the fields on the form, switch to the Advanced view.

The following video shows how to configure inbound email actions and how to create and edit a notification. In the video, go to 3:35 for details on configuring a notification.

1. Navigate to System Notification > Email > Notifications.
2. Click New.
3. Fill in the fields at the top of the Notification form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the email notification. Descriptive names help identify the purpose of the email notification. For example, Incident Opened &amp; Unassigned.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the database table to link the notification to, for example Incident (incident). <strong>Attention:</strong> Do not select the Task (task) table. This table is for extending other tables. Notifications that run on the Task table directly are not supported.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the type of notification you are creating: EMAIL or Meeting Invitation.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to enable the email notification.</td>
</tr>
</tbody>
</table>

**Note:** Only tables and database views that are in the same application scope appear in the list.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>Select the category to which this notification belongs. A category identifies and groups related notifications. This notification, if active and subscribable, is listed in the selected Category in the notification preferences for each user (Notifications tab in the System Settings window).</td>
</tr>
</tbody>
</table>

**Note**: Do not leave the category as Uncategorised, as users may not be able to find the notification in their list of notifications.

If you need a new category, see Create notification categories.

<table>
<thead>
<tr>
<th>Allow Digest</th>
<th>Select the check box if an email digest is to be created for the notification. If selected, the What Digest will contain tab is displayed for creating the digest content.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Type a description for this notification.</td>
</tr>
</tbody>
</table>

4. Fill in the fields on the **When to send** tab.
Note: If the same trigger generates multiple notifications, the system only sends one notification. The system considers all other notifications, even if they have a different subject and body, as duplicates. The Ignore Duplicates business rule controls this functionality.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send when</td>
<td>Select under what condition the notification is sent:</td>
</tr>
<tr>
<td></td>
<td>• When a record is inserted or updated</td>
</tr>
<tr>
<td></td>
<td>• When a particular event is fired</td>
</tr>
<tr>
<td></td>
<td>• When triggered as an action step in Flow Designer</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Weight</td>
<td>(Required) Set a numerical value for the notification priority relative to duplicate notifications. Notifications that have the same target table and recipients, or the same subject and body, are considered duplicates. When there are duplicate notifications, the system only sends the notification with the highest weight. All other notifications are moved from the Outbox to the Skipped mailbox. The default value 0 causes the system to always send the notification (assuming the conditions are met). For example, suppose that a service desk agent adds a comment to an incident and shortly thereafter closes it. By default, these actions trigger both the Incident commented and Incident Closed notifications. However, both notifications are from the Incident table and also notify the incident caller. The system only sends the notification with the highest weight, which in this case is the Incident Closed notification. Note: The SMTP Sender scheduled job determines how often to send email. By default, this job runs every minute.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Use the condition builder to select the conditions under which this notification is sent. For example, select Priority &gt; greater than 3 - Moderate to send the notification only for High and Critical priority incidents.</td>
</tr>
<tr>
<td>Inserted</td>
<td>Select the check box to enable email notification when a record is inserted. This field appears when you set the Send when field to Record inserted or updated.</td>
</tr>
<tr>
<td>Updated</td>
<td>Select the check box to enable email notification when a record is updated. This field appears when you set the Send when field to Record inserted or updated.</td>
</tr>
<tr>
<td>Event name</td>
<td>Select the event that triggers this notification. This field appears when you set the Send when field to Event is fired.</td>
</tr>
</tbody>
</table>
## Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Advanced condition  | Create a script to perform certain actions, like sending a notification based on the current email record, changing field values, or changing system properties. The advanced condition script must return true or set a global answer variable to true to send the notification. The advanced condition script uses the following global variables:  
  - current: contains the current record from the table to which the notification is linked.  
  - event: contains the event that triggered the notification. |

**Note:** The Advanced condition field is evaluated in addition to other conditions you set on the notification. Both the condition and advanced condition must evaluate to true to send the notification.

5. Fill in the fields on the **Who will receive** tab.

The following example shows the default view of the tab. The advanced view contains additional fields (see table).

---

**Tip:** Consider limiting the recipient list of any notification to 1000 users. By default, if a notification has more than 100 intended recipients, the system creates multiple notification messages with up to 100 recipients each. If you want to change the recipient limit, set the system property `glide.email.smtp.max_recipients`.

---

### When to send

<table>
<thead>
<tr>
<th>Who will receive</th>
<th>What it will contain</th>
</tr>
</thead>
<tbody>
<tr>
<td>Users</td>
<td>Groups</td>
</tr>
<tr>
<td>Users/Groups in fields</td>
<td>Exclude delegates</td>
</tr>
<tr>
<td>Subscribable</td>
<td>Send to event creator</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Users</td>
<td>Select the users you want to receive the email notification. You can search for users with the reference lookup icon or manually add their email addresses. This list of users is static.</td>
</tr>
<tr>
<td>Users/groups in fields</td>
<td>Select fields from the target record that reference the User (sys_user) or Group (sys_user_group) tables. The system sends the notification to users or groups in each field that you select. For example, if a notification uses the Incident (incident) table, you can select the <em>Opened by</em> field to send the notification to users or groups who opened the incident. This list of users or groups is variable and depends upon the values of the associated task record. You can also select a field that includes an email address string to send a notification to that address.</td>
</tr>
<tr>
<td>Note:</td>
<td>You can dot-walk to values in reference fields by clicking the plus sign in the field selector and then selecting the related field.</td>
</tr>
<tr>
<td></td>
<td>If you address the notification to a user with an inactive record in the User (sys_user) table, the system does not send the notification to that user.</td>
</tr>
<tr>
<td>Groups</td>
<td>Select the groups you want to receive the email notification. You can search for groups with the reference lookup icon or by manually entering the group name. This list of groups is static.</td>
</tr>
<tr>
<td>Note:</td>
<td>Group members receive individual notifications only if <em>Include members</em> is selected in the group record.</td>
</tr>
<tr>
<td>Exclude delegates</td>
<td>Select this option to prevent the instance from sending email notifications to delegates of the users and members of the groups you selected.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Send to event creator</td>
<td>Select this check box to send the notification to the person who performed the action that started the notification process if the person is also a recipient. If the event creator is not specified in one of the recipient fields, the event creator does not receive a notification regardless of the setting in this field. For new notifications, this option is selected by default. If you want to know why you may not be receiving certain email notifications, see the blog post Troubleshooting email notifications - Send to the Event Creator by a ServiceNow Technical Support Engineer in the ServiceNow Now Community.</td>
</tr>
<tr>
<td>Event parm 1 contains recipient</td>
<td>Select this check box if the event parameter 1 contains one or more notification recipients (in a comma separated-list). This field is visible only when the Send when field is set to Event is fired.</td>
</tr>
<tr>
<td>Event parm 2 contains recipient</td>
<td>Select this check box if the event parameter 2 contains one or more notification recipients (in a comma-separated list). This field is visible only when the Send when field is set to Event is fired.</td>
</tr>
<tr>
<td>Subscribable</td>
<td>Select this check box to allow all users to subscribe to this notification. See Subscription-based notifications for more information.</td>
</tr>
</tbody>
</table>

Note: If the record contains sensitive or protected data, consider restricting the recipient list only to those users and groups who normally have access to it, and do not enable the Subscribable option. You can also configure your notification content so that private or sensitive data is not exposed. For example, you could insert a link back to the associated record, so that details are not revealed in the notification.

The system does not exclude recipients based on access controls. Recipients can receive email about records that they cannot normally access from the user interface. For example, requesters can receive email about incidents and catalog requests opened on their behalf even though they normally do not have access to these records. If a notification includes record details, verify that all recipients need these details.

Note: By default, the system does not send email notifications to itself. For example, an email notification from instanceABC@service-now.com does not send to instanceABC@service-now.com. The system prevents this behavior to avoid looping.

6. Fill in the fields on the What it will contain tab.
The following example shows the default view of the tab. The advanced view contains additional fields (see table).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Email template | If you want to reuse existing content, select an email template to add content to the email notification. You can only select an email template that meets one of the following conditions:  
  - shares the same scope and table as the notification  
  - shares the same scope but has no specified table  
  - shares the same table and is in the global scope |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Subject**      | Enter the subject line for the email message. The subject can include variables from the **Select variables** column.  
If empty, the system uses the **Subject** value from the **Email template**. If you enter a value in this field, it overrides the template value.  
If your recipients subscribe to the email notification on an SMS channel, then the system sends the email notification subject as an SMS message. To send a different SMS message, fill in the **SMS alternate** field on the email template form or the email notification form. |
| **Message HTML** | Enter the content of the email notification message. The message can include variables from the **Select variables** column.  
Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes.  
The **Message HTML** field is visible only if you set the content type to **HTML and plain text** or **HTML only**.  
If empty, the system uses the **Message HTML** value from the **Email template**. If you enter a value in this field, it overrides the template value.  
To prevent adding extra `<p>` and `<div>` elements to your email notifications, see the blog post [Extra line spacing with paragraph tags in email client](https://community.servicenow.com/servicenow/blog/extra-line-spacing-with-paragraph-tags-in-email-client) by a ServiceNow employee in the ServiceNow Now Community. |
| **SMS alternate**| Enter the notification message to send to an SMS device. The SMS alternate message is limited to 140 characters.  
If empty, the system uses the **SMS alternate** value from the **Email template**. If you enter a value in this field, it overrides the template value.  
If you don’t fill in the **SMS alternate** field on this form or the email template, then the system uses the email notification subject as the SMS message. |
| **Importance**   | Set the importance of the email message to low or high. |

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Content type          | Select the content type for the email notification:  
  - HTML and plain text  
  - HTML only  
  - Plain text only  
  By default, **HTML only** is enabled.                                                                                       |
| Include attachments   | Select this check box to send all attachments from the triggering record as email attachments.                                                                                                           |
| Omit watermark        | Use this check box to apply or remove the watermark attached to each email. If the email does not contain a watermark, the system reviews the conditions of the inbound actions to create or update task records.  
  For more information, and an alternative way to hide watermarks, see [Watermarks on notification emails](#).                                           |
| Message Text          | Enter the notification message to send in plain text. This field appears when you set the content type to **HTML and plain text** or **Plain text only**.  
  If empty, the system uses the **Message Text** value from the **Email template**. If you enter a value in this field, it overrides the template value. |
| From                  | Enter the email address that you want the email notification to use in the From field. For example, helpdesk@yourcompany.com. The email must be in a valid format, otherwise a notification message appears near the field.  
  Changing this address may require an advanced email setup such as [enabling email forwarding](#), for example when using Sender Policy Framework (SPF) records for spam detection. |
| Reply to              | Enter the email address you want people to use when replying to the email notification. For example, helpdesk@yourcompany.com. The email must be in a valid format, otherwise a notification message appears near the field.  
  You can add no more than one email address in this field.  
  Changing this address requires an advanced email setup such as [enabling email forwarding](#). |
<p>| Push message only     | Select this option to send this notification only as a push notification to a mobile device. The <strong>Push Notification</strong> feature must be active.                                                                 |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Push messages</td>
<td>Associate one or more push messages with this notification. The <a href="#">Push Notification</a> feature must be active.</td>
</tr>
</tbody>
</table>

**Note:** The push message and notification must be for the same table.

7. If you selected the **Allow Digest** check box, fill in the fields on the **What Digest will contain** tab to create the email digest content for the notification. The following example shows the default view of the tab. The advanced view contains additional fields (see table).
Field | Description
--- | ---
Digest Template | If you want to reuse existing content, such as headers or footers, select an email template to add content to the email digest.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digest Subject</td>
<td>Enter the subject line for the email digest. The subject can include variables from the Select variables column. If empty, the system uses the Subject value from the Email template. If you enter a value in this field, it overrides the template value.</td>
</tr>
<tr>
<td>Digest HTML</td>
<td>Enter the recurring content for the email digest. The digest content can include variables from the Select variables column. Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes. To prevent adding extra <code>&lt;p&gt;</code> and <code>&lt;div&gt;</code> elements to your email digest, see the blog post <em>Extra line spacing with paragraph tags in email client</em> by a ServiceNow employee in the ServiceNow Now Community.</td>
</tr>
<tr>
<td>Digest Separator (HTML)</td>
<td>Use the line to separate each item summarized in the digest.</td>
</tr>
<tr>
<td>Digest From</td>
<td>Enter the email address to be used in the From field of the email digest. For example, <a href="mailto:helpdesk@yourcompany.com">helpdesk@yourcompany.com</a>. The email address must be in a valid format, otherwise a notification message appears near the field. Changing this address requires an advanced email setup such as enabling email forwarding.</td>
</tr>
<tr>
<td>Digest Reply To</td>
<td>Enter the email address that you want people to use when replying to the email digest. For example, <a href="mailto:helpdesk@yourcompany.com">helpdesk@yourcompany.com</a>. The email must be in a valid format, otherwise a notification message appears near the field. Changing this address requires an advanced email setup such as enabling email forwarding.</td>
</tr>
<tr>
<td>Digest Text</td>
<td>Enter the recurring content of the email digest to send in plain text. This field appears when you set the content type to HTML and plain text or Plain text only.</td>
</tr>
<tr>
<td>Digest Separator (text)</td>
<td><em>(Optional)</em> Use the dash character as a line to separate each item summarized in the digest. This field appears when you set the content type to HTML and plain text or Plain text only.</td>
</tr>
</tbody>
</table>
When you save or update the notification, the email Digest option is available for the notification in the notification settings of your users.

8. When you finish creating the notification, click Submit. Or, if you are done modifying the notification, click Update.

Use the Preview Notification option to check your notification. For example, you can see:

- How the Subject and Message fields are displayed.
- Which users will or will not receive the notification, including the reasons why users will not receive it.

Convert legacy email notifications to rich HTML

By default, new email notifications are created in the rich HTML format. But you can also convert legacy notifications to rich HTML.

Role required: admin

1. Navigate to System Notification > Email > Notifications.
2. On the Email Notifications list screen, click the name of the email notification you want to convert.
3. Click the What it will contain tab.
4. Click **Switch to Rich HTML Editor**.

The system copies any raw HTML from the **Message** field and converts it to rich HTML in the **Message HTML** field. Additionally, any mail scripts in the body are automatically saved to the **Email Script [sys_script_email]** table and are replaced in the notification body with an embedded script tag. This makes the notification body easier to read.
You have been assigned to complete tests on $metric_type$. Please follow the link below and complete the tests by $due_date$. You can save your results until you are ready to submit them. When you have completed the tests, and filled in all final results, submit the test.

Click here to begin the test:

$script_name

To view your test queue at any time, sign in and navigate to Self-Service > My Tests.
When you convert an email notification that was created in a version prior to Eureka to rich HTML, mail scripts are automatically moved to the Email Script (sys_script_email) table and an embedded script tag with the name of the script is automatically inserted into the body of the notification.

When creating new email notifications, write mail scripts using System Notification > Email > Notification Email Scripts. When the scripts are completed, add a $\{mail_script:script_name\} embedded script tag to the email notification body. This makes it easy to use the same scripts in multiple email notifications. All you need to copy and paste from one notification to the next is the embedded script tag.

If you manually enter a mail script, any text bounded by <mail_script> </mail_script> in the body of a new or converted email notification or template which is saved to the record, a message asks whether the mail script should be converted.

In many cases, an unconverted mail script fails to run from inside the HTML editor. If you select Yes, the script is added to the Email Script (sys_script_email) table and is automatically replaced in the body with an embedded script tag. You can view the mail scripts in their original form by opening the email notification and clicking the Show Notification Scripts related link.

Advanced conditions for email notifications
Use an advanced condition to send a notification based on the current email record, changing field values, or system properties.

To send a notification using an advanced condition, you can:

- Call a function that returns a value, or
- Set the global variable answer using a script

For example, in the following code, you call a function to prevent the system from sending an email notification if the sender of a self-service request is a member of the XYZ group:

```javascript
(function() {
    var groupMember = gs.getUser();
    return !groupMember.isMemberOf('XYZ');
})();
```
Alternatively, you can script the same advanced condition by using the `answer` variable:

```javascript
var groupMember = gs.getUser();
if(groupMember.isMemberOf('XYZ')){
    answer = false;
} else {
    answer = true;
};
```

Note that the script must set the `answer` variable to `true` to send the notification. If you script no conditionals, the value of `answer` is equal to the last value that you set for the variable.

You can add a script-based condition in the **Advanced condition** field by configuring the Email Notification form and adding the field. You can access the field in the **Advanced** view without configuring the form.

The advanced condition script uses the following business rule global variables:
- current: contains the current record from the table to which the notification is linked.
- event: contains the event that triggered the notification.

**Note:** The **Advanced condition** field is evaluated in addition to other conditions you set on the notification. Both the **Condition** and **Advanced condition** must evaluate to true in order to send the notification.

---

**Edit HTML content in an email notification**

For added control over the content of an email notification, you can edit the underlying HTML.

Role required: admin

1. Navigate to **System Notification > Email > Notifications**.
2. Open an email notification record.
3. On the form, open the **What it will contain** tab.
4. In the **Message HTML** field, click the source code icon (✍️) to open the HTML source code editor.
5. Make the needed changes to the HTML.
6. On the window, click **Ok**.
7. On the form, click **Update**.

**Document attachments on an email notification**

You can attach documents and reports to email notifications by scripting or linking to the sys ID of the record.

You can include all attachments from the source record with the notification. For example, if an incident update generates a notification, you can include all attachments from the incident record with the notification. To include all attachments from the source record, select the check box for the **Include attachments** field. Note that email messages, including attachments, cannot exceed the maximum email size. This size includes MIME encoding, which increases total attachment size by approximately 37%.
Attaching documents with scripting

Using scripting, you can attach documents by linking to them, or you can attach various types of reports by specifying their IDs in the system.

Linking to an attachment

You can add an attachment to a notification by linking to the attachment record in the message of the notification. Upon clicking the link, email recipients log in to the instance to view the attachment record.

Linking to attachment records in this fashion requires using email notification scripting. For example:

```
template.print ( 'Attachment: <a href="/sys_attachment.do?sys_id=' + gr.sys_id + '"></a>' + gr. file_name + '</a>
' ) ;
```

Attaching reports using the Sys ID

You can also attach various types of reports, including gauges, dashboards, and charts, to a notification. The scripts to attach these reports take the following syntax:

```
${report:X:Y}
```

where:

- X is the type of report you want to attach (reportID, gaugeID, dashboardID, or chartID).
- Y is the sys ID of the report, gauge, dashboard, or chart to be attached.

For example:

- `${report:reportID:<abc123>}`
- `${report:gaugeID:<abc123>}`
- `${report:dashboardID:<abc123>}`
- `${report:chartID:<abc123>}`

Line breaks in email notifications and rich HTML

Rich HTML provides additional control over line breaks in your email notifications and templates. To provide control over line breaks, a Newlines to HTML check box is available in the Email Script form.
Newlines to HTML option

Selecting the **Newlines to HTML** check box indicates that the method for handling line breaks in earlier versions carries forward for email notifications and templates. When an email notification or template is converted to rich HTML, the **Newlines to HTML** check box is automatically selected.

For new mail scripts, add correct HTML line breaks to `template.print()` statements.

If an email notification or template is not converted to rich HTML, newlines are automatically wrapped with `<div>` tags, the same as previous versions. The old mail scripts still work. However, the administrator does not enjoy the benefits of working in the rich HTML format, and does not have as much control over exact HTML formatting.
**HTML line breaks in new scripts**

When writing new scripts, insert explicit HTML line breaks and clear the Newlines to HTML check box so that no HTML tags are injected when email notifications are generated. For existing notifications and templates, replace template.print("\n") JavaScript function calls with template.print("<br />"). This replacement gives you better control over the HTML formatting of your email notifications.

**Preview email notifications**

You can preview what notifications look like before you actually enable the instance to send them.

Role required: admin

You can preview both types of notifications as specified by the Send when field on the Notification form:

- **Record inserted or updated**: A change to record in the instance triggers the notification.
- **Event is fired**: An event, such as expiration of a certificate or an inbound email action, triggers the notification.

1. Navigate to System Notification > Email > Notifications.
2. Open the notification or create one.
   
   You must save the record before you can view the preview accurately.
3. Click Preview Notification on the form header.
4. On the Notification Preview window, verify that the notification works as expected.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Preview records for this breakdown source</td>
<td>The type of event that triggers the notification. This choice list appears if you preview an event-triggered notification. Select one of the following:</td>
</tr>
<tr>
<td></td>
<td>• Generated Event: Preview the notification with a generic event that the previewer creates. This does not actually generate an event record.</td>
</tr>
<tr>
<td></td>
<td>• Existing Event: Preview with an existing event record in the instance. If you select this option, select the event in the Event Record field.</td>
</tr>
<tr>
<td>Event Record</td>
<td>An existing event to preview an event-created notification. This option appears if you select Existing Event as the event type (for event-triggered notifications only).</td>
</tr>
<tr>
<td>Event Creator</td>
<td>The user triggering the notification for the purpose of the preview. The event creator defaults to the user who clicked Preview Notification. You can change the creator as needed. You can change the preview record as needed to see the changes in the notification content.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Preview Record| The record triggering the notification for the purpose of the preview. The preview record defaults to one of the records in the Table field on the Email Notification form.  
You can change the preview record as needed to see the changes in the notification content. |
| Users         | The users who will receive the notification, as specified in the Who will receive section of the Email Notification form:  
· All users that you specify on the form appear, but only the users that will actually receive the notification with the current preview settings appear in black text.  
· Users that are specified but for whatever reason will not receive the notification appear in red, strikethrough text. Place the cursor over any of these names to see the reason the user will not receive the notification. For example, one reason could be that the user's notification settings are disabled. |
| Subject and Body| The content of the notification as defined by the template. The Subject and Body sections on the preview display the content in the corresponding Subject and Message fields on the template.  
If the template includes a link to the record that triggered the notification, the Preview Record link is used. Click the link to go to that record. |

5. After you have reviewed the notification, exit the preview window.
6. Make the necessary changes to the notification or template, if necessary.

**Time zone for email notifications**
A system property controls the time zone that the instance uses for the date and time stamp of a message.

The date and time stamp of a notification uses the system time zone, not the time zone of any recipient. The email property `glide.email.append.timezone` controls whether to append the time zone. If true, the system time zone of the instance is appended to any Date/Time fields in outbound email messages (for example, 2018-07-02 04:01:14 PST).

**Specify alternative outbound email addresses for notifications**
By default, the system sends all outbound email notifications from the default email address of the instance, but you can specify an alternative address.

Role required: admin
For organizations that need to send email messages from specific email addresses, such as from multiple service desks, or they want to send notifications in different languages, the platform supports configuring multiple outbound addresses.

1. Navigate to **System Notification > Email > Notifications**.
2. Select an existing notification record for the desired event, such as **Incident Closed**.
3. Create a copy of this notification for each outbound email address.
4. Open one of the notification copies, and click the **Advanced view** related link.
5. In the **What it will contain** section, add an email address to the From field that is different from the default instance address.
   
   For more information on how to construct the From address, refer to section 3.6.2 of **RFC 2822**.
6. Add a different email address than the From address to the **Reply to** field if you want replies to this notification to go to a different address.

   The system checks the From field for an address. If this field is empty, then the system uses the default address for the instance. If the Reply to field is empty, then all replies are sent to the address from which the notification was sent. If the Reply to field contains an email address, then the system sends all replies to the notification to this address.

7. Create mutually-exclusive conditions for notifications of the same type, so only the desired notification is sent when the event is fired.
   
   For example, if the **Company** is a certain value, then the notification comes from a unique email address entered in the From field.
8. Click **Update**.

**Specify an outbound email address for a particular language**

You can specify a different email address for each language your instance supports.

Role required: admin

1. Create or copy a notification record for the desired event.
2. In the **What will it contain** section, enter a new email address in the From field.
3. Create the **Subject** and **Message** content in the desired language.
4. In the **When to send** section, create a condition as follows:
   
   1. In the list of **Condition** fields, select **Show Related Fields** from the bottom of the choice list.
   2. From the choice list of **Related Fields**, select the field that identifies the recipient.
      
      For example, select **Caller > User** fields to send the notification to the user who called in an incident, or **Assigned to > User** fields to send the notification to the user to whom an incident is assigned.
   3. From the choice list of user fields, select **Language**.
   4. Select the **is** operator.
   5. Complete the condition by selecting the language of the desired user.
5. Click **Update**.

All notifications for that event originate from the specified email address and go out in the language of the recipient.

**Notification variables**

Use notification variables to display dynamic information in the body of a notification such as a field value, a link to a record, or a link to system preferences.
Syntax

Specify a notification variable using this syntax:

```
${variable-name+variable-parameters}
```

The `variable-name` portion is always required. Not all notification variables support the `variable-parameters` portion. When available, most variable parameters are optional. See the list of available notification variables for variable names and available parameters.

Available variables

The system provides these notification variables.

### Available notification variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Available parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>${field-name}</code></td>
<td>Display the value of the specified field.</td>
<td>None</td>
</tr>
<tr>
<td><code>${image-field-name}</code></td>
<td>Display an image associated with a record. This variable is typically used with HTML to specify the source of an image element.</td>
<td>None</td>
</tr>
<tr>
<td>· ${URI}</td>
<td>Display a link to the current record.</td>
<td>Any valid <code>sysparm</code> URL parameter. For example:</td>
</tr>
<tr>
<td>· ${URL_REF}</td>
<td>· URI: The link text is the word LINK.</td>
<td>· <code>sysparm_scriptlet</code></td>
</tr>
<tr>
<td></td>
<td>· URI_REF: The link text is the display value of the record.</td>
<td>· <code>sysparm_view</code></td>
</tr>
<tr>
<td>· ${reference-field.URI}</td>
<td>Display a link to the record listed in a reference field.</td>
<td>Any valid <code>sysparm</code> URL parameter. For example:</td>
</tr>
<tr>
<td>· ${reference-field.URI_REF}</td>
<td>· URI: The link text is the word LINK</td>
<td>· <code>sysparm_scriptlet</code></td>
</tr>
<tr>
<td></td>
<td>· URI_REF: The link text is the display value of the record.</td>
<td>· <code>sysparm_view</code></td>
</tr>
<tr>
<td><code>${CMS_URI}</code></td>
<td>Display a link to the specified record within a CMS page.</td>
<td><code>&lt;CMS-site&gt;/CMS-page&gt;</code>: The required relative path to the CMS page.</td>
</tr>
<tr>
<td><code>${notification:body}</code></td>
<td>Display the body contents of an email template or email notification. Use this notification variable to specify where to display body content in an email layout.</td>
<td>None</td>
</tr>
<tr>
<td><code>${mail_script:script-name}</code></td>
<td>Run the specified mail script.</td>
<td>None</td>
</tr>
<tr>
<td><code>${NOTIF_UNSUB}</code></td>
<td>Display a link unsubscribe from this notification.</td>
<td><code>link_text</code>: specify the text to display as a link within quotation marks.</td>
</tr>
<tr>
<td><code>${NOTIF_PREFS}</code></td>
<td>Display a link to set notification preferences.</td>
<td><code>link_text</code>: specify the text to display as a link within quotation marks.</td>
</tr>
</tbody>
</table>
Variable | Description | Available parameters
--- | --- | ---
$\{\text{comments:} n\}$ | Display the most recent comments that were made on the target record. The number of comments to display is $n$. For example, $\{\text{comments:3}\}$ displays the last three comments that were made to the record. To display all comments, use the variable $\{\text{comments}\}$. | Any number greater than 0.

$\{\text{comments_and_work_notes:} n\}$ | Display the most recent comments and work notes that were made on the target record. The number of comments and work notes to display is $n$. For example, $\{\text{comments_and_work_notes:3}\}$ displays the last three comments and work notes that were made to the record. To display all comments and work notes, use the variable $\{\text{comments_and_work_notes}\}$. | Any number greater than 0.

### Examples

Refer to the following examples to see how each notification variable is rendered in the output:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Example</th>
</tr>
</thead>
</table>
| $\{\text{field-name}\}$ | Source: Incident $\{\text{number}\}$ - comments added  
Output: Incident INC1000001 - comments added |
<table>
<thead>
<tr>
<th>Variable</th>
<th>Example</th>
</tr>
</thead>

<td></td>
</tr>
</tbody>
</table>
**Links to records in email notifications**

Adding the `{URI}` parameter to an outbound email body or template creates a link to a specific record.

When a user clicks the word LINK, the instance prompts the user to log in if not already logged in, and then redirects the user to the record specified in the URI.

![Example email notification](image)

**URI email notification**

The `{URI}` parameter has an extension called the `{URI+}` format to specify additional arguments in the email link, such as sysparm terms, in addition to the automatically created URI. For example (whitespace added for improved readability):

```plaintext
{URI+&sysparm_scriptlet=current.assigned_to=gs.getUserID()
 &sysparm_scriptlet_condition=current.assigned_to.nil()
 &sysparm_view=incident_active}
```

This example executes the JavaScript:

```javascript
current.assigned_to=gs.getUserID()
```

when the condition of

```javascript
current.assigned_to.nil()
```

is satisfied. Additionally, the script sets the view to `incident_active`.

Enable links to records

Adding the special `{URI}` parameter to an outbound email body or template creates a link to a specific record.

When a user clicks the word LINK, the instance prompts the user to log in if not already logged in, and then redirects the user to the record specified in the URI.

![Example email notification](image)
This example executes the JavaScript:

```javascript
current.assigned_to=gs.getUserID()
```

when the condition of

```javascript
current.assigned_to.nil()
```

is satisfied. Additionally, the script sets the view to incident_active.

Change the link text

To show the display value of the record as the link text instead of the word LINK, use the `${URL_REF}` parameter instead of the `${URL}` parameter.

**URI_REF email notification**

For example, if the URL displays an incident record, the link text is the incident number, which is the display value for incidents. If the URL displays a user record, then the link text is the user name.

**Link to related records**

A notification can link to a related record by specifying a reference field in front of the `${URI}` or `${URL_REF}` parameters.

Format the related record link as follows:

- `${<reference field that contains the related record you want to display>.URI}`
- `${<reference field that contains the related record you want to display>.URL_REF}`

For example:

<table>
<thead>
<tr>
<th>Related record to provide link to</th>
<th>Notification record table</th>
<th>Reference field</th>
<th>Samples</th>
</tr>
</thead>
</table>
| Related task record to be approved from an approval notification | Approval (sysapproval_approver) | Approval for (sysapproval) | · ${sysapproval.URI}  
· ${sysapproval.URL_REF} |
| Related problem record in an incident notification | Incident | Problem (problem_id) | · ${problem_id.URI}  
· ${problem_id.URL_REF} |

For example, the following notification template produces the email links in the picture below:

Click here to view Incident: `${URL_REF}`
Content page links in email notifications

Links to CMS pages can be put in notifications to make it easy for the reader to access the pages. The link takes the following format: \$\{CMS\_URI+<site>/<page}\}.

For example, to link the email recipient to a page called Incident in the content site ESS, with the current incident as the target document, use the following format: \$\{CMS\_URI+ess/incident\_detail\}.

The resulting email URL has this format: https://<instance name>.service-now.com/ess/incident\_detail.do?sysparm\_document\_key=incident,46e18c0fa9fe19810066a0083f76bd56

Email unsubscribe

Administrators can add unsubscribe links to notifications so that users can stop receiving particular email messages.

Note: The base system notifications include unsubscribe and notification preferences links.

The system offers two types of macros to create unsubscribe links.

- An unsubscribe link that creates an email message to the instance.
- An unsubscribe link that opens the notification preferences for the user on the instance.

Available unsubscribe macros

<table>
<thead>
<tr>
<th>Unsubscribe type</th>
<th>Macro used</th>
<th>Description</th>
<th>Available parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unsubscribe by email (Unauthenticated)</td>
<td>${NOTIF_UNSUB}</td>
<td>The system generates an HTML mailto hyperlink. When users click the link, their browser or email client creates a pre-formatted unsubscribe email message to the instance.</td>
<td>\textit{link_text}: specify the text to display as a link within quotation marks.</td>
</tr>
<tr>
<td>Unsubscribe by notification preferences (Authenticated)</td>
<td>${NOTIF_PREFS}</td>
<td>The system generates an instance link directly to the notification preferences for this notification type.</td>
<td>\textit{link_text}: specify the text to display as a link within quotation marks.</td>
</tr>
</tbody>
</table>

Administrators can add unsubscribe macros to any notification record type such as:

- Email layouts
- Email templates
- Email notifications
Unsubscribe by email

Unsubscribe by email requires the user email client or browser to create a pre-formatted email message containing these elements:

- The **To** field has the email address of the instance.
- The **Subject** starts with the string *Unsubscribe from*.
- The **Body** has a JSON string with a name-value pair of **Unsubscribe** and an array value that contains two more name-value pairs.
  - The **notification_id** parameter specifies the Sys ID of the notification the user wants to unsubscribe from.
  - The **unsub_token** parameter specifies an instance ID the system uses to verify that the email came from a ServiceNow instance.

**Note:** Some email clients and web browsers, such as GMail on Chrome, require extra client configuration to support mailto hyperlinks. Administrators can provide an alternative unsubscribe method for users whose email client or browser does not support mailto links. See [RFC6068](https://tools.ietf.org/html/rfc6068) for information about the mailto URI scheme.

The **Unsubscribe from Notification** inbound action processes the email and unsubscribes the sender from the listed notification.

**Note:** Unsubscribing by email message does not require users to authenticate with the instance first.

Unsubscribe by notification preferences

Unsubscribe by notification preferences requires the user’s browser to navigate to the notification preferences page on the instance. After logging in, the system displays the notification preferences for this particular notification.

Users can set preferences for this notification such as disabling notifications for a particular device. Users must save their notification preferences for changes to take effect.

**Unsubscribe links**

This email layout adds several unsubscribe links to the bottom of each email notification.

```
${NOTIF_UNSUB} from this notification by email or ${NOTIF_UNSUB+link_text="click here"}.
Manage your ${NOTIF_PREFS} or ${NOTIF_PREFS+link_text="click here"}.
```

When rendered in an email notification, the unsubscribe links only display the link text.
Sample email with unsubscribe links

If a user clicks the **Unsubscribe** link, the email client creates a message such as this:
Scripting for email notifications
Email scripts allow for business rule-like scripting within an outbound email message.

With mail scripts, you can dynamically change the email output of your system based on different criteria. Mail scripts allow you to perform simple tasks, such as displaying incident data, and complex ones, such as making advanced database queries.

You can add a `${mail_script:script name}` embedded script tag to the body of the email notification or template, replacing script name with the name of the script you created. This makes it easy to use the same scripts in multiple email notifications or templates.

If you manually enter a mail script bounded by `<mail_script>` and `</mail_script>` in the body of a new or converted email notification or template, and then attempt to save the record, a message asks whether the mail script should be converted. In many cases, an unconverted mail script fails to run from inside the HTML editor. If you select Yes, the script is added to the Email Script (sys_script_email) table and is automatically replaced in the body with an embedded script tag `${mail_script:script_name}`.

JavaScript in emails
Create mail scripts in System Notifications > Email > Notification Email Script, and refer to them by using `${mail_script:script name}` in the script field.

To print text into the body of the message, use the `template.print("a string")` function.
### JavaScript in templates

The **event.parm1** and **event.parm2** parameters that come from the originating event can also be used.

### Mail script API

Certain variables are available when processing mail_script scripts.

#### Mail script variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Object Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>template</td>
<td>Handles printing from the mail script to the email message.</td>
</tr>
<tr>
<td></td>
<td>template.print(&quot;message&quot;); //outputs message to the email body.</td>
</tr>
<tr>
<td></td>
<td>template.space(&quot;number of spaces&quot;); //outputs spaces to the email body.</td>
</tr>
<tr>
<td>email_action</td>
<td>GlideRecord object for the email notification (sysevent_email_action).</td>
</tr>
<tr>
<td>event</td>
<td>GlideRecord object for the event that fired the notification (sysevent).</td>
</tr>
</tbody>
</table>
### Variable | Object Description
--- | ---
**email** | EmailOutbound object

Available methods:
- `addAddress(String type, String address, String displayName)` - type can be cc or bcc.
- `setFrom(String address)` - override the sender address.
- `setReplyTo(String address)` - override the reply to address.
- `setSubject(String subject)` - override the subject of the message.
- `setBody(String message)` - override the body of the message.

The email address that is passed by `setFrom` and `setReplyTo` needs to be in a valid form such as `helpdesk@sn.com` or `Display Name <helpdesk@sn.com>`. If the email address includes a 'Display Name', then that value overrides the instance's display name.

---

**Example scripting for email notifications**

Examples of scripting for email notifications.

### Scripting examples for email notifications

A simple text string is the most basic example of the way a mail script works. This script prints out "Incident number - INC00001".

```java
...template.print("Incident number - "+ current.number);
```

More advanced scripts, like this one, can be found by browsing through the base system email templates.

```java
template.print("Summary of Requested items:<br />
var gr = new GlideRecord("sc_req_item");
gr.addQuery("request", current.sysapproval);
gr.query();
while(gr.next()) {
    template.print(gr.number + ": " + gr.quantity + " X " +
gr.cat_item.getDisplayValue()
        + " at " + gr.cat_item.price.getDisplayValue() + " each
<br />
}
```

To dynamically change field values within an email, use the following functions within `<mail_script>` syntax:

```java
...email.setFrom(current.caller_id.email);
email.setReplyTo("joe.employee@yourcompany.com");
email.setSubject("This is the new subject line");
email.setBody("This is the new body");
```
Using the `instance_name` property ensures that the notification still works when migrated between instances.

```javascript
function dothis(){
    var gr = new GlideRecord('sys_attachment');
    gr.addQuery('table_sys_id', current.sys_id);
    gr.query();
    while (gr.next()){
        template.print('Attachment: <a href="https://' +
        gs.getProperty('instance_name') +
        '.service-now.com/sys_attachment.do?sys_id=' +
        gr.sys_id + '">
        ' +
        gr.file_name + '</a>');
    }
}
```

You can specify copied and blind copied recipients by using the email object within a mail script.

```javascript
//email.addAddress(type, address, displayname);
email.addAddress("cc", "john.copy@example.com", "John Roberts");
email.addAddress("bcc", "john.secret@example.com", "John Roberts");
```

The following is an example script to add users from `watch_list` as copied recipients.

```javascript
if(!current.watch_list.nil()){
    //get watch list addresses and add to cc
    var watcherIds = current.watch_list.split(",");
    //get user records
    var user = new GlideRecord("sys_user");
    user.addQuery("sys_id", watcherIds);
    user.addQuery("notification", 2);
    //email
    user.addQuery("email", ",!=,"");
    user.query();
    while (user.next()){
        //add to cc list
        email.addAddress("cc", user.email, user.getDisplayValue());
    }
}
```

Useful attachment scripts
This is a searchable version of the Useful Attachment Scripts.

**Caution:** The customization described here was developed for use in specific instances, and is not supported by ServiceNow Technical Support. This method is provided as-is and should be tested thoroughly before implementation. Post all questions and comments regarding this customization to our community [forum](#).

**Copy attachments from record to record**

Use the following script to copy an attachment from one record to another record:

```javascript
GlideSysAttachment.copy('sourcetable', 'sys_id', 'destinationtable', 'sys_id');
```
**Delete duplicate attachments**

Use the following script in a business rule, scheduled job, or background script to delete duplicate attachments located in the Attachments (sys_attachment) table:

```javascript
function fixDuplicateImages(){
var gr = new GlideRecord('sys_attachment');
gr.addQuery('table_name', 'LIKE', 'ZZ_YY%');
gr.orderBy('table_sys_id');
gr.orderByDesc('sys_created_on');
gr.query();
var lastID = 'not_a_match';
var lastFile = 'not_a_match';
while(gr.next()){
    var isDuplicate = (lastID == gr.table_sys_id) && (lastFile == gr.file_name);
    lastID = gr.table_sys_id;
    lastFile = gr.file_name;
    gs.print(gr.table_sys_id+' '+ gr.table_name+' '+ gr.file_name+' '+
    gr.sys_created_on+' '+ isDuplicate);
    if(isDuplicate)
        gr.deleteRecord();
}
}
```

**Display whether tasks have attachments in list view**

Use the following script in a business rule to display whether tasks have attachments when viewed in the record list view. Note that the script needs a custom field on the Has Attachments (u_has_attachments) table.

```javascript
function checkAttachment(){
// if inserting then the task has an attachment
if(current.operation()=='insert'){
    hasAttachment('true');
// if deleting attachment check for other attachments
if(current.operation()=='delete'){
    var timeNow3 = new GlideDateTime();
    gs.log('has_attachment br: gliderecord query start date time is: '+
    timeNow3.getNumericValue(),'jwtest');
    var attachCount = new GlideAggregate('sys_attachment');
    attachCount.addQuery('table_sys_id', current.sys_id);
    attachCount.addAggregate('COUNT');
    attachCount.query();
    var numAttachments = '0';
    if no other attachments task does not have attachment
    if(attachCount.next()){
        numAttachments = attachCount.getAggregate('COUNT');
        if(numAttachments >0){
            hasAttachment = 'true';
        }else{
            hasAttachment = 'false';
        }
    var timeNow4=new GlideDateTime();
    gs.log('has_attachment br: gliderecord query start date time is: '+
    timeNow4.getNumericValue(),'jwtest');
}

function hasAttachment(answer){
var task = new GlideRecord('task');
task.addQuery('sys_id', current.table_sys_id);
task.query();
if(task.next()){
```
task.u_has_attachment= answer;
    task.autoSysFields(false);//Don't set the lastUpdatedTime or the
    Simultaneous Update Alert will likely get triggered
    task.setWorkflow(false);//Don't allow other business rules to run,
    otherwise multiple notifications will likely be sent
    task.update();}}

Note: Schedule the business rule to run after insert/delete.

Link to attachments in an email notification

Use the following script in an email notification or template to include links to attachments:

printattachments();

function printattachments(){var gr =new GlideRecord('sys_attachment');
    gr.addQuery('table_sys_id',current.sys_id);
    gr.query();while(gr.next()){ template.print('Attachment: <a
        href="http://'+gs.getProperty("instance_name")+'.service-now.com/
        sys_attachment.do?sys_id='+ gr.sys_id+'">'+ gr.file_name+'</a>');}}

Note: Replace "instance_name" with your instance name.

Attachment Logging

Whenever a user downloads an attachment, the action writes an attachment.read event record to the event log. If desired, you can process these events with a Script Action or an Email Notification. This can be useful if you want to do something when an attachment is read. For example, you can record when and by whom certain attachments are downloaded. For this functionality, the current variable must point to a sys_attachment record, and the event record must use the following parameters:

- parm1: File name
- parm2: Table name

Baseline email notifications

The baseline system provides several email notifications.

Some events listed in this table do not appear in a business rule and are fired by other conditions in the platform. Some events are hardcoded and are not user configurable.
### Baseline email notification descriptions

<table>
<thead>
<tr>
<th>Email notification</th>
<th>Description</th>
<th>Triggering event</th>
<th>Business Rule Controlling Event</th>
</tr>
</thead>
</table>
| Appointment Invite         | **Type:** Meeting Invitation
  Adds a meeting invitation to the recipient’s calendar by sending an iCalendar formatted email | itil_appointment.inserted | Global business rule            |
| Appointment Update         | **Type:** Meeting Invitation
  Updates an existing meeting in the recipient’s calendar by sending an iCalendar formatted email | itil_appointment.updated | Global business rule            |
| Approval Rejected          | **Type:** EMAIL
  A task-based approval has been rejected – includes the approver’s name. | approval.rejected      | approver events                 |
| Approval Rejected by Other | **Type:** EMAIL
  A task-based approval has been rejected – includes the approver’s name. | approval.rejected.by.other | approver events                 |
| Approval Request           | **Type:** EMAIL
  Sends an email for the recipient to reply with an approval decision. In the approval email, the recipient selects a link that builds the appropriate reply email. These emails come only from task-based approvals. | approval.inserted      | approver changes                |
| Catalog Approval Rejected  | **Type:** EMAIL
  A catalog request has been rejected – includes the approver’s name. | request.approval.rejected | approver events                 |
| Catalog Approval Request   | **Type:** EMAIL
  A catalog request for which you were an approver has been cancelled. | request.approval.cancelled | approver changes                |

| Scheduled Import Completed | Type: EMAIL
A scheduled import set has completed. | scheduled_import_set.completed |                                |
| System Upgraded            | Type: EMAIL
The recipient’s system has been upgraded. | system.upgraded              |                                |
| Task approved              | Type: EMAIL
An ITIL task has been approved. | task.approved                | Change events and task events  |
| Text Index Completed       | Type: EMAIL
A scheduled system index has completed. | text_index.complete          |                                |
| Unscheduled Change         | Type: EMAIL
A named configuration item has changed, and no active change request exists. | cmdb.unscheduled.change     |                                |

**Notification example:** notify task assignees
Notify users who are assigned a Task (task) record.

**Role required:** admin

Set up your email as a test email address. Navigate to **System Properties > Email Properties**, and then enter your email address under **Send all email to this test email address**.

1. Navigate to **System Notification > Email > Notifications**, and then click **New**.
2. On the form, enter the following values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Task Assigned</td>
</tr>
</tbody>
</table>
3. In the **Message HTML** field, add a message to send to whomever the task is assigned to.

4. From the form context menu, click **Save**.

5. To see a mock version of the system email that you created, click **Preview Notification** on the notification form.

6. Test the notification sends to a task assignee.
   a) Assign some task records.
   b) Check your email for assignment notifications.

**Notification example: notify an assignment group of updates to Priority 1 Incidents**

Notify users by email when there are updates to high priority incidents.

Role required: admin

Send emails to an assignment group whenever there are updates to an incident in which the **Priority** is **1 - Critical**. Include information that is of interest to the recipients, such as the incident number, category, assignees, and any comments that were added to the incident.

1. Navigate to **System Notification > Email > Notifications**, and then click **New**.

2. On the email notification form, enter the following values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Priority 1 Incident Updated</td>
</tr>
<tr>
<td>Table</td>
<td>Incident (incident)</td>
</tr>
<tr>
<td>Active</td>
<td>Selected</td>
</tr>
<tr>
<td>Category</td>
<td>Incident Alert</td>
</tr>
<tr>
<td>Send when</td>
<td>Record inserted or updated</td>
</tr>
<tr>
<td>Inserted</td>
<td>Selected</td>
</tr>
<tr>
<td>Updated</td>
<td>Selected</td>
</tr>
<tr>
<td>Conditions</td>
<td>(Priority) (is) (1 - Critical) AND (Updated) (changes)</td>
</tr>
</tbody>
</table>
### Table

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Users/Groups in fields</td>
<td>Assignment group</td>
</tr>
<tr>
<td>Subject</td>
<td>Priority ${priority} Incident updated</td>
</tr>
</tbody>
</table>

**Note:** In this notification, the variable \( ${priority} \) returns the value 1 - Critical.

3. In the **Message HTML** field, enter the following message and script:

```
Short Description: ${short_description}
Click here to view incident: ${URI}
Incident number: ${number}
Category: ${category}
Assigned to: ${assigned_to}
Assignment group: ${assignment_group}
<hr/>
Comments:
${comments}
```

4. From the form context menu, click **Save**.

5. Preview the email notification to ensure it includes all the needed information.
   a) On the notifications form, click **Preview Notification**.
   b) Note that the email includes the following information:
      - Short description
      - A link to the incident record
      - Incident number
      - Category
      - The name of the user to whom the incident is assigned
      - The group assigned to the incident
      - Comments from the incident record

6. Test that the email notification sends to an assignment group when its Priority 1 Incident is updated.
   a) **Create a user** who has an email address that you can monitor, and then **create a group** that includes the user that you created.
   b) Navigate to **Incident > Open**, and then open an incident in which the **Priority** is 1 - Critical.
   c) In the **Assignment group** field, enter the group that you created.
   d) From the form context menu, click **Save**.
   e) Add comments to the form to update the incident, and then click **Update**.
   f) Check the email account of the user member in the assignment group.

**Email templates**

Email templates enable administrators to create reusable content for the subject line and message body of email notifications.
Templates deliver consistent information on specific system activities and improve the efficiency of creating multiple email notifications for similar actions. If necessary, you can make minor changes on the fly to an email that uses a template by overriding the subject line and message body content in the notification form. A common practice is to define the message body in a template and create new subject lines for different types of recipients. There is no limit to the number of templates that you can create.

Email templates are created in rich HTML format, and administrators have the option of converting existing email templates to rich HTML (starting with the Eureka release). This format provides several advantages, including:

- Raw HTML content is converted into a WYSIWYG format.
- The content can be edited in a feature-rich HTML editor.
- Mail scripts are condensed into a single, easy-to-read line that can be reused in multiple email notifications.
- To prevent broken links, images linked using URLs relative to a particular instance are converted to absolute links.

Create an email template
You can create an email template with rich HTML formatting, rather than plain text.

Role required: admin

1. Navigate to **System Policy > Email > Templates**.
2. Click **New**.
3. Fill in the form fields (see table).
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the template. For example, <code>change.update.risk</code>.</td>
</tr>
<tr>
<td>Application</td>
<td>The type of scoped application.</td>
</tr>
<tr>
<td>Email layout</td>
<td>If the message body for the template is to be formatted using a predefined email layout, select the layout.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the name of the table involved. For example, <code>Change Request [change_request]</code>.</td>
</tr>
</tbody>
</table>
| Subject            | Enter a subject line that explains the purpose of the email. Select the appropriate variables for the subject line from the fields available on the selected table. Place the cursor where you want the variable to appear, and click the field name in the Select variables column. For example: \n\n\n```text
${sys_class_name} ${number} with ${risk} risk has been assigned to you.
``` |
| Message HTML       | Enter the content of the email template message. You can use the HTML editor toolbar to format the HTML, and you can include variables from the Select variables column. Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes. Notes:  
- When a template is applied to a notification, the contents of this field are used when you select HTML and plain text or HTML in the Content Type field in the Email Notification form.  
- You cannot use HTML code to control the appearance of the contents in the ${comments} variable.  
- If you want to include a link to the record that triggered the notification, see Enable links to records. |
| Message Text       | Enter the notification message to send in plain text. Note: When a template is applied to a notification, the contents of this field are used when you select HTML and plain text or Text in the Content Type field in the Email Notification form. |
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMS alternate</td>
<td>Create a different message to be delivered to an SMS device. Enter a brief message, showing the most important information only. If this message field is blank, the contents of the <strong>Message Text</strong> field are used for the SMS message.</td>
</tr>
</tbody>
</table>

**Note:** The message in this field is used when the message is sent to a device configured as SMS.

---

**Apply a template to an email notification**

After you create an email template, you can apply it to a notification.

Role required: admin

1. Navigate to System Notification > Email > Notifications.
2. Open the email notification record that should use the template.
3. Navigate to the **What it will contain** section.
4. From the **Email template** field, select the appropriate template.
5. Click **Update**.

**Convert an email template to rich HTML**

If you have an email template created prior to the Eureka release, you can convert it to rich HTML.

Role required: admin

1. Navigate to System Policy > Email > Templates.
2. Open the email template you want to convert.
Email Template
notify.change

* Name
notify.change

Email layout
Unsubscribe and Preferences

Subject
${TABLE_NAME} ${DISPLAY_VALUE}

Message
Click here to view ${TABLE_NAME}:

SMS alternate
3. Click **Switch to Rich HTML Editor**.

When content is converted, these changes are made to the content:

- **HTML Editor**: Any raw HTML in the **Message** field is rendered as WYSIWYG text in the **Message HTML** field. The content can be edited in a feature-rich HTML editor.
- **Simplified Mail Scripts**: Any mail scripts in the body are automatically saved to the **Email Script (sys_script_email)** table and are replaced in the notification body with an embedded script tag. This makes the template body easier to read and makes it easier to reuse scripts in multiple email templates.
<table>
<thead>
<tr>
<th>Name</th>
<th>notify.change</th>
<th>Table</th>
<th>Incident [incident]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email layout</td>
<td>Unsubscribe and Preferences</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Subject</td>
<td>${TABLE_NAME} ${DISPLAY_VALUE} Change Notification</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Message HTML

Click here to view ${TABLE_NAME}: ${URL}
4. Modify the message text, as needed, using the WYSIWYG editor or by editing the underlying HTML.

**Note:** The letter "P" at the bottom of the screen shows the location of your cursor within the Message field. In this case, the cursor is in a line containing an <HTML> tag.

**Note:** Email templates that are already formatted with rich HTML do not show the Switch to Rich HTML Editor button.

Whether you are working with templates converted from earlier versions or creating new templates in the rich HTML format, it is a good practice to write mail scripts in **System Notification > Email > Notification Email Scripts**. When the scripts are completed, a `${mail_script:script name}` embedded script tag should be added to the email template body. This makes it easy to use the same scripts in multiple email templates. All that needs to be copied and pasted from one template to the next is the embedded script tag.

If you manually enter a mail script in the body of a new or converted email notification or template, and then attempt to save the record, a message asks whether the mail script should be converted. Unconverted mail scripts often fail to run from inside the HTML editor. If you select Yes, the script is added to the Email Script (sys_script_email) table and is automatically replaced in the body with an embedded script tag.

You can view the mail scripts in their original form by opening the email template and clicking the **Show Notification Scripts** related link.

**Construct an email message with a template**

Email templates provide a list of the fields from database tables that are available for constructing an email message.

An email template can include a mailto automatic response link, which enables the email recipient to simply choose a link that sends a preformatted response back to the instance. An example is the email template used for notification that an approval is required. The following example shows the base email:

© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
In this case, when a change request approval is requested, an update is made to the 
sysapproval_approval table. The "approval events" business rule is then executed, which 
creates the 'approval.inserted' event. The 'Approval Request' email event is defined to 
process the approval.inserted event, and this email event is defined to use the following 
change.itil.approve.role email template. Notice that this template has two mailto: items specified. 
One for "mailto.approval" and one for "mailto.rejection." This email template builds an automatic 
response that lets the email receiver simply click a link in the email to either approve or reject the 
change request.

Here is what the change.itil.approve.role template looks like using the rich HTML editor:
Email Template
change.itl.approve.role

Name: change.itl.approve.role
Application: Global

Email layout:
Unsubscribe and Preferences

Table: Approval [sysapproval.approver]

Subject: ${sysapproval.sys_class_name} ${sysapproval} Approval Request

Message HTML:

B / U / I
Font Family / Font Sizes

Short Description: ${sysapproval.short_description}
Priority: ${sysapproval.priority}
Category: ${sysapproval.category}

${mail_script:change_request_summary}

Comments:
${sysapproval.description}

${mailto:mailto.approval}

${mailto:mailto.rejection}

Click here to view Approval Request: ${URI}
Click here to view ${sysapproval.sys_class_name}: ${(sysapproval.URI)}

div
The selection list on the right shows the available fields from the `sysapproval_approver` table. Notice the `change.itil.approve.role` template also uses a predefined email layout (Unsubscribe and Preferences), which provides links for the recipient to unsubscribe from approval notifications and set notification preferences.

And here is the `mailto.approval` template:

```plaintext
mailto approval template

**Note:** If you put text on the lines following the **Click here to approve \${sysapproval}** line, this text forms the actual body of the email.

The combination of templates used would generate an email similar to the following example:
Template generated email message

Notice that the email recipient can use the following links in the mail:

- A link to view all the details of the change request
- A link to view the approval record
- A link that generates an automatic email response to approve the change
- A link that generates an automatic email response to reject the change
- A link to unsubscribe from approval notifications and another link to set notification preferences

Add blank lines in an email template
You can easily add blank lines in an email template using HTML tags.

Judicious use of these HTML tags can make your email easier to read.

- You can use `<br/>` to insert a line break
- You can wrap paragraphs in `<p> ... </p>` tags to format your email nicely.

Calendar integration
With email notifications, you can use import export maps to leverage information about records and integrate with Outlook or another calendar.

For example, an email notification can create a calendar event based on the planned start and end dates of a change request. To enable integration with a calendar, the following iCalendar variables are available to be added to an email template message and reference the email template from the notification. The variables must be added to the Message Text field.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>${dtstart}</td>
<td>Start Date</td>
</tr>
<tr>
<td>${dtend}</td>
<td>End Date</td>
</tr>
<tr>
<td>${location}</td>
<td>Location</td>
</tr>
<tr>
<td>Variable</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>---------------------------</td>
</tr>
<tr>
<td>${alarm_time}</td>
<td>Alert or reminder time</td>
</tr>
</tbody>
</table>

The instance computes the value of iCalendar variables using import and export maps for the following tables:

- change_request
- reminder
- itil_appointment
- incident

**Import export maps**

Each import export map can specify a different set of iCalendar fields. For example, the icalendar.change_request import export map only maps two iCalendar fields.
iCalendar change request mappings

The instance uses the External Name value as the variable name in the email template. For example, the icalendar.change_request import export map defines the dtstart and dtend variables.

<table>
<thead>
<tr>
<th>External name</th>
<th>Associated variable name</th>
<th>Table</th>
<th>Field mapped</th>
<th>Field label</th>
</tr>
</thead>
<tbody>
<tr>
<td>dtstart</td>
<td>${dtstart}</td>
<td>change_request</td>
<td>start_date</td>
<td>Planned start date</td>
</tr>
<tr>
<td>dtend</td>
<td>${dtend}</td>
<td>change_request</td>
<td>end_date</td>
<td>Planned end date</td>
</tr>
</tbody>
</table>

Map date fields to iCalendar variables

You can specify what fields provide the date information in calendar invitation notifications by changing the field mappings of the dtstart and dtend variables in the import export map for the iCalendar invitation.

Role required: admin

1. In the navigation filter, enter sys_impex_map.list.
2. Open the icalendar.change_request map or the map you want to edit.
3. In the Field Maps related list, click either the end_date or start_date mapped field to change the mapping for dtstart or dtend, as needed.
4. Change the Database field to the field you want to use to set the start date or end date.
5. Click Update.
Create iCalendar invitations for custom tables

To generate iCalendar invitations that use field values from custom tables, create an import export map that computes the values of the iCalendar fields.

Role required: admin

1. Create the custom table and fields using the Date/Time field type for the fields that map to the $dtstart and $dtend variables.
2. In the navigation filter, enter sys_impex_map.list.
3. Click New.
4. Set the following fields:
   - Name: Use the following naming convention: icalendar.<table name>. For example, icalendar.u_my_custom_table.
   - Table: Select the custom table you created.
   - Type: Select icalendar.
5. Right-click the form header and select Save.
6. In the Field Maps related list, click New.
7. In the Mapping Entry Wizard, select Mapping to a Database Field.
8. Create field mappings for dtstart and dtend. These variables are required.
   For example, map the External Name dtstart to the u_meeting_start_time field in u_my_custom_table.
9. Click Submit.
10. Create field mappings for any other iCalendar fields as necessary.
11. Click Update.

Here are sample field mappings between iCalendar variables and custom fields in a custom table, u_my_custom_table:

<table>
<thead>
<tr>
<th>External name</th>
<th>Database field</th>
<th>Type</th>
<th>Map</th>
</tr>
</thead>
<tbody>
<tr>
<td>dtstart</td>
<td>u_meeting_start_time</td>
<td>field</td>
<td>icalendar.u_my_custom_table</td>
</tr>
<tr>
<td>dtend</td>
<td>u_meeting_end_time</td>
<td>field</td>
<td>icalendar.u_my_custom_table</td>
</tr>
<tr>
<td>description</td>
<td>u_meeting_description</td>
<td>field</td>
<td>icalendar.u_my_custom_table</td>
</tr>
</tbody>
</table>

12. Create an email template that defines what to include in the iCalendar invitation.
   a) Set the Table field to the custom table you created.
   b) In the Message text field, use the following format to define the iCalendar invitation.

```
BEGIN:VCALENDAR
PRODID:-//Service-now.com//Outlook 11.0 MIMEDIR//EN
VERSION:2.0
METHOD:REQUEST
BEGIN:VEVENT
ATTENDEE;ROLE=REQ-PARTICIPANT;RSVP=TRUE:MAILTO:${to}
DTSTART:${dtstart}
DTEND:${dtend}
UID:${sys_id}
DTSTAMP:${dtstamp}
DESCRIPTION:${description}
SUMMARY:${u_meeting_summary}
END:VEVENT
```
**Note:** Mail script is not allowed or processed in meeting invitation email templates.

### iCalendar invitation template details

<table>
<thead>
<tr>
<th>iCalendar template line</th>
<th>Required?</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>BEGIN:VCALENDAR</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>PRODID:-//Service-now.com//Outlook 11.0 MIMEDIR//EN</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>VERSION:2.0</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>METHOD:REQUEST</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>BEGIN:VEVENT</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>ATTENDEE;ROLE=REQ-PARTICIPANT;RSVP=TRUE:MAILTO: ${to}</td>
<td>Yes</td>
<td>You must use the import export map to map dtstart to a start time field on the custom table.</td>
</tr>
<tr>
<td>DTSTART:${dtstart}</td>
<td>Yes</td>
<td>You must use the import export map to map dtstart to a start time field on the custom table.</td>
</tr>
<tr>
<td>DTEND:${dtend}</td>
<td>Yes</td>
<td>You must use the import export map to map dtend to an end time field on the custom table.</td>
</tr>
<tr>
<td>UID:${sys_id}</td>
<td>Yes</td>
<td>You must provide the name of a field that uniquely identifies the record, such as the sys_id or the record number field.</td>
</tr>
<tr>
<td>DTSTAMP:${dtstamp}</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>DESCRIPTION:${description}</td>
<td>No</td>
<td>To include a multiple line description, you must use the import export map to map description to a text field on the custom table. The field mapping ensures that the system encodes line breaks correctly for the iCalendar file format.</td>
</tr>
<tr>
<td>SUMMARY: ${u_meeting_summary}</td>
<td>No</td>
<td>To include a summary from a text field on the custom table, provide the name of the field, such as u_meeting_summary. The summary field value must not contain line breaks. You do not need to create a field mapping.</td>
</tr>
<tr>
<td>END:VEVENT</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>END:VCALENDAR</td>
<td>Yes</td>
<td></td>
</tr>
</tbody>
</table>

13. Create an email notification to trigger the iCalendar invitation and ensure the following fields are set accordingly:
- **Table**: Select the custom table.
- **Type**: Select **Meeting Invitation**.
- **Content type**: Select **Plain text** only.
- **Email template**: Select the template you created.

**Email layouts**

Create reusable content for the message body of email templates.

Administrators can use email layouts to:

- Ensure all email notifications have a consistent layout such as always displaying a header, body, and footer.
- Display static content on all email notifications such as a company logo or a background.
- Declare inline styles available for use in the message body of an email template such as setting a text font, size, and color.
- Provide users with links to common response actions such as unsubscribe from a notification or manage notification preferences.

**Note:** To display dynamic content such as mail scripts, use email templates. For more information, see [Create an email template](#).

Email layouts insert HTML elements into the message body of email templates. Any style elements you define in the email layout are available to the email template. Email layouts support style sheets in these formats:

- Internal style sheets defined within a `<style>` element.
- Inline styles within a `style` attribute.

By default, the system includes several sample layouts administrators can use to create their own layouts. Administrators can create email layouts using an inline HTML editor or manually entering HTML code. The system stores email layout records in the Email Layout (sys_email_layout) table.

**Create an email layout**

Create an email layout to specify the HTML content you want to appear in the body of one or more email templates.

- **Role required:** admin
- **Record required:** email template record

1. **Navigate to System Policy > Email > Layouts.**
   - The system displays the list of existing email layouts.
2. **Click New.**
   - The system displays a blank email layout form.
3. **Fill in the form.**

### Email layout fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Specify a unique name for the record.</td>
</tr>
<tr>
<td>Application</td>
<td>Lists the parent application to which this record belongs.</td>
</tr>
<tr>
<td>Description</td>
<td>Specify an optional description of the layout.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select whether to display the Advanced Layout field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Layout</td>
<td>Use the inline editor to add HTML elements. The system displays HTML from this field in the body of any email template that uses the layout. Include notification variables to show content from the related record. For more information notification variables see Notification variables.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The editor automatically formats any HTML code you enter from the Source code view.</td>
</tr>
<tr>
<td>Advanced Layout</td>
<td>Use this field to manually enter HTML code. The system displays HTML from this field in the body of any email template that uses the layout.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> To enter text in this field, select Click here to disable syntax highlighting and script formatting.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.  
The system creates the email layout record.

5. Navigate to **System Policy > Email > Templates**.  
The system displays the list of existing email templates.

6. Select the email template which you want to use an email layout.  
The system displays the email template record.

7. In **Email layout**, select the email layout you want to use to format the body of email messages.

8. Click **Update**.  
The email template uses the selected email layout to format the body of email messages.

**Inbound email actions**

Inbound email actions enable you to define the actions an instance takes when receiving email. Inbound email actions are similar to business rules: both use conditions and scripts that take action on a target table. An inbound email action checks the email for a watermark that associates it with a task and checks for other conditions. If the conditions are met, the inbound email action takes the action that you configure. The system can take two types of actions:

- Record action: setting a value for a field in the target table.
- Email reply: sending an email back to the source that triggered the action.

By default, if an email has no identifiable watermark, an inbound email action attempts to create an incident from the message. If the email has a watermark of an existing incident, an inbound email action updates the existing incident according to the action’s script.

The following video explains the actions that the instance can take in response to messages from users and shows how to create or modify inbound email actions.
Inbound email action types

The system classifies all incoming email into one of three types: forward, reply, or new.

Inbound action classifications

<table>
<thead>
<tr>
<th>Order</th>
<th>Type</th>
<th>Criteria</th>
</tr>
</thead>
</table>
| 1     | Forward | The system classifies an email as a forward only when it meets all these criteria:  
· The subject line contains a recognized forward prefix such as **FW:**.  
· The email body contains a recognized forward string such as **From:**.  
The system classifies any email that meets these criteria as a forward, even if the message contains a watermark or record number that otherwise classifies it as a reply. |
| 2     | Reply  | The system classifies an email as a reply when it fails to match it to the forward inbound action type and it meets any one of these criteria:  
· The subject line or email body contains a recognized watermark such as **Ref:MSG0000008.**  
· There is no watermark and the **Reply-To header** contains a recognized message ID of an email with a target record.  
· There is no watermark and the subject line contains a recognized reply prefix such as **RE:** and a recognized record number such as **INC0005574.** |
| 3     | New    | The system classifies an email as new when it fails to match it to the forward and reply inbound action types. |
Determining the type of incoming email

Attachments

If an inbound email contains one or more email attachments, the inbound email action adds the attachments to the first record the action produces.

Character encoding

- If the email encoding is ASCII-7 or UTF-8, inbound email actions preserve the character encoding in any associated task records they produce.
- If the email encoding is ISO-8859-1, the inbound email action attempts to convert the email to Windows 1252.
- Inbound email actions convert any other encodings (for example, Mac OS Roman) to plain text, which may or may not be readable.

See the System email log and mailboxes for examples of what you might see if a notification or inbound email action is not processed.

**Note:** The state of all incoming emails that have been run against inbound email actions, even if there is no matching action, is changed to **Processed**.

**Domain separation**

The system ignores the domain that the inbound email action record is in when it creates a record based on the inbound email action. Keep inbound actions in the global domain. For example, if your inbound email action creates an incident, the system creates the incident in the same domain as the user in the **Caller** field. If that user is not in the User (sys_user) table, the incident is in the global domain.

**Inbound email processing**

The system determines which inbound actions to run by comparing the inbound email type and inbound action conditions to the incoming email message. Certain properties are available to set the reply and forwarding prefixes in the email subject lines that your instance recognizes when processing inbound emails.

The system follows this processing flow to determine whether to run an inbound action.
Inbound action processing work flow

The system only runs an inbound action when:

- The incoming email type matches the inbound action **Type**.
- If present, the watermark or record number refers to a record in the **Target table**.
- The inbound action **Conditions** evaluates to true.

If any of these criteria are not met, the system skips the current inbound action and evaluates the next active inbound action. The system processes inbound actions from the lowest to highest **Order** value. If the inbound action has **Stop processing** enabled, then the system updates the **State** of the email record to **Processed** after running the inbound action **Script**.

The following video shows how an inbound action condition prevents an incident from being created.

### Prefixes recognized in email subject lines

#### Email reply prefixes

When no watermark is present or the In-Reply-To email header is present, the instance recognizes email containing a prefix from the **glide.email.reply_subject_prefix** property as reply email. You can use this property to set non-standard reply prefixes in your email system.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.email.reply_subject_prefix | Specifies the list of prefixes (comma-separated) in the subject line that identify an email reply.  
  • Type: string  
  • Default value: re:,aw:,r:  
  • Location: Add to the System Properties (sys_properties) table |

**Note:** Prefixes are case insensitive.

#### Email forward prefixes

Emails with certain prefixes trigger the forward type of inbound email action. The instance recognizes any email whose subject line contains a prefix from the **glide.email.forward_subject_prefix** property as forwarded email. Emails with these prefixes trigger inbound email actions of the type forward. Use this property to set non-standard forward prefixes in your email system or you want email forwards to behave like replies. If the value of the system property is empty, then the system reverts to using the values **fw:** and **fwd:**.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.email.forward_subject_prefix | Specifies the list of prefixes (comma-separated) in the subject line that identify a forwarded email.  
  • Type: string  
  • Default value: fw:,fwd:  
  • Location: Add to the System Properties (sys_properties) table |

**Note:** Prefixes are case insensitive.

#### Email forwards as replies
Properties are available to force inbound actions to process forwarded mail as replied mail. These properties control the subject prefix that the inbound actions use.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value needed</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.reply_subject_prefix</td>
<td>re:, Re:, Re:, aw:, r:, fw:, fwd:, Fwd:, FWD:</td>
</tr>
<tr>
<td>glide.email.forward_subject_prefix</td>
<td>(any text that is not a forward prefix)</td>
</tr>
</tbody>
</table>

These properties cause the Update Incident inbound action to process all forwarded and replied-to mail.

**Note:** The glide.email.forward_subject_prefix property must contain some text so that the forwarded email can be processed as a Reply. It can be any text except a forward prefix (that is, fw:, fwd:, Fwd:, FWD:).

### Matching a sender email address to a user

The instance matches a senders email address to an active user in the User (sys_user) table using inbound actions.

**Note:** The Email Automatic User Creation plugin must be active.

When processing an email, the instance sets the current user to the user whose email address matches email.from. Inbound actions can then reference that current user. For example, the base system inbound action Create Incident sets the caller_id of the incident to the value returned by gs.getUserID().

If multiple users have the same email address, the instance first searches for an active user with the email address. The instance does not match inactive users.

**Note:** Each user record must have a unique email address so that the instance can reliably match the email to the correct user.

If a unique email address for each user is not possible, assign a shared email address to only one active user so that the instance always matches incoming email from that address to the active user.

### Matching watermarks in the Subject line or Body

The following examples illustrate how the instance matches randomized watermarks in an email subject line or body.

**Note:** For instances upgraded from a release before Jakarta, the system can recognize both randomized and non-randomized watermarks during a watermark transition period. For details, see the Notifications upgrade information.
Examples of matching watermarks in the Subject line or body

<table>
<thead>
<tr>
<th>Subject Line or Body Contents</th>
<th>Matching Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ref:MSG0000008_ aLjc130zDhCVuh3spXmt</td>
<td>The instance recognizes this string as a watermark and searches the Email Watermarks (sys_watermark) table for a record with the number MSG0000008_ aLjc130zDhCVuh3spXmt. If this watermark exists, the instance matches the email to the associated record. If this watermark does not exist, the system processes inbound email messages as described in Criteria for matching email to inbound actions.</td>
</tr>
<tr>
<td>Ref:MSGWTR0000008_wfLLz42lxCgUvG2JlYnh</td>
<td>The instance recognizes this string as a watermark and searches the Email Watermarks (sys_watermark) table for a record with the number MSGWTR0000008_wfLLz42lxCgUvG2JlYnh. If this watermark exists, the instance matches the email to the associated record. If this watermark does not exist, the system processes inbound email messages as described in Criteria for matching email to inbound actions.</td>
</tr>
</tbody>
</table>

Matching record numbers in the Subject line or Body

The following examples illustrate how the instance matches record numbers in the subject line of an email to an existing record when no watermark is present.

Examples of matching record numbers in the Subject line

<table>
<thead>
<tr>
<th>Subject line contents</th>
<th>Matching results</th>
</tr>
</thead>
<tbody>
<tr>
<td>RE: Example INC0005574</td>
<td>The instance recognizes this subject line as a reply and recognizes the INC prefix as belonging to the Incident table. The instance searches the Incident table for an existing record INC0005574. If this incident exists, the email is associated with this incident. If this incident record does not exist, the instance uses the inbound action for new emails to create an incident and associates the new incident with the email.</td>
</tr>
<tr>
<td>RE: Example &quot;INC0005574&quot;</td>
<td>The instance recognizes this subject line as a reply but does not recognize the &quot;INC prefix as belonging to the Incident table because of the quotation mark. The same error occurs for any character other than a space before the record number. The instance instead uses the inbound action for new emails to create an incident and associates the new incident with the email.</td>
</tr>
<tr>
<td>RE: Example &quot;INC0005574&quot;</td>
<td>The instance recognizes this subject line as a reply but does not recognize the &quot;INC prefix as belonging to the Incident table because of the quotation mark. The same error occurs for any character other than a space before the record number. The instance instead uses the inbound action for new emails to create an incident and associates the new incident with the email.</td>
</tr>
<tr>
<td>Subject line contents</td>
<td>Matching results</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------------</td>
</tr>
<tr>
<td>RE: &quot;Example INC0005574&quot;</td>
<td>The instance recognizes this subject line as a reply and recognizes the INC prefix as belonging to the Incident table. The instance searches the Incident table for an existing record INC0005574&quot;, which it cannot find because of the quotation mark. The same error occurs for any character other than a space at the end of the record number. The instance instead uses the inbound action for new emails to create an incident and associates the new incident with the email.</td>
</tr>
<tr>
<td>RE: Example INC0005574*</td>
<td></td>
</tr>
<tr>
<td>RE: CHG0008593 and INC000576</td>
<td>The instance recognizes this subject line as a reply and recognizes one, but not both, of the number prefixes. There is no way to predict which prefix the instance matches first. Whichever prefix it matches, it searches the corresponding table for a matching record. If the record exists, the email is associated with the table. If the record does not exist, the instance uses the inbound action for new emails to create an incident and associates the new incident with the email.</td>
</tr>
<tr>
<td>FW: Example INC0005574</td>
<td>The instance recognizes this subject line as a forward because of the &quot;FW:&quot; prefix. It uses the inbound action for forwarded emails to create an incident and associates the new incident with the email.</td>
</tr>
<tr>
<td>Example INC0005574</td>
<td>The instance recognizes this subject as a new email because it does not contain a matching reply or forward prefix. It uses the inbound action for new emails to create an incident and associates the new incident with the email.</td>
</tr>
</tbody>
</table>

Criteria for matching email to inbound actions

The system matches incoming email to the conditions of the active inbound actions.

The default inbound actions create or update task records under these conditions.

Note: The instance does not support processing email with multiple numbers in the subject line because there is no way to predict which record the instance matches first. For this reason, do not include more than one $number variable in your notifications.
Default matching criteria

If you customize or deactivate the default inbound actions, the system checks the conditions of the active inbound actions. If the system cannot find an inbound action with matching conditions, it sets the state to **Processed**.
Custom matching criteria
## Inbound action type criteria

<table>
<thead>
<tr>
<th>Inbound email action type</th>
<th>Required matching criteria</th>
<th>Name of default action (Incident table)</th>
<th>Result of default action</th>
</tr>
</thead>
</table>
| Forward                   | The email contains the following conditions:  
  1. A subject starting with a recognized forward prefix (even if a watermark or an In-Reply-To header is present).  
  2. From <user email> appears anywhere in the email body. | Create Incident (Forwarded) | Create new record |
| Reply                     | The email contains one of the following conditions and the table specified in the email matches the table of the inbound action:  
  1. A valid watermark that matches an existing record.  
  2. An In-Reply-To email header (when no watermark is present) that matches an existing record.  
  3. A subject line starting with a recognized reply prefix (when neither a watermark nor an In-Reply-To header is present) and a valid record number that matches an existing record. | Update Incident (BP) | Update existing record |
| New                       | The email does not meet the conditions for either a reply or forward type inbound email action | Create Incident | Create new record |

If more than one inbound action is available for a particular type, the instance uses the Table field to match the email to a particular table. If there is also more than one action for the inbound action’s table, the instance uses the Order field to determine the order in which the actions run.
Create an inbound email action
You can create inbound email actions to define the actions that the system takes when an email is received.

Role required: admin

1. Navigate to System Policy > Email > Inbound Actions.
2. Click New.
3. Fill in the fields as described in the table.
Inbound email actions specify how ServiceNow creates or updates task records in a table when the instance receives an email. The inbound email action looks for a watermark in the email to associate it with a specific task. If the conditions specified in the inbound action are met, the script is run.

### Inbound Email Actions - Create Incident

<table>
<thead>
<tr>
<th>Name</th>
<th>Create Incident</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target table</td>
<td>Incident [incident]</td>
</tr>
<tr>
<td>Action type</td>
<td>Record Action</td>
</tr>
<tr>
<td>Application</td>
<td>Global</td>
</tr>
<tr>
<td>Active</td>
<td>Yes</td>
</tr>
<tr>
<td>Stop processing</td>
<td>No</td>
</tr>
</tbody>
</table>

**When to run**

- Only emails of the selected Type will trigger this inbound action.
- Only emails from senders with the Required roles will trigger this inbound action.

**Order**

- Order determines when to run relative to other inbound actions. The inbound action with the lowest order runs first.

- From

**Conditions**

- Choose field
- Type
- Value

**Update**

### Inbound Email Actions form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>When to run</strong></td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Enter a descriptive name for this email action.</td>
</tr>
<tr>
<td>Target table</td>
<td>Select the table where the action will add or update records.</td>
</tr>
<tr>
<td>Action type</td>
<td>Select the type of action the instance takes. Select <strong>Record Action</strong> to modify a record in the instance or select <strong>Reply Email</strong> to have the instance send an email back to the source of the inbound email.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to activate the inbound email action. Clear the check box to disable the action.</td>
</tr>
<tr>
<td>Stop processing</td>
<td>Select this check box to prevent the system from running additional inbound email actions after this action runs.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the message type required to run the action. The action runs only if the inbound email is of the selected type. Available types are:</td>
</tr>
<tr>
<td></td>
<td>• New: An email that is not recognized as a reply or forward.</td>
</tr>
<tr>
<td></td>
<td>• Reply: An email with a watermark with an In-Reply-To email header, or whose subject line begins with a recognized reply prefix.</td>
</tr>
<tr>
<td></td>
<td>• Forward: An email whose subject line begins with a recognized forward prefix, even if the email also contains a watermark or In-Reply-To header.</td>
</tr>
<tr>
<td><strong>Note:</strong> By default, inbound emails of the Forward type always generate new incidents regardless of the presence of a watermark. If this behavior does not match your business logic, you can change the recognized reply and forward prefixes to treat forwards like replies.</td>
<td></td>
</tr>
<tr>
<td>Required roles</td>
<td>Specify required roles the sender must have to trigger the inbound action.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number that specifies when this inbound action runs relative to other inbound actions that use the same target table. The instance processes the action with the lowest order number first.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From</td>
<td>Select the user required to run the action. If a user is selected, the action runs only when the email sender matches the user name. Leave this field blank to perform the action for all users.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If the selected user is later archived or deleted, the restriction is removed and anyone can trigger the inbound email action.</td>
</tr>
<tr>
<td>Condition</td>
<td>Specify the condition that must evaluate to true to trigger the inbound action. Build a condition with the choice lists or enter a statement that determines when the inbound email action runs. For example:</td>
</tr>
</tbody>
</table>
|           | ```
|           | email.subject. startsWith ("chg:"
<p>|           | )  |
| Actions   |                                                                                                                                                                                                       |
| Field actions | Specify how information in the email is inserted into the record. For example, select <em>(Created by) (From email) (Sender)</em>, so that when the request is inserted, you can see who it is for. This field appears if the action type is <strong>Record Action</strong>. |
| Reply email | Compose the email message to send to the source that triggered the inbound email action. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Script</td>
<td>Enter the script the action runs. Typically, this script uses the validators script include and email variables. A template is provided:</td>
</tr>
</tbody>
</table>

```javascript
(function runAction(/ *GlideRecord*/ current, / *GlideRecord*/ event, / *EmailWrapper*/ email, / *ScopedEmailLogger*/ logger) { // Implement email action here })(current, event, email, logger);
```

These are the objects available:
- **current**: access the record referred to by the inbound email. For example, `current.assigned_to` accesses the person assigned to the task.
- **event**: access one of the parameters of the originating event. For example, `event.parm1` accesses the first parameter of the event or `event.parm2` for the second parameter. See Events for more information.
- **email**: access the inbound current email record. For example, `email.subject` accesses the content in the subject line of the email. See Accessing email object variables for more information.
- **logger**: add a message to the log file with the source set to `email.<Sys ID of incoming email>`. For example: `logger.log ("Some information")`

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Enter a detailed explanation of what this inbound email action does.</td>
</tr>
<tr>
<td>Other fields</td>
<td></td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number to define the order in which this email action should be processed. Actions with lower numbers are processed first. For more information. This field is not installed by the Ordered Email Processing plugin.</td>
</tr>
</tbody>
</table>

**Accessing email object variables**

An inbound email action script contains the email object to access various pieces of an inbound email through variables. You can use the global variable `sys_email` with inbound email actions.
## Accessing email objects with variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>email.to</td>
<td>Contains a comma-separated list of email addresses in the To: and Cc: boxes.</td>
</tr>
<tr>
<td>email.direct</td>
<td>Contains a comma-separated list of email addresses in the To: box.</td>
</tr>
<tr>
<td>email.copied</td>
<td>Contains a comma-separated list of email addresses in the Cc: box.</td>
</tr>
<tr>
<td>email.body_text</td>
<td>Contains the body of the email as a plain text string.</td>
</tr>
<tr>
<td>email.body_html</td>
<td>Contains the body of the email as an HTML string.</td>
</tr>
<tr>
<td>email.from</td>
<td>Contains an email address that depends on the following conditions:</td>
</tr>
<tr>
<td></td>
<td>- If the address listed in the email Headers field matches an existing user’s Email address, this variable contains the user's email address.</td>
</tr>
<tr>
<td></td>
<td>- If the address listed in the email Headers field does not match an existing user’s Email address, this variable contains the address listed in the email Headers field.</td>
</tr>
<tr>
<td>email.from_sys_id</td>
<td>Contains the Sys ID of the user who sent the email to the instance.</td>
</tr>
<tr>
<td>email.origemail</td>
<td>Contains the address of the email sender as listed in the email Headers field.</td>
</tr>
<tr>
<td>email.subject</td>
<td>Contains the subject of the email as a plain text string.</td>
</tr>
<tr>
<td>email.recipients</td>
<td>Contains a comma-separated list of recipient addresses.</td>
</tr>
<tr>
<td>email.recipients_array</td>
<td>Contains the recipient addresses as an array.</td>
</tr>
<tr>
<td>email.content_type</td>
<td>Contains the MIME content type of the email (for example, text/plain; charset=&quot;us-ascii&quot; or text/html; charset=&quot;us-ascii&quot;).</td>
</tr>
<tr>
<td>email.headers</td>
<td>Contains details about the sender, route, and receiver as a plain text string in the format of the sending email client.</td>
</tr>
<tr>
<td>email.importance</td>
<td>Contains an indication from the sender about how important a message is. The value can be High, Low, or empty.</td>
</tr>
</tbody>
</table>

**Note:** The instance follows [RFC 2822](https://tools.ietf.org/html/rfc2822) (Internet Message Format), which requires multiple email addresses in a group to be separated by commas, not semicolons. The instance can set the values of the email.to, email.direct, and email.copied variables only if emails addressed to groups follow the expected RFC format.
**Inbound email.recipient variables**

The recipients variables (email.recipients, email.recipients-array) allow processing of inbound email based on the email recipients. For example, you can create a script to process email based on the array values:

```javascript
var rarray = email.recipients_array; for (var i = 0; i < rarray.length; i++) {
    var recipient = rarray[i]; // do something with it
}
```

**The sys_email variable**

This variable lets you access the received sys_email record that triggered the inbound email action. It can be used to reference fields on the email record, such as uid, sys_id, content_type, and so on.

**Email user matching**

When the instance receives an email message, the system searches for an existing user record with the same email address as the sender.

**Matching email to existing users**

<table>
<thead>
<tr>
<th>Value of email.from Variable</th>
<th>Matching User ID</th>
<th>Email Address</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td>Michael Tossi</td>
</tr>
<tr>
<td>&quot;Michael Tossi&quot; <a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td>Michael Tossi</td>
</tr>
<tr>
<td>&quot;Tossi, Michael&quot; <a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td>Michael Tossi</td>
</tr>
<tr>
<td>&quot;Tossi&quot; <a href="mailto:mtossi@company.com">mtossi@company.com</a></td>
<td><a href="mailto:mtossi@company.com">mtossi@company.com</a></td>
<td><a href="mailto:mtossi@company.com">mtossi@company.com</a></td>
<td>Tossi</td>
</tr>
</tbody>
</table>

**Note:** This functionality requires that you activate the Email Automatic User Creation plugin.

Inbound Email Action scripts no longer support the gs.createUser() method. Use either the automatically-generated email variables or the gs.GetUserID() method instead.

**User impersonations and inbound actions**

When the instance receives an email, it can take a variety of actions by impersonating the sender.

If the sender of an incoming email matches an existing user, the instance impersonates the matching user to complete any inbound email actions. If the sender does not match an existing user, the instance impersonates the Guest user to complete any inbound email actions. If the impersonated user is locked out, the inbound email action fails.

**Note:** If inbound email comes from an untrusted domain, the instance impersonates the Guest user unless you explicitly prevent users from untrusted domains from triggering inbound actions. For more information, see the glide.user.trusted_domain system property in Inbound mail configuration.

Enable automatic user creation
An administrator can set an email property to automatically create users from incoming email. The administrator provides a list of trusted domains to prevent untrusted users from being automatically created.

Role required: admin

For example, you can prevent email from users outside your company domain from creating incidents. When an instance receives a message and there is no matching email address from the sender, the instance can create a user with the User ID (sys_user.user_name) set to the sender’s full email address.

Users in your instance must still have write and update access to the records that they create or update through inbound email actions.

Creating users from incoming email

<table>
<thead>
<tr>
<th>Value of email.from Variable</th>
<th>User ID Created</th>
<th>Email Address</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td>New User</td>
</tr>
<tr>
<td>&quot;New User&quot;<a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td>New User</td>
</tr>
<tr>
<td>&quot;User, New&quot;<a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td>New User</td>
</tr>
<tr>
<td>&quot;User&quot;<a href="mailto:nuser@company.com">nuser@company.com</a></td>
<td><a href="mailto:nuser@company.com">nuser@company.com</a></td>
<td><a href="mailto:nuser@company.com">nuser@company.com</a></td>
<td>User</td>
</tr>
</tbody>
</table>

1. Navigate to System Properties > Email Properties.
2. Select the check box for Automatically create users for incoming email from trusted domains (glide.pop3readerjob.create_caller).

3. Enter the list of trusted domains in Trusted domains for creating users from incoming emails (glide.user.trusted_domain).

Note: The glide.user.trusted_domain property only prevents user creation if the sender is not from a trusted domain. The system processes the inbound actions of the email as a guest user. If you want the system to ignore these email messages, use the email filters plugin, specifically the “Ignore sender” setting. You can also prevent untrusted users from triggering inbound actions by locking out the guest user.

4. Click Save.
5. Optional: Complete the following steps to lock out the guest user.
a) Navigate to User Administration > Users and select the user guest.

b) Select the Locked out field to disable the guest account.

When the property glide.pop3readerjob.create Caller is set to false, the instance runs inbound actions from users who do not match an existing user by impersonating the guest user.

If the property glide.pop3readerjob.create Caller is set to true, but a user has a valid email address associated with a non-primary device, the instance creates a new user record for that email address if there is no matching email address in the Users (sys_user) table. The instance does not validate non-primary email addresses against the Notification Devices (cmn_notif_device) table.

The method the instance uses to create users can be upgraded to use the full email address by activating the Email Automatic User Creation plugin.

The plugin makes the following changes:

- Sets the property glide.email.create_userid_from_email to true.
- Increases the width of the User ID (sys_user.user_name) column to accommodate email addresses.

After activating the plugin, enable automatic user creation from email.

**Warning:** Review your existing user records to reconcile any that contain identical email addresses. If you activate the plugin prior to reconciling email addresses, your instance cannot distinguish between users with identical email addresses and randomly selects one of the users with the matching email address.

Allowing locked out users to process inbound email actions

A property is available to allow locked out users to trigger inbound actions. For example, enabling the property can allow locked out users to reset their password and send email to the instance asking for assistance.

**Property allowing locked out users to trigger inbound email actions**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.pop3.process_locked_out</td>
<td>Enables (true) or disables (false) the ability for locked out users to trigger inbound actions.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: false</td>
</tr>
<tr>
<td></td>
<td>• System Properties (sys_properties) table</td>
</tr>
</tbody>
</table>

**Warning:** Enabling this property (glide.pop3.process_locked_out) also enables users from untrusted domains to trigger inbound actions.

Redirecting email to the instance POP3 account

You can have other mailboxes forward email to the instance’s POP3 account.

By default, the POP Reader scheduled job checks for new email every two minutes. It connects to the mail server and account specified in email properties. The POP Reader downloads any email waiting on the mail server and creates email.read events. After the instance processes the events, the inbound email actions run.
The **POP Reader** shows the number of emails processed during the reader's last run. The message shows the number of emails the reader processed or 0 processed if no emails were available. The reader resets the status each time it runs.

While it is not possible to specify more than one POP3 account for the instance, you can forward other mailboxes to the designated POP3 account. This script can be added to the Create Incident inbound email action to differentiate the content based on the original recipient, and then set an `assignment_group` value.

```java
if(email.direct.indexOf('facilities@anycorp.com')>-1)
current.assignment_group.setDisplayValue('Facilities Management');
```

### Setting field values from the email body

Values in an inbound email can set field values in a task record.

Any `name:value` pair in an inbound email body gets parsed into a variable/value pair in the inbound email script. The `name:value` pair must be on its own line. Note that most email clients limit the number of characters allowed per line and may truncate excessively long `name:value` pairs.

**Tip:** To prevent unexpected parsing, ensure that all the names in the `name:value` pairs are unique.

To populate a reference field, use `setDisplayValue()` instead. See [Redirecting Emails](#) for an example of using `setDisplayValue()` in an inbound email action.

**Note:** The action always generates a lowercase variable name. Also, this functionality does not work on reference fields.

For example, if an email body contains this line:

```
Foo:bar
```

The inbound email script creates the variable `email.body.foo` with the value of `bar`. You can use these variables to create conditions such as:

```java
if(email.body.foo!=undefined){
current.[field]=email.body.foo;
}
```

In this example, the script sets the value of `(field)` to the value `bar`.

**Note:** Spaces are rendered as underscores when a `name:value` pair gets parsed into a variable/value pair. For example, if an email body contains a line with spaces like `my_variable: data`, then the inbound email script creates the variable `email.body.my_variable`. The value of the variable is `data`.

### Integrate inbound events

This example illustrates how to create a notification from an inbound JSON request.

**Role required:** admin

When complete, you will be able to:

- Send a JSON request to the `imp_notification` web service import set with the JSON processor
- Create a new import set in the `imp_notification` table in the instance using data from the JSON request
The following example steps assume you have your own demonstration instance.

1. Activate the JSON Web Service plugin.
2. Install the RESTClient Firefox plugin.
3. Open the RESTClient.
4. Create the following JSON request.
   - **Method**: POST
   - **URL**: http://<instance name>.service-now.com/imp_notification.do?JSON
   - **Headers**: Authorization: Basic
   - **Body**:
     ```json
     {"sysparm_action":"insert","message":"this is an event","uuid":"abc"}
     ```

5. Click **Send**.
6. Navigate to **Response > Response Body (Raw)**.
7. Verify that the instance sends back a response with a **sys_id**.
8. Login to your development instance.
10. Verify that the import set table has an event matching your JSON request.

**Inbound email action examples**

Several examples of inbound email actions are available to help you build your own inbound email actions.

**Inbound email action example: handling email replies**

This example shows you how to set up inbound email actions to handle replies that users send back to the instance.

**Role required:** admin

The inbound email action parses the email and responds using a script. By default, an email received by the instance creates a new incident, and the body of the email is added to the **Additional Comments** text box. More refined Inbound Email Actions can create incident tickets with more data, thus saving the incident management team valuable time.

Normally, when a user responds to an email sent by the instance, the inbound email action matches the watermark to an existing incident, and updates the incident rather than creating a new record. However, if the watermark is missing, this inbound email action attempts to match a reply to the original incident.

1. Navigate to **System Policy > Inbound Actions** and click **New**.
2. Populate the form as follows:
Inbound email action example: logging a problem

This example shows you how to set up inbound email actions to create a problem record.

Role required: admin

Inbound email actions allow users to log or update incidents on an instance via email. The inbound email action parses the email and responds using a script.

1. Navigate to **System Policy > Inbound Actions** and click **New**.
2. Populate the form as follows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Log Problem</td>
</tr>
<tr>
<td>Type</td>
<td>New</td>
</tr>
<tr>
<td>Active</td>
<td>True</td>
</tr>
</tbody>
</table>
Inbound email action example: requesting a change

This example shows you how to set up inbound email actions to create a change request record.

Role required: admin

Inbound Email Actions allow users to log or update incidents on an instance via email. The inbound email action parses the email and responds using a script.

1. Navigate to System Policy > Inbound Actions and click New.
2. Populate the form as follows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Request Change</td>
</tr>
<tr>
<td>Type</td>
<td>New</td>
</tr>
<tr>
<td>Active</td>
<td>True</td>
</tr>
<tr>
<td>Target Table</td>
<td>Change Request (change_request)</td>
</tr>
</tbody>
</table>

**Condition**

```javascript
email.subject.indexOf("Problem: ") == 0
```

**Script**

```javascript
current.description = email.body_text;
current.short_description = email.subject.toString().substring(9);
current.assignment_group.setDisplayValue("Development");
if (email.body.assign !== undefined)
    current.assigned_to = email.body.assign;
current.insert();
```

<table>
<thead>
<tr>
<th>Field</th>
<th>Entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Request Change</td>
</tr>
<tr>
<td>Type</td>
<td>New</td>
</tr>
<tr>
<td>Active</td>
<td>True</td>
</tr>
<tr>
<td>Target Table</td>
<td>Change Request (change_request)</td>
</tr>
</tbody>
</table>

**Condition**

```javascript
email.subject.indexOf("Change Request: ") == 0
```

**Script**

```javascript
current.comments = email.body_text;
current.short_description = email.subject;
current.notify = 2;
if (email.body_text.assign !== undefined)
    current.assigned_to = email.body_text.assign;
```
Values automatically set from incoming email

The default inbound action for the incident table automatically sets the following field values when it receives an incoming email.

<table>
<thead>
<tr>
<th>Field value set</th>
<th>Value used from incoming email</th>
</tr>
</thead>
<tbody>
<tr>
<td>current.caller_id</td>
<td>User ID of the first user whose email address matches the email.from variable.</td>
</tr>
<tr>
<td>current.opened_by</td>
<td>User ID of the first user whose email address matches the email.from variable.</td>
</tr>
</tbody>
</table>

If multiple users have the same email address, the instance first searches for an active user with the email address. Use unique email addresses for each user record whenever possible. If not, having only one active user with the shared email address guarantees that the instance always matches incoming email from this address to the active user.

**Specifying the inbound email processing order**

The Ordered Email Processing plugin enables you to configure a processing order for inbound email actions.

In addition to forcing email actions to run in a prescribed order, the administrator can add a command to the script for an action that halts processing after the script runs. The plugin simply adds the **Order** column to the Rules (sysrule) table, which the instance uses to determine when to process emails.

**Activate ordered email processing**

The Ordered Email Processing plugin is enabled by default for all new instances and can be installed by a user with the admin role for upgraded instances.

Role required: admin

1. Navigate to **System Definition > Plugins**.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the **Activate/Upgrade** related link.

If the plugin depends on other plugins, these plugins are listed along with their activation status.

If the plugin has optional features that depend on other plugins, those plugins are listed under **Some files will not be loaded because these plugins are inactive**. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. Optional: If available, select the **Load demo data** check box.

Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.

You can also load demo data after the plugin is activated by clicking the **Load Demo Data Only** related link on the System Plugin form.

5. Click **Activate**.

**Configure the processing order**

Configure the processing order for inbound email actions to force them to run in a prescribed order.

Role required: admin

1. Navigate to **System Policy > Email > Inbound Actions**.
2. Open an existing inbound action or create one.
3. Complete the form and assign an order number to the **Order** field to establish when this inbound rule should run in relation to other rules. If you upgraded and activated the plugin, the **Order** field might be named **Execution Order**.

**Note:** Ensure each inbound action has a unique **Order** value to ensure the system stops processing as expected. If multiple inbound actions have the same **Order** value, the system might evaluate all of the inbound actions, even if one of them contains the `event.state="stop_processing";` script or has the **Stop processing** option selected.

4. To stop rule processing when an inbound email action runs successfully: add the following line to the bottom of the script:
   - Select the **Stop processing** check box.
   - Add the following line to the bottom of the **Actions** script:

   ```
   event.state="stop_processing";
   ```
Inbound email actions specify how ServiceNow creates or updates task records in response to an email. Each email action looks for a watermark in the email to associate it with a specific task. When the script is run, More Info

<table>
<thead>
<tr>
<th>Name</th>
<th>Unsubscribe from Notification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target table</td>
<td>Notification Messages [c… ▼]</td>
</tr>
<tr>
<td>Action type</td>
<td>Record Action</td>
</tr>
</tbody>
</table>

**When to run**

- **Only emails of the selected Type will trigger this inbound action.**
  - **Type**: New
  - **Order determines when to run relative to other inbound actions. The inbound action with the lowest order runs first.**
    - **Execution Order**: 35

**Conditions**

- **Add Filter Condition**
- **Add "OR" Clause**
Manage multiple filters in an inbound email action

Use process ordering and the `stop_processing` command to manage multiple filters in inbound email actions.

Role required: admin

In this example, you can create new problem records when `prb:` appears in the subject line and new change requests when `chg:` appears in the subject line. All other emails are used to create an incident. The actions are set up as follows:

1. Create an action with a condition of `Subject > starts with > chg:` and the `event.state="stop_processing";` command appended to the script.
2. Assign this action an Order value of 100.
3. Create an action with a condition of `Subject > starts with > prb:` and the `event.state="stop_processing";` command appended to the script.
4. Assign this action an Order value of 200.
5. Create an action for incident with no conditions and an Order value of 300.

It is not necessary to add the `stop_processing` command to the script for the incident action unless you want processing to stop at this rule to avoid continuing to another action.

If either a change request or a problem is created, the `stop_processing` command stops processing, and no incident record is created. If neither a change request nor a problem is created, the inbound email action for incident creates a record.

**Email filters**

Email filters enable administrators to specify when to move email to particular mailboxes or to ignore it using a condition builder or a condition script. The Email Filters (com.glide.email_filter) plugin is active by default.

When an email is ignored, the email is saved to your instance but is not processed. You can access an ignored email by viewing its Email (sys_email) record.

**Default email filters**

By default, the following filters are available from the **System Mailboxes > Filters** module:

<table>
<thead>
<tr>
<th>Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ignore VCAL</td>
<td>Ignores all email containing vCalendar requests. This filter prevents inbound email actions from creating unnecessary incident records when the instance receives a response to sent email. vCalendar requests in email responses are identified by the EmailUtils script include.</td>
</tr>
<tr>
<td>Ignore header</td>
<td>Ignores email that contains specific headers. This filter overrides the <code>glide.pop3.ignore_headers</code> property.</td>
</tr>
<tr>
<td>Ignore sender</td>
<td>Ignores email from specific senders. This filter overrides the <code>glide.pop3.ignore_senders</code> property.</td>
</tr>
<tr>
<td>Ignore subject</td>
<td>Ignores email with specific terms or phrases in the subject line. This filter overrides the <code>glide.pop3.ignore_subjects</code> property. This filter might not apply to emails arriving from unknown users. Unknown users can be locked out.</td>
</tr>
<tr>
<td>Filter</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Move spam to junk folder</td>
<td>Moves email identified as spam to the Junk folder. This filter checks for the value of the ServiceNow spam header. If the header is X-ServiceNow-Spam-Status:Yes, the filter moves the email to the Junk folder</td>
</tr>
</tbody>
</table>

**Email filter script include**

Email filters use a script include called `EmailUtils` that contains a simple utility function to determine if `vCalendar` is in the body of the response email. The results of this query are used in a condition script in the Ignore VCAL email filter.

**Spam scoring and virus scanning**

Every message sent through email servers is assessed for the likelihood of being spam. Based on this assessment, the instance adds headers to each message that can be used for filtering within the customer instance using the Email Filters plugin.

The system also adds the `X-ServiceNow-Virus:INFECTED` header to an email that contains one or more virus-infected attachments. The system ignores the email.

Spam scoring and virus scanning are available only for instances that use the ServiceNow email infrastructure. For more information on spam scoring and filtering, see [KB0549426](#).

**Activate email filters**

Administrators can activate the Email Filters plugin (com.glide.email_filter).

Role required: admin

1. Navigate to **System Definition > Plugins**.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the **Activate/Upgrade** related link.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
   - If the plugin has optional features that depend on other plugins, those plugins are listed under **Some files will not be loaded because these plugins are inactive**. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. Optional: If available, select the **Load demo data** check box.
   - Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
   - You can also load demo data after the plugin is activated by clicking the **Load Demo Data Only** related link on the System Plugin form.
5. Click **Activate**.

**Create an email filter**

You can create email filters to apply a custom action script or filter actions when email matches your filter’s conditions.
Role required: admin

1. Navigate to System Mailboxes > Administration > Filters.
2. Click New.
3. Complete the fields (see the table).
4. Right-click in the header bar and select Save from the context menu.
   The Filter Actions related list appears.
5. Click New in the related list.
6. Select how the system should react when the conditions of this filter evaluate to true.
   The two choices in the base system are: Mark as Ignored and Move to Junk. You can use the Action script to perform additional email tasks.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Brief, descriptive name for this filter.</td>
</tr>
<tr>
<td>Order</td>
<td>Define an order for this filter to determine when it is evaluated. By default, the Ignore VCAL filter has the lowest order number and is evaluated first.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box (true) to enable this filter.</td>
</tr>
<tr>
<td>Short description</td>
<td>Concise description of the function of this filter.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Add conditions for this filter with the condition builder or with a condition script. Note that conditions are case sensitive.</td>
</tr>
<tr>
<td>Condition script</td>
<td>Create a script that defines the conditions for this filter. Use this script to access other tables, variables, or methods. For example, the condition script for the Ignore VCAL filter looks for the results of the EmailUtils script include, which detects vCalendar attachments.</td>
</tr>
<tr>
<td>Action script</td>
<td>Use the action script to define additional behavior to be performed when the filter condition evaluates to true. This might include an email action not included in the default filter actions. In the base system, the action script is used to produce the error string that is published to the email log (System Logs &gt; Email).</td>
</tr>
</tbody>
</table>

Note: Before creating additional email actions with a script, see Inbound Email Actions. Like business rules, inbound email actions use both conditions and scripts and can provide a number of useful actions on emails the instance receives.

Email retention

You can archive and eventually destroy email messages that you no longer need or if your Email table is excessively large.
Email retention is available starting with the Helsinki release.

**Email archive and destruction plugins**

The email archiving and destruction feature uses the Data Archiving and Email Retention plugins. The Data Archiving plugin must be active to archive and destroy email records. The Email Retention plugin provides a set of rules that specify when the system archives and destroys email records.

- **Note:** The Email Retention plugin also prevents the system from deleting watermarks, which are required for inbound email actions to continue to function.

The Email Retention plugin and associated archive and destroy rules are active by default on new instances. On upgraded instances, you must manually activate both the plugin and the archive and destroy rules. ServiceNow recommends that you review and approve these rules before activating them.

If your instance already has a process to manage email records, you do not need to activate the Email Retention plugin. If you want to replace your current process with Email Retention, be sure to deactivate the current process before activating the archive and destroy rules.

**Archiving and destroying email records**

Archiving means moving records from the Email (sys_email) table to the Archive Email (ar_sys_email) table when they exceed the archive rule time limit. Destroying means deleting records in the Archive Email table when they exceed the destroy rule time limit.

- **Note:** When a destroy rule deletes email records, associated watermarks are not deleted. They are preserved to ensure that your inbound email actions continue to function.

**Default archive and destroy rules**

Email Retention provides these email archive rules:

- **Emails - Ignored and over 90 days old:** archives email message records that were created more than 90 days prior to the current date and are of type `received-ignored` or `sent-ignored`.
- **Emails - Over a year old:** archives email message records that were created more than 365 days prior to the current date.

Email Retention also provides this email destroy rule:

- **Email Archive - Over a year old:** destroys email records that have been archived for more than 365 days prior to the current date.

With these default settings, your email messages are kept on the instance for a total of two years: one year in the Email table, and one year in the Email archive table. At the end of this period, the system deletes the expired email records from the Email archive table.

- **Note:** By default these rules are active on new instances and inactive on upgrades. The system runs archive and destroy rules when you activate them.
Compatibility with other record management implementations

If you are already using another method to manage email records, such as table cleaners, you do not have to use the Email Retention feature. To prevent unexpected record deletion, ServiceNow recommends that you avoid using multiple email management processes on the same instance at the same time.

Note: For assistance replacing your existing record management implementation with Email Retention, contact your professional services or sales representative.

Effects of archiving and deleting email records

Inbound email actions copy the body of an email to the work notes of the related record. If the inbound email record is later deleted, the work notes still contain a text copy of the email.

When the system sends an email message about a record, the activity formatter displays a Sent Email section with a link to the email message. If the system archives the email message, the activity formatter removes Sent Email section. When the system deletes the email message, it is no longer visible in the activity formatter nor the work notes.

Note: Set the archive time length long enough so your users can access sent emails through the activity formatter.

Archiving email records changes the methods available to the system to identify inbound email as a reply. After archiving an email record, the system can no longer use the In-Reply-To field to match an incoming email to an email record. However, the system can still match incoming email to an existing record from a record number or watermark.

Activate the Email Retention plugin

The Email Retention plugin provides archive and destruction rules for email messages. It is active by default for new instances, but must be activated for upgrades.

Required role: admin

The Email Retention plugin requires these plugins:

- Data Archiving
- System Mailboxes

1. Navigate to System Definition > Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   
   If the plugin depends on other plugins, these plugins are listed along with their activation status.
   
   If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).

4. Optional: If available, select the Load demo data check box.

   Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
You can also load demo data after the plugin is activated by clicking the **Load Demo Data Only** related link on the System Plugin form.

5. Click **Activate**.

**Archive email manually**

You can archive email messages manually on demand instead of waiting for the instance to archive them based on a scheduled job.

Role required: admin

Email Retention provides these email archive rules:

- **Emails - Ignored and over 90 days old**: archives email message records that were created more than 90 days prior to the current date and are of type `received-ignored` or `sent-ignored`.
- **Emails - Over a year old**: archives email message records that were created more than 365 days prior to the current date.

You can manually archive email messages that meet these archive rules or any additional archive rules that you create.

**Note:** An archive record must be active for the instance to be able to process records with it.

1. Navigate to **System Archiving > Archive Rules**.
2. Open the email archiving rule that you want to modify.
3. Click **Recalculate Estimate** to see how many records in the Email (sys_email) table are going to be archived. The estimate appears in the **Record estimate** field.
4. Click **Run Archive Now**.

**Note:** You can also archive related records.

**Watermarks on notification emails**

By default, the system generates a watermark label at the bottom of each notification email to allow matching incoming email to existing records. Each watermark includes a random 20-character string that makes it unique.

Starting with the Jakarta release, the system automatically generates randomized watermarks for notification emails in base systems. The random 20-character string reduces the possibility of a watermark being guessed or coincidentally matching the watermark of an email from another instance.

**Note:** If you are upgrading from a release before Jakarta, random watermark support is optional and requires the Random Watermark Support plugin to be activated. For details on the plugin and related upgrade considerations, see **Notifications upgrade information**.

**Watermark format**

The email watermark always begins with `Ref:` to identify the label as a watermark. After this identifier, the default label is 31 characters in length and consists of:

- **Customizable prefix** — The default prefix is `MSG`.
- **Auto-numbered identifier** — The numeric string identifying the source record, such as incident, problem, or change request.
When inbound emails are processed, the system matches random watermarks to the appropriate source records.

### Watermark configuration

Watermarks are always generated, but you can configure them to:
- Create a custom watermark prefix for each instance to prevent accidentally triggering events in the wrong instance.
- Have custom prefix characters after MSG
- Be hidden globally
- Be omitted from individual email messages

If watermarks are omitted from email notifications, inbound email actions might not work properly. Without a watermark, the system processes inbound email messages as described in [Criteria for matching email to inbound actions](#).  

**Note:** Email clients that use the plain text version of the email still show the watermark.

*Create a custom watermark prefix for email notifications*

By default, email notifications use the watermark prefix MSG, but you can create a custom watermark prefix.

**Role required:** admin

Any email notifications that are forwarded from one instance to another might be more easily distinguished with different prefixes for each instance. To avoid unintentionally triggering events in the wrong instance, create a unique watermark prefix for each instance.
Note: Do not use colons (:) in custom watermark prefixes. Colons are a reserved character and may cause the watermark to be ignored.

1. Navigate to System Definition > Number Maintenance.
2. Open the MSG record in the Email Watermark (sys_watermark) table.
3. Enter the unique Prefix for this instance.

4. Click Update.

Your custom watermark applies to all new email notifications. Email notifications that existed before you created a custom watermark keep the same watermarks as before.

Omit an email notification watermark
You can omit watermarks on email notifications if you do not want the instance to match the notification to an existing record.

Role required: admin

1. Navigate to System Notification > Email > Notifications.
2. Select the email notification to update.
3. Click the Advanced View related link.
4. In the What it will contain section, select the Omit watermark check box.

When incoming email does not contain a watermark, the system searches the subject line and message body for a record number. The system attempts to match any record number that it finds to an existing record. If there is a matching record number, the system updates the record with the values in the incoming email. To ensure that response email messages don’t update records, remove the record number variable ${number} from the Subject and Message HTML fields.
Hide email watermarks globally
Rather than omitting watermarks, it is possible to hide watermarks on a global basis using HTML markup.

Role required: admin

Watermarks can only be hidden in the HTML message. The text version of the message, because it does not have markup allowing show/hide semantics, will always have the watermark.

1. Navigate to `sys_properties.list` in the Application Navigator.
2. Create a new property named `glide.email.watermark.visible` and set it to `false`.

This ensures that all watermarks are hidden on all email messages. This cannot be done on a per-email basis.

System mailboxes

Email messages can be seen in the System Mailboxes menu, which gives you access to the system Inbox, Outbox, and Sent mail box.

Each provides a filtered view of emails to let you see only what you need to at any given time, including list fields applicable to each. The system mailboxes menu shows your current POP and SMTP status.

The System Mailbox is hosted by ServiceNow, who have sole access to the mailboxes. By default, once the instance pulls an email message, it is deleted from the mail server and stored in the application on the Email (sys_email) table.

For information about the fields that are shown in the System Mailbox, see System email log and mailboxes. You can configure the layout of a system mailbox to show any of the email log fields, not only the ones that are shown by default.

- **Inbound emails**: All inbound mail is placed into the Inbox until it is processed. After it is cleared, the email moves to the `Received` state. If the email message matches the criteria in an inbound email action, the email is changed to `Processed`. If not, it is changed to `Ready`. If the system is restarted for any reason (such as during a system upgrade), all inbound mail waits on the external mail server until the system can request delivery.

- **Outbound emails**: All outbound mail is placed into the Outbox until it is processed. Once cleared, it is moved to `Sent` (if sent) or `Skipped` (not sent, as in the case of no valid recipients). If the system is restarted for any reason (such as during a system upgrade), all outbound mail waits in the instance database until the system comes online, and the scheduler looks for mail to deliver.

The email client

The email client enables you to send email directly from any record, such as an incident, change request, problem, or user record.

The email client is available by default, and enabled by default on the incident table.

The email client can be useful in cases where you want to send an email:

- To engage more people in a piece of work
- That includes Cc and Bcc recipients
- That includes personalized comments
- To a third party who doesn’t have an account in your instance
- To someone about an incident where you don’t have an email notification set up to do exactly what you want

The email client always uses the multipart/mixed content type and supports HTML markup in the message body.
Enable the email client for a table

Enable the email client for a table so that users can send emails directly from the table record.

Role required: admin

The email client is enabled by default on the Incident (incident) table. You can enable the email client for another table by adding the `email_client` dictionary attribute to the table.

**Note:** This capability is not inherited by tables that extend the current table. For example, enabling the email client on the Task table does not enable it for the Incident or Problem tables.

1. Open a record in the table that you want to enable the email client for.
   For example, to enable the email client for the Problem (problem) table, navigate to Problem > Open, and then open any problem record.

2. On the form, click the menu icon (⋮) and then click Configure > Dictionary.

3. On the Dictionary Entries list, open the first record.
   The first record has the record type Collection and does not have any entry for Column name.

4. On the form, in the Related Links section, click Advanced view.

5. In the Attributes field, enter email_client=true.
   If there are other values in the field, separate the attribute with a comma.

6. Click Update.

**Email client interface**

The instance's email client interface looks like a standard email interface, which contains a toolbar for text formatting and adding attachments.

Users see an email icon based on the UI version.

- **UI16**: The email icon (✉️) appears in the more options menu.
- **UI15**: The email icon (✉️) appears in the form header.

Users click the email icon to launch the email client as a pop-up window.
The email client interface

**Note:** The **Subject** field on the email client allows a larger character count than the default setting for the **Subject** field on the Email table. If the subject text from the client is being truncated, increase the **Max length** value for the **Subject** field on the Email table.

**Customize the email client**

The email client has default properties and values that you can customize to suit your needs.
## Email client default properties and values

<table>
<thead>
<tr>
<th>Property</th>
<th>Default Value</th>
<th>How to Customize</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACL access</td>
<td>Defaults to allowing only users with the itil role to access the email client. Change the ACL rule to control access to the email client.</td>
<td>To control who can see the email client, see <a href="#">Control access to the email client</a>.</td>
</tr>
<tr>
<td>Email icon</td>
<td>Allows only users with write access to the current table to see the email icon.</td>
<td>To remove the email icon, see <a href="#">Email icon display</a>.</td>
</tr>
<tr>
<td>Autocomplete</td>
<td>Defaults to only displaying a user's first and last name. A system property controls what columns the email client auto-complete displays. If your organization has several users with the same name, consider adding company or email address columns to help distinguish between users.</td>
<td>- To change search behavior, see <a href="#">Configure email client auto-complete search results</a>.&lt;br&gt;- To display additional information, see <a href="#">Additional information in the email client auto-complete</a>.</td>
</tr>
<tr>
<td>To</td>
<td>Defaults to the email address of the caller.</td>
<td>To edit the default value, create an email client template.</td>
</tr>
<tr>
<td>Cc</td>
<td>Defaults to the email addresses of the user who opened the incident and all users in the watch_list.</td>
<td>To edit the default value, create an email client template.</td>
</tr>
<tr>
<td>Subject</td>
<td>Defaults to the incident number and short description.</td>
<td>To edit the default value, create an email client template.</td>
</tr>
</tbody>
</table>

### Configure email client auto-complete search results

You can control the email client's auto-complete search results with an email client property.

The following properties on [System Properties > UI Properties](#) control the autocomplete functionality for the email client.

- **Maximum number of autocomplete matches to return to the email client.** Applies separately to users and groups.  
  
  | 10 |

- **Include groups in email client autocomplete results.**  
  
  - Yes | No

### Email client autocomplete properties
### Email client properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.ui.email_client.autocomplete.count</td>
<td>Set the maximum number of auto-complete matches.</td>
</tr>
<tr>
<td>glide.ui.email_client.autocomplete.group</td>
<td>Specify whether groups are included in auto-complete results.</td>
</tr>
</tbody>
</table>

Additional information in the email client auto-complete

A system property allows the email client to display additional columns from the User table in the auto-complete list.

Administrators can add this system property to help distinguish between individuals who have the same first and last names, and to ensure that users select the proper recipient for an email.

### Email client properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.ui.email_client.email_address.disambiguator</td>
<td>Sets the columns from the User (sys_user) table that the autocomplete list displays. Separate each column name with a semicolon character (;). See the system dictionary for a list of available column names. For example, to add the sys_user.email and sys_user.company columns, enter email;company in the Value field.</td>
</tr>
<tr>
<td>· Type: string</td>
<td>· Default value: name</td>
</tr>
<tr>
<td>· Location: Add to the System Property (sys_properties) table</td>
<td></td>
</tr>
</tbody>

Control access to the email client
You can control access to the email client by changing an ACL rule.

Only users with the itil role can access the email client. The following ACL rule controls this access:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>EmailClientProcessor</td>
<td>processor</td>
<td>execute</td>
</tr>
</tbody>
</table>

*Note:* Because the visibility of the email icon is determined by whether the current user has write access to the table, it is possible that a user may be able to see the email icon and still not open the email client.

Create an email client template
Create email client templates so that users in your organization can respond efficiently in emails that they send from a certain record type.

Role required: admin

*Note:* If the Client Templates module is not visible, enable the module.

The email client uses its own email templates to define default values for fields. You can use HTML formatting to enter the content of the message body, rather than plain text. You can also use mail scripts to dynamically generate content for the email body. For more information, see JavaScript in emails.

You can create one email client template per table. When users open the email client from the table record, the template content is applied automatically to the email client message.

1. Navigate to System Policy > Email > Client Templates.
2. Click New.
3. Fill in the fields on the Email Client Template form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique template name.</td>
</tr>
<tr>
<td>Content type</td>
<td>Select HTML or plain text to create the body of the template.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the table that the template applies to. Enable the email client for the same table.</td>
</tr>
<tr>
<td>To</td>
<td>Enter a comma-separated list of either field names that contain user email addresses or specific email addresses. To reference an email address using a script, create a script include and then call the script include in the To field. Your script must start with the javascript: prefix. The script must return email addresses in a comma-separated string.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Cc</td>
<td>Enter a comma-separated list of either field names that contain user email addresses or specific email addresses. To reference an email address using a script, create a script include and then call the script include in the Cc field. Your script must start with the javascript: prefix. The script must return email addresses in a comma-separated string. This field cannot have the same values as the To field.</td>
</tr>
<tr>
<td>Bcc</td>
<td>Enter a comma-separated list of either field names that contain user email addresses or specific email addresses. To reference an email address using a script, create a script include and then call the script include in the Bcc field. Your script must start with the javascript: prefix. The script must return email addresses in a comma-separated string. This field cannot have the same values as the To or Cc fields.</td>
</tr>
<tr>
<td>Subject</td>
<td>Enter a description of the email. The description can contain a comma-separated list of field names or specific values.</td>
</tr>
<tr>
<td>Body HTML</td>
<td>If you selected HTML for the Content type, enter the content of the message body using the HTML editor toolbar to format the HTML. You can include variables from the Select variables column. Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table, such as an incident short description or comments and work notes. You can call a mail script by using ${mail_script:script name} in the Body HTML field.</td>
</tr>
</tbody>
</table>
| Body text | If you selected plain text for the Content type, enter any text or mail script that you want to appear in the message body. You can insert a mail script in the Body text field using the following syntax: 

```
<mail_script> [code] </mail_script>
```

4. Click Submit.

Set the from address with an email client template
Use an email client template to set a default value for the From field if it should be different from the system default.
Role required: admin

For example, you can dynamically set the From field to the email address of the current user.

1. Navigate to System Policy > Email > Client Templates.
2. Select an existing template or create one. For example, select the Incident Template record.
3. Configure the form to add the From field.
4. Enter a script to add a default value to the From field.

   For example, the following script displays the current user name and the current user email address.

   ```javascript
gs.getUserDisplayName() + " <" + gs.getUser().getEmail() + " >"
```  

### Display an editable From field

By default, the email client does not display a From field on email messages, but you can add one and have it be editable.

Role required: admin

By default, the email client uses an email address taken from the email account. To display an editable From field in the email client:

1. Navigate to System Properties > UI Properties.
2. Select the Yes check box for Override the email 'From:' address in the email client (glide.ui.email_client.from).

### Display the Reply To field

By default, the email client does not display the Reply to field because users cannot change this address. But you can display this field using a UI property.

Role required: admin

The email client always uses the same Reply to address as that defined for email notifications. This ensures that the email has a valid watermark and can generate inbound email actions as normal. If you want to change the global reply-to address you must configure your instance to use your own SMTP server.

1. Navigate to System Properties > UI Properties.
2. In the Override the email 'Reply to:' address in the email client (glide.ui.email_client.reply_to) field, select the Yes check box.

### SMS delivery with the email client

A property is available that lets the user select an option to send a notification via SMS.

The Subscription Based Notifications plugin activates the following system property:

**Email client system property**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email_client.show_sms_option</td>
<td>Specify whether a check box appears in the email client for sending the message to the user's SMS device. If no SMS device exists, the email client sends the message to the primary email device.</td>
</tr>
</tbody>
</table>
### Quick messages

Quick messages allow you to insert predefined text into the message body of the email client.
Role required: admin

Selecting a quick message fills the Message Text field with the body specified in the quick message. After you define one or more quick messages, the Quick Message selector appears in the email client. Use the following syntax: ${variable_name}.

**Note:** If you add attachments to the Quick Message templates, the attachments are not sent as part of the email distribution.

1. Navigate to **System Policy > Email > Quick Messages**.
2. Click **New**.
3. Fill in the Email Client Canned Messages form.

### Email client canned messages form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Enter a name to appear in the Quick Message selector.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the quick message available for selection. Clear this check box to remove the message from the Quick Message selector.</td>
</tr>
<tr>
<td>User</td>
<td>Select the user who has access to this quick message. Selecting a user restricts access to that user only. Leave the field blank to have no user-based restrictions.</td>
</tr>
<tr>
<td>Group</td>
<td>Select the group whose members have access to this quick message. Selecting a group restricts access to members of that group only. Leave the field blank to have no group-based restrictions.</td>
</tr>
<tr>
<td>Body</td>
<td>Enter the text you want to insert into the Message Text field. By default, the field supports HTML format.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.
Email icon display
You can use access control rules to hide or display the email icon on forms.

Users with write access to the current table can see the email icon. To remove the icon, remove the user's write access to the table. Typically you do this in one of two ways:
- Make the user an Employee Self-Service (ESS) user. ESS users do not have a user role, and without a role they do not have write access to the Incident table. Making a user an ESS user, therefore, hides the email icon on the Incident form.
- Create a custom ACL rule and user role that does not have write access to the table. The default ACL rule for the email client checks to see if the user has the itil role. If you grant users a custom role other than itil, then any such users will not see the email icon.

Remove or display the email icon for a table by setting the `email_client` dictionary attribute to true or false on the table's collection record. This will not display the email icon for users without write access to the table. For more detail see Dictionary attributes.

**Email Service**

Email Service installs the Email API on the instance.

By default, Email Service only allows admin users to access the Email API. Administrators can grant access to the Email API by:

1. Adding an access control for creating records in the Email (sys_email) table linked to the email_api_send role.
2. Assigning the email_api_send role to the non-admin user.
3. Verifying the non-admin user has read access to the notification target table. For example, an email notification for an incident, requires read access to the Incident table.

Non-admin users with the email_api_send role can access the Email API from the REST API Explorer.

**Activate Email Service**

Users with the admin role can activate the Email Service plugin (com.glide.email.service) to enable the Email API.

Role required: admin

1. Navigate to System Definition > Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
   - If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. Optional: If available, select the Load demo data check box.
   - Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
   - You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.
5. Click Activate.

Grant access to the Email API

To grant non-admin users access to the Email API, administrators must create an access control and assign a special role.
Role required: admin

For additional details, see Email API.

1. Elevate privileges to security_admin.
3. Click New.
4. Create an access control for the Email (sys_email) table.

### Access control values

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>record</td>
</tr>
<tr>
<td>Operation</td>
<td>create</td>
</tr>
<tr>
<td>Admin overrides</td>
<td>Selected</td>
</tr>
<tr>
<td>Name</td>
<td>sys_email</td>
</tr>
<tr>
<td>Requires role</td>
<td>email_api_send</td>
</tr>
</tbody>
</table>

5. Assign the email_api_send role to the non-admin user.
6. Verify the non-admin user either has read access to all records in the notification target table or has read access to a specific record in the table.

For example, to work with incident notifications the non-admin user needs access to the Incident table. You can provide record access by:

- Granting the user an appropriate role, such as the itil role.
- Selecting a specific incident that was opened on behalf of the user.

### Troubleshooting notification emails

Logs and diagnostics are provided to help determine whether notification emails are being sent and received successfully, what any issues are, and who receives the email.

Diagnostics help monitor the overall health of the system and troubleshoot general problems, such as not receiving any incoming mail. Logs help identify problems with individual emails, and different logs are useful for diagnosing different types of problems.

### Log checking scenarios

<table>
<thead>
<tr>
<th>Problem</th>
<th>Log</th>
</tr>
</thead>
<tbody>
<tr>
<td>Need to check whether an individual notification email was successfully sent</td>
<td>Check the Sent System Mailbox for that email. Also check the Failed System Mailbox for failure notifications.</td>
</tr>
</tbody>
</table>
| Individual email failed | • Check the message log of the individual email.  
• Check the Error string field of the email record.  

**Warning:** Some email servers do not return error strings |
Problem | Log
--- | ---
Email not received by end user | • Check the Junk System Mailbox for notifications about returned emails. These emails also appear in the Emails log with a **Type** of received-ignored.
• Check the **Error string** field of the email record.
• **Warning:** Some email servers do not return error strings
• Check the message log of the individual email for the reasons different recipients were included or excluded.

Troubleshooting resources

See the following resources on troubleshooting inbound and outbound email problems.

<table>
<thead>
<tr>
<th>Error or symptom</th>
<th>Solution</th>
</tr>
</thead>

<tr>
<td>Email from Outlook produces an empty Incident record containing an attachment named winmail.dat.</td>
<td>Configure the local Outlook client or Exchange server to not send Rich Text formatted (RTF) data to the instance.</td>
</tr>
</tbody>
</table>

Email diagnostics

The Diagnostics and Connection page provides information on the current state of your email configuration. This page includes status on email properties, scheduled jobs, and email account connections that affect how your instance receives and sends email.

Email diagnostic information can help you identify problems with inbound or outbound email. The following video shows different steps to determine why your instance is not receiving inbound emails. One of the steps uses email diagnostics to check the email connection status and email reader scheduled job.

Navigate to the Diagnostics and Connection page from either of these modules:

- **System Mailboxes > Email Diagnostics**
- **System Diagnostics > Email Diagnostics**

Email Diagnostics and Connection page
Diagnostics and Connection

**Email Sending is Operational**
- **Email Sending Stats**
  - Email Sending: Enabled
  - Email in Queue: 0
  - Last Sent Email: 2017-06-15 15:15:50

**SMTP Sender**
- SMTP Sender State: Ready
- Processing Time: 20ms
- Job Last Run: 2017-06-15 15:15:59

**SMS Sender**
- SMS Sender State: Ready
- Processing Time: 2ms
- Job Last Run: 2017-06-15 15:15:11

**System email log and mailboxes**

The system email log records all emails that the instance creates or receives. System mailboxes are filtered views of this log.

Every notification email that the instance creates or receives is recorded in an Email (sys_email) record. You can navigate to a log of these records at **System Logs > Emails**.

The System Mailboxes are filtered views of the Emails (sys_email) table. The instance assigns an email record to a system mailbox depending on the values of the **Type** and **State** fields. For more information, see **System mailboxes**.

The following fields can be included in the layout of the system log and any of the system mailboxes:

**Email log**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mailbox</td>
<td>The system mailbox that lists this email record. The instance sets the value of this field according to the values of the <strong>Type</strong> and <strong>State</strong> fields.</td>
</tr>
<tr>
<td>State</td>
<td>The current state of the email (Error, Ignored, Processed, or Ready).</td>
</tr>
<tr>
<td>Receive type</td>
<td>The type of inbound email (None, Forward, New, or Reply).</td>
</tr>
<tr>

</table>
### Message logs for individual emails

The email log entries for an individual notification email are accessible as a related list in the email record. The **Error string** field in the email record can provide additional information.

Every email record contains an **Email Log** related list. This list shows the Email Log Entry (syslog_email) records. For troubleshooting purposes, the most useful fields are probably **Level** and **Message**.

To diagnose problems with outbound emails, also examine the **Error string** field in the email record. However, not every receiving email server sends back an error string.

**Note:** The Email Log Entry record is available for only 7 days after the email record is created.

### Inbound actions on received emails

Check these logs as the first step to diagnose issues with inbound actions. The logs show which inbound action did or did not apply and for what reason.

**Note:** If an inbound action did not update any field on the target record, the log indicates that the inbound action was skipped.
Inbound email log

Reasons for including or excluding recipients

For outbound notifications, the email system log provides reasons that recipients were included or excluded.

Each log entry corresponds to a reason for inclusion or exclusion. For example, all users who were excluded because they are inactive appear in a single log entry.
A series of system properties can be used to fine-tune the information to be logged. Two master switch properties, glide.notification.recipient.include_logging and glide.notification.recipient.exclude_logging, control all recipient inclusion and exclusion logging. Several other properties allow you to tailor the information reported in the logs to meet your needs. All of the properties are enabled by default.

Outbound email log

Push notifications

In addition to sending email and SMS notifications, an instance can send push notifications to mobile devices.

A push notification is a text message that appears on a user’s mobile device to alert them about something important or to ask them to perform an action. Your instance supports push notifications.
An example push notification

Use push notifications to send messages to users when certain conditions are triggered on your instance, such as the assignment of an incident to the user. A push notification can even ask for a reply, and the instance can process the reply by acting on the related records. For example, you can have the instance send an approval request for a Change to a user. You can let the user approve or deny the Change by clicking a response button on the push notification. The user's response can then update the status of the Change record.

You can set up push notifications in a similar manner to email and SMS notifications. Determine:

- who to send the notification to
- when it should be sent
- what it should contain

By default, the ServiceNow mobile application supports push notifications. But you can also develop your own push application and configure your instance to send push notifications to it.
Push notification setup

Push notification setup differs depending on the mobile or push application that you want your users to use. For an overview, see:

- **Push notification setup with the ServiceNow mobile application**

  **Note**: Push notifications for on-premise instances are not supported.

- **Push notification setup with a custom push application**. If you create your own application, you must understand how push notifications and the Apple Push Notification Service system work. For more information, see the APNs Overview in the *Local and Remote Notification Programming Guide* for Apple developers.

**Attention**: Apple does not guarantee delivery of all push notifications. Review the Quality of Service (QoS) information in the *Local and Remote Notification Programming Guide* for Apple developers.

Push notification system

The push notification system involves several key elements that manage the delivery of push messages, push notification responses, and push feedback.

**Customer instance**

Your ServiceNow instance.

**Push proxy**

An instance that collects all push notifications that go to the ServiceNow mobile application and forwards them to the ServiceNow iOS or Android applications. If you create a custom push application, you do not use the push proxy.

**Push provider**

The provider of push messages, which is the Apple Push Notification service (APNs) or Google Cloud Messaging (GCM) service, for the ServiceNow mobile app or custom mobile apps.

**Feedback provider**

The provider of feedback messages, which tells the instance what devices are no longer valid. The Apple feedback or GCM server handles feedback messages for the ServiceNow mobile application on iOS and Android devices respectively.

**Feedback proxy**

The ServiceNow instance that handles feedback messages from the Apple feedback server.

**Push application on a mobile device**

The application, such as the ServiceNow mobile application. You can also build and customize your own push application.

Push notification process

The push notification process is as follows:

1. Activity on the instance triggers a push notification.
2. The instance looks for who to send the notification to and checks the user notification preferences to find their push device settings.

3. The instance sends the push notification to the push notification service, either the Apple Push Notification service (APNs) or Google Cloud Messaging (GCM) service. If you are using the ServiceNow mobile app, the instance sends the notification through a push proxy instance, which then forwards the notification to the APNs or GCM service.

4. The push notification service sends the notification to the user’s push application. When the instance sends the notification to the push notification service, it includes message content along with the instance name and ID. This information ensures that a response to the notification is sent back to the correct instance. If the user can reply to the notification, such as sending an approval to a change request, the response is sent via REST message back to the instance.

5. The instance identifies a script to run to handle the response.

6. The script performs an action on the instance, such as marking a change request approved. If there is invalid JSON or if the script fails, an error response is sent back to the device.

The following diagram shows the elements of the push notification system with the ServiceNow mobile application. Within the ServiceNow infrastructure is your instance, the optional push proxy instance, and the ServiceNow feedback proxy. External to ServiceNow are the messaging services (APNs or GCM) and user mobile devices, which include the application that is registered to receive push notifications. See Push feedback for an explanation of the feedback service.

Push notification system with the ServiceNow mobile app
Push notification responses

With custom push applications, you can have your users act on records in the instance by responding to a push notification.

The actions that they can take are defined in a script that you associate with the notification message. The response is sent to the instance in this format:

```
https://{instance_name}/api/now/v1/push/{application Name}/action/{action}
```
The application name is the push application the user is using. The application name must match the application name in the Push Application (sys_push_application) table. The action is the Sys ID of the action in the Push Notifications Actions (sys_push_notif_act_script) table.

**Push feedback**

Feedback refers to the information about failed iOS message delivery and the iOS push applications that can no longer receive push notifications.

The instance uses a scheduled job to pull feedback data every hour from the APNs. When the APNs determines that a device can no longer receive push messages, the corresponding device is set to inactive, making it unable to receive push notification messages. The Push Feedback (sys_push_feedback) table shows the token for the device that failed. If the same device is again able to receive push notifications, the device might receive the same token from the APNs. A new record is inserted into the Push Notification Installation (sys_push_notif_app_install) table.

**Activate push notifications**

Several plugins must be activated to use push notifications. If you have the Mobile UI (com.glide.ui.m) plugin active, push notification plugins are automatically activated.

Role required: admin

Ensure the following plugins are active on your instance:

- Push Notification: Provides the necessary components and REST APIs to send push notifications to mobile devices.
- Notification System Push Addon: Adds support for push notifications to the existing notification system.
- Push Feedback: Handles feedback from Apple on which devices are no longer valid so they do not keep receiving push notifications.

1. In the HI Service Portal, click Service Requests > Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows.</td>
</tr>
</tbody>
</table>

3. Click Submit.
Installed with push notifications
Several types of components are installed with the push notifications plugins.

Tables installed with push notifications
These tables are installed with push notifications.

<table>
<thead>
<tr>
<th>Table name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Push Applications (sys_push_application)</td>
<td>Push applications registered to the instance to receive push messages.</td>
</tr>
<tr>
<td>Push Default Registrations (sys_push_notif_default_reg)</td>
<td>Contains all the notifications users are automatically subscribed to for a given push application. You can add notifications to this table on the Push Default Registrations related list on the Push Application form.</td>
</tr>
<tr>
<td>Push Feedbacks (sys_push_feedback)</td>
<td>Feedback from the APNs that tells the instance which push devices can no longer receive push messages. The feedback is handled either on the same instance where your notifications are triggered, or on a central instance that uses a REST call to tell your instance which push applications to deactivate.</td>
</tr>
<tr>
<td>Push Message Attribute Definitions (sys_push_notif_msg_attr_def)</td>
<td>The attribute definitions used for push message content specification.</td>
</tr>
<tr>
<td>Push Message Attribute Values (sys_push_notif_msg_attr_val)</td>
<td>The values associated with push messages.</td>
</tr>
<tr>
<td>Push Notifications (sys_push_notif_msg)</td>
<td>The push notifications that the instance attempted to send to users.</td>
</tr>
<tr>
<td>Push Notification Actions (sys_push_notif_act_script)</td>
<td>The action scripts that the instance uses in response to an actionable push message.</td>
</tr>
<tr>
<td>Push Notification Installations (sys_push_notif_app_install)</td>
<td>The devices with push apps where users agreed to receive push notifications. This table lists the records by the token for the push app. The instance uses this information to know which push device and app to send notifications to. Records are created in this table when a user logs on an instance with the push app. The Mobile Devices (sys_mobile_devices) table, which is installed with the Mobile UI plugin, contains all the user devices that logged in to the instance with the ServiceNow mobile application.</td>
</tr>
<tr>
<td>Push Notification Messages (sys_push_notif_msg)</td>
<td>Messages customized for push notifications. These messages can be associated with a notification.</td>
</tr>
<tr>
<td>Push Notification Message Contents (sys_push_notif_msg_content)</td>
<td>The entire content, including JSON, for push messages.</td>
</tr>
<tr>
<td>Push Platforms (sys_push_platform)</td>
<td>The platforms that are supported for push notifications, and the maximum payload size.</td>
</tr>
</tbody>
</table>

<td>Live Feed Message (live_message)</td>
<td>Sends a push notification when a new live feed message is received.</td>
</tr>
</tbody>
</table>

### Push notification properties

Push notifications provides several properties to customize the setup.

Add these properties to the System Properties (sys_properties) table.

**glide.push.debug**

Creates entries in the system log for push notification errors.

- Type: true | false
- Default value: false

**glide.push.feedback.debug**

Creates entries in the system log for feedback sent by the APNs for custom iOS push applications.

- Type: true | false
- Default value: false

**glide.push.notification.ttl_seconds**

Specifies the number of seconds after which a queued push notification expires. After a push notification is triggered, it is queued and finally processed by a scheduled job. If the time the notification sits in the queue exceeds this value, the notification is not sent. Check the Push Notifications log for more information.

- Type: integer
- Default value: 21600

**glide.push.enabled**

Enables or disables push notifications.

- Type: true | false
- Default value: true
Push notification setup with the ServiceNow mobile application

The default ServiceNow mobile application automatically enables push notifications and configures mobile devices for push notifications when users initially log in to the instance with the mobile app.

**Note:** Push notifications with the ServiceNow mobile application are not supported in on-premise instances.

Setting up push notifications involves both the system administrator and users:

- Admin creates or updates push notifications for the ServiceNow mobile app. The admin does not need to set up the mobile devices for users nor update their user preferences for receiving push notifications.
- Users install the ServiceNow mobile app on their iOS or Android mobile devices and set their preferences for receiving notifications on the ServiceNow mobile app.
What to do — admins

Admins create push notifications, similar to setting up email notifications. A push notification has two main parts: the push message and the notification, which includes the push message.

**Note:** The push message and notification must be for the same table.

Create the push message

Before creating a push notification, create the push message with the actual message content (JSON payload) to be included in the push notification.

Create the push notification that includes the push message

Create the push notification that includes the push message and message content. A push notification specifically sends the push message. You can update a standard platform notification and use it as a push notification that includes the push message.

Add the new push notification to the Push Default Registration table

To ensure that a new push notification is included and enabled in the notification preferences of your users, register a new push notification in the Push Default Registration table. The notification is listed in the notification preferences of your users the next time that they log in to the ServiceNow mobile app.

What to do — ServiceNow mobile app users

Download the ServiceNow mobile app

*Install* the ServiceNow mobile app on an iOS or Android mobile device.

Agree to accept push notifications

After installing the ServiceNow mobile app, users are asked to accept push notifications. When the instance receives the push notification acceptance message from a user, it creates a record in the Push Notification Installations (sys_push_notif_app_install) table. This record is what the instance uses to identify the device + mobile application combination necessary to identify a push notification recipient.

The device then:

- Obtains a token that identifies the device.
- Triggers the creation of the device in the user notification preferences.

Log in to the company instance from the ServiceNow mobile app

Logging in automatically subscribes users to the push-specific notifications registered in the Push Default Registration table.

Update preferences for receiving notifications on the ServiceNow mobile app

Users can *enable or disable notifications* through Notification Settings in the ServiceNow mobile app. They can set additional notification preferences, such as conditions or filters that affect notification delivery, by using the System Settings window on a desktop or mobile browser. For details, see *User notification preferences in UI16.*
Next steps

If you are an admin, review the base system notifications and determine if new push message content and push notifications are needed.

Create a push message

Before you create a push notification, create the push message with the actual message content for the notification.

The Push notification plugin must be active. The plugin is active by default, starting with the Geneva release.

Role required: admin

The push message and notification must be for the same table.

2. Fill out the fields on the form (see table).
3. Click Submit.
Push notification messages allow you to specify the messages used in a push notification. Use a Push Notification Message to create the message and associate it with a specific push application and push message content.

### Push Notification Message form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the message.</td>
</tr>
<tr>
<td>Push App</td>
<td>Select the ServiceNow Mobile Application.</td>
</tr>
<tr>
<td>Message</td>
<td>${{subject}}</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
Push Message Content | Select the JSON content to be included in the push notification payload.  
**Note:** For details on defining payloads that control push notification behavior, see KB0622333. For example, you can specify predefined button pairs (Yes/No, Approve/Reject, Accept/Decline) as part of the push message content.

Message | Enter the message. You can add variables just as you would for other notifications. Any message you enter here overrides the message in the notification.

Related list | Push Message Attribute Values | Optional. Select the attributes that apply to this notification. For details, see Create an attribute value or action for a push message.

**Set up the push notification** that contains the message created or update an existing push notification to use the push message.

**Create a notification using a push message**

Email administrators can create a notification that specifically sends a push notification.

Configure the push message before performing these steps.

Role required: admin

You can associate a push message with a standard notification. A push message specifies the text the system sends as part of the push notification to the mobile device.

1. Navigate to System Notification > Create Push Notification.
2. Fill out the notification form as necessary (see Create an email notification for descriptions of the form fields).
3. Click the What it will contain tab.
4. Next to Push Messages, click the lock icon and select a push message.
   **Note:** The push message and notification must be for the same table.
5. If you want this notification to be sent only as a push notification and not as any other type of notification, select Push Message Only.
6. Click Submit.
   If the notification fails, the user is not notified. If the message fails to send because it exceeds the maximum payload, the instance logs the failure in the System Log.

**Add the push notification to the Push Defaults Registrations table** so that the push notification is listed in the notification preferences for users. Users can then select which notifications they want to receive for the ServiceNow mobile app.
Add a push notification to the Push Default Registrations table

After you create a new push notification, add it to the Push Default Registration table. Push notifications registered in this table are listed and automatically enabled in the notification settings of your ServiceNow Mobile Application users.

Role required: admin

2. Select the ServiceNow Mobile Application.
3. In the Push Application form for the ServiceNow Mobile Application, select the Push Default Registrations tab and click New.
A push application is a mobile app that can receive push notifications from a ServiceNow instance. Create a mobile application record for your customized mobile app and specify how to handle push messages and feedback.

Display Name: ServiceNow Mobile Application
Name: ServiceNowPushApp
Push: REST API

Push Notification Message Center... Push Default Registrations (170)
- Push Application = ServiceNow Mobile Application
- Notification
  - Notify quiz manager overdue
  - Approval Error Message response
  - Change comment (unassigned)
4. In the Push Default Registration New record, select the notification to be registered.
5. Click **Submit**.
   The next time that users log in to their instance, the new push notification is included in their list of notifications.

**Push notification setup with a custom push application**

If you are using your own custom mobile or push application, you must configure your app for use and set up the push contents.

Setting up a push notification infrastructure that uses a custom push app involves a push admin (also called push app developer or mobile app developer) and system administrator. When push admins create a customized push app, they also configure the app, its push message content (payload generators), and optional attributes, such as push action scripts. The admin creates and updates the push notifications for the custom push app. After users install the custom push app and initially log in to their instance from their mobile device, the system automatically creates a device (channel) for the custom app.

**Note:** These instructions are intended for users who develop their own customized push application. You do not need to configure the ServiceNow mobile application.
**Before you begin**

Complete the steps in **Activate push notifications**. The Push Feedback (com.glide.push.feedback) plugin enables the system to receive push feedback from Apple and is required if you have an iOS app.

Assign the push_admin role to your organization’s mobile app developer.

**What to do — push admin**

Configure push notifications for your custom push app. This process differs for iOS and Android devices.

1. (iOS only) **Upload a push certificate to your instance**
Upload a push certificate to your instance so that you can use it later to connect your iOS device to the push notification system.

2. **Create a push application record for your custom app**

Register your customized mobile application with your instance to receive push notifications for the application. The instance uses this push application record to identify the device + push application combination necessary to determine a push notification recipient.

3. **Create push message content**

Create a JSON content payload for different types of push notifications. The content determines how a push notification appears on the push application, and whether the user can send a message in response to the push notification. The push admin can create attribute definitions that specify a default push action script or string, for use in the push message content.

4. (Optional) **Create a push message attribute definition**

Push message attribute definitions allow you to create reusable properties for push message content specification.

5. (Optional) **Create an attribute value or action for a push message**

You can create attribute values that override the default attribute definitions used in the push message content.

6. (Optional) **Create a push action**

A push action is a server-side script that runs when the instance receives a response to an actionable push message.

What to do — admin

**Create the push messages and push notifications**

The administrator creates the push messages, sets up push notifications for the custom push app, and if desired, the content.

Next steps

Monitor push feedback to track push notifications that are failing to send to your custom push app. For more information, see [Monitor push feedback](#).

**Upload a push certificate to your instance**

Upload a push certificate to your instance so that you can use it later to connect your iOS device to the push notification system.

Using your Apple developer environment, create a push certificate and convert it to a PKCS (.p12) file. For details on generating the .p12 file with the required certificate and private key, see [Enable push notifications](#) and [Communicate with APNs using a TLS certificate](#) in the Apple documentation.

**Note:** Ensure that your certificate is a push certificate and not a developer certificate. Also, if you’re developing an app for testing purposes, ensure that you create a Sandbox certificate. If you’re developing an app that you plan to launch in the Apple App Store, ensure that you create a Production certificate.
Role required: push_admin or admin

After you create a PKCS (.p12) file that contains the iPhone developer certificate and the private key used to sign the certificate, you need to upload the file to your instance. The system uses the information in the PKCS file to communicate with the APNs.

1. Navigate to System Definition > Certificates, and then click New.
2. On the form, fill in the following fields:
   - Name: Enter a certificate name.
   - Type: Select PKCS12 Key Store.
3. Attach the PKCS (.p12) file to the record.
4. Click Submit.

Create a push application record for your custom app

Register your customized mobile application with your instance to receive push notifications for the application.

Complete the following:
1. Activate push notifications
2. (iOS only) Upload a push certificate to your instance

Role required: admin or push_admin

Push notifications are application-specific: They are sent to one type of mobile application, regardless of how many users have this application installed. If you develop your own mobile application, you must configure it for use by creating a record for it in the Push Application (sys_push_application) table. By default, the ServiceNow mobile application is automatically set up and ready to use.

1. Navigate to System Notification > Email > Push Application.
2. Fill out the fields on the form (see table).
3. Click Submit.
A push application is a mobile app that can receive push notifications from a ServiceNow instance. You can configure and specify how to handle push messages and feedback.

Create push message content that contains the JSON content in the push notification payload.

Create push message content

Push message content specifies additional JSON content in the push notification payload that is sent to the push provider.

Complete the following:

1. Activate push notifications
2. (iOS only) Upload a push certificate to your instance
3. Create a push application record for your custom app

You must know how to use JSON with push messages.

Role required: admin or push_admin

Push message content defines the style of push notification that can be sent out for your custom app. You can add custom content, such as a picture, icons, or action buttons for the user to respond to the notification. Use the following variables in the script:

- **current**: properties of the current record.
- **message**: push message sent as the body of the entire push content.
- **attributes**: object of the push message attributes that you define.

2. In the Push Notification Message Contents table, click New.
3. Fill out the fields on the Push Notifications Message Content form (see table).
4. Click Submit.
Push notification message content specifies additional JSON content in the push notification payload that is sent to the push provider. Use this record to create the JSON content and specify the provider-specific values, such as a sound or badge.

The following variables are available for use in the script:
- `current`: access properties of the record that triggered this push notification, such as the fields on an incident record.
- `message`: access contents of the message that will be sent as the body of the push notification.
- `attributes`: access attributes defined for this push notification.

```javascript
VAR json = {
    "app": "default",
    "record": {
        "table": current tablename,
        "sys_id": current sys_id
    }
};
```
## Notification Message form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the message content.</td>
</tr>
<tr>
<td>Push app</td>
<td>The push application the content can be used with.</td>
</tr>
<tr>
<td>Push Message Generation</td>
<td>Enter a script that determines the message content. See the example scripts.</td>
</tr>
<tr>
<td>Related list</td>
<td></td>
</tr>
<tr>
<td>Push Message Attribute Definitions</td>
<td>Select the attributes that apply to this notification. Attributes can be a value or an action. These attributes are used as default values for the content items you create in the content script. However, any attributes you create with the push message can override these attributes. See Create a push message attribute definition for information on creating attributes.</td>
</tr>
</tbody>
</table>

The following is an example of a content record that creates a two-button layout, one to approve something, such as a change request, and one to decline it.

```javascript
var json = {
  "table" : current.getTableName(),
  "sys_id" : current.sys_id,
  "template" : {
    "type": "2 button",
    "button1" : {
      "title" : "Approve",
      "action" : attributes.button_action,
      "parameters" : {
        "response" : "approve"
      }
    },
    "button2" : {
      "title" : "Decline",
      "action" : attributes.button_action,
      "parameters" : {
        "response" : "decline"
      }
    }
  }
};
```

Define a push message attribute to specify a default push action script or string that you can use in the push message content.

### Create a push message attribute definition

Push message attribute definitions allow you to create reusable properties for push message content specification.
1. **Activate push notifications**

2. (iOS only) **Upload a push certificate to your instance**

3. **Create a push application record for your custom app**

4. **Create push message content**

Role required: admin or push_admin

Use an attribute definition to specify a default push action script or string that you can then use in the push message content.

You can override these attributes by creating any push message attribute values.

1. Navigate to **System Notification > Push > Push Message Content**.

2. Select a content record or script record.

3. In the Push Message Attribute Definitions related list, click **New**.

4. Fill out the fields on the form (see table).

5. Click **Submit**.

---

**Push Message Attribute Definition form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute Name</td>
<td>Enter a descriptive name for the layout.</td>
</tr>
</tbody>
</table>
Create an attribute value or action for a push message

Attribute values are associated with push messages to provide a way for the message to include certain types of information in the push notification.

Complete the following:

1. **Activate push notifications**
2. (iOS only) **Upload a push certificate to your instance**
3. **Create a push application record for your custom app**
4. **Create push message content**
5. **Create a push message attribute definition**

Role required: admin or push_admin

These push message attribute values override values that you set in an attribute definition on the Push Content form.

2. Select a message.
3. In the Push Message Attribute Values related list, click New.
4. Fill out the fields on the form (see table).
5. Click Submit.

If you want to override default attribute definitions, see *Create an attribute value or action for a push message*. 

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute Type</td>
<td>Select the type of attribute:</td>
</tr>
<tr>
<td></td>
<td>• <em>Action</em>: An action to take on the instance, as defined by a script.</td>
</tr>
<tr>
<td></td>
<td>• <em>String</em>: An arbitrary string to send as part of the message content. The string can specify items like a button label in the message.</td>
</tr>
<tr>
<td>Default Script</td>
<td>Select the mobile action script that tells the instance what to do when it receives a response from the push notification. This option appears if you select <em>Action</em> for the Type.</td>
</tr>
<tr>
<td>Default Value</td>
<td>Specify an arbitrary string value to be placed in the attribute that is used by the message content. For example, the string could specify a button label. This option appears if you select <em>String</em> for the Type.</td>
</tr>
</tbody>
</table>
Push message attribute values override values that you set in an attribute definition.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute</td>
<td>Select a push message attribute definition.</td>
</tr>
<tr>
<td>Value/Action</td>
<td>Enter the value for the attribute or select the push action. This field changes to Value or Action depending on the type of attribute you select in the Attribute field.</td>
</tr>
</tbody>
</table>

(Optional) **Create a push action** to perform an action on the instance.

**Create a push action**

A push action is a server-side script that runs when the instance receives a response to an actionable push message.

Complete the following:

1. **Activate push notifications**
2. (iOS only) **Upload a push certificate to your instance**
3. **Create a push application record for your custom app**
4. **Create push message content**
5. **Create a push message attribute definition**
6. **Create an attribute value or action for a push message**

Role required: admin or push_admin
Create a push action to perform an action on the instance. For example, you might have an actionable push message that lets the user approve a change request. The action that handles the response should update the Approval field on the relevant Change Request record.

You can use global variables or, optionally, current variables and parameters passed through the JSON content.

2. Fill in the form fields (see table).
3. Click Submit.

### Push Notification Action form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the action.</td>
</tr>
<tr>
<td>Script</td>
<td>Enter the script.</td>
</tr>
</tbody>
</table>

### Monitor push feedback

Monitor push feedback to track push notifications that are failing to send to your custom push app.

Complete the steps in Activate push notifications. The Push Feedback (com.glide.push.feedback) plugin enables the system to receive push feedback from Apple and is required if you have an iOS app.

Role required: push_admin or admin

The information presented on the Push Feedback table is delivered to your system by the push notification service that is associated with your device. If you linked your instance to an iOS device, the information is delivered via the Apple Push Notification service (APNs). If you linked your instance to an Android device, the information is delivered via Firebase Cloud Messaging (FCM).

**Note:** The push feedback received from the APNs uses what Apple refers to as its 'legacy binary protocol.' For more information on how the legacy binary protocol works, see the Apple documentation.

1. In the navigation filter, enter sys_push_feedback.list.
2. On the list header, click the gear icon (⚙️) and add the following columns to the list view:
   - Sys push application ID
   - Push Platform
3. On the list, refer to the following columns to monitor push feedback:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Failure updated on</td>
<td>Date and time when the push feedback arrived to the system from Apple or Google.</td>
</tr>
<tr>
<td>Token</td>
<td>Unique key to identify the device + push application combination that the system sends the push notification to. The token is generated by Apple or Google.</td>
</tr>
<tr>
<td>When failed</td>
<td>Date and time when Apple or Google reported the push delivery failure.</td>
</tr>
</tbody>
</table>
### Requeue failed push notification messages

Push notification delivery might fail for various reasons. You can view which messages failed and requeue them to be sent out if necessary.

Role required: admin

**Note:** There is no way for the instance to guarantee or confirm push message delivery. For more information on how Apple handles push notifications, see the [Local and Remote Notification Programming Guide](#) for Apple developers.

Messages can also fail to send for several reasons, such as a large message queue or other issue with the instance. You can use a system property to control how long the instance queues a push notification after it is triggered.

Push notification message payload size is limited by provider:
- Apple iOS: 2,048 bytes
- Google: 4,096 bytes

Your instance does not send push messages that exceed this limitation. System logs save any failed messages. For details on Apple payload limitations, see the [Local and Remote Notification Programming Guide](#) for Apple developers.

1. Navigate to System Logs > Push Notifications.
   - By default, the messages that were created today appear. You can change the filter if necessary. The Type column can have these values:
     - **failure**: The message could not be sent.
     - **pending**: The message is queued for processing.
     - **success**: The message was successfully sent, although not necessarily received by the mobile device.

2. Put any failed messages back into the queue to be resent by selecting the check boxes next to the failed messages, and then selecting **Re-queue failed push notifications** from the choice list.
3. If some push notifications continue to fail, consider increasing the value in the `glide.push.notification.ttl_seconds` property. See [Push notification properties](#) for more information.

### Push notification retention

You can archive and eventually destroy push notifications that you no longer need or if your Push Notification table is excessively large.

Push notification retention is available starting with the Jakarta release.
Push notification archive and destruction plugins

The push notification archiving and destruction feature uses the Data Archiving and Push Retention plugins. The Data Archiving plugin must be active to archive and destroy push notification records. The Push Retention plugin provides a set of rules that specify when the system archives and destroys push notification records.

In new instances, the Push Retention plugin and associated archive and destroy rules are active by default. On upgraded instances, you must manually activate both the plugin and the archive and destroy rules. Be sure to review and approve the archive and destroy rules before activating them.

If your instance already has a process for managing push notification records, you do not need to activate the Push Retention plugin. If you want to replace your current process with Push Retention, be sure to deactivate the current process before activating the archive and destroy rules.

Archiving and destroying push notification records

Archiving means moving records from the Push Notification (sys_push_notification) table to the Push Notification Archive (ar_sys_push_notification) table when they exceed the archive rule time limit. Destroying means deleting records in the Push Notification Archive table when they exceed the destroy rule time limit.

Default archive and destroy rules

Push retention provides the following push archive rules:

- **Push Notification - Over a year old:** archives push notification records that were created more than 365 days prior to the current date.
- **Push Notification Archive - Over a year old:** destroys push notification records that have been archived for more than 365 days prior to the current date.

With these default settings, your messages are kept on the instance for a total of two years: one year in the Push Notification table, and one year in the Push Notification Archive table. At the end of the period, the system deletes the expired notification records from the Push Notification Archive table.

**Note:** By default these rules are active on new instances and inactive on upgrades. The system runs archive and destroy rules when you activate them.

Compatibility with other record management implementations

If you are already using another method for managing push notification records, such as table cleaners, you do not have to use the Push Retention feature. To prevent unexpected record deletion, avoid using multiple push notification management processes on the same instance at the same time.

**Note:** For assistance replacing your existing record management implementation with push notification retention, contact your professional services or sales representative.
Activate the Push Retention plugin

The Push Retention plugin (com.glide.push_retention) provides the retention policy for push notifications, so that you can specify when the system archives and destroys push notification records.

Role required: admin

The Push Retention plugin requires the Data Archiving plugin.

1. Navigate to System Definition > Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
   - If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. Optional: If available, select the Load demo data check box.
   - Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
   - You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.
5. Click Activate.

Archive push notifications manually

You can manually archive push notifications on demand instead of waiting for the instance to archive them based on a scheduled job.

Role required: admin

Push retention provides these push notification archive rules:

- **Push Notification - Over a year old**: archives push notification records that were created more than 365 days prior to the current date.
- **Push Notification Archive - Over a year old**: destroys push notification records that have been archived for more than 365 days prior to the current date.

You can manually archive push notification messages that meet the default archive and destroy rules or any additional archive rules that you create.

1. Navigate to System Archiving > Archive Rules.
2. Open the push notification archiving rule, for example Push Notification - Over a year old
3. Click Recalculate Estimate to see how many records in the Push Notification (sys_push_notification) table are going to be archived. The estimate appears in the Record estimate field.
4. Click Run Archive Now.
Subscription-based notifications

Subscription-based notifications enable users to proactively subscribe to items that interest them and unsubscribe from messages that are not mandatory.

Users can also specify additional notification channels that each of their notifications can be configured to use.

Before users can manage the notifications that are sent to them, administrators must create email notifications to which users can subscribe. Administrators can also make subscription-based notifications mandatory so users cannot unsubscribe to them. Then users can subscribe or unsubscribe to the notifications, and add schedules and filters to the subscription to limit the notifications that can be received.

Notifications that administrators mark as subscribable are automatically available in user notification settings.

Administrators should create subscription-based notifications when they do not want to specify users for a notification and want to let users proactively subscribe to the notification.

**Note:** Subscription-based notifications are not domain aware and cannot support domain-specific settings.

Subscriptions 2.0 plugin

The Subscription Based Notifications 2.0 plugin must be active to use subscribable notifications. This plugin is active by default on all new and upgraded instances.

The plugin installs the Notification Subscription (sys_notif_subscription) table, which holds user subscriptions to all notifications.

Subscriptions and notification preferences

Users can subscribe to notifications available to them through their notification preferences. In the UI16 interface, all users can set and modify their notification preferences through the **Notifications** tab of the System Settings window. In the UI15 interface and earlier, admins and users set their notification preferences through the **Notification Preferences** link in the User form.

User notification preferences in UI16

You can set your own notification preferences, including personal subscriptions and channels (devices) for receiving them. All users can set these preferences through the **Notifications** tab of the System Settings window.

With the **Notifications** tab, you can:

- Use a global switch to enable or disable all your notifications.
- Enable or disable a particular channel for receiving notifications, as well as create, edit, or delete channels.
- Control the notifications that you receive and apply conditions to restrict notification delivery.
- Create personal notifications, which are subscriptions to notifications that are important to you.
Comparison between notification preferences in UI16 and earlier interfaces

In new and upgraded instances that use the UI16 interface, the System Settings window is the central location for managing your notification preferences. The Notification Preference User Interface plugin (com.glide.notification.preference.ui) is activated by default.
Notification preferences in UI16 Interface

In UI15 and earlier interfaces:

- Users set notification preferences through the Notification Preferences link in the User form (Self service > My Notification Preferences).
• Admins created user devices and set notification preferences for users through the Notification Preferences link in the User form, accessed through the User Administration module (User Administration > Users).

**Note:** Admins can revert to the UI15 notification preferences interface by setting the glide.notification.preference.UI.enabled property to false.

---

### Manage your notification preferences in UI16

To access your notification preferences, click the gear icon (⚙️) in the banner frame, and in the System Settings window, click the **Notifications** tab. You can also access the System Settings by navigating to **Self Service > My Notification Preferences**.

![Notifications tab in System Settings window](image-url)
In the **Notifications** tab, use the following settings to manage your notifications:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow notifications</td>
<td>Global switch for enabling or disabling all notifications.</td>
</tr>
<tr>
<td>Notification channels</td>
<td>List of your channels for receiving notifications. Use this section to:</td>
</tr>
<tr>
<td></td>
<td>• Enable or disable a channel by using its toggle switch. If you disable a channel, notifications are not delivered through that channel.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Add channels</strong> using the <strong>Create Channel</strong> option.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Modify channel information</strong>. Click the channel row or the right arrow (&gt;) next to the appropriate channel to edit or delete it.</td>
</tr>
<tr>
<td>Notifications by category</td>
<td>List of notification categories that identify and group related notifications. Each category contains the notifications that you can subscribe to. To view the notifications in a given category, click the category row or the right arrow (&gt;) next to the appropriate category. You can:</td>
</tr>
<tr>
<td></td>
<td>• Edit a notification.</td>
</tr>
<tr>
<td></td>
<td>• Enable or disable channels for the selected notification.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Apply notification conditions</strong>, such as schedules and filters, that affect the delivery of the notification.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Create personal notifications</strong>, which are subscriptions to specific notifications that matter to you.</td>
</tr>
</tbody>
</table>

**Create notification channels**

You can add channels to receive your notifications. A notification channel is an email account or voice message system that you have access to.

Role required: user

Notification channels include email addresses, service providers for SMS messages, and mobile applications. You can create voice notification channels to support applications like Notify.

**Note:** If you are using the ServiceNow mobile application or a custom push application, you do not need to create a push channel for your mobile device. The system automatically creates a channel for the mobile app after you initially log in to your instance from your mobile device.

1. Click the gear icon (⚙️) in the banner frame to open the System Settings window, and click the **Notifications** tab.
2. Click **Create Channel**.
3. Complete the fields on the New Channel form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A descriptive name for the channel, such as the device or email account.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
**Type** | The type of channel:  
- **Email**: for email messages.  
- **SMS**: for SMS messages.  
- **Voice**: for phone messages.  

*Note:* All users with an email address have a primary email channel, which is created automatically after a notification is sent to them. If you are using the ServiceNow mobile application or a custom push application, the system automatically creates a channel for the mobile app after you initially log in to your instance from your mobile device.

**Email address** | The email address of the channel.  
**Phone number** | The phone number for SMS messages or for voice messages.  
**Service provider** | The service provider for SMS messages.

4. **Click** **Save**.  
The system creates and enables the channel, and adds it to the list of notification channels.

To receive notifications on your new notification channel, you must enable the channel for individual notifications. After you enable the channel for a notification, you can set conditions to further control the notifications that you receive on the channel. For more information, see **Apply notification conditions**.

**Modify notification channels**

You can update channel information for your notifications.  
**Role required:** none

1. Click the gear icon (⚙️) in the banner frame to open the System Settings window, and click the **Notifications** tab.  
2. In the Notification Channels section, click the channel row or the right arrow (►) next to the channel name.  
3. In the Edit Channel form, update the fields (see **Create notification channels** for descriptions of the form fields).  
4. **Click** **Save**.  
The system updates and saves the channel information that you modified.

**Delete a notification channel**

Delete a notification channel so that you no longer receive notifications through the channel.  
**Role required:** admin

1. Click the gear icon (⚙️) in the banner frame to open the System Settings window, and click the **Notifications** tab.
2. In the Notification Channels section, click the channel row or the right arrow (>) next to the channel name.
3. On the Edit Channel form, click **Delete**.

The system deletes the channel from the list of notification channels and no longer delivers notifications to that channel.

**Apply notification conditions**

You can set various conditions and filters to control the notifications you receive. You can also enable or disable an email digest and the delivery of individual notifications by channel.

Role required: user
You can choose to enable certain features and set different conditions that control the notifications you receive. You can:

- Enable or disable an email digest if a digest is available for the notification. An email digest is a single email that summarizes the activity for the notification during a time interval that you specify. Admins configure the email digest content for a notification.
- Enable or disable a channel on which the notification is received.
- Set preconfigured schedules and filters that determine when you receive your notifications.
- Set more advanced filter conditions to limit the notifications delivered to you.

1. Click the gear icon (⚙️) in the banner frame to open the System Settings window, and click the Notifications tab.
2. Select the notification:
   a) In the Notifications By Category section, click the row or right arrow (►) of the category that you want to view.
   b) In the list of notifications for the category, click the row or right arrow (►) next to the notification that you want to edit.
3. To enable or disable an email digest for the notification, if an email digest is available:
   a) Click the Email Digest switch.
      The email digest is enabled when the switch is green and disabled when the switch is grey.
   b) If you enabled the digest, select the Interval (length of time) during which the notifications are accumulated.
The interval begins with the first occurrence of notification activity during the specified interval. For example, if you selected the Daily interval and the first notification occurs at 07:00, the system begins accumulating notifications at 07:00 and stops at 07:00 the next day. Soon after the interval ends, the system sends the email digest instead of sending the individual notifications that were triggered during the digest interval. If you disabled the digest, the system immediately stops accumulating the notifications and does not send the email digest.

4. To enable or disable a channel on which the notification is received, click the switch for the channel.
   The notification is enabled when the switch is green and disabled when the switch is grey. If you previously disabled an entire channel, you cannot enable that channel for the notification.

5. To set more criteria for notification delivery, click the row or the right arrow (>) next to the channel for the notification.
   a) Complete the Apply Conditions form (see table).
### Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Schedule</td>
<td>Select a schedule that determines when the notification can and cannot be received.</td>
</tr>
<tr>
<td>Filter</td>
<td>Select a pre-configured filter with the criteria that determines when the notification can be sent. For example, you might select a filter whose conditions send notifications when an incident with a priority of 1 - Critical is opened for a network issue.</td>
</tr>
<tr>
<td>Advanced filter</td>
<td>Select this check box to use the condition builder to create additional criteria. When you select the check box, the Table and Conditions fields are displayed.</td>
</tr>
</tbody>
</table>
### Create personal notifications

You can create personal notifications, which are subscriptions to notifications of importance to you. You can apply conditions that control specific content included in your personal notification, and also enable or disable the channels for delivery.

**Role required:** user

A personal notification is a subscribable notification that you can customize. You can assign the notification a name that is meaningful to you and filter the information received in that notification.

1. **Click the gear icon (⚙️) in the banner frame to open the System Settings window, and click the **Notifications** tab.**
2. **Click Create Personal Notification.**
3. **Complete the New Personal Notification form (see table).**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select the table for the notification. For example, if you selected an incident-related notification, you might select the Incident (incident) table.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Define as many conditions as needed to limit the notifications you receive. For example, you can choose to be notified only when an incident alert is created for a specific configuration item.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Name</td>
<td>A descriptive name for your personal notification. Use a meaningful name to distinguish it from system notifications.</td>
</tr>
</tbody>
</table>
### ServiceNow Kingston Now Platform Capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notification</td>
<td>The notification to subscribe to. You can subscribe only to notifications that are configured to allow subscriptions. Depending on the notification you select, the Table, Affected record, and Send when fields are displayed.</td>
</tr>
<tr>
<td>Table</td>
<td>The database table that the notification is linked to.</td>
</tr>
<tr>
<td>Affected record</td>
<td>The specific record that the notification is based on. This field appears when you select a notification that has an affected record (for example, a notification for a problem record that has multiple affected CIs). Click the lookup icon, select the table and specific document (record) in that table, and click OK.</td>
</tr>
<tr>
<td>Send when</td>
<td>Another condition that must be met to send the notification. For example, you might create a filter whose conditions send notifications when an incident with a priority of 1 - Critical is opened for a network issue.</td>
</tr>
</tbody>
</table>

4. **Click Save.** The system creates the personal notification and adds it to the appropriate notification category.

   In the following example, notice the category in which the system placed the personal notification.
5. Enable or disable the channels for your personal notification.
6. Navigate back to the list of notifications for the category by clicking the left back arrow (←) at the top of the form.
   Notice that your Personal Notifications are listed above the System Notifications in the given category.
7. Navigate back by clicking the left back arrow («) at the top of the form or by clicking the Notifications tab.

User notification preferences in UI15 and earlier

In UI15 and earlier interfaces, use the Notification Preferences link in the User form to manage the notifications that you can subscribe to.

The following instructions explain how to use Notification Preferences to manage notifications.

Set up a notification device in UI15 and earlier

You can add devices for a user to receive notifications. A device is a mobile device, email account, or voice message system that the user has access to.
Role required: admin

Notification devices include email addresses, service providers for SMS messages, and mobile applications.

1. Navigate to User Administration > Users.
2. Select a user.
3. Click Notification Preferences.
4. Click Create New Device.
5. Fill in the fields on the form (see table).
6. Click Submit.

### New Device form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A descriptive name of the device or account.</td>
</tr>
<tr>
<td>Type</td>
<td>The type of device:</td>
</tr>
<tr>
<td></td>
<td>- Email: for email messages.</td>
</tr>
<tr>
<td></td>
<td>- SMS: for SMS messages.</td>
</tr>
<tr>
<td></td>
<td>- Mobile: for push notifications.</td>
</tr>
<tr>
<td>Email address</td>
<td>The user's email address.</td>
</tr>
<tr>
<td>Mobile application</td>
<td>The mobile application for push notifications.</td>
</tr>
<tr>
<td>Phone number</td>
<td>The user's phone number for SMS messages.</td>
</tr>
<tr>
<td>Service provider</td>
<td>The service provider for SMS messages.</td>
</tr>
<tr>
<td>User</td>
<td>The user's record in the system.</td>
</tr>
</tbody>
</table>
### ServiceNow Kingston Now Platform Capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>A number that determines which device receives the notification when multiple devices are configured. The device with the lowest number receives the notification.</td>
</tr>
<tr>
<td>Active</td>
<td>A flag that indicates if the device is active.</td>
</tr>
<tr>
<td>Related list</td>
<td></td>
</tr>
<tr>
<td>Notification Device Variables</td>
<td>Additional, optional attributes of an SMS device used inside an advanced script from the SMS service provider. These attributes are generally used to deliver SMS notifications to an internal SMS distribution technology. This advanced scripting procedure is not necessary for configuring external SMS providers.</td>
</tr>
</tbody>
</table>

**Note:** If you inactivate a device, it still appears in the user preferences, but the switches that allow users to select the notifications are grayed out for that device column.

---

**Edit a notification device in UI15 and earlier**

All users can edit their notification preferences, including notification devices.

**Role required:** any user

1. Navigate to **Self-Service > My Profile**.
2. Click **Notification Preferences**.
3. Click the name of the existing device.

The device form opens allowing you to make certain modifications, depending on your user role. See **Set up a notification device in UI15 and earlier** for a description of all fields.

---

**Add personal subscriptions in UI15 and earlier**

After setting up your devices, you can subscribe to notifications that are configured as subscribable.

The Subscription Based Notifications 2.0 plugin must be active.

If you have subscribed to messages, your list of notification messages can build over time. You can create preferences for how and when these messages are delivered, or unsubscribe to messages that are not configured as mandatory.

**Note:** Conditions that you apply to personal subscriptions do not override the filters that the administrator creates for the subscribable notifications. Your conditions are evaluated after the conditions on the subscribable notification are met. If the notification filter set by the administrator fails, the filter conditions on your personal subscription are not evaluated.

1. Navigate to **Self-Service > My Profile** to open your user profile.
2. Click the **Notification Preferences** related link.
   The Notification Preferences page opens. You can see your personal subscriptions and the general notifications that you are subscribed to.

3. Click **Subscriptions**.
4. Click **Add Personal Subscriptions**.
5. Fill in the fields as described in the table.

### Add personal subscriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A descriptive name for the subscription.</td>
</tr>
<tr>
<td>Notification</td>
<td>The notification to subscribe to. You can only subscribe to notifications that are configured to allow subscriptions.</td>
</tr>
<tr>
<td>Table</td>
<td>The table that the incident is configured to run on. You cannot modify the table from this form. To select another table, configure the notification. See <a href="#">Create an email notification</a>.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box indicating whether the subscription is active. Users can receive notifications for subscriptions only if the subscription is active. If it is not active, the on-off switch for the subscription is set to off and is read-only.</td>
</tr>
<tr>
<td>Send to</td>
<td>The devices that this subscription is sent to. Selecting the devices in this field is the same as turning on the switch for the subscription on the <strong>Subscriptions</strong> page.</td>
</tr>
<tr>
<td>Affected record</td>
<td>The specific record that the subscription is based on. Click the lookup icon, and then select the table and the specific record in that table.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Send when</td>
<td>Another condition that must be met to send the notification. For example, you might select a filter whose conditions send notifications when an incident with a priority of 1 - Critical is opened for a network issue. The system evaluates the conditions in this filter after the conditions set in the notification filter by the administrator.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.
7. You can turn the subscription for active subscribable notifications on or off using the switch on the Subscriptions management section of the Notification Preferences page.

![Personal subscriptions](image)

Personal subscriptions are saved in the Notification Subscriptions (sys_notif_subscription) table. The records in this table are made active or inactive when you slick the switch to subscribe or unsubscribe from the notification.

8. You can edit the subscription at any time by clicking **Edit** next to it.

**Select notifications in UI15 and earlier**

Administrators can configure notification preferences for each user and users can also select which notifications they want to receive for various devices.

1. Navigate to **Self-Service > My Profile** to select your own notifications, or if you have admin access, navigate to **User Administration > Users** to select notifications for another user.
2. Click a user record to open it.
3. On the User form, click **Notification Preferences** under Related Links.

The notification preferences page appears. The preferences pages show all the notifications available to the user and the devices that the user has configured, such as email or mobile phone. If a user does not have read access to the table on which the notification is based, the notification does not appear.

Every user has the **Primary email** device, where subscriptions to email notifications can be enabled.
4. Click the switch next to the notification to subscribe the user to it.

Modify notifications for a user device in UI15 and earlier

After you set up the devices through which users receive notifications, you can assign the notifications to each device and add advanced conditions to limit what notifications are received.

Role required: admin

1. On the Notification Preferences page for a user, find the notification from the list of notifications.
2. Click Edit next to the notification. The preferences for that notification appear.
3. Fill in the fields on the form (see table).
4. Click Submit.
Notification preferences for a user's device

Form fields

<table>
<thead>
<tr>

</tbody>
</table>

### Create a service provider

Administrators can configure service providers for devices that use SMS.

**Role required:** admin

Administrators also have the option of configuring how a device's service provider affects the construction of the device's email address.

1. Navigate to the Notification Service Provider (cmn_notif_service_provider) table by typing `cmn_notif_service_provider.list` in the application navigator filter.
2. Fill out or change the fields on the form (see table).
3. Click **Update**.
4. Click **Save** on the Notification Preferences page.
The Notification Service Provider form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Configured name of the service provider.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of device, in this case SMS.</td>
</tr>
<tr>
<td>Active</td>
<td>Enables or disables this notification device.</td>
</tr>
<tr>
<td>Advanced notification</td>
<td>Removes all the previous options and displays the Advanced script field.</td>
</tr>
<tr>
<td>Advanced script</td>
<td>Used for custom notifications that run a script rather than construct a traditional SMS/email. This is generally used when all outbound SMS messages must run through a central SMS hub, as opposed to being sent directly from the instance to the SMS provider. Advanced users can construct a script in this field that will send a notification to an old style numeric pager that cannot receive SMS communications. This field is rarely used and employs advanced scripts. Contact your representative to assist you with any advanced SMS scripting.</td>
</tr>
<tr>
<td>Construct address manually</td>
<td>Removes the prefix and suffix options and displays the Construction script field.</td>
</tr>
</tbody>
</table>
### Field

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Construction script</td>
<td>Allows you to script the email address construction as you would in a business rule. For example, abc + current.phone_number + <a href="mailto:def@text.att.net">def@text.att.net</a> would construct an email address of <a href="mailto:abc222334444def@text.att.net">abc222334444def@text.att.net</a>. <strong>NOTE:</strong> Current is a reference to the device, not the service provider, hence the current.phone_number variable that uses the device's phone_number value.</td>
</tr>
<tr>
<td>SMS Provider Email Prefix</td>
<td>Places the provided text before the device's specified phone number; for example: <a href="mailto:PREFIX2223344444@text.att.net">PREFIX2223344444@text.att.net</a></td>
</tr>
<tr>
<td>SMS Provider Email Suffix</td>
<td>Places the provided text after '@' sign; for example: 2223344444@SUFFIX</td>
</tr>
<tr>
<td>Notification Device Variables</td>
<td>Additional, optional attributes of an SMS device used inside an SMS service provider's Advanced script. This is generally used to deliver SMS notifications to an internal SMS distribution technology. This is an advanced scripting procedure and is not necessary for configuring external SMS providers.</td>
</tr>
<tr>

</tr>
</tbody>
</table>
Make a notification mandatory

To prevent users from turning off or deleting a subscription to a notification, make the notification mandatory.

Role required: admin

When you make a notification mandatory, the notification is locked in user notification preferences, preventing the user from removing or unsubscribing to the notification, filtering it, or changing the schedule.

Users receive mandatory notifications even if they disable notifications.

Note: Mandatory notifications apply to only the primary device of the user. You cannot make a notification mandatory for secondary devices.

1. Navigate to System Notification > Email > Notifications.
2. Open the appropriate notification.
3. Configure the form and add the Mandatory field. This field does not display by default.
   a) Click the context menu icon (…) and select Configure > Form Layout.
   b) Using the slushbucket, select the Mandatory field and the order in which you want the field to appear.
   c) Click Save.
4. Select the Mandatory check box.

When a user checks their notification preferences, the control button for the mandatory notification is on and is read only.
Force a notification to be sent

To force a notification to be sent to the specified users, enable forced delivery.

Role required: admin

Forcing a notification means that the relevant users receive the notification, even if they have not subscribed to the notification or have turned off the subscription. In addition, the users receive the notification even if the Notification field is set to Disable.

**Note:** Forced delivery applies to only the primary device of the user. You cannot force a notification to be sent to secondary devices.

1. Navigate to System Notification > Email > Notifications.
2. Open the appropriate notification.
3. Configure the form and add the Force delivery field.
4. Select the Force delivery check box.
5. Click Update.

Unlike using the Mandatory option, forcing the delivery does not lock the user’s preference or prevent the user from unsubscribing from the notification.

Create a notification filter

Notification filters enable a user to control the delivery of messages by creating special conditions on multiple tables in a single, reusable filter.

Role required: admin

For example, you can create a filter that controls message delivery when active incidents, problems, and change requests for network issues reach a critical state. For U115 and earlier interfaces, notification filters are available for selection in the Filter field of a user’s Notification Preferences form. For U116, filters for notifications or channels are set through the Notifications tab of the System Settings window. For details, see [Apply notification conditions](#).

**Note:** The system applies the user’s filter conditions after the administrator’s conditions have been evaluated. If the administrator’s conditions fail, the system ignores notification filters.

1. Navigate to System Notification > Email > Notification Filters and create a record.
2. In the Notification conditions related list of the new record, create and submit filter conditions on one or more tables.
3. Repeat the procedure to create additional conditions on other tables for this filter.
Filter device notifications using a schedule

You can associate devices, such as Email, SMS, and Voice, to schedules that define when the devices can and cannot receive notifications.

Role required: admin

Notifications that are triggered outside of the scheduled days and times for the device are not queued up for delivery at a later time. For example, if an administrator selects the Weekdays schedule for an email device, the device receives email notifications triggered between Monday and Friday. If notifications are triggered on Saturday, they are not delivered to the device.

1. Define schedules as needed using System Scheduler > Schedules > Schedules.
2. Add or edit a device.
3. Configure the New Device for System Administrator form and add the Schedule field.
4. In the Schedule field, select the schedule for the device.
5. Click Submit.

Edit the schedule or filter of an existing notification message

You can update a schedule or filter that was previously created for an email notification.

Role required: admin

To edit the schedule or filter of an existing notification message:

1. In the Notification Preferences screen, click the message to edit. You cannot edit any attributes of a mandatory message.
2. Make the appropriate changes in the form.
3. Click Update.
Email unsubscribe

Administrators can add unsubscribe links to notifications so that users can stop receiving particular email messages.

Note: The base system notifications include unsubscribe and notification preferences links.

The system offers two types of macros to create unsubscribe links.
- An unsubscribe link that creates an email message to the instance.
- An unsubscribe link that opens the notification preferences for the user on the instance.

Available unsubscribe macros

<table>
<thead>
<tr>
<th>Unsubscribe type</th>
<th>Macro used</th>
<th>Description</th>
<th>Available parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unsubscribe by email</td>
<td>{NOTIF_UNSUB}</td>
<td>The system generates an HTML mailto hyperlink. When users click the link, their browser or email client creates a pre-formatted unsubscribe email message to the instance.</td>
<td>link_text: specify the text to display as a link within quotation marks.</td>
</tr>
<tr>
<td>Unsubscribe by notification preferences</td>
<td>{NOTIF_PREFS}</td>
<td>The system generates an instance link directly to the notification preferences for this notification type.</td>
<td>link_text: specify the text to display as a link within quotation marks.</td>
</tr>
</tbody>
</table>

Administrators can add unsubscribe macros to any notification record type such as:
- Email layouts
- Email templates
- Email notifications

Unsubscribe by email

Unsubscribe by email requires the user email client or browser to create a pre-formatted email message containing these elements:
- The To field has the email address of the instance.
- The Subject starts with the string Unsubscribe from.
- The Body has a JSON string with a name-value pair of Unsubscribe and an array value that contains two more name-value pairs.
  - The notification_id parameter specifies the Sys ID of the notification the user wants to unsubscribe from.
  - The unsub_token parameter specifies an instance ID the system uses to verify that the email came from a ServiceNow instance.

Note: Some email clients and web browsers, such as GMail on Chrome, require extra client configuration to support mailto hyperlinks. Administrators can provide an alternative unsubscribe method for users whose email client or browser does not support mailto links. See RFC6068 for information about the mailto URI scheme.
The **Unsubscribe from Notification** inbound action processes the email and unsubscribes the sender from the listed notification.

**Note:** Unsubscribing by email message does not require users to authenticate with the instance first.

**Unsubscribe by notification preferences**

Unsubscribe by notification preferences requires the user’s browser to navigate to the notification preferences page on the instance. After logging in, the system displays the notification preferences for this particular notification.

Users can set preferences for this notification such as disabling notifications for a particular device. Users must save their notification preferences for changes to take effect.

**Unsubscribe links**

This email layout adds several unsubscribe links to the bottom of each email notification.

```
${NOTIF_UNSUB} from this notification by email or ${NOTIF_UNSUB +link_text="click here"}.
Manage your ${NOTIF_PREFS} or ${NOTIF_PREFS+link_text="click here"}.
```

When rendered in an email notification, the unsubscribe links only display the link text.
Sample email with unsubscribe links

If a user clicks the **Unsubscribe** link, the email client creates a message such as this:
Sample unsubscribe by email message

Email digests

An email digest is a single email that summarizes the activity for a selected notification and its target record during a specified time interval. You can enable an email digest to reduce the number of notifications received when frequent updates to the associated record occur within a short time period.
Example email digest

![Example email digest]

**Note:** Email digests apply to email notifications only and are not supported for SMS messages, push notifications, and activity streams.

**How email digests work**

In new and upgraded instances, the Email digest (com.glide.email_digest) plugin is activated by default. Your instance must use the UI16 interface, since the email digest feature involves setting user notification preferences in the System Settings window.

Admins determine which notifications can be delivered in an email digest and configure the digest content for those notifications. Admins can also control the intervals for digests. An interval is the length of time that notifications are collected for the digest, such as daily or hourly.
Users enable the digest and select the digest interval for a specific notification in their notification preferences. The system accumulates the notifications that normally would be sent during the specified interval and summarizes them in the email digest.

When processing an email digest, the system:

- Stores the digest configuration for the notification in the Notifications (syseven_email_action) table.
- Temporarily stores the notification content accumulated for a user in the Email Digest Parts (sys_email_digest_part) table and the Email Digest Part Users (sys_email_digest_part_user) table.
- Runs an email digest job every 15 minutes to check when a digest is ready to be sent to a user.
  
The system uses the digest interval to determine when the digest is ready to be sent. The digest interval begins when the first notification is triggered for the user and stops at the end of the interval time.
- Sends the email digest to the user soon after the selected digest interval ends.
  
For example, if a user selects an hourly digest interval and the first notification is triggered at 08:15, the interval starts at 08:15. When the digest interval ends, the system generates the email digest approximately one hour later, at about 09:15 or shortly after, depending on when the email digest job ran.

Set up email digests

**What to do — admins**

1. Review the base system digest intervals and if needed, [create or modify intervals](#).
   
The base system digest intervals are hourly, every four hours, daily (24 hours), and weekly (seven days).
2. Determine the email notifications that can be delivered in a digest and [configure the email digest content](#) for those notifications.
   
   When determining which notifications are appropriate for an email digest, consider the notification content and intervals that your users can select. For example, digests that can be generated weekly might be better suited for notifications that are non-urgent.

**What to do — all users**

For a notification that can be delivered in an email digest, [enable the email digest in your notification preferences](#) (Notifications tab in the System Settings window). You also specify the interval time that the notifications are accumulated.

Next step

If you are an admin, begin the digest setup process by reviewing the base system email digest intervals and [create or modify the intervals](#).

Create or modify email digest intervals

Admins can create or modify the email digest intervals (length of time) during which activity for a selected notification is accumulated in an email digest. Users select a digest interval when they enable an email digest in their notification preferences.

Role required: admin
Before adding an email digest interval, review the base system digest intervals in the Digest Intervals (sys_email_digest_interval) table. You can modify intervals, including the base system intervals, which are daily (24 hours), hourly, every four hours, and weekly (seven days).

1. Navigate to **System Notification > Email > Digest Intervals.**

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>To add an interval</td>
<td>Click <strong>New.</strong></td>
</tr>
<tr>
<td>To modify an interval</td>
<td>Select the interval to be changed.</td>
</tr>
</tbody>
</table>

2. Enter the new or changed interval information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Interval name that describes the interval length of time, for example: Every 2 hours.</td>
</tr>
<tr>
<td>Interval</td>
<td>Length of the interval, either number of Days or Hours (hours, minutes, and seconds). The minimum time length allowed is one hour, and the maximum time length allowed is seven days (one week).</td>
</tr>
</tbody>
</table>

3. If you created an interval, click **Submit.** Or, if you changed an interval, click **Update.**

The system updates the Digest Intervals (sys_email_digest_interval) table with the new or modified interval. The digest interval is listed as an option in the notification preferences (Notifications tab in the System Settings window) when a user enables a digest for the notification. For example:

![Image of System Settings window with Notifications tab selected and incident commented with email digest interval set to daily.]
4. To delete an interval, select the interval to be deleted in the Digest Intervals (sys_email_digest_interval) table and click **Delete**.

**Note:** If the interval is in use, the system does not remove the interval.

Determine the email notifications that can be delivered in a digest and configure the email digest content for those notifications.

**Configure email digests**

Use the Notification form to create or modify the content of an email digest for a notification. You can also disable the email digest for a notification so that it is not available in the notification preferences of your users.

Role required: admin

When you create or update a notification, use the What Digest will contain tab of the Notification form to configure the email digest for the notification. After you define the digest content, the digest option for the notification is available in the notification settings of your users.

1. Navigate to **System Notification > Email > Notifications**.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you are creating a notification</td>
<td>Click <strong>New</strong> to open the Notification form.</td>
</tr>
<tr>
<td>If you are modifying a notification</td>
<td>Select the notification to be changed.</td>
</tr>
</tbody>
</table>

2. In the Notification form, select the **Allow Digest** check box to display the What Digest will contain tab and define the digest content.
3. Complete the fields in the **What Digest will contain** tab. The example shows the default view of the tab. The advanced view contains additional fields (see table).
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digest Template</td>
<td>If you want to reuse existing content, such as headers or footers, select</td>
</tr>
<tr>
<td></td>
<td>an email template to add content to the email digest.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Digest Subject</td>
<td>Enter the subject line for the email digest. The subject can include variables from the Select variables column. If empty, the system uses the Subject value from the Email template. If you enter a value in this field, it overrides the template value.</td>
</tr>
<tr>
<td>Digest HTML</td>
<td>Enter the recurring content for the email digest. The digest content can include variables from the Select variables column. Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes. No extra &lt;p&gt; and &lt;div&gt; elements are added to your email digest; see the blog post <a href="https://community.servicenow.com/groups/service-now/blogs/email_compatibility_blog/extra_line_spacing_with_paragraph_tags_in_email_client">Extra line spacing with paragraph tags in email client</a> by a ServiceNow employee in the ServiceNow Now Community.</td>
</tr>
<tr>
<td>Digest Separator (HTML)</td>
<td>Use the line to separate each item summarized in the digest.</td>
</tr>
<tr>
<td>Digest From</td>
<td>Enter the email address to be used in the From field of the email digest. For example, <a href="mailto:helpdesk@yourcompany.com">helpdesk@yourcompany.com</a>. The email address must be in a valid format, otherwise a notification message appears near the field. Changing this address requires an advanced email setup such as enabling email forwarding.</td>
</tr>
<tr>
<td>Digest Reply To</td>
<td>Enter the email address that you want people to use when replying to the email digest. For example, <a href="mailto:helpdesk@yourcompany.com">helpdesk@yourcompany.com</a>. The email must be in a valid format, otherwise a notification message appears near the field. Changing this address requires an advanced email setup such as enabling email forwarding.</td>
</tr>
<tr>
<td>Digest Text</td>
<td>Enter the recurring content of the email digest to send in plain text. This field appears when you set the content type to HTML and plain text or Plain text only.</td>
</tr>
<tr>
<td>Digest Separator (text)</td>
<td>(Optional) Use the dash character as a line to separate each item summarized in the digest. This field appears when you set the content type to HTML and plain text or Plain text only.</td>
</tr>
</tbody>
</table>
4. When you finish creating the notification, click **Submit**. Or, if you are done modifying the notification, click **Update**.

The email **Digest** option is available for the notification in the notification settings of your users.

**Note:** The email recipients identified in the **Who will receive** tab will receive the digest after they **enable the digest** in their notification preferences. If the user is not a designated recipient for the notification, a digest is not generated even though the user may have the digest enabled for a notification. In this case, the user receives the actual notifications as they are generated.

5. (Optional). To disable the email digest for a notification, unselect the **Allow Digest** check box and click **Update** when you finish your changes to the notification.

When you disable the digest content, the digest option is also no longer available for the notification and is not listed in the notification preferences for your users. If a user previously enabled the digest option for the notification, the system stops collecting those notifications for a digest and does not generate the digest.

**Note:** If you disabled the digest and want to make the digest available again, select the **Allow Digest** check box. The system retains the previously saved digest content and displays it in the **What Digest will contain** tab.

---

**Enable an email digest**

In your notification preferences, you can enable an email digest that summarizes the activity for a selected notification during a specified time interval. The digest is a single email that you receive instead of the individual notifications generated during the specified interval.

**Role required:** user

The email digest option is available for a notification (in your notification preferences) only when your admin has configured the email digest content for that notification.

Consider enabling an email digest to reduce the number of emails you would normally receive when the target record for a notification is frequently updated within a short time period.

1. Click the gear icon (⚙️) in the banner frame to open the System Settings window, and click the **Notifications** tab.

2. Select the notification:
   a) In the Notifications By Category section, click the row or right arrow (►) of the category that you want to view.
   b) In the list of notifications for the category, click the row or right arrow (►) next to the notification that you want to edit.

3. To enable or disable an email digest for the notification, if an email digest is available:
   a) Click the **Email Digest** switch.
      The email digest is enabled when the switch is green and disabled when the switch is grey.
   b) If you enabled the digest, select the **Interval** (length of time) during which the notifications are accumulated.
The digest interval begins with the first occurrence of notification activity. For example, if you selected the Daily interval and the first notification occurs at 07:00, the system begins accumulating notifications at 07:00 and stops at 07:00 the next day.

Soon after the interval ends, the system sends the email digest to you instead of sending the individual notifications generated during the digest interval. If you disabled the digest, the system immediately stops accumulating the notifications for the digest and does not send the email digest. The system resumes sending the notifications as they are generated.

**Notify**

Notify allows you to integrate with the Twilio telephony service to send and receive phone calls and SMS messages from within your instance.

Notify automatically creates a TwiML application in the Twilio service and configures the application to use the instance as an endpoint. Phone numbers associated with the Twilio subaccount are imported to Notify.

To manage phone numbers per instance, set up one Twilio subaccount for each instance and configure all relevant phone numbers for the instance under that subaccount. The Notify plugin must be active to access the Notify product.

**Note:** Only one Twilio account (or subaccount) can be configured on Notify at a time.
Activate Notify

The Notify plugin (com.snc.notify) requires a separate subscription. This plugin includes demo data and activates related plugins if they are not already active.

Role required: admin

Notify activates these related plugins if they are not already active.

### Plugins for Notify

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>E164 Compliant Phone Number</td>
<td>Provides E-164 compliant phone number support.</td>
</tr>
<tr>
<td>(com.glide.phone_number)</td>
<td></td>
</tr>
<tr>
<td>Notify - Twilio Driver</td>
<td>Provides Notify support for Twilio. Requires a separate contract with Twilio for SMS/Voice capabilities.</td>
</tr>
<tr>
<td>(com.snc.notify.twilio)</td>
<td></td>
</tr>
</tbody>
</table>

To purchase a subscription, contact your ServiceNow account manager. After purchasing the subscription, activate the plugin within the production instance.

1. Navigate to **System Definition > Plugins**.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the **Activate/Upgrade** related link.

   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
   - If the plugin has optional features that depend on other plugins, those plugins are listed under **Some files will not be loaded because these plugins are inactive**. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. Optional: If available, select the **Load demo data** check box.

   - Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
   - You can also load demo data after the plugin is activated by clicking the **Load Demo Data Only** related link on the System Plugin form.
5. Click **Activate**.

Migrating from Legacy Notify

When migrating to Notify from the Legacy Notify functionality, several changes are made to the instance.

If the Legacy Notify functionality is already enabled, several automatic changes occur when you activate Notify:

- The Legacy Notify menu is removed from the application navigator.
- Two separators are added to the new Notify menu: **Legacy Notify** and **Legacy Notify Admin**.
- New modules that replace the Legacy Notify modules are added to these sections.
Note: The added modules are not the same modules that were in the Legacy Notify menu. Any customizations made to the Legacy Notify modules are not preserved.

- The notify_admin role allows access to Notify modules.
- The notifynow_admin role allows access to Legacy Notify modules.
- All workflow activities from the Legacy Notify application are moved to the Legacy Notify group.

Differences between Notify and Legacy Notify

Describes the differences between the Notify and Legacy Notify applications, including architecture, workflows, Twilio support, and task-initiated conference calls.

<table>
<thead>
<tr>
<th>Legacy Notify (com.snc.notifynow)</th>
<th>Notify (com.snc.notify)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manage a single number from a Twilio account per instance.</td>
<td>Provides support for multiple numbers per Twilio account, especially gross-geographical scenarios.</td>
</tr>
<tr>
<td>Does not include support for customizable workflows for Voice and SMS incoming or outgoing scenarios.</td>
<td>Workflow-driven approach for handling incoming and outgoing Voice and SMS events, making the integration easy to customize.</td>
</tr>
<tr>
<td>Hard-coded join conference SMS and IVR prompts for joining a conference call.</td>
<td>Includes a configurable workflow for handling SMS and Voice IVR prompts.</td>
</tr>
<tr>
<td>Support for SMS-based answers and threaded conversations.</td>
<td>Notify On Task support for sending SMS and initiating conference calls from any task.</td>
</tr>
</tbody>
</table>

Configure Notify with the Twilio service

You can configure Notify to use the Twilio telephony service.

You must have an SID and authentication token for an active Twilio account (https://www.twilio.com/).

Important: Ensure that each instance on which you configure Notify uses a different Twilio account. Each account specifies a unique SID, authentication token, telephone numbers, and endpoint. Using the same account across multiple instances may cause your Twilio service configuration to be overwritten.

Note: Account and subaccount are Twilio categorizations and both act the same for a ServiceNow instance.

Role required: notify_admin

1. Navigate to Notify > Twilio Configuration.
2. On the Twilio Account Properties page, enter your Account SID.
   
   Note: This value is only visible to users with the admin role.

3. Enter your Auth Token.
   
   Note: This value is only visible to users with the admin role.

4. Click Connect.
If the account is not associated with an instance and the connection is successful, a read-only list of E.164 and short code phone numbers associated with this Twilio account appears. This list displays the phone number, supported capabilities such as voice or SMS, the country for each Twilio number, and the Notify number group to which the number belongs.

If the account is already associated with an instance, the system displays an error message. To connect to this account, you must do one of the following:

- Disconnect the account from the instance
- Clear the request URLs on Twilio's TwiML app

**Note:** If you buy or release numbers on the Twilio account, open the configuration page again to refresh the list of numbers. Numbers removed from the Twilio service remain as Notify Number records, but with the Active field set to false. Use only active phone numbers for inbound or outbound communication.

Phone numbers and short codes are provided by Twilio once the account is successfully connect and are stored on the Notify Phone Numbers (notify_number) table. Assign each number to a number group. Number groups allow you to control which workflows run when using the phone numbers in each number group.

**Create a number group**

Number groups allow you to group Notify phone numbers and share workflows across grouped numbers.

Role required: notify_admin

Each phone number within Notify has an associated number group. Numbers within a group use the same workflows for handling incoming and outgoing calls and SMS messages.

Numbers associated with a group appear on the Notify Phone Numbers related list on the Notify Phone Number Group form.

1. Navigate to Notify > Number Groups.
2. Click New.
3. Enter a Name, and select Notify: (Re)join Conference Call for the Incoming call workflow field.
Incoming call workflows must run on the Notify Call (notify_call) table. Incoming and outgoing SMS workflows must run on the Notify Message (notify_message) or Global (global) tables.

Short codes can only be associated with SMS workflow groups. You cannot add an incoming or outgoing call to a short code group.

4. Click Submit.

Associate a number to a number group

After creating a number group, associate numbers with that group to use the selected workflows.

Note: Each phone number can only be associated with one number group.
Associate a number to a number group

Associate a Notify number to a number group to use inbound and outbound workflows.

Role required: notify_admin

1. Navigate to Notify > Numbers.

2. Click the listed phone number and assign it to a **Number Group**, as appropriate.

   **Note:** Each phone number can only be associated with one number group.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Number for the entry.</td>
</tr>
<tr>
<td>Phone number</td>

</tr>
</tbody>
</table>

3. Click **Update**.

Disconnect from a Twilio account

If a Twilio account is already associated with a different system, disconnect the account from the other system before connecting to the current instance.

Role required: notify_admin

1. Navigate to Notify > Twilio Configuration.
2. On the Twilio Account Properties page, click **Disconnect**.
3. In the Disconnecting Twilio account pop-up window, click **OK**.

The account is disconnected from the instance. The system clears the **Account SID** and **Auth Token** fields and deactivates the list of associated phone numbers.

Outbound communication requirements

Outbound communications initiated through Notify, such as phone calls and SMS messages, must satisfy certain requirements.
These requirements apply to all outbound communication initiated through Notify, such as by using Notify workflow activities or the Notify JavaScript API. Invalid numbers prevent Notify workflows from running and cause an error to be logged. Set the `glide.notify.debug` property to true to create detailed error logs.

**Recipient number requirements**

These requirements apply to any number that receives a Notify phone call or message.
- The calling country must be authorized from Twilio.
- The number must be E.164 compliant.
- The number must be different than the phone number used to initiate the call or message.

**How Notify processes incoming calls**

Notify processes incoming calls using workflow activities.

Any Notify activity that manages incoming phone calls creates a record on the Notify Workflow Activity (notify_wf_activity) table. Each notify_wf_activity record is associated with a single call. These records store JSON data detailing the actions to send to the telephony provider.

Notify processes incoming calls in the following way:

1. A person calls a Notify phone number.
2. Notify launches the incoming call workflow associated with that Notify phone number.
3. The workflow reaches a Notify activity and invokes the activity `onExecute()` function.
4. The activity creates a new notify_wf_activity record detailing any actions to take, with a State value of execute.
5. Notify sends the specified actions to the telephony provider.
6. The notify_wf_activity record State changes to processed.
7. The telephony provider sends a response.
8. Response arguments, such as user input or recording info, are stored as JSON data in the notify_wf_activity response_args field.
9. The notify_wf_activity State changes to complete.
10. The JSON data from the notify_wf_activity record is copied to the Last action field in the Notify call record that triggered the workflow.
11. The workflow invokes the `onUpdate()` function in executing activities.
12. The activity confirms that the associated notify_wf_activity record has completed, and changes the activity state to finished.
13. The workflow transitions to the next activity.

**View a list of Notify calls**

As a Notify administrator, you can view a list of calls made to or from Notify. To view a list of calls, navigate to Notify > Calls.
Call records are generated automatically when a user calls a Notify number, or when a user makes an outbound call through Notify. You cannot create call records manually. You can delete call records.

**Note:** Deleting a call record may result in cascade deletion of related records.

<table>
<thead>
<tr>
<th>Call status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>No answer</td>
<td>The call is not answered, or if the number is configured for voicemail, a message is left on the voice mailbox.</td>
</tr>
<tr>
<td>In-progress</td>
<td>The call is answered and is active.</td>
</tr>
<tr>
<td>Completed</td>
<td>The conference call is completed.</td>
</tr>
<tr>
<td>Failed</td>
<td>The provided phone number is invalid.</td>
</tr>
</tbody>
</table>

**Notify conference calls**

Notify allows you to connect multiple callers to a single conference call.

Conference call records are stored on the Notify Conference Calls (notify_conference_call) table. Conference call participant records are stored on the Notify Conference Call Participants (notify_participant) table.

Conference call and participant records are created automatically when starting and connecting to a conference call. Most fields, such as the Duration of a call are set automatically using business rules.

**Note:** If a participant attempts to join a conference call using an invalid phone number, the caller is added to the participant list and the phone number is marked with a status of Invalid.

Notify administrators can manage conference call participants, such as by muting or kicking them.

Several conference call workflows are available by default. These workflows can be used for incoming and outgoing calls and incoming SMS messages. Conference call workflows are:

- Notify: (Re)join Conference Call
- Notify: Join Conference Call Via SMS

The number groups Conference Call Group and Notify On Task Group use these conference call workflows by default.

**Mute or kick a conference call participant**

You can mute or kick conference call participants.

Role required: notify_admin

Before starting this procedure, ensure there is an active conference call with one or more participants.

1. Navigate to Notify > Conference Calls.
2. Select a conference call.
3. In the Notify Conference Call Participants related list, select a participant.
4. Click Mute or Kick.

You can unmute a muted participant but cannot add a kicked participant back to the conference call. A kicked participant may rejoin the conference call, such as by calling in again.

**Use SMS with Notify**

You can send and receive SMS messages using Notify.

The Notify application stores inbound and outbound SMS messages in the Notify Messages (notify_message) table.

Notify supports sending concatenated SMS messages. Messages that exceed 160 characters, or 70 unicode characters, are split into multiple messages. This may affect your total telephony cost as each message can incur a cost. Some mobile carriers, such as Sprint, do not support concatenated SMS messages.

To send SMS messages to an individual recipient, use the Notify API sendSMS method. This method takes one recipient as an input parameter. You can also use the send SMS workflow activity.

To send SMS messages to one or more recipients, use the Notify API sendBulkSMS method. This method takes a list as an input parameter and uses one API call to send multiple messages. Include the list of phone numbers in an array in the API call. This method improves performance by streamlining platform checks and Notify number validation.

**Notify workflow activities**

Notify workflow activities manage calls and SMS messages in Notify.

All Notify workflows that manage a phone call must run on the notify_call table. Call-related Notify activities can be added only to workflows where the Table field value is Notify Call (notify_call).

You can identify if an outbound call was answered by a human or by an answering machine from within a Notify workflow by evaluating the current.is_human variable, such as with an If workflow activity. This variable is set by the telephony provider when an outbound call is answered. This variable is always true for inbound calls.

*Note:* Do not add a Timer activity between multiple Notify activities that interact with active phone calls.

*Important:* When creating a Notify workflow, set the workflow If condition matches field to -- None --. Notify controls which workflow to run based on the configured number groups.

**Join conference call workflow activity**

The Join Conference Call activity connects an incoming or outgoing call to a Notify conference call.

Notify includes the workflows Notify: (Re)join Conference Call and Notify: Join Conference Call Via SMS to demonstrate how to use the join conference call activity to connect inbound and outbound calls, and inbound SMS messages to a conference call.

**Input variables**

Input variables determine the initial behavior of the activity.
Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advanced</td>
<td>Select this check box to display advanced configuration options.</td>
</tr>
<tr>
<td>Script</td>
<td>Specify advanced configuration options using JavaScript, such as if the new participant should be muted upon joining the conference call. You can access values from the workflow scratchpad.</td>
</tr>
</tbody>
</table>

Conditions

The conditions determine which transition comes after this activity. The join conference call activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the conference_call scratchpad variable is not set.

Scratchpad entries

The activity uses the workflow scratchpad to read persistent values.

Values read from scratchpad

<table>
<thead>
<tr>
<th>Scratchpad variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workflow.scratchpad.conference_call</td>
<td>A GlideRecord for a single conference call record. A call processed by this activity is added to this conference call. If this value is not specified, the join conference call activity will log an error. When initiating an outgoing call workflow using the Notify API call(String notifyPhoneNumber, String toPhoneNumber, GlideRecord conferenceCall) method, this scratchpad value is set automatically to the conference call GlideRecord. For incoming call workflows, or workflows initiated using a different mechanism, you must explicitly set this scratchpad value.</td>
</tr>
</tbody>
</table>

Enable the hangupOnStar attribute

System administrators can enable the hangupOnStar attribute and use it in the Join Conference Call workflow activity. When hangupOnStar is enabled (set to true), participants in a conference call can press the * button to disconnect from the call. Control is returned to the workflow, which can be used to trigger customer-defined actions.

To enable the hangupOnStar attribute:

1. Navigate to Workflow > Administration > Workflow Versions.
2. Open the Notify: (Re)join Conference Call workflow.
3. Click the **Show Workflow** related link.
4. To modify the workflow, click the Workflow Actions icon and click **Checkout**.
5. Open the Join Conference Call workflow activity.
6. Enable the **Advanced** check box to display the **Script** field.
7. Set the **hangupOnStar** attribute to true. The default setting is false.
8. Click **Update**.
9. Click the Workflow Actions icon and click **Publish** to save the changes.

**Call workflow activity**

The **Call** activity makes outbound phone calls using a Notify workflow.

**Input variables**

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th><strong>Variable</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Notify Number</td>
<td>The Notify phone number to make the call from. When you initiate a call, the outgoing call workflow for the number group associated with this number runs.</td>
</tr>
<tr>
<td>Phone number to call</td>
<td>The E.164-compliant phone number to call.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to determine number to call, and the Notify number to call from instead of using the <strong>Phone number to call</strong> and <strong>Notify Number</strong> variables.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script that controls which number to call. This script should return a string listing the Notify number sys_id, as well as the phone number to call, such as <code>{notify_number: 'sys_id', phone_number: '+316...'}</code></td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition comes after this activity. The **call** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the call could not be set up due to invalid data returned by the advanced script.

**Send SMS workflow activity**

The **send SMS** workflow activity to send short text messages using Notify to users’ phones.
**Input variables**

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From</td>
<td>Select the Notify phone number to use to send the SMS message.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use JavaScript to determine which numbers to send the message to, and the Notify number to use to send the message.</td>
</tr>
<tr>
<td>To</td>
<td>Select any number of users to send the message to. The user record must have a E.164-compliant phone number or notification device configured for SMS messages.</td>
</tr>
<tr>
<td>To (groups)</td>
<td>Select any number of groups to send the message to. All members of that group with an E.164-compliant phone number or SMS notification device receive the message.</td>
</tr>
<tr>
<td>Message</td>
<td>Enter the message to send. You can add field values from the current record by using the Select variables box. You can also add values from the workflow scratchpad. If a field and a scratchpad variable have the same name, the field value is used. Because you can use variables in this message, it is not possible to determine the length of the message at design time. If the activity sends a message that is longer than supported by the telephony provider, the message is truncated and the instance logs a warning.</td>
</tr>
<tr>
<td>To (script)</td>
<td>Enter a script to determine which numbers to send the message to, and the Notify number to use to send the message. The script should return a JavaScript object with the format `{notify_number: '...sys_id...', users: [...], groups: [...], numbers: [...]}. Specify the users or groups to send the message to as an array of sys_id values. Specify other numbers as an array of E.164-compliant phone numbers. This field appears only if Advanced is selected.</td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition comes after this activity. This activity does not specify any conditions by default.
You can add an error condition to this activity. The activity transitions through the error condition if the Notify number used to make the call is not configured correctly or unable to send SMS messages, or if an error occurs while sending the SMS.

**Forward call workflow activity**

The **Forward Call** activity forwards a Notify call to an E.164-compliant phone number. If the person receiving a forwarded call hangs up, the **forward call** activity completes and transitions to the next activity. Any further Notify activities in the workflow run for the caller only.

**Input variables**

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Phone number to call</td>
<td>Enter the phone number to forward the call to.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait for the call to be answered before hanging up.</td>
</tr>
<tr>
<td>Record</td>
<td>Select this check box to record the conversation.</td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition comes after this activity. The **forward call** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the phone number to call is invalid.

**Input workflow activity**

The **Input** activity creates a phone menu by presenting a list of options on a Notify call.

**Input Variables**

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of digits</td>
<td>Specify the maximum number of digits the caller can enter. A caller can enter fewer digits than the maximum and press the Finish key to complete the entry.</td>
</tr>
<tr>
<td>Finish key</td>
<td>Specify the key a caller can press on their phone when finished selecting a menu option.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Specify the amount of time to wait before closing the menu automatically when the caller does not select a menu option.</td>
</tr>
<tr>
<td>Variable</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to build the phone menu, instead of using the activity conditions.</td>
</tr>
<tr>
<td>Script</td>
<td>Define the script to build the phone menu. The script must specify an <code>answer</code> variable as a JavaScript object with the following format:</td>
</tr>
<tr>
<td></td>
<td>```javascript</td>
</tr>
<tr>
<td></td>
<td>answer = {</td>
</tr>
<tr>
<td></td>
<td>1&quot;: {</td>
</tr>
<tr>
<td></td>
<td>&quot;say&quot;: &quot;https://some_url.com/options/one.mp3&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;myCustomData&quot;: &quot;some data here&quot;},</td>
</tr>
<tr>
<td></td>
<td>2&quot;: {</td>
</tr>
<tr>
<td></td>
<td>&quot;say&quot;: &quot;type 2 to speak to a representative&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;language&quot;: &quot;en-US&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;myCustomData&quot;: &quot;some more data here&quot;</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
<tr>
<td></td>
<td>```</td>
</tr>
<tr>
<td></td>
<td>The script may specify either a text-to-speech string and language code or the URL of a prerecorded message for each entry. You can also add optional attributes to store related information, such as <code>myCustomData</code> in the example above.</td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine the transition that comes after this activity.

The `input` activity does not specify any conditions by default. You must define conditions to build the phone menu. Each condition is one option on the phone menu. Notify reads the text from each condition `Name` to the caller, up to 100 characters per condition.

You can specify a language for each condition by prefixing the message with the language code, in the format `xx-XX:<Message>`. For example, add `fr-CA:` for Canadian French. Available languages are stored on the Notify Language (`notify_language`) table.

The condition that the activity transitions through depends on the digits entered by the caller. Set the condition `Condition` value to `parseInt(workflow.scratchpad.digits) == <expected digits>`. For example, to transition through a condition when the caller presses the number 3, set the `Condition` to `parseInt(workflow.scratchpad.digits) == 3`.

You can add an error condition to this activity. The activity transitions through the error condition if the advanced script returns an invalid value, or if the text to say for a condition is empty.

**Scratchpad Entries**

The activity uses the workflow scratchpad to write persistent values.
Values written to scratchpad

<table>
<thead>
<tr>
<th>Entry</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workflow.scratchpad.digits</td>
<td>The digits entered by the caller, as a string.</td>
</tr>
</tbody>
</table>
| workflow.scratchpad.menu<activity name> | The entire `answer` variable, if using the advanced script option. You can access this menu from other activities after this activity successfully executes. For example, if the activity name is `choices`, you can access values from the menu using:  
```javascript
var previousActivity = "choices";
var choicesMenu = workflow.scratchpad.menu[previousActivity];
var menuItem = choicesMenu[workflow.scratchpad.digits];
// Selects the menu item based on the caller's input.
var selectedValue = menuItem.myCustomData; //get the custom data for the selected menu item.
```

**Hangup workflow activity**

The **Hangup** activity disconnects an active Notify phone call.

You can use the **hangup** activity to disconnect only calls that have been answered. Use the **reject** activity to disconnect calls that have not been answered.

**Play workflow activity**

The **Play** activity plays a sound file on a Notify call.

**Input Variables**

Input variables determine the initial behavior of the activity.

**Input Variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>Enter the URL of a sound file to play. If the URL is inaccessible, or if the audio file mime type is not supported by the telephony provider, the <code>play</code> activity is skipped.</td>
</tr>
<tr>
<td>Loop</td>
<td>Enter the number of times the sound file should play.</td>
</tr>
</tbody>
</table>
Conditions

The conditions determine which transition comes after this activity. The play activity does not specify any conditions by default.

You can create an error condition to handle errors with the sound file. The activity transitions through the error condition if the specified sound file is not available, or has an unsupported mime type. Supported mime types are listed on the Notify Audio MIME Types (notify_mime_type) table.

Record workflow activity

The Record workflow activity records audio from a user on a Notify call.

Input Variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max duration (in seconds)</td>
<td>Enter the maximum duration, in seconds, allowed for a recording.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait before ending a recording automatically when the caller is silent.</td>
</tr>
<tr>
<td>Finish Key</td>
<td>Specify the key a caller can press on their phone to end the recording.</td>
</tr>
</tbody>
</table>

Scratchpad Entries

The activity uses the workflow scratchpad to store persistent values.

The record activity adds the recording variable to the workflow scratchpad. This variable stores metadata about the recording, such as URI, ID, and duration. You can access the following values from this variable.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>recording.recordingDuration</td>
<td>The duration of the recording, in seconds.</td>
</tr>
<tr>
<td>recording.from_number</td>
<td>The caller's phone number, including country code.</td>
</tr>
<tr>
<td>recording.notify_number</td>
<td>The Notify phone number used to respond to the call, including country code.</td>
</tr>
<tr>
<td>recording.recordingID</td>
<td>The ID used by the telephony provider to identify the recording.</td>
</tr>
<tr>
<td>recording.recordingURL</td>
<td>The URL from the telephony provider to access the recording.</td>
</tr>
</tbody>
</table>
Reject workflow

The **Reject** workflow activity rejects an incoming Notify call.

You can use the **reject** activity to disconnect only calls that have not yet been answered. Use the **hang up** activity to disconnect calls that have been answered.

**Input variables**

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reason</td>
<td>Select a reason for rejecting the call, such as busy.</td>
</tr>
</tbody>
</table>

Say workflow activity

The **say** workflow activity allows you to play a message, using text to speech, on a Notify call.

**Input variables**

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text to say</td>
<td>Specify the text to read.</td>
</tr>
<tr>
<td>Language</td>
<td>Select the language and locale to use when reading text.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to define the language and message, instead of using the <strong>Text to say</strong> and <strong>Language</strong> values.</td>
</tr>
</tbody>
</table>
| Script | Define a script to set what text is read on the call. The script must return a string that defines the language and the text to read. For example, to play an English-language message, return 

Forward to notify client workflow activity

The **forward to notify client** workflow activity connects a phone call to a Notify WebRTC client.

**Input variables**

Input variables determine the initial behavior of the activity.
Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>Select the user to connect the call to.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to determine which client to connect to, instead of using the User variable.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script that controls which client to connect to. This script should return a GlideRecord for a single User (sys_user) record.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait for the call to be connected before hanging up.</td>
</tr>
<tr>
<td>Record</td>
<td>Select this check box to record the call.</td>
</tr>
</tbody>
</table>

Conditions

The conditions determine which transition comes after this activity. The Forward to Notify Client activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if there is an issue with the Notify client.

Queue workflow activity

The Queue activity places an active Notify call in a queue.

Add the Queue activity to a workflow on the Notify Call (notify_call) table to put the current call on hold. This activity does not specify any input variables.

The queue that the call is added to is given a random ID.

Notify activity event handlers

Notify workflow activities provide JavaScript functions that are invoked automatically when your telephony provider broadcasts certain events.

When the Twilio service broadcasts an event related to a Notify call, such as the caller hanging up, the event is processed by the workflow associated with that Notify call. All currently-executing Notify activities in that workflow invoke a JavaScript function associated with that event.

Not all activities that support an event provide a default event handler implementation. You can provide an implementation for those event handlers when creating custom Notify activities.

Creating Notify activities

Default Notify workflow generally perform a single action, such as initiating a phone call. You can create custom Notify workflow activities to implement more complex functionality.

Use event handler functions in each Notify activity definition to design your own activity behavior. For example, you can set the activity result if the caller hangs up by using the onCompleted function.

```javascript
onCompleted: function() {
    activity.result = 'call_ended';
}```
When creating a new Notify workflow activity, follow these design principles.

- Within `onExecute` event handler function, create a new NotifyAction object. Use this object to create a simple or complex action, then serialize the object to the `notify_wf_activity` table.
- Within the `onUpdate` event handler function, deserialize the NotifyAction object from the `notify_wf_activity` table and use this object to perform any other operations.
- Use the other event handler functions and the Notify as needed to implement the desired activity behavior.

**Available Notify activity event handlers**

When creating Notify workflow activities, you can use event-handler functions to respond to events from a telephony provider.

Not all activities or telephony providers support all events. For example, the `Reject` activity ends the call before the caller connects so the `onNoAnswer` function is never invoked from this activity.

**Note:** When configuring an activity to respond to an event, ensure that your telephony provider supports that event.

The following table describes available event handlers and lists the Notify workflow activities that can invoke each handler.

<table>
<thead>
<tr>
<th>Handler</th>
<th>Description</th>
<th>Activities</th>
</tr>
</thead>
<tbody>
<tr>
<td>onExecute</td>
<td>Runs when the activity first runs.</td>
<td>All call-related activities</td>
</tr>
<tr>
<td>onUpdate</td>
<td>Runs when the call record associated with the workflow is updated.</td>
<td>All call-related activities</td>
</tr>
<tr>
<td>onCompleted</td>
<td>Runs when a call ends.</td>
<td>All call-related activities</td>
</tr>
<tr>
<td>onRinging</td>
<td>Runs when a call starts ringing.</td>
<td>Forward call, call, join conference call, forward to notify client</td>
</tr>
<tr>
<td>onInProgress</td>
<td>Runs when both parties are connected on a call.</td>
<td>Forward call, call, join conference call, forward to notify client</td>
</tr>
<tr>
<td>onNoAnswer</td>
<td>Runs when a call is not answered.</td>
<td>Forward call, call, join conference call, forward to notify client</td>
</tr>
<tr>
<td>onBusy</td>
<td>Runs when a called number is busy.</td>
<td>Forward call, call, join conference call, forward to notify client</td>
</tr>
<tr>
<td>onFailed</td>
<td>Runs when an error occurs.</td>
<td>All call-related activities</td>
</tr>
</tbody>
</table>

**Notify languages**

Notify supports multiple languages when using text-to-speech.

For example, when using the `input` or `say` workflow activities, you can specify which language to use when reading the text.
The list of available languages is stored on the Notify Languages (notify_language) table. By default, languages supported by all Notify telephony providers are available. You can add additional languages if they are supported by your specific telephony provider.

Using Notify with tasks

Notify allows you to send initiate conference calls and send SMS alerts from task records.

This functionality is available for all tables that extend the Task table, such as Incident, Problem, or Change. All calls and messages made from tasks are initiated using a single Notify phone number (E.164 or short code). You can configure which phone number is used by setting the property glide.notify.task.phone_number.

Send an SMS alert from a task

You can use Notify to send SMS alerts from a task record.

Role required: itil

Notify must be set up before you can use Notify on task. Ensure there are Notify phone numbers (E.164 or short code) in number groups with SMS workflows. Also ensure the property glide.notify.task.phone_number is set to one of these Notify phone numbers.

1. Navigate to any task record, such as an incident or change.
2. Click the Send SMS related link.
3. Select one or more Recipients to receive the SMS.
4. Enter the Message to send.
   The task record number is added to the message automatically.
5. Click Send.
   Any SMS records created from a task are associated with that task. You can view associated SMS messages from the task record in the SMS Messages related list. You may need to configure the form to add the related list.

Start a conference call from a task

You can use Notify to start conference calls from a task record.

Role required: itil

Notify must be set up before you can use Notify on task. Ensure there are Notify phone numbers (E.164 or short code) in number groups with phone call workflows. Also ensure the property glide.notify.task.phone_number is set to one of these Notify phone numbers.

1. Navigate to any task record, such as an incident or change.
2. Click the Start conference call related link.
3. Select one or more Recipients to participate in the conference call.
4. Click Start.
   Any conference call records created from a task are associated with that task. You can view associated conference calls from the task record in the Conference calls related list. You may need to configure the form to add the related list.

Using Notify with incident alert

You can use Notify with Incident Alert to send SMS messages or start conference calls based on incident alerts.
Certain configuration steps are required to use Notify with Incident Alert.

- Both Notify and Incident Alert must be active.
- Notify must be configured and able to initiate and receive phone calls and SMS messages.
- The property `com.snc.iam.notify_number` must be set to an active Notify number.
- This Notify number must belong to a number group configured with inbound and outbound conference call workflows.

**Note:** The Conference Call Group number group is configured with conference call workflows by default.

**Numbers and number groups**

Number groups allow you to group Notify phone numbers and share workflows across grouped numbers.

Each phone number within Notify has an associated number group. Numbers within a group use the same workflows for handling incoming and outgoing calls and SMS messages.

Numbers associated with a group appear on the **Notify Phone Numbers** related list on the Notify Phone Number Group form.

**Launch a conference call from an incident alert**

As part of processing an incident alert, a conference call can be created between involved users.

Call participants can include:

- Those users who have been assigned specific responsibilities.
- Any required ad-hoc user contacts.
- Other involved parties who are not recorded as users, such as third-party contacts.

**Note:** Only one conference call at a time can be active for each incident.

1. Navigate to **Incident Management > Open**.
2. Open the relevant incident alert.
3. Click the **Initiate Conference Call** related link.
4. Within the dialog box that appears, select the participants for the conference.
Select participants

The dialog box displays the recommended and selected participants for the conference. All users from the User Contacts list in the incident alert and the frequently called participants are displayed in the Recommended list by default.

If a rotation schedule exists for the group contacts, the primary and secondary on-call resources are shown in the Recommended list. This way, the current on-call persons can quickly be invited to join the conference call. Calls are placed to the number in the Mobile phone field on the user record. If that information is blank, the user cannot be contacted through Notify. The mobile phone number has to be an E.164 compliant phone number. If the phone number is a local number, without the + prefix, the number will be retrieved based on the user’s location and, if possible, converted into a valid E.164 number.

5. To select ad-hoc participants, do one of the following:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Click the reference lookup icon, and select the relevant user.</td>
<td>Click Add to selected.</td>
</tr>
<tr>
<td>Enter the participant’s phone number in the field beside the telephone icon.</td>
<td>Click Add to selected.</td>
</tr>
</tbody>
</table>

6. After the participant list is finalized, click OK.
The conference call starts and a **Conference call initiated** message is displayed at the top of the Incident Alert form. Each user is called and can accept the call to join the conference. Several response types are possible from users invited to join the conference call, apart from **Accepted**.

7. Click the **Conference call initiated** message to see details of that conference call. When the final participant leaves the conference, the conference call closes.

**Note:** VoIP phone systems, which do not use touch tone phones, may encounter issues with recognizing key presses. To avoid problems, ensure that conference call users use touch tone phones, or configure your VoIP system settings to recognize key presses, as described in your VoIP system documentation.

### Viewing conference call information

Conference calls are listed as system activities in the **Activity** section of the Incident Alert form and also are listed in the **Conference Calls** related list.
Conference bridge history

Send an SMS notification for an incident alert

Notify sends an SMS to the users defined as default contacts for the alert.

When you create a new incident alert, Notify sends an SMS notification to the users defined as default contact responsibilities for the alert.

This text message is sent to the user’s mobile phone number: IA<number>: a <Severity> severity <Event Type> incident alert for <CI Name> has been opened.

Administrators can modify the content of this message by editing the SMS on new Incident Alert business rule.

Using Notify with on-call scheduling

When using both Notify and On-call scheduling you can send scheduling notifications as SMS messages, in addition to emails.

Certain configuration steps are required to use Notify with On-call scheduling.

- You must add at least one Notify phone number to the On-Call Group number group. This group is configured by default to handle inbound SMS responses that accept or reject an on-call assignment.
- You must configure any outbound SMS workflows, such as the On-Call: Assign by Acknowledgement workflow to use this Notify phone number to send SMS messages. Edit all Send SMS activities in these workflows to use this number as the From value.

Set up Notify with on-call scheduling

You can configure on-call scheduling to use Notify functionality to send SMS alerts and assign users to tasks based on the SMS responses.

Ensure that the Notify and On-Call Scheduling plugins on your instance are activated.

Role required: admin

Set up Notify with On-call scheduling for the first time or migrate from On-call scheduling with NotifyNow.

1. Navigate to Notify > Numbers.
2. Select the phone number you want to use to send and receive on-call scheduling messages.
3. In the Notify group field, select the On-Call Group.
   The On-Call Group is configured with the on-call workflow by default.
4. Navigate to Workflow > Workflow Editor.
5. Select the On-Call: Assign by Acknowledgement workflow.
   If migrating from NotifyNow, and you have previously customized this workflow, you must import the new version of the workflow manually. See KB0551603 for more information.
6. Click the workflow menu icon in the title bar and select Copy to copy the On-Call: Assign by Acknowledgement workflow. Save the copied workflow under a different name than what it is named by default.
7. Select a Send SMS activity.
8. In the To (script) field, modify the getRecipientsAndNumberToSendFrom() function and uncomment the line //notify_number : getNotifyNumber()..
9. **Perform one of the following actions.**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specify a static number</td>
<td>Within the <code>getRecipientsAndNumberToSendFromChange()</code> function, change <code>getNotifyNumber()</code> to the <code>sys_id</code> of the Notify phone number you selected in step 2.</td>
</tr>
<tr>
<td>Specify a number procedurally</td>
<td>Update the <code>getNotifyNumber()</code> function to return the <code>sys_id</code> of the Notify phone number you selected in step 2.</td>
</tr>
</tbody>
</table>

10. **Repeat the previous 2 steps for each Send SMS activity on the workflow.**

11. **Click the workflow actions icon and select Publish.**

12. **Close the Workflow Editor interface.**

13. **Navigate to On-Call Scheduling > Trigger Rules.**

14. **Select a trigger rule that launches an assignment workflow.**

15. **In the Trigger action field, select Workflow.**

16. **In the Trigger workflow field, select the On-call: Assign by Acknowledgement workflow.**

17. **Click Update.**

18. **Repeat the previous 3 steps for each assignment trigger rule.**

   *Each time the conditions for one of these trigger rules is met, the On-call: Assign by Acknowledgement workflow runs.*

### Using the on-call: assign by acknowledgement workflow

The On-Call: Assign by Acknowledgement workflow is provided with Notify.

The workflow uses data from the escalation settings of rotas and rosters. Depending on these settings, the workflow iterates through the defined escalation chain and sends notifications by SMS or email to users asking them for incident assignment. The workflow respects time-off as specified in the rosters. People who have time-off are not included in the escalation chain and no notifications are sent to them.

When you install both On-call scheduling and Notify, the `message_number` column is added to the Notify Messages (`notify_messages`) table to track responses to on-call assignment requests. This column indicates if the contacted user accepted or rejected the assignment. Before you can send notifications, you must define trigger rules. Trigger rules determine the conditions that must be met before a notification is sent and what action must be taken.

### Controlling the on-call communication channel with Notify

You can configure On-call scheduling with Notify to always use a user’s preferred communication channel.

If **Force communication channel** is specified in the **Escalation settings** for rosters, the preferred user device is used, either SMS or email.

If the preferred device is SMS, and the on-call member does not have an SMS device defined, the user is not contacted even if the user has an email address. When forcing a communication channel on an escalation level does not succeed, no further communication attempts are made. The fact that the user could not be reached is logged.

The setting **Force communication channel** is only available if Notify is installed.
Key differences between on-call scheduling with NotifyNow and with Notify

There are key differences between on-call scheduling with NotifyNow and on-call scheduling with Notify.

Tracking responses to questions

The On call: Assign by Acknowledgement workflow no longer uses the Notify Question tables to track assignment responses. When you install On-call scheduling with Notify, the message_number column is added to the Notify Messages (notify_messages) table to track responses to on-call assignment requests. This column indicates if the contacted user accepted or rejected the assignment.

Scripting Notify

You can use scripts with Notify to interact with calls and SMS messages, or to provide a custom client interface.

Notify

The Notify API allows you to interact with Notify calls and SMS messages using scripts.

Notify - getPhoneNumbers()

Returns all phone numbers and short codes available to Notify, as an array.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>An array of NotifyPhoneNumber objects, each object representing one phone number available to Notify.</td>
</tr>
</tbody>
</table>

```javascript
// instantiate notify
var notify = new SNC.Notify();

// get all available phone numbers
var phoneNumbers = notify.getPhoneNumbers();

// iterate over phone numbers
for (var i = 0; i < phoneNumbers.size(); i++) {
    var number = phoneNumbers.get(i);
    //perform any actions using each phone number
```
Notify - getShortCodes()

Returns all short codes available to Notify, as an array.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>An array of NotifyPhoneNumber objects, each object representing one short code available to Notify.</td>
</tr>
</tbody>
</table>

```javascript
// instantiate notify
var notify = new SNC.Notify();

// get all available shortcodes
var shortCodes = notify.getShortCodes();

// iterate over phone numbers
for (var i = 0; i < shortCodes.size(); i++) {
    var shortCode = shortCodes.get(i);
    gs.log(shortCode.getNumber());
    //perform any actions using each shortcode
}
```

Notify - call(String notifyPhoneNumber, String toPhoneNumber)

Makes a call to an E.164-compliant phone number.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyPhoneNumber</td>
<td>String</td>
<td>The phone number to make the call from. This number appears as the caller ID.</td>
</tr>
<tr>
<td>toPhoneNumber</td>
<td>String</td>
<td>The phone number to call.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
```javascript
var from = '+14048007337';
var to = '+31646810495';

// set up call
new SNC.Notify().call(from, to);
```

### Notify - call(String notifyPhoneNumber, String toPhoneNumber, GlideRecord conferenceCall)

Call a number to add that number to an active conference call.

This method is intended specifically for conference calls. To initiate calls between only two participants, use the `call(String notifyPhoneNumber, String toPhoneNumber)` method instead.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyPhoneNumber</td>
<td>String</td>
<td>The Notify phone number to make the call from. When you initiate a call,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>the outgoing call workflow for the number group associated with this number</td>
</tr>
<tr>
<td></td>
<td></td>
<td>runs. Ensure this workflow includes a <code>join conference call</code> activity to</td>
</tr>
<tr>
<td></td>
<td></td>
<td>connect the user to the conference call.</td>
</tr>
<tr>
<td>toPhoneNumber</td>
<td>String</td>
<td>The phone number to call. Called numbers are added to the conference call.</td>
</tr>
<tr>
<td>conferenceCall</td>
<td>GlideRecord</td>
<td>A GlideRecord for the Notify Call (notify_call) table identifying the</td>
</tr>
<tr>
<td></td>
<td></td>
<td>conference call record. This record is automatically added to the outgoing</td>
</tr>
<tr>
<td></td>
<td></td>
<td>call workflow scratchpad as the workflow.scratchpad.conference_call variable.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var notify = new SNC.Notify();
var from = '+14041234567';
var participants = ['+31612345678', '+31623456789', '+31687654321'];

// set up a conference call
var conferenceCall = notify.conferenceCall();
```
// set up the outbound calls for all conference call participants
for (var i in participants) {
    var to = participants[i];
    notify.call(from, to, conferenceCall);
}

// feedback
gs.log(gs.getMessage('set up a conference call with number {0} and (re)join code: {1}',
    [ conferenceCall.getValue('number'),
    conferenceCall.getValue('code') ]));

**Notify - sendSMS(NotifyPhoneNumber notifyPhoneNumber, String toPhoneNumber, String messageBody)**

Sends an SMS text message to an E.164-compliant phone number.

This function creates a new record on the Notify Message (notify_message) table.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyPhoneNumber</td>
<td>NotifyPhoneNumber</td>
<td>The Notify phone number or short code to send this SMS from.</td>
</tr>
<tr>
<td>toPhoneNumber</td>
<td>String</td>
<td>An E.164-compliant phone number to send the SMS to.</td>
</tr>
<tr>
<td>messageBody</td>
<td>String</td>
<td>The SMS text.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The sys_id of the Notify Message (notify_message) record created by this function.</td>
</tr>
</tbody>
</table>

**Notify - sendSMS(NotifyPhoneNumber notifyPhoneNumber, String toPhoneNumber, String messageBody, GlideRecord source)**

Sends an SMS text message to an E.164-compliant phone number.

This function creates a new record on the Notify Message (notify_message) table and associates it with the source record.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyPhoneNumber</td>
<td>NotifyPhoneNumber</td>
<td>The Notify phone number or short code to send this SMS from.</td>
</tr>
<tr>
<td>toPhoneNumber</td>
<td>String</td>
<td>An E.164-compliant phone number to send the SMS to.</td>
</tr>
<tr>
<td>messageBody</td>
<td>String</td>
<td>The SMS text.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>---------------</td>
<td>----------------------------------------------------------</td>
</tr>
<tr>
<td>source</td>
<td>GlideRecord</td>
<td>The source record that prompted this SMS message, such as an incident.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The sys_id of the Notify Message (notify_message) record created by this function.</td>
</tr>
</tbody>
</table>

Notify - getChildCallIDs(GlideRecord callRecord)

Returns the sys_id values of calls that are children of a specified call.

Any call started by forwarding another call, such as with the Forward workflow activity, is considered a child of the original call. The original call is the parent call.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callRecord</td>
<td>GlideRecord</td>
<td>A record on the Notify Call (notify_call) table.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>The sys_id values of all calls that are children of the specified call.</td>
</tr>
</tbody>
</table>

```javascript
var callRecord = new GlideRecord('notify_call');
callRecord.get("0f4f5863ff13310014ecf0fffff28");

var notify = new SNC.Notify();
var childCallIDs = notify getChildCallIDs(callRecord);

for(var callID in childCallIDs)
  //perform any operations with the child callID values
```

Notify - getParentCallID(GlideRecord callRecord)

Returns the sys_id of a specified call's parent call.

Any call started by forwarding another call, such as with the Forward workflow activity, is considered a child of the original call. The original call is the parent call.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callRecord</td>
<td>GlideRecord</td>
<td>A record on the Notify Call (notify_call) table.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The sys_id of the parent call record.</td>
</tr>
</tbody>
</table>

```javascript
var callRecord = new GlideRecord('notify_call');
callRecord.get("0f4f5863ff13310014ecffffff28");
var notify = new SNC.Notify();
var parentCallID = notify.getParentCallID(callRecord);
```

### Notify - getTokens()

Returns client tokens for any installed telephony drivers for use in WebRTC or mobile clients. This function uses the currently logged-in user record as the client.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The client tokens, as a JSON string.</td>
</tr>
</tbody>
</table>

```javascript
// get Notify Client Tokens per active Notify Driver for the currently logged in user
var json = new SNC.Notify().getTokens();

// parse the json that was return into a tokens object
var tokens = JSON.parse(json);

// log line
gs.log('Notify Client Tokens for the currently logged in user');

// iterate over the driver tokens
for (var driver in tokens) {
    gs.log(driver + ' Driver token: ' + tokens[driver]);
}
```
**Notify - getTokens(GlideRecord record)**

Get client tokens for any installed telephony drivers for use in WebRTC or mobile clients.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>record</td>
<td>GlideRecord</td>
<td>A record used to generate the client tokens.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The client tokens. The value of the string depends on the GlideRecord parameter.</td>
</tr>
</tbody>
</table>

This example demonstrates getting Notify client tokens for every Notify group.

```javascript
// instantiate Notify
var notify = new SNC.Notify();

// get all Notify Groups
var notifyGroup = new GlideRecord("notify_group");
notifyGroup.query();

// iterate over all notify groups
while (notifyGroup.next()) {
    // generate Notify Client tokens per active Notify Driver for this group
    var json = notify.getTokens(notifyGroup);
    var tokens = JSON.parse(json);

    for (var driver in tokens) {
        gs.log(gs.getMessage("Notify Client token for {0} driver and Notify Group '{1}': {2}", [driver, notifyGroup.getValue('name'), tokens[driver]]));
    }
}
```

**Notify - getAvailableClients(String notifyNumber)**

Returns a list of client sessions that are available to receive calls.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyNumber</td>
<td>String</td>
<td>Any valid Notify phone number.</td>
</tr>
</tbody>
</table>
### Notify - conferenceCall()

Create a new conference call GlideRecord.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>A new Notify Call (notify_call) record for a conference call.</td>
</tr>
</tbody>
</table>

```js
var notify = new SNC.Notify();
var from = '+14041234567';
var participants = ['+31612345678', '+31623456789', '+31687654321'];

// set up a conference call
var conferenceCall = notify.conferenceCall();

// set up the outbound calls for all conference call participants
for (var i in participants) {
    var to = participants[i];
    notify.call(from, to, conferenceCall);
}

// feedback
gs.log(gs.getMessage('set up a conference call with number {0} and (re)join code: {1}',
    [ conferenceCall.getValue('number'),
    conferenceCall.getValue('code') ]));
```

### Notify - queueCall(GlideRecord callRecord)

Put a call into a queue.

Resume a queued call using the dequeueCall method.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>A new Notify Call (notify_call) record for a conference call.</td>
</tr>
</tbody>
</table>
## Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callRecord</td>
<td>GlideRecord</td>
<td>A GlideRecord object on the Notify Call (notify_call) table with the call you want to put on hold.</td>
</tr>
</tbody>
</table>

## Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var call = new GlideRecord('notify_call');
call.get('<call record sys_id>');
if (call.isValid()) {
  new SNC.Notify().queueCall(call);
}
```

### Notify - dequeueCall(GlideRecord callRecord)

Resume a call after it was put in a queue.

Use this method to resume calls that were put in a queue with the queueCall method.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callRecord</td>
<td>GlideRecord</td>
<td>A GlideRecord object on the Notify Call (notify_call) table with the held call you want to resume.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var call = new GlideRecord('notify_call');
call.get('some sys_id');
if (call.isValid()) {
  new SNC.Notify().dequeueCall(call);
}
```

### Notify - kick(GlideRecord participant)

Kicks a specified user from a Notify conference call.
### ServiceNow Capabilities

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>A GlideRecord object containing the Notify Participant (notify_participant) to kick from the conference call.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var participant = new GlideRecord('notify_participant');
participant.get('<sys_id>');
if (participant.isValid()) {
    new SNC.Notify().kick(participant);
}
```

### Notify - forwardCall(GlideRecord call, String destination, String dtmf)

Forward a call to connect that call with a different recipient.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>call</td>
<td>GlideRecord or String</td>
<td>A Notify call record, or the telephony provider call ID.</td>
</tr>
<tr>
<td>destination</td>
<td>GlideRecord or String</td>
<td>A Notify phone number record, or an E.164-compliant phone number.</td>
</tr>
<tr>
<td>dtmf</td>
<td>String</td>
<td>A DTMF code to play upon connection.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

### NotifyAction

The NotifyAction API allows you to define actions to send to a telephony provider. You add actions to a NotifyAction object by calling the respective add function for each type of action.

Each add function returns an Action object, such as a SayAction object for the addSay() function. Refer to each method example for information about returned objects.
**NotifyAction - addDial()**

Makes an outbound call.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DialAction</td>
<td>The action added to the NotifyAction object. Use the DialAction object to define.</td>
</tr>
</tbody>
</table>

```javascript
var action = new SNC.NotifyAction();
var dial = action.addDial();
dial.setRecord(activity.vars.record);
dial.setClientRecord(activity.vars.user, "sys_user");
```

**NotifyAction - addGather()**

Presents an interactive phone menu to the user.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GatherAction</td>
<td>The action added to the NotifyAction object. Use the GatherAction object to define the menu settings and options to present to the user.</td>
</tr>
</tbody>
</table>

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// present the user with a menu
var gather = notifyAction.addGather();
gather.setNumberOfDigits(1); // the user can type 1 digit
gather.setFinishKey('#'); // # or *, usefull for > 1 digits
gather.setTimeout(10); // time to enter answer, in seconds

// add first menu item
var usSay = gather.addSay();
```
usSay.setText('Press 1 for english');
usSay.setLanguage('en-US');

// add second menu item
var nlSay = gather.addSay();
nlSay.setText('Kies 2 voor Nederlands');
nlSay.setLanguage('nl-NL');

// add third menu item
var frSay = gather.addSay();
frSay.setText('Choisissez 3 pour le français.');
frSay.setLanguage('fr-FR');

// and finish off with an applause
var play = gather.addPlay();
play.setURL('http://www.wavsource.com/snds_2015-04-12_5971820382841326/sfx/applause_y.wav');

### NotifyAction - `addHangUp()`

Ends an active phone call.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HangUpAction</td>
<td>The action added to the NotifyAction object.</td>
</tr>
</tbody>
</table>

// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// hang up
notifyAction.addHangUp();

### NotifyAction - `addQueue()`

Queue the call, putting it on hold.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QueueAction</td>
<td>The action added to the NotifyAction object. Use the QueueAction object to define the queue name, and queueing or dequeueing behavior.</td>
</tr>
</tbody>
</table>

// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// queue the call
var queue = notifyAction.addQueue();
queue.setName('my queue');

// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// dequeue the call
var queue = notifyAction.addQueue();
queue.setDequeue(true);

**NotifyAction - addPlay()**

Plays an audio file on the call.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PlayAction</td>
<td>The action added to the NotifyAction object. Use the PlayAction object to define the audio file URL and number of times to loop the audio.</td>
</tr>
</tbody>
</table>

// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a play action
var play = notifyAction.addPlay();
play.setURL('http://www.moviesounds.com/2001/imsorry.wav');
play.setLoop(1);

**NotifyAction - addReject()**

Rejects an incoming call.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RejectAction</td>
<td>The action added to the NotifyAction object. Use the RejectAction object to define the reason for rejecting the call.</td>
</tr>
</tbody>
</table>

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// reject the call
var rejectAction = notifyAction.addReject();
rejectAction.setReason('busy'); // 'busy' or 'rejected'
```

### NotifyAction - addSay()

Use text-to-speech to read text on the call.

Multiple languages are supported with text-to-speech. Available languages depend on the telephony provider.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SayAction</td>
<td>The action added to the NotifyAction object. Use the SayAction object to define the text and language to read.</td>
</tr>
</tbody>
</table>

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a say action to say something in US English
var usSay = notifyAction.addSay();
usSay.setText('Welcome. I can speak english');
usSay.setLanguage('en-US');

// add a say action to say something in Dutch
var nlSay = notifyAction.addSay();
nlSay.setText('Ik spreek ook vloeiend nederlands');
```
notifyAction.setLanguage('nl-NL');

// and german
var deSay = notifyAction.addSay();
desay.setText('Und ich kann auch deutsch sprechen');
desay.setLanguage('de-DE');

**NotifyAction - addSMS()**

Sends an SMS message.

When using this function with an active call, you do not need to call the `setTo` function on the returned SMSAction object. The SMS is automatically sent to the caller.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMSAction</td>
<td>The action added to the NotifyAction object. Use the SMSAction object to define the message text and the phone number to send the message to.</td>
</tr>
</tbody>
</table>

// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// define where to send the sms to
var number = new GlideElementPhoneNumber();
number.setPhoneNumber('+31612345678', true);

// add a SMS action
var sms = notifyAction.addSMS();
sms.setMessage('Lorem ipsum dolor sit amet, consectetur adipiscing elit.');
sms.setTo(number);

**NotifyAction - fromJson(String json)**

Deserialize a NotifyAction object from a JSON string.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>json</td>
<td>String</td>
<td>A JSON string representation of a NotifyAction object.</td>
</tr>
<tr>
<td>Type</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
<td></td>
</tr>
<tr>
<td>void</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This example demonstrates deserializing a NotifyAction object.

```javascript
var json = ".... some json obtained from toJson ....";

// instantiate notify action
var notifyAction = new SNC.NotifyAction();

// deserialize and reconstruct the notify action instance
notifyAction.fromJson(json);
```

This example demonstrates both serializing and deserializing a NotifyAction object.

```javascript
// instantiate notify action
var notifyAction = new SNC.NotifyAction();

// add a queue
var queue = notifyAction.addQueue();
queue.setName('myQueueName');
queue.setDequeue(false);

// serialize to json
var json = notifyAction.toJson();
gs.log('serialization result: ' + json);

// instantiate a new notify action
var newAction = new SNC.NotifyAction();

// deserialize the json generated above
newAction.fromJson(json);

// serialize the new object and log the result
newJson = newAction.toJson();
gs.log('new serialization result: ' + newJson);
gs.log('the same: ' + (json == newJson));
```

Output:

```javascript
*** Script: serialization result: ("fClassName":"NotifyAction","fActions":[{"fClassName":"QueueAction","fDequeue":true,"fQueueName":"myQueueName"}])
*** Script: new serialization result: ("fClassName":"NotifyAction","fActions":[{"fClassName":"QueueAction","fDequeue":true,"fQueueName":"myQueueName"}])
*** Script: the same: true
```

**NotifyAction - toJson()**

Serialize the NotifyAction object to a JSON string.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>A JSON representation of this NotifyAction object.</td>
</tr>
</tbody>
</table>

This example demonstrates serializing a NotifyAction object.

```javascript
// instantiate notify action
var notifyAction = new SNC.NotifyAction();

// add one or more notify actions
// ...

// and serialize to json
var json = notifyAction.toJson();
```

This example demonstrates both serializing and deserializing a NotifyAction object.

```javascript
// instantiate notify action
var notifyAction = new SNC.NotifyAction();

// add a queue
var queue = notifyAction.addQueue();
queue.setName('myQueueName');
queue.setDequeue(false);

// serialize to json
var json = notifyAction.toJson();
gs.log('serialization result: ' + json);

// instantiate a new notify action
var newAction = new SNC.NotifyAction();

// deserialize the json generated above
newAction.fromJson(json);

// serialize the new object and log the result
newJson = newAction.toJson();
gs.log('new serialization result: ' + newJson);
gs.log('the same: ' + (json == newJson));
```

Output:

```javascript
** *** Script: serialization result: {
"fClassName": "NotifyAction", "fActions": [{
"fClassName": "QueueAction", "fDequeue": true, "fQueueName": "myQueueName"}]
}
*** Script: new serialization result: {
"fClassName": "NotifyAction", "fActions": [{
"fClassName": "QueueAction", "fDequeue": true, "fQueueName": "myQueueName"}]
}
*** Script: the same: true
```

** NotifyAction - addConference()**

Add a call to a Notify conference call.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConferenceAction</td>
<td>The action added to the NotifyAction object. Use the ConferenceAction object to define the conference call name, and the behavior of the conference call when a participant joins or leaves.</td>
</tr>
</tbody>
</table>

**NotifyPhoneNumber**

The NotifyPhoneNumber API allows you to query information about a Notify phone number.

**NotifyPhoneNumber - getDialCode()**

Returns the international dialing code for a Notify phone number.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>International phone code for a country.</td>
</tr>
</tbody>
</table>

**NotifyPhoneNumber - getID()**

Returns the ID of this phone number as defined by the telephony provider.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The ID of the number within the telephony provider.</td>
</tr>
</tbody>
</table>

**NotifyPhoneNumber - getNumber()**

Returns the numerical phone number for a NotifyPhoneNumber.
### NotifyPhoneNumber - getOwner()
Returns the telephony provider associated with this phone number.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>An E.164-compliant phone number.</td>
</tr>
</tbody>
</table>

### NotifyPhoneNumber - getTerritory()
Returns the country associated with the phone number.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The name of the country the phone number belongs to.</td>
</tr>
</tbody>
</table>

### NotifyPhoneNumber - supportsConferenceCall()
Determines if the Notify phone number supports conference calling.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

© 2020 ServiceNow, Inc. All rights reserved. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Returns true if the Notify phone number supports conference calling.</td>
</tr>
</tbody>
</table>

**NotifyPhoneNumber - supportsIncomingPhoneCall()**

Determines if the Notify phone number supports receiving phone calls.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Returns true if the Notify phone number supports receiving incoming phone calls.</td>
</tr>
</tbody>
</table>

**NotifyPhoneNumber - supportsIncomingSMS()**

Determines if the Notify phone number supports receiving SMS messages.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Returns true if the Notify phone number supports receiving incoming MMS messages.</td>
</tr>
</tbody>
</table>

**NotifyPhoneNumber - supportsOutgoingPhoneCall()**

Determines if the Notify phone number supports initiating phone calls.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Returns true if the Notify phone number supports initiating outgoing phone calls.</td>
</tr>
</tbody>
</table>
NotifyPhoneNumber - supportsOutgoingSMS()

Determines if the Notify phone number supports sending SMS messages.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Returns true if the Notify phone number supports sending SMS messages.</td>
</tr>
</tbody>
</table>

NotifyPhoneNumber - supportsRecording()

Determines if the Notify phone number supports recording phone calls.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Returns true if the Notify phone number supports recording phone calls.</td>
</tr>
</tbody>
</table>

NotifyPhoneNumber - supportsWebRTC()

Determines if the Notify phone number supports calls to a browser, such as in a WebRTC implementation.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Returns true if the Notify phone number supports calls to a browser.</td>
</tr>
</tbody>
</table>

Notify Client

The Notify Client API allows you to use Notify telephony functionality, such as making and receiving calls, from a web browser.
Several Notify Client methods take a callback function as a parameter. Because Notify Client calls are made asynchronously, these methods cannot return a value directly. Use the callback function to parse the returned data, such as by assigning variables or making other API calls.

**Notify Client - Client(Object notifyConfig)**

Instantiates a new Notify WebRTC Client object.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyConfig</td>
<td>Object</td>
<td>The configuration settings for the Notify WebRTC Client, as a JSON object.</td>
</tr>
</tbody>
</table>

```javascript
var notifyConfig = {
    vendor: SNC.Notify.Vendor.TWILIO,
    callerId: 'xyz',
    autoReconnect: true,
    onReady: function() {},
    onOffline: function() {},
    onError: function( message ) {},
    onConnect: function( status ) {},
    onDisconnect: function() {},
    onIncoming: function( {from, to, callSid} ) {},
    onOutgoing: function( callSid ) {},
    onAccept: function() {},
    onMute: function() {},
    onUnmute: function() {},
    onCancel: function() {}
};

$.function() {
    notifyClient = new SNC.Notify.Client(notifyConfig);
    notifyClient.init();
});
```

**Notify Client - call(Object identifier)**

Call a specified phone number or the phone number associated with a specified user.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>identifier</td>
<td>Object</td>
<td>Enter a JSON object that provides either the phone number to call or the sys_id of a user record to get the phone number from.</td>
</tr>
</tbody>
</table>

**Note:** If you provide both a phone number and user sys_id, only the phone number is used.
This example demonstrates passing a phone number as the function parameter.

```javascript
notifyClient.call({
    phoneNumber: "+18001112223"
});
```

This example demonstrates passing a user record sys_id as the function parameter.

```javascript
notifyClient.call({
    userId: "6816f79cc0a8016401c5a33be04be441"
});
```

### Notify Client - hangupCall()

End the current call.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example demonstrates mapping a client function to an interface button using jQuery.

```javascript
$\('<\#pickupCallBtn\>').on('click', function() {
    notifyClient.hangupCall();
});
```

### Notify Client - pickupCall()

Answers and connects to an incoming call from an Twilio WebRTC client.

Call this method when there is a notification of an incoming call.
### Notify Client - mute(Boolean muted)

Mutes or unmutes the current client.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>muted</td>
<td>Boolean</td>
<td>Set this value to true to mute the current client, false to unmute.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

### NotifyClient - forwardCall(Object argument)

Forward the current call to a different phone number or Notify client session.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>argument</td>
<td>Object</td>
<td>A JavaScript object detailing the number or Notify client to forward the call to.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example demonstrates forwarding a call to a different phone number. The **dtmf** attribute allows you to send DTMF dial tones to the receiving number.

```javascript
var arg = {
    type: "number",
    id: "+17012345678",
    dtmf: "1234"
}
```
This example demonstrates forwarding a call to a different Notify client.

```javascript
var arg = {
    type: "userId",
    id: "6816f79cc0a8016401c5a33be04be441"
}
client.forwardCall(arg);
```

### NotifyClient - sendDtmf(String digits)

Send one or more DTMF-valid digits over the current call.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>digits</td>
<td>String</td>
<td>One or more DTMF-valid digits.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

### Notify client event handlers

Notify Client event handlers allow you to define scripted behavior for responding to events from the Twilio telephony service.

#### Event handlers

A communication between the Notify WebRTC Client and a telephony provider is asynchronous. The client function calls, such as `notifyClient.call()` do not wait for a response from the telephony provider. Instead, event handler methods define how to respond to certain events from the telephony provider.

You can create event handler implementations when creating the Notify Client configuration object. Fully define the handlers in the configuration object before instantiating a Notify Client object.

**onReady**

The `onReady` function runs after you call the `init` function on the client object. The `onReady` function indicates that the WebRTC session is ready.

**onOffline**

The `onOffline` function runs if the WebRTC session is not active.
**onError**

The `onError` function runs if the client encounters an error.

This function exposes one parameter. Use this parameter when implementing the event handler function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>The error message text.</td>
</tr>
</tbody>
</table>

**onConnect**

The `onConnect` function runs when the client receives a call connection event for an incoming or outgoing call.

This function exposes one parameter. Use this parameter when implementing the event handler function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status</td>
<td>String</td>
<td>The call status, as a string constant.</td>
</tr>
</tbody>
</table>

Note: When evaluating call status, use the constants provided by `SNC.Notify.Status`.

```javascript
onConnect: function(status) { // webRTC receives a call connection event (incoming or outgoing).
    if (status == SNC.Notify.Status.OPEN) {
        setStatus(getTimeStamp() + " -- Successfully established call");
        showHangupButton(); //update the UI
    }
},
```

**onDisconnect**

The `onDisconnect` function runs when a call disconnects.

**onIncoming**

The `onIncoming` function runs when a call is made to the client and the telephony provider returns the parent call ID.

This function exposes these parameters as a single JSON object. Use these parameters when implementing the event handler function.
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callInfo.from</td>
<td>String</td>
<td>The caller's phone number.</td>
</tr>
<tr>
<td>callInfo.to</td>
<td>String</td>
<td>The called phone number.</td>
</tr>
<tr>
<td>callInfo.callSid</td>
<td>String</td>
<td>The SID of the call from the telephony provider.</td>
</tr>
</tbody>
</table>

```javascript
onIncoming: function(callInfo) {
  gs.log('incoming call from : ' + callInfo.from);
  var gru = new GlideRecord('sys_user');
  gru.addQuery('phone', callInfo.from);
  gru.query(function() {
    while (gru.next()) { // there may be more than one person with same number?
      // fetch caller's info
      gs.log('caller : ' + gru.name);
    }
  });
},
```

### onIncoming

The **onIncoming** function runs when an incoming call is made from the client.

This function exposes one parameter. Use this parameter when implementing the event handler function.

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callSid</td>
<td>String</td>
<td>The SID of the call from the telephony provider.</td>
</tr>
</tbody>
</table>

### onAccept

The **onAccept** function when the client accepts an incoming call.

### onMute

The **onMute** function runs when the client is muted.

### onUnmute

The **onUnmute** function runs when the client is unmuted.
**onCancel**

The `onCancel` function runs if the caller cancels the call.

**Notify client building a configuration object example**

This example demonstrates how to construct the configuration object needed to instantiate a Notify WebRTC Client object.

The configuration object is a JSON object that specifies properties such as the telephony service provider and caller information, and event handler functions.

This sample code demonstrates how to create a simple configuration object.

```javascript
var notifyConfig = {
    vendor: SNC.Notify.Vendor.TWILIO, //Pass one of the supported vendor constants. Supported value is SNC.Notify.Vendor.TWILIO. Do not pass raw string values.
    callerId: '19991231234', //Pass a valid phone number to use as the caller ID. This number is usually provided by your telephony vendor.
    autoReconnect: true, //Pass true to automatically create a new WebRTC vendor session when the current session expires.
    onReady: function() {},
    onOffline: function() {},
    onError: function( message ) {},
    onConnect: function( status ) {},
    onDisconnect: function() {},
    onIncoming: function( {from, to, callSid} ) {},
    onOutgoing: function( callSid ) {},
    onAccept: function() {},
    onMute: function() {},
    onUnmute: function() {},
    onCancel: function() {}
};
```

**Components installed with Notify**

Several types of components are installed with the Notify application.

**Roles installed with Notify**

Notify adds the following roles.

<table>
<thead>
<tr>
<th>Role title (name)</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notify administrator</td>
<td>Administrator with privileges for Notify 2 functionality.</td>
<td>workflow_admin, workflow_creator, workflow_publisher</td>
</tr>
</tbody>
</table>
### Notify viewer

<table>
<thead>
<tr>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can view notify content. This role has read-only access to the Notify Conference Calls table (notify_conference_call), Notify Conference Call Participants table (notify_participant), Notify Conference Call Participant Session table (notify_participant_session) and Notify Call table (notify_call).</td>
<td></td>
</tr>
<tr>
<td>The itil role inherits the notify_view role when the Incident Alert Management and the Notify plugins are activated.</td>
<td></td>
</tr>
</tbody>
</table>

### Tables installed with Notify

Notify adds the following tables.

#### Tables

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notify Conference Calls (notify_conference_call)</td>
<td></td>
</tr>
<tr>
<td>Notify Calls (notify_call)</td>
<td></td>
</tr>
<tr>
<td>Notify Call Queue (notify_queue)</td>
<td></td>
</tr>
<tr>
<td>Notify Call Status (notify_call_status)</td>
<td></td>
</tr>
<tr>
<td>Notify Client Connected Sessions (notify_client_session)</td>
<td></td>
</tr>
<tr>
<td>Notify Conference Calls (notify_conference_call)</td>
<td></td>
</tr>
<tr>
<td>Notify Conference Call Participants (notify_participant)</td>
<td></td>
</tr>
<tr>
<td>Notify Conference Call Participant Sessions (notify_participant_session)</td>
<td></td>
</tr>
<tr>
<td>Notify Messages (notify_message)</td>
<td></td>
</tr>
<tr>
<td>Notify Phone Numbers (notify_number)</td>
<td></td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Notify Phone Number Groups (notify_group)</td>
<td></td>
</tr>
<tr>
<td>Notify Languages (notify_language)</td>
<td>A list of the languages that Notify supports when using text-to-speech workflow activities.</td>
</tr>
<tr>
<td>Notify Recordings (notify_recording)</td>
<td></td>
</tr>
<tr>
<td>Notify Workflow Activity (notify_wf_activity)</td>
<td></td>
</tr>
<tr>
<td>Notify Audio MIME Types (notify_mime_type)</td>
<td></td>
</tr>
<tr>
<td>Temporary Serialized Notify Action Cache (notify_action)</td>
<td></td>
</tr>
</tbody>
</table>
Notify call sequence

Properties installed with Notify

Notify adds the following properties.

Properties for Notify

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sn_twilio_driver.max_conference_participants</td>
<td>Twilio max limit for number of participants in the conference call.</td>
</tr>
</tbody>
</table>
### Property | Description
---|---
com.snc.iam.notify_number | The Notify number to use for conference calls. **Note:** This number needs to have a group configured with conference call workflows.
glide.notify.task.phone_number | Notify phone number used for sending SMS-s and starting conference calls from any record that belongs to the task table (or table that extends task table). The number must be entered in E.164-compliant format.
glide.notify.sms.max_concatenation | Maximum number of concatenated messages to receiver mobile phone.

### Business rules installed with Notify
Notify adds the following business rules.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>No Call Workflows for Shortcodes</td>
<td>(notify_group)</td>
<td>Checks and displays an error if the call is being triggered by a short code.</td>
</tr>
<tr>
<td>Update Call Active State</td>
<td>(notify_call_status)</td>
<td>Updates the status of the call in notify_call_status with the status received from Twilio.</td>
</tr>
<tr>
<td>Update Conference Call Active State</td>
<td>(notify_participant)</td>
<td>Updates the active flag in notify_participant table. Also calculates the duration when the call is ended by a participant.</td>
</tr>
<tr>
<td>Update Participant Active State</td>
<td>(notify_participant_session)</td>
<td>Updates the active flag for the participant (notify_participant), and calculates the total time on the call upon disconnecting from the call.</td>
</tr>
<tr>
<td>Update Participant Session Active State</td>
<td>(notify_call)</td>
<td>Synchronizes the state of the call between notify_call and notify_participant_session. Upon disconnecting from the call, updates notify_participant_session with the duration of the call.</td>

</tbody>
</table>

### Legacy Notify
Legacy Notify enables organizations with a Twilio account to send notifications using text and voice messages.
Legacy Notify also allows conference calls between ServiceNow users to enable quick communications.

When Legacy Notify is active, you can configure ServiceNow to automatically generate and send notifications to selected contacts, for instance when a new incident alert is raised in the incident alert management process.

Users with the notifynow_admin role can set properties and monitor message and conference call activities.

Legacy Notify has been implemented for use within Incident Alert Management. Refer to the Notify API documentation for details on how to implement Legacy Notify for use within other ServiceNow applications.

**Working with Legacy Notify**

Follow this process to enable and use Notify.

1. Set up a Twilio account to provide phone connectivity for Notify.
2. Activate Notify.
3. Configure Notify to use Twilio.
4. Begin using Notify immediately within incident alert management.
5. Use the Notify API with other ServiceNow applications to provide SMS, voicemail, email, and conference calls for those applications.

**View a Legacy Notify question**

Questions contain a response action and a set of response choices. Use these questions to simplify communications. Then, you can monitor the resulting communication thread.

Role required: notifynow_admin

For example, the process can be used to ask members of a specific on-call group to acknowledge or reject an incident. Depending on the answer from the first team member, the incident is assigned to that person or an SMS question is sent to the next on-call member. In this example, the questions are used as part of a workflow.

To see a list of predefined questions both Notify and On-Call Scheduling need to be active.

1. Navigate to Notify > Questions.
2. Click the question On-Call responsibility Accept/Reject to see the question details.
Notify Question

3. Click the Notify Response Choices related list to view or edit the choices. The person who receives the SMS question can either choose to accept or reject the assignment. If the assignment is accepted, the Response action can be that the incident is actually assigned to that person. The response action is a script that you can modify or replace. If the assignment is rejected, an SMS question may be sent to the next person in the escalation chain, and so on. You can combine questions with a workflow to automate a process like on-call scheduling escalation.

Create a question in Legacy Notify

Define a question that can be sent to users.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to Notify > Questions.
2. Click New.
3. Fill in the fields, as appropriate.
### Notify New Question form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a description of the question.</td>
</tr>
<tr>
<td>Question</td>
<td>Enter the question you want to send. You can enter variables in the question with the <code>{ }</code> tags, for example, <code>{0}</code>. When using more than one variable, use consecutive numbering. When using multiple variables, reference them by specifying their position in the parameter list, starting from <code>{0}</code>. The variable is picked up by the script and translated into, for example, an incident or a problem number.</td>
</tr>
<tr>
<td>Params</td>
<td>Enter parameters which map to the fields on the record that the workflow was triggered for. This enables the message to show dynamic data. Multiple parameters should be separated by a comma. For example, <code>number</code>, shows the incident number in case the workflow was triggered from an incident. A second parameter could be, for example <code>short_description</code>.</td>
</tr>
<tr>
<td>Response Action</td>
<td>Select the action that must be taken. This is a script that can be modified, or you can create a new script by clicking the search button and selecting New. Several examples of scripts are shown. Write your own script and click Submit.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

### Create a new response choice in Legacy Notify

Create a new response choice to allow users to select that response for a Notify question.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to **Notify > Questions**.
2. Open the notify question you have just created.
3. Click New to create a new notify response choice.
4. Fill in the fields, as appropriate.

### Notify New Response Choice form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code</td>
<td>The abbreviation for the response choice in the text message. For example, ACC for accept or REJ for reject.</td>
</tr>
<tr>
<td>Text</td>
<td>The text displayed for this response choice.</td>
</tr>
</tbody>
</table>
ServiceNow    Kingston    Now Platform Capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>A number indicating the order in the list of response choices. Choices with lower order numbers are listed before choices with higher order numbers.</td>
</tr>
</tbody>
</table>

5. **Click Submit.**

**View Legacy Notify messages**

Applications implementing Notify, such as incident alert management, can send Short Message Service (SMS) text messages to relevant contacts under predefined conditions, such as when a new incident alert has been created.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see [Notify](mailto:notify@servicenow.com).

1. Navigate to **Notify > Messages**.
2. Click a message to see the message details.

![SMS Outbox](image)

**SMS Outbox Details**

**View Legacy Notify conversations**

The Notify Conversation (notifynow_conversation) table tracks bi-directional communications and adds the ability to have more than one active conversation with the same phone number at the same time.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see [Notify](mailto:notify@servicenow.com).

The thread number is combined with the phone number to link the SMS or email response to the correct conversation. Conversations remain active until a response is received or until they are...
automatically deactivated after the thread release time runs out. The default thread release time is 10 days. To change this value, add the `nn.thread.release.age` property.

1. Navigate to **Notify > Conversations**.
2. Click a conversation record to see the conversation details.

### Notify Conversation Details

The State of the conversation can have one of the following values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ended</td>
<td>The conversation has been completed.</td>
</tr>
<tr>
<td>Failed</td>
<td>The conversation has failed.</td>
</tr>
<tr>
<td>Pending</td>
<td>The SMS or email is waiting to be sent.</td>
</tr>
<tr>
<td>Sent</td>
<td>The SMS or email has been sent.</td>
</tr>
<tr>
<td>Unanswered</td>
<td>The SMS or email has not been answered.</td>
</tr>
</tbody>
</table>

**Note:** The mode of conversation cannot be changed during one conversation thread. For example, you cannot switch between SMS and email during one conversation.

### View Legacy Notify conference calls

Applications that use Notify, such as incident alert management, can launch and maintain conference calls between involved parties.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see [Notify](#).

1. Navigate to **Notify > Conference Calls**.
2. You can also access conference call information from the relevant record, such as the **Conference Calls** related list in an incident alert record.
3. Click a conference call in the list to view details.
Notify Conference Call Details

3. Click the arrow beside the check box to expand a Participant entry. This shows participant session information, including details of the conference calls that the participant has been involved in.

4. Click a Participant name to see more detailed information about that participant.
Legacy public conference calls

A Notify conference call can be public.

Note: This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

The Private field on the conference call record indicates if a call is private (selected) or public (not selected). By default, all calls created automatically, such as those created through Incident Alert Management, are public. You can create private calls using the Notify API initiateConferenceCall method.

When created, public conference calls generate an associated Code which is sent via SMS to all invited participants. These participants can distribute the code to allow other users to join the public call. An administrator can control the format of the code using the property glide.notifynow.conference_call.code.pattern. Anyone with the code can connect to a public conference call using one of these methods:

- By calling the Twilio phone number and entering the code for that conference call.
- By sending the code in an SMS message to the Twilio phone number. Participants that join a public call this way are considered ad-hoc participants, indicated on the participant record.

Administering Legacy Notify

An administrator can set up Notify, manage Notify properties and conference call participants.
Configuring legacy Notify to use the Twilio service

Each ServiceNow instance using Notify requires a valid Twilio account and telephone number. Refer to the Twilio documentation for detailed instructions.

After the Twilio account is set up, perform the following to use that account with Notify:

- Associate the account with Notify
- Configure Twilio with ServiceNow endpoints

Associate a Twilio account with Legacy Notify

Associate a Twilio account with your instance to use that account for legacy Notify.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to Notify > Administration > Properties.
2. Enter the **AccountSID**, **AuthToken** and **phone number** values. These values can be obtained from the Twilio dashboard:
When the Twilio account details are entered in the Notify Properties page, the account status is updated.

3. (Optional) To use Notify on multiple ServiceNow instances, activate Notify on each instance and create a separate Twilio account and telephone number for each instance.

**Note:** Some telephone numbers are voice capable, but not SMS capable. This is shown in the Notify properties with relevant messages. Two methods are available to check this: isSMSCapable and isVoiceCapable.

**Configuring the Twilio service with endpoints in legacy Notify**

In order for the Twilio service to receive Notify commands, the Request URL field value for every Twilio telephone number must point to the ServiceNow instance that uses Notify with that Twilio telephone number.

**Note:** This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

To set these values, do one of the following:

- Define them manually in the Twilio service dashboard.
- Ensure the fields are blank in the Twilio service dashboard, then open the Notify Properties page. Notify automatically configures the correct endpoints if the Request URL fields are blank.

Set these values from within the Twilio service dashboard.
Twilio Numbers Dashboard

The notifyusa values underlined in the image should be replaced with your ServiceNow instance name, for:

- Voice Request URL: https://notifyusa.service-now.com/NotifyNowCallProcessor.do

• Status Callback URL: https://notifyusa.service-now.com/NotifyNowCallStatusProcessor.do
• Messaging Request URL: https://notifyusa.service-now.com/NotifyNowSmsProcessor.do

View and edit legacy Notify properties

You can view and edit Notify properties.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to Notify > Administration > Properties.
### Notify Properties form

2. Fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Status</td>
<td>Information showing the status of the associated Twilio account.</td>
</tr>
<tr>
<td>Twilio AccountSID</td>
<td>The Twilio account AccountSID, acting as the user name for that account.</td>
</tr>
<tr>
<td>Twilio AuthToken</td>
<td>The Twilio account AuthToken, acting as the password for that account. See Associating a Twilio Account.</td>
</tr>
</tbody>
</table>
Field | Description
----- | -------
Twilio SMS and voice enabled phone number | The Twilio number that Notify will use. Telephone numbers must be entered in the E.164 format and need to exist under the Twilio account. See Associating a Twilio Account.
Number of frequent conference call participants to be displayed | The number of people to display in the frequently called list.
Voice | The voice used for Notify communications. Select woman or man to provide female or male voice support for English, Spanish, French, German, and Italian. Select alice to provide female voice support for a wider range of languages.

3. Click **Submit**.

**Legacy Notify account status messages**
Account status messages are visible on the Notify Properties page.

**Account Status Message Descriptions**

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Your account is ready for use</td>
<td>Notify is correctly configured and ready for use.</td>
</tr>
<tr>
<td>Your Twilio AccountSID or AuthToken are not valid</td>
<td>An incorrect value has been entered in the AccountSID or AuthToken fields in the Notify properties.</td>
</tr>
<tr>
<td>Your Twilio phone number is not valid</td>
<td>Incorrect telephone number information is defined in the Notify properties.</td>
</tr>
<tr>
<td>Your Twilio phone number does not have properly configured endpoints</td>
<td>The Request URL endpoint settings have not been properly configured.</td>
</tr>
<tr>
<td>Your Twilio account is not configured properly</td>
<td>One or more of your Twilio account settings is incorrect. Open the Twilio dashboard and check the settings.</td>
</tr>
</tbody>
</table>

**Manage Legacy Notify conference call participants**
As a Notify administrator, you can mute, unmute, and kick participants on a conference call.
Role required: notifynow_admin
This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see [Notify](#).
Muting a participant prevents that person from speaking on the conference call but does not notify any participants, including the muted participant. Kicking a participant removes that person from the conference call and sets the **Response** field for the participant session to kicked.

1. Navigate to Notify > Conference Calls.
2. Select an active conference call.
3. In the Notify Conference Call Participants related list, select a participant.
4. Click the button for the action you want to perform, such as **Mute** to mute the participant.
You can perform these actions for multiple participants as a single operation using the Actions on selected rows choice list on the Notify Conference Call Participants related list.

**Installed with Legacy Notify**

Activating the Notify plugin adds or modifies tables, user roles, script includes, and other components.

**Note:** This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

**Tables**

Notify adds or modifies the following tables.

<table>
<thead>
<tr>
<th>Display Name (Table Name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Answer [notifynow_answer]</td>
<td>Information for possible answers to the SMS question sent.</td>
</tr>
<tr>
<td>Conversation [notifynow_conversation]</td>
<td>Information for the conversation thread.</td>
</tr>
<tr>
<td>NotifyNow Conference Call [notifynow_conference_call]</td>
<td>Information for conference call records.</td>
</tr>
<tr>
<td>NotifyNow Participant Session [notifynow_participant_session]</td>
<td>Information regarding conference call sessions for individual conference call participants.</td>
</tr>
<tr>
<td>Participant [notifynow_participant]</td>
<td>Information regarding individual conference call participants.</td>
</tr>
<tr>
<td>Question [notifynow_question]</td>
<td>Information for the possible questions in the SMS.</td>
</tr>
<tr>
<td>Response_action [notifynow_response_action]</td>
<td>Information for the notify response action associated with the question.</td>
</tr>
<tr>
<td>Response_choice [notifynow_response_choice]</td>
<td>Information for the notify response choice associated with the question.</td>
</tr>
<tr>
<td>SMS Messages [notifynow_message]</td>
<td>Information for the actual SMS messages sent.</td>
</tr>
</tbody>
</table>

**Properties**

Notify adds the following system properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.notifynow.frequent_participant_count</td>
<td>The number of frequent conference call participants to be displayed.</td>
</tr>
<tr>
<td>glide.notifynow.voice</td>
<td>The voice used for Notify communications.</td>
</tr>
<tr>
<td>glide.notifynow.twilio.accountsid</td>
<td>The Twilio account AccountSID.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>glide.notifynow.twilio.token</td>
<td>The Twilio account AuthToken.</td>
</tr>
<tr>
<td>glide.notifynow.twilio.phonenumber</td>
<td>The Twilio number that Notify will use.</td>
</tr>
<tr>
<td>glide.notifynow.twilio.answering_machine_detection</td>
<td>A boolean flag to enable or disable answering machine detection. Set to true to use answering machine detection. Set to false to continue the call.</td>
</tr>
<tr>
<td>nn.thread.release.age</td>
<td>The number of days after which the conversation thread release time runs out. Defaults to 10 days.</td>
</tr>
<tr>
<td>glide.notifynow.conference_call.code.pattern</td>
<td>The pattern used to generate a conference call code for public conference calls. Number signs (#) in the pattern are replaced with random numbers when a code is generated.</td>
</tr>
<tr>
<td>glide.notifynow.fix_invalid_phone_number</td>
<td>A boolean flag to enable or disable automatic correction of invalid phone numbers. Twilio might incorrectly prefix non-US phone numbers with 1. When this property is true, the instance automatically removes the 1 for non-US calls. When this property is false, you might be incorrectly identified when reconnecting to a call using SMS.</td>
</tr>
</tbody>
</table>

### User Roles

Notify adds the following user roles.

<table>
<thead>
<tr>
<th>Role</th>
<th>Contains Roles</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifynow_admin</td>
<td>None</td>
<td>Administrator with privileges for Notify functionality.</td>
</tr>
</tbody>
</table>

### UI Actions

Notify adds the following UI actions.

<table>
<thead>
<tr>
<th>UI Action</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initiate Conference Call</td>
<td>Incident Alert [incident_alert]</td>
<td>Adds a link to the Incident Alert form, if that plugin is activated, which displays a dialog box for starting a conference call with selected participants.</td>
</tr>
<tr>
<td>Invite to Conference Call</td>
<td>NotifyNow Conference Call [notifynow_conference_call]</td>
<td>Adds a link to the Notify Conference Call form which displays a dialog box for adding more users to an active conference call.</td>
</tr>
</tbody>
</table>
### Script Includes

Notify adds the following script includes.

#### Script Includes

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IncidentAlertConferenceCall</td>
<td>A utility JavaScript Prototype class allowing users to initiate the conference call and add other users to the conference call. Should be used in conjunction with the slushbucket UI page (notifynow_participant).</td>
</tr>
</tbody>
</table>

### Business Rules

Notify adds the following business rules.

#### Business Rules

<table>
<thead>
<tr>
<th>Business Rule Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMS on new Incident Alert</td>
<td>Incident Alert [incident_alert]</td>
<td>Sends an SMS to any default contacts added when an incident alert record is created.</td>
</tr>
<tr>
<td>Conference Call Allowed</td>
<td>Incident Alert [incident_alert]</td>
<td>Displays or hides the initiate conference call UI action by storing true or false in g_scratchpad.conferenceCallAllowed.</td>
</tr>
<tr>
<td>Update Conference Call Started IA Activity</td>
<td>NotifyNow Conference Call [notifynow_conference_call]</td>
<td>Logs when a conference call started by writing to an incident alert's comment field if the source record is from the incident_alert table.</td>
</tr>
<tr>
<td>Update Conference Call Finished IA Activity</td>
<td>NotifyNow Conference Call [notifynow_conference_call]</td>
<td>Logs when a conference call ended and what actions the conference call participants took by writing to an incident alert's comment field if the source record is from the incident_alert table.</td>
</tr>
</tbody>
</table>

### Workflow Activities

Notify adds the following workflow activities.
Workflow Activities

<table>
<thead>
<tr>
<th>Activity Name</th>
<th>Activity Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send Notify SMS</td>
<td>Notify</td>
<td>Sends an SMS message (maximum 1600 Characters) to an E.164 compliant mobile phone number of the selected recipients and/or groups.</td>
</tr>
<tr>
<td>Send Notify SMS Question</td>
<td>Notify</td>
<td>Sends predefined SMS Question message (maximum 1600 Characters) to an E.164 compliant mobile phone number of the selected recipients and/or groups. This is one of two main activities for workflow On-Call Assign by Acknowledgement. In a predefined message, the recipient is asked to assign himself to a newly created incident. The same message also contains predefined answers.</td>
</tr>
<tr>
<td>Send Email Question</td>
<td>Notify</td>
<td>Sends email generated from email template containing notification that recipient is the current On-call resource for a newly created task. This is one of two main activities for the workflow On-Call Assign by Acknowledgement. In a predefined message, the recipient is asked to assign himself to a newly created incident. The email contains two links that enable the user to accept or reject assignment.</td>
</tr>
</tbody>
</table>

Legacy Notify API

The legacy Notify API provides functionality for sending emails, sending SMS messages, and setting up conference calls.

Use this when you want to use Notify functionality with applications on your system.

Note: This API is included with the legacy Notify functionality. For APIs included in the current Notify feature, see the Notify, NotifyAction, NotifyPhoneNumber, and NotifyClient APIs.

NotifyNow - getReadyState()

Indicates whether Notify is set up correctly or not.

This method can only be accessed by administrators or users with the notifynow_admin role. Users with all other roles get the message False when trying to run the function in a script.
### NotifyNow - getStatus()

Return the current status of Notify configuration.

This method can only be accessed by administrators or users with the notifynow_admin role. Users with all other roles get the message Unauthorized when trying to run the function in a script.

```javascript
var nn = new SNC.NotifyNow();
gs.log(((nn.getReadyState()) ? "OK" : "NOT OK"));
```
### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>One of the possible status messages.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO_NUMBER_MESSAGE</td>
<td>The account does not have a telephone number set up. Ensure that you set up the telephone number for the account.</td>
</tr>
<tr>
<td>NO_ENDPOINTS_MESSAGE</td>
<td>The account does not have its endpoints set up correctly. Ensure that you set up the endpoints for the account.</td>
</tr>
<tr>
<td>ACCOUNT_OK_MESSAGE</td>
<td>The account is active and ready for use.</td>
</tr>
<tr>
<td>ACCOUNT_NO_AUTH</td>
<td>The Twilio AuthToken is not valid.</td>
</tr>
<tr>
<td>ACCOUNT_NOT_CONFIGURED</td>
<td>Twilio AccountSID or AuthToken is not valid.</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
gs.log(nn.getStatus());
```

### NotifyNow - initiateConferenceCall(String[] conferenceCallParticipants, String conferenceCallTitle)

Initiate a new conference call.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCallParticipants</td>
<td>String</td>
<td>One or more users, conference call participants, identified by the sys_ids from the sys_user table or E.164-compliant phone numbers.</td>
</tr>
<tr>
<td>conferenceCallTitle</td>
<td>String</td>
<td>Title of the conference call. This parameter has a maximum length of 40 characters.</td>
</tr>
</tbody>
</table>
This initiates a conference call with E.164-compliant phone numbers for participants, without the optional source record parameter and and does not send any conference call details via SMS or email.

```javascript
var participants = ['+31205655548', '+31205655552', '+31652825393'];
// set up conference call
var nn = new SNC.NotifyNow();
var conferenceCall = nn.initiateConferenceCall(participants, "testing12");
gs.log('started conference call: ' + conferenceCall.getUniqueValue());
```

**NotifyNow - initiateConferenceCall(String[] conferenceCallParticipants, String conferenceCallTitle, GlideRecord sourceRecord, Boolean private)**

Initiate a new conference call.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCallParticipants</td>
<td>String</td>
<td>One or more users, conference call participants, identified by the sys_ids from the sys_user table or E.164-compliant phone numbers.</td>
</tr>
<tr>
<td>conferenceCallTitle</td>
<td>String</td>
<td>Title of the conference call. This parameter has a maximum length of 40 characters.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>GlideRecord</td>
<td>Source record to associate to the conference call such as an incident or problem number.</td>
</tr>
<tr>
<td>private</td>
<td>Boolean</td>
<td>Value to control if a conference call is private. This value defaults to false.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The conference call record, or null if there was an error.</td>
</tr>
</tbody>
</table>
This initiates a conference call with participants that have a E.164-compliant phone number and participants from the sys_user table and sends conference call details via SMS and email to all participants.

```javascript
// define phone number participants
var participants = ['+31205655548', '+31205655552', '+31652825393'];

// we also want to add two Dutch sys_user participants
var user = new GlideRecord('sys_user');
user.addNotNullQuery('mobile_phone');
user.addQuery('mobile_phone', 'STARTSWITH', '+316');
user.setLimit(2);
user.query();

// add users to the participant array
while (user.hasNext() && user.next()) {
    gs.log('adding user ' + user.getValue('name') + ' with phone number ' + user.getValue('mobile_phone') + ' to the participant array');
    participants.push(user.getUniqueValue());
}

// define a source record to associate with the conference call
var source = new GlideRecord('cmdb_ci');
source.query("asset_tag", "P1000167");
if (source.hasNext() && source.next()) {
    // set up conference call
    var nn = new SNC.NotifyNow();
    var conferenceCall = nn.initiateConferenceCall(participants, "testing 1 2", source);

    // check if the conference call was successfully created
    if (conferenceCall != null) {
        gs.log('started conference call: ' + conferenceCall.getUniqueValue());
    } else {
        gs.log('could not start the conference call :(');
    }
}
```

### NotifyNow - isCallable(String participant)

Determines whether a user is callable or not.

A user must have a valid phone number to be callable. A user who is already in an active session is not callable.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>String or GlideRecord</td>
<td>A sys_user or notifynow_participant record, or an E.164-compliant phone number.</td>
</tr>
</tbody>
</table>
### NotifyNow - isSMSCapable()

Checks if the telephone number associated with the Twilio account is capable of sending SMS messages.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Whether the telephone number associated with the Twilio account is capable of sending SMS messages.</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
gs.log('by number: ' + nn.isCallable('+31612345678'));

var user = GlideRecord('sys_user');
user.query('sys_id', '13d39544eb5201003cf587b9d106fea9');
if (user.hasNext() && user.next())
gs.log('by user: ' + nn.isCallable(user));

var participant = GlideRecord('notifynow_participant');
participant.query('sys_id', '33b11430eb1201003cf587b9d106feb9');
if (participant.hasNext() && participant.next())
gs.log('by participant: ' + nn.isCallable(participant));
```

```javascript
gs.log('The twilio number is SMS capable: ' + ((new SNC.NotifyNow().isSMSCapable()) ? 'yes' : 'no'));
```

### NotifyNow - isSMSCapable(String userID)

Checks if a user is able to send SMS messages.
### NotifyNow - isSMSCapable()

Checks if the user can send SMS messages.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userID</td>
<td>String</td>
<td>The sys_id of the user you want to check for an SMS-capable phone number.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>If the user can send SMS messages.</td>
</tr>
</tbody>
</table>

```javascript
gs.log('the user is able to send SMS messages (e.g. has a SMS device): ' + ((new SNC.NotifyNow().isSMSCapable('<user sys_id>')) ? 'yes' : 'no'));
```

### NotifyNow - isVoiceCapable()

Checks if the telephone number associated with the Twilio account is capable of setting up phone calls.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Whether the telephone number associated with the Twilio account is capable of setting up phone calls.</td>
</tr>
</tbody>
</table>

```javascript
gs.log('the Twilio number is Voice capable: ' + ((new SNC.NotifyNow().isVoiceCapable()) ? 'yes' : 'no'));
```

### NotifyNow - isVoiceCapable(String userID)

Checks if a user is able to make voice calls.
### NotifyNow - kick(GlideRecord participant)

Removes a participant from a conference call.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>The conference call participant to remove from the call.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the participant was removed, otherwise false.</td>
</tr>
</tbody>
</table>

```javascript
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
    // kick participant
    result = new SNC.NotifyNow().kick(participant);
    gs.log('participant kicked: ' + result);
}
```

### NotifyNow - mute(GlideRecord participant)

Mutes a participant on a conference call.

```javascript
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
    // mute participant
    result = new SNC.NotifyNow().mute(participant);
    gs.log('participant muted: ' + result);
}
```
### NotifyNow - mute(GlideRecord participant)

Mutes a participant on a conference call.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>The conference call participant to mute.</td>
</tr>
</tbody>
</table>

```javascript
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
  // mute participant
  result = new SNC.NotifyNow().mute(participant);
  gs.log('participant muted: ' + result);
}
```

### NotifyNow - umute(GlideRecord participant)

Unmutes a participant on a conference call.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>The muted conference call participant to unmute.</td>
</tr>
</tbody>
</table>

```javascript
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
  // unmute participant
  result = new SNC.NotifyNow().unmute(participant);
  gs.log('participant unmuted: ' + result);
}
```
NotifyNow - sendEmailQuestion(String emailAddress, String question, GlideRecord sourceRecord, String emailSubject)

Send an email question to an email address.
The sendEmailQuestion method produces a question body and requires users to click a link to indicate their choice.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>emailAddress</td>
<td>String</td>
<td>Email address to send the question to.</td>
</tr>
<tr>
<td>question</td>
<td>String or GlideRecord</td>
<td>The question record to send or the sys_id of a question record.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>GlideRecord</td>
<td>An optional source record to associate to the SMS question, such as an incident.</td>
</tr>
<tr>
<td>emailSubject</td>
<td>String</td>
<td>Optional text to override the default email subject.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The conversation sys_id.</td>
</tr>
</tbody>
</table>

This example demonstrates using the default email subject.

```java
var user = GlideRecord("sys_user");
user.get("email", "someone@somedomain.com");
new SNC.NotifyNow().sendEmailQuestion(user.getValue('email'), "b6b34500bf3111003cf585ce2c0739ce", user);
```

This example uses dot-walking and specifies a source record and email subject.

```java
new SNC.NotifyNow().sendEmailQuestion("someone@somedomain.com", "b6071733bf1111003cf585ce2c07390f", current, "Please answer this question");
```

This example uses dot-walking and specifies an email subject but no source record.

```java
new SNC.NotifyNow().sendEmailQuestion("someone@somedomain.com", "b6071733bf1111003cf585ce2c07390f", "Please answer this question");
```
NotifyNow - sendSMS(String phoneNumber, String smsBody)

Sends an SMS message to an E.164-compliant mobile phone number.
Notify supports international numbers. Using this method with a number that does not support sending SMS messages results in an error being logged.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>The E.164-compliant phone number to send the message to.</td>
</tr>
<tr>
<td>smsBody</td>
<td>String</td>
<td>The message to send, maximum 1600 characters.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
new SNC.NotifyNow().sendSMS("+31612345678", "This is a message without source record");
```

NotifyNow - sendSMS(String phoneNumber, String smsBody, GlideRecord source)

Sends an SMS message to an E.164-compliant mobile phone number.
Notify supports international numbers. Using this method with a number that does not support sending SMS messages results in an error being logged.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>The E.164-compliant phone number to send the message to.</td>
</tr>
<tr>
<td>smsBody</td>
<td>String</td>
<td>The message to send, maximum 1600 characters.</td>
</tr>
<tr>
<td>source</td>
<td>GlideRecord</td>
<td>The source record to associate with this SMS message.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var source = new GlideRecord("my_table");
```
source.query("my_field", "my_value");

if (source.hasNext() && source.next()) {
    // send a text message
    var nn = new SNC.NotifyNow();
    var message = "this is just a test";
    var number = "+31612345678";
    nn.sendSMS(number, message, source);
}

This example uses dot-walking and the current record as the source record.

new SNC.NotifyNow().sendSMS("+31612345678", "this is a test", current);

**NotifyNow - sendSMSQuestion(String phoneNumber, String question, GlideRecord sourceRecord)**

Sends an SMS question.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>An E.164-compliant phone number to send the message to.</td>
<td></td>
</tr>
<tr>
<td>question</td>
<td>String or GlideRecord</td>
<td>The question record to send or the sys_id of a question record.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>An optional source record to associate to the SMS question, such as an incident.</td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The conversation sys_id, or null if the SMS was not sent successfully.</td>
</tr>
</tbody>
</table>

```
var question = new GlideRecord("notifynow_question");
question.query();

// get the first question
if (question.hasNext() && question.next()) {
    // send the sms question
    var number = "+31612345678";
    var nn = new SNC.NotifyNow();
    nn.sendSMSQuestion(number, question.getUniqueValue(), current);
}
```
NotifyNow - addConferenceCallParticipant(String conferenceCall, String participant)

Adds ad-hoc users to an ongoing conference call.
When the method is called with a phone number for the participant parameter and there is exactly one sys_user record that matches the phone number, that sys_user record will be related to the participant. The participant's phone number field will be left blank because the phone number is in the sys_user record. If there are several sys_user records that match the phone number, or if there are no results, the participant's phone number field will be filled in, and there will be no stored reference to sys_user because the user is not known.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCall</td>
<td>String or GlideRecord</td>
<td>The sys_id or GlideRecord of an active conference call.</td>
</tr>
<tr>
<td>participant</td>
<td>String or GlideRecord</td>
<td>The sys_id or GlideRecord of a user with an E.164-compliant phone number, or an E.164-compliant phone number.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The participant record of the new participant that was added to the conference call.</td>
</tr>
</tbody>
</table>

```java
// add a new participant by conference call sys_id (string) and phone number (string)
var nn = new SNC.NotifyNow();
gs.log(nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe39', '+31612345678'));
```

```java
// add a new participant by conference call sys_id (string) and user record (GlideRecord)
var user = new GlideRecord('sys_user');
user.query('user_name', 'myUserName');
if (user.hasNext() && user.next()) {
    var nn = new SNC.NotifyNow();
    gs.log(nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe39', user));
    // you could have added the user by sys_id as well:
    // nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe39', user.getValue('sys_id'));
} else {
    gs.log('no such user');
}
```
// add a new participant by conference call record (GlideRecord) and phone number (string)
var conferenceCall = new GlideRecord('notifynow_conference_call');
conferenceCall.query('title', 'IA0001001');
if (conferenceCall.hasNext() && conferenceCall.next()) {
    var nn = new SNC.NotifyNow();
    gs.log(nn.addConferenceCallParticipant(conferenceCall, '+31612345678'));
} else {
    gs.log('no such conference call');
}

NotifyNow - convertLocalPhoneNumberToE164(String userId, String phoneNumber)

Converts a local phone number to an E.164-compliant phone number based on a user's location.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userId</td>
<td>String</td>
<td>The sys_id of a sys_user record to get location information from.</td>
</tr>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>The phone number.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The E.164-compliant phone number.</td>
</tr>
</tbody>
</table>

var localPhoneNumber = '01784 221600';
var userName = 'Heath Vanalphen';

var user = new GlideRecord('sys_user');
user.get('name', userName);
var E164Number = new SNC.NotifyNow().convertLocalPhoneNumberToE164(user.getUniqueValue(), localPhoneNumber);
gs.log('converted: ' + localPhoneNumber + ' to ' + E164Number + ' based on ' + user.getUniqueValue('name') + '\'s location (' + user.getUniqueValue('location') + ')');
NotifyNow - getConferenceCallParticipants(String conferenceCallId, Boolean isCallable)

Returns all participants for a conference call.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCallId</td>
<td>String</td>
<td>The ID of the conference call.</td>
</tr>
<tr>
<td>isCallable</td>
<td>Boolean</td>
<td>An optional flag to return either only the users you can call (true) or those you cannot call (false).</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The participants</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
var user = nn.getConferenceCallParticipants('c2e91710eb120100f34087b9d106fe37');

while (user.hasNext() && user.next()) {
    if (user.getValue('participant')) {
        gs.log('user: ' + user.getValue('sys_id'));
    } else {
        gs.log('phone number: ' + user.getValue('phone_number'));
    }
}
```

```javascript
var nn = new SNC.NotifyNow();
var user = nn.getConferenceCallParticipants('c2e91710eb120100f34087b9d106fe37', true);

while (user.hasNext() && user.next()) {
    if (user.getValue('participant')) {
        gs.log('user: ' + user.getValue('sys_id'));
    } else {
        gs.log('phone number: ' + user.getValue('phone_number'));
    }
}
```

```javascript
var conferenceCallId = '32b11430eb1201003cf587b9d106feb8';
// get all participants
```
gs.log('all conference call participants:\');
var nn = new SNC.NotifyNow();
var user = nn.getConferenceCallParticipants(conferenceCallId);
gs.log(user);

// get all callable participants
gs.log('all conference call participants we can call:\');
user = nn.getConferenceCallParticipants(conferenceCallId, true);
gs.log(user);

// get all un callable participants
gs.log('all conference call participants that are already in
active session and whom we cannot call:\');
user = nn.getConferenceCallParticipants(conferenceCallId,
false);
gs.log(user);

**NotifyNow - getFrequentlyCalledUsers(Number limit)**

Returns a number of frequently-called users, up to the limit parameter, in alphabetical order.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>limit</td>
<td>Number</td>
<td>The maximum number of results.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The frequently called users in alphabetical order.</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
var fc = nn.getFrequentlyCalledUsers(10);

while (fc.hasNext() && fc.next()) {
  gs.log("got user "+ fc.getValue('name') + ' - ' +
  fc.getValue('sys_id'))
}
```

**NotifyNow - getPreferredE164VoiceNumber(GlideRecord user)**

Returns a user's preferred E.164-compliant phone number for voice calls.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>GlideRecord or String</td>
<td>The user record or the sys_id of a user to get the E.164-compliant phone number from.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The E.164-compliant phone number or null.</td>
</tr>
</tbody>
</table>

```javascript
var userID = "<user sys_id>";
var E164Number = new SNC.NotifyNow().getPreferredE164VoiceNumber(userID);
gs.log('the preferred phone number for setting up voice calls is ' + E164Number + ' for user with id: ' + userID);
```

NotifyNow - getPreferredE164SMSNumber(GlideRecord user)

Returns a user's preferred E.164-compliant phone number for SMS messages.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>GlideRecord or String</td>
<td>The user record or the sys_id of a user to get the E.164-compliant phone number from.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The E.164-compliant phone number or null.</td>
</tr>
</tbody>
</table>

```javascript
var userID = "<user sys_id>";
var E164Number = new SNC.NotifyNow().getPreferredE164SMSNumber(userID);
gs.log('the preferred phone number for sending SMS notifications is ' + E164Number + ' for user with id: ' + userID);
```

NotifyNow - getPreferredEmailAddress(GlideRecord user)

Returns a user's preferred email address

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>GlideRecord or String</td>
<td>The user record or the sys_id of a user to get the email address from.</td>
</tr>
</tbody>
</table>

```javascript
var userID = "<user sys_id>";
var EmailAddress = new SNC.NotifyNow().getPreferredEmailAddress(userID);
gs.log('the preferred email address for sending email notifications is ' + EmailAddress + ' for user with id: ' + userID);
```
<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The email address or null.</td>
</tr>
</tbody>
</table>

```javascript
var userID = "some user sys id";
var email = new SNC.NotifyNow().getPreferredEmailAddress(userID);
gs.log('the preferred email address for sending email notifications is ' + email + ' for user with id: ' + userID);
```

Configuration Management Database

With the ServiceNow® Configuration Management Database (CMDB) application, build logical representations of assets, services, and the relationships between them that comprise the infrastructure of your organization. Details about these components are stored in the CMDB which you can use to monitor the infrastructure, helping ensure integrity, stability, and continuous service operation.

Use core features such as CMDB Health, CMDB Identification and Reconciliation, and CMDB CI Lifecycle Management to monitor and detect health issues, reconcile data integrity issues, and manage data life cycle.

Note: CMDB modules, features, and wizards are not supported on mobile devices. You cannot use a mobile device to access the CI Class Manager or the Query Builder. Or to access or configure CMDB features such as Identification and Reconciliation, CMDB Health, CI Lifecycle Management, baseline CMDB, and proposed changes.

### Domain separation in Configuration Management Database (CMDB)

This is an overview of domain separation and the Configuration Management Database (CMDB). Domain separation allows you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

#### Overview

**Support: Level 2**

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see [Application support for domain separation](#).

The following topics provide details about domain separation in Configuration Management (CMDB) modules:

- Domain separation in CMDB Health
- Domain separation in CMDB Query Builder
- Domain separation in CMDB Identification and Reconciliation
- Domain separation for the relations formatter and the CI relationship editor
- CMDB APIs (CMDB SDK)

### Configuration Management and the CMDB

The Configuration Management data base (CMDB) creates and maintains the logical configurations your network infrastructure needs to support a ServiceNow service.

These logical service configurations are mapped to the physical layout data of the supporting network and application infrastructure in each of your respective domains. They track the physical and logical state of IT service elements and associate incidents to the state of service elements, which helps in analyzing trends and reducing problems and incidents.

The configurations are stored in a configuration management database (ServiceNow CMDB) which consists of entities, called Configuration Items (CI), that are part of your environment. A CI may be:

- A physical entity, such as a computer or router
- A logical entity, such as an instance of a database
- Conceptual, such as a Requisition Service

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
In each case, there are attributes about the CI that you want to maintain, and there is control you want to have over the CI. There are changes that may need to be made and tracked against the CI. Also, a CI does not exist on its own. CIs have dependencies and relationship with other CIs. For example, the loss of disk drives may take a database instance down, which affects the requisition service that the HR department uses to order equipment for new employees.

It is this relationship data that makes the CMDB a powerful decision support tool. Understanding the dependencies and other relationships among your CIs can tell you, for example, exactly who and what is affected by the loss of that bank of disk drives. When you find out that a router has failed, you will be able to assess the effect of that outage. When you decide to upgrade the processor in a server, you can tell who or what will be affected during the outage.

Configuration items differ from environment to environment because each customer has unique needs. Details about the exact physical attributes of a computer may be needed by one customer, but may represent meaningless data to another. The NOW Platform provides a mechanism to easily define new classes of configuration items and new relationships that may exist between CIs. New classes can be defined that extend other classes. For example, a laptop class exists that extends the computer class. The computer class itself extends the base CI class. Customer class extensions are automatically part of the ServiceNow environment and blend seamlessly into the integration points for other ITIL processes.

You can for example, set the *Used for* attribute in the `cmdb_ci_server` table to a value such as `development`, `test`, or `production`. These values indicate the environment that the CI is supporting, and serve as a way of tracking a CI through its lifecycle in a changing environment.

**Roles required**

For viewing CMDB-related records in the user interface, the `itil` role is usually sufficient. For updating records and for other manipulation of records, roles with higher credentials are usually required, as noted in each procedure throughout the documentation set.

**ITIL Configuration Management integration**

The CMDB has relationships with IT service management processes in the following areas: ITIL incident management, ITIL problem management, ITIL change management, ITIL service catalog management, and financial management.

**ITIL Incident Management**

Configuration management assists *Incident Management* by providing the Service Desk with immediate information on the CIs affected, and more timely resolution of faults by understanding what CIs have been affected and changed.

**ITIL Problem Management**

Configuration Management assists *Problem Management* by linking the CIs affected by problems to the Incident / Problem / Change Management processes, and ensuring the CI status is properly maintained.
ITIL Change Management

Configuration Management assists Change Management by recording which CIs have been changed and controlling the status of CIs throughout the entire CI lifecycle. Configuration Management ensures any changes made to CIs are recorded and kept accurate.

ITIL Service Catalog Management

With Service Portfolio Management, business services in the CMDB can also be managed by the Service Catalog team, and exposed to end users who can then request items from them.

Financial Management

With Cost Management, costs can be associated with configuration items, so that the cost associated with Configuration Management can be tracked and bundled into expense lines, budgets, or cost centers.

ITIL

The IT Infrastructure Library (ITIL) is an integrated, process-based framework for managing IT services.

It provides guidance for creating and operating a Service Desk that provides efficient communication between the user community and the IT provider. Originally initiated to improve IT service management for the UK central government, it has become a standard for many organizations; public or private sector, large or small, centralized, or distributed.

ITIL provides processes for three service concepts: design, transition, and operation.

Service design
This guide provides a general overview of ITIL service design concepts.

Service level management
The service level management process is designed to ensure customer satisfaction within IT service processes. Service level agreements are made between the IT staff and the customers, and the IT desk must monitor their performance as compared to the agreements. In addition, underpinning contracts with external vendors and operational level agreements with internal vendors ensures that these service level agreements are feasible.

Availability management
The availability management process ensures that availability within a system is kept as close to 100% as possible. By both reacting to past service failures, and planning to avoid future service failures, availability management can greatly increase end-user satisfaction with services.

Capacity management
The capacity management process is designed to ensure that business services are not made unavailable by over-capacity. By analyzing past failures and planning for growth of demand of services, capacity management can increase end-user satisfaction with services.

Supplier management
Supplier management is a process that defines and monitors agreements between an IT department and an external supplier.

Service catalog management
The service catalog provides a front end for customers to request items and services. Service catalog management ensures that this service catalog provides accurate and useful information on the items and services.

Service transition
This guide provides a general overview of ITIL service transition concepts and how the Now Platform can enable these processes.

Change management
The change management process ensures that standardized methods and procedures are used for efficient and prompt handling of all changes to minimize the impact of change related incidents on service quality. Consequently, change management aims to improve the day-to-day operation of the organization. IT-related changes that may affect one or many customers are tracked with change management. Adding memory to one machine, getting a new server, and installing the latest Windows OS on all PCs are all examples. To find out how the ServiceNow platform implements change management, see Change Management.
Knowledge management

The knowledge management process ensures that important information flows freely throughout the IT organization. Knowledge management keeps the CMDB and knowledge base of an organization up-to-date, and uses a knowledge-centered support approach to reduce repeat incidents and problems. For more information on how the ServiceNow platform implements knowledge management, see Knowledge Management.

Asset management

Asset management enables a process of monitoring processes, organizations, people, information, applications, infrastructure, and financial capital within an organization. This allows the organization to collect accurate records of these business components, making them available for both internal and external auditing processes. To find out how the Now Platform implements asset management, see Asset Management.

Configuration management

Configuration management provides a logical model of the infrastructure or a service by identifying, controlling, maintaining and verifying the Configuration Items in existence. To find out how the Now Platform implements configuration management, see .

Release management

This discipline of IT service management is the management of all software configuration items within the organization. It is responsible for the management of software development, installation and support of an organization’s software products. Software Control & Distribution procedures include the management of the software Configuration Items and their distribution and implementation into a production environment. This involves the definition of a release program suitable for the organization, the definition of how version control is implemented, and the procedures surrounding how software is built, released and audited. To find out how the Now Platform implements release management, visit Release Management.

Populate the CMDB

You can populate the CMDB by using Discovery, by importing information from another source, by integrating with an existing external CMDB, or by manually creating CIs.

When you populate the CMDB with information, you create a record for each configuration item in the cmdb_ci table or on one of the tables that extend that table.

ITIL configuration management auto-discovery

The key to any configuration management business practice is the initial and on-going inventory or discovery of what you own. The ServiceNow platform provides three options for auto-discovery:

- The separate and highly robust Discovery product.
- A lightweight native discovery tool, called Help the Help Desk, as part of the overall CMDB.

Help the Help Desk enables organizations to proactively scan their network to discover all Windows-based PCs and the software packages installed on those PCs. This WMI-based
discovery is included in the core ServiceNow functionality, in the Self Service application, at no additional cost.

- For organizations that want to leverage the discovery technologies they already have deployed (SMS, Tally NetCensus, LanDesk, and so on), the ServiceNow platform supports integrations to those technologies via web services. Scanned data can be mapped directly into the CMDB.

For further information on designing, constructing, and maintaining the CMDB, see white papers **CMDB Design & Configuration** and **CMDB Design**.

**Discovery**

The Discovery product automatically populates the CMDB. Discovery runs probes and sensors to collect information on hardware on the network, software running on that hardware, and the relationships between all the items found. This information is sent back to the ServiceNow instance, and is used to populate the CMDB.

**Import information from another source**

Information can be imported to the CMDB using import sets. **Import sets** find files of information (in formats such as XML, Excel, or CSV), import them, and transform them onto the required table. This process can be scheduled or performed on demand.

To import relationships between CIs, use import sets to populate the table \( \text{cmdb\_rel\_ci} \) with information on the parent, the child, and the nature of the relationship. The \( \text{cmdb\_rel\_ci} \) table displays a list of all CI relationships and is useful when importing CI data.
Integrate with an existing external CMDB

If the data required for the CMDB is already being collected by another CMDB, it is possible to collect the information from that CMDB in an automated process.
CMDB import integration overview

CMDB instance API

Use the CMDB instance API to populate the CMDB by creating or updating CMDB tables.

Manually create a CI

Create a single CI for a specific class. The role required is based on the selected table settings.

1. Use the CI Class Manager:
   a. Navigate to Configuration > CI Class Manager.
   b. Click Hierarchy to display the list of CI Classes. Select the class to use for the CI.
   c. In the class navigation bar, select CI List and then on the CI list view, click New.
   d. Fill out the CI form and then click Submit.

2. Or, directly use a table:
a. Navigate to and expand **Configuration** and then elect the class to use for the CI, such as Business Services.

b. In the navigation filter of the application navigator, enter the table label (such as 'Linux'), or the table name in the format of `<table name>.list` (such as 'cmdb_ci_linux_server.list'). Then, press Enter.

c. In the list view of the table, click **New** and fill out the form fields for the table.

d. Click **Submit**.

**Baseline CMDB**

CMDB baseline provides capabilities that help you understand and control the changes that have been made to your configuration items (CIs) in the CMDB.

- You can create a baseline, which is a snapshot of your configuration items in the CMDB. You can review the changes that have been made to that configuration item since a previous baseline. Multiple baselines may be created and the system tracks the changes that have been made per baseline.

  Creating a baseline captures the attributes of the CI as well as all first-level relationships for the CI. Any changes to the base CI or to any related CIs are captured and displayed. Newly created CIs are not automatically added to a baseline.

- Associate a configuration item with a task, a change or change task, and to propose changes to the CI after the change is complete. You can record changes, and these changes are not applied to the CI immediately but are delayed until the change is complete.

  When the change is complete, you can choose to apply the proposed changes which makes all changes previously proposed and associates the changes with the task.

**Create a CMDB baseline**

You can create a baseline for a CI to track updates to the CI over time.

Role required: ecmdb_admin and itil

1. Navigate to **Configuration > Baselines > Baselines**.
   
   If the Baselines module is not visible in the Configuration application, the module is inactive. In that case append `/sys_app_module.do?sys_id=f4463879a9fe3dba01b30bc100c0b04` to the instance URL, and in the **Module - Baselines** form, ensure that the module is **Active**.

2. Click **New**.

3. Enter a **Name** for the baseline.
   
   By default, the cmdb_ci table is selected so that the record creates the baseline for all configuration items in the system.

4. Optional: To limit the baseline to specific CIs, select a different **Table** or choose **Conditions** that a CI must meet for it to have a baseline entry.
   
   For example, you might create a baseline for the Database table with the condition 
   
   (Location) (is) (<configured location>).

5. Click **Submit**.

   The creation of a baseline is time consuming and occurs in the background. A message at the top of the record list notifies you that your baseline has been scheduled and you will receive an email when the process is complete.
Display baseline differences

You can see the changes that have been made to a CI or any first level related CIs by configuring the CI form layout to display the CMDB Baseline diff field. This field is labeled Baseline differences on the form.

Role required: itil

Changes are displayed only for the cmdb_ci table and child tables.

1. Open a CI record.
2. Select the baseline you want to see for this CI from the choice list.
   The field displays the details of any changes that were made to the current record for the selected baseline, or indicates that no changes were made.

<table>
<thead>
<tr>
<th>Baseline differences</th>
<th>For: SQL Baseline</th>
</tr>
</thead>
<tbody>
<tr>
<td>Basic attribute changes</td>
<td></td>
</tr>
<tr>
<td>2009-09-14 14:46:49  System Administrator - Changed: RAM (MB), Disk space (GB)</td>
<td></td>
</tr>
<tr>
<td>RAM (MB): 4 was: -1</td>
<td></td>
</tr>
<tr>
<td>Disk space (GB): 500 was: 100</td>
<td></td>
</tr>
</tbody>
</table>

Details of baseline differences

3. To add a relationship to the CI, click the green plus icon in the Related Items toolbar. The new relationship appears below the toolbar. For more information about the Related Items toolbar and how to control the display, see CI relations formatter.

4. Update a related CI and see the changes displayed as Basic attribute changes in the current CI record.

<table>
<thead>
<tr>
<th>Baseline differences</th>
<th>For: SQL Baseline</th>
</tr>
</thead>
<tbody>
<tr>
<td>Basic attribute changes</td>
<td></td>
</tr>
<tr>
<td>2009-09-14 15:17:42  System Administrator - Changed: Sys audit, RAM (MB), Disk space (GB)</td>
<td></td>
</tr>
<tr>
<td>Storage Area Network 002 was: (relationship added) - CI Relationship Change</td>
<td></td>
</tr>
<tr>
<td>ApplicationServerPeopleSoft was: (relationship added) - CI Relationship Change</td>
<td></td>
</tr>
<tr>
<td>RAM (MB): 4 was: -1</td>
<td></td>
</tr>
<tr>
<td>Disk space (GB): 500 was: 100</td>
<td></td>
</tr>
</tbody>
</table>

Managing proposed changes

The proposed changes feature allows you to pre-configure changes to configuration items and their associated relationships. These pre-configured changes are prepared to be implemented, but do not actually happen until they are applied at a later time.

When you view a CI, the proposed changes can be displayed so that you can see what is planned.

This feature is useful when you want to make modifications while a change process is in the approval stage, and only implement the changes after the approvals are complete. If the
change is never approved, no changes to records have to be reversed. If the change is approved, a quick command applies all the proposed changes.

You can make the following proposed changes to a CI:

- Modify any field on the CI form.
- Add or delete a relationship to that CI.

To modify a relationship, you must delete the current relationship and add a new relationship. You cannot delete a proposed change.

**View CI history**

You can view the history of changes to a CI in a list, calendar, or timeline format.

**View the proposed changes of a CI**

You can view the proposed changes so that you can see what is planned for the CI.

Role required: personalize_form

To view any proposed changes, configure the CI form layout to display the **CMDB Scheduled Changes** field. Proposed changes are not displayed in a CI form by default.

1. Navigate to **Change > Open** and open a change request.
2. In the **Affected CIs** related list, open the **Configuration Item**.
   You may also navigate directly to the CI form.
3. Right-click the form header bar.
4. Select **Configure > Form Layout**.
5. Move the **CMDB Scheduled Changes** field to the **Selected** pane.
6. Click **Save**.

   The CI form shows the details of any proposed changes in the **Scheduled changes** area.

**Add a proposed change to a CI**

Proposed changes to a CI can be made while viewing a change request or any task-related record.

Role required: itil

1. In the Change Request form, go to the **Affected CIs** related list.
   If there are no CIs in the Affected CIs list, click **Edit** to add CIs that are affected by this change request.
2. Right-click the CI that you want to configure for a proposed change, and select **Proposed Change**.
3. Complete the form to make the proposed changes, and click **Save Proposed Change**.
   Click **Update** to apply the changes immediately. Click **Delete** to delete the CI.
4. To propose an addition or a removal of a CI relationship:
   a) Click the plus icon in the **Related Items** section.
   b) In the Relationships section, add or delete a relationship. For information about using the relationship editor, see **Create or edit a CI relationship**.
   c) Click **Save Propose Change**.
d) Confirm saving the proposed change.

Click **Update** or **Delete** to commit the changes immediately.

**Note:** Use only with CI relationships. Proposing additions or removal of relationships is not valid for user relationships and group relationships.

After the proposed changes are saved, the **Apply Proposed Changes** button appears on the Change Request form. This button lets the user commit the proposed changes to the CI. Your business processes determine the appropriate time to commit the changes. The CI retains the existing data until the proposed changes are committed. However, users can see that changes have been proposed.

**Apply a proposed change to a CI**

When you apply the proposed changes, all the proposed changes for that change request are applied to the configuration item. You can apply proposed changes without verification, or if verification tests of the proposed changes have failed.

Role required: itil

After you apply the proposed changes, the **Scheduled changes** part of the form displays **No scheduled changes found**. You can configure proposed change verification rules which you can use to verify proposed changes before applying the changes.

1. Navigate to the Change Request form.
2. Click the **Apply Proposed Changes** button.
   
   You may have to right-click the form header and select the **Reload Form** option to see the changes.

**Create or edit a proposed change verification rule**

Ensure that proposed changes meet business requirements and do not introduce invalid data to the CMDB, create a rule that includes a script to verify the proposed changes.

Role required: asset or itil

When you configure proposed change verification rules for a CI, you have an option to verify that the proposed changes pass the verification test script in the rule. The verification test results are logged as passed or failed, and you can view the results. Running the verification test is not mandatory, and a failed verification test does not prevent you from applying proposed changes.

1. Navigate to **Configuration > Change Verification > Proposed Change Verification Rules**.
2. Click **New** or select an existing rule to edit.
3. Fill in the fields, as appropriate.

**Proposed Change Verification Rules form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rule name</td>
<td>The name of this rule.</td>
</tr>
<tr>
<td>Table name</td>
<td>The table to which the rule applies.</td>
</tr>
<tr>
<td>Filter condition</td>
<td>Conditions to apply this rule to specific CIs.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to activate this rule.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Rule script</td>
<td>A verification Java script that needs to return true or false. For example:</td>
</tr>
</tbody>
</table>
|               | ```javascript
validateRule()
{
  var os =
current.getValue("os");
  var cpu =
current.getValue("cpu_count");

  //Use
current.getValue(fieldName)
to get the proposed
change value, eg. var os =
current.getValue("os");
  //Your verification code
  if (os != "SunOS" || cpu < 2)
    return false;
  //Return true to pass the
  // verification and false if the
  // verification failed
  return true;
} ``` |

4. Click **Submit** or **Update**.

On the **Change Request** form, you can click **Verify Proposed Changes** to verify proposed changes for the affected CIs.

### Verify proposed changes

Before applying proposed changes to affected CIs, use proposed change verification rules to verify that the changes meet business requirements and do not add invalid data to the CMDB.

Create or edit the rules used to verify proposed changes. For details, see [Create or edit a proposed change verification rule](#).

Role required: none

You can apply proposed changes even if they are unverified or fail a verification test.

1. Open the **Change Request** form that affects the CI.
2. Click **Verify Proposed Changes**.
   The proposed changes are verified against any proposed change verification rules in which the CI meets the **Filter condition** criteria.
3. Review the message that appears at the top of the form after the verification process is finished.
   The message states whether the verification tests passed or failed.

To view the details of any verification tests that were performed for the change request in the past two days, click the **Proposed Change Verification Log** related link.
Create or edit a planned change validation script

Create a custom script that checks if a change to a class was valid according to business requirements, and whether the change was planned or not. A planned change validation script is used whenever a CI change is viewed in the CI timeline or change history.

Role required: admin or itil

The system attempts to validate each CI change as follows:

- If a custom script exists for the CI or one of the CI parents, then the script is executed and the results are used to flag the change as valid or invalid. Parent CIs are examined in the hierarchical order.
- If a custom script does not exist for the CI or any of its parents, then a predefined validation script is used. The change is determined as a planned change if the change occurred between the **Work start** and **Work end** dates of the change request associated with the changed CI.

However, this check is not always reliable because a user might have manually modified the CI within the work dates, which flags the change as valid even if it is invalid.

The script needs to return a boolean, true or false, which depends on meeting the test criteria in the script. You can define a separate script for each CI class, and you can define multiple planned change validation scripts for a single class. For example, to maintain different versions of the script. Only one script can be active for a CI class at any given time.

These are the parameters that uniquely characterize a change:

- The fields that were changed
- The data source that performed the change
- The time stamp of the change

To correctly determine the validity of a change, examine the parameters and apply business logic to evaluate if the validation tests are met. A planned change validation script can test any of these characteristics and determine when a change meets pre-established criteria. For example, the custom script can check if the mode of the CI is operational or maintenance, or who initiated the change.

1. Navigate to **Configuration > Change Verification > Planned Change Validation Script**.
2. Click **New** or select a validation script to edit.
3. Complete the form.

### Planned change validation script form

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check box to activate this script for validating changes.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Class that this script applies to.</td>
</tr>
<tr>
<td>Script</td>
<td>Script to run to validate a change. If the script does not return a boolean value, then it is configured to false.</td>
</tr>
</tbody>
</table>
### Template script input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>current</td>
<td>GlideRecord</td>
<td>Current record that is being processed.</td>
</tr>
<tr>
<td>updatedOn</td>
<td>GlideDateTime</td>
<td>Time stamp of the change.</td>
</tr>
<tr>
<td>updatedBy</td>
<td>String</td>
<td>Entity responsible for the change.</td>
</tr>
<tr>
<td>fieldsChanged</td>
<td>String</td>
<td>Comma-separated list of the names of all fields that were changed.</td>
</tr>
</tbody>
</table>

This sample script checks who initiated the record update. It returns true if admin initiated the record update. Otherwise, the script returns false.

```javascript
isValidChange();

function isValidChange(/*GlideRecord current, GlideDateTime updatedOn, String updatedBy, String changedFields*/) {
  //Return true if the user that updated the record has an admin role
  return isUserAdmin(updatedBy);
}

function isUserAdmin(userName) {
  var grUser = new GlideRecord("sys_user");
  grUser.addQuery('name', userName);
  grUser.query();
  if(grUser.next()) {
    var roles = new GlideRecord("sys_user_has_role");
    roles.addActiveQuery();
    roles.addQuery('user', grUser.sys_id);
    roles.query();
    while(roles.next()) {
      if(roles.role.name == 'admin')
        return true;
    }
  }
  return false;
}
```

4. Click Submit.

### CI relationships in the CMDB

The CMDB, in contrast to a static asset list, helps you track not only the configuration items (CIs) within your system, but also the relationships between those items.

A relationship in the CMDB consists of two CIs and a relationship type:

- Parent CI
- Child CI
For example, in the (Server1) (Managed by) (Server2) relationship:
- Server1 is the child CI
- Server2 is the parent CI
- (Managed by) is the relationship type

For example, a web application might read data from an instance of Oracle, which in turn might depend on a piece of underlying hardware. Most CIs in a CMDB have multiple relationships to other CIs, users, and groups.

The system keeps a table of relationship types that are appropriate for a CI type, based on its class. You can view these relationships by navigating to Configuration > Suggested Relationships. You can also add additional suggested relationships.

Suggestion model
The relationship editor has a base CI. The base CI designates the CI that a user was on before launching the relationship, for example, a user was on Linux100 before launching the relationship editor. If the base CI is a Linux server, then the relationship editor looks at the base class of the user or any of its parent classes. For example, when looking at a Linux server, the suggestion model would retrieve any relationships whose base class was cmdb_ci_linux_server, cmdb_ci_server, cmdb_ci_computer, or cmdb_ci.

Many CI types are children of other types in the hierarchy. For example, the class hierarchy for a Linux server is:
- cmdb_ci
- cmdb_ci_computer
- cmdb_ci_server
- cmdb_ci_linux_server

Looking at a Linux server, the suggestion model works by analyzing the suggested relationship table for all relationships whose base class is the current base class of the user or any of its parent classes. For example, when looking at a Linux server, the suggestion model would retrieve any relationships whose base class was cmdb_ci_linux_server, cmdb_ci_server, cmdb_ci_computer, or cmdb_ci.

Suggested CI relationships in the relationship editor
The relationship editor uses the suggestion model to help users select reasonable relationships for a CI type based on its class. You can view these relationships by navigating to Configuration > Suggested Relationships. You can also add additional suggested relationships.

Typically, a user uses these relationships to define the following relationship types:
- Provides Power for :: Receives Power From
- Runs on :: Hosts

For example, consider these relationship types in the system:
- a database runs on a server

The relationships between CIs in a CMDB can be automatically discovered if you use Discovery, many relationships can be automatically imported from another system, and you get some form of relationships to other CIs, users, and groups.
- a rack provides power for a server

Typically, neither of the following definitions would be appropriate:
- a rack runs on a server
- a server runs on a database

**Add a suggested CI relationship**

You can define suggested relationships that can be selected when new CI relationships are created.

Role required: admin

1. Navigate to **Configuration > Relationships > Suggested Relationships**.
2. Click **New**.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Base class</td>
<td>The base class in the relationship, which depending on the relationship type, is either the parent or the child in the relationship.</td>
</tr>
<tr>
<td>Relationship</td>
<td>Relationship type.</td>
</tr>
<tr>
<td>Dependent class</td>
<td>The dependent class in the relationship, which depending on the relationship type, is either the parent or the child in the relationship.</td>
</tr>
</tbody>
</table>

You can add suggested relationships such as the following

<table>
<thead>
<tr>
<th>Base Class</th>
<th>Relationship</th>
<th>Dependent Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle</td>
<td>Is Hosted On</td>
<td>Linux Server</td>
</tr>
<tr>
<td>Oracle</td>
<td>Is Hosted On</td>
<td>Solaris Server</td>
</tr>
</tbody>
</table>

Note: The same parent class and relationship can appear more than once.

You may need to delete a suggested relationship, for example, to limit the choice of available relationships in the CI relationship editor. Removing a suggested relationship does not affect relationships that are created or updated by Discovery.

**CI relations formatter**

The default CI form includes a CI relations formatter from which you can examine a CI and its relationships in various views. From the CI relations formatter, you can also launch the CI relationship editor for the CI.

If the domain separation plugin is activated, then only relationships in which the logged on user is authorized to view both CIs, are displayed.

The CI relations formatter contains a list of related CIs and a toolbar with controls for viewing the relationships between the current CI and related CIs. You can configure the controls in this...
formatter to modify varying aspects of the view. For more information about formatters, see Create a formatter and add it to the form.

**Note:**
- If an endpoint is a child in one relationship and the same endpoint is a parent in another relationship, then that endpoint is hidden and does not appear in the relations formatter view. Similarly, relationship qualifier chains are also hidden and do not appear in the relationship formatter view.
  - Example: CI1 > endpoint > CI2
    - In this example, CI1 is related to CI2 through relationships with endpoint. A single relationship appears in the relations formatter.
    - CI1 > CI2 (These relationships appear as a direct relationship without endpoint, because endpoint is a parent in one relationship and a child in another relationship)
  - Example: CI1 > endpoint1 > CI2 > endpoint2
    - Two relationships appear in the relations formatter:
      - CI1 > CI2 (endpoint1 is hidden because it is a parent in one relationship and a child in another relationship)
      - CI1 > CI2 > endpoint2 (appears as level 2 relationship – endpoint1 is hidden and endpoint2 appears as if a child and not a parent in any other relationship)
- On instances that do not meet the internet browser requirements for the CI relations formatter, the default CI form includes the legacy CI relations formatter instead. For more information, see Legacy CI relations formatter.
- CIs not extended from the Configuration Item (cmdb_ci) table, are not displayed in Dependency Views maps and in CI relation formatters.
- The Applicative Flow To::Application Flow From relationship is a special relationship type used only between Service Mapping endpoints. This relationship type is not intended for use in the CMDB as a relationship between CIs and therefore it is not displayed in the relations formatter.

### Controls for viewing related CIs

<table>
<thead>
<tr>
<th>Control</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="Image" alt="Add CI relationship" /></td>
<td>Starts the relationship editor to manually create CI relationships. For more information, see Create or edit a CI relationship.</td>
</tr>
<tr>
<td><img src="Image" alt="Show dependency views" /></td>
<td>Launches a Dependency Views map in another window or tab. The CI is the central node in the map, with a configurable number of levels above and below that node in the hierarchy. Map indicators next to the nodes indicate the number of tasks, incidents, problems, changes, or outages related to that node. Right-click to expand collapsed nodes or display a list of related tasks or problems. For more information, see Dependency Views map.</td>
</tr>
<tr>
<td><img src="Image" alt="Search for CI" /></td>
<td>Filters the CIs included in the display.</td>
</tr>
</tbody>
</table>
Click the **Settings** (⚙️) icon to configure additional view settings that filter the data displayed. Settings are preserved through logging out and logging back in.

### Related items settings

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show Relations in Flat/Tree Layout</td>
<td>To view a flat list of related CIs that are grouped by relationship type in alphabetical order, click <strong>Flat</strong>. If you select the tree view, you cannot configure any other settings for viewing related CIs. A single list of upstream and downstream relationships is displayed.</td>
</tr>
<tr>
<td>Show Relations in Split/Merge Layout</td>
<td>To view separate lists for upstream and downstream relationships, click <strong>Split</strong>. To view a single list that includes both upstream and downstream relationships, click <strong>Merge</strong>. Relationships are grouped by relationship type.</td>
</tr>
<tr>
<td>Filter Relations by Max Level</td>
<td>Select the number of levels in the hierarchy to include when displaying CIs in a flat view.</td>
</tr>
<tr>
<td>Filter Relations by Relationship Type</td>
<td>Select the types of relationships to view.</td>
</tr>
<tr>
<td>Filter Relations by CMDB View</td>
<td>Filter by tables specified in CMDB views, if any relationship filters exist.</td>
</tr>
</tbody>
</table>

The relations formatter uses the following icons to provide additional information about changes, problems, and outages related to CIs in the relationship:

### Icons related to CIs

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>📄</td>
<td>Recently closed changes</td>
</tr>
<tr>
<td>📄✍️</td>
<td>Planned changes</td>
</tr>
<tr>
<td>📄📝</td>
<td>Currently open changes</td>
</tr>
<tr>
<td>📄🌟</td>
<td>Recently closed outages</td>
</tr>
<tr>
<td>📄✓</td>
<td>Problems</td>
</tr>
<tr>
<td>📄⚠️</td>
<td>Incidents</td>
</tr>
<tr>
<td>📄☐</td>
<td>Planned outages</td>
</tr>
</tbody>
</table>
In large networks, a list of related CIs might be excessively long, which can slow performance when a CI form is rendered. You can configure these properties to control the amount of data that is displayed. To find a property, enter `sys_properties.list` in the left navigation filter and search for the property.

### Properties related to performance

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>glide.ecmdb.find_relationship_issues</code></td>
<td>Hides or displays an icon in the CI relations formatter that links to open issues for the CI. This property defaults to true (displays the icon).</td>
</tr>
<tr>
<td><code>glide.ui.max_relation_levels</code></td>
<td>Specifies the maximum level for displaying CIs in flat view before reaching the maximum relations limit. The default value is 5.</td>
</tr>
<tr>
<td><code>glide.ui.max_relations</code></td>
<td>Specifies the maximum number of related CIs to display. When exceeded, a notification is displayed indicating that the limit has been reached, and that not all relations are displayed. The default value is 1000.</td>
</tr>
</tbody>
</table>

### Domain separation for the relations formatter and the CI relationship editor

This is an overview of domain separation as it pertains to the relations formatter and the CI relationship editor. Domain separation allows you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

### Overview

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see [Application support for domain separation](#).

### How domain separation works in the relations formatter and relationship editor

- **Relations formatter**
  
  The relations formatter is domain-separation supported. The relations formatter is used to display CMDB relationships in the UI in different views. Since the CI Relationship (cmdb_rel_ci) table is not domain separated, relationships are visible in the relations formatter only if both parent and child CIs (cmdb) are visible in the domain.

  The CI Relationship Type (cmdb_rel_type) table is not domain separated. Therefore, in the relations formatter, all the relationship types are available to be selected as a filter.

  By default domain separation is supported in the relations formatter.

- **Relationship editor**
The relationship editor is domain-separation supported. You can use the relationship editor to add new relationships or delete existing relationships for the current CI.

- The CI relationship editor displays a list of CIs to add or remove from relationships. Since they are domain separated, the CI list view in the relationship editor displays the CIs that are visible to the current domain.
- The CI relationship editor displays a list of relationships to add or remove. Since the CI Relationship (cmdb_rel_ci) table is not domain separated, the relationships list view displays all the relationships of the current CI.

The Suggested Relationship (cmdb_rel_type_suggest) table is not domain separated, which means that all the suggested relationship types in the relationship editor are visible for all domains.

By default domain separation is supported in the relationship editor.

**Create or edit a relationship filter**

Create a custom relationship filter to display CI relationships from selected tables in the CI relations formatter.

Role required: ecmdb_admin

The CI relations formatter displays related CIs for the base CI, and the relationships between the CIs. You can use relationship filters on the CI relations formatter to customize CI relationship views.

1. Navigate to **Configuration > Relationships > Relationship Filters**.
2. Click **New** or select a filter to edit.
3. Enter or edit the relationship filter name.
4. Right-click the form header and click **Save**.
5. In the **Configuration Types** section, click **Edit**.
6. On the **Edit Members** form, select the tables of the CIs that you want to show with the filter and then move the tables to the **Configuration Types list**.
7. Click **Save**.

On a CI form, in the relations formatter settings, you can select the newly defined relationship filter from the **Filter Relations by CMDB View** list.

In the legacy CI relations formatter, you can click **View** and select the newly defined relationship filter.

After you select a filter, the relations formatter displays only CIs from the tables specified in the filter or from descending tables.

**Exclude relationships from the relations formatter view**

Create a list of relationships that should not appear in the relations formatter view on CI forms.

Role required: ecmdb_admin

1. Navigate to **Configuration > Relationships > Relationship Type Exclusion List**.
2. In the CI Relation Filters list view, click **New**.
3. Fill out the CI Relation Filter form to specify the relationship that you want to exclude from view.
4. Click **Submit**.

Excluded relationships do not appear in Related Items on CI forms.
Legacy CI relations formatter

On instances that do not meet the internet browser requirements for the latest CI relations formatter, the default CI form includes the legacy CI relations formatter instead.

This element contains the list of related CIs and a toolbar with controls for viewing the relationships between the current CI and related CIs.

Related items field

Note: The legacy BSM map provides a more complete view of CI relationships.

Configure the controls in this formatter with two properties that restrict varying aspects of the view.

Flat layout

Click the flat layout icon (雛) to group the related CIs by relationship.

Tree layout

Click the tree layout icon (雛) to group the related CIs in a hierarchical tree.
CI relationship editor

Use the CI relationship editor to create CI relationships.

When you use the relationship editor, the CI from which the editor was launched is designated as the base CI. You can then select one or more CIs as a second CI for the relationship. Depending on the selected relationship type, the base CI can become the parent CI or the child CI in the new relationship.

The relationship editor operates differently, depending on whether you select the **Use suggested relationship** check box.

- With suggested relationships, the relationship editor lists all available relationship types for the base CI. To define a new relationship, select a relationship type, and then select a second CI for the relationship.

  Suggested relationships are highlighted for you. These relationships are displayed in blue with a prefix of (Suggested).

- Without suggested relationships, you define a new relationship by first selecting a second CI for the relationship and then selecting a parent or a child relationship type.

**Note:** The following relationship types are used only for Service Mapping endpoints, and you cannot use them as a relationship type between two CIs:

- **Implement End Point To:** Implement End Point From
- **Use End Point To:** Use End Point From
- **Applicative Flow To:** Applicative Flow From

Suggested relationships

If you select the **Use suggested relationship** check box in the editor, the **Suggested relationship** list appears. It displays all available CI, user and group relationship types for the base CI. Relationship types have a suffix of (Parent) or (Child) to note the relationship descriptor, and suggested relationship types are displayed in blue and have a *** prefix.

When you select a relationship, you are also designating the base CI as being the parent or the child CI in the new relationship. For example, if you select the ‘Feeds’ relationship type, the base CI becomes the designated parent CI, and the second CI that you select becomes the child CI in this relationship.
Downstream relationships

If you do not select the **Use suggested relationship** check box in the editor, the **Downstream relationships** list appears. It displays all relationships in which the base CI is the parent CI. The child CI of the relationship is displayed in the **Child** column.

Upstream relationships

If you do not select the **Use suggested relationship** check box in the editor, the **Upstream relationships** list appears. It displays all relationships in which the base CI is the child CI. The parent CI in each relationship is displayed in the **Parent** column.

Supported browsers for the relationship editor

You must use supported browser versions in order to use the latest CI relationship editor. If you do not use a supported browser version, the instance provides the legacy CI relationship builder.

- Firefox version 20 and up
- Chrome version 25 and up
- Safari version 6 and up
- Internet Explorer version 9 and up

Create or edit a CI relationship

Use the relationship editor to view, create or modify CI relationships. You can open the relationship editor from the CI Relations formatter.

Role required:

- To create relationships: ITIL or asset
- To view relationships, depending on the state of the Table API ACL:
  - If inactive (default): ITIL or asset
  - If active: ITIL or asset, and snc_platform_rest_api_access

For more information, see [REST API security](#) and [Table API](#).

The relationship editor operates differently, depending on whether you check the **Use suggested relationship** option or not.

1. Launch the relationship editor:
   a) Open a CI form.
   b) Locate the **Related Items** section near the center of the form.
   c) Click the plus (+) icon on the **Related items** section.

2. To use suggested relationships, first select a relationship type, and then select one or more CIs to be the child CIs in the relationship:
a) Select **Use suggested relationship**.
b) From the **Suggested relationship type** list, select a relationship type. You can filter the list of suggested relationships by using the filter check boxes.

<table>
<thead>
<tr>
<th>Filter option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hide CI relationship</td>
<td>Hides any relationships between the base CI and another CI (such as &quot;receives data from&quot;). Default filter is stored in the cli_manage_relationships_filter_hint.cmdb_ci user preference.</td>
</tr>
<tr>
<td>Hide user relationship</td>
<td>Hides any relationships between the base CI and a user (such as &quot;logs reviewed by&quot;). The default filter is stored in the cli_manage_relationships_filter_hint.sys_user preference.</td>
</tr>
<tr>
<td>Hide group relationship</td>
<td>Hides any relationships between the base CI and a group (such as &quot;backups done by&quot;). Default filter is stored in the cli_manage_relationships_filter_hint.sys_user_group user preference.</td>
</tr>
</tbody>
</table>

The **Configurations Items** list displays all the CIs that are appropriate for the base CI and the selected relationship type. The **Relationships** list at the bottom of the editor, displays all existing relationships of the selected relationship type, in which the base CI is a parent CI or a child CI.

c) From the **Configuration Items** list, select one or more CIs as a second CI for the relationship.

You can filter the list of **Configurations Items** by adding conditions in the **Filter** section and clicking **Run filter**.

If you selected a parent relationship type, these CIs becomes the child CI in the relationship, and if you selected a child relationship type, then the selected CIs become the parent CI in the relationship.

d) In the **Relationships** section, click the plus icon (+) to add the new relationships. Alternatively, you can drag the selected CIs to the **Relationships** list. Each new relationship will consist of the base CI, the selected relationship type, and a selected second CI.

3. To not use suggested relationships, first select one or more CIs to be the child CIs in the relationship, and then select the relationship type:
a) Clear **Use suggested relationship**.

b) In the **Configuration Items** list, select one or more CIs as a second CI for the relationship. You can filter the list of **Configurations Items** by adding conditions in the **Filter** area and clicking **Run filter**. Depending on the relationship type that you will select, the selected CIs might become a parent or a child CI in the relationship.

c) With at least one CI selected in the **Configuration Items** list, click the ‘+’ sign in the **Downstream Relationships** section or the **Upstream Relationships** section to create the relationship.
• Add the relationship to **Downstream Relationships** to create a relationship in which the base CI is the parent CI and the selected CI is the child CI.
• Add the relationship to **Upstream Relationships** to create a relationship in which the base CI is the child CI and the selected CI is the parent CI.

d) For each newly created relationship in either the **Downstream Relationships** or the **Upstream Relationships** lists, click **Please select a relationship** and select a relationship type.

- The list of available relationship types in the **Downstream Relationships** list contains parent relationships only, in which the base CI is the parent CI.
- The list of available relationship types in the **Upstream Relationships** list contains child relationships only, in which the base CI is the child CI.

e) Click **Save** or **Save and Exit**.

Only after you enter all the information that is necessary for creating the relationship, these buttons light up indicating that there are pending updates that require saving.

**Legacy CI relationship builder**

Used to define CI relationships manually, this page is a sophisticated version of the standard slushbucket. In the legacy CI relations formatter, click the CI relationship builder icon (†) to display the legacy Define Relationships page.

**Select a CI relationship type**

The top half of the legacy relationship editor contains a large option box that allows you to select which type of relationship you want to manipulate. Click the particular type of relationship you are interested in working with.

**Filter the list of CI relationships**

In the legacy relationship editor, the checkboxes along the right hand edge of the select box provide a quick way to filter down the list of available relationships.

By default, the system displays a list of all suggested relationships for the type of CI you selected. For example, if you selected a Database instance, a relationship of "Runs on" makes sense, but a relationship of "Provides HVAC for" does not. The default filter is stored in the user preferences ci_manage_relationships_filter_hint.cmdb_cici_manage_relationships_filter_hint.sys_user, and ci_manage_relationships_filter_hint.sys_user_group.

- **Hide CI relationship** -- Hides any relationships between this CI and another CI (e.g. "Receives data from").
- **Hide user relationships** -- Hides any relationships between this CI and a user (e.g. "Logs reviewed by").
- **Hide group relationships** -- Hides any relationships between this CI and a group (e.g. "Backups done by").
- **Show all relationships** -- If you have the appropriate role (out of the box this is itil_admin) you will have an additional checkbox labeled "Show all relationships." If you click that checkbox, the system will let you choose any relationship defined in the system, regardless of where it is on the "suggested" list for this type of CI.
Select CI relationship targets

In the legacy relationship editor, users can link or unlink CIs for a relationship type.

As soon as you pick a relationship type, the system will fill in the two select boxes at the bottom of the screen with CIs that are appropriate for the relationship you suggested. The left hand select box will contain a list of CIs that might reasonably be linked via this relationship, while the right hand box contains a list of those CIs which are already linked.

1. Link or unlink items.

<table>
<thead>
<tr>
<th>Link new items</th>
<th>Move that CI from the left hand box to the right hand box.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unlink existing items</td>
<td>Move them from the right hand box to the left.</td>
</tr>
</tbody>
</table>

**Result:** When you make either type of change, a message appears indicating that you have pending changes.

2. Apply or cancel your changes.

<table>
<thead>
<tr>
<th>Click the Save button.</th>
<th>This will save your set of changes, and go back to the previous screen (either a CI or the BSM map depending on how you got here).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Click the Cancel button.</td>
<td>This causes you to exit without saving your changes.</td>
</tr>
</tbody>
</table>

Relation qualifier

A relation qualifier, which is a CI of the Qualifier (cmdb_ci_qualifier) type, stores important information about the CI relationships.

In a relation qualifier, you can annotate arbitrary unique information about the relationship between two CIs. You can define multiple qualifiers for a single relationship, resulting in a qualifier chain. But, there can be only a single qualifier chain for a specific relationship type between two CIs.

For example, for a relationship between a parent CI and a child CI, you can add a relation qualifier to note that the relationship was discovered based on traffic (such as cmdb_ci_qualifier_trafficbased). This results in having two records in the CI Relationship (cmdb_rel_ci) table for the relationship.

- A record that links the parent CI and the new qualifier
- A record that links the new qualifier and the child CI

For this relationship, there is a parent CI and a child CI, and a relation qualifier of type cmdb_ci_qualifier_trafficbased.

For information about usage of relation qualifiers in the identification process, see Identification rules.
CI relationship security

When applying security to CI relationships, it is important to apply the access controls both to the CI Relationship (cmdb_rel_ci) table and to create an operation editCIRelations to the * table as well.

If the current instance has defined security for editCIRelations, it will be applied to edit_ci_relations automatically in the process of upgrading, and the out-of-date security will be removed.

Create a CI relation rollup

A CI relation rollup allows you to sum, count, max, min, or mean a relationship type. You can create CI relation rollups.

Role required: ecmdb_admin

CI relation rollup can be useful for tracking and for receiving notifications. For example:

- In a sum roll up, add up fields from multiple CIs and display the result on another CI to which they are related. So, if you have four configuration items in a rack that are all consuming power, create a CI relation rollup to add all the power usage together and display the result in one field on the rack CI form.
- If a certain level of power consumption in a rack is exceeded, send a notification.
- With a rack that has 10 slots, send a notification when 9 slots are filled.

CI relation rollups use the `cmdb synch event` business rule on the (cmdb_ci) table. Although this business rule is active by default, you must modify the rule slightly before it will run.

1. Navigate to Configuration > Relationships > CI Relation Rollups.
2. Click New.
3. Complete the form.

<table>
<thead>
<tr>
<th>CI Relationship Rollup fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI Relationship Type</td>
<td>Select a relationship type from the list to use with the rollup. For example, Members::Member of contains the parent descriptor Members and the child descriptor Member of.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the type of rollup from the drop-down list: COUNT, MAX, MEAN, MIN, or SUM.</td>
</tr>
<tr>
<td>Parent field</td>
<td>The target field on which the operation will be done.</td>
</tr>
<tr>
<td>Child field</td>
<td>The input to the equation type. The Parent field is affected by the selections in the child field.</td>
</tr>
<tr>
<td>Rollup class</td>
<td>The classes that can use the relationship. For example, you can specify that the relationship only applies to racks.</td>
</tr>
</tbody>
</table>

4. To run the `cmdb synch event` business rule, navigate to Business Rules.
5. Use the search box to find the (cmdb synch event) table.
6. Click the `cmdb synch event` business rule to go to the Business Rule page.
7. Select the Update, Delete, and Query check boxes.
Additionally, if you wish CI relation rollups to recalculate when there is a change to a relationship, use a similar procedure to select the Active check box on the cmdb_rel_ci synch event business rule.

CMDB classifications

CMDB classifications are groups of configuration items (CIs) that share attributes and are stored in their own table. Classifications allow administrators to define the hierarchy of CIs within the CMDB. A CI class refers to the actual table name in the instance database. In that context, CI Type is a friendly name that a CI is known by, such as computer, router, or printer.

As good practice, keep CI classifications as simple as possible.

Configuration Management Database

The Configuration Management Database (CMDB) is a series of tables that contain all the assets and business services controlled by a company and its configurations.

This information includes computers and devices on the network, software contracts and licenses, business services, and more. The IT desk can use the CMDB to better understand their network users’ equipment, and the relationships between them. The CMDB can also be referenced by other processes within the system.

The CMDB can be populated using the Discovery product. Discovery searches the network for all attached computers and devices, then populates the CMDB with information on each computer/device's configuration, provisioning, and current status. Discovery also reports on any software which is running, and the TCP connections between computer systems, thereby establishing their relationships.

Applications such as Asset Management and Contract Management, operate in conjunction with the CMDB. Asset Management and Software Asset Management link to CMDB all assets, hardware, software, assets in stock, as well as records for manufacturers and vendors. The Contract Management application contains information about contracts, including leases, service contracts, purchase orders, warranties, and software licenses. The Configuration Management application has a focus on operation.

For more background information about the CMDB, see the ServiceNow® Community post at CMDB 101 - What is a configuration management database and why do you need one?

CMDB tables

Key tables in the configuration management database (CMDB):

- The Base Configuration Item (cmdb) table, which is the core CMDB table for non IT CIs (descending classes are non IT CIs).
- The core Configuration Item (cmdb_ci) table, which stores the basic attributes of all the CIs. The admin, itil, or asset user role is required to access this table (descending classes are IT CIs).
- The CI Relationship (cmdb_rel_ci) table, which defines all relationships between CIs.

The Configuration Item table is extended to other tables, such as Database (cmdb_ci_database) and Computer (cmdb_ci_computer). The Computer table is extended to the Server (cmdb_ci_server) table, which is extended to the UNIX Server (cmdb_ci_unix_server) table, and so on.
**Note:** The Base Configuration Item (cmdb) table uses the table per partition extension model, which has different inheritance and replication behaviors than other extended tables. See *Table extension and classes*.

You can use the schema map to view more details of tables and their relationships:

1. Navigate to **System Definition > Tables & Columns**.
2. Select a table and click **Schema Map**.

![Schema Map](image-url)
**Note:** CIs not extended from the Configuration Item (cmdb_ci) table, are not displayed in Dependency Views maps and in CI relation formatatters.

**CI attributes**

Attributes apply to all the CIs in a classification. To change attributes for a CI, you must extend the table and create a new classification for that CI.

The position of a CI in a classification hierarchy is determined by the attributes it shares with the CIs below it. Each time a CI has a single different attribute from its parent, the classification hierarchy branches.

For example, servers have different attributes from computers, which include workstations and laptops. Linux servers and UNIX servers have different attributes from the parent server classification and from each other, so they occupy separate branches in the hierarchy.

**CMDB table column descriptions**

Descriptions of the columns in the Base Configuration Item (cmdb) table, and in its first level extended table Configuration Item (cmdb_ci).

**Attention:** Do not modify any of these attributes in the dictionary. For example, do not modify the type of the **location** attribute from reference to list. Such modifications may prevent features that use the CMDB, from functioning properly.

<table>
<thead>

</table>

**CMDB record types**

The CMDB contains the following major record types.
## CMDB record types

<table>
<thead>
<tr>
<th>Record types</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Item (CI)</td>
<td>Any computer, device, or service in the CMDB. A CI’s record includes all of the relevant data, such as manufacturer, vendor, location, etc. Configuration items can be created or maintained either using tables, lists, and forms within the platform, or using the Discovery application.</td>
</tr>
<tr>
<td>Relation Type</td>
<td>A defined relationship between a CI and either another CI, a user, or a group. Relation types are defined twice, once from the perspective of the child CI and once from the parent CI’s perspective. For example, a parent CI that powers a child CI uses relation type <strong>Powers::Is Powered By</strong>. Example relation types include <strong>In Rack::Rack contains</strong>, <strong>Log Reviewed by::Reviews logs</strong> for, or <strong>Backup done by::Does backups</strong> for. CMDB relationships can be established using Discovery or using the tables, lists, and forms within the platform. The CMDB form has a specific Related Items toolbar optimized for modifying relationships.</td>
</tr>
</tbody>
</table>

### Related Lists of CI components

Related Lists in CI records display additional components contained by that CI, such as disk drives on a server and the rules that control the behavior of a network router.

When Discovery runs, the Related List is populated with the components that Discovery finds running on the CI. The CI record might show different lists from scan to scan, depending on whether or not Discovery found the component.

By default, the Related Lists only display those components that are associated with that CI in the CMDB but are not discovered in a scan, are deemed absent and do not appear in the list.

There are two types of components that appear in the Related List: those that are CIs themselves (such as hard disks), and those that are not (serial numbers and rules). The default filter condition in the breadcrumbs for components that are CIs is `(Status) (!=) (Absent)`. The filter condition for components that are not CIs is `(Absent) (=) (false)`.

In the following example, the `snc-tc01` router has several Related Lists affected by these filter conditions, including routing rules, disk drives, interfaces, and network adapters. Only those components found during the last Discovery appear in these Related Lists.
### Create a CI class

Create a CI class (table) that is an extension of an existing CI class. Then create identification and reconciliation rules for the new class.

The class that is being extended must have its **Is_Extendable** field checked, indicating that the class is extendable.

**Roles:**
- `Itil_admin` and `personalize_dictionary`: Required for editing the dictionary table
- `admin`: Full access

The CI Class Manager is a centralized location for managing CMDB tables and for creating a class that is derived from another CMDB class. Creating a class requires basic details such as a label and a name. Identification and reconciliation rules are also required to ensure that the class can be successfully identified by the identification engine.

For more information about extending a class and how attributes are derived from a parent class in that process, see **Table extension and classes**.

1. Navigate to **Configuration > CI Class Manager**.
2. Click **Hierarchy** to expand the CI Classes list. Then select the class that the new class is extended from.
3. Click **Add Child Class**.
   - The **Add Child Class** option appears only if the selected class is extendable.
4. On the **Basic Info** tab, fill out the information and then click **Next**.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display name</td>
<td>A unique label for the class (such as Laptops or Thin Clients). The label appears on list and form views for the class. Updating the Label field also updates the label record in the language file for the current language. See Field Labels in Data dictionary tables. Maximum string length is 80 characters.</td>
</tr>
<tr>
<td>Table name</td>
<td>Automatically populated based on the table label and a prefix as follows:</td>
</tr>
<tr>
<td></td>
<td>• For a table in a scoped application, the name is prefixed with a namespace identifier to indicate that it is part of an application.</td>
</tr>
<tr>
<td></td>
<td>• For a table in the global application, the name is prefixed with the string ‘u.cmdb_ci’.</td>
</tr>
<tr>
<td></td>
<td>You cannot modify the prefix; however, you can modify the rest of the table name. The name can contain only lowercase, alphanumeric ASCII characters and underscores (_). Maximum string length is 80 characters.</td>
</tr>
<tr>
<td>Description</td>
<td>Explanation of the use purpose of the class.</td>
</tr>
<tr>
<td>Icon</td>
<td>The icon associated with the class.</td>
</tr>
<tr>
<td>Extensible</td>
<td>Indicator of whether this class can be extended.</td>
</tr>
</tbody>
</table>

5. On the Columns tab, click the + sign and enter details for each new class column. Then click Next. For description of the different columns in the list view, see Dictionary entry form. Set Identification to true to designate the column as a CI identifier for class identification.

6. On the Identification tab, examine the Derived identification rule and its Identifier Entries. You can click Replace to replace the derived rule with a new identification rule and new identifier entries specific to the new class.

   See Identification rules for details about identification rules and identifier entries.

7. On the Dependencies tab, click Add dependency to add dependent rules.

   The Dependencies tab appears only if there are dependent identification rules for the selected class.

8. On the Reconciliation tab, click Add to create the following rules:

   a) Reconciliation Rules

   b) Data Precedence Rules

   c) Data Refresh Rules

9. Click Done.

Reclassify a CI

You can upgrade, downgrade, or switch the class of a CI by modifying its Class attribute.
Role required: itil or asset (In general, the roles required to update a CI)

Each class is defined with a unique set of attributes. This set consists of attributes that were derived from the parent class, and additional attributes defined for the class.

When you reclassify a class, the following occurs.

1. The set of attributes is adjusted to match the set of attributes of the newly assigned class. Attributes are added or removed as needed.
2. If any attributes are unique to the current class and are not defined in the newly reclassified class, they are lost.
3. A new record with the CI's sys_id is inserted to the table of the new class, with the appropriate set of attributes for the class.

Depending on the reclassification, the following occurs.

**Downgrade**

The CI class is updated to a class that is lower in the class hierarchy, and the newly assigned class is a parent of the current class. For example, reclassifying a CI from the cmdb_ci_server class to the cmdb_ci_computer class.

For example, the cmdb_ci_server class has attributes that the cmdb_ci_computer class does not have. During the downgrade, these attributes and their respective values are not included in the new CI record that is inserted into the cmdb_ci_computer class.

**Upgrade**

The CI class is updated to a class that is higher in the class hierarchy, and the newly assigned class is a derived child of the current class and has additional attributes. For example, reclassifying a CI from the cmdb_ci_computer class to the cmdb_ci_server.

**Switch**

The newly assigned class is in a different branch in the class hierarchy and has a different set of attributes than the current class. For example, reclassifying a CI from the cmdb_ci_linux_server class to the cmdb_ci_win_server class.

A switch is a combination of a downgrade and an upgrade. For example if the CI is downgraded to the cmdb_ci_server, and then upgraded to the cmdb_ci_win_server class. Therefore, attributes are lost in the same manner as in a downgrade operation.

**Note:** Avoid the CI class downgrade and CI class switch operations as those can lead to data loss. When automatic CI reclassification is enabled (which is by default), the identification process can result in some automatic reclassifications which lead to data loss.

For more information about system properties that control system-wide behavior of automatic CI reclassification, see [CI reclassification](#).

1. Locate the CI that you want to reclassify and display it in a list view. You can use the application navigator. Or for example, if the CI is a server, then in the navigation search box, type `cmdb_ci_server.list` to display the CI in the **Servers** view.
2. Ensure that the **Class** field is displayed in the list. If you do not see this attribute, personalize the list to add the **Class** field.
3. Double-click the **Class** value for the CI, and select a new class.
4. Click the green check box to confirm your selection.
Delete CIs for a CMDB class

You can use the CI Class Manager to delete CIs that are no longer needed.

Role required: itil_admin

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to expand the CI Classes list and then select the class from which you want to delete CI records.
3. In the class navigation bar on the left, click CI List.
4. On the CI List form view, select the CIs that you want to delete. Select the check box in the header to select all the CIs that are visible.
5. Click Actions on selected rows and then click Delete.
6. Click Delete in the Confirmation dialog box.

View and edit class definitions and metadata

Use the CI Class Manager as a central location to explore the CMDB class hierarchy, CI table definitions, and class CIs. View the details of each table such as its label and fields, relationships, and all related metadata definitions.

The CI Class Manager displays the entire CMDB class hierarchy in a tree-view format, consolidating class definitions into a central location. It lets you display metadata information for a class, such as reconciliation rules, mandatory and recommended fields, and audit templates. You can also select a specific class to view, to modify, or to extend its definition to create a derived class. For each table, you can directly access CMDB Health settings and rules such as datasource precedence rules, orphan scorecard, and certificate template defined for the table class.

For more information about extending a class and how attributes are derived from a parent class in that process, see Table extension and classes.

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to expand the CI Classes list and then select a class to display details for.
3. On the class navigation bar, expand the following items to display further details for the class.
   - **Class Info**:
     - **Basic Info**: Displays details for the selected class, such as the display and table name, description, and class icon. Lets you edit some of the class definitions, and prevents editing of some details such as the table name.
       Role requirement: itil for reading, and itil_admin and personalize_dictionary for writing.
     - **Columns**: Displays and lets you edit and add table columns. For description of the different columns in the list view, see Dictionary entry form.
       Role requirement: personalize_dictionary and itil for editing, and personalize_dictionary for reading.
       To add a column:
       1. Click the Added tab and scroll to the bottom of the list.
       2. Click the + sign, enter details for each new class column. Set Identification to true to designate a column as a CI identifier for class identification.
       3. Click Save, and fix any errors that appear.
     - **Identification and Reconciliation**: Display and let you edit, create, and delete identification and inclusion rules, reconciliation, data precedence, and data refresh rules for the class.
See **CMDB Identification and Reconciliation** for more information.

Role requirement: itil for reading, and itil_admin (on top of itil) for writing.

- **Dependencies**: Displays and lets you edit, create, and delete hosting and containment relationships for the class. See **Dependent relationship rules** for more information.

  Role requirement: itil for reading and itil_admin (on top of itil) for writing.

- **Relationships**: Displays a diagram of all suggested relationships and all dependent relationships (hosting and containment rules) for the class. See **Suggested CI relationships** for more information.

  Role requirement: itil

- **Health**: Lets you review and configure CMDB Health-related system properties, scorecards, and rules and settings for all CMDB health KPI and metrics, at the class level. See **CMDB Health** for information about enabling and configuring CMDB Health, and displaying health reports.

  Role required: itil for reading and itil_admin (on top of itil) for writing.

- **CI List**: Displays the CIs of the selected class. Lets you create CIs of the selected class and perform other operations such as delete.

  Role required: Itil for reading. Writing requirements follow the selected table settings.

### Querying the CMDB

The CMDB Query Builder allows you to easily build complex infrastructure and service queries that span multiple CMDB classes, and that involve many CIs that are connected by different relationships.

The CMDB Query Builder provides a canvas into which you drag the CI classes and other artifacts that you want to include in a query. Then you add relationships, AND/OR operators between the CI classes, and define the relationship properties to query for. You can use saved queries to populate a CMDB group with CIs, and then use scriptable APIs to retrieve the CI list and apply actions collectively to all the CIs in the group.

There are two query types: CMDB Query and a Service Mapping query, which you can use separately or in combination to create queries such as:

- All CIs of a certain type in a business service. For example, all Apaches/Web Servers/Linux servers per service.
- All virtual servers and the physical servers that host them.
- All servers that are not mapped to any business service.
- All Servers with a database.
- All database servers that are included in any business service or in a particular business service.
- All business services and their associated servers and the cost of each server. This query helps evaluate the cost of technology for each business service.

The Query Builder uses the concept of **start node** which is the starting point of the query and is noted by gray background in its query node. The first class that you drag to the canvas becomes automatically the start node of the query and you cannot select a different start node. In a complex query, the start node must always be the only node connected to an AND/OR operator. If you try to connect a second node to an operator that the start node is connected to, the query fails to run and you will be prompted to select a different start node.
CMDB Query

A query type that queries the infrastructure for CI classes, and the relationships and references that connect them.

Service Mapping Query

A query type that queries business services and technical services, and thus requires that Service Mapping is activated. The query is framed within a business service map. You define a pattern, and query for business service maps that have that pattern in their definition. The relationships in Service Mapping queries are matched by single-level direct relationships which is similar to the CMDB queries, and in addition, they are also matched by multi-level indirect relationships if they exist. A query for a relationship between two CI classes is satisfied even if the two CI classes are connected by intermediate CI classes that are not specified in the query.

Combination Query

You can combine the two query types by incorporating a saved Service Mapping query into a CMDB query. For example, create a CMDB query for Windows Servers that are connected to Tomcat WAR. Then connect the Tomcat WAR CI class to a Service Mapping query. This changes the query to find Windows Servers that are connected to Tomcat WAR which is included in the services that returned by the Service Mapping query. You can inverse that query by choosing - Does Not Belong To Service. This changes the query to find Windows Servers that are connected to Tomcat WAR that is not included in services returned by the Service Mapping query.

Relationship properties

When you connect CI classes on the canvas, the CMDB Query Builder displays the Connection Properties dialog box where you can choose from a list of relationships that exist between these two CI classes including relationships to descendent classes. For Service Mapping queries, only related and not-related connections are displayed.

The relationship arrow on the canvas shows the direction of the query, but the connection properties for the relationship determine what the relationship is queried for.

Connection properties include:

- Parent/child direction: Which CI class is the parent and which CI class is the child in the relationship.
- No relations: Query for a CI class which has no relation to the class it is connected to.
- References fields: A field that the parent and ancestor parent CI classes use to reference the child CI class.

Newly added relationships between CI classes may take up to 30 minutes to appear in the relationship list.

Domain separation in CMDB Query Builder

This is an overview of domain separation as it pertains to the CMDB Query Builder. Domain separation allows you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.
Overview

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

How domain separation works in the CMDB Query Builder

With the CMDB Query Builder you can easily build complex infrastructure and service queries that span multiple CMDB classes, and that involve many CIs that are connected by different relationships. Domain separation is set to be on by default.

- **Saved Query**
  
The user creates a query by dragging a class node from the class hierarchy and dropping it to the canvas and connecting the nodes with the relationships type.
  
The user can save the created query as an XML file to the database (qb_saved_query) table in the CMDB for future use. The saved query is domain separated.

- **Query results**
  
  With a saved query, the user clicks Run and the query result is saved and displays in the platform list view.
  
  In the query results, the domain separation behaves in the same way as the platform list view for the CI relationship (cmdb_rel_ci) table and CMDB CI (cmdb) table. Consequently, since the CI relationship is not domain separated, all relationships of the query result display, regardless of the domains. Conversely, if the query result is CI only, since the CMDB CI is domain separated, the results display only if visible in the current domain.

Build a CMDB query using the CMDB Query Builder

Build a CMDB query in the CMDB Query Builder.

The **U16 plugin** (com.glide.ui.ui16) must be activated.

Role required: cmdb_query_builder (contained for itil and asset)

Build the query by dragging the CI classes that you want to include in the query, dropping them as nodes on the canvas, and then defining relationship properties between them. For every class node in the query, you can filter on its attributes to narrow down the results to a specific set of CIs of that class or to a single specific CI. You can also select the property columns that display in the query results. Query filters use related list conditions which allow the inclusion of a relationship with another table in the filter. For more information, see Add related list conditions.

Authorized users can update and delete a query created by another user.

1. Navigate to Configuration and click CMDB Query Builder.
2. On the **CMDB Query Builder** page you can:
   a) Click Create new. Type in a Name, choose CMDB Query as the Query type, and click Create.
   b) Click a widget of a saved query to continue building an existing query. Search saved queries first if needed.
   c) Point to the upper right corner of a saved query widget, and click the Duplicate Query icon to edit a copy of a saved query. The new query's default name contains the string 'copy'.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
3. On the canvas, you can:
   - Add CI classes to the query: Select classes from the class hierarchy under **CMDB Artifacts** and drag them to the canvas.
   - Add connections between two nodes on the canvas:
     1. On the first node in the relationship, click the small square at the center of the right side to toggle its color to blue.
     2. On the second node in the relationship, click the small square at the center of the left side to toggle its color to blue.
   - In the **Connection Properties** dialog box:
     - Choose the parent/child roles in the relationship and then configure the properties in the respective section of the connection properties.
     - Click **Add Relations** and select a relationship from the list of existing relationships between the CIs (including descendant classes).
     - Select **No Relations** to query for classes that do not have any relationships with each other. For example, query for all Tomcat WAR CIs which are not connected to a Windows Server.
     - Click **Add Reference** to choose a field that the parent class (including ascendant parent classes) uses to reference the child.
   - Click **Confirm**.

### Relationship UI Notations

<table>
<thead>
<tr>
<th>Notation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Full line</td>
<td>A relationship in a CMDB query.</td>
</tr>
<tr>
<td>Dotted line</td>
<td>A relationship in a Service Mapping query.</td>
</tr>
<tr>
<td>Red asterisk at the center of the connection line</td>
<td>Information such as relationship type is missing, invalidating the query.</td>
</tr>
</tbody>
</table>

- Add filters to the query:
  
  The initial elements of a query are classes. Applying filters, you can narrow a class down to a specific set of CIs or to a single specific CI.
  
  1. Point to the node to add a filter to.
  2. Click the **Apply Filters** icon that pops up above the node.
  3. Add attribute and related list conditions.
  4. Close the **Filters** section on the canvas.

  For example, add a filter for database location to query for databases located in Seattle.

  Click **Applied Filters** in the navigation bar on the right to view all filters that were added for each node on the canvas. When you select a set of filters in the navigation bar, the respective node that these filters apply to, is highlighted. And, if you select a node, the respective set of filters that apply to that node, is highlighted.

- Add AND/OR operations to the query:
  
  1. Connect one node to two other nodes.
  2. Click the **AND** box that appears to toggle between the And and the Or operations.
For example, C1 is Tomcat WAR, C2 is Linux Server, and C3 is Windows Server. Query for all Tomcat WAR CIs which are connected either to Linux Server Or to a Windows Server.

- Add property columns to display in the query results:

  Note: For a relationship, the query results display the parent, child, and type columns. You cannot add any other columns from the (cmdb_rel_ci) table.

  1. Click the node to add properties to.
  2. Click the Properties tab, and then click Add Columns.
  3. Select the properties to display and then click outside the properties list to close it.

- Select columns and add filters that will be applied to the resulting set of services:

  1. Ensure that Properties is selected at the top on the right-hand side navigation bar, and then click an empty space on the canvas to ensure that nothing is selected.
  2. Click Add Columns at the bottom of the right-hand side navigation bar and select columns to add.

- Create a combination query by integrating a Service Mapping query into a CMDB query:

  1. Click Saved Service Queries.
  2. Select a Service Mapping query and drag it to the canvas.

  This query returns all CIs that satisfy the CMDB query, and that are included in the services returned by the Service Mapping query.

- Add a search tag that can then be used as a search criteria for saved queries:

  1. Click the Add Tags icon.
  2. Click Add Tag, and enter the tag string.
  3. Click the Add Tags icon again to close the Query Tags dialog box.

4. Modify the query:

   - Apply filters: Click a node and then click the Apply filters icon to add or edit the node's filters.
   - Modify relationship properties: Click the line that represents the relationship between two nodes to display the Connection Properties on the right-hand side pane.
   - Modify Query Builder settings: Click the (Settings) icon to open the Query Builder Settings dialog box.

   - Click Save.

   In the Saved Queries tab, you can point to a saved query widget and click the 'i' icon to view query information such as the query type, last update date, CMDB groups associated with the query, and the query schedules.

   - Click Run.

   Note: When a query is running, wait for it to complete or to time out before opening or running another query.
The query results pane displays only the first 100 results of the query.

- Click **Load More Results** to display the next set of 100 results.
- Click **Load All Results** to display the rest of the query results, up to the number specified by the `glide.cmdb.query.max_results_limit` system property (10,000 by default).

- **Create a report from CMDB query results.**
- **Create a schedule** to run the query at a future time, and to email the results to interested parties.
- Click the Query Results context menu and select **Export**. Even if the **Load More Results** button is visible, indicating that there are additional query results, only the results that are visible are exported.
- **Populate a CMDB group** using the saved query.

**Build a Service Mapping query using the CMDB Query Builder**

Build a Service Mapping query in the CMDB Query Builder. A Service Mapping query is a pattern consisting of classes and relationships between those classes. After you build the pattern and run the query, the query returns all the Service Mapping services that contain that pattern.

Service Mapping and **UI16** (com.glide.ui.ui16) must be activated.

Role required: **cmdb_query_builder** (contained for itil and asset)

Build the query by dragging the CI classes that you want to include in the query, dropping them as nodes on the canvas, and then defining relationship properties between them. For every class node in the query, you can filter on its attributes to narrow down the results to a specific set of CIs of that class or to a single specific CI, and you can select the property columns that display in the query results. Query filters use related list conditions which allow the inclusion of a relationship with another table in the filter. For more information, see **Add related list conditions**.

Authorized users have the ability to update and delete a query that was created by another user.

1. Navigate to **Configuration** and click **CMDB Query Builder**.
2. On the **CMDB Query Builder** page do either of the following:
   a) Click **Create new**. Type in a **Name**, choose **Service Mapping Query** as the **Query type**, and click **Create**.
   b) Click on a widget of a saved query to continue building an existing query. **Search saved queries** first if needed.
   c) Point to the upper right corner of a saved query widget, and click the **Duplicate Query** icon to edit a copy of a saved query. The new query’s default name contains the string ‘copy’.
3. Do any of the followings on the canvas:
   - Add CI classes to the query: Select classes from the class hierarchy under **CMDB Artifacts** and drag them to the canvas.
   - Add connections between two nodes on the canvas:
     1. On the first node in the relationship, click the small square at the center of the right side to toggle its color to blue.
     2. On the second node in the relationship, click the small square at the center of the left side to toggle its color to blue.
     3. In the **Connection Properties** dialog box:
• Choose the parent/child roles in the relationship and then configure the properties in the respective section of the connection properties.
• Click Add Relations and select a relationship from the list of existing relationships between the CIs (including descendant classes).
• Select No Relations to query for a pattern in which the two classes have no relationships with each other. For example, all Tomcat WAR CIs which are not connected to a Windows Server.
• Click Add Reference to choose a field that the parent class (including ascendant parent classes) uses to reference the child.

4. Click Confirm.

<table>
<thead>
<tr>
<th>Notation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dotted line</td>
<td>A relationship in a Service Mapping query.</td>
</tr>
<tr>
<td>Red asterisk at the center of the connection line</td>
<td>Information such as relationship type is missing, invalidating the query.</td>
</tr>
</tbody>
</table>

- Add filters to the query:
  The initial elements of a query are classes. Applying filters, you can narrow a class down to a specific set of CIs or to a single specific CI.
  1. Point to the node to add a filter to.
  2. Click the Apply Filters icon that pops up above the node.
  3. Add attribute and related list conditions.
  4. Close the Filters section on the canvas.

For example add a filter for business criticality to query for businesses that are ‘most critical’.

Click Applied Filters in the navigation bar on the right to view all filters that were added for each node on the canvas. When you select a set of filters in the navigation bar, the respective node that these filters apply to, is highlighted. And, if you select a node, the respective set of filters that apply to that node, is highlighted.

- Add AND/OR operations to the query:
  1. Connect one node to two other nodes.
  2. Click the AND box that appears to toggle between the And and the Or operations.

For example C1 is Tomcat WAR, C2 is Linux Server, and C3 is Windows Server. Query for all Tomcat WAR CIs which are connected either to Linux Server Or to a Windows Server.

- Add property columns to display in the query results:

  Note: For a relationship, the query results display the parent, child, and type columns. You cannot add any other columns from the (cmdb_rel_ci) table.

  1. Click the node to add properties to.
  2. Click the Properties tab, and then click Add Columns.
3. Select the properties to display and then click outside the properties list to close it.

- Select columns and add filters that will be applied to the resulting set of services:
  1. Ensure that Properties is selected at the top on the right hand-side navigation bar, and then click an empty space on the canvas to ensure that nothing is selected.
  2. Click Add Columns at the bottom of the right hand-side navigation bar and select columns to add.
  3. Click the Apply Service Mapping Query Filters icon at the top of the canvas and add filters.

- Disable Services Including This Pattern to inverse the entire query and search for all Service Mapping services that do not include the query pattern.
- Add a search tag that can then be used as a search criteria for saved queries:
  1. Click the Add Tags icon.
  2. Click Add Tag, and enter the tag string.
  3. Click the Add Tags icon again to close the Query Tags dialog box.

4. Modify the query:
   - Apply filters: Click a node and then click the Apply filters icon to add or edit the node's filters.
   - Modify relationship properties: Click the line that represents the relationship between two nodes to display the Connection Properties on the right hand side pane.
   - Modify Query Builder settings: Click the (Settings) icon to open the Query Builder Settings dialog box.

- Click Save. A saved Service Mapping query can be built into a CMDB query.

  In the Saved Queries tab, you can hover over a saved query widget and click the 'i' icon to view query information such as the query type, last update date, CMDB groups associated with the query, and the query schedules.

- Click Run.

  **Note:** When a query is running, wait for it to complete or to timeout before opening or running another query.

The query results pane displays only the first 100 results of the query.

- Click Load More Results to display the next set of 100 results.
- Click Load All Results to display the rest of the query results, up to the number specified by the glide.cmdb.query.max_results_limit system property (10,000 by default).

  - Create a report from CMDB query results.
  - Create a schedule to run the query at a future time, and to email the results to interested parties.

- Click the Query Results context menu and select Export. Even if the Load More Results button is visible, indicating that there are additional query results, only the results that are visible are exported.
- **Populate a CMDB group** using the saved query.

**Sample CMDB queries**

Use the following sample queries to build your own CMDB queries.

Using the CMDB Query Builder requires that the [UI16 plugin](com.glide.ui.ui16) is activated.

**CMDB query sample**

Use this example to build a CMDB query.

**All servers with a connection to a database**

1. Navigate to **Configuration** and click **CMDB Query Builder**
2. Click **Create new**, Enter a **Name** - All servers with a connection to a database. Choose **CMDB Query**, and click **Create**.
3. In the **CMDB Artifacts** list, locate the **Server** class, and drag it to the canvas.
4. Locate the **Database** class, and place it to the right of the **Server** class node on the canvas.
5. Click at the center of the right side of **Server**, and then at the center of the left side of **Database** to create a connection.
6. In the **Connection Properties** dialog, in the **Add Relations for Server 1** section – one by one, select all the listed relationships.
   
   Note that the added relationships are displayed in the navigation bar on the right, underneath **Server 1**.
7. Click **Save**, and then click **Saved Queries** on the left to see the tile for the saved query.
8. Click the query tile to return to the canvas in edit mode.
9. Click **Run** to execute the query.

Review the query results. Each row displays the name of a server CI, the name of a database CI, and the relationship type between them.

10. Add columns to the query results:
    a. Click **Server 1** on the canvas.
    b. On the right navigation bar, underneath **Server 1 Report Columns**, click **Add Columns**.
    c. Select **Manufacturer**.
    d. Click **Run**.

Review the query results which now include the **Manufacturer** column.

- **Click Save** again to save all your customization for this query.

**Service Mapping query sample**

Use this example to build a Service Mapping query.
Linux server in services

Note: To build and run a Service Mapping query, Service Mapping must be activated.

1. Navigate to Configuration and click CMDB Query Builder.
2. Click Create new. Enter a Name - Linux server in services. Choose Service Mapping Query, and click Create.
3. In the CMDB Artifacts, locate Linux Server, and drag it to the canvas.
4. Click Run.

Review the query results. Each row displays the name of a Service Mapping Service and the name of a Linux Server that is a member of that service.
5. On the right navigation bar, click Disable Service Including This Pattern, and then click Run again.

Review the query results. Now, each row displays the name a Service Mapping Service that does not include the specified Linux Server.

Run a partial CMDB query

You can run a partial query in the CMDB Query Builder by defining a section of a query, and then running it.

The UI16 plugin (com.glide.ui.ui16) must be activated.

Role required: cmdb_query_builder (contained for itil and asset)

While building a query or reviewing a saved query, you can run only a section of the query. On the canvas in the CMDB Query Builder, highlight a section of the query which contains the nodes and relationships of the partial query that you want to run. You can then examine the results of the partial query, and update the query if needed.

1. Navigate to Configuration and click CMDB Query Builder.
2. On the CMDB Query Builder page, click a tile to open an existing query.
3. Click the selection tool under the navigation tool to switch to a section selection mode.
4. Border a section of the query:
   a) Click the mouse device on the upper left corner of the section that you want to create.
   b) Drag the mouse device to the bottom right corner of the section that you want to create. As you drag the mouse device, the selected section is highlight in light blue.
   c) Release the mouse device. The query nodes that are included in the partial query, appear with a blue border.
5. Click Run.
6. In the Pick Starting Node dialog box, select the starting node for the partial query, and click Confirm.

The results of the partial query appear in the Results pane.
Create a report from CMDB query results

After running a query in the CMDB Query Builder, you can generate static reports that are scoped to the query results.

The **UI16 plugin** (com.glide.ui.ui16) must be activated.

Role required: cmdb_query_builder (contained for itil and asset) or cmdb_query_builder_read

1. Navigate to **Configuration** and click **CMDB Query Builder**.
2. Build a query.
3. In the query results pane, click the list context menu and select **Bar Chart** or **Pie Chart**.

The Reports application creates a report that is scoped to the query results.

Settings in CMDB Query Builder

Use settings to control some aspects of the CMDB Query Builder behavior.

The **UI16 plugin** (com.glide.ui.ui16) must be activated.

Open the **Query Builder Settings** dialog box:

1. Navigate to **Configuration** and click **CMDB Query Builder**.
2. On the **CMDB Query Builder** page, click the (Settings) icon.
3. Click the **Settings** icon again to close the dialog box.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Relationships in Results</td>
<td>Enable to display the relationship between CIs in the query results.</td>
</tr>
<tr>
<td>Display Suggested Connections</td>
<td>Enable to filter the class hierarchy in the left pane to display only classes that the selected class on the canvas has a relationship with. You can then drag any class from the filtered list to the canvas, and connect it to the selected class on the canvas. This setting applies only to CMDB queries.</td>
</tr>
</tbody>
</table>

Navigation in CMDB Query Builder

Use the navigation tools to enlarge or shrink the query, to move the query, or to border a section of the query to run.

The **UI16 plugin** (com.glide.ui.ui16) must be activated.
Use the buttons in the navigation tool as follows:

- Use the plus sign (+) to increase magnification of the query.
- Use the minus sign (-) to decrease magnification of the query.
- Click the center dot to center the query on the canvas.
- Use the direction arrows to move the query in that direction.
- Use the selection tool under the navigation tool to toggle between two states:
  - Moving the entire query on the canvas.
  - Bordering a section of the query, which you can then run as a partial query.

Search saved queries

The CMDB Query Builder allows you to search for a specific saved query using any combination of search criteria based on the query’s title, type, custom tags, and who created or updated the query.

To locate a saved query using a Query Tags search criteria, the query must have a query tag associated with it. For more information see Build a CMDB query using the CMDB Query Builder, or Build a Service Mapping query using the CMDB Query Builder.

The UI16 plugin (com.glide.ui.ui16) must be activated.

Role required: cmdb_query_builder (contained for itil and asset)

1. Navigate to Configuration > CMDB Query Builder.
2. In the Search Saved Queries box on the Saved Queries tab, enter a string to search for.
   The resulting list displays all search categories that can be applied using the search string.
3. Select an item from the list to add it as a search criteria.
4. Refine the search string or select additional search criteria as needed.

Create a schedule for a CMDB query

Schedule a saved CMDB query to run once at a scheduled time or on a recurring schedule, and to email the query results to specified users.

The UI16 plugin (com.glide.ui.ui16) must be activated and a saved CMDB query that was built in the CMDB Query Builder must exist.

Role required: cmdb_query_builder (contained for itil and asset)

The query results are attached to the email as a file in the specified format. By default, the maximum result rows that can be attached is 10,000. This is controlled by a system property.

1. If need to, navigate to Configuration, click CMDB Query Builder, and then click a saved query.
2. Click Create Schedule and fill out the form.
### Scheduled Email of Query Builder form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Query</td>
<td>The query to run.</td>
</tr>
<tr>
<td>Users</td>
<td>Users who should receive query results email. To receive emails, users must have an Email address defined and have Notifications set to Enable in their user records.</td>
</tr>
<tr>
<td>Groups</td>
<td>Groups to email the query results to.</td>
</tr>
<tr>
<td>Zip output</td>
<td>Indicates whether the report should be sent as a zip file.</td>
</tr>
<tr>
<td>Active</td>
<td>Indicates whether to run the query according to the specified schedule.</td>
</tr>
<tr>
<td>Run</td>
<td>Frequency for running the query.</td>
</tr>
<tr>
<td>Time</td>
<td>Time of day to run the query.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Indicates whether to display the Condition field, which allows you to specify conditions under which the query runs.</td>
</tr>
<tr>
<td>Omit if not records</td>
<td>Indicate whether to distribute email if the query returns zero results.</td>
</tr>
<tr>
<td>Email addresses</td>
<td>Email addresses of users who should receive the email but who are not in the system.</td>
</tr>
<tr>
<td>Subject</td>
<td>Text that appears in the subject line of the distribution email.</td>
</tr>
<tr>
<td>Introductory message</td>
<td>Additional message that is delivered with the query results.</td>
</tr>
<tr>
<td>Condition</td>
<td>User-created script that checks for certain conditions to be true before running the query. This field is visible only when Conditional is checked.</td>
</tr>
<tr>
<td>Type</td>
<td>File format to use for the query results.</td>
</tr>
</tbody>
</table>

**Note:** Configure the form layout to add this field to the form.

### System properties associated with the CMDB Query Builder

CMDB Query Builder uses the following system properties.
### CMDB CI Lifecycle Management

From the time of its creation to the time that it is no longer needed, a CMDB CI would typically transition through several operational states while undergoing various operations. CI Lifecycle Management provides the mechanism to define states and actions for a CI and lets you apply appropriate actions based on a CI’s state to tailor the management of CI lifecycle to business needs.

**Terms associated with CI Lifecycle Management:**

**Operational states**

A set of states that a CI can be at such as ‘Operational’ or ‘Repair in Progress’. A CI can be associated with only a single operational state at any given time. The choices for operational states are based on the `operational_status` field in the [cmdb_ci] table. There are several operational states that are defined in the base system such as ‘Retired’ and ‘Repair in Progress’. You can modify this list to reflect operational states that are relevant in your business.

**Note:** By default, Service Mapping is configured to ignore all host CIs for which the value of Operational status (`operational_status`) is not 1 (Operational) or the value of status (`install_status`) is 100 (absent). For additional information about this behavior, see [Preparing customized ServiceNow deployments to work with Service Mapping](KB0647574) in the HI Knowledge Base.

CI Lifecycle Management allows multiple operators and automations to simultaneously set different operational states of a CI. Since a CI cannot be associated with multiple operational states, it is important to configure each operational state with a priority. These priorities are then used in such situation to determine which of the operational states is the cumulative operational state.
CI actions
A set of actions that can be applied to a CI during its lifetime. You can define CI actions that are relevant in your business.

Compatible CI Actions
CI Lifecycle Management allows a CI to have multiple active CI actions simultaneously, however they must be specifically defined as compatible. By default, there are no two actions for a CI that are compatible with each other. You can change this behavior by specifying pairs of actions that are compatible and thus allowed to be applied simultaneously to a CI. For example, you can specify that the ‘Patching’ and the ‘Provisioning’ CI actions are compatible making it possible to apply both simultaneously to a CI.

Not Allowed CI Actions
By default, any CI action can be applied to any CI. You can restrict this behavior by defining a rule that an action is not allowed for a CI when it is in a specific operational state. For example, you can define a Not Allowed CI Action in which it is not allowed to apply the ‘Provisioning’ action to a Linux Server that is in a ‘Non-Operational’ state.

Not Allowed Operational Transitions
By default, transitions are allowed from any operational state to another. You can restrict this behavior by defining a rule that for a specified CI, a transition from a certain operational state to another operational state is not allowed. For example, you can define that for a Linux Server it is not allowed to transition from ‘Repair in progress’ to ‘Non-Operational’.

Requestor
A requestor can be a workflow or a non-workflow operator that is trying to set operational states and apply CI actions. Each requestor has an associated requestor ID that is a GUID and that can be an active workflow context or a non-workflow registered operator ID.

Lease time
A time period that each requestor (especially non-workflow operators) can provide, during which a specified CI action is allowed to be active for a specified CI.

CMDB CI Lifecycle Management provides a set of APIs to manage CI operational states and CI actions. And the UI where you define a set of rules to restrict certain operational state transitions and to restrict actions based on operational states. It also provides a mechanism to audit CI operational state and CI actions during the entire CI lifecycle.

Providers such as automation, workflows, or Change Management can use CI Lifecycle Management as a mechanism to manage CI operational states and apply CI actions. By default, the behavior of CI Lifecycle Management has no restrictions on some operations, and full restrictions on other operations. The CI Lifecycle Management UI lets you modify this default behavior by specifying Not Allowed CI Actions, Compatible CI Actions, and Not Allowed Operational Transitions that restricts some operations and enables for others.

With CI Lifecycle Management you can:
• Manage CI operational states and CI actions throughout the entire CI lifecycle.
• Manage CI operational state transitions.
• Restrict certain operational state transitions.
• Associate certain actions for certain CI types that are in specific operational state.
• Restrict IT Service Management applications based on CI operational state.
• Audit CI operational states and CI actions during the entire CI lifecycle.
Lifecycle management APIs

CI Lifecycle Management provides a set of APIs to manage CI operational state and CI actions during the entire CI lifecycle. All restrictions and allowances specified by rules in the UI are enforced when state management APIs run, and if an API attempts to perform a restricted operation, the operation is blocked and an error is logged.

Registering requestors

When using the lifecycle management APIs to apply CI actions, requestors are required to be registered and to obtain a requestor ID which is unique within the lifecycle management tables. To register and to obtain a requestor ID, non-workflow users should call the registerOperator API. Workflow users can use the active Workflow context as the requestor ID, and they do not need to explicitly call registerOperator.

After completing the CI lifecycle operations, the requestor should call the unregisterOperator API to unregister. All the state management records associated with that specific requestor ID are then marked as inactive or they are removed by the CI Lifecycle Management - Restore Internal State Management Tables scheduled job.

Integration with Incident Management and Problem Management

A base instance includes the pre-defined CI action CreateTask used for creating a task for a CI. New instances have a pre-defined Not Allowed CI Action, specifying that the CreateTask action is not allowed for any CI with a Retired operational state. This restriction is integrated with Incident Management and with Problem Management to prevent the creation of incident or problem tasks for retired CIs. The CreateTask CI action is used as a reference qualifier to the Configuration Item field of the Incident/Problem tables. In a new incident or problem, CIs in which Operational Status is Retired – are filtered out from the Configuration Item list on the form. For more information about reference qualifiers, see Reference qualifiers.

Integration with Asset Management

In a base system, a CI’s Operational Status field and the Status/Hardware Status (if its hardware) fields are kept synchronized if one of the two fields’ values is Retired. When Operational Status of a CI is set to Retired, then the Status/Hardware Status field is automatically set to Retired. In the opposite direction, when the Status/Hardware Status field of a CI is set to Retired, Operational Status is then automatically set to Retired too. When an Operational Status field changes from Retired to another status, the CI’s Status/Hardware Status field is set to Installed. And when a CI’s Status/Hardware Status field changes from Retired to another status, the Operational Status field is automatically set to Non-Operational.

Whenever CI’s Status/Hardware Status changes, it is synchronized to the CI’s corresponding Asset State field, and vice versa - keeping the CI’s Operational Status and the CI’s corresponding Asset State synchronized.

For more information about mapping Asset State and Substate fields to a CI’s Status/Hardware Status (if its hardware) field, see Map asset state and CI hardware status. And for more information about retiring assets, see Retire assets.
Get started with CI Lifecycle Management

Follow these high level steps to get started and to track activities of the CI Lifecycle Management module of the CMDB application.

1. Activate the base system **CI Lifecycle Management - Restore Internal State Management Tables** scheduled job that continuously checks and maintains data integrity of all internal CI Lifecycle Management tables.
2. Define **CI actions** rules.
3. Define compatible **CI actions** rules.
   - Navigate to **Configuration > CI Lifecycle Management > CMDB CI Actions** to display currently active/inactive CI actions in the CMDB.
4. Define **not-allowed CI actions** rules.
5. Define **not-allowed operational state transitions** rules.
6. Define new operational states by modifying the **operational_status** field in the (cmdb_ci) table in the system dictionary.
   - Navigate to **Configuration > CI Lifecycle Management > View Internal Operational States** to display available operational states set by each requestor.
7. Set priority for operational states.
8. Call APIs to apply CI actions.
   - Navigate to **Configuration > CI Lifecycle Management > CMDB CI Actions** to display which actions were submitted and thier active/inactive state in the CMDB.
9. Navigate to **Configuration > CI Lifecycle Management > View CI State Registered Users** to display currently registered operators that were registered via the registerOperator API.
10. Review **Renew Lease tasks and extend leases as needed**: Navigate to **Configuration > CI Lifecycle Management > Renew Lease Tasks**. These tasks are created automatically by the **CI Lifecycle Management - Restore Internal State Management Tables** scheduled job for CI action records in which the lease for a valid requester has expired. The Requestor should use the lifecycle management API **ExtendCIActionLease** to extend the lease. Otherwise, if the lease remains expired for a specified grace period, the **CI Lifecycle Management - Restore Internal State Management Tables** scheduled job marks the respective CI action record as 'inactive'.
    - The grace period for expired lease time is configurable by the system property **glide.cmdb.stategmt.max_lease_expired_days**.
11. Navigate to **Configuration > CI Lifecycle Management > State Management Logs** to display logs of CI Lifecycle Management operations.

Lifecycle management APIs

CI Lifecycle Management provides a set of state management APIs for manipulating CI operational states, and applying CI actions. State management APIs adhere to restrictions and allowances specified by Not Allowed CI Actions, Compatible CI Actions, and Not Allowed Operational Transitions. If an API attempts to perform a restricted operation, the operation is blocked, an error is logged, and a task is automatically created if appropriate.

Lifecycle management APIs can set operational states and CI actions to CMDB groups by utilizing lifecycle management bulk APIs.

Registration APIs

- registerOperator() - Method to register operator with state management for non-workflow user.
- unregisterOperator(String requestorId) - Method to unregister operator for non-workflow users.
- isValidRequestor(String requestorId) - Method to determine if the specified requestor is a valid active workflow user or a registered user.
- isLeaseExpired(String requestorId, String ciSysId, String ciActionName) - Method to check if registered user lease expired.
- extendCIActionLease(String requestorId, String ciSysId, String ciActionName, String leaseTime) - Method to extend CI Action Lease time, for registered users. If previous lease already expired, extend lease from now.

**Operational State APIs**

- setBulkCIOperationalState(String requestorId, String sysIdList, String opsLabel, String opsStateListOld) - Method to set Operational State for an array of CIs.
- getOperationalState(String ciSysId) - Method to get CI Operational State.

**CI Actions APIs**

- addBulkCIAction(String requestorId, String sysIdList, String ciActionName, String ciActionListOld, String leaseTime) - Method to add CI Action for an array of CIs.
- removeBulkCIAction(String requestorId, String sysIdList, String ciActionName) - Method to remove a CI Action for a list of CIs.
- getCIActions(String ciSysId) - Method to get CI Actions.

**Not Allowed Action Based on Operational State API**

- isNotAllowedAction(String ciType, String opsLabel, String actionName) - Method to check if a specific CI action is not allowed for specific Operational State on a CI Type.

**Not Allowed Operational State Transition API**

- isNotAllowedOpsTransition(String ciType, String opsLabel, String transitionOpsLabel) - Method to check if specific operational state transition is not allowed on a CI Type.

**Compatible Action API**

- isCompatibleCIAction(String actionName, String otherActionName) - Method to check if two specific actions are compatible with each other.

**Using state management APIs**

```javascript
// 1. Register Operator with State Mgmt
var output = SNC.StateManagementScriptableApi.registerOperator();
var jsonUntil = new JSON();
var result = jsonUntil.decode(output);
var requestorId = result.requestorId;

// Get list of sys_ids to update
var sys_ids;
```
// 2. Set list of sys_ids's Operational State to 'Repair in Progress'
output = SNC.StateManagementScriptableApi.setBulkCIOperationalState(requestorId, sys_ids,'Repair in Progress');
gs.print(output);

// 3. Set list of sys_ids's CI Action State to 'Patching'
output = SNC.StateManagementScriptableApi.addBulkCIAction(requestorId, sys_ids, 'Patching');
gs.print(output);

System properties associated with CI Lifecycle Management

CI Lifecycle Management uses the following system properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.cmdb.statemgmt.max_bulk_count</td>
<td>Maximum number of CIs that CI Lifecycle Management can process in a bulk update operation.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> integer</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value:</strong> 1000</td>
</tr>
<tr>
<td></td>
<td>• <strong>Location:</strong> System Property (sys_properties) table.</td>
</tr>
<tr>
<td>glide.cmdb.statemgmt.max_lease_expired_days</td>
<td>Maximum number of days that lease expiration can be set with for CI Actions.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> integer</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value:</strong> 15</td>
</tr>
<tr>
<td></td>
<td>• <strong>Location:</strong> System Property (sys_properties) table.</td>
</tr>
</tbody>
</table>

Tables installed with CI Lifecycle Management

CI Lifecycle Management adds the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI State Registered Users</td>
<td>All currently active registered users that were created via the <strong>registerOperator</strong> API. You cannot manually add new records to this table.</td>
</tr>
<tr>
<td>(statemgmt_register_users)</td>
<td></td>
</tr>
<tr>
<td>CI Actions</td>
<td>A set of CI actions that can be applied to a CI during its lifetime.</td>
</tr>
<tr>
<td>(statemgmt_ci_actions)</td>
<td></td>
</tr>
<tr>
<td>CMDB CI Actions</td>
<td>Active/inactive CI actions set by a specific requestor for a specific CI. You cannot manually add new records to this table.</td>
</tr>
<tr>
<td>(statemgmt_cmdb_actions)</td>
<td></td>
</tr>
<tr>
<td>Compatible CI Actions</td>
<td>Set of rules that define pairs of CI actions that are compatible for a CI and can be applied simultaneously.</td>
</tr>
<tr>
<td>(statemgmt_compat_actions)</td>
<td></td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Not Allowed CI Actions</td>
<td>Set of rules that define specific actions that are not allowed for a CI when it’s in a specific operational state.</td>
</tr>
<tr>
<td>(statemgmt_not允许_actions)</td>
<td></td>
</tr>
<tr>
<td>Internal Operational States</td>
<td>Internal operational states set by a specific active requestor for a specific CI. You cannot manually add new records to this table.</td>
</tr>
<tr>
<td>(statemgmt_ops_state)</td>
<td></td>
</tr>
<tr>
<td>Renew Lease Task</td>
<td>Set of tasks that were automatically created to renew the lease of CI actions whose lease has expired. You cannot manually add new records to this table.</td>
</tr>
<tr>
<td>(statemgmt_renew_lease_task)</td>
<td></td>
</tr>
<tr>
<td>Operational State Priorities</td>
<td>Priorities of operational states which determine precedence when multiple operational states are set for same CIs by different requestors.</td>
</tr>
<tr>
<td>(statemgmt_ops_state_pri)</td>
<td></td>
</tr>
<tr>
<td>Not Allowed Operational Transitions</td>
<td>Set of rules that define specific operational state transitions that are not allowed.</td>
</tr>
<tr>
<td>(statemgmt_not允许_ops)</td>
<td></td>
</tr>
</tbody>
</table>

**Activate the CI Lifecycle Management scheduled job**

When starting to use the CI Lifecycle Management module, ensure to activate the **CI Lifecycle Management - Restore Internal State Management Tables** scheduled job which is disabled by default. This scheduled job continuously checks and maintains the data integrity of all internal CI Lifecycle Management tables.

When CI Lifecycle Management operations do not complete properly, for example due to a failure of the requestor or a requestor whose lease has expired, the integrity of tables related to CI Lifecycle Management might be compromised. The **CI Lifecycle Management - Restore Internal State Management Tables** scheduled job scans tables related to CI Lifecycle Management, and does the following:

- De-activates or removes all internal lifecycle management records with invalid requestors, and closes any corresponding Renew Lease Tasks if present.
- Detects records associated with a valid requestor whose lease has expired, and automatically creates a Renew Lease Task to notify the user and to provide details for extending the lease. If the requestor takes no action and the lease remains expired for a specified grace period (default 15 days), automatically de-activates the corresponding CI action record, and closes any corresponding Renew Lease Task if present.

1. Navigate to **System Definition**, and click **Scheduled Jobs**.
2. Search for the **CI Lifecycle Management - Restore Internal State Management Tables** job.
3. In the respective **Active** column, double-click the value **false**, and select **true**.
4. Click the **Save** icon.

**Define a CI action**

Define a CI Lifecycle Management CI action that can be later applied to CIs.

You can view a list of all the actions that are currently applied to CIs by navigating to **Configuration** and clicking **CMDB CI Actions**.

1. Navigate to **Configuration** > **CI Lifecycle Management** > **CI Actions**.
2. On the **CI Actions** page, click **New**. Fill in **Name** and **Description**, and then click **Submit**.
Define compatible CI actions

Allow a CMDB CI Lifecycle Management operation in which two specified CI actions can be applied simultaneously to a CI.

By default, it is not allowed to apply more than a single action to a CI. You can change that behaviour by defining pairs of CI actions as compatible and therefore these actions can be applied simultaneously to a CI. For example you can specify that Provisioning and Patching are compatible CI actions, which lets you apply both to a CI at the same time.

1. Navigate to Configuration, and click Compatible CI Actions.
2. On the Compatible CI Actions page click New and fill out the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>First action in the compatibility actions pair.</td>
</tr>
<tr>
<td>Compatible Action</td>
<td>Second action in the compatibility actions pair.</td>
</tr>
</tbody>
</table>

An API can successfully apply the two specified actions simultaneously to a CI.

Define a not-allowed CI action

Define a restriction for CI Lifecycle Management in which a specified action is not allowed for a CI that is in a specified operational state.

By default, there are no restrictions in the CMDB CI Lifecycle Management on applying CI actions. You can restrict this behaviour by not allowing a specified action to be applied to a CI when it is in a specified operational state. For example, you can define a restriction in which the provisioning action cannot be applied to a Linux Server that is in a non-operational state.

1. Navigate to Configuration > CI Lifecycle Management > Not Allowed CI Actions.
2. Click New on the Not Allowed CI Actions page, and fill out the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not Allowed Action</td>
<td>The action that is being restricted.</td>
</tr>
<tr>
<td>CI Type</td>
<td>The CI type for which the restriction applies to. To apply a rule to all CIs, select Configuration Item.</td>
</tr>
<tr>
<td>Operational State</td>
<td>The operational state that the CI must be at in order to apply the restriction.</td>
</tr>
</tbody>
</table>

3. Click Submit.

If an API attempts to apply the specified action to the specified CIs, while it is in the specified operational state, the operation fails and an error is logged.

Set priority for an operational state

CI Lifecycle Management allows multiple operators or automations to simultaneously set different operational states for a CI. A CI can have only a single operational state, so in this case, the cumulative operational state of the CI is set to the one with the highest priority. It is recommended
that you specify a priority for each operational state that you define so that a cumulative state can be correctly calculated.

1. Navigate to Configuration > CI Lifecycle Management > Operational State Priority.
2. On the Operational State Priority page, click the operational state for which you want to set or update priority.
3. Enter a Priority and click Update.
   Smaller numbers represent higher priority.

Define a non-allowed operational transition

Define a restriction for CI Lifecycle Management in which a specified CI cannot transition from one operational state to another.

By default, CI Lifecycle Management has no restrictions for transitioning CIs from one operational state to another. You can restrict this behaviour by defining transitions that are not allowed for a specified CI. For example, you can define a restriction on transitioning a Linux server from non-operational state to repair in progress state.

1. Navigate to Configuration > CI Lifecycle Management > Not Allowed Operational Transitions.
2. On the Not Allowed Operational Transitions page, click New and fill out the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI Type</td>
<td>The CI type for which the restriction applies.</td>
</tr>
<tr>
<td>Not Allowed Transition</td>
<td>The CI state into which transitioning is restricted.</td>
</tr>
<tr>
<td>Operational State</td>
<td>The operational state that the CI must be in for the restriction to apply.</td>
</tr>
</tbody>
</table>

If an API attempts to transition a CI that is in the specified operational state to a state that is not allowed, the operation fails and an error is logged.

CMDB groups

A CMDB group is a collection of CIs that lets you apply CI actions collectively to all the CIs that are members in the group. For example, a CMDB CI Lifecycle Management API can use a CMDB group scriptable API to retrieve the group's list of CIs, and then apply a CI Lifecycle Management action collectively to all the CIs.

Group type

A CMDB group is configured with a group type. If a CMDB group is set with the Health group type, then the CIs in the group can be monitored by CMDB Health, and the aggregated health is reported for the group as a whole in the CMDB group view dashboard. For example, you can monitor health only for CIs in a specific location.

Populate a CMDB group

Depending on the group type, you can populate a CMDB group by manually adding individual CIs, selecting saved CMDB queries, or building encoded queries in the CMDB group itself. The resulting CIs from each query are added as members to the group.
Roles required:
- To view CMDB groups - itil
- To use a CMDB queries - cmdb_query_builder on top of itil
- To manually add CIs - itil or asset

Also, to populate a CMDB group using a CMDB query, a saved CMDB query must exist.

1. Navigate to Configuration > CMDB Group.
2. In the CMDB Groups pane click New.
3. Fill out the form, right-click the title bar and select Save.

4. To use saved CMDB queries:
   a) Click CMDB Group Contains Saved Queries and then click Add Query.
   b) Select a query from the Query Builder Saved Query list.
   c) Click Submit.

   The query that is used returns a list of CIs of the class in the start node of the query.

5. To manually add CIs:
   a) Click CMDB Group Contains Configuration Items and then click Edit Manual CI.
   b) Optionally add filters.
   c) Select CIs in the Configuration Item list and click the + icon at the bottom.
   d) In the Group members list, select the CIs to add to the group.
   e) Click Save or Save and Exit.
   f) In the Save Confirmation dialog box, click OK.
   g) Click Submit.

6. To use encoded queries:
   a) Click CMDB Group Contains Encoded Queries and then click New.
   b) Select a class for which the encoded query applies to and add conditions to build a query. The resulting CIs are included in the group.
Note: Dynamic filters are not supported for CMDB health-type groups, even though it is possible to add them in a condition clause.

c) Click Submit.

Click Show All CI to display all CI members of the group.

Show CI Lifecycle Management details for CMDB group CIs

Display CI Lifecycle Management operational state and CI actions that apply to the CIs that are members of a CMDB group.

If the CMDB group is based on a CMDB query, then the query runs in real-time and displays the resulting CIs. If the query does not complete successfully due to timing out or for other reasons, then appropriate error messages are displayed.

1. Navigate to Configuration > CMDB Groups.
2. On the CMDB Groups page, click on a CMDB group.
3. Click Show All CI.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Item</td>
<td>CI group member.</td>
</tr>
<tr>
<td>Class</td>
<td>Class of CI group member.</td>
</tr>
<tr>
<td>Operational Status</td>
<td>CI Lifecycle Management operational state of the CI such as ‘Repair in Progress’ or ‘Operational’. Possible operational states are defined in the choice list of the Operational status field in the cmdb_ci table.</td>
</tr>
<tr>
<td>Actions</td>
<td>CI Lifecycle Management actions that apply to the CI such as ‘Cloning’ and ‘Provision’. Possible actions are defined in the CMDB CI Actions (statemgmt_cmdb_actions) table.</td>
</tr>
</tbody>
</table>

CMDB Identification and Reconciliation

The Identification and Reconciliation module provides a centralized framework for identifying and reconciling data from different data sources. It helps maintain the integrity of the CMDB when multiple data sources such as EventManagement, Discovery, ImportSets, and ManualEntry are used to create and update CI records.

The use of multiple sources increases the risk of introducing inconsistencies through duplicate records. To maintain the integrity of the database, it is important to correctly identify CIs and services so that new records are created only for CIs that are truly new to the CMDB. Identification and Reconciliation helps you prevent duplication of CI records, reconcile CI attributes, reclassify CIs, and allow only authoritative data sources to update the CMDB.

Domain Separation

The identification process is domain aware. If the domain separation plugin has been activated, then identification processes only those CIs in which the domain ID is identical to the domain of
the currently logged on user. If duplicate CIs exist across domains (including parent and child domains), then those CIs are not considered duplicate CIs because their domain IDs do not match.

**Domain separation in CMDB Identification and Reconciliation**

This is an overview of domain separation and the CMDB Identification and Reconciliation feature. Domain separation allows you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

**Overview**

This topic explains how domain separation is enforced during the CMDB Identification and Reconciliation process. In addition this topic addresses how domain separation is applied to the Identification and Reconciliation rules.

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

**How domain separation works in Identification and Reconciliation**

Domain separation in the identification engine is enforced as soon as users activate the domain separation plugin.

**Domain separation during the Identification and Reconciliation Process**

- Domain separation during the Identification/Reconciliation process is enforced through the domain ID.
- Domain IDs do not need to be explicitly sent in the input payload of the identification engine APIs. Internally, the identification engine causes the current domain ID of the user to call the identification engine APIs.
- Only CIs that have the same domain ID as the currently logged-in user’s domain display during matching.
- During matching, if no records are found and a CI needs to be inserted, the CI’s domain ID is the same as the domain ID of the currently logged-in user’s domain.
- During matching, if duplicates are found, De-Duplication tasks created in the reconcile_duplicate_task table, have the same domain ID as those of the duplicate CIs.
- Duplicate CIs that exist across domains (including parent and child domains) are not considered as duplicate CIs by the identification engine.
- During matching, if reclassification of the CI is not allowed, reclassification tasks are created in the reclassification_task table, with the same domain ID as the CI for which reclassification is needed.

**Domain separation and Identification Rules**

- The identification rules and identification inclusion rules used during the identification process are always defined at the global level. For example, the tables below do not have a sys_domain field:
Domain separation and Reconciliation Rules

- The reconciliation definition rules and data source precedence rules that are used during the reconciliation process can be defined for different domains. For example, the tables below do have sys_domain, sys_overrides, sys_domain_path fields:
  - Reconciliation Definition (cmdb_reconciliation_definition), Datasource Precedence (cmdb_datasource_precedence), and Data Source Staleness Definitions (cmdb_datasource_staleness).

Identification and reconciliation components and process

The CMDB identification and reconciliation functionality is supported by identification rules, reconciliation rules, de-duplication tasks, and reclassification tasks.

Components of Identification and Reconciliation

Identification

Identification is the process of uniquely identifying CIs, to determine if the CI already exists in the CMDB or if it is a newly discovered CI that must be added to the CMDB. The identification engine performs identification processes, relying on identification rules.

Reconciliation

Reconciliation is the process of reconciling CIs and CI attributes by allowing only designated authoritative data sources to write to the CMDB at the CI table and attribute level. The CMDB is updated in real time as records are being processed. There is no staging area to verify the reconciliation activities before they are committed. The process relies on reconciliation rules.

De-duplication tasks

If the instance encounters duplicate CIs during the identification and reconciliation process, it groups each set of duplicate CIs into a de-duplication task. Review the information in these tasks to see how it was determined that these CIs are duplicates.

Reclassification tasks

During the CI identification process, a matched CI might need to be upgraded, downgraded, or switched to another CI class. If automatic reclassification is disabled, then the system generates a reclassification task. Review the information in these tasks, and decide whether a manual reclassification of the CI is appropriate.

APIs

The Identification and Reconciliation APIs are a centralized set of APIs that can be used with different sources of data such as Discovery, Monitoring, or Import Sets. You can use it to enforce identification and reconciliation before data is stored in the CMDB. Data sources do not directly write to the CMDB. Instead, they call the APIs first to ensure that the data being written does not introduce inconsistencies.

Identification engine APIs are accessible in scoped apps. See Activate Configuration Management For Scoped Apps (CMDB) for information about how to activate the plugin, and how to script a scoped app to access those APIs.
- **createOrUpdateCI()**: A scriptable API that creates or updates a CI based on identification and reconciliation rules.
- **IdentifyCI()**: Similar to the createOrUpdateCI API, but does not commit the result to the database. Use this API with a given payload to find out if the identification engine will perform insert or update operations, without committing the operation.
- **CMDBTransformUtil**: An API to be used exclusively with Import Sets to apply identification and reconciliation processes to data imported by Import Sets.

Predefined identification and reconciliation rules are included for tables that are in the base instance. You can customize these rules for your organization. When a new table is created in the CMDB, it derives identification and reconciliation rules from its parent table if these rules exist. To apply identification and reconciliation rules to a new table, create the rules either at the child level or at its parent level.

**Process flow of Identification and Reconciliation**

![Diagram showing process flow of Identification and Reconciliation](image.png)
Activate Configuration Management For Scoped Apps (CMDB)

You can activate the Configuration Management For Scoped Apps (CMDB) plugin (com.snc.cmdb.scoped) to allow a scoped app in scripts to use the prefix 'sn_cmdb.IdentificationEngine.<method>' to access identification engine APIs. This plugin does not include demo data and activates related plugins if they are not already active.

Role required: admin

1. Navigate to System Definition > Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
   - If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. Optional: If available, select the Load demo data check box.
   - Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
   - You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.
5. Click Activate.

Apply CI Identification and Reconciliation to Import Sets

You can apply CMDB Identification and Reconciliation processes when Import Sets are used to import CIs into the CMDB. CI identification can prevent duplicate CIs in the CMDB, which Import Sets might otherwise cause.

Populating CMDB tables using Import Sets can inadvertently result in duplicate CIs when multiple imported records are identical to an existing CI. To minimize this duplication, you can apply CMDB Identification and Reconciliation processes to Import Sets when importing new records into CMDB tables.

Transform map script

In the onBefore transform map script for an import set, add a call to the CMDBTransformUtil API, similar to the following code sample:

```javascript
(function runTransformScript(source, map, log, target) {
  // Call CMDB API to do Identification and Reconciliation of current row
  var cmdbUtil = new CMDBTransformUtil();
  cmdbUtil.identifyAndReconcile(source, map, log);
  ignore = true;

  if (cmdbUtil.hasError()) {
    var errorMessage = cmdbUtil.getError();
    log.error(errorMessage);
  } else {
    log.info('IE Output Payload: ' + cmdbUtil.getOutputPayload());
}
```
log.info('Imported CI: ' + cmdbUtil.getOutputRecordSysId());
}
}
(source, map, log, target);

The `ignore = true` code phrase prevents Import Sets from creating the same record again after it is processed by the identification engine.

**Process**

The identification engine performs identification of each source record before it is inserted into the CMDB. The identification engine determines if the record is a duplicate of an existing CI, and then:

- If not duplicate: Inserts the record to the target table.
- If duplicate: Updates the existing CI in the CMDB, with data from the source record.

The CMDBTransformUtil API pre-processes the source data. Then passes the input values to the identification engine with import set being the data source by default. The CMDBTransformUtil API supports a target field that is a reference field in the same manner that Import Sets supports it. The CMDBTransformUtil API also supports a source script, evaluating source scripts to determine the target value which is then passed to the identification engine. For more information, see [Create a field map](#).

**Restrictions**

The following restrictions apply:

- An import set should be associated with a single transform map. While adding a call to the CMDBTransformUtil API, ensure that still a single transform map exists for the import set.
- The CMDBTransformUtil API does not check if mandatory fields have values when used with Import Sets. Regardless of how `enforce mandatory fields` is set in the transform map, data import fails if a mandatory field does not have a value.
- CI Identification and Reconciliation cannot be applied to Import Sets for dependent CIs (CIs with dependent identification rules).

**Identification rules**

The CMDB identification process relies on identification rules to uniquely identify CIs.

An identification rule applies to a CI class and consists of a single CI identifier and one or more identifier entries and related entries, each with a different priority. Each identifier entry defines a unique attribute set with a specific priority and each related entry defines rules for identifying related items. Create strong identification rules that are set with the highest priority for the strongest identifier entries and related entries.

The identification process and identification rules use the CIs attributes for identification:

- **Unique attributes**
  Designated sets of criterion attribute values of a CI, that can be used to uniquely identify the CI. Unique attributes can be from the same table or from derived tables.

- **Required attributes**
  Designated attributes of a CI that cannot be empty.
Identification rule types

The steps for identifying dependent CIs can be different from the steps for identifying independent CIs. This difference is reflected in the differences between dependent identification rules and independent identification rules.

Independent identification rule

A rule that identifies a CI based on the CI’s own attributes, independently of other CIs or relationship.

Dependent identification rule

A rule in which identifying a CI requires identifying a dependent CI first. A CI can have dependency on one or more CIs, and a dependent CI can have only a single parent CI with dependency. The relationship types between the CI and its dependent CIs are also included in the identification process. To help with the identification process of dependent CIs, create dependent relationships that define the dependency chain within CI types.

The payload used for identification of a dependent CI, can include a relationship with a qualifier chain. For such relationship, if there is a matching parent/child pair, the system compares the qualifier chain in the payload, with the qualifier chain of the CIs in the database. If there is a difference, the qualifier chain in the database is updated to match the qualifier chain in the payload for that relationship.

Identifier entries

You can configure an identifier entry to match a CI not only based on the CI’s own attributes (field based identification) but also based on the CI’s related list (lookup based identification) such as Serial Numbers or Network Adapters. The lookup based table that is used for identification, needs to have a reference field that points to cmdb_ci.

There are two types of identifier entries:

**Regular identifier entry**

Based on CI’s attributes that uniquely identify the CI.

**Lookup identifier entry**

Uses a related table (lookup table) which can be any table that has a reference to the CI that is being identified. After you select a related table in the lookup identifier entry, the list in **Referenced field** is populated with fields from the related table that reference either the cmdb_ci table itself, or one of its descendants.

Guidelines for lookup tables

Follow these guidelines when specifying a lookup table in an identifier entry.

1. Ensure that lookup tables reference the cmdb_ci table.
2. It is preferable to enforce exact count match (check box **Enforce exact count match (Lookups)**) for a stronger identification rule. During lookup identification, this option enforces matching only on exact lookup records count match.
3. Do not create conflicting identification rules especially for lookup based rule.

Example: In a CI Identifier for the Hardware class you specify a lookup based rule for the Network Adapter class, and you also define a CI Identifier for the Network Adapter class.
Duplicates might potentially be created in the Network Adapter table, because there are contradicting rules to identify a unique CI in that table:

- One rule that looks only at criterion attributes (CI identifier rule)
- Another rule that looks at criterion attributes and referenced sys_id (lookup rule).

Example: CI with related items that needs to be inserted - sysId is available.

```javascript
var payload = {
  items: [{
    className:'cmdb_ci_linux_server',
    related: [{
      className:'cmdb_ci_spkg',
      values: {
        name:'package1',
        version:'version1'
      }
    }],
    values: {
      sys_id:'194876usytrr65378098'
    }
  }]
};
```

Related entries

You can also define related entries which are rules that are based on related CIs. A related entry is based on a related table which can be any table that has a reference to the CI that is being identified. After you select a related table for the rule, the list in Referenced field is populated with fields from the related table that reference either the cmdb_ci table itself, or one of its descendants.

Create or edit a CI identification rule

Identification rules are used to uniquely identify CIs in the CMDB, as part of the identification and reconciliation process. Each CMDB class can be associated with a single identification rule.

Role required: itil has read access, itil_admin (on top of itil) has full access.

In a CI identification rule, specify a CI identifier, and identifier entries and related entries that uniquely identify the CI. You cannot use the CI Class Manager to create related entries for an identification rule, you need to add those directly to the cmdb_identifier table.

Review the following before creating identification rules:

- Identification rules
- Effective usage of CMDB Identification

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to display the CI Classes list. Select the class for which to create an identification rule.
3. In the class navigation bar, expand Class Info and then click Identification.
4. Click Edit to edit an existing rule, or click Add in the Identification Rule section to create one. Fill out the form, and then click Save.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Independent/Dependent</td>
<td>Designation of whether the CI identifier can identify the CI independently of other CIs, or not.</td>
</tr>
</tbody>
</table>

**Note:** To set the rule as **Dependent**, you must specify dependent relationship rules for the selected class.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of CI identifier.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the CI identifier.</td>
</tr>
</tbody>
</table>

5. In the Identifier Entries section, click an existing identifier entry to edit, or click **Add** to create one.

6. Fill out the details in the Identifier Entry dialog box to specify criteria for matching a CI, and then click **Save**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Search on table</td>
<td>The lookup table:</td>
</tr>
<tr>
<td></td>
<td>- For a regular identifier entry: Select the same table as the table specified in <strong>Applies to</strong> on the Identifier form.</td>
</tr>
<tr>
<td></td>
<td>- For a lookup identifier entry: Select a table that is different from the <strong>Applies to</strong> table specified on the Identifier form. Also, the lookup table must have a reference field to <strong>cmdb_ci</strong>, otherwise the identifier entry is considered invalid.</td>
</tr>
<tr>
<td></td>
<td>The <strong>Rule Info</strong> and the <strong>Lookup Info</strong> tabs appear.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Priority</td>
<td>Priority of the identifier entry. Identifier entries are applied based on priority. Rules with lower priority numbers are given higher priority. Identifier entries of identical priorities are applied randomly. It is recommended that you keep gaps between the priority numbers, so you can assign the unused priority numbers to new entries without modifying the existing priority order.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Criterion attributes</td>
<td>Set of attributes that uniquely identify the CI. Attributes can belong to the current class, or to a parent class. Use the slushbucket to add or remove attributes from the identification rule. It is not possible to add reference fields as a criterion attribute. Reference fields store sys_ids that point to a record in another table, and thus is considered a weak criterion attribute (in terms of uniqueness) for the current table.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Allow null attribute</td>
<td>Check box to allow null values for criterion and unique attributes.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that specifies the identifier entry is active. At least one identifier entry in an identification rule must be active for the rule to apply.</td>
</tr>
<tr>
<td>Allow fallback to parent's rules</td>
<td>Designation that the identification rules of the CI's parent are used if a match is not found for this identification rule. Applies only for dependent identification rules.</td>
</tr>
</tbody>
</table>

**Note:** If criterion attributes have only two attributes and `sys_class_name` is one of them (for example (name, sys_class_name), (ip_address, sys_class_name)), then the other attribute cannot be NULL, even if `Allow null attribute` is enabled. This restriction is due to `sys_class_name` being considered a special system matching attribute.

7. If **Search on table** is set to a table that is different than the table on the Identifier form, then the **Rule Info** and the **Lookup Info** advanced tabs appear. Click **Lookup Info** and enter the information for a lookup identifier.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional condition</td>
<td>A filter to narrow the set of records that will be searched for a matching CI. Applies only to lookup based identification.</td>
</tr>
<tr>
<td>Enforce exact count match (Lookup)</td>
<td>Indicates that for lookup identification, match only on exact lookup records count match.</td>
</tr>
</tbody>
</table>

8. Optional: Add related entries to the `cmdb_identifier` table.
   a) In the main platform navigation bar, navigate to **Configuration > Identification/Reconciliation**, and click **CI Identifiers**.
   b) In the **Identifiers** view, locate and click the identification rule that you have been editing or creating.
   c) Click the **Related Entries** tab.
   d) In the **Related Entries** related list, click **New** or open an existing entry to specify a related entry for matching the related item. Fill out the form, and then click **Submit**.

**Related Entry form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identifier</td>
<td>The CI identifier for which this related entry belongs to. By default it is set to the identifier you previously selected.</td>
</tr>
<tr>
<td>Related table</td>
<td>A related table that references the CI that is being matched.</td>
</tr>
<tr>
<td>Referenced field</td>
<td>A referenced field in Related table that should store the referenced CI. This field always references the <code>cmdb_ci</code> table, or a descendent of the <code>cmdb_ci</code> table.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Criterion attributes</td>
<td>The set of attributes to uniquely identify the related item. Attributes can belong to the current class, or to a parent class. Click the lock icon to view, add, or remove attributes from the identification rule.</td>
</tr>
<tr>
<td>Optional condition</td>
<td>Use the Add Filter Condition and the Add &quot;OR&quot; Clause buttons to construct a filter to narrow the set of records that will be searched for a matching related item.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that specifies that the related entry is active.</td>
</tr>
<tr>
<td>Allow null attribute</td>
<td>If at least one criterion attribute in the related table is not null, allow to attempt matching with an identifier entry even if there are criterion attributes which are null.</td>
</tr>
<tr>
<td>Priority</td>
<td>Priority of the related entry for the specified Related table. Rules with lower priority numbers are given higher priority while matching a related item for specific related table. Related entries for the specified related table with identical priorities are applied randomly. You can keep gaps between the priority numbers, so you can assign the unused priority numbers to new entries without modifying the existing priority order.</td>
</tr>
</tbody>
</table>

**Note:** If criterion attributes have only two attributes and `sys_class_name` is one of them (for example (name, sys_class_name), (ip_address, sys_class_name)), then the other attribute cannot be NULL, even if Allow null attribute is enabled. This restriction is due to `sys_class_name` being considered a special system matching attribute.

For example, the pre-defined Hardware Rule applies to the Hardware (cmdb_ci_hardware) table. It has an identifier entry with the criterion attribute Serial Number, Serial Number Type and its Search on table field is set to Serial Number.

The following payload snippet adds a CI to the cmdb_ci_linux_server class, that is a child of the Hardware class. It also shows how you can add related items in the payload for which you should create Related Entries on the CI Identifier page for the Hardware (cmdb_ci_hardware) table:

```json
{
  "items": [
    
  ]
}
When the Hardware Rule is applied, the Serial Number (cmdb_serial_number) table is searched for a match with the values specified within the lookup key. Unless Enforce exact count match (Lookup) is checked, it is not necessary for every lookup key to return a match, as long as there is at least one match. If all matches reference the same CI, then that CI is considered to be the existing CI record. If no match is found, then the identification search continues to the next rule entry.
If after all the rules are exhausted without finding a match, a new CI record is created in the database.

You can optionally create an inclusion rule to narrow the scope of CIs that are included in identification.

Create identification inclusion rule

You can narrow the scope of CIs that are included in the identification process by creating identification inclusion rules. If any identification inclusion rules exist, they are automatically used also by the CMDB Health duplicate metric, in the same manner that health inclusion rules are used for other metrics.

Role required: itil has read access, itil_admin (on top of itil) has full access.

During duplication detection of independent CIs, the identification engine processes only the CIs that satisfy the identification inclusion rules. For example, you can include only CIs whose operational state is operational. When no identification inclusion rules exist, all CIs are included in the identification process and in the CMDB Health duplicate metric calculations. In the base system, there are no predefined identification inclusion rules. Identification inclusion rules are defined at the class level.

Note: Be careful when creating Identification inclusion rules. Identification inclusion rules can prevent the identification of certain types of CIs, affecting some features of Discovery and Service Mapping.

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to display the CI Classes list. Select the class for which to create an identification inclusion rule.
3. In the class navigation bar, expand Class Info and then click Identification.
4. In the Inclusion Rule (Advanced) section, click Add to create a rule or select an existing rule to edit. Fill out the details in the Create Inclusion Rule dialog box.
5. In the Create Inclusion Rules dialog box, specify a criteria in the Active record condition field. CIs must meet this criteria to be included in the identification process and in the duplicate CMDB Health metric.
6. Click Save.

Navigate to Configuration > Identification/Reconciliation > Identification Inclusion Rules > to see the list of all identification inclusion rules.

Reconciliation rules

Reconciliation rules specify which data sources can update a table or a set of table attributes, and they can be defined at the parent and the child table level. Ensure that there is a reconciliation rule for each data source that is authorized to update an attribute - multiple reconciliation rules can exist for the same set of attributes.

Data sources are used with the createOrUpdateCI() API to simulate manual updates to CIs. EventManagement, ImportSet, ManualEntry, and Tivoli are examples of data sources.

As you create reconciliation rules, keep the following principles and guidelines in mind. These principles are designed for flexibility and the refinement of rules at the attributes level.
Example reconciliation rules

For example, you might have the following reconciliation rules. The rules are created for the cmdb_ci_computer table and one of its child tables, the cmdb_ci_linux_server table. The rules specify the following:

1. Discovery is exclusively authorized to update the `name` attribute in the cmdb_ci_computer table.

   Because reconciliation rules are derived by child tables from parent tables, this rule also authorizes Discovery to update the `name` attribute in any child tables for the cmdb_ci_computer table.

2. ServiceWatch is exclusively authorized to update the `name` attribute in the cmdb_ci_linux_server table.

3. ServiceWatch is exclusively authorized to update all attributes in the cmdb_ci_linux_server table, as configured by leaving the Attributes field empty in the rule.

Authorization for all attributes in a table

If you want to authorize a data source to update all attributes in a table, leave the attribute list empty in the reconciliation rule for the data source. However, this authorization can be overridden for some of the attributes by rules for child tables in which specific attributes are listed.

For example, if only example rules #1 and #3 are created, then Discovery is authorized to update the `name` attribute in the cmdb_ci_linux_server table. ServiceWatch is authorized to update all other attributes in the table except for the `name` attribute.

To override the authorization of Discovery to update the `name` attribute, example rule #2 is added to specifically authorize ServiceWatch to update the attribute.

Authorization to only specific attributes in a table

If you want to authorize a data source to update specific attributes in a table, list these attributes in the reconciliation rule for the data source. A rule that grants access to specific attributes in a table overrides other rules with an empty attribute list that grants access to the entire table.

Example rule #1 grants Discovery with exclusive authority to update the `name` attribute of the cmdb_ci_computer table. All other data sources are prevented from updating the `name` attribute of any CI in the cmdb_ci_computer table.

Child table rules overrides parent table rules

Any reconciliation rules defined for a child table override the rules defined for its parent table.

For example, rule #1 lets Discovery update the `name` attribute in the cmdb_ci_computer table and all of its child tables. However, rule #2 for the cmdb_ci_linux_server child table, which overrides rule #1 for the parent table, explicitly authorizes ServiceWatch to update this attribute in the child table.

As a result:

- Discovery cannot update the `name` attribute of the child cmdb_ci_linux_server table. Only ServiceWatch is authorized to update this attribute.
• Discovery is authorized to update the name attribute of CI records in all other child tables of the cmdb_ci_computer table.

Overlapping rules

Rules that authorize different data sources for the same attributes of the same table can coexist and do not exclude each other.

For example, assume the following rule is added. It is similar to example rule #1 but authorizes a different data source:
• ServiceWatch is authorized to update the name attribute in the cmdb_ci_computer table.

Like example rule #1, this new rule applies to the name attribute in the cmdb_ci_computer table so both Discovery and ServiceWatch can update the attribute. Any applicable data source precedence rules are enforced to prevent the data sources from overwriting each other's updates.

Domain separation

If Domain Separation is enabled, then you can scope reconciliation rules to specific domains. Rules of the parent domain, if not overridden, apply to CIs of child domain. All rules that are visible to a domain are applied, and a rule overriding the parent domain displays the child domain version.

Create or edit a CI reconciliation rule

A reconciliation rule specifies the attributes that a data source is authorized to update for a given table and prevents unauthorized data sources from overwriting the attributes' values. If an attribute does not have any reconciliation rules created for it, data sources are allowed to overwrite each other's updates to the attribute's value.

Role required: itil has read access, itil_admin (on top of itil) has full access.

Reconciliation rules are used in conjunction with data refresh rules and data source precedence rules to determine reconciliation steps for a CI. These rules determine if, when, and by which data source a CI can be updated.

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to open the CI Classes list. Then select a class for which to create a reconciliation rule.
3. In the class navigation bar, expand Class Info and then click Reconciliation Rules.
4. In the Reconciliation Rules section, click Add to create a rule or select an existing rule to edit.
5. Fill out the fields on the Rule Info tab, and then click Next.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source</td>
<td>The data source that you are configuring this rule for.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to activate this reconciliation rule.</td>
</tr>
</tbody>
</table>

6. Fill out the fields on the Attributes tab, and then click Next.
7. Fill out the fields on the Filter Condition tab if applicable.

The Filter Condition tab appears only when you create or edit a reconciliation rule for an existing class. When creating a new class, this tab does not appear.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filter Condition</td>
<td>Conditions that a CI must meet, in order for the rule to apply to that specific CI. For example, to apply this rule only to CIs that are associated with the Finance department, select this condition: (Department) (is) (Finance)</td>
</tr>
</tbody>
</table>

8. Click Submit.

Additional rules that affect reconciliation:

1. Define or edit data source precedence rules
2. Create data refresh rules

**Define or edit data source precedence rules**

If multiple data sources are authorized to update the same table or the same table attributes in the CMDB, assign a priority to each of these data sources to prevent them from overwriting each other's updates. Without data source precedence rules, data sources can overwrite each other's modifications.

Role required: itil has read access, itil_admin (on top of itil) has full access.

Data source precedence rules are used along with data refresh rules and reconciliation rules to determine reconciliation steps for a CI. These rules determine if, when, and by which data source a CI can be updated.

After an authorized data source updates an attribute, subsequent updates are accepted only from the same data source or from a data source with a higher priority. Updates from a data source with a lower priority are rejected, unless these two conditions are met:

- The lower priority source is the first source updating the CI.
- The CI became stale based on data refresh rules for the CI class.
Information about the last data source that updates each attribute is stored in the Data Source History (cmdb_datasource_last_update) table.

Data source precedence rules affect reconciliation of stale CI attributes. During reconciliation, the information in the Data Source History table is considered along with the data refresh rules for the CI’s class, to determine if a CI attribute is stale. A CI attribute is determined to be stale if it was not updated by the latest data source to update the CI within a time period. The time period is specified by the Effective Duration time in the data refresh rule for the class for the data source. In this case, if another authorized data source, with a lower priority attempts to update the stale CI attribute, the update is allowed.

**Note:** Users with the itil role have read access to the CI identification rules.

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to display the CI Classes list. Select the class for which to create a data source precedence rule.
3. In the class navigation bar, expand Class Info and then click Reconciliation Rules.
4. In the Data Precedence Rules section, click Add to create a rule or select an existing rule to edit. Fill out the details in the Create Precedence Rules dialog box.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data source</td>
<td>The data source that this precedence rule applies to. EventManagement, ImportSet, ManualEntry, or an application such as Tivoli are examples of a data source.</td>
</tr>
<tr>
<td>Priority</td>
<td>Priority of this precedence rule within the set of precedence rules for the specified table. Smaller numbers designate higher priority. Data sources without a precedence rule are assigned the lowest priority.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to activate this precedence rule.</td>
</tr>
</tbody>
</table>

5. Click Save.

**Create data refresh rules**

Specify data refresh rules to determine if a CI is stale for a specific data source. Such CIs can then be updated by a lower-priority authorized data source.

Role required: itil has read access, itil_admin (on top of itil) has full access.

Data refresh rules are used in conjunction with data source precedence rules and reconciliation rules to determine reconciliation steps for a CI. These rules determine if, when, and by which data source a CI can be updated.

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to display the CI Classes list. Select the class for which to create a data refresh rule.
3. In the class navigation bar, expand Class Info and then click Reconciliation Rules.
4. In the Data Refresh Rules section, click Add to create a rule or select an existing rule to edit. Fill out the details in the Create Data Refresh Rules dialog box.

<table>
<thead>
<tr>

</tbody>
</table>

5. Click **Save**.

**Generate and simulate payload execution using identification simulation**

Identification simulation is a central location for automatically constructing a payload that is guaranteed to be complete and valid. You can then simulate the processing of the payload by the identification and reconciliation engine (IRE) and examine the results before actually submitting it for execution by IRE.

Use identification simulation to construct an input payload, and simulate processing of the payload by IRE. You can then examine the results, adjust identification rules if needed, and re-run the simulation of the updated payload.

Use the identification simulation to:

- Automatically construct input payload that is based on existing identification rules, hosting and containment rules.
- Simulate execution of a payload (automatically constructed by identification simulation, or manually created).
- Browse payload output and execution log messages for a simulated run.

**Note:** Identification simulation does not commit any updates to the CMDB, other than setting the **discovery_source** attribute to **Duplicate** for a CI that is determined to be duplicate.

**Automatically generate payload using identification simulation**

Use identification simulation to automatically construct an input payload for a specified class. The constructed payload is complete with any required dependent CIs, correctly structured, and syntactically valid for processing by the identification and reconciliation engine (IRE).

Role required: itil

The payload that is constructed during identification simulation is for the specified class. For a dependent CI class, you will be prompted for information about all dependencies. After you provide the required details, identification simulation constructs the payload based on your input.

1. Navigate to **Configuration > Identification/Reconciliation**, and click **Identification Simulation**.
2. In the **Start with CI Class** box click **Start**.

© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
3. On the **Payload Information** form, in the **Source** field, select the data source that is associated with this class update.
   For the ServiceNow Discovery data source, select **ServiceNow**.

4. Select the **Class** in the payload.
   a) In the **Criterion Attributes** area select the CI identifier attributes and then specify the values that uniquely identify a CI.
   b) In the **Additional Attributes** area specify attributes and values that matching CIs will be updated with.

5. For dependent CIs associated with dependent identification rules, fill out the **Criterion Attributes** and **Additional Attributes** sections in all **Container level** sections that display.

6. Click **Generate**. If any errors indicate that there are missing fields, fill in the missing fields and then click **Generate** again.

7. You can optionally click **Execute** to simulate processing of the payload by IRE.

Examine the results of the simulation, fine-tune the payload as needed, and combine with other payloads for other classes as desired. After finalizing the payload, use the **createOrUpdateCI()** API to execute the payload by IRE which will result in actual updates to the CMDB.

**Simulate payload processing using identification simulation**

Use identification simulation to simulate the identification and reconciliation engine (IRE) process of CI identification for an input payload. Provide a valid payload, which was constructed using identification simulation or that was created manually.

Role required: itil

1. Navigate to **Configuration > Identification/Reconciliation**, and click **Identification Simulation**.

2. To execute an existing payload:
   a) Click **Start** in the **Start with Existing Payload** tile.
   b) In the **Source** field, select the data source that is associated with this class update.
   c) Paste the JSON payload into the empty canvas.

3. Or, to construct a new payload click **Start** in the **Start with CI Class** tile. See **Automatically generate payload using identification simulation** for more information.

4. Click **Execute** to simulate processing of the payload by IRE.

1. Examine the results of the simulation in the results pane, and fine-tune the payload as needed:
   a. Click **Run #1** to display the **Context ID** and the **Run ID** of the simulated run.
   b. Click the drop down arrow next to **Run #1** to display additional details.
      - **Input**: Displays the payload for the simulation.
      - **Logs**: Displays all the logged messages that IRE generated while simulating processing of the payload, according to the specified logging level.
      - **Output**: Displays the output payload returned by IRE.

2. After finalizing the payload, use the **createOrUpdateCI()** API to execute the payload by IRE which will result in actual updates to the CMDB.
Set logging level for identification simulation

Identification simulation logs each step of a simulated payload processing. You can then examine these run logs to determine if a payload was processed as expected, and if identification rules are effective. You can adjust the level of logging so it is helpful, and so that the amount of messages is not excessive or insufficient.

Role required: itil

1. Navigate to Configuration > Identification/Reconciliation, and click Identification Simulation.
2. Click the Settings icon.
3. Select logging level for the identification and reconciliation engine (IRE) under IE Log Level and for the service cache under Service Cache Log Level.
   The logging levels are displayed in ascending order, from the minimum level to the maximum level of logging.
4. Click on the Settings icon again to close the Settings dialog box.

Resolve de-duplication tasks

When the instance encounters duplicate CIs during identification and reconciliation, it groups each set of duplicate CIs into a de-duplication task for review. Use de-duplication tasks to track the duplicate CIs until they can be resolved. A large number of duplicate CIs might be due to weak identification rules.

De-duplication tasks provide details about the duplication, including a list of all the duplicate CIs and the internal payload used during the identification process. Review the details of each duplicate CI in the task and the data that was used to determine that the CI is a duplicate.

If the duplicate CI is a dependent CI, then you can view the details of the dependent relationship, the Depend on CI, and any relation qualifier chain. If the dependent CI has a lookup table, then you can see the details of the respective lookup table.

Skip duplication

Processing of sets of duplicate CIs depends on the system properties glide.identification_engine.skip_duplicates (set to true by default) and glide.identification_engine.skip_duplicates.threshold (set to 5 by default), and on the number of duplicate CIs in a set.

- If glide.identification_engine.skip_duplicates is true, and the number of duplicate CIs is less than the threshold specified by glide.identification_engine.skip_duplicates.threshold, then the oldest of the duplicate CIs is picked as a match and gets updated. The rest of the duplicate CIs are tagged as duplicates by setting the cmdb_ci©s discovery_source field as 'Duplicate'.
- If glide.identification_engine.skip_duplicates is false, then matching of duplicate CIs fails with an error, and none of the duplicate CIs is updated.

**Note:** In either case, de-duplication tasks are always created.

To modify these properties, you need to first add them to the System Properties (sys_properties) table. For more information, see Properties installed with Identification and Reconciliation.

Role required: admin or itil

1. Navigate to Configuration > Identification/Reconciliation > De-duplication Tasks.
2. Select a task.
De-duplication Task fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>A unique task number.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>A person that is responsible for resolving the task.</td>
</tr>
<tr>
<td>Short description</td>
<td>A short description for the task.</td>
</tr>
<tr>
<td>Internal payload</td>
<td>Payload that was used in the identification process, during which the de-duplication task was generated.</td>
</tr>
<tr>
<td>Description</td>
<td>Full description for the task.</td>
</tr>
<tr>
<td>Work notes</td>
<td>Notes to keep track of the decisions and steps of resolving the task.</td>
</tr>
<tr>
<td>Priority</td>
<td>Task priority.</td>
</tr>
<tr>
<td>State</td>
<td>State of the de-duplication task as it progresses through resolution.</td>
</tr>
</tbody>
</table>

3. In the Duplicate Audit Results section, click a CI in the Duplicate CI column to view the details about how the CI was identified as a duplicate.

Duplicate Audit Results list columns

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Duplicate CI</td>
<td>Reference to the duplicate CI.</td>
</tr>
<tr>
<td>Note: This field is a document ID type, which means that it can reference any record on any table. If the referenced CI is deleted as part of resolving duplicate tasks, then this field will be empty.</td>
<td></td>
</tr>
<tr>
<td>Depend on</td>
<td>If the duplicate CI is a dependent CI, then this field displays the depend on CI.</td>
</tr>
<tr>
<td>Qualifier chain</td>
<td>If the duplicate CI is a dependent CI, then this field shows a list of sys_ids of qualifier CIs, if it exists.</td>
</tr>
<tr>
<td>Follow on task</td>
<td>The associated de-duplication task that captures the duplication.</td>
</tr>
<tr>
<td>Relationship</td>
<td>For a duplicate CI that is a dependent CI, this field shows the relationship between the duplicate CI and depend on CI.</td>
</tr>
</tbody>
</table>

Based on your analysis of de-duplication tasks, you can determine which CI should remain active and which of the duplicate CIs in the Duplicate Audit Results records are stale or incorrect. Determine if it is appropriate to delete or inactivate any of these CIs.
CI reclassification

During the CI identification process, a CI might need to be reclassified to a different sys_class_name type. By default, CIs are reclassified automatically. If automatic reclassification is disabled, then the CI is not reclassified and the system generates a reclassification task for your review.

A CI can be upgraded to a higher class, downgraded to a lower class, or switched to a different branch in the class hierarchy. For more details about reclassification operations, see Reclassify a CI. You can configure CI reclassification behavior at a system-wide level or individually per CI.

Enabling and disabling automatic CI reclassification

You can use the glide.class.upgrade.enabled, glide.class.downgrade.enabled, and glide.class.switch.enabled properties to configure system-wide behavior for CI reclassification. These properties are set to true by default, enabling automatic reclassification. To disable automatic CI reclassification, set the respective properties to false.

Alternatively, you can control the reclassification behavior for individual CIs in the input payload of the createOrUpdateCI() API. In the payload, you can set these properties to true or false to temporarily override the respective property setting.

- classUpgrade
- classDowngrade
- classSwitch

The following sample JSON payload enables automatic reclassification for the specified CI:

```json
{ items: [{className: 'cmdb_ci_server', classUpgrade: true, classDowngrade: true, classSwitch: true, values: {name: 'linux123', serial_number: '12srt567', ip_address: '10.2.3.4'}}, ]}
```

View a reclassification task

When automatic CI reclassification is disabled, reclassification tasks are created for CIs that could not be automatically reclassified during the identification process. Review these tasks to locate the CIs and decide if to reclassify them.

Role required: admin or itil

1. Navigate to Configuration > Identification/Reconciliation > Reclassification Tasks.
2. Select a reclassification task.
3. Examine the details on the Reclassification Task form.

Reclassification Task form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Item</td>
<td>The CI that must be reclassified.</td>
</tr>
<tr>
<td>Short description</td>
<td>Short description noting that CI reclassification was not allowed.</td>
</tr>
<tr>
<td>Description</td>
<td>Description noting the current class of the CI and the class that the CI must be changed to.</td>
</tr>
<tr>
<td>Internal payload</td>
<td>Payload used in the identification process.</td>
</tr>
</tbody>
</table>
After examining the task details, you can locate the CI that is noted in the task **Description** and manually reclassify it. For details, see **Reclassify a CI**.

**Dependent relationship rules**

Service definitions consist of CI types and relationship types. Dependent relationship rules define the dependency structure of the CI types and the relationship types in these service definitions, helping in CI identification and in the construction of business service maps.

The dependencies that are defined by these rules are used when identifying dependent CIs to prioritize the order of CI identification, and to match CIs and respective dependent CIs in a payload. Dependent relationship rules are also used by Service Mapping and can be defined for custom CI types. After defining a new CI type, you can define dependent relationship rules that specify how the new CI type is related to existing types in the CMDB.

Dependent relationship rules consist of hosting and containment rules (dependent relationship rules), each type modeling the data from a different perspective of the CI. Containment rules represent CIs' configuration hierarchy, describing which CI contains which other CIs. Hosting rules represent CIs' placement in a business definition, describing what CIs run on.

Both hosting and containment rules describe a relationship type between two CI types and the same relationship type can be used in a hosting rule and in a containment rule. It is the context in which the relationship is used that distinguishes between a containment and hosting rule.

Manage dependent relationship rules:

- To access rules at the class level, use the CI Class Manager. Navigate to **Configuration > CI Class Manager**.
- To access grouped rules, use the Metadata Editor. Navigate to **Configuration > Identification/Reconciliation > Metadata Editor**.

The plugins that have been activated on an instance determine which hosting and containment rules exist in a base system.

**Hosting rules**

Hosting rules represent all the possible valid combinations of pairs of hosting and hosted CIs in the service definition. Hosting rules are a flat set of rules that can be only one level deep, and which always involve resources, typically physical or virtual hardware. Each hosting rule is a stand-alone rule between two CI types, describing either a valid CI type that another CI type can host, or by which another CI type can be hosted. A hosting rule consists of a parent CI type, a relationship type (such as Hosted On::Hosts) and a child CI type. For example, you can have a hosting rule that specifies that the CI type 'Application' 'Runs On::Runs', the CI type 'Hardware'.

A CI can be hosted on multiple resources (such as Windows and Linux). This CI is represented by a hosting rule for the CI with each resource that the CI can be hosted on. During CI identification, the pair of CIs that are being examined, should satisfy at least one hosting rule.

Hosting rules are stored in the CMDB Metadata Hosting Rules (cmdb_metadata_hosting) table.

**Reference rules**

Reference rules represent all possible valid combinations of pairs of referencing and referenced CIs in the service definition.

- Reference rules are a flat set of rules that can be only one level deep.
• Reference rules always involve resources, typically virtual entities. Each reference rule is a stand-alone rule between two CI types, describing either a valid CI type that another CI type can reference, or by which another CI type can be referenced. Both the CI classes should be able to live independent of each other.

• A referencing rule consists of a parent CI type, a relationship type (such as `Provisioned From::Provisioned`) and a child CI type. For example, you can have a referencing rule that specifies that the CI type ‘Virtual Machine’ `Provisioned From::Provisioned`, the CI type `Image`.

• A CI can reference multiple resources (for example, a VM Instance can have a reference relation with both the Image and the Hardware templates). This CI is represented by a referencing rule for the CI with each resource that the CI can be referenced from.

• The reference rule cannot be part of the CI identification.

• Reference rules are stored in the CMDB Metadata Reference Rules (cmdb_metadata_reference) table.

**Containment rules**

Containment rules represent the containment hierarchy for a CI type, describing valid objects that a CI type can contain in the service definition, and valid objects that can be contained by the CI type. Containment rules are chained to each other in a containment rules group, with a CI type that is the top-level (root) parent of the group. The collection of containment rules construct a hierarchy-like map of containment relationships. Containment rules are logical concepts used to represent logical CIs, for example to describe software that runs on a server. A containment rule consists of a parent CI type, a relationship type (such as ‘Contained By::Contains’), and a child CI type. For example, you might have a containment rule specifying that the CI type ‘Tomcat’ ‘Contains::Contains CI type ‘WAR File’.

Endpoints are special containment rules that specify incoming or outgoing connections in the model, designating the CI types that data of some specified type flows in to or out from the service definition. After adding an endpoint to a containment rule, you cannot add any child rules to the endpoint rule.

Containment rules are stored in the CMDB Metadata Containment Rules (cmdb_metadata_containment) table.

**Rules requirements**

The rules that you create are bound by the following requirements which narrow the relationships and ensure that only valid options are available in the drop-down lists in the Metadata Editor.

• Given a CI type that is as a child in a containment rule: Not this CI type or its children can be a top-level (root) parent of any other containment rule, and it cannot be in any hosting rule, either as a parent or as a child.

• Given a CI type that is a top-level (root) parent of a containment rule: It cannot be a child in a hosting rule (for example, you cannot be hosted on Tomcat, if Tomcat has any containment rules).

• Given a CI type that is a child in a hosting rule: It cannot be in any containment rule, either as a parent or a child.

• Given a CI type that is a parent in a hosting rule: It cannot be a child in any containment rule.

• Hosting rules cannot create loops such as Tomcat –runs_on- VMWare –runs_on- Tomcat.
Hosting and containment rules model

Hosting rules that model the diagram:
- Tomcat ‘Runs on’ Hardware

Containment rules that model the diagram:
- Tomcat ‘Contains’ Configuration File
- Tomcat ‘Contains’ WAR
- WAR has two endpoints for JDBC with MySQL:
  - Inbound
  - Outbound

Valid set of rules

<table>
<thead>
<tr>
<th>Tomcat Hosted Linux</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linux Hosted Computer</td>
</tr>
</tbody>
</table>

The second metadata entry triggers the third requirement, which is satisfied (it is a hosting rule, not a containment rule).

Create dependent relationships

Create hosting and containment rules (dependent relationship rules) for CI classes to help with correctly identifying dependent CIs during the business discovery process and service mapping. Discovery calls the identification API that applies dependent relationship rules.

You can create a basic hosting or containment rule in the CI Class Manager. Or, use the Metadata Editor to create groups of hosting and containment rules, and inbound or outbound
endpoints in containment rules. The CI Class Manager and the Metadata Editor are synchronized, and you can use each of those tools to display and edit a dependent rule.

**Create a dependent relationship rule for a CMDB class**
Use the CI Class Manager to create a basic dependent relationship rule (hosting or containment rule) for a CMDB class.

Role required: itil has read access, itil_admin (on top of itil) has full access.

The class for which you create dependent relationship rule, must have a **dependent identification rule**.

1. Navigate to **Configuration > CI Class Manager**.
2. Click **Hierarchy** to display the CI Classes list, and select the class for which you want to create a hosting or a containment rule.
3. In the class navigation bar, click **Dependent Relationships**.
4. In the Dependent Relationships view, click **Add dependency**.
5. Fill out the details in the Add Dependent Relationship Rule dialog box.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rule Type</td>
<td>Designation of whether this rule is a hosting rule or a containment rule.</td>
</tr>
<tr>
<td>This Class</td>
<td>The class that the rule applies to.</td>
</tr>
<tr>
<td>Relationship</td>
<td>The relationship type for the rule.</td>
</tr>
<tr>
<td>Target Class</td>
<td>The target class for the dependent relationship rule. The designation of this class as a child or parent class, is based on the specified Relationship.</td>
</tr>
</tbody>
</table>

6. Click **Save**.

You can click **Reset to derived** and then confirm the operation to delete all dependent relationship rules that were added specifically for the selected class. Only dependent relationships that are derived from a parent class, remain.

For more information about child and parent classes, see **Table extension and classes**.

**Create or edit a collection of containment rules**
Create containment rule for CIs to help with correctly identifying dependent CIs during the business discovery process and service mapping. Discovery calls the identification API that applies dependent relationship rules.

Role required: admin

A containment rule is a dependent relationship rule which defines a relationship between two CIs, structured as: CIType1 RelationshipType CIType2. The first CI type that you add becomes the top level CI of a containment rules group which is a chain of containment rules. The entire set of containment rules is organized as groups according to top-level CIs.

To create a containment rules group for a new CI type, you need to first add the CI Type1 of the relationship. To add a child containment rule for a CI type that exists, you need to select that CI type, and define the second portion of the relationship rule which is the relationship type and CI Type2.

To each rule within a containment rules group you can add inbound or outbound endpoints, which are noted by blue up and down arrows. After adding an endpoint, you can not add a containment rule in that branch of the containment rules hierarchy.

1. Navigate to **Configuration > Metadata Editor**.
2. In the Metadata Editor, click the Containment Rules tab.
3. Click Add New Rule to add a top-level rule. Or, point to a rule for which you want to add a child rule and click the green '+=' icon that appears on the right.
4. Complete the Add Containment Rule to <class> form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Item Type</td>
<td>The CI class that the rule applies to.</td>
</tr>
<tr>
<td>Relationship Type</td>
<td>The relationship type for the rule.</td>
</tr>
<tr>
<td>Reverse Relationship Direction</td>
<td>Enable to use the reverse relationship in the rule.</td>
</tr>
<tr>
<td>Always include in Service Model</td>
<td>Enable to always include the CIs of the specified class in the Service Map if their parent CI (based on the containment relationship) is present in the Service Map.</td>
</tr>
</tbody>
</table>

5. Click Create.
6. Add an endpoint to a child rule:
   a) Point to a child rule for which you want to add an endpoint.
   b) Click the blue "+" icon that appears on the right.
   c) Complete the Add Endpoint To <class> form.
   d) Click Create.

Create or edit a collection of hosting rules
Create hosting rule for CIs to assist in correctly identifying dependent CIs during the business discovery process and service mapping. Discovery calls the identification API that applies dependent relationship rules.

A hosting rule is a dependent relationship rule which defines a relationship between two CIs, structured as: <CI Type1> <relationship type> <CI Type2>. To create a hosting rule, you need to add a CI type as <CI Type1> in the relationship rule, and then define the second portion of the relationship rule which is the relationship type and <CI Type2>. The entire set of hosting rules is organized as groups according to the top-level hosted CIs.

A hosting rule implicitly contains two rules, which are the reversal of each other. When you create the rule '<CI Type1> <relationship type> <CI Type2>', the rule '<CI Type2> <reversed relationship type> <CI Type1>' is automatically added.

Role required: admin

1. Navigate to Configuration > Metadata Editor.
2. In the Metadata Editor, click the Hosting Rules tab.
3. Click Add New Rule to add a top-level rule. Or, point to a rule for which you want to add a child rule and click the green '+=' icon that appears on the right.
4. Complete the Add Hosted/Hosting Rule to <class> form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Item Type</td>
<td>The &lt;CI Type2&gt; in the rule.</td>
</tr>
</tbody>
</table>
Effective usage of CMDB Identification

Use CMDB Identification effectively.

Identification rules

An independent identification rule identifies a CI based on the CI's attributes, independently of other CIs.

A dependent identification rule identifies a CI by its dependent CIs and the relationships of the identified CI with those dependent CIs. Identification with a dependent identification rule is based on the dependent CIs and the relationships and qualifiers between the identified CI and its dependent CIs. Identification then requires more time than with an independent identification rule and is prone to some identification errors. Usage of dependent rules should therefore be minimized.

CI modeling determines which type of identification rules are required for proper CI identification.

Create identification rules using the following order of importance:

1. Independent identification rules — It is always preferable to create independent identification rules rather than dependent identification rules. When you model a CI, define the CI with a complete set of attributes that lend themselves to independent identification, eliminating the need to use additional CIs for identification.

2. Dependent identification rules — If it is necessary to create dependent identification rules, then define a single level of dependency. Two is the maximum number of dependency levels that is supported.

3. Avoid creating lookup identifier entries. The use of lookup identifier entry is highly discouraged as it can reduce performance. If unavoidable, ensure to first review class definitions and consider updates that allow usage of independent identification rules.

4. Limit the number of identifier entries within an identification rule, ideally to 1. A second identifier entry can further reduce performance, as will each additional identifier entry.

5. Create strong identification rules in which the strongest identifier entries and related entries are set with the highest priority.

6. Ensure that the identification rule is at the class level that it needs to be.

Payload

Create the payload using the following order of importance:

1. Payload size — Limit the number of CIs per payload to 500.

2. Avoid duplicate entries in the payload.
Example: If an identification rule has a criterion attribute for the **name** field, then the following payload has duplicate items resulting in failure:

```javascript
var payload = {
  items: [{
    className:'cmdb_ci_linux_server',
    values: {
      name:'Win Server 200',
      ram:'2048'
    },
    { 
      className:'cmdb_ci_linux_server',
      values: {
        name:'Win Server 200',
        ram:'4096'
      }
    ]
  ]
};
```

3. Do not pass system data such as the following in the payload.

```javascript
var payload = {
  items: [{
    className:'cmdb_ci_linux_server',
    values: {
      name:'Win Server 200',
      sys_domain:'global',
      sys_domain_path:'xyz',
      sys_updated_on:'2017-06-15 16:25:11',
      sys_mod_count:23,
      sys_id:'194876usytrr65378098'
    }
  ]
};
```

4. Provide the minimum necessary set of criterion attributes for each payload item, according to what is specified in the corresponding identification rules.

5. When matching CIs, use CIs’ sysIds if available.
   - Example: Independent CI that needs to be updated — sysId is available.

```javascript
var payload = {
  items: [{
    className:'cmdb_ci_linux_server',
    values: {
      sys_id:'194876usytrr65378098',
      ram:'2048',
    }
  }]
};
```

- Example: Dependent CI that needs to be inserted. Tomcat War CI depends on Tomcat CI, and Tomcat CI depends on Linux Server CI. SysIds for the Tomcat and the Linux CIs are available.

```javascript
var payload = {
  items: [{
    className:'cmdb_ci_app_server_tomcat_war',
    values: {
      name:'war1',
      short_description:'my description'            
    },
    { className:'cmdb_ci_app_server_tomcat',
      values: {
        sys_id:'194876usytrr65378098'
      }
    }
  }]
};
```
var payload = {
  items: [
    {
      className: 'cmdb_ci_app_server_tomcat_war',
      values: {
        sys_id: '039387euey637465sytet',
        short_description: 'my description new'
      }
    }
  ]
};

6. When inserting many CIs, all of which depend on the same CI, you should serialize your API calls. Otherwise, attempting to concurrently process many CIs can clog the system, significantly degrading overall system performance.

## Installed with Identification and Reconciliation

CMDB Identification and Reconciliation adds tables, properties, and script includes.

### Tables installed with Identification and Reconciliation

Identification and Reconciliation uses the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identifier (cmdb_identifier)</td>
<td>Identification rule sets defined for different classes of CIs.</td>
</tr>
<tr>
<td>Reconciliation Definition</td>
<td>Reconciliation rules defined for different classes of CIs at the table and field level.</td>
</tr>
<tr>
<td>Identifier Entry</td>
<td>Rule entries with different priorities assigned to each identifier.</td>
</tr>
<tr>
<td>Data Source Precedence (cmdb_datasource_precedence)</td>
<td>Priorities of data sources that are authorized to update the same CI types or CI type with same sets of attributes.</td>
</tr>
<tr>
<td>Duplicate Audit Result (duplicate_audit_result)</td>
<td>Duplicate audit results corresponding to a specific duplicate task. These results are generated automatically during the identification process and should not be added manually.</td>
</tr>
</tbody>
</table>
## Table

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reconcile Duplicate Task (reconcile_duplicate_task)</td>
<td>Task to address duplication that is detected during the identification process. Records are generated automatically, and users should not add records manually.</td>
</tr>
<tr>
<td>Reclassification Task (reclassification_task)</td>
<td>Reclassification tasks that were generated during the identification process.</td>
</tr>
<tr>
<td>Data Source History (cmdb_datasource_last_update)</td>
<td>Information about the last data source that updated each attribute. Used to determine if a data source can update a stale CI.</td>
</tr>
<tr>
<td>Data Source Staleness Definition</td>
<td>Effective duration per data source. When effective duration is exceeded, then CMDB Health determines that the information provided by that data source is stale.</td>
</tr>
<tr>
<td>Identification Engine Context (cmdb_ie_context)</td>
<td>Input payload, and data source (cmdb_ci’s discovery_source) that will be used as input for a specific identification engine API. Also information about which specific identification engine API will be called (IdentifyCI or createOrUpdateCI API).</td>
</tr>
<tr>
<td>Identification Engine Run (cmdb_ie_run)</td>
<td>Specific cmdb_ie_context record that was used to run against the identification engine. Also details about the output payload returned by APIs, such as start and end time of the run and whether the run was successful.</td>
</tr>
<tr>
<td>Identification Engine Log (cmdb_ie_log)</td>
<td>Identification engine logs for a specific cmdb_ie_run simulated in the identification simulation. Also details about logs level and order.</td>
</tr>
</tbody>
</table>

### Properties installed with Identification and Reconciliation

Identification and Reconciliation uses the following properties.

Updating these properties requires users to have the admin role.

Note: To open the System Property (sys_properties) table, enter `sys_properties.list` in the navigation filter.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.required.attribute.enabled</td>
<td>Flag for enforcing required attributes during identification and reconciliation so that attributes cannot be null.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Type</strong>: true</td>
</tr>
<tr>
<td></td>
<td>- <strong>Default value</strong>: true</td>
</tr>
<tr>
<td></td>
<td>- <strong>Location</strong>: System Properties (sys_properties) table.</td>
</tr>
<tr>
<td>glide.class.upgrade.enabled</td>
<td>Flag for allowing class upgrade during identification and reconciliation.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Type</strong>: true</td>
</tr>
<tr>
<td></td>
<td>- <strong>Default value</strong>: true</td>
</tr>
<tr>
<td></td>
<td>- <strong>Location</strong>: System Properties (sys_properties) table.</td>
</tr>
<tr>
<td>glide.class.downgrade.enabled</td>
<td>Flag for allowing class downgrades during identification and reconciliation.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Type</strong>: true</td>
</tr>
<tr>
<td></td>
<td>- <strong>Default value</strong>: true</td>
</tr>
<tr>
<td></td>
<td>- <strong>Location</strong>: System Properties (sys_properties) table.</td>
</tr>
<tr>
<td>glide.class.switch.enabled</td>
<td>Flag for allowing class switching during identification and reconciliation.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Type</strong>: true</td>
</tr>
<tr>
<td></td>
<td>- <strong>Default value</strong>: true</td>
</tr>
<tr>
<td></td>
<td>- <strong>Location</strong>: System Properties (sys_properties) table.</td>
</tr>
<tr>
<td>glide.reconciliation.override.null</td>
<td>Flag for allowing the update of an empty field by a lower priority data source.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Type</strong>: true</td>
</tr>
<tr>
<td></td>
<td>- <strong>Default value</strong>: true</td>
</tr>
<tr>
<td></td>
<td>- <strong>Location</strong>: System Properties (sys_properties) table.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>glide.identification_engine.skip_duplicates</td>
<td>Controls how identification processes a small set of duplicate CIs.</td>
</tr>
<tr>
<td></td>
<td>- When true: If the number of duplicate CIs is less than the threshold specified by <code>glide.identification_engine.skip_duplicates.threshold</code>, then the oldest of the duplicate CIs is picked as a match and gets updated. For the rest of the duplicate CIs, the CMDB_CIs' discovery_source field is set to 'Duplicate'.</td>
</tr>
<tr>
<td></td>
<td>- When false: Matching a CI fails, and an error is logged.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Type</strong>: true</td>
</tr>
<tr>
<td></td>
<td>- <strong>Default value</strong>: true</td>
</tr>
<tr>
<td></td>
<td>- <strong>Location</strong>: Add to the System Properties (sys_properties) table.</td>
</tr>
<tr>
<td>glide.identification_engine.skip_duplicates.threshold</td>
<td>The maximum number of CIs that can be in a set of duplicate CIs to allow identification to process the duplicate CIs according to the setting of <code>glide.identification_engine.skip_duplicates</code>.</td>
</tr>
<tr>
<td></td>
<td>If the number of duplicate CIs exceeds the threshold, then identification processes the duplicate CIs as if <code>glide.identification_engine.skip_duplicates</code> is set to false.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Type</strong>: Integer</td>
</tr>
<tr>
<td></td>
<td>- <strong>Default value</strong>: 5</td>
</tr>
<tr>
<td></td>
<td>- <strong>Location</strong>: Add to the System Properties (sys_properties) table.</td>
</tr>
<tr>
<td>glide.cache.size.service_cache</td>
<td>The max cache size (in MB) that is used by the identification engine for inbound and outbound relations. When the limit is reached, the least recently used cached data is discarded, releasing space for new data.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: You cannot disable the service cache.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Type</strong>: Integer</td>
</tr>
<tr>
<td></td>
<td>- <strong>Default value</strong>: 20</td>
</tr>
<tr>
<td></td>
<td>- <strong>Location</strong>: Add to the System Properties (sys_properties) table.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>glide.identification_engine.distributed_locking</td>
<td>By default, identification and reconciliation processes acquire a global lock. Enable this property to allow acquiring mutex lock faster, and at a more granular level. This lock optimization is mostly beneficial for scenarios with update operations rather than insert operations.</td>
</tr>
<tr>
<td>glide.identification_logs.max_run_ids</td>
<td>Determines how many log runs can be displayed when navigating to Configuration &gt; Identification Logs.</td>
</tr>
</tbody>
</table>
| glide.identification_engine.granular_insert_locking | Determines whether to use multiple granular insert locks or single global insert lock.  
Set to false if there are performance issues associated with the usage of multiple granular insert locks.  
- **Type**: true | false  
- **Default value**: true  
- **Location**: System Properties (sys_properties) table. |
| glide.identification_engine.batch_update_last_discovered | Controls batch update of last_discovered field in CIs that are being processed by the identification engine.  
Set to false if there are business rules that apply to last_discovered field, and you want to trigger these rules when calling Identification and Reconciliation API.  |

</tr>
</thead>
<tbody>
<tr>
<td>CMDBTransformUtil</td>
<td>Performs identification and reconciliation.</td>
</tr>
</tbody>
</table>

**Examine identification engine run logs**

Applications that use the identification engine (such as Discovery) can provide a URL to viewing identification engine run logs. To view results and for debugging purposes, you can use these links to examine the details of logs generated by the identification engine for payload runs.

**Role required:** admin

These URLs link to a central page where the identification engine payload output logs appear in a user friendly format. Logging is in the context of a specific run of the identification engine, and you can filter the log list by a specific data source and time range. Up to 1000 run logs that are up to 2 months old are listed, grouped by Context IDs, and run times. You can use the glide.identification_logs.max_run_ids system property to modify the 1000 limit.

You can control the logging level by using the glide.discovery.identification.log_level Discovery system property, setting the value to one of the following:

- Info
- Warn
- Error
- Debug
- DebugVerbose
- DebugObnoxious

1. **Navigate to Configuration > Identification/Reconciliation > Identification Logs.**
2. **Filter the runs list as follows:**
   a) **Source:** Select the data source for which to display run logs.
   b) **Time Range:** Specify a time range for which to display run logs.

   The **Runs** list displays all runs for the specified data source, during the specified time range.

3. **In the Runs list, click a Run # to display its Context ID and Run ID.**
   A unique Context ID is associated with each specific payload that is run. Each run of that payload, is associated with a unique Run ID. A single Context ID for a payload that is run multiple times is associated with multiple Run IDs.
4. Click the drop down arrow for a Run # to display additional details.
   - **Input**: Displays the payload for the run.
   - **Logs**: Displays all the logged messages that the identification engine generated while running the payload, according to the specified logging level.
   - **Output**: Displays the output payload returned by the identification engine.

**Identification engine error messages**

The identification engine generates the following errors, which are displayed in the Identification Logging pane and in the system logs.

For information about lookup-based CI identification and qualifier chains, see [Create or edit a CI identification rule](#).

Remove one of the duplicate lookup items present in the payload. |
CMDB Health

Monitoring and maintaining the health of the CMDB is essential to an effective and continuous use of the product. Health indicators such as duplicate CIs, required CI fields, and audits contribute to the calculation of health scorecards at the CI, class, and CMDB level.

The health of the CMDB data is monitored and reported for the following KPIs, each further consisting of sub metrics:

- Completeness: CIs are tested for required and recommended fields that are not populated.
- Correctness: CIs are tested against pre-defined data integrity rules such as identification rules, orphan CI rules, and stale CI rules.
- Compliance: The CMDB data is audited for adherence to pre-defined certificates.
- Relationships: The health of CI relationships is tested for indicators such as orphan and duplicate relationships. And for compliance with suggested relationships, hosting and containment rules.

After CIs are tested for various health indicators, the results are aggregated at the class level, and eventually at the overall CMDB level. You can configure how health is calculated and the weight of each KPI and each metric at every level of the aggregation. For most health tests, you can configure the health tests themselves.

CMDB Health is domain aware. If the domain separation plugin has been activated, then the CMDB dashboard displays health based on data, rules, and settings from the logged-on user domain. If rules and settings are not defined for a child domain, then the parent’s settings are applied, recursively.

CI remediation

CMDB Health provides a framework for configuring CI remediation. Remediation lets you proactively apply corrective actions to unhealthy CIs in a managed and standardized fashion.

Setup

You need to configure CMDB Health related system properties, and health KPI and metric rules, to customize how aggregated data is calculated and other CMDB Health behavior. To start gathering and aggregating health data, you need to enable the CMDB Health-related jobs (CMDB Health Dashboard jobs) which are initially disabled. See Setup and configure CMDB Health for details about enabling these jobs and about configuring other CMDB Health settings.

Setup and configure CMDB Health

The data collection system is highly configurable, however, the base system is minimally configured for aggregating CMDB health data. Most importantly, the CMDB Health Dashboard jobs are disabled by default and data is not collected. To display valuable and meaningful data, you should review and adjust settings.

1. Review CMDB health KPIs and metrics to learn what CMDB Health can monitor, and what needs to be configured to enable and support each metric.
2. For each KPI and associated metric that you want monitored, define the necessary rules and fulfill other needed requirements. For example, create orphan rules for detecting orphan records, if you are interested in this metric.
3. Review and adjust the threshold ranges for best, at risk, and critical states for the CMDB health metrics scorecards - see Configure CMDB health scorecard thresholds.
4. Set metric aggregation preferences, deactivate KPI and metrics that you are not interested in reporting, set failure thresholds, and adjust weighted averages of aggregation - see Configure KPI and metrics aggregation preferences.

5. Narrow the scope of CIs that are included in health calculations - see Create health inclusion rule.

6. Enable the Health Dashboard jobs for the KPIs that you want reported - see Enable and configure a CMDB Health Dashboard job.

7. Customize the CI dashboard (optional).

Domain separation in CMDB Health

This is an overview of domain separation as it pertains to CMDB Health. Domain separation allows you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

CMDB dashboards should be set up with their own set of rules to best accommodate how the user needs them. CMDB dashboard jobs adhere to those rules to produce reports. These are covered in separate sections below.

How domain separation works in CMDB Health

For dashboards to be the most effective, users should configure the dashboard accordingly. This is done by setting up the orphan, staleness, and inclusion rules to meet their needs, and which then affect the reports displayed on the dashboard.

The settings and metrics define different aspects of each application because each domain can be configured differently. These rules are set up in addition to those that are included in the base system. There are different types of owners for different CIs; each domain has its own set of rules.

Note: Domain separation is on by default, but each domain can be configured as needed.

Health preferences

Configure these preferences during setup:

1. Global system properties that control CMDB Health – System properties are not domain separated. To learn more see CMDB health system properties.

2. CMDB Health Dashboard Jobs – There is a dashboard job for each major KPI, such as Completeness. That job finds the health of the CIs across all the enabled domains. There is only one job run for all domains and jobs themselves are not domain separated. To learn more see Enable and configure a CMDB Health Dashboard job.

Users can define the frequency with which they want to run jobs; the report runs for all the domains. The more domains included in the job, the longer the job runs.
3. Health Metrics – These selections are domain-separated and adhere to the established “system overrides” logic of domain separation. Changes are made according to the domain for which the user is logged in. Base system values are defined at the global domain. The overriding domain logic means these values apply for all domains. If users want different values for a domain, they must be logged in to a specific domain and change the property from there. The new property setting applies only to that domain and any domain that inherits this domain. To learn more see Health Metrics.

**Note:** Regarding the Completeness, Compliance, and Correctness KPIs: Users can disable this KPI if they don’t want to see that as part of the dashboard score. All these settings are domain-separated and the user can define specific properties for the domain.

a. Weighted averages – These settings can affect all or part of the metrics in Completeness, Compliance, Correctness, and Relationship. They can be set differently for different domains.

b. Active – This setting is the most important because it affects how long the jobs run. The more domains with flags set to Active, the longer the jobs take. It’s best to select only those domains you wish to be Active and render the rest Active = false. You can set this in Health Preferences. The default settings for global domain are set to Active = true, but you can modify or disable specific domains the user wants to see in the dashboard. Users should consider the domain hierarchy when changing these values. If there is a large number of domains (>100) the job can take a very long time. To mitigate this, set Active to false for all the root domains, thereby disabling all the other domains in the hierarchy. If there is a rule at the top, all child domains inherit that rule.

c. Failure Threshold, Create Task, Task Assignee Group – All these settings can be set differently for different domains depending on what is needed in each domain.

d. Exceptions – For Relationship metrics (relationship, duplicate relations, orphan relations, stale relations) the failure threshold setting is not domain separated. The failure threshold for the global domain is applied to all domains. For example, even if users were to override the failure threshold for a domain, the global domain setting for threshold is still applied.

e. Troubleshooting / Implementation detail – These settings are stored in the cmdb_health_metric_pref table, which is domain separated.

**Health rules**

Health rules settings are addressed here:

- **Required**
- **Recommended**
- **Orphan**
- **Staleness**

Most of the CMDB Health Rules are domain separated and provided by the users. Users can define different rules for different domains by logging in to each domain and adding/overriding rules in the CI Class Manager.

These are the rules for the different metrics:

1. Completeness
a. Required fields – These are based on the class schema defined in the platform’s System dictionary and is fixed for all domains. These cannot be changed.

b. Recommended fields – These are domain separated. The table used is `cmdb_recommended_fields`, which is domain separated. The user can set these up for different domains.

2. Correctness
   a. Duplicates – Duplicates are based on Identification rules, which are not domain separated, so the same rules apply to all domains.
   b. Orphan – Orphan rules are domain separated; there are different orphan rules for different domains. The table used is `cmdb_health_orphan_rule` and is domain separated.
   c. Staleness – Staleness rules are domain separated. The table used is `cmdb_health_staleness_rule`. The base system rule (60 days) is set for global domain so is inherited by all domains as the default rule.

3. Compliance
   a. Audit – Audit scores are based on the desired state or scripted audits defined in the compliance module by the user. Audits themselves are domain separated. When audit score evaluation is enabled for a domain, scores become based only on the audits visible in that domain.

   **Note:** Health Inclusion Rules are also domain separated. The table used is `cmdb_health_config`, which is domain separated.

**Health Dashboards (CMDB View/ Service View / Group View)**

If a user is logged into a domain and views a health dashboard:

1. Only scores for enabled metrics in that domain display (based on the Health Preferences Active flag as discussed above).

2. All scores are based on CIs that are visible from the specific domain. (These are regular domain visibility rules: From that domain you can see CIs in global domain, the specific domain, any child domain of that domain or any domain that gets directly or indirectly contained by that domain.)

3. The dashboard view is based on domain rules defined in domain mapping, as opposed to those provided by the logged-in user. This view overrides any additional domain visibility rules that a logged-in user might have. The admin sets the basic rules, but does not set each individual domain. The admin can give specific users or user groups additional visibility to other domains and the dashboard still does not change. The dashboard strictly follows the domain rules mentioned above, based on the domain hierarchy for the domain in which the user is logged in.

4. As explained in the Health Preferences section, users can define different preference values for any domain which impact the scores reported in the dashboard. Preferences that can impact scores include Weighted Averages, Failure Threshold, and Active.

5. As explained in the CMDB Health Rules section, the scores reported for the metrics are based on the health rules defined for them (staleness, orphan, recommended, audit, and inclusion
rules) which can be defined differently for a specific domain (in the CI Class Manager). Only
the required metric and duplicate metric are based on rules that apply in all domains.

6. Service View/Group View – These reports also largely follow the above points. Typically, these
views differ from various views/filters for the Health Report. One is based off business rules, the
other is based off CMDB Health groups.

**CMDB health system properties**

Configure the following system properties to customize how CMDB health is monitored and
evaluated.

**Role required:** itl_admin

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Max time in minutes for which individual metric processor will run in each scheduled cycle (glide.cmdb.health.metricProcessor.maxRunningTime) | If processing of a metric exceeds the specified time, CMDB health processing halts until the next CMDB health job is scheduled to run.  
  - **Type:** integer  
  - **Default value:** 120  
  - **Location:** Navigate to Configuration > Health Preference. In the right hand-side navigator, click System Properties.  
  For performance reasons, it is recommended not to set this property to a value greater than 120.  
  - **Note:** If you enter an invalid value, the default value is used. |
| glide.cmdb.logger.use_syslog.CMDBHealth | A comma separated list that controls the level of logging of CMDB health jobs. Logging creates entries in the system logs to capture messages generated by the health auditing process each time they run. This helps debugging in case of failure.  
  For example, to log error and info messages, set the value to 'error,info'.  
  - **Type:** String  
  - **Default value:** error  
  - **Other possible values:** Comma separated list with any of the following values:  
    - info  
    - error  
    - warn  
  Or '*' which is equivalent to including all possible values.  
  - **Location:** System Property (sys_properties) table. |
Enable and configure a CMDB Health Dashboard job

Enable and configure the jobs that process CMDB health tests, to start calculating CMDB health scores for the *completeness, compliance, correctness, and relationship* KPI. These health scores are then aggregated into the overall CMDB health report.

Role required: admin

In the base system, CMDB Health Dashboard jobs are disabled by default. Enable and configure the respective job for the CMDB health KPI that you want data collected and aggregated for. You can schedule a job to run on a recurring schedule, or execute it once at any time.

1. Navigate to **Configuration > CMDB Dashboard > CMDB View**, and then click **CMDB Health Dashboard Jobs**.
2. Select a job that you want to enable or configure.

<table>
<thead>
<tr>
<th>CMDB Health Dashboard job</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMDB Health Dashboard - Completeness Score Calculation</td>
<td>Script for calculating the completeness KPI of CMDB health.</td>
</tr>
<tr>
<td>CMDB Health Dashboard - Compliance Score Calculation</td>
<td>Script for calculating the compliance KPI of CMDB health.</td>
</tr>
<tr>
<td>CMDB Health Dashboard - Correctness Score Calculation</td>
<td>Script for calculating the correctness KPI of CMDB health.</td>
</tr>
<tr>
<td>CMDB Health Dashboard - Relationship Score Calculation</td>
<td>Script for calculating the CI relationships KPI of CMDB health.</td>
</tr>
<tr>
<td>CMDB Health Dashboard - Relationship Compliance Processor</td>
<td>Script for calculating compliance of relationships with suggested relationships, and with hosting and containment rules.</td>
</tr>
</tbody>
</table>

3. Review the default configuration, and update as necessary.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Job name. It is recommended that you do not modify the job's name.</td>
</tr>
<tr>
<td>Active</td>
<td>Select to activate the job.</td>
</tr>
<tr>
<td>Run</td>
<td>Configure recurring schedule of job execution, or select <strong>On Demand</strong>.</td>
</tr>
<tr>
<td>Time</td>
<td>If <em>Active</em> is selected, set the time (hour, minute, and second) to run the job.</td>
</tr>
<tr>
<td>Conditional</td>
<td>If selected, the scripted condition must evaluate to true before the job can run.</td>
</tr>
<tr>
<td>Run this script</td>
<td>The job's script. Modifications to the script are not recommended.</td>
</tr>
</tbody>
</table>

4. Click **Execute Now** to run the job once immediately.

After you enable a CMDB Health Dashboard job, the results for the KPI are aggregated and displayed in the CMDB dashboard and CI dashboard, at the CMDB, class, and CI levels.

Configure CMDB health scorecard thresholds

Configure the thresholds for best, at risk and critical state definitions for the KPIs and metrics scorecards. You can configure these settings globally for the entire CMDB, or individually per class.
Role required: itil has read access, itil_admin (on top of itil) has full access.

Scorecard thresholds are used to determine overall metric state, and are defined by upper and lower thresholds. For example, scorecards thresholds for completeness:

- 0 - lower threshold: Best state
- Lower threshold - upper threshold: At risk state
- Upper threshold - 100: Critical state

In the base system, upper thresholds are set to 67 and lower thresholds are set to 33 for all KPIs and metrics. You can adjust scorecard thresholds to reflect the range of failures that should be used for each health state. Applying the change to a scorecard is based on the selected class in the CI Classes list:

- If the top level Configuration Item class is selected in the CI Classes list, changes to metric scorecards apply to the entire hierarchy.
- If any other class is selected in the CI Classes list, changes to metric scorecards apply to the selected class.

For CMDB groups, you can specify a separate set of scorecard thresholds, per CMDB group/KPI or metric. See Configure CMDB groups scorecard thresholds for more details.

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to display the CI Classes list, and then select a class to set scorecards for.
3. In the class navigation bar, expand Health.
4. To configure the overall scorecard, select Other Scorecards and then select Overall Scorecard.
5. To configure a scorecard for any of the KPIs (such as Compliance), or for relationship-related metrics (such as duplicate relations):
   a) Select the top level Configuration Item in the CI Classes list.
   b) Click a KPI item, Completeness, Compliance, or Correctness.
   c) Click the tab CMDB Completeness Scorecard, CMDB Compliance Scorecard, or CMDB Correctness Scorecard.

When you select the top-level Configuration Item class, changes to threshold settings in any metric scorecard apply to the entire class hierarchy.

6. To configure a scorecard for any metric:
   a) In the CI Classes list, select the class to which the updated scorecard should apply to. Select the top level Configuration Item to apply the change to the entire hierarchy.
   b) Click the KPI that contains the metric for which you want to configure scorecard. For example, click Completeness to configure the Required Fields scorecard.
   c) Select the scorecard tab of the metric to configure, such as Required Fields Scorecard. You might need to click New to edit the scorecards.

7. Slide the threshold sliders, or enter specific numbers to increase or to decrease the threshold bars to fit your definitions for best, at risk, and critical levels for the scorecard.
8. Click Save.

Configure CMDB groups scorecard thresholds

Each CMDB group can have its unique set of scorecard thresholds for best, at risk, and critical state definitions for specific KPIs or metrics.

Role required: itil_admin (on top of itil)
Scorecard thresholds are used to determine overall metric state, and are defined by upper and lower thresholds:

- 0 - lower threshold: Best state
- Lower threshold - upper threshold: At risk state
- Upper threshold - 100: Critical state

In the base system, for all KPIs and metrics, upper thresholds are set to 67 and lower thresholds are set to 33. You can adjust scorecard thresholds for a specific CMDB group per KPI or metric, to reflect the range of failures that should be used in health reporting.

CMDB groups scorecard thresholds are stored in the (cmdb_health_scorecard_group_threshold) table.

1. In the search box in the navigation bar, enter `cmdb_health_scorecard_group_threshold.list` and press the Enter key.
2. In the **CMDB Health Group Scorecard Thresholds** list, click **New**.
3. Fill out the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Upper threshold</td>
<td>Upper range of percentage of CIs failing the specified metric tests, that is used to calculate best and at risk states.</td>
</tr>
<tr>
<td>CMDB Group</td>
<td>The CMDB group to which this scorecard threshold setting applies to.</td>
</tr>
<tr>
<td>Lower threshold</td>
<td>Lower range of percentage of CIs failing the specified metric tests, that is used to calculate at risk and critical states.</td>
</tr>
<tr>
<td>Metric</td>
<td>The metric to which the scorecard threshold setting applies to.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Configure KPI and metrics aggregation preferences**

Metrics health scorecards are aggregated into their respective KPI, which in return are aggregated into the overall CMDB Health report. Set aggregation preferences for KPIs, and for each of their respective metrics, deactivate KPIs and metrics that you are not interested in reporting, and adjust weighted averages of aggregation.

To start collecting and reporting CMDB health KPIs and metrics, you must first **enable and configure the CMDB health dashboard jobs**.

Role required: itil_admin (on top of itil)

The completeness KPI for example, consists of the metrics **required fields** and **recommended fields**, each contributing a different weight to the sum. You can configure the proportional weight of required fields and recommended fields within completeness to be 25 and 75 respectively. You can also configure the proportional weight of completeness, compliance and correctness within the aggregated sum of the overall CMDB health.

**Note:** Non-active KPI or metrics are displayed on the CMDB dashboard in faded coloring, displaying the most recent aggregations that were calculated when the KPI or metric was active.

If Domain Support - Domain Extensions is activated, then you can configure aggregation preferences per domain.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
In the ServiceNow base system, the weights of KPIs have default settings, and metrics are globally set.

1. Navigate to Configuration > Health Preferences.
2. Select Health Metrics on the right-hand side navigator.
3. From the Select Metric list select one of the KPIs such as Completeness, or a metric. For Completeness, Compliance and Correctness:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Activate the KPI so it is included in the aggregated CMDB health report.</td>
</tr>
<tr>
<td>Weighted Averages</td>
<td>Specify the weight of each metric in the aggregated KPI health report. The sum of weighted averages of all metrics should be 100.</td>
</tr>
</tbody>
</table>

For a metric:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Activate the metric so it is included in the aggregated health report for the respective KPI.</td>
</tr>
<tr>
<td>Create Task</td>
<td>If a record fails the metric test, create a task with details about the failure. You can then view the task on the CI dashboard, and configure remediation for the task.</td>
</tr>
<tr>
<td>Failure Threshold</td>
<td>When the threshold number of CIs that fail the health metric test is reached, health processing stops for the metric for this cycle.</td>
</tr>
<tr>
<td>Task Assignee Group</td>
<td>An assignment group for the task.</td>
</tr>
</tbody>
</table>

4. Click Save.

Set a CI field to be mandatory

Configure a CI field as mandatory so it is included in the CMDB Health tests for the required metric if enabled. Required is a metric of the CMDB Health completeness KPI.

Role required: itil_admin

When a field is configured as mandatory, then if the required metric is enabled, the CMDB health tests check whether that field is populated or not. The CMDB dashboard displays the aggregated report of the percentage of CIs for which one or more required fields is empty.

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to display the CI Classes list. Then select the class with the field that needs to be set as mandatory.
3. In the class navigation bar, expand Class Info and then select Columns. In the Columns view, click Added.
4. Locate the column that you want to set as mandatory, and then double-click its Mandatory value and set it to true.

The next time the form is opened, a field status indicator appears next to the field label, indicating that a value is mandatory.
Set a CI field to be recommended

You can define a list of CI fields as recommended, noting that it is desirable that they are populated by a data source such as Discovery. You can then configure the CMDB completeness KPI to include recommended fields in its aggregated health reports.

Role required: itil has read access, itil_admin (on top of itil) has full access.

Use this for fields which should not be mandatory, but that might have useful information that the CI should have. For example, a field with information that might at some point help with diagnosis. Initially, a derived class is set with the recommended fields that are defined at the parent level. You can add or remove recommended fields for a derived class, setting it with its own recommended fields, without affecting the recommended fields at the parent or sibling levels. If all recommended fields for a derived class are removed, then the derived class automatically derives the recommended fields from its parent class.

For more information about child and parent classes, see Table extension and classes.

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to display the CI Classes list. Then select the class that contains the fields that need to be set as recommended.
3. In the class navigation bar, expand Health and click Completeness. Then click Recommended Fields.
4. On the Recommended Fields form, use the slushbucket to move the fields that you want to designate as recommended, from the Available list to the Selected list.
5. Click Save.

Create or edit a CMDB health orphan rule

Create an orphan rule to determine the percentage of orphan CIs in the CMDB. This sum is then aggregated into the correctness CMDB Health KPI, and weighed into the overall CMDB health report. Orphan rules are defined per class, and only a single orphan rule can be defined per class.

Role required: itil has read access, itil_admin (on top of itil) has full access.

In order for a CI to be considered an orphan CI, specify attributes that a CI must have, relationships that a CI should not have, or both. In the relationship conditions, you can either specify that the CI has no relationships, or a set of specific relationships that the CI does not have. An orphan rule can for example define that if a CI doesn’t have an owner or an asset, then it is considered an orphan CI.

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to display the CI Classes list. Select the class for which to create an orphan rule.
3. In the class navigation bar, expand Health and then click Correctness.
4. Click Orphan Rule and select a rule to edit if one exists, or click New. Fill out the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Class</td>
<td>The class for which the orphan rule applies.</td>
</tr>
</tbody>
</table>
Create or edit a CMDB Health staleness rule

If the staleness metric is in effect, then staleness rules are used to determine the percentage of stale CIs in the CMDB. This sum is then aggregated into the correctness KPI, and weighs into the overall CMDB health calculation. Staleness rules are defined per class.

Role required: itil has read access, itil_admin (on top of itil) has full access.

The Discovery setting of certain types of CIs as stale takes precedence over a CMDB Health staleness rule defined for the CI. For more information about Discovery marking CIs as stale, see Discovery for VMware vCenter.

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to display the CI Classes list. Select the class for which to create a staleness rule.
3. In the class navigation bar, expand Health and then click Correctness. Click Staleness Rule.
4. Select a staleness rule to edit or click New, and then fill out the Staleness Rule form.

5. Click Submit or Update to save the rule.

Prepare a scripted audit for the compliance KPI

To include a scripted audit in CMDB Health compliance calculations, you need to update the audit's script so it captures the time that the audit ran last.
Role required: certification_admin

CMDB Health uses audits’ Last run date to collect the results from the most recent complete audit run. These results are then aggregated into the CMDB Health compliance KPI. When scripted audits run, they do not register the runtime. Therefore, to include scripted audits in the compliance KPI health aggregation, you must update the audit script so it populates the Last run date field.

1. Create or edit a scripted audit.
2. On the Audit form, update the script in Run this script. Add the following code at the top of the script, just before the code that filters CIs:
   ```javascript
   SNC.CertificationProcessing().updateLastRunDate(current.sys_id);
   ```

Create health inclusion rule

You can narrow the scope of CIs that are included in health calculations by defining health inclusion rules. Health inclusion rules can be specified per domain.

Role required: itil has read access, itil_admin (on top of itil) has full access.

You can apply health inclusion rules only to the required, orphan, recommended, and staleness health metrics. Evaluation for these health metrics applies only to CIs that satisfy health inclusion rules. To narrow the scope of CIs that are included in the duplicate metric, use Identification inclusion rules.

Inheritance of health inclusion rules:

- If there are no health inclusion rules specified for a child class, then rules specified on a parent class are applied to the child class.
- If health inclusion rules are specified for a child class, then those rules take precedence over rules specified on a parent class.

In the base system, there are no predefined health inclusion rules, in which case all CIs are included in the CMDB Health calculations.

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to display the CI Classes list. Select the class for which to create a health inclusion rule.
3. In the class navigation bar, expand Health and then click Health Inclusion Rules.
4. Click an existing rule to edit or click New and then fill out the Health Inclusion Rules form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applies to</td>
<td>Class this rules applies to.</td>
</tr>
<tr>
<td>Active record condition</td>
<td>Criteria that CIs must meet to be included in the evaluation for the specified health metrics.</td>
</tr>
<tr>
<td>Applies to metric</td>
<td>Metrics that the rule applies to.</td>
</tr>
</tbody>
</table>

5. Click Save or Update.

CMDB health KPIs and metrics

The overall CMDB health score consists of three Key Performance Indicators (KPIs) which are correctness, compliance and completeness, each further consisting of sub-metrics. Each KPI and metric is associated with a scorecard that determines its contribution to the aggregated health at the overall CMDB level, class, and CI level.
You can configure which KPIs and metrics are included in the aggregated calculation, and set their weight in the aggregation. In the base system, all KPIs and all metrics are included in the aggregated health report.

**Overall**
An aggregation of all three KPIs (correctness, completeness and compliance), according to their overall scorecard weight settings.

**Correctness**
A KPI which is an aggregation of the following metrics, according to the correctness scorecard weight settings.

**Orphan**
Measures the percentage of orphan CIs in the CMDB. A CI can become orphan if it was unintentionally left in the CMDB when it is no longer needed. A CI is determined to be orphan if:
- The CI satisfies the criteria in an [orphan rule](#). This criteria checks for specific attributes that a CI must have, and for CIs that have no relationships or that don't have specific relationships.
- Data is missing for the CI in its respective table, or in one of its parents' table.

**Staleness**
Measures the percentage of stale CIs in the CMDB. A CI is stale if it was not updated within the **Effective Duration** time period that is specified in the [staleness rule](#) that applies to the class.

The base system includes a default staleness rule for the Configuration Item (cmdb_ci) class, which sets the **Effective Duration** time to 60 days. This rule applies to all extended CMDB classes, and can be overridden by class specific staleness rules defined by the user. To determine CI staleness, a staleness rule for the CI's class is used if it exists, otherwise, the default staleness rule is used.

In addition, a relationship in which a stale CI is a parent or a child, is determined to be a stale relationship.

**Duplicate**
Measures the percentage of duplicate CIs in the CMDB using [identification rules](#). Only independent CIs are evaluated for duplication. In a set of duplicate CIs, the count of duplicate CIs is the total number of CIs in the set, minus one. The detailed graphs for a duplicate set of CIs display all the CIs in the set.

**Completeness**
A KPI which is an aggregation of the following metrics, according to the completeness scorecard weight settings.

**Required**
Measures the percentage of CIs in which fields that are defined as mandatory, are not populated. Missing fields are tagged as incomplete noting that for this CI some information is missing. Required fields are equivalent to the fields that are specified as mandatory in the system dictionary.

**Recommended**

Measures the percentage of CIs in which fields that are set as recommended, are not populated. Out-of-box, no recommended fields are specified.

**Compliance**

Based on the results of actual CMDB audit runs.

**Audit**

Audit compares actual values of specified fields, against expected values defined in template and scripted audits. Based on the Last run date of audits, CMDB Health identifies the set of the most recent complete audit run, and uses those audit results. To pass the CMDB Health audit test, a CI must be in compliance with all audits for that CI. Create a compliance-type audit, for which the results are calculated into the CMDB Health compliance KPI.

When running scripted audits, the Last run date is not populated. Therefore, for the compliance KPI to include the results of a scripted audit, update the script in the audit to record the audit run time.

For more information, see Create an audit.

**Relationships**

Measures the health of CI relationships, consisting of the following metrics which are not-configurable:

**Duplicate relationships**

Relationships that have identical parent and child CIs, identical relationship type, and an identical port. Duplicate relationships are displayed per relationship type. In a set of duplicate relationships, the duplicate relationship count is the total number of duplicate relationships in the set, minus one. The detailed graphs for a duplicate set of relationships display all the relationships in the set.

**Orphan relationships**

A relationship that is missing either a parent CI, a child CI, or both.

**Stale relationships**

A relationship in which the parent CI or the child CI is a stale CI.

A single relationship can fail more than one health test. For example, a duplicate relationship can also be stale.

Also reports the following relationship-related summaries:

- Relations not compliant with suggested relations
- Relations not compliant with containment rules
- Relations not compliant with hosting rules
## CMDB Health dashboards

CMDB dashboards display CMDB health reports and let you configure the CMDB health KPIs and metrics that CIs are evaluated for.

<table>
<thead>
<tr>
<th>Dashboard</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CMDB Dashboard</strong>&lt;br&gt;Configuration &gt; CMDB Dashboard &gt; CMDB View</td>
<td>Main CMDB health dashboard:&lt;br&gt;• Overall CMDB and class level aggregated CI health. Aggregation is displayed from the metric level up to the overall CMDB level.&lt;br&gt;• Aggregated health for CI relationships, and its metrics.&lt;br&gt;• Displays the tasks that were generated for CIs that failed a health test.&lt;br&gt;• Drill down for each KPI to a detailed report of associated metrics, broken by class.&lt;br&gt;• Manage the CMDB Health Dashboard jobs.</td>
</tr>
<tr>
<td><strong>CI Dashboard</strong>&lt;br&gt;&lt;CI form&gt; &gt; Dashboard</td>
<td>Health reports at the CI level:&lt;br&gt;• Pass/fail results for each metric, per CI.&lt;br&gt;• Displays incidents, changes, and other tasks affecting the CI, and business services affected by the CI.</td>
</tr>
<tr>

<td>Central location to manage CI classes and to configure CMDB health settings:&lt;br&gt;• Configure scorecard thresholds of all KPIs and associated metrics.&lt;br&gt;• Configure weight of KPIs and associated metrics in health aggregation.&lt;br&gt;• Manage rules and definitions that are used for health tests, such as orphan rules, audit certificates, and recommended fields rule.&lt;br&gt;• Explore the class hierarchy.&lt;br&gt;• Update and extend a CI class.&lt;br&gt;• Delete all records for a class.</td>
</tr>
<tr>
<td><strong>CMDB Health Preferences</strong>&lt;br&gt;Configuration &gt; Health Preferences</td>
<td>Central location for configuring CMDB Health settings:&lt;br&gt;• Configure CMDB Health preferences.&lt;br&gt;• Manage the CMDB Health Dashboard jobs.&lt;br&gt;• Activate and configure weighted averages for KPIs and metrics.&lt;br&gt;• Set the maximum failure threshold for the KPIs.&lt;br&gt;• Configure creation of tasks for failed CIs.</td>
</tr>
</tbody>
</table>
### View CMDB health reports

The CMDB dashboard serves as a central location to view aggregated health reports for your CMDB at a glance which helps you understand the CMDB health status. Also, it provides functions to address health issues, and improve CMDB health.

The CMDB dashboard requires some configuration before it can display meaningful data. Once CMDB Health is configured and the CMDB Health Dashboard Jobs are enabled, the dashboard displays data that is automatically collected and calculated on a recurring schedule. The CMDB dashboard uses the Performance Analytics framework for dashboards and employs some of the capabilities it provides. The CMDB dashboard is domain aware.

Using the CMDB dashboard requires the asset or itil role, and if the system property `glide.cms.enable.responsive_grid_layout` exists, then its value must be true. For more information, see [Enable responsive dashboards](#).

For information about sharing a responsive dashboard (Sharing), see [Share a responsive dashboard](#).

**Note:** Only users with the itil role can view a CMDB dashboard which has been shared.

Access the CMDB dashboard by navigating to **Configuration > CMDB Dashboard > CMDB View**.

On the CMDB dashboard:

- Click **CMDB Health Dashboard Jobs** to enable and manage the jobs that monitor and collect health data for CIs and CI relationships.
- Click the default **CMDB Dashboard - CMDB View** dashboard to list additional CMDB drill-in dashboards.

The CMDB dashboard has two viewing modes. Click **CI Health** or **Relationship Health** to toggle between them.
CMDB Health view

The CMDB Health view is the default view for the CMDB dashboard. It contains scorecards detailing the overall health of CIs in your CMDB, per health KPI and metric. Also, it contains useful reports showing a breakdown of any duplicate, orphan or stale CIs by class, and lists the top 10 incident, alert, and change generating CIs in the CMDB.

All the default widgets in the CI Class view can be filtered using the CMDB class hierarchy tree. Initially, the class hierarchy filter is set to the root class, Configuration Item (All). Click All to select a different class, filtering all widgets on the dashboard to display data only for the selected class and its child classes.

In each scorecard widget, the horizontal bar in the center and the % number are correlated, displaying the aggregated health summary for the KPI. Health results of associated metrics are displayed underneath, each contributing according to the configuration of the metric scorecard, and its threshold.

Except for the Overall health scorecard, you can drill into any widget in the CI Class view:

- In a scorecard widget: Click the large aggregated percent number or the health bar to drill into a more detailed dashboard for that KPI.
- In a charts widget: Click a bar to display a list of all the records that the bar represents.
- In lists: Click the ‘i’ icon to view a list of all the tasks or alerts related to the CI.

Relationship Health view

The Relationship Health view displays various scorecards for health indicators of CI relationships in your CMDB. It contains charts detailing any duplicate, orphan or stale relationships, broken down by relationship type. You can drill down these charts for further details.

Changing the CI Class selection while in the Relationship view has no effect on the data displayed in this view.

Color codes

Both, the CI class view and the relationship view, use color codes when displaying aggregated health status. The status definitions are based on each scorecard’s threshold limits that are defined in the CI Class Manager.

<table>
<thead>
<tr>
<th>Color code</th>
<th>Definition</th>
<th>Default threshold setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>Best</td>
<td>Less than or equal to 33</td>
</tr>
<tr>
<td>Orange</td>
<td>At risk</td>
<td>More than 33 and less than or equal to 67</td>
</tr>
<tr>
<td>Red</td>
<td>Critical</td>
<td>More than 67</td>
</tr>
<tr>
<td>Gray</td>
<td>Incomplete</td>
<td>N/A</td>
</tr>
</tbody>
</table>

Note: The icon is a notation that the maximum failure threshold for the scorecard has been reached. The tests for the metric are halted for this cycle, and all associated aggregated summaries are 0%. Review the scorecard rules which might be ineffective, or the CMDB might be in an unstable state.
Dashboard layout configuration

The CMDB dashboard uses some of the capabilities that Performance Analytics provides for responsive dashboards. You can, for example, add or remove widgets from the layout.

For information about adding a widget (Add Widgets) and changing other layout settings such as adding a tab (Create Tab) to the dashboard, see Edit a responsive dashboard. The drop-down that appears when adding a widget, includes CMDB-related widgets that are used in CMDB dashboards and other system widgets which are typically not relevant in CMDB reports.

Domain separation

If the Domain Support - Domain Extensions Installer plugin is activated, then the CMDB dashboard is domain aware:

- The CMDB dashboard aggregates and reports health failures and scores based on user’s domain visibility of CIs. If domain visibility lets a user see a CI, then the audit rule in that user’s domain applies to that CI, whether the CI is in the user’s domain or in a contained domain. If a CI fails health tests from different user domains, then separate failure records are created.
- Users can configure KPI and metric settings specific to the needs in their domain. So different domains can have different settings such as active/inactive, and thresholds.
- A child domain derives its immediate parent’s domain health configurations if the child domain does not configure its own. A child domain can override parent’s configurations by modifying them.

View services health reports

The CMDB service dashboard serves as a central location to view aggregated health reports for services at a glance. Also, it lets you drill into a service to perform remediation actions that address health issues, and that improve CMDB health. The CMDB service dashboard uses the Performance Analytics framework for dashboards and employs the capabilities it provides.

Requirements

- The Event Management and Service Mapping Core plugin must be activated.
- If the system property glide.cms.enable.responsive_grid_layout exists, then it needs to be set to true. For more information, see Enable responsive dashboards.
- Role required: asset or itil

Configuration

The CMDB service dashboard requires some configuration before it can display meaningful data, using the same settings as the CMDB dashboard. The CMDB service dashboard uses the settings for the Business Service, Manual Service, and Technical Service classes. For each CI that is included in a service, the rule settings of its respective class are applied. You can customize these settings in the CI Class Manager, and on the CMDB Health Preferences page. Once CMDB Health is configured and the CMDB Health Dashboard Jobs are enabled, the CMDB service dashboard displays data that is automatically collected and calculated on a recurring schedule.

CMDB Health is domain aware. If domain separation has been activated, then the CMDB service dashboard displays health based on data, rules, and settings from the logged-on user domain.
If rules and settings are not defined for a child domain, then the parent’s settings are applied, recursively.

Access

Access the CMDB service dashboard by navigating to Configuration > CMDB Dashboard > Service View.

Report details

The CMDB service dashboard displays aggregated health for services, and also details for individual services. For a specific service, the CMDB service dashboard displays aggregated health for all the CIs in that service, including the service CI itself. Also it provides useful reports about service classes such as the Business Service class. You can drill down those reports to display further details of duplicate, orphan, or stale CIs per service and lists of the top 10 incident, alert, and change generating CIs in the service.

All default widgets can be filtered using the CMDB service hierarchy tree. Initially, the service hierarchy filter is set to Business Service. Click Business Service to expand it and to select a different class, filtering all widgets on the dashboard to display data only for the selected class, its child classes, or services of that class.

In each scorecard widget, the horizontal bar in the center and the % number are correlated, displaying the aggregated health summary for the KPI. Health results of associated metrics are displayed underneath, each contributing according to the weight configuration of the metric scorecard, and its threshold.

With the exception of the Overall health scorecard, you can drill into any widget in the service dashboard:

- In a scorecard widget: Click the large aggregated percent number or the health bar to drill into a more detailed dashboard for that KPI.
- In a charts widget: Click a bar to display a list of all the records that the bar represents.
- In lists: Click the ‘i’ icon to view a list of all the tasks or alerts related to the CI.

Color codes

The CMDB service dashboard uses color codes when displaying aggregated health status. The status definitions are based on the threshold limits for each scorecard, defined in the CI Class Manager.

<table>
<thead>
<tr>
<th>Color code</th>
<th>Definition</th>
<th>Default threshold setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>Best</td>
<td>Less than or equal to 33</td>
</tr>
<tr>
<td>Orange</td>
<td>At risk</td>
<td>More than 33 and less than or equal to 67</td>
</tr>
<tr>
<td>Red</td>
<td>Critical</td>
<td>More than 67</td>
</tr>
<tr>
<td>Gray</td>
<td>Incomplete</td>
<td>N/A</td>
</tr>
</tbody>
</table>
The icon is a notation that the maximum failure threshold for the scorecard has been reached. The tests for the metric are halted for this cycle, and all associated aggregated summaries display 0%.

View CMDB groups health reports

The CMDB group view dashboard serves as a central location to view aggregated health reports for CMDB groups at a glance. Also, it lets you drill into a CMDB group to perform remediation actions that address health issues, and that improve CMDB health. The CMDB group view dashboard uses the Performance Analytics framework for dashboards and employs the capabilities it provides.

Configuration

The CMDB group view dashboard requires some configuration before it can display meaningful data, using the same settings as the CMDB dashboard. For each CI that is included in a CMDB group, the rule settings of its respective class are applied. You can customize these settings in the CI Class Manager, and on the CMDB Health Preferences page. Once CMDB Health is configured and the CMDB Health Dashboard Jobs are enabled, the CMDB group view dashboard displays data that is automatically collected and calculated on a recurring schedule.

If the system property `glide.cms.enable.responsive_grid_layout` exists, then it needs to be set to true. For more information, see [Enable responsive dashboards](#).

CMDB Health is domain aware. If domain separation has been activated, then the CMDB group view dashboard displays health based on data, rules, and settings from the logged-on user domain. If rules and settings are not defined for a child domain, then the parent’s settings are applied, recursively.

Role required: asset or itil

Access

Access the CMDB group view dashboard by navigating to Configuration > CMDB Dashboard > Group View. Then, select a CMDB group from the CMDB Health Group List drop-down list.

Report details

For each CMDB group, the CMDB group view dashboard displays aggregated health for all the CIs in that group. You can drill down those reports to display further details of duplicate, orphan, or stale CIs per CMDB group. In each scorecard widget, the horizontal bar in the center and the % number are correlated, displaying the aggregated health summary for the KPI. Health results of associated metrics are displayed underneath, each contributing according to the weight configuration of the metric scorecard, and its threshold.

With the exception of the Overall health scorecard, you can drill into any widget in the CMDB group view dashboard:

- In a scorecard widget: Click the large aggregated percent number or the health bar to drill into a more detailed dashboard for that KPI.
- In a chart widget: Click a bar to display a list of all the records that the bar represents.
- In lists: Click the ‘i’ icon to view a list of all the tasks or alerts related to the CI.
**Color codes**

The CMDB group view dashboard uses color codes when displaying aggregated health status. The status definitions are based on the threshold limits for each scorecard, defined in the CI Class Manager.

<table>
<thead>
<tr>
<th>Color code</th>
<th>Definition</th>
<th>Default threshold setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>Best</td>
<td>Less than or equal to 33</td>
</tr>
<tr>
<td>Orange</td>
<td>At risk</td>
<td>More than 33 and less than or equal to 67</td>
</tr>
<tr>
<td>Red</td>
<td>Critical</td>
<td>More than 67</td>
</tr>
<tr>
<td>Gray</td>
<td>Incomplete</td>
<td>N/A</td>
</tr>
</tbody>
</table>

The warning icon is a notation that the maximum failure threshold for the scorecard has been reached. The tests for the metric are halted for this cycle, and all associated aggregated summaries display 0%.

**View CI health**

The CI dashboard is a central location displaying health report for an individual CI, history of changes to the CI in a timeline view, and the relation formatter. The CI dashboard also displays incidents, changes, and other tasks affecting the CI, and business services affected by the CI. You can access the CI dashboard from a CI form, or from the CMDB dashboard.

Role required: asset or itil

The health scores are based on settings of CMDB Health KPIs and metrics. The report is calculated in real-time from data stored in health-related tables which the CMDB Dashboard jobs update on a recurring schedule. The completeness and correctness KPIs are always up to date, but for other KPIs, it is possible that updates to the CMDB are not reflected because one of the dashboard jobs hasn’t run yet, as follows:

- Compliance: Depends on audit cycles and on the ‘CMDB Health Dashboard - Compliance Score Calculation’ job.

To ensure that the latest updates to these KPIs are reflected on the CI dashboard, navigate to the respective dashboard job, and click **Execute Now**.

1. On a CI form click **Dashboard**.
2. Or, navigate to **CMDB Dashboard > CMDB Health** and click **CMDB Dashboard - All** to display the class hierarchy. Enter a search string and then select a CI from the **Configuration Items** group.
   The search results are grouped by **Classes** and **Configuration Items** that match the search string.

Various widgets in the report display CI’s health with the following color codes:

- Green: The CI passed the health test (for example, it is not a duplicate).
- Red: The CI failed the health test (for example, it is a duplicate)
- Grey: The CI was not tested for this metric, because the threshold was not set for the CI (class) in the CI module.
The report displays the change history for the CI in a timeline format, that you can zoom in or out to select a time period for which to display details for. Use the related lists tabs Change, Incident, Task, Business Services, and Alerts to further drill into additional details.

**Note:**

Missing rules or other class definitions can prevent some health scores from being evaluated for a CI. The results in the CI dashboard in these situations, are described below:

**Duplicate**
- If no identification rules ([cmdb_identifier]) are defined for the CI’s class or its ancestors: A notification to that effect appears.
- If only dependent identification rules are defined: Not applicable notification appears.

**Orphan**
- If the CI is excluded by health inclusion rules: Not applicable notification appears.
- If no orphan rules ([cmdb_health_orphan_rule]) are defined for the CI’s class or its ancestors: A notification about missing a rule appears.

**Staleness**
- If the CI is excluded by health inclusion rules: Not applicable notification appears.
- If no staleness rules ([cmdb_health_staleness_rule]) are defined for the CI’s class or its ancestors: A notification about missing a rule appears.

**Audit**
- If no audits ([cert_audit]) are defined for the CI (CI dashboard checks only desired states and scripted audits): Not applicable notification appears.
- If there are audits defined for the CI but the audits did not run: Not applicable notification appears.

**Customize the CI dashboard**

You can add, remove or re-arrange content on the CI dashboard to display the CI health statistics that are important to you.

Role required: itil_admin

On a CI form click **Dashboard** and customize the CI dashboard as follows:

- Drag a tile near its upper edge and drag it to a different location on the dashboard to rearrange the current layout.
- Click the X in the upper right side of a widget to hide the widget.
- Click the + sign in the upper left corner of the dashboard to add content. In the **Add content** dialog box, select the content to add and the location to place it.
- Click the gear icon in a widget tile to edit widget settings such as title and height.
- Click **Reset to Default** to revert to the base system settings.

See the following video on YouTube: [CMDB Health Dashboard for Helsinki | Overview](https://www.youtube.com/watch?v=link) for information about configuring and using the CMDB dashboard.
View CI relationships health

View aggregated orphan, stale, and duplicate CI relationships in the CMDB dashboard. You can configure the relationship scorecards, but you cannot configure the underlying relationship KPI health tests.

The CMDB Health Dashboard - Relationship Compliance Processor dashboard job must run to generate data for these reports.

Role required: itil or asset

CMDB Health measures CI relationship health using a separate KPI and metrics.

**Orphan relationship**

A relationship that is missing a parent or missing a child.

**Duplicate relationship**

Relationships that have identical parent, child and relationship type.

**Stale relationship**

A relationship in which one of the CIs is stale. For a stale CI – its associated relationships are also stale.

In addition, the following relation compliance reports are generated and displayed at the bottom of the screen:

**Relations not compliant with suggested relations**

Suggested CI relationships are used as rules to test if relationships comply with specified suggested relationships.

**Relations not compliant with containment rules**

Containment rules are used to test if relationships comply with specified containment relationships.

**Relations not compliant with hosting rules**

Hosting rules are used to test if relationships comply with specified hosting relationships.

For each of the compliance reports, to test a relationship there needs to be a rule (suggested relationship, hosting rule, or containment rule) in which the parent and child CI classes match the parent and child CI classes in the tested relationship. If the relationship types in the rule and in the tested relationship do not match, then the relationship is not in compliance. If an applicable rule is not found, then the relationship is considered to be in compliance. Rules apply to the classes specified in the rule, and also to descendant classes. Therefore, when testing a relationship, rules that apply to ascendant parents of the CIs in the tested relationship, are used. If there are multiple rules that match the parent and the child CI classes of the tested relationship, then the tested relationship needs to satisfy only one of these rules to be in compliance.

1. Navigate to Configuration > CMDB Dashboard > CMDB View.
2. Select the Relationship Health tab.
3. Scroll to the bottom of the page to examine the relation compliance reports.

Report results are grouped by relationship type, and you can do the following:

- Point to a relationship type to display its label and the % of relationships that are not in compliance.
- Click on a relationship type to drill down to a detailed list of all the relations of that type that are not compliant. Click on a specific relationship to display more details such as the failure description. The Failure Description field lists only a single rule that the relationship
did not comply with, even if there are additional rules that the relationship fails to comply with.

Create CMDB remediation rule

A CMDB remediation rule is associated with a task that was created for a failed CMDB health test. A CMDB remediation rule is applied automatically or manually to execute a remediation workflow that can, for example, delete stale CIs.

You need to first create and publish a remediation workflow that addresses the CI issue. The workflow can be a regular workflow, or an Orchestration workflow, and the table in the workflow needs to match the task type in the remediation rule. Do not configure the workflow with any filter conditions by setting If condition matches to None, so that the filters of the CMDB remediation rule will apply.

Role required: itil_admin (on top of itil)

1. Navigate to Configuration > CMDB Remediations.
2. Fill in the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Remediation name.</td>
</tr>
<tr>
<td>Task type</td>
<td>Type of CMDB health-related tasks to apply the remediation to.</td>
</tr>
<tr>
<td>Task filter</td>
<td>Filters tasks to apply remediation to. Also applies dot-walking on CI fields so that remediation is applied to tasks associated with matching CIs.</td>
</tr>
<tr>
<td>Execution</td>
<td>Manual: Remediation is applied manually. Automatic: The workflow is applied once, upon the creation of a task that matches the Task type and Task filter.</td>
</tr>
<tr>
<td>Active</td>
<td>Allowing the workflow to run.</td>
</tr>
<tr>
<td>Workflow</td>
<td>The CMDB remediation workflow (regular or Orchestration) that will execute automatically or manually, depending on the Execution setting. You can click the Lookup using list icon, and then click New to create a new workflow.</td>
</tr>
</tbody>
</table>

3. Click Submit.

If Execution is set to Automatic, then the business rule Run remediations for CMDBHealth task applies the remediation workflow to CIs that match the Task filter. If Execution is set to Manual, then you can manually apply the remediation workflow defined in the rule.

Apply CMDB remediation

Manually initiate a workflow to remediate a CI that failed a CMDB health test. For example, you can remediate CIs that are orphan or stale.

To manually apply a CMDB remediation, a CMDB remediation rule must exist, in which Execution is set to Manual.

Role required: itil_admin
Except for the duplicate and audit health metrics, you can choose to create tasks for health test failures for a metric.

To remediate failures of the duplicate metric, use *de-duplication tasks*.

For all metrics except for audit, each CI that failed a metric test is associated with a single task. Because a CI can fail multiple audits, a single CI can be associated with multiple audit tasks. The first of those tasks is in the **Task** field, and any additional tasks are in the **Additional Tasks** field. To remediate failures of the audit metric, refer to the audit tasks for the audits that the CI failed.

1. Navigate to **Configuration > CMDB Dashboard**, and then click **CMDB View, Service View, or Group View**.
2. Click on one of the bars in a bar chart on the page. Or, click on a metric tile that is associated with the remediation that you want to apply, and then in a detailed report click on a bar in a bar chart. For example, to remediate an orphan CI, click the **Completeness** tile.
3. In the **Task** column in the **CMDB Health Results** list, select the task that is associated with the CI that you want to remediate. Hover over the information icon (i) for a result record to display the CMDB Health Results dialog box with more details about the health test.

   The **CMDB Health Results list** contains records only for the CIs that failed a metric test.

<table>
<thead>
<tr>
<th>Field</th>
<th>Column</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI</td>
<td>The CI associated with the test results.</td>
</tr>
<tr>
<td>Class Name</td>
<td>The CI’s class.</td>
</tr>
<tr>
<td>Description</td>
<td>Details about the reasons for the CI failing the metric test.</td>
</tr>
<tr>
<td>Last Evaluated On</td>
<td>Time that the CI was evaluated for the metric, and which resulted in failure.</td>
</tr>
<tr>
<td>Metric</td>
<td>The CMDB Health metric associated with this test result.</td>
</tr>
<tr>
<td>Source</td>
<td>Source of the health test failure:</td>
</tr>
<tr>
<td></td>
<td>· CMDB Health Audit: Corresponds to the dashboard</td>
</tr>
<tr>
<td></td>
<td>· Cloud discovery</td>
</tr>
<tr>
<td>Task</td>
<td>The task associated with the health test failure. For the audit metric, if there are multiple failures, then only the first task is listed.</td>
</tr>
<tr>
<td>Additional Tasks</td>
<td>If there are multiple tasks related to the audit metric, contains all tasks other than the first which is in the <strong>Task</strong> field.</td>
</tr>
<tr>
<td>Active</td>
<td>Used internally in combination with the <strong>To Delete</strong> field to determine the correct results set that this failure belongs to.</td>
</tr>
<tr>
<td>To Delete</td>
<td>Used internally in combination with the <strong>Active</strong> field to determine the correct results set that this failure belongs to.</td>
</tr>
</tbody>
</table>

4. On the task form, click **Remediate**.

5. In the **Run Remediations** dialog box, select the remediation rule that you want to apply.
The list of remediation rules is based on the type of health metric (such as orphan, stale), and on the filter defined in the rule.

6. Click Execute.

### Tables installed with CMDB Health

CMDB Health tracks and reports various KPI and metrics that monitor the health of the CMDB. CMDB Health adds the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMDB Health Metric (cmdb_health_metric)</td>
<td>Details such as if a KPI or metric is enabled, maximum failure threshold, and other settings for all CMDB Health KPIs and metrics.</td>
</tr>
<tr>
<td>CMDB Health Result (cmdb_health_result)</td>
<td>Results from the most recent CMDB Health processing cycle.</td>
</tr>
<tr>
<td>CMDB Health Scorecard (cmdb_health_scorecard)</td>
<td>Current and historic health scores. Status of historic score records is ‘Historic’, and of latest score records is ‘Complete’.</td>
</tr>
<tr>
<td>CMDB Health Orphan Rule (cmdb_health_orphan_rule)</td>
<td>Rules for calculating orphan records per class.</td>
</tr>
<tr>
<td>CMDB Recommended Fields (cmdb_recommended_fields)</td>
<td>Recommended fields per class.</td>
</tr>
<tr>
<td>CMDB Health Metric Status (cmdb_health_metric_status)</td>
<td>Internal table that tracks the status of each KPI and metric that is being processed. Includes status, processing time, and processing start date. State for a KPI or metric changes from ‘In Progress’ to either of: Complete, MaxFailures, Daily Processing Time Out. Processing of a timed out KPI or metric continues on the following day.</td>
</tr>
<tr>
<td>CMDB Health Processor Status (cmdb_health_processor_status)</td>
<td>Internal table that tracks the processing progress of each KPI and metric. Contains a list of tables that are processed for each KPI and metric, and processing status. Classes are processed sequentially, changing status from Draft -&gt; In Progress -&gt; Complete.</td>
</tr>
</tbody>
</table>

### CMDB Health troubleshooting

Use the following information to track and resolve issues with the CMDB Health processes.

#### Logging

By default, only error messages are logged to the syslog table, with the source name CmdbHealth. To enable logging of 'info' and 'warning' messages (which are typically
logged at the start and end of each processing cycle), update the system property glide.cmdb.logger.use_syslog.CMDBHealth. For information about using this property, see CMDB health system properties.

**Processing status**

If scheduled jobs are enabled, but data is not displaying on the CMDB dashboard, you can check the processing status in the CMDB Health Metric Status (cmdb_health_metric_status) table. Depending on the status of the **inactive** metric, decide how to proceed.

Initially, the state of all metrics is 'In Progress'. Possible final states of a metric:

- **Complete**
  All classes are processed and the number of failures is under the maximum failures threshold.

- **Max Failures**
  The number of failures for this metric reached the maximum failures threshold. Processing has been aborted and will start over in the next run.

- **Daily Time Out Pause**
  The processor reached the processing time limit. Processing is paused and will resume in the next run.

At the end of a processing cycle, the final state of a KPI depends on the final state of its associated metrics. Possible final state of a KPI:

- **Complete**
  All associated metrics are in Complete state and score calculation is complete.

- **Incomplete**
  Score is not calculated because one of the associated metrics reached its maximum failure thresholds.

- **Daily Time Out Pause**
  Timed out because one of the associated metrics has reached its processing time limit.

**Processing time**

If processing of a metric times out, you can find out which class takes too long to process. Use this information to find out if any validation rules are weak.

The progress of each metric is tracked in the CMDB Health Processor Status table (cmdb_health_processor_status). Status for classes that have been processed for a metric is Complete, and for classes that are yet to be processed is Draft. By looking at the update time for each class, you can calculate the length of processing time for each class.

**Fixing orphan records due to broken hierarchy**

Orphan rules might detect an orphan CI, which you are not able to access and delete. Or, there might be a mismatch between the list view that displays the orphan records, and the total number of records. These findings are due to records being deleted in the database from only one table in the CMDB hierarchy.
These CI records are not accessible via GlideRecord and must be deleted directly from the database. Therefore, in this case, to delete an orphan CI from the database you must get help from ServiceNow Technical Support.

Orphan test results provide the details of where exactly the hierarchy is broken. For example, the message "This cmdb_ci_linux_server CI (91054fc24f22520053d6e1d10c713) is missing record in cmdb_ci_computer table" means that a record of that sys_id must be deleted from the CMDB, cmdb_ci, cmdb_ci_hardware, cmdb_ci_server, and the cmdb_ci_linux_server tables (the Computer class is between the Hardware and the Server classes in the hierarchy.)

**Scripted audits Skipped**

An error message is logged if the results from a scripted audit are not included in the compliance KPI. The reason can be that the script in the audit was not updated to populate its Last ran date field. Without a Last ran date value, CMDB Health is unable to identify these run results as part of a recent complete audit run, and skips those results.

See prepare scripted audits for the compliance KPI for information about how to resolve this issue.

**CMDB Health troubleshooting: failure threshold reached**

The CMDB dashboard displays the string ‘failure threshold reached’ when the number of CIs that are failing the metric tests, reaches the failure threshold set for the metric.

CMDB Health stops processing for this metric in the current cycle, and therefore there is no aggregated health score for the metric. Processing will be attempted again in the next cycle. Also, status in the CMDB Health Metric Status (cmdb_health_metric_status) table is set to Max Failures for this metric.

When the health score of a metric cannot be evaluated, then the processing status of the respective KPI (for example, correctness) is set to Incomplete. The CMDB dashboard displays the string Incomplete score for the respective KPI and for the CMDB Health overall score. Also, aggregated health scores for the metric are not available for any class in the CMDB hierarchy.

To troubleshoot, do any of the following:

- Review and refine the rules defined for the metric which has reached max failures. If a rule associated with the metric is too generic, resulting in large number of failures, attempt to refine it. For Example:
  - Completeness – Review the recommended fields that are causing failures and remove the ones that are not critical for the health score. For more information see Set a CI field to be recommended.
  - Correctness – For the staleness metric, depending on the cause of the failures it might be helpful to increase the value of the glide.cmdb.health.staleness CMDB Health system property.

- Reduce the number of failures by fixing CI records: If after adjusting the metric test rules the max failures for some metrics is still reached, then address the failures by updating CI records with the relevant missing information.
- Increase the failure threshold for the metric that is failing and check if processing for this metric completes successfully in the next cycle. Increasing the failure threshold beyond 500K might reduce overall performance.

**CMDB Health troubleshooting: incomplete score**

The CMDB dashboard displays the string ‘incomplete score’ for a metric when it fails to calculate the score for the metric.

‘Incomplete score’ is displayed when:
• The number of CIs that are failing the tests of one of its sub-metric, reaches the failure threshold set for the metric. In this situation, the processing status for the respective parent metric (for example, correctness) is set to ‘incomplete’ in the CMDB Health Metric Status (cmdb_health_metric_status) table. Processing for the failing metric in the current cycle stops, and therefore there are no aggregated health scores for the sub-metric, the parent parent metric, or the overall CMDB Health.

To troubleshoot, resolve the underlying cause of CIs failing the sub-metric tests. See CMDB Health troubleshooting: failure threshold reached for more information about resolving the failures of the sub-metric.

• An error is encountered while processing the sub-metric.

To troubleshoot, examine the system logs system logs to determine the cause of the error. After fixing the cause of the problem, restart processing by manually executing the respective parent metric dashboard job.

CI Class Manager

Use the CI Class Manager to centrally display, create, or edit basic class definitions, and class settings for identification, reconciliation, and CMDB Health. To access the CI Class Manager, navigate to Configuration > CI Class Manager.

Class Basics
- Create a class
- View class basic information
- Class columns
- Display all CIs for a class
- Dependency Views map icons for a class
- Delete CIs for a CMDB class

CMDB Health
- CMDB Health orphan rule
- CMDB Health staleness rules
- Set a CI field to be recommended
- Set a CI field to be mandatory
- Certification filter
- Certification template
- Audit
- CMDB health scorecard thresholds
- Health inclusion rules

Identification and Reconciliation
- Identification:
  - CI identification rules
  - Identification inclusion rules

- Reconciliation:
  - CI reconciliation rules
  - Data source precedence rules
  - Data refresh rules

- Dependencies:
  - Dependent relationship rules (hosting and containment)

Service Mapping
- Entry point types for Service Mapping
- CI types for Service Mapping and Discovery

View CMDB benchmarks

CMDB calculates several CMDB Health benchmarks which then display in the Benchmarks dashboard. These benchmarks are based on various CMDB Health metrics, displaying monthly averages, trends, comparisons to industry averages of your ServiceNow peers, and global benchmarks.
The CMDB Health Dashboard jobs must be enabled and health data must be collected. Also, navigate to Benchmarks > Setup and ensure that the CMDB KPIs are enabled under IT Operations Management.

CMDB provides the following benchmarks:

- % of non-compliant CIs
- % of duplicate CIs
- % of stale CIs

For an instance, each of these benchmarks is the calculated monthly average for the corresponding CMDB Health metric. Calculating a monthly average requires that there is a metric result value for each day of the month. Therefore, each day on which the respective Health Dashboard job did not run, is assumed with the aggregated result from the run that is most recent to that day. The monthly average is then calculated based on the sum of all the daily aggregated results for the metric in that month, divided by the number of days of the month. For a CMDB Health Dashboard job that ran multiple times in a single day, only the results of the last run in that day are used for the monthly average calculation.

**Note:** The frequency of CMDB Health Dashboard job executions depend on whether the job is enabled, its schedule and on manual runs.

Global averages are based on the sum of monthly averages of all peer instances, divided by the number of instances (aside from instances for which the monthly average is 0).

1. Navigate to Benchmarks > Dashboard.
2. Click the icon and select IT Operations Management.
3. Click ALL or CMDB.
4. Click on a CMDB benchmark to drill down to trend data, and other benchmark details.

**CMDB APIs (CMDB SDK)**

Use CMDB APIs to create, update, and read operations on the CMDB. Domain separation is supported in CMDB APIs.

**CMDB APIs (CMDB SDK)**

Use the following CMDB APIs to create, update, and read operations on the CMDB:

- `CMDBGroupAPI`
- `CMDBTransformUtil`
- `CMDBUtil`
- `IdentificationEngineScriptableApi`
- `IdentificationEngine`

**Domain separation in CMDB APIs**

Domain separation allows you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.
Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

CMDB APIs are used for accessing the CMDB from a script. CMDB stores the CI and relation information; CMDB is domain separated.

CMDB APIs support the following operations:

- Create a new CI
  - This operation goes through the Identification and Reconciliation Engine which supports domain separation when creating a CI. The domain of the caller is used for this operation.

- Update an existing CI
  - This operation goes through the Identification and Reconciliation Engine which supports domain separation when creating a CI. The domain of the caller is used for this operation.

- Create/Delete relations
  - The cmdb_rel_ci table is not domain separated.

- Query CMDB CI/Query CMDB table
  - Results are filtered by the domain(s) visible to the caller.

- Query CMDB metadata table
  - Metadata information is not domain separated.

Setting up domain separation for CMDB APIs

If domain separation is enabled for CMDB, then it is also available for CMDB APIs.

Data separation

Data is stored and domain separated in CMDB. There is no additional work needed from the CMDB API perspective.

Configuring a domain-separated environment

The configuration is done at the CMDB level.

If a domain column is present for base system application tables

See the Domain separation in CMDB Health topic.

Tenant domains and application data

There is no application-specific data to manage with CMDB.
Useful related lists in CI forms

By default, the forms that display manageable configuration items (CI) - computers, printers, network gear, uninterruptible power supplies (UPS), and power distribution units (PDU) - provide a number of related lists for the form.

The following related lists are common to all forms for manageable CIs.

- Network Adapters - Displays all the NICs installed on a CI.
- CI IPs - Displays all the IP addresses on this CI:
  - Computers (workstations, laptops using various Mac and Windows operating systems)
  - Windows servers
  - Linux servers
  - AIX servers
  - Solaris servers
  - Devices discovered through SNMP.
- DNS Names for CIs - Displays all the DNS names on a CI.

The IP version information appears in all IP address related lists and forms.

**Note:** Since all paths here click into the IP Address to DNS Names list that associates an IP address with a DNS name, this part of the common flow was not added to the tree structure.

Discovery source

A table called Source (sys_object_source) stores information identifying the source of a discovery (by ServiceNow Discovery or another product), the ID of that source, and the date/time of the last scan. To view this information, configure a CI form and add the Sources related list. This table is populated automatically when the Discovery plugin is enabled.

Activate the Extended CMDB plugins

The Configuration Management (CMDB) application provides core functionality for the configuration management database, including modules for hardware and configuration items. The separate Extended CMDB plugin includes a collection of modules for specialized configuration items, such as radio hardware, test equipment, and voice system hardware.

Role required: admin

The Configuration Management (CMDB) plugin is automatically active for all instances. You must activate related plugins to access the modules for specialized configuration items.

- CMDB Mainframe (com.snc.cmdb.mainframe)
- CMDB Radio Category (com.snc.cmdb.radio.category)
- CMDB Telecom Category (com.snc.cmdb.telecom.category)
- CMDB Test Equipment (com.snc.cmdb.test.equipment)
Note: In Helsinki, many of the tables from the Extended CMDB plugin were moved to the core Configuration Management (CMDB) (com.snc.cmdb) plugin, or to one of the newly added plugins. See the Helsinki release notes for details about those tables.

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.
   If the plugin depends on other plugins, these plugins and their activation status are listed.
3. Optional: Select the Load demo data check box.
   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when first activating the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click Activate.

Help the Help Desk

Help the Help Desk is a tool that allows users to populate the CMDB automatically with information about their Windows computer.

Help the Help Desk is a small web application that downloads and runs locally, using a WMI login script to gather information such as serial number, computer name, disk configuration, network configuration, installed software, memory, and much more. Users have the option of using two types of SOAP authentication for running the Help the Help Desk script.

- Cookie-based authentication for Help the Help Desk
- Basic access authentication for Help the Help Desk

Note: Domain separation is not supported for Help the Help Desk.

User roles and user names

Users must have the hthd_user role, and only this role, to use Help the Help Desk from within an instance. The user should also be configured for web access only.

For users without access to an instance, you can configure Help the Help Desk to allow users to run the script without login credentials. Users with access to an instance can also use Help the Help Desk configured in this way, but only if they have the hthd_user role.

User name cannot contain these characters: \n
Any user name that contains the \n characters prevents the Assigned to field on a computer from being populated.

Help the Help Desk device identification

Help the Help Desk uses a predefined series of queries to identify and update existing CIs in the CMDB or to create a new CI if no match is found. These queries attempt to match devices using three criteria in a certain order.
Updates to an existing CI require only a single match as the list is evaluated. For example, if a device's name has changed, but the MAC address is the same, the CI with the matching MAC address is updated.

- Serial number in the (cmdb_ci_computer) table
- MAC address in the (cmdb_ci_network_adapter) table
- Computer name in the (cmdb_ci_computer) table

Note: Discovery Identifiers are incompatible with Help the Help Desk queries.

Script include

The script include CIIdentifierForHelpDesk provides the logic for updating existing CIs or creating a new CI if no matching device exists in the CMDB. Do not modify this script. Errors introduced into this script can result in update failures or in new CIs being created for every device found.

Configure SOAP authentication

By default, the ServiceNow system requires SOAP authentication. This affects the way in which your browser is configured for Help the Help Desk.

Role required: admin

1. Navigate to System Properties > Web Services.
2. Verify the system property for Require basic authorization for incoming SOAP requests glide.basicauth.required.soap is enabled.
3. Click Save.

Note: If you receive the error, There was a problem retrieving the XML data(0): Unknown, an authentication issue is preventing the script from sending information to your ServiceNow instance. Verify the user meets the requirements for Cookie-based authentication for Help the Help Desk or Basic access authentication for Help the Help Desk.

Cookie-based authentication for Help the Help Desk

Cookie-based authentication uses cookies generated by Windows Internet Explorer for SOAP authentication on the instance.

This type of authentication can be used to run the Help the Help Desk script at the time it is downloaded or after it has been saved to the local drive. When the script is downloaded, Internet Explorer generates a cookie using the user's login credentials, and then shares this cookie with the script. When a user attempts to run the script, the instance checks first for this cookie. If the cookie has been created, the script can authenticate on the instance through SOAP.
Cookie-based authentication

The following setup requirements are imposed on .hta file downloads by Microsoft.

- You must use Internet Explorer and choose to run the script while you are logged in to your instance. If you choose to use a different browser and download the script file to run later, the script will not work properly unless you have an active session on your instance with Internet Explorer.
- Disable Protected Mode and User Account Control (UAC). Protected Mode is available in Internet Explorer 7 or later in Windows Vista. UAC is a feature of Windows Vista and Windows 7.
This feature requires that your logged in user session be persisted to the Help the Help Desk script. For this to occur, the Remember me check box in the login screen must be enabled and selected (the default behavior). This option enables the system to write back an HTTP cookie to your browser to be persisted across sessions.

Basic access authentication for Help the Help Desk

An alternative to cookie-based authentication for the Help the Help Desk script is basic access authentication, which employs two properties to configure the script with credentials. When a user logs in with the proper credentials, that user accesses the instance in the hthd_user role, which grants access to the ECC queue but limits the user's access to other features. The administrator then configures the system properties with the user name and password for the hthd_user user.

The values from these properties are automatically saved to the script file helpthehelpdesk.js. When this user runs the Help the Help Desk script, the instance checks for a cookie. If no cookie is found, the instance checks for the login credentials provided by the system properties, and authenticates the script automatically.

Set up basic access authentication for the Help the Help Desk script

You can set up basic access authentication for the Help the Help Desk script.

Role required: admin
1. Create a new user with the following values.

<table>
<thead>
<tr>
<th>User ID</th>
<th>Create an easily recognizable user name such as SOAPAUTH or SOAPONLY.</th>
</tr>
</thead>
<tbody>
<tr>
<td>First name</td>
<td>SOAP</td>
</tr>
<tr>
<td>Last name</td>
<td>Authentication</td>
</tr>
<tr>
<td>Password</td>
<td>Any password</td>
</tr>
</tbody>
</table>

2. Right-click the header bar and select Save. The record is saved, and the Related Lists appear.
3. In the Roles Related List, click Edit.
4. In the slushbucket, move the hthd_user role from the Collection list to the Roles list, and then click Save.
5. Navigate to System Definition > Help the Help Desk.
6. Add the user name and password you created to the appropriate properties, and then click Save.

    The password is encoded when saved.

The login credentials from these properties are saved to the helpthehelpdesk.js script. When the Help the Help Desk script is run by a user logged in with these credentials (in the hthd_user role), the script is able to authenticate automatically on the instance.

Help the Help Desk login script

The Help the Help Desk script enables organizations to proactively scan their network to discover all Windows based hardware and the software packages installed on those devices.

This WMI-based script is included in the core ServiceNow platform functionality. This script also can be set up to run as a Windows login script and used to keep the CMDB up to date. The script is named helpthehelpdesk.js and can be downloaded from each customer's local instance.
Install and use the login script

The login script is installed on the instance and can be downloaded directly from a module.

Role required: admin

The same script is used to perform the Help the Help Desk scan, which gathers information about a user’s Windows computer and updates the CMDB.

1. Log in to your instance with Windows Internet Explorer.
2. Navigate to System Definition > Help the Help Desk Login Script.
3. Follow the download instructions in the page that appears.
4. Put the helpthehelpdesk.js file in the following folder: %SystemRoot%\sysvol\sysvol\<domain DNS name>\scripts where %SystemRoot% is usually c:\winnt or c:\WINDOWS and <domain DNS name> is the DNS name of the domain, similar to MyDomain.com. This folder is replicated to all domain controllers in the domain.
5. Open the helpthehelpdesk.js file in a text editor, such as Wordpad.
6. Check the var server line to ensure that the URL for your ServiceNow instance is correct. The name of the instance is added automatically. It should look something like this:

   var server = "https://abctech.service-now.com/";

7. Ensure that basic authorization for SOAP requests is enabled in your instance, and a SOAP user is defined.
   This allows the script to connect to your instance. The entry should look something like this:

   var httpUsername = "user_on_your_instance";
   var httpPassword = "user's_password";

8. Create a Logon.bat script to run helpthehelpdesk.js as follows.

   @echo off
   cscript %0\..\helpthehelpdesk.js
   EXIT

9. Add Logon.bat to the Logon script field on the Profile tab of the user properties dialog in the Active Directory Users and Computers MMC corresponds to the scriptPath attribute of the user object.

   Logon scripts can also be configured in Group Policy. However, Group Policy only applies to clients with Windows 2000 or above. The setting in Group Policy is User Configuration, Windows
Settings, Scripts (Logon/Logoff), Logon. Copy the file you want for the Logon script to the Windows clipboard.

10. Open the Logon setting in the Group Policy editor.
11. Click the Show Files button.
12. Paste the desired file in the dialog.
   You can select the file and edit it in this dialog as well. This is easier than navigating in Windows Explorer to the folder where Group Policy Logon scripts are saved. However, if you do have to navigate to the folder, the path on the domain controller is:

   %SystemRoot%\sysvol\sysvol\<domain DNS name>\<policy GUID>\user\scripts\logon

   Again, %SystemRoot% is usually c:\winnt and <domain DNS name> is the DNS name of the domain, similar to MyDomain.com.

   <policy GUID> is a hexadecimal string representing the GUID (unique identifier) of the specific Group Policy Object (GPO). Group Policies are assigned to a domain, site, or organizational unit in Active Directory.

   The logon script setting applies to all users in the domain, site, or organizational unit to which the GPO applies. You will notice that you assign a logon script to all users in the container at once, rather than having to assign the scriptPath attribute for each user. This makes it much easier to assign logon scripts to many users. However, since the same Group Policy applies to all users in the domain, site, or organizational unit, you must code the logon script to accommodate all users.

Encode the Help the Help Desk password

You can use the Help the Help Desk properties to encode the password with simple base64 encoding.

Role required: admin

Configure the user name and encode the password in the properties before downloading the script. This adds the encoded password directly to the script without any further configuration.

1. Navigate to System Definition > Help the Help Desk.
2. Enter a user name and password into the properties for SOAP authentication.
3. Click Save.
4. Navigate to **System Definition > Help the Help Desk Login Script**
5. Download the script.

```javascript
/* *****************************************************************************/
/* Required Variables **********************************************************/
/* The following section should be modified if the information is not correct.*/
/* ****************************************************************************/

var server = "https://demow.service-now.com/";

var httpUserName = "sncuser";
var httpPassword = "encrypt:cgFzc3dvcmQ=";

/* *****************************************************************************/

// If SOAP authentication is turned on on the instance. The http authentication should be provided here
```

The script downloads with the encoded password in place. If you download the script before encoding the password in the properties form, you must add the variable and encoded password manually.

**Run the Help the Help Desk script**

You can run the Help the Help Desk script manually.

You also can configure Help the Help Desk to run automatically when users log into their computer. For more details, see [Help the Help Desk login script](#).

1. On your instance, navigate to **Self Service > Help the Help Desk**.
2. Click **Start the Scan to Help the Help Desk**.
You are prompted to run or save the `discovery.hta` script.

3. Run or save the `discovery.hta` script.
   - If your browser is Windows Internet Explorer, run the script.
   - If you are using any other browser, click Save and save the script to the local machine. To execute the saved script, double-click the file.

The script runs a series of WMI queries to gather information about the Windows machine. When it is finished, the data is sent back to your instance and is used to populate the configuration database (CMDB).

The error message Error: Unable to parse SOAP document means that the Help the Help Desk script was unable to connect to the instance to relay the information that was discovered.

### Run the discovery.hta script with browsers other than Internet Explorer

You can run the `discovery.hta` script with browsers other than Internet Explorer.

Browsers other than IE cannot handle files with the `.hta` extension. Browsers like Firefox, Safari, and Opera prompt users to download the script file, which you can then double-click to run.

However, in Windows XP (including Vista, Windows 2003 Server, and later), files downloaded from the Internet are marked with a security restriction that interferes with running the script. The typical error message introduced by this security restriction looks like this:

```
eccevent(): Access Denied
```

To remove the security lock on the downloaded file, complete the following steps.

1. Right-click on the downloaded file and select Properties.
   - The following message is displayed on the bottom of the form:
     - This file came from another computer and may be blocked to protect this computer.

2. Click Unblock to remove the security restriction.
   - The script will run if SOAP authentication is disabled.

### Access Help the Help Desk status

Help the Help Desk displays the status of all scans in daily records. Drill down into a record for details on how the CMDB was updated within the last 24 hours from scans performed on the instance.

Role required: admin

1. Navigate to System Definition > Help the Help Desk Status.
   - A new status record is created each day and displays the number of scans completed (devices scanned). The Description field shows Help the help desk as the source of the scan.
2. To view the details of individual scans, open a scan record.

3. In the scan record, select the **Devices** tab to view all the devices scanned by Help the Help Desk that day.

   Each CI displays the device class and the activity completed: **Created CI** or **Updated CI**. By default, Help the Help Desk cannot discriminate class between servers and workstations and classifies each CI as a **Computer**. However, if Discovery is activated on the instance, Help the Help Desk can classify CIs as either Windows servers or computers.

4. Select the **ECC Queue** tab to examine the data payload returned from each scan.
If Discovery is active on the instance, the Help the Help Desk status appears in the Discovery Status record list. These scan records are described as Help the help desk in the list to differentiate them from regular discoveries run from a schedule or a UI action. Open the status record to access the forms described in this page.

### Determine values for the Assigned to field

This page explains how to set properties to determine which value appears in the Assigned to field when the script is run.

Role required: admin

Any user name that contains the \n characters prevents the Assigned to field on a computer from being populated.

- **Navigate to** System Definition > Help the Help Desk.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.wmi.assigned_to_always_overwrite | If the Help the Help Desk script is run on the same computer by different users, the platform overwrites the user name in the Assigned to field each time the script is run.  
To prevent this, set the For Help the Help Desk script, if the property is “yes”, the “assigned_to” field of the CI is always overwritten; otherwise the field is not overwritten unless it is empty (glide.wmi.assigned_to_always_overwrite) property to false (clear the check box). |

| glide.discovery.assigned_user_match_field | Help the Help Desk attempts to match a Windows user name it finds with the the user_name field of the User (sys_user) table. However, this might not be desirable if the user_name field from the User (sys_user) table contains formatting that is different from that found in Windows.  
The For Discovery and Help the Help Desk, the following field in the sys_user table is used to associate a computer CI with a user (glide.discovery.assigned_user_match_field) property enables you to select an alternative field for matching. For example, you can create a field called u_username, and then populate it with a user ID that can be matched against the Windows user name. In this case, replace the default value in the property with u_username. |
View scan results

You can view the results of Help the Help Desk scans on an instance.

Role required: admin

These records provide access to logs, CI records, and the ECC Queue for all scans conducted each day. Help the Help Desk status reports are also accessible from the Discovery list.

1. Navigate to System Definition > Help the Help Desk Status.
2. Open the daily status record.

Help the Help Desk script troubleshooting

With the Help the Help Desk script, you can detect all system software on a 64-bit machine. You can also configure the Help the Help Desk script to run for users without prompting for a user name and password.

Allow users without a ServiceNow instance login to run Help the Help Desk script

You can configure the Help the Help Desk script to run for users without prompting for a user name and password.

Role required: admin

This setup enables users who do not have access privileges to an instance to run the script on their Windows machines without having to provide a user name and password. The script can be configured to login in automatically as a SOAP user with the hthd_user role.

1. Log in to your instance with Windows Internet Explorer.
2. Navigate to System Definition > Help the Help Desk Login Script.
3. Follow the download instructions in the page that appears.
4. Put the helpthehelpdesk.js file in the following folder: %SystemRoot%\sysvol\sysvol \<domain DNS name>\scripts where %SystemRoot% is usually c:\winnt or c:\WINDOWS and <domain DNS name> is the DNS name of the domain, similar to MyDomain.com. This folder is replicated to all domain controllers in the domain.
5. Open the helpthehelpdesk.js file in a text editor, such as Wordpad.
6. Check the var server line to ensure that the URL for your ServiceNow instance is correct.

The name of the instance is added automatically. It should look something like this: var server = "https://abctech.service-now.com/"
7. Ensure that basic authorization for SOAP requests is enabled in your instance and a SOAP user is defined.
This allows the script to connect to your instance. The entry should look something like this:

```javascript
var httpUsername = "user_on_your_instance";
var httpPassword = "user's_password";
```

8. Make the script file available to all users.

**Detect software on 64-bit systems with Help the Help Desk**

You can detect all system software successfully on a 64-bit machine.

A 64-bit browser can detect both 64-bit and 32-bit software, but a 32-bit browser cannot detect 64-bit software.

- To detect all system software, run the Help the Help Desk script from a 64-bit browser.

**Enterprise CMDB**

The Enterprise Configuration Management Database (ECMDB) is targeted toward businesses that want to monitor, manage, measure, track, alert on change, and generally understand business systems that consist of a large number of components, business, and support personnel.

For example, a bond trading service may have multiple application, and web servers, several databases, Linux, UNIX, and Windows servers. There will be security products, network storage, disaster recovery procedures and hardware, etc. that are necessary for the service to operate properly.

The ECMDB makes it easy to either manually enter the relationships or have them populated automatically by discovery tools. In addition to the hardware, software, network, database, and storage areas, it is beneficial to know which individuals or groups are responsible for the service from both a business perspective as well as an IT perspective. Who are the line of business users and managers? Who starts and stops the application or its components? Who monitors the log files? Who is in charge of backup and restore, business continuity, and disaster recovery?

Enterprise CMDB is available with the Configuration Management (CMDB Enterprise Edition) (com.snc.cmdb.enterprise) plugin, which is active in the base system.

**CMDB Relationships**

The ECMDB lets you easily track all relationships by relationship type.

The Enterprise CMDB extends the capabilities of the ServiceNow platform CMDB in the following areas.

**Extended configuration item types**

- Clusters
- Database Instances (Oracle, MySQL, MSFT SQL Server)
- File Systems (Direct and network attached)
- Linux Servers
- Solaris Servers
- AIX Servers
Extended relationships

Accurate description of relationships between items, and between items and people or groups, is important to understand the fabric of a business service. ECMDB provides many relationship types out of the box, but it is easy to extend the number of relationship types. Example relationship types include the following:

- Connects to
- Depends on / Provides Service to
- Powered by / Powers
- Protected by / Protects
- Disaster Recovery Provided by / Provides Disaster Recovery for

Visualization

The system can show relationships as a hierarchy using a standard treeview, flattened, or graphically, all in a simple web interface.

Auditing

Auditing of changes to configuration items is turned on by default.

Federation

Federation of third party discovery and configuration data is supported through standard synchronization offerings (SMS, LAN Desk, others) and through the CMDB Discovery (cmdb_discovery) table.

Configuration item modeling (product models)

Model driven configuration management allows the definition of CI models up front that can be associated to product maintenance lifecycles, cost centers, and support organizations, as well as provides a means for capacity and inventory planning. By defining models for CIs (which have a many to one relationship to the model), you can dynamically group actual discovered or imported CIs into logical, operational, and financial models. This facilitates an organized approach to managing your assets (CIs) in their respective domains.

Enterprise Configuration Management Database (ECMDB) action icons

Any of the following icons may appear in the ECMDB lists of related items.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1.png" alt="icon1" /></td>
<td>For currently active incidents against this configuration item</td>
</tr>
<tr>
<td><img src="image2.png" alt="icon2" /></td>
<td>For currently active problems against the configuration item</td>
</tr>
<tr>
<td><img src="image3.png" alt="icon3" /></td>
<td>For currently active changes against the configuration item that are not covered in the past, current, pending changes. For example, a request to update the operating system on a server that is currently in progress may display this icon.</td>
</tr>
</tbody>
</table>
For changes that were recently completed against the configuration item. changes with an "Actual_end_date" in the past.

For changes that are planned soon against the configuration item. changes with an "Actual start date" in the future.

For currently active changes against the configuration item. outages with an "Actual start date" in the past.

For outages that were recently completed against the configuration item. outages with an "Actual start date".

For outages that are planned soon against the configuration item. outages with an "end" date in the future.

For currently active outages against the configuration item that have a "begin" date in the past and no "end" date.

This will only show up in the Tree view and indicates that a configuration item that is downstream has at least one of the above issues against it.

The system looks 5 calendar days in the past and 7 calendar days in the future when looking at recent outages and changes.

**Business service tables**

In the CMDB, the Business Service table (cmdb_ci_service) stores information about business services.

A business service is work or goods that are supported by an IT infrastructure. For example, delivering email service to an employee can require services such as email servers, web servers, and the work to configure the user’s account. A business service management map graphically displays the configuration items (CI) that support a business service and the relationships between the configuration items.

The Business Service table (cmdb_ci_service) stores the business services in the CMDB.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Business criticality | The importance of this service to the business. This field can be used to determine disaster recovery strategies for this service. Default options are:  
  - 1 - most critical  
  - 2 - somewhat critical  
  - 3 - less critical  
  - 4 - not critical |
<p>| SLA               | A reference to the Agreement (sla) table.                                   |</p>
<table>
<thead>
<tr>

</table>

Table form views

When you view a table definition form, you can open the context menu, and select a form view in which to display the table. The default view for a table is the Default view. For any class that is an extension of the CMDB table, you can select the CI Definition view which provides additional access to related tables and information.

The CI Definition form view is a centralized location from which you can configure and view a table. In addition to the information that the default view displays, the CI Definition form view provides the following controls,

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Icon tab</td>
<td>View and create new NG-BSM icons for CI types</td>
</tr>
<tr>
<td>CI Identifier tab</td>
<td>View and create new CI identifiers</td>
</tr>
<tr>
<td>Reconciliation Definitions tab</td>
<td>View and create new data source definitions</td>
</tr>
<tr>
<td>Inclusion related link</td>
<td>Links to the Metadata Editor</td>
</tr>
</tbody>
</table>

To access these additional controls on the CI Definition form view, you need to first create a new table that is derived from the CMDB table, and then view it using the CI Definition form.

Out-of-the-box Configuration Management (CMDB) Performance Analytics Solutions

Solutions contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Note: You can activate Performance Analytics solutions and in-form analytics on instances that have not licensed Performance Analytics to evaluate the functionality. However, to start collecting data you must license Performance Analytics.

Solutions

Use the Performance Analytics widgets on the dashboard to visualize data over time, analyze your business processes, and identify areas of improvement. With solutions, you can get value from Performance Analytics for your application with minimal setup.

Note: Solutions include some dashboards that are inactive by default. You can activate these dashboards to make them visible to end users according to your business needs.

To enable the solutions for Configuration Management (CMDB), an admin can navigate to Performance Analytics > Guided Setup. Click Get Started then scroll to the section for
Configuration Management (CMDB). The guided setup takes you through the entire setup and configuration process.

Dependency Views

ServiceNow® Dependency Views graphically displays an infrastructure view for a configuration item (CI) and the business services that it is part of and that it supports. Dependency Views indicates the status of its configuration items, and allows access to CIs related alerts, incidents, problems, changes, and business services.

If Service Mapping is activated, Dependency Views maps are enhanced to display dependencies that reflect connections in service maps.

### Components installed with Dependency Views

The Dependency Views plugin adds tables and system properties.

### Tables installed with Dependency Views

Dependency Views adds the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Available CI icons</td>
<td>Stores all available CI class icons.</td>
</tr>
<tr>
<td>(ngbsm_ci_icons)</td>
<td></td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Icons for CI types (ngbsm_ci_type_icon)</td>
<td>Maps icons to CI class names.</td>
</tr>
<tr>
<td>Map Script (ngbsm_script)</td>
<td>Custom scripts that run in real time and generate a custom view of a map for a specific CI.</td>
</tr>
<tr>
<td>Map View (ngbsm_view)</td>
<td>Serialized map views saved by users.</td>
</tr>
<tr>
<td>Map Filter (ngbsm_filter)</td>
<td>Filters saved by users.</td>
</tr>
<tr>
<td>Menu Action (ngbsm_context_menu)</td>
<td>Default and custom context menu actions that appear when users right click a map.</td>
</tr>
<tr>
<td>Related Item (ngbsm_related_item)</td>
<td>Stores which reference fields should be treated as relationships when building the map. This allows users to include CIs that are related via a reference field instead of a relationship.</td>
</tr>
<tr>
<td>Edge Colors (bsm_edge_color)</td>
<td>Color definitions to use when drawing the relationships between nodes based on relationship type.</td>
</tr>
<tr>
<td>Map Indicator (bsm_indicator)</td>
<td>Stores all map indicators.</td>
</tr>
<tr>
<td>BSM Saved Map (bsm_graph)</td>
<td>Details of maps.</td>
</tr>
<tr>
<td>BSM Map Actions (bsm_action)</td>
<td>Actions on the map.</td>
</tr>
<tr>
<td>BSM Map View (map_view)</td>
<td>Parents’ predefined filters.</td>
</tr>
<tr>
<td>Map View Configuration Types (map_view_ci_type)</td>
<td>Configuration type filters, limiting the CI class types to be displayed, per predefined filter.</td>
</tr>
<tr>
<td>Map View Relationship Types (map_view_rel_type)</td>
<td>Relationship type filters, limiting the links to be displayed between CIs, per each predefined filter.</td>
</tr>
<tr>
<td>(map_viewroles)</td>
<td>Roles that a specific predefined filter should be applied to.</td>
</tr>
<tr>
<td>CI Filters (map_filter)</td>
<td>CI attribute filters, limiting the CIs to be displayed, per predefined filter.</td>
</tr>
</tbody>
</table>

**Properties installed with Dependency Views**

Dependency Views adds the following properties.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Maximum number of CIs to display on a map at once | The maximum number of nodes to retrieve from the database. If more nodes exist in the database, they are not displayed in the map.  
  - **Type**: Integer  
  - **Default value**: 1000  
  - **Location**: Dependency Views > Map Properties  
  glide.bsm.max_nodes |
| Maximum level depth from the root CI that can be initially displayed in Dependency Views. Range is 1 to 49 | Level depth is the graph distance between the root CI and a node.  
  - **Type**: Integer  
  - **Default value**: 3  
  - **Other possible values**: 1-49  
  - **Location**: Dependency Views > Map Properties  
  glide.bsm.max_levels |
| Show children of virtual groups | Display the continuation of the map underneath virtual group. Virtual links are used to connect virtual groups to their child nodes.  
  - **Type**: Yes | No  
  - **Default value**: No  
  - **Location**: Dependency Views > Map Properties  
  glide.bsm.show_virtual_node_children |
| Maximum number of child nodes to display (the rest will be collapsed) | Maximum number of nodes (of a similar CI type and at the same level) to display before applying virtual grouping. Nodes are collapsed for the map to meet this limit.  
  - **Type**: Integer, valid values 1 or greater  
  - **Default value**: 10  
  - **Location**: Dependency Views > Map Properties  
  glide.bsm.too_many_children |
| A value of true indicates that filtered out items will be removed from the graph along with any disconnected children while a value of false indicates that the items will be dimmed in color |  
  - **Type**: Yes | No  
  - **Default value**: Yes  
  - **Location**: Dependency Views > Map Properties  
  glide.ngbsm.filters_remove_filtered_items |
| Maximum number of relations per node | The maximum number of relations to retrieve from the database. If more relations exist in the database, they are not displayed in the map.  
  - **Type**: Integer, valid values 1 or greater  
  - **Default value**: 100  
  - **Location**: Dependency Views > Map Properties  
  glide.bsm.max_num_rels |
| A value of true indicates that when filters are changed the graph will recalculate its layout using the currently selected layout algorithm |  
  - **Type**: Yes | No  
  - **Default value**: Yes  
  - **Location**: Dependency Views > Map Properties  
  glide.ngbsm.filters_run_layout_automatically |
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| A value of true indicates that when filters are changed the graph will be fit to the screen automatically glide.ngbsm.filters_fit_to_screen_automatically | | Type: Yes | No  
| Default value: No  
| Location: Dependency Views > Map Properties |
| A value of true allows relationship lines to be drawn using smooth curves instead of straight line segments. These curves can be more taxing on the browser, setting to false may improve fluidity of animation and interaction for Dependency Views glide.ngbsm.performance_allow_curves | | Type: Yes | No  
| Default value: Yes  
| Location: Dependency Views > Map Properties |
| Amount of time in milliseconds a notification stays on the screen glide.ngbsm.notification_display_time | | Type: Integer  
| Default value: 5000  
| Location: Dependency Views > Map Properties |
| The maximum amount of results displayed when searching for CIs glide.ngbsm.search_ci_limit | | Type: Integer  
| Default value: 10  
| Location: Dependency Views > Map Properties |
| The maximum amount of results displayed when searching for Relationship Types glide.ngbsm.search_rel_type_limit | | Type: Integer  
| Default value: 5  
| Location: Dependency Views > Map Properties |
| When available, the map should display the class labels for each CI glide.ngbsm.show_class_labels | | Type: Yes | No  
| Default value: Yes  
| Location: Dependency Views > Map Properties |
| Truncate node labels to a single line and to fit available space (default). Disable to display entire labels on multiple lines and wrapped as needed glide.ngbsm.truncate_long_labels | If glide.ngbsm.show_class_labels is enabled, then the class label always displays on top of the CI label, and wrapping applies to both the class and the CI labels.  
| | Type: Yes | No  
| Default value: No  
| Location: Dependency Views > Map Properties |
| Minimum horizontal distance between nodes in horizontal layout glide.bsm.layout_horizontal_spacing_x | The distance is measured in pixels between one node's center to another node's center.  
| | Type: Integer  
| Default value: 200  
| Location: Dependency Views > Map Properties |
| Minimum vertical distance between nodes in horizontal layout glide.bsm.layout_horizontal_spacing_y | The distance is measured in pixels between one node's center to another node's center.  
| | Type: Integer  
| Default value: 100  
| Location: Dependency Views > Map Properties |
### Minimum horizontal distance between nodes in vertical layout

---

### Supported browsers for Dependency Views

The latest version or service pack of internet browsers are required to view and manipulate Dependency Views maps.

The Dependency Views module supports the latest version or service pack of the following browsers:

- Firefox with the latest ESR
- Chrome latest version
- Safari version 8 or later (latest is recommended)
- Microsoft Internet Explorer (IE) version 11 and Microsoft Edge.

The Dependency Views module is not supported on tablets and on mobile devices.

### Domain separation in Dependency Views

This is an overview of domain separation in Dependency Views. Domain separation allows you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

#### Overview

**Support: Level 1**

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

### How domain separation works in Dependency Views

Dependency views are generated using both Configuration Item (cmdb_ci) and CI Relationship (cmdb_rel_ci) tables. The (cmdb_ci) table is domain separated, but the (cmdb_rel_ci) table is not. You can create relationships only by selecting two CIs. They should be in the same domain for you to be able to see them.
To be successful with domain separation in Dependency Views, make sure that relevant CIs are visible for the current domain. If the instance is domain separated, ServiceNow domain separation rules apply (see Related information link below).

Tenant domains will be able to see only their domain and global CIs.

**Dependency Views map**

ServiceNow® Dependency Views maps graphically display configuration items that support business services and the relationships between the configuration items.

A ServiceNow business service is work or goods that are supported by an IT infrastructure. For example, delivering email service to an employee can require services such as email servers, web servers, and the work to configure the user’s account.

A Dependency Views map has one starting point, called the root CI or root node of the map. The root CI is surrounded by a darker frame that repaints itself with a pulsing effect drawing the attention to the root CI. The maps can show both upstream and downstream dependencies for the root CI. By default the Dependency Views map displays 3 levels, both upstream and downstream relationships. Administrators can configure the number of levels displayed. The map collapses and expands clusters to make them easier to view. By default, clusters are collapsed.

In a Dependency Views map, map indicators indicate if a CI has any active, pending issues. You can investigate the tasks that are connected to a CI to get more details. When you return to the map from another form, the system restores the last map viewed, using the default filter and layout settings. When you click the icon () on a CI record or on a task record that identifies a CI, the map opens.

Many of the relationships in map are created through the discovery process. You can also create, define, and delete CI relationships in the map. You can display the map from different perspectives and open specific records that relate to configuration items. The system refreshes the map automatically to reflect changes to the CMDB.

**Note:** CIs not extended from the Configuration Item (cmdb_ci) table, are not displayed in Dependency Views maps and in CI relation formatters.

The Dependency Views module is active in all instances, and includes demo data.
Dependency Views sample map

When you click the map icon ( ) on a CI record or on a task record that identify a CI, a map opens.

Roles

Users with the itil and ecmdb_admin roles can view maps and perform all actions in the map. Actions include access to the map views and saved filters, both from the lists in the map and from the Saved Filters module.

Dependency Views map menus and controls

Dependency Views maps contain the following menus and controls.
ServiceNow    Kingston    Now Platform Capabilities

Map options

The following options are available across the top of the map.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Menu</td>
<td>Menu to save, load and export views of the map.</td>
</tr>
<tr>
<td>&lt;Root CI&gt;</td>
<td>Next to the menu icon is the name of the current root node (CI) of the map.</td>
</tr>
<tr>
<td>Search for CI</td>
<td>Enter the name of a CI or a business service to load into the map.</td>
</tr>
<tr>
<td>Vertical</td>
<td>Display the map in vertical view.</td>
</tr>
<tr>
<td>Horizontal</td>
<td>Display the map in horizontal view.</td>
</tr>
<tr>
<td>Radial</td>
<td>Display the map in radial view.</td>
</tr>
<tr>
<td>Force</td>
<td>Centers the elements around the parent CI, regardless of upstream or downstream relationships.</td>
</tr>
<tr>
<td>Group</td>
<td>Groups the elements according to their CI type.</td>
</tr>
<tr>
<td>Details</td>
<td>Displays related lists such as Problems, Changes and Related Business Services that are associated with the selected CI.</td>
</tr>
<tr>
<td></td>
<td>• Click on a business service, to highlight the CIs that are associated with that business service.</td>
</tr>
<tr>
<td></td>
<td>• Click Related Business Services, then double-click a business service to display the business service map in the Event Management dashboard.</td>
</tr>
<tr>
<td></td>
<td>If the Event Management plugin is active, then events and alerts are also displayed.</td>
</tr>
<tr>
<td>Settings</td>
<td>Set filters for the map.</td>
</tr>
<tr>
<td>Navigation</td>
<td>Use the navigation tools to increase or decrease the view of the map, rearrange the icons on the map, and move the map on the page.</td>
</tr>
<tr>
<td></td>
<td>• Use the plus sign (+) to increase magnification of the map.</td>
</tr>
<tr>
<td></td>
<td>• Use the minus sign (-) to decrease magnification of the map.</td>
</tr>
<tr>
<td></td>
<td>• Click the center dot to center the map on the page.</td>
</tr>
<tr>
<td></td>
<td>• Use the direction arrows to move the page in that direction.</td>
</tr>
<tr>
<td></td>
<td>• Use the selection tool under the navigation tool to toggle between moving the entire map or moving one CI on the map.</td>
</tr>
</tbody>
</table>
### Map menu

The following options are available if you right-click the map background.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run Layout</td>
<td>Redraws the map with the current layout option.</td>
</tr>
<tr>
<td>Fit To Screen</td>
<td>Redraws the map to fit all the nodes in the map window.</td>
</tr>
<tr>
<td>Reset Filters</td>
<td>Performs the same action as the <strong>Filters &gt; Reset</strong> option.</td>
</tr>
</tbody>
</table>

### Node menu

The following options are available if you right-click a node.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View Form</td>
<td>Displays the CMDB record of the selected CI in a new tab of the browser.</td>
</tr>
<tr>
<td>View Map</td>
<td>Reloads the map using the selected CI as the new root node, with the currently defined layout setting. This option does not display on the root node.</td>
</tr>
<tr>
<td>View Related Tasks</td>
<td>Displays all tasks or outages associated with the selected CI, including incidents, problems, change requests, and follow-on tasks. This option is always available, even if there are no tasks associated with the CI. This option does not appear on collapsed nodes.</td>
</tr>
<tr>
<td>View Affected CIs</td>
<td>Shows a list of all tasks that have the CI listed as an Affected CI. This option is only visible when you access the map from the map icon in a task record's Configuration item field.</td>
</tr>
<tr>
<td>View Related Outages</td>
<td>Displays all outages involving the selected CI. This option only appears when there is an outage associated with the CI. This option does not appear on collapsed nodes.</td>
</tr>
<tr>
<td>Add Relationship</td>
<td>This option displays a dotted green line that you can drag to another CI to create a relationship link. A popup dialog allows you to define the relationship type.</td>
</tr>
</tbody>
</table>
| Expand          | Displays all CIs and components within a clustered node, or virtual groups (virtual nodes that appear when `glide.bsm.too_many_children` is reached). This option appears only if the node is a cluster node or a virtual group node.  
If **Load More** was previously used, then **Expand** reverts the results of the **Load More** operation.  
The number of additional icons to display is bound by the value of the `glide.bsm.max_nodes` property. |
### Collaps

Collapses all CIs and components within a cluster node back to a single node. Also, collapses a virtual group that has been expanded. This option only appears if the node has been expanded using the **Expand** menu item.

If **Load More** was previously used, then **Expand** reverts the results of the **Load More** operation.

### Run Layout From Here

This option re-runs the chosen layout using the current node. Use this option to get a new or clearer view on the same map.

### Load More

Starting at the selected icon, loads the next level of the map, past the setting of **Max Levels**.

Virtual grouping is not applied at the newly loaded level even if the criteria for virtual grouping is met.

The number of additional icons to display is bound by the value of the **glide.bsm.max_nodes** property.

---

**Relationship menu**

The following options are available if you right-click a relationship link.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View Relationship Form</td>
<td>Opens the <strong>CI Relationship</strong> form. You can modify the <strong>Parent</strong>, <strong>Type</strong>, and <strong>Child</strong> of the relationship from this form.</td>
</tr>
<tr>
<td>Modify Relationship</td>
<td>Searches for and selects a new relationship for this link.</td>
</tr>
<tr>
<td>Delete Relationship</td>
<td>Deletes a relationship. The relationship is deleted after prompting for confirmation.</td>
</tr>
</tbody>
</table>

---

**Cluster nodes in a Dependency Views map**

Dependency Views maps can display cluster group nodes alongside individual CI nodes, and the child nodes of these cluster groups.

*Clusters* are CIs in the Cluster (cmdb_ci_cluster) table. A cluster CI is an organized set of computer CIs that work together as a single system. Each node in a cluster group represents a CI, typically a server, that can have referenced hardware, such as disks and network adapters.

Cluster nodes on a Dependency Views map can display in two modes:

- **Collapsed mode:** Displays only the cluster CI node without its child CI nodes. This mode avoids unnecessary clutter in large maps.
- **Expanded mode:** Displays the cluster CI node and all its child CI nodes.

Menu options available for a clustered node include **Collapse** and **Expand** which allow you to control the density on the map.

By default, Dependency Views collapses all cluster groups and displays clusters in collapsed mode on the map.

© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Annotation

Icons for cluster nodes and cluster group CI nodes are noted by the string "Cluster" and by a unique cluster icon. The system searches through all the component nodes in a cluster CI or collapsed node looking for tasks, outages, and trouble, such as incidents, problems, or change requests. This search evaluates only the number of levels that are displayed in the diagram.
An expanded cluster node displaying its child nodes
Virtual grouping of nodes in a Dependency Views map

To reduce the density on a map, Dependency Views automatically groups CIs of a similar CI type from the same level.

A large number of nodes can cause a Dependency Views map to become too dense to be helpful. Therefore, if the number of nodes with a similar CI type from same level, exceeds the value of the Maximum number of nodes (of a similar CI type and at the same level) to display before applying virtual grouping property, then those nodes are automatically grouped into a virtual group. A single node, the virtual group node is displayed to represent the virtual group, while all actual nodes in the virtual group (that are of a similar CI type), are hidden. Virtual group nodes represent CIs of a similar CI type but are not CIs by themselves and cannot have tasks assigned to them. The number of actual collapsed nodes in the virtual group is noted on the virtual group node.

By default, child nodes of a virtual group are not displayed. You can enable the Show children of virtual groups property to display child nodes underneath virtual groups.

Virtual grouping is not applied at the level underneath a virtual group even if the criteria for virtual grouping is met (the number of nodes with a similar CI type from that level exceeds the preconfigured property value). However, virtual grouping can happen at the following level if that criteria is met. This behaviour does not depend on any property settings, and you cannot change it.

Menu options for a virtual group include Expand and Collapse, which allow you to apply virtual grouping and display only the virtual group node, or to undo the virtual grouping and display all actual nodes.

Virtual links

A virtual node is connected to other nodes with a virtual link. A virtual link denotes that there such link between at least one CI in the virtual group, to another CI node on the map.

Note: Predefined filters do not apply to virtual groups. Therefore a virtual group displays even if it contains CIs that a predefined filter would have excluded. Upon the expansion of a virtual group, predefined filters are applied, and any or all of the CIs that were previously virtually grouped, might no longer display on the map.

Also, when using the node menu option Load More, virtual grouping is not applied at the newly loaded level even the criteria for virtual grouping is met.
An expanded virtual group
Use Dependency Views

Use the layout controls on a Dependency Views map to display elements in different configurations for easier management. Use the filter panel on the map to display fewer levels or to filter out elements you don't want to see, then save the filter for use later. Draw new relationships between elements or edit existing relationships.

View a Dependency Views map

When you display a Dependency Views map using one of the options below, the map is centered on the root CI, and displays the layout and number of levels defined in the map properties. If Operational Intelligence is activated, then a Dependency Views map provides a mode that lets you directly access metrics information for the CIs on the map.

General role requirements:

- To access a Dependency Views map from either the navigation menu, a script API, or directly from a URL, the minimum role required is the dependency_views. Some operations that are related to icons, indicators, and menu actions require the ecmdb_admin role. Some operations that are related to properties and dependency types require the admin role.
- Dependency Views enforces ACL permissions on CIs, and visually hides them and their relationship from the map if the permission requirement is not met.

The maps generated by Dependency Views are based on D3 and Angular technology, providing a modern interactive graphical interface to visualize configuration items and their relationships.

If Service Mapping is activated, Dependency Views maps are enhanced to display dependencies that reflect connections in service maps. In addition, the list of related business services in the Details section includes business services that were discovered by Service Mapping. All CIs that are included in a business service, are displayed underneath the business service node on the map.

Maps provided by Service Mapping are for business services, including comprehensive maps from the perspective of business services. For more information, see Service Mapping.

Administrators can configure the setting for the default layout of the map and number of levels displayed. When you access the map from a saved view, the map opens using the properties in the saved view, and not the default map properties.

Navigate to Dependency Views and open one of these modules:

- **View Map in New Tab**: Opens the map in a new, full screen tab without the application navigator.
- **View Map**: Opens the map in the content pane of the current tab.
- **Saved Views**: Opens a view of a map that you previously saved.

Click a number in the Version column, and then click the ( ) icon.

Save or load a Dependency Views map

In the View Map module, use the menu icon to save and load Dependency Views maps.

1. Navigate to Dependency Views > View Map.
2. Click the menu icon ( ).
3. Select Save View, Load View, or Last View.

Delete a saved Dependency Views map view
Use the Saved Views module to delete a previously saved view.
1. Navigate to Dependency Views > Saved Views.
2. Use the checkbox in the first column of the table to select the map view that you wish to delete.
3. Select Delete from the Actions on selected rows drop-down menu.

Change the layout of Dependency Views map
You can select from different layout options for your Dependency Views map.
1. Navigate to Dependency Views > View Map.
2. Select one of the following layout options from the menu across the top of the view.
   - **Vertical**: Displays the elements in a vertical tree pattern according to their upstream and downstream relationships. This is the default value for the initial display of the map.
   - **Horizontal**: Displays the elements in a horizontal tree pattern according to their upstream and downstream relationships.
   - **Radial**: Displays the elements in a radial pattern according to their upstream and downstream relationships.
   - **Force**: Centers the elements around the parent CI, regardless of upstream or downstream relationships.
   - **Group**: Groups the elements according to their CI type.
   - **Details**: Displays related alerts, incidents, problems, and business services. If Service Mapping is activated, then the list of related business services includes business services that were discovered by Service Mapping.
   
   Click Related Business Services and then double-click a business service to display the business service map in the Event Management dashboard.

Filter the view of a Dependency Views map
You can filter a Dependency Views map to display specific types or categories of configuration items.
Use the filter panel to control which elements of the map are displayed and to save versions of a filter for later use.
1. Navigate to Dependency Views > View Map.
2. Click the button to open Map Settings. Click a filter strip to expand or collapse it, and to set filter items.
<table>
<thead>
<tr>
<th>Filter panel strips and options</th>

**Fit to Screen Automatically** | **On:** The map magnification will increase or decrease automatically to display all CIs on the map.  
**Off:** The map magnification remains unchanged when the map is reloaded.

---

View metrics for CIs in a Dependency Views map

Operational Intelligence processes metrics data for CIs, calculates statistics and aggregations, and detects metrics anomalies. A Dependency Views map lets you switch to metrics mode to directly access the Metric Explorer that displays metrics data for CIs on the map.

The Operational Intelligence (com.snc.sa.metric) plugin must be activated to enable this functionality, and metrics data needs to be processed for the CIs on the Dependency Views map.

Open a Dependency Views map in metric mode which integrates a Dependency Views map with the Metric Explorer functionality that is tailored to the map. In this mode, you can access Metric Explorer functions directly from the map, to explore metrics data for the CIs on the map. All map CIs are accessible in the right hand side pane, from where you can drill into metrics data.

1. Navigate to **Dependency Views > View Map** to open a map.
2. Right-click on a CI on the map and select **View Metrics** to open the Dependency View map in metrics mode.
   In the panel on the right side, the CI that you selected on the Dependency View map is selected by default, and the list of all the metrics available for that CI are displayed.
3. Click the ‘<’ sign on the left of the CI to display all the CIs that you can explore metrics for.
   The Metric Explorer is scoped for exploring only the CIs that currently display on the Dependency Views map, and you cannot add or remove CIs from the list. If you use map settings or filters to filter out CIs from the map, the same filtering will apply to the list of CIs that you can explore metrics for.
4. Click on a CI in the CIs list or right-click on a CI on the Dependency Views map, to drill down to the CI’s metrics.
5. Click the **Dependencies Map** tab or the **Metrics** tab to switch modes:
   a) In **Metrics** mode: The full functionality of the Metric Explorer is available, you can create metric charts by dragging metrics into the canvas. You can modify chart settings, select different time ranges for the charts, and perform other actions as described in **View metric values in the Metric Explorer**.
   b) In **Dependencies Map** mode: Select a CI on the map to drill down to its metrics data, drop-down the **Layout** list to choose a different layout, or modify map settings.

Perform actions on nodes in a Dependency Views map

You can view various related items for the nodes in a Dependency Views map.

If the node is a collapsed node or represents a cluster, the incidents, problems and change requests are for all the collapsed nodes.

1. Navigate to **Dependency Views > View Map**.

---

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
2. Click the ▼ icon next to a node or right-click a node on the map, to access the following menu items:

**Node Menu**

<table>
<thead>
<tr>
<th>Menu Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View Form</td>
<td>Displays the CMDB record of the selected CI in a new tab of the browser.</td>
</tr>
<tr>
<td>View Map</td>
<td>Reloads the view using the selected CI as the new root node, with the currently defined layout setting. This option does not display on the root node.</td>
</tr>
<tr>
<td>View Related Tasks</td>
<td>Displays all tasks or outages associated with the selected CI, including incidents, problems, change requests, and follow-on tasks. This option is always available, even if there are no tasks associated with the CI. This option does not appear on collapsed nodes.</td>
</tr>
<tr>
<td>View Affected CIs</td>
<td>Shows a list of all tasks that have the CI listed as an Affected CI. This option is only visible when you access the view from the view icon in a task record’s Configuration Item field.</td>
</tr>
<tr>
<td>View Related Outages</td>
<td>Displays all outages involving the selected CI. This option only appears when there is an outage associated with the CI. This option does not appear on collapsed nodes.</td>
</tr>
<tr>
<td>Add Relationship</td>
<td>This option displays a dotted green line that you can drag to another CI to create a relationship link. A popup dialog allows you to define the relationship type.</td>
</tr>
<tr>
<td>Expand</td>
<td>Displays all CIs and components within a cluster node or a collapsed node. This option only appears if the node is a collapsed or cluster node. The number of additional icons to display is bound by the value of the glide.bsm.max_nodes property.</td>
</tr>
<tr>
<td>Collapse</td>
<td>Collapses all CIs and components within a cluster node or a collapsed node back to a single node. This option only appears if the node has been expanded using the Expand menu item.</td>
</tr>
<tr>
<td>Run Layout From Here</td>
<td>This option re-runs the chosen layout using the current node. Use this option to get a new or clearer view on the same map.</td>
</tr>
<tr>
<td>Load More</td>
<td>Starting at the selected icon, loads the next level of the map, past the setting of Max Levels. The number of additional icons to display is bound by the value of the glide.bsm.max_nodes property.</td>
</tr>
</tbody>
</table>

Export a Dependency Views map

You can export a Dependency Views map to an image in PNG format.

1. Navigate to **Dependency Views > View Map**.
2. Configure the map view as you want the image to appear. The exported image displays the current view of the map.
3. Click the menu icon (≡).
4. Click **Export Image**.
5. Right-click the image and select **Save Image As, Print**, or any other menu option.

**Note:** You can not export images from a Dependency Views map using Internet Explorer as your browser.

6. Click the "X" button to close the **Export Image** window.

View collapsed nodes in a Dependency Views map

Cluster and virtually grouped nodes can be displayed in a collapsed mode to avoid unnecessary clutter in large maps.

1. To expand a collapsed node, right-click the CI and select **Expand** from the context menu.
2. To collapse an expanded cluster node with children, right-click the CI and select **Collapse** from the context menu.

Administer Dependency Views

Users with the admin role can control the appearance and behavior of Dependency Views by configuring map indicators, map related items, map icons, and menu actions.

Create or modify Dependency Views map indicators

Dependency Views maps uses icons to display additional information for a CI by displaying its related records such as alerts, outages, incidents and problems. These icons are called **map indicator**.

The default configuration includes map indicators for the following record types:

- Open incident.
- Open alert.
- Unplanned current outage.
- Planned current outage, or an open problem.
- Current, planned, or recent change request.

You can filter out the display of affected CIs, alerts, current change requests, incidents and problems from the **Settings** menu. Also, you can create a map indicator to define additional record types, such as trouble sources for business service CIs. You can also modify an existing map indicator, for example to use a different color scheme or to alter the priority of a task.

The Affected CI’s map indicator appears for CIs in two related but not identical situations. It appears for CIs for which tasks such as change request, incident, or problem were directly created for, and for any CIs that were added in those tasks (parent tasks) as Affected CIs (The CI for which a task is directly created for, is automatically added as an affected CI in that task).
The state of affected CI’s depends on the status of the respective parent task. For as long as the parent task is active, the associated affected CIs continue to be impacted by the task issue. In a Dependency Views map, the Affected CI’s indicator displays for all affected CIs for as long as the parent task is active. On a Dependency Views map, the Affected CI tooltip displays the details of the task records in which the CI was added as an affected CI. However, the Details pane does not contain an Affected CI’s tab, and no further details about affected CIs, or the associated tasks are displayed. After the parent task is closed, the Affected CI’s indicator no longer displays for any of the tasks’ affected CIs. For information about affected CIs in Change Management, see Associate CIs to a change request.

Note: Details about affected CIs are derived from the task and the cmdb_ci tables and their extensions. Therefore, if you use custom tables to store CIs for incidents, problems and changes, it affects the details that are displayed for affected CIs.

For more information on how map indicators are used to show tasks and outages in clusters and collapsed nodes, see Cluster nodes in a Dependency Views map.

1. Navigate to Dependency Views > Map Indicators.
2. Click New to create a new map indicator, or click the name of an indicator from the Table column to modify an existing map indicator.
3. Fill in the fields on the form, as appropriate.

Map Indicator form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Name of the table represented by this map indicator.</td>
</tr>
<tr>
<td></td>
<td>Note: The list shows only tables and database views that are in the same scope as the map indicator. Views are not supported, although included in the list.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the indicator.</td>
</tr>
<tr>
<td>Order</td>
<td>Priority order of the task. The highest priority task is the indicator with the lowest order number. When more than one indicator is present on a CI, the displayed color is the color associated with the highest priority task. Additionally, a glyph on a CI displays the color indicator of the highest priority task attached to that CI.</td>
</tr>
<tr>
<td>Icon</td>
<td>File name and path of the icon image file, which can be a system image.</td>
</tr>
<tr>
<td></td>
<td>• To create a new icon, see Create or modify map icons</td>
</tr>
<tr>
<td></td>
<td>• To create or use a system image see</td>
</tr>
<tr>
<td>CMDB CI field</td>
<td>Name of the field on the selected table that contains the configuration item.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Start field</td>
<td>The record property that determines the time-point on the metric chart timeline for placing records in the Metric Explorer. Possible values depend on the selected Table. For example, the incident indicator has values such as Actual end, Actual Start, and Approval Set.</td>
</tr>
<tr>
<td>Description field</td>
<td>Name of the field on the selected table that contains the description of the configuration item.</td>
</tr>
<tr>
<td>Description</td>
<td>Text to display when hovering over the indicator. Alphanumeric characters and spaces are valid for this field.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Condition builder that specifies for which CIs to apply this indicator. For example, a CI that has a current past outage is highlighted for 5 days. You can configure a condition to designate a different timeframe for what is considered to be current.</td>
</tr>
<tr>
<td>Active in Service Map</td>
<td>Enable to make the toggle for the specified table available in the Settings dialog box for Business Service maps. You can then toggle between displaying or not displaying the respective records on the map.</td>
</tr>
<tr>
<td>Active Dependencies</td>
<td>Enable to make the toggle for the specified table available in the Settings dialog box for Dependency Views maps. You can then toggle between displaying or not displaying the respective records on the map.</td>
</tr>
<tr>
<td>Active in Metrics</td>
<td>Enable to make the toggle for the specified table available in the Settings dialog box for the Metric Explorer. You can then toggle between displaying or not displaying the respective records on the Metric Explorer.</td>
</tr>
<tr>
<td>Label</td>
<td>Text to display for the indicator on the map.</td>
</tr>
<tr>
<td>Tooltip Label</td>
<td>The prefix portion of the tooltip (Tooltip Label : Tooltip info).</td>
</tr>
<tr>
<td>Tooltip Info</td>
<td>The suffix portion of the tooltip (Tooltip Label : Tooltip info).</td>
</tr>
</tbody>
</table>

4. Click **Submit** to enter a new map indicator. Click **Update** to modify an existing map indicator.

For an indicator to appear in a Dependency Views map, a CI must meet all filter conditions, and **Active Dependencies** must be selected.

**Create or modify map icons**

You can upload new icons or modify existing icons to customize the icon displayed for a CI in maps in Dependency Views, Service Mapping, and Event Management.

The icons used in Dependency Views maps are listed in the Map Icons module. Records in the Map Icons list are arranged by CI classes, such as cmdb_ci_linux_server. The path to the default
image files is https://<instance name>.service-now.com/images/app.ngbsm/<image name.svg>. For information about uploading images to the database, see Storing images in the database.

Role required: admin or ecmdb_admin roles are required to access the records in this table (ngbsm_icon) to upload new icons.

- Navigate to Configuration > CI Class Manager, and:
  a) Click Hierarchy to display the CI Classes list.
  b) Select a class to modify the icon for.
  c) In the class navigator bar, expand Class Info and then select Basic Info. On the Basic Info form, click Icon.
  d) In the Icons dialog box, select an icon and then click Update.
  e) On the Basic Info form, click Update.

- Navigate to Dependency Views > Map Icons, and:
  a) Click New to create a new map icon or click the name of an existing icon in the Label column to modify an existing icon.
  b) Fill in the fields on the form, as appropriate.

Map Icons form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI Type</td>
<td>Label or the informal name of the CI table that this icon represents in the view.</td>
</tr>
<tr>
<td>Icon</td>
<td>Name of the icon.</td>
</tr>
<tr>
<td>URL</td>
<td>Path to the icon image using the following format: /image name.svg. Click the lock icon to enter a new path.</td>
</tr>
</tbody>
</table>

c) Fill in the fields on the form, as appropriate.
d) Click Submit to enter a new icon. Click Update to modify an existing icon.

You can modify a Dependency Views map indicator to use the new icon.

Create a predefined filter

Create filters to narrow down the CIs that are displayed on a Dependency Views map. You can create filters that are based on CIs’ class, CIs’ attributes, or CIs’ relationships.

Role required: ecmdb_admin

Create a predefined filter that you can then select to determine the scope of the CIs that are displayed in a Dependency Views map. Configuration type filters filter by CI class, CI filters filter by CI attributes, and relationship filters filter by relationships. Only CIs that match at least one of the configuration type filters (if any exists), and at least one of the CI filters (if any exists), and at least one of the relationship type filters (if any exists) - are displayed on the map. If no filters are defined, then no filtering is applied.

**Note:** Predefined filters do not apply to virtual groups. Therefore a virtual group displays even if it contains CIs that a predefined filter would have not included. Upon the expansion
of a virtual group, predefined filters are applied, and any or all of the CIs that were previously virtually grouped, might no longer display on the map.

1. Navigate to **Dependency Views > Predefined Filters**.
2. On the **Predefined Filters** page, click **New**.
3. Type in a **Name** for the filter. Click **Roles**, and in the **Roles** dialog box, select the roles that this filter will be available for.
4. Right-click on the page header, and click **Save**.
5. To create a configuration type filter:
   a) Click **Configuration Types**, and then click **Edit**.
   b) In the **Collection** slushbucket, select the classes that CIs must belong to in order to be displayed on the map, and move them to the **Configuration Types List**.
   c) Click **Save**.
6. To create a CI filter:
   a) Click **CI Filters**, and then click **New**.
   b) In the **CI Filters** page enter conditions to filter CIs by specific attribute values.
   c) Click **Submit**.
7. To create a relationship type filter:
   a) Click **Relationship Type**, and then click **New**.
   b) In the **Collection** slushbucket, select the relationships that CIs must have in order to be displayed on the map, and move them to the **Relationship Types List**.
   c) Click **Save**.

After creating a predefined filter, you can apply it to a map:

1. Click the button to open **Map Settings**.
2. Select a filter from the **Predefined Filters** list.
3. Click **Apply**.

**Set a predefined filter as default**

You can set a custom predefined filter as the default predefined filter for viewing maps.

1. Create the custom predefined filter to be used as the default predefined filter.
2. On the predefined filter form, click the context menu and select **Copy sys_id**.
3. Navigate to **User Administration > User Preferences**.
4. Click **New** and create a new user preference record using these values:
   - **Name**: ecmdb.ciview
   - **Type**: String
   - **Value**: Paste the sys_id of the custom predefined filter
   - **User**: Leave blank to create a system-wide setting
   - **Description**: Description of the predefined filter
   - **System**: Selected
5. Click **Submit**.

In **Map Settings**, when you select the **Default** option for **Predefined Filters**, the custom predefined filter that was set, will be applied.

**Create or modify Map Related Items**

The Map Related Items module relates referenced CIs to one another, which allows them to be displayed in a Dependency Views map.

The base system configuration includes the following tables and relates them to items in the Computer (cmdb_ci_computer) and Server (cmdb_ci_server) tables.

- Disk (cmdb_ci_disk)
- Network Adapter (cmdb_ci_network_adapter)
- Database (cmdb_ci_database)

Some additional referenced CIs that can be related in this manner are file systems and running processes.

In the following example, computer nodes in the map are related to network adapter nodes if the **Configuration Item** field of the adapter records reference the specific CI node. Access or create a network adapter record from the Network Adapter related list in the cmdb_ci_computer record.

![Diagram of network adapter configuration](image)

**Dependency Views Configuration Item field**

The Dependency Views map for the *JEMPLOYEE-IBM computer shows the network adapter attached to the computer.
You can configure Dependency Views to display CIs that have no relationship record, but are related to other CIs by reference fields.

1. Navigate to Dependency Views > Map Related Items.
2. Click **New** to create a new related item, or click in the row of an existing CI to modify an existing map related item.
3. Fill in the fields on the form, as appropriate.
   See the Related Items form table.
4. Click **Submit** to enter a new map related item. Click **Update** to modify an existing map related item.

### Related Items form

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration item</td>
<td>CI that represents the base node or a CI in a table that extends the base node table. In the base system, the configuration item represents the base node is Computer (cmdb_ci_computer), which includes all types of workstations and servers.</td>
</tr>
<tr>
<td>Related item</td>
<td>Table name of the related item. Only the cmdb_ci table and tables that extend it are displayed in the choice list.</td>
</tr>
<tr>
<td>Related field</td>
<td>Field that links this related item to the configuration item. In many cases, the appropriate value is automatically populated in the field after the first two fields are selected. Select the drop-down menu for additional options.</td>
</tr>
</tbody>
</table>
Create or modify Dependency Views menu actions

To modify an existing menu option, first you create a copy of the original menu action record, and then you modify the copy.

This ensures that your instance can update the record normally during the upgrade process and allows you to quickly restore the original menu option, if necessary.

1. To create a new menu option, navigate to Dependency Views > Map Menu Actions and click New.
   Fill in the fields on the form, as appropriate. See the Menu Action form table.
2. To modify an existing menu option, navigate to Dependency Views > Map Menu Actions.
3. Open the menu action you want to edit.
4. Right-click in the header and click Insert and Stay.
   This step creates a duplicate copy of the menu action and leaves it open for editing.
5. Change the name of the copied record to avoid confusion.
6. Modify the form fields as necessary and save the record.
7. Open the original record and disable it by clearing the Active check box.

Menu Action form

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name that appears as the menu option.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that allows you to enable or disable this record.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition that triggers the display of this menu option. If the condition</td>
</tr>
<tr>
<td></td>
<td>evaluates to false the menu option does not display. Script is evaluated</td>
</tr>
<tr>
<td></td>
<td>in JavaScript in the user's browser and does not have access to all the</td>
</tr>
<tr>
<td></td>
<td>APIs that Business Rules do. For details on available parameters, see</td>
</tr>
<tr>
<td></td>
<td>Condition Parameters.</td>
</tr>
<tr>
<td>Item</td>
<td>Map element for which the menu option displays. Valid values are:</td>
</tr>
<tr>
<td></td>
<td>· Canvas for the menu on the map background.</td>
</tr>
<tr>
<td></td>
<td>· Node for the menu on a CI.</td>
</tr>
<tr>
<td></td>
<td>· Relationship for the menu on a relationship link.</td>
</tr>
<tr>
<td>Order</td>
<td>Physical location of the option in the menu. The option with the lowest</td>
</tr>
<tr>
<td></td>
<td>order number appears first in the menu. All editable and custom options</td>
</tr>
<tr>
<td></td>
<td>appear below the permanent menu options.</td>
</tr>
<tr>
<td>Control</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>Script</td>
<td>Script that is executed in the browser when the menu option is selected. Script is evaluated in JavaScript in the user's browser and does not have access to all the APIs that Business Rules do.</td>
</tr>
<tr>
<td>Type</td>
<td>Menu action type being created, either a menu option or a menu separator. The menu separator is a single line. When the type is a separator, the Script field is ignored.</td>
</tr>
</tbody>
</table>

**Condition and script parameters for menu actions**

You can use the following condition and script parameters for menu actions.

**Condition parameters**

![Note: The usual regular expression conventions are valid in the condition field, such as ! for NOT, && for AND, and || for OR.](image)

The Condition field contains a boolean expression that evaluates to true or false. If the condition is true or if there is no condition, the specified option appears in the menu when you right-click a CI or a relationship link. When you select the option from the menu, ServiceNow executes the associated script.

**Common Elements for Building a Condition**

<table>
<thead>
<tr>
<th>Text</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item</td>
<td>Node or reference link’s data on which you performed the right-click action.</td>
</tr>
<tr>
<td>item.label</td>
<td>Label of the node.</td>
</tr>
<tr>
<td>item.ci_type</td>
<td>CI’s type (table), such as cmdb_ci_service.</td>
</tr>
<tr>
<td>item.name</td>
<td>Name of CIs. CI’s type name or the table label, such as Business Service.</td>
</tr>
<tr>
<td>item.location</td>
<td>Location of the CI, such as New York.</td>
</tr>
<tr>
<td>item.manufacturer_name</td>
<td>Name of the CI’s manufacturer, such as Dell Inc.</td>
</tr>
<tr>
<td>item.id</td>
<td>The sys_id of the CI.</td>
</tr>
<tr>
<td>item.is_selected</td>
<td>The item that is selected in the map.</td>
</tr>
<tr>
<td>item.level</td>
<td>The current default level.</td>
</tr>
<tr>
<td>item.locationId</td>
<td>The sys_id of the CI node’s location.</td>
</tr>
<tr>
<td>item.locationName</td>
<td>The full address of the location.</td>
</tr>
<tr>
<td>item.manufacturerId</td>
<td>The sys_id of the CI’s manufacturer.</td>
</tr>
</tbody>
</table>
Valid Conditions for Condition Parameters

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item.is_collapsed</td>
<td>The node is a collapsed node.</td>
</tr>
<tr>
<td>item.is_cluster</td>
<td>The node is a cluster node.</td>
</tr>
</tbody>
</table>

Script parameters

Menu action scripts are executed on the client when a user clicks the menu option. You can use the same building blocks in scripts as in conditions. Menu action scripts do not function on separators. These are some additional, useful expressions for scripts:

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item.id</td>
<td>The sys_id of the CI node or relationship link.</td>
</tr>
<tr>
<td>item.source</td>
<td>The sys_id of the relationship’s parent or child.</td>
</tr>
<tr>
<td>item.target</td>
<td>The sys_id of the relationship’s parent or child.</td>
</tr>
<tr>
<td>item.label</td>
<td>The name of the CI node, such as IronMail-SD-02.</td>
</tr>
<tr>
<td>item.location</td>
<td>The sys_id of the CI node's location.</td>
</tr>
<tr>
<td>item.location_name</td>
<td>The full address of the location, such as 4616 Clairemont Drive, North Clairemont, San Diego CA.</td>
</tr>
<tr>
<td>item.manufacturer_id</td>
<td>The sys_id of the CI's manufacturer.</td>
</tr>
</tbody>
</table>

Create or edit a dependency type

Use one of the dependency types provided, or create a custom dependency type with a script that will execute in real time to generate a custom view of a Dependency Views map for a specific CI.

Create a JavaScript to customize the map. The script must comply with JavaScript syntax guidelines and the directions in the default script template, and it can call platform APIs. Use a dependency type, for example:

- To narrow down and simplify a map, leaving out CIs that are not important for a specific task.
- To include only specific CIs that are hidden by default, such as qualifiers, end-points, and entry points.
- To display virtual relationships that are calculated, and that otherwise do not exist in the CMDB.
- As a tool to plan a new topology deployment that is based on existing resources.

The following dependency types are included in the base system:

**Application to Network Devices**
Returns the network devices in the network paths leading to/from the given CI.

**Network Device to Applications**
Returns the applicative CIs which are target or source of network paths containing the given network device. In addition, returns the hosts of those applicative CIs, and for an applicative CI that is an inclusion, its parent CI is returned too.

**Physical Network Connections**
Returns hosts/network devices that are physically connected to the given host or network device.

**Flow Dependencies**

Returns all the server to server connections that were discovered using the Netflow collector. The script builds a graph based on data in the `sa_flow_server_comm` table. This table contains pairs of services represented by an IP and a listening port that are communicating with each other. For more information, see Data collection and discovery using Netflow and Data collection and discovery using VPC Flow Logs.

**Show All Relationships**

Returns all qualifiers, end points, and entry points. This dependency type is disabled by default and is typically enabled for debugging and tracking purposes. Available with the activation of Service Mapping or Event Management.

1. Navigate to Dependency Views > Dependency Types.
2. In the Load Filter Scripts list view, select an existing dependency type, or click New.
3. Enter or modify a script, adhering to the guidelines and requirements in the script template that is provided.
4. Click Submit.

In a Dependency Views map, you can click Use Dependency Type to apply a custom script defined in a dependency type.

**Compliance**

Compliance is a tool set that enables administrators to certify ServiceNow data for correctness and fix any discrepancies found in the data.

Compliance offers these certification options to suit the size and requirements of your organization:

<table>
<thead>
<tr>
<th>Compliance certification options</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Option</strong></td>
</tr>
<tr>
<td>Desired State</td>
</tr>
<tr>
<td>Architecture Compliance</td>
</tr>
</tbody>
</table>
Compliance Activation

Compliance functionality is provided by the Certification Core plugin. The Certification Core plugin which contains shared functionality required for certification audits. It consists of the following plugins, and is activated by default.

- Desired State (activated by default)
- Architecture Compliance (activate)
- Data Certification (activate)

Installed with Compliance

These components are installed with the Certification Core plugin.

Demo data is included with the Desired State and Architecture Compliance plugins. The Certification Core plugin adds or modifies these tables.

<table>
<thead>
<tr>
<th>Compliance Certification Core tables</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>Audit (cert_audit)</td>
</tr>
<tr>
<td>Audit Result (cert_audit_result)</td>
</tr>
<tr>
<td>Follow On Task (cert_follow_on_task)</td>
</tr>
<tr>
<td>Certification Template (cert_template)</td>
</tr>
<tr>
<td>Certification Condition (cert_cond)</td>
</tr>
<tr>
<td>Certification Attribute Condition (cert_attr_cond)</td>
</tr>
<tr>
<td>Certification CI Relationship Condition (cert_ci_rel_cond)</td>
</tr>
<tr>
<td>Certification User Relationship Condition (cert_user_rel_cond)</td>
</tr>
<tr>
<td>Certification Group Relationship Condition (cert_group_rel_cond)</td>
</tr>
<tr>
<td>Certification Related List Condition (cert_related_list_cond)</td>
</tr>
</tbody>
</table>
### User roles

The certification role is automatically assigned to all users with the itil role when the Certification Core plugin is activated or when compliance applications are upgraded. Certification core installs two business rules, both called Add Certification Role To Manager, that perform similar tasks on different tables. One rule checks for a manager specified on the User (sys_user) table, and the other checks for the certification role on the User Role (sys_user_has_role) table. When both a manager and the certification role are specified for a user, the system automatically grants the certification role to the manager. This functionality ensures that a certification task can be escalated successfully to the next level. The system grants this automatic role to the user's immediate manager only and not to others up the management chain.

**Note:** When a manager has only the certification role and no other role, the manager is considered a Requester and is not counted as a subscribed user (Fulfiller).

### Compliance Certification Core user roles

<table>
<thead>
<tr>
<th>Name</th>
<th>Contains roles</th>
<th>Description</th>
</tr>
</thead>
<tbody>

<td>Update template version</td>
<td>Certification Template (cert_template)</td>
<td>Creates a version when the template changes in any meaningful way.</td>
</tr>
</tbody>
</table>
Compliance Templates and Audits

The Templates and Audits modules on the top level of the Compliance menu enable a certification_admin user to create, edit, and delete all template and audit types.

You can use Compliance Templates and Audits to evaluate records for any table in the ServiceNow system, not just those tables extending the Configuration Item [cmdb_ci] table. Compliance audits certify record attributes only. Compliance templates can be used in Control Test Definitions in Governance Risk and Compliance.

Compliance Overview module

The Compliance Overview module is a type of homepage.

The Compliance Overview module summarizes:

- Current audit states
- Outstanding certification tasks
- Compliance discrepancies
- Upcoming audits
- General state of compliance audits for Data Certification, Desired State, Architectural Compliance, and Scripted audits

To use the Compliance Overview:

1. Navigate to Compliance > Overview.
2. Click elements within the reports to obtain more information.
   For example, click the Disk space (GB) bar in the Compliance Discrepancies chart to open a list of audit results filtered by disk space attributes.
Compliance Overview module roles

Only users with certain roles can access the Overview module.

The different levels of access are:

<table>
<thead>
<tr>
<th>Role</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>certification</td>
<td>View (view overview page and refresh reports)</td>
</tr>
<tr>
<td>certification_admin</td>

</tr>
<tr>
<td></td>
<td>View, customize</td>
</tr>
<tr>
<td>admin</td>
<td>• View (view overview page and refresh reports)</td>
</tr>
<tr>
<td></td>
<td>• Customize (refresh, add, delete, and rearrange reports)</td>
</tr>
<tr>
<td></td>
<td>• Edit (can edit gauges)</td>
</tr>
</tbody>
</table>

Architecture Compliance

Architecture Compliance performs scheduled or on-demand audits of configuration management database (CMDB) data to determine which configuration items (CI) match the expected attributes.

The compliance process checks servers to ensure that their resources, such as CPU speed or memory, comply with standards set by your organization. Audit reports show any discrepancies in the attributes of the target CIs, and ServiceNow automatically assigns follow-on tasks to qualified users who can remediate those discrepancies.

Activate Architecture Compliance

Administrators can activate the Architecture Compliance plugin to access the application. Activating this plugin automatically activates these additional plugins.

- Certification Core plugin contains shared functionality required for certification audits.
- Version Management plugin manages certification filter and template versions.

1. Navigate to System Definition > Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
   - If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. Optional: If available, select the Load demo data check box.
Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.

You can also load demo data after the plugin is activated by clicking the **Load Demo Data Only** related link on the System Plugin form.

5. Click **Activate**.

**Architecture Compliance**

Architecture Compliance manages scheduled or on-demand reviews of CMDB data to determine which configuration items (CI) match expected attributes. The compliance audits check servers to ensure that their physical resources, such as CPU speed or memory, comply with certain standards.

The administrator responsible for compliance checking creates template definitions of expected attributes and then schedules an audit to check CIs for compliance. The audit results identify CIs that pass certification and itemize the discrepancies in those CIs that fail. ServiceNow automatically generates and assigns follow-on tasks to track the process of getting the CIs back into compliance. Users with the admin role activate Architecture Compliance.

**Architecture Compliance Process**

Perform these tasks in this order to certify configuration items with Architecture Compliance.

1. **Create a filter.**
   
   Create a filter that defines a subset of configuration items to certify. You can create multiple versions of a filter, and then activate the version you want to use for compliance checking. Architecture compliance only supports filters on the Configuration Item (cmdb_ci) table and all tables that extend it.

2. **Create a template.**
   
   Create template conditions using values from reference fields in a related list or conditions that define the expected physical attributes of each CI in an audit. The template uses a filter to determine which configuration items the system examines based on these conditions.

3. **Create and run an audit.**
   
   Create and schedule an audit or run an audit on demand. The audit generates a set of results based on the conditions in the template you specify.

4. **View audit results.**
   
   View the audit results which display any discrepancies between the expected state, as expressed by the template conditions, and the actual state of the target configuration items.

5. **Correct discrepancies.**
   
   Correct the discrepancies the audit found by completing the follow-on tasks created by the system.

**Architecture Compliance Overview module**

The Architecture Compliance Overview module displays various architecture compliance reports. The Overview module is a type of homepage.
Only compliance users with certain roles can access the Overview module. The different levels of access are:

**Access levels per role**

<table>

</tr>
</tbody>
</table>
Architecture Compliance roles

To access or configure certification elements, a user must have the certification_admin role. These users can create, update, and delete filters if they have the proper access to necessary tables.

In the base ServiceNow system, certification_admin users have limited system rights and do not have access to all the necessary tables. When assigning compliance resources, make sure to grant additional roles to the certification_admin user as needed. For example, the certification administrator needs roles that grant access to these tables:

- Company [core_company]
- Cost Center [cmn_cost_center]
- Schedule [cmn_schedule]

Desired State

Desired State performs scheduled or on-demand audits of CMDB data to determine which records match the expected attributes, CI relationships, and relationships to other records in the system.

For example, desired state can determine if a computer has a license for a particular software program. The compliance process checks configuration items (CI) to ensure that their attributes and relationships comply with standards set by your organization. Audit results show any discrepancies in the desired state of a record, and ServiceNow automatically assigns follow-on tasks to qualified users who can remediate those discrepancies.

Desired State process

The Desired State application conducts scheduled or on-demand audits of CMDB data to determine which configuration items (CI) match a desired state.

The desired state certification process can mean checking servers to ensure that their physical resources, such as CPU speed or memory, comply with certain standards. This process also ensures that all critical business services have a manager, support group, and approval group assigned.

The administrator responsible for certification creates definitions of desired states and then schedules an audit to check CIs for compliance. The audit results identify CIs that pass certification and itemize the discrepancies in those CIs that fail. The ServiceNow system automatically generates follow-on tasks to track the process of adjusting the CIs to the desired state.

Desired state differs substantially from data certification. Data certification is a manual process to ensure that your data matches reality. Desired state examines the same data and determines when the configuration of each item is in the desired and approved state.

1. Create a certification filter: Create a filter that defines a subset of configuration items to certify. You can create multiple versions of a filter, and then activate the version you want to use for certification. You can create filters on the Configuration Item (cmdb_ci) table and all tables that extend it.

2. Create a template: Create a template with conditions that define the desired state of the physical attributes, related records, and relationships for a CI. The certification filter you select for the template determines which configuration items the system examines.

3. Create and run an audit: Create an audit using the template. Set the audit to run on a schedule or on demand. The audit generates a set of results based on the conditions from the template you specify. Determine usage of follow-on tasks:
• Determine if the audit creates follow-on tasks and assignment.
• Determine if the same follow-on task is used for the same audit failure across multiple runs.

The system attribute glide.allow.new.cert_follow_on_task is set to true by default, allowing for new follow on tasks to be created for the same failure, at each audit run.

4. View audit results: View the audit results which display any discrepancies between the desired state, as specified by the template, and the actual state of the target configuration items.

5. Correct discrepancies: Correct the discrepancies the audit found by completing the follow-on tasks created by the system.

**Desired State roles**

To access or configure certification elements, a user must have the certification_admin role. These users can create, update, and delete filters if they have the proper access to necessary tables.

In the base system, certification_admin users have limited system rights and do not have access to all the necessary tables. When assigning compliance resources, make sure to grant additional roles to the certification_admin user as needed. For example, the certification administrator requires roles that grant access to these tables:

- Company (core_company)
- Cost Center (cmn_cost_center)
- Schedule (cmn_schedule)

**Desired State Overview module**

The Desired State Overview module displays various desired state reports. The Overview module is a type of homepage.

The Desired State Overview module is a type of homepage.

**Use the Desired State Overview module**

The Desired State Overview module displays various desired state reports.

1. Navigate to **Compliance > Desired State > Overview**.
2. Move or add reports where needed.
3. Click elements within the reports to obtain more information.

The Desired State Overview Module in the base system contains these reports:

- Upcoming Desired State Audits: All scheduled audits.
- Outstanding Desired State Tasks: All follow-on tasks in the **Pending**, **Open**, or **Work in Progress** state.
- Hierarchical Task Roll Up: All follow-on tasks grouped by **Assigned to** user.
- Desired State Discrepancies: All audit discrepancies for attributes and relationships.
- 30/60/90 Day Task Aging: All outstanding follow-on tasks grouped by age in 30-day increments.
**Desired State Overview module roles**

Only compliance users with certain roles can access the Overview module.

The different levels of access are:

<table>
<thead>
<tr>
<th>Role</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>certification</td>
<td>View (view overview page and refresh reports)</td>
</tr>
<tr>
<td>certification_admin</td>
<td>• View (view overview page and refresh reports)</td>
</tr>
<tr>
<td></td>
<td>• Customize (refresh, add, delete, and rearrange reports)</td>
</tr>
<tr>
<td>admin</td>
<td>View, customize</td>
</tr>
<tr>
<td></td>
<td>• View (view overview page and refresh reports)</td>
</tr>
<tr>
<td></td>
<td>• Customize (refresh, add, delete, and rearrange reports)</td>
</tr>
<tr>
<td></td>
<td>• Edit (can edit reports)</td>
</tr>
</tbody>
</table>

**Access levels**

The different levels of access are:

- **View**: can view the overview page and refresh reports.
- **Customize**: can refresh, add, delete, and rearrange reports.
- **Edit**: can edit reports.

**Desired State reporting**

The Desired State application includes reports to assess your audit results.

These reports are available to all users whose role gives them access to the Reporting application. Users with the admin role can share these reports with specific users of groups or change the display options.

Navigate to **Reports > View / Run**. In the Reports search field, enter all or part of the report name. You can also scroll to the designated category and select one of the reports.

In addition to these reports, you can also generate other reports.

**Certification audits**

A certification audit compares the actual attributes of certain ServiceNow records. This audit selects a filter, against the expected attributes, relationships, and related record values defined by template conditions or a script.

You can configure the audit to create and assign follow-on tasks to remediate any discrepancies the audit finds. Audit records use a standard ServiceNow scheduler to determine when to run. After an audit runs, the results and follow-on tasks appear in related lists in the audit record.

Users with the certification_admin role can create, update, delete, and run audits. Users with the certification role can view audits, audit results, and follow-on tasks.

**Create an audit**

Compliance offers two types of audits: one uses templates to define conditions and the other uses a script.

Role required: certification_admin

1. Ensure that an appropriate template record was created for this audit.

   **Note:** Conditions in the template define the values to audit.

2. Use the CI Class Manager:
   a) Navigate to Configuration > CI Class Manager.
   b) Click Hierarchy to display the CI Classes list. Select the class for which to create an audit.
   c) In the class navigation bar, expand Health and then click Compliance. Click Audit.

3. Or, navigate to one of these modules:
   - Compliance > Audits
   - Compliance > Architecture Compliance > Audits
   - Compliance > Desired State > Audits
   - Compliance > Scripted Audits > Audits

4. Click New.
   The system opens a new record for the audit type associated with the navigation path you selected. The **Audit type** field is read-only.

5. Complete the form using the fields described in the table below.

6. Right-click the header bar and select Save.
   The **Audit Results** and Follow On Tasks related lists appear on the form.

7. To run the audit immediately, click Run Audit.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
When template audits run, ServiceNow updates the date and time in the **Last run date** field and populates the related lists. For scripted audits, the **Last run date** field is not populated.

**8.** View the records that passed and the discrepancies found by the audit in the **Audit Results** related list.

You can open template records and any follow-on tasks directly from this related list. Notice that the value in the **Task description** field appears as the **Short description** in the follow-on tasks.

**Note:** You cannot delete audit records that have audit results or audit results that have follow-on tasks. ServiceNow disables the **Delete** option in records and lists where these dependent records exist.

### Creating Audits

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for this audit.</td>
</tr>
<tr>
<td>Filter</td>
<td>Filter to use when the audit type is Scripted. This field is required for scripted audits, but is hidden for all other audit types.</td>
</tr>
<tr>
<td>Template</td>
<td>(Required) Template to use when this audit runs. Audit type filters the list of available templates, and only the active versions of templates are available for selection. For example, when you create an audit from Desired State, only templates of the Desired State audit type are available for selection. For the Desired State and Architecture Compliance audit types, only templates for tables that extend the Configuration Item (cmdb_ci) table are available. This field is hidden when the audit type is <strong>Scripted</strong>.</td>
</tr>
<tr>
<td>Table</td>
<td>(Read-only) Table for the template.</td>
</tr>
<tr>
<td>Create tasks</td>
<td>Option to create follow-on tasks for correcting discrepancies (selected). In a scripted audit, you can create the logic for either task state by using <strong>true</strong> to create tasks or <strong>false</strong> to not create tasks. By default, this check box is cleared (<strong>false</strong>) in a new audit record.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Assignment type** | Method for assigning follow-on tasks. This field is visible only when the Create task check box is selected. Choices are:  
- User Field: Select a user reference field on the table being audited. For example, you choose the user identified in the Managed by field on the failed record to perform the tasks. This selection displays the Assigned to and Assign to empty fields. If the reference field on the record is empty, the value in the Assign to empty field is used.  
- Specific User: Select a specific user to perform the tasks. This selection displays the User field.  
- Group Field: Select a group reference field on the table being audited. For example, you choose the group identified in the Support group field on the failed record to perform the tasks. Tasks are assigned to all members of the group. This selection displays the Assign to group and Assign to empty fields. If the reference field on the record is empty, the value in the Assign to empty field is used.  
- Specific Group: Select a specific group to perform the tasks. This selection displays the Group field. All members of the selected group are assigned to the tasks. |
| **User** | The specific user this audit assigns to follow-on tasks. This user must have the certification role. This field is available under these conditions:  
- Assignment type is set to Specific User.  
- Assign to empty is set to Create Assigned Task, and Assignment type is set to User Field. |
<p>| <strong>Assign to group</strong> | The group field that defines which group this audit assigns to the follow-on task. This field is available only when the Assignment type is Group Field. |
| <strong>Group</strong> | The specific group this audit assigns to follow-on tasks. This field is available only when the Assignment type is Specific Group. |
| <strong>Assign to</strong> | The user field that defines which user this audit assigns to the follow-on task. This field is available only when the Assignment type is User Field. |</p>

</thead>
</table>
| Assign to empty         | The behavior to use if the field selected in Assign to or Assign to group is blank on the record being audited. For example, if a follow-on task must be assigned to a manager, but no manager is identified, the Assign to empty setting determines what happens. This field appears only when the Assignment type is User Field or Group Field. Choices are:  
  - Do Not Create Task: No follow-on task is created when the Assign to or Assign to group field is empty.  
  - Create Unassigned Task: Create a follow-on task, but do not assign it to any user or group. The task can be manually assigned later.  
  - Create Assigned Task: Create a follow-on task and assign it to the user or group specified. If the assignment type is User Field, the User field becomes available. If the assignment type is Group Field, the Group field becomes available.  
  The audit automatically creates follow-on tasks for all records that have Assign to populated, regardless of the Assign to empty setting. |
| Short description       | Brief description of the purpose of the audit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Task description        | General description of the work required for the follow-on tasks for the audit. All follow-on tasks created by this audit inherit this description.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Active                  | Activation control for this audit record. Clear this check box to prevent this audit from running and creating follow-on tasks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Run                     | How often to run the schedule that generates the audit.  
  - Daily  
  - Weekly  
  - Monthly  
  - Periodically  
  - Once  
  - On Demand                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Day                     |  
  - If Run is Weekly, the day of the week when the audit runs.  
  - If Run is Monthly, the day of the month when the audit runs. If the day is 29, 30 or 31, for shorter months the audit runs on the last day of the month.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
<table>

</tbody>
</table>

**Audit Scheduling**

The system performs audits automatically from the schedule you configure.

Users with the *certification_admin* or *admin* role can generate on-demand audits directly from the Audit form by clicking **Run Audit**. When an audit runs, ServiceNow populates the **Audit Results** related list in the form and shows follow-on tasks, if any, in the **Follow On Tasks** related list. Click **Preview Audit Results** to generate an audit preview that tests your template conditions without generating any audit results.
Audit Running

Certification audit results

Audit results show the records that have passed or failed an audit and itemize any discrepancies detected.

A discrepancy is considered any departure from the expected conditions defined in the template or script used for the audit. Audit results provide links to the source records and to the follow-on tasks for bringing failed records into compliance. Records that pass an audit have a single entry in the results table with a state of Certified. Records that fail an audit show all discrepancies, each with a state of Failed.

ServiceNow displays results from a certification audit in these locations:

- Audit Results list
- A related list in the Audit record
A related list in the compliance view of a CI record

View an audit result

To generate certification results, you must first create and run an audit.

1. Navigate to one of the following locations:
   - Compliance > Desired State > Audit Results
   - Compliance > Architecture Compliance > Audit Results
   - Compliance > Scripted Audits > Audit Results
   - Data Certification > Schedules > Audit results

2. From any audit results list, you can edit the filter to show the results for any audit type.

   ![Audit Type filter](image)

   Audit Type filter

   The results filter by audit type and grouped by audit number. Within the groups, results list by date, from oldest to newest.

3. You can open the audit record, the CI record, or the follow-on tasks from this list.

   **Note:** The **Audit type** field was set automatically when the audit result was created and cannot be changed. For scripted audits, the audit type is set when you create the audit record.
Desired State Audit Results

Audit results show this information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created</td>
<td>Date and time the audit ran.</td>
</tr>
<tr>
<td>Document</td>
<td>Record that was certified, such as a configuration item (CI).</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| State             | Results of certification for each condition evaluated. The three possible states are:  

- **Certified** A certified record is one that passed all conditions. ServiceNow generates only one audit result for a certified record.  
- **Failed** Records that are not certified have an audit result for each failed condition. The **Column name**, **Desired value**, **Discrepancy value**, and **Follow on task** are only populated for failed results.  
- **Pending** A pending state indicates that the audit is incomplete. Data certification audits use this state when a result is awaiting user input. |
| Column name       | Audited field, relationship, or related list column that did not match the expected state. |
| Desired value     | Attribute or relationship required for this record that was not found, from the condition in the expected state template. For data certification, this column is blank if the record has a state of Failed or Pending. |
| Discrepancy value | Actual value of the attribute that did not match the expected state. The follow-on task, if provided, tracks resolution of this discrepancy. In a list of results for the **Data Certification** audit type, this column is blank if the record has a state of Certified or Pending. |
| Follow on task    | Link to the follow-on task generated for remediating a discrepancy. |
| Audit             | Link to the audit record that produced the results. |
| Threshold         | State of an audited, desired state field with a defined failure threshold. This threshold is the acceptable number of failures for a desired state field within a specified health window and is configured in the Audit form. Possible threshold states for the results are:  

- **In Limit**  
- **Exceeded** |
## Delete an audit result

While audit results can be deleted, you cannot delete an audit result that has a follow-on task associated with it.

1. Navigate to one of these modules:
   - Compliance > Desired State > Audit Results
   - Compliance > Architecture Compliance > Audit Results
   - Compliance > Scripted Audits > Audit Results

   The list groups by audit name.

2. Select the checkbox for a result in the list, and then select **Delete** from the **Actions on selected rows** menu at the bottom of the list.

   **Note:** If the result record has a follow-on task, the **Delete** option is not available. If you select multiple records, some with and some without tasks, the system only deletes those records that do not have tasks.
3. Click a date/time link to see the results for a specific CI.

   **Note:** The Delete button only appears on the form if the audit result does not have a follow-on task.

4. Click **Delete**.
View an audit result in the Compliance view

After an audit has run, you can view the results and follow-on tasks from the Compliance view in the records of every CI audited.

This view is available only for systems that use the default CI classes provided with the base ServiceNow system, such as Hardware, Software, and Computer. For information about creating views, see View Management.

1. Navigate to Configuration and open the record of a CI that was included in a compliance audit.
2. Select the view to configure by performing the appropriate action for your list version.

<table>
<thead>
<tr>
<th>Version</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>List V2</td>
<td>Open the context menu and select <strong>View &gt; Compliance</strong>.</td>
</tr>
<tr>
<td>List v3</td>
<td>Open the context menu and select <strong>Change View</strong>, and then click <strong>Compliance</strong>.</td>
</tr>
</tbody>
</table>

List v2: select **View > Compliance**

The Audit Results Compliance View appears.
Audit Results Compliance View

Audit Results Compliance View List Descriptions

<table>
<thead>
<tr>
<th>Lists</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Passed Audit Results</td>
<td>Lists audits for this CI that passed without discrepancies. The information includes the versions of the template and filter used. Records are grouped first by audit, and then by creation date and time.</td>
</tr>
<tr>
<td>Failed Audit Results</td>
<td>Lists all failed audits for this CI. The information includes the discrepancy data, the follow-on task, and the versions of the template and filter used. Records are grouped first by audit, and then by creation date and time.</td>
</tr>
<tr>
<td>Follow On Tasks</td>
<td>Lists all follow-on tasks generated from audit discrepancies for this CI.</td>
</tr>
</tbody>
</table>

3. Right-click the header bar and select View > Compliance from the context menu.
Results preview

You can preview an audit to view potential results without saving audit results or generating follow-on tasks. For example, use this feature to test template conditions for correctness without creating thousands of result records.

In an audit record, click **Preview Audit Results** under **Related Links**.

A summary of the potential audit results appears at the top of the audit record. Previewing does not change the **Last run date** field.

Health windows

A health window is a trailing time frame in which the ServiceNow system evaluates audit results from CIs that have desired state fields defined.
The **Health window** and **Health unit** fields define each window, and ends when an audit runs. For example, an audit runs on the fifteenth of the month with a seven-day window. It evaluates the threshold values of a desired state field from the eighth to the fifteenth. When the same audit runs the next day, the system evaluates the threshold from the ninth to the 16th, and so on. The audit counts backward seven days from the current day. ServiceNow evaluates a CI threshold value for each health window, without considering the results from the previous window. As a result, the health of a CI can fail for one audit and then pass in a subsequent audit that runs in a new window.

ServiceNow evaluates stability by recording the number of times a desired state threshold value for a CI switch between **Failed** and **Certified** within the health window. In the example shown here, a 5-minute health window was set for the desired state field on a UPS unit that measures the remaining battery time. The threshold was set at 2, which allows the field to fail two audits in the same health window.

**Desired State Health Window**

In the initial audit, the system evaluated the threshold value for the **Seconds on battery** field within a 5-minute window. This window ran from 13:52:51 to the time of the audit at 13:57:51. The desired state field showed In Limit for that audit and the second audit conducted less than a minute later. The next two audits were conducted within five minutes of the first audit and both showed that the threshold (set at 2) was Exceeded. A subsequent audit was conducted five minutes after the audit in which the desired state field threshold was first exceeded. Since the health window had moved forward enough units, the **Seconds on battery** field was within limits again with only one failure in the 5-minute window being evaluated.
Copy an audit

New audits can be created from an existing audit.

1. Open the audit record you want to copy.
2. Change the name or short description to distinguish this audit from the original.
3. Make any other changes you need.
4. Right-click in the header bar and select either Insert or Insert and Stay from the context menu.
Arch Comp Audit Insert

The system clears the **Last run date** field and inserts the record into the database.

**Certification filters**

A certification filter creates a subset of ServiceNow records to audit, typically from configuration items (CI) of a certain type, such as all UNIX servers in a specific datacenter.

However, you can define a filter for any ServiceNow table by using any set of system-supported conditions. Audited records identified by a filter for expected attributes or relationships, depending on the audit type.

You can create multiple versions of a filter, reactivate inactive versions, and select the version you want to use in a template or a certification schedule. Only the active versions of a filter are available for selection in template records. You can use a single filter for multiple certification templates or schedules.
Certification filters

<table>
<thead>
<tr>
<th>Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Certification</td>
<td>Validates CMDB data.</td>
</tr>
<tr>
<td>Architecture Compliance</td>
<td>Manages reviews of CMDB data in architecture compliance audits to determine which configuration items (CIs) match expected attributes.</td>
</tr>
<tr>
<td>Desired State</td>
<td>Manages reviews of CMDB data to determine which CIs match a desired state for both attributes and relationships.</td>
</tr>
<tr>
<td>Compliance</td>
<td>Manages reviews of records from any ServiceNow table to determine which records match an expected set of attributes and related record conditions.</td>
</tr>
<tr>
<td>IT Governance Risk and Compliance</td>
<td>Generates audits and tests to ensure that controls are being followed and creates tasks to track corrective actions.</td>
</tr>
</tbody>
</table>

Compliance filter

The compliance filter for license bases uses the following fields to define entitled users or CIs. These field values can be used independently or together to calculate compliance.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Entitled company</td>
<td>All users or configuration items (CI) at all locations of this company, in all departments are entitled to use this software package. Compliance at this level calculates how many licenses are purchased for the company at large and how many entitled users or CIs consume them.</td>
</tr>
<tr>
<td>Entitled location</td>
<td>CIs and users who are assigned to this company location in any department are entitled to use this software package. Compliance at this level calculates how many licenses are purchased for this company location and how many users and CIs consume them.</td>
</tr>
<tr>
<td>Entitled department</td>
<td>Only the users or CIs in this department at this company location are entitled to use this software package. Compliance is calculated for a single department only.</td>
</tr>
</tbody>
</table>

The license form can display information about all CIs or named users who are using this software package. The form indicates when license reconciliation is necessary and displays all compliant users or CIs.

Possible compliance levels are:
### Compliance

<table>
<thead>
<tr>
<th>Level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Non applicable</td>
<td>Compliance levels for all infrastructure licenses that are related to cluster licenses are set to Non applicable automatically. Compliance levels are calculated in the cluster license only, and not in the related infrastructure licenses.</td>
</tr>
<tr>
<td>Out of compliance</td>
<td>More licenses are being consumed than were purchased. There are more users or CIs using this license than the license allows, and some users or CIs are not be entitled to use this software package.</td>
</tr>
<tr>
<td>Unused</td>
<td>The licenses for this software package are currently unused.</td>
</tr>
<tr>
<td>Reconciliation required</td>
<td>CIs or users who are not entitled to use this software are consuming licenses. Licenses that require reconciliation are considered out of compliance. Reconciliation requires action to ensure that unentitled users are not using the software. Reconciliation involves uninstalling software or increasing license counts to match actual user counts.</td>
</tr>
<tr>
<td>Nearly out of compliance</td>
<td>For a software package to be at this compliance level, more than 95% of the licenses are in use by entitled users or CIs. License bases at this level are considered to be In compliance.</td>
</tr>
<tr>
<td>In compliance</td>
<td>This software package has unused licenses. All users or CIs using a license are entitled to use this software package.</td>
</tr>
</tbody>
</table>

### Copy a filter

New filters can be created from an existing filter.

1. Open the filter record you want to copy.
2. Make sure to change the filter name or description to distinguish the new filter from the original.
3. Make any other necessary changes.
4. Right-click in the header bar and select either Insert or Insert and Stay from the context menu.
Desired State Filter Clone

The system increments the record number and sets the version to 1 for the new record. Both the original filter and the copy are Active and appear in the record list. Showing all copies of a filter allows you to see the entire history of the filter.
Additional Roles

In the base ServiceNow system, users with the certification_admin role have limited system rights and do not have access to the tables required for creating a filter.

When assigning compliance resources, make sure certification_admin users have any additional roles they need. For example, a user requires roles that grant access to the Company [core_company] table.

Filter versions

Versions can be displayed in a list.

The default list of filters displays only the active version of each filter. To see all filter versions in the list view, select All in the breadcrumbs.

Create a filter

You can create as many versions of a filter as necessary. You can designate which versions are active and available for selection in Compliance template records, Governance Risk and Compliance control test definitions, or Data Certification schedule definitions.

1. Navigate to Configuration > CI Class Manager, and:
   a) Click Hierarchy to display the CI Classes list. Select the class to create a filter for.
   b) In the class navigation bar, expand Health and select Compliance. Then click Certification Filter.

2. Or, navigate to one of these modules:
   - Compliance > Filters
   - IT GRC > Administration > Filters
   - Data Certification > Schedules > Certification Filters

3. Select an existing filter to edit, or click New if needed.
4. Fill in the fields (see table).
5. Click Submit.
   This action saves the filter as version 1.
6. To create another version of this filter, open the record and modify the name, table, or conditions.

**Note:** You can change a filter Description without incrementing a version.

7. Click **Update**.

The system saves a new version of the current filter and makes it the Active version. The previous version is marked inactive. The system displays only active filter versions for selection when you create templates or schedules.

### Creating Filters

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>(Read-only) Displays the automatically assigned filter identification number. All versions of a filter have the same number.</td>
</tr>
<tr>
<td>Name</td>
<td>(Required) Filter name.</td>
</tr>
<tr>
<td>Description</td>
<td>(Optional) Describes this filter. You can change the description of a filter without incrementing a version.</td>
</tr>
<tr>
<td>Table</td>
<td>Specifies the table containing the records to select. The template or schedule that uses this filter works on this table. For example, select the ESXi Server [cmdb_ci_esx_server] table to select VMware ESX servers.</td>
</tr>
<tr>
<td>Active</td>
<td>Makes this filter available for use from the Filter field on the Certification Template or Schedule Definition form. Multiple versions of a filter can be active. You can activate or deactivate a filter without incrementing the version.</td>
</tr>
<tr>
<td>Version</td>
<td>(Read-only) Indicates the version of this filter. Any changes to this filter, except to the description or the Active check box, makes it inactive. The system increments the version of the updated filter and marks it as active. The system saves all versions of the filter and makes them available for reactivation.</td>
</tr>
<tr>
<td>Filter condition</td>
<td>Specifies the fields, operators, and values that create the filter. The available fields are based on the table selected. The condition builder shows the number of records that match the conditions. Click the refresh icon to recalculate the number of matching records when you edit the conditions.</td>
</tr>
</tbody>
</table>
Delete a filter

Only users with the certification_admin or admin role can delete filter versions. But, you cannot delete a filter that is being used in a template or a scripted audit.

You cannot delete a filter that is being used in a template or a scripted audit.

1. To delete a single filter version, open that version record and click **Delete**.

   The system hides the **Delete** button for filters that are in use. If you delete the latest version of a filter that is active, the previous version of that filter is reset to Active.

2. To delete all unused and inactive versions of a filter, open any version of that filter and click **Delete inactive versions** under **Related Links**.

3. When prompted, click **OK** to proceed.

   The system deletes unused filter versions. A message in the header bar identifies filter versions that cannot be deleted because they are used in a template or scripted audit.
Manage a filter version in a form

You can view and manage all versions of a filter from the Certification Filter form.

1. Open any version of a filter.
   The Other Versions related list displays all other versions of this filter, both active and inactive. The system prevents you from editing either the filter version or the record number in the list view.

2. Click any version in the related list to display the record for that version.

3. To make an inactive filter the current version, open the filter, edit it if desired, and then click Revert.
   This action:
   - Deactivates the previous active version of the filter.
   - Copies the inactive filter.
   - Makes this new copy current and active.
Certification follow-on tasks

The ServiceNow system can automatically generate and assign follow-on tasks to correct discrepancies detected during compliance audits.

The system attribute `glide.allow.new.cert_follow_on_task` is set to true by default, allowing for new follow-on tasks to be created for the same failure, at each audit run. You can set this property to false, to configure audit to use the same follow-on task for the same audit failure across multiple runs.

You configure and assign follow-on tasks to qualified users or groups in the audit record. A user with the certification_admin role can reassign any follow-on task. The Audit Results related list in the Follow On Task form contains links to the records that failed.

Access follow-on tasks

Users with the certification role can only access follow-on tasks assigned to them but can reassign these tasks to other users.

1. Navigate to Compliance > My Follow On Tasks.
   The list contains all active follow-on tasks assigned to the logged in user.
2. Open a task.

The record shows the specifics of the task, the task activity, and the failed audit results.
Follow-on Task

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
3. Open records from the **Audit Results** related list to see each discrepancy.

![Audit Result Detail](image)

**Audit Result Detail**

4. Go to the CI named in the record and perform the work to bring it into compliance.
5. Update the **State** field in the follow-on task record and add work notes as you correct each discrepancy.

When you change the state, the system updates the task activity appropriately.

![Follow-on Task Activity](image)

**Follow-on Task Activity**

When the task is **Closed Complete** it no longer appears on the **My Work** list.
Manage follow-on tasks

Users with the certification_admin or admin role can see all follow-on tasks.

Tasks are pre-assigned to a user or group as specified in the audit record, but users with the certification_admin role can reassign the task.

1. Navigate to the appropriate application:
   - Compliance > Architecture Compliance > Follow On Tasks
   - Compliance > Desired State > Follow On Tasks
   - Compliance > Scripted Audits > Follow On Tasks

The list of follow-on tasks appears, filtered by audit type.

2. Open a task.
   - The Audit and Configuration item fields are read-only for all users.

3. Edit the Assignment group or the Assigned to field if necessary.

4. Edit the Short description field if necessary.
   - The short description is inherited from the Task description field in the Audit form.
5. Use the links in the Audit Results related list to open the individual records that failed the audit.
6. If you update the follow-on task record, be sure to add work notes.

Certification templates

Certification templates can define attributes, relationships, and reference field values that indicate what a record is expected to contain.

These values are used to perform audits on ServiceNow records. The certification filter selected in the template identifies the table and records to audit, and the template conditions set the expected state for those records. The type of audit you create determines which tables and template conditions are available.

Users with the certification_admin role can create, update, and delete templates. Users with the certification role can view template versions.
Certification template audit types

When you create a template, ServiceNow assigns an Audit type that determines which tables and conditions are available in the certification template. This value is based on the application from which the template is created. Each application lists only the templates with the associated type.

Available Condition Builders

The available condition builders for each audit type:

- **Compliance**: Runs audits on any set of ServiceNow records, not only configuration items (CI). This audit type provides the following types of conditions for any ServiceNow table:
  - Attribute: Sets conditions for the attributes of the records.
  - Related List: Runs audits on records in tables that reference the table defined in the template.

- **Architecture Compliance**: Defines the following types of conditions for tables that extend the Configuration Item [cmdb_ci] table.
  - Attribute: Sets conditions for physical attributes of CIs, such as memory or disk size.
  - Related List: Runs audits on records in tables that reference the table defined in the template.

- **Desired State**: Defines the following types of conditions for tables that extend the Configuration Item [cmdb_ci] table.
  - Attribute: Sets conditions for physical attributes of CIs, such as memory or disk size.
  - CI relationship: Defines the relationships these CIs have with other CIs. An example of a relationship is a business service, such as Outlook Web Access, that depends on a server.
  - User relationship: Defines the user who reviewed the log records. The only operator available with this condition builder.
  - Group relationship: Defines user groups who backed up this CI. The only operator available with this condition builder.
  - Related List: Runs audits on records in tables that point toward the table defined in the template.

Create or edit a certification template

To create a certification template, follow these instructions.

Activate the Certification Core plugin to enable the Compliance functionality. See [Compliance Activation](#) for details.

1. Ensure that you have an appropriate filter that defines the records the template evaluates. The template applies its conditions to these records.
2. Use the CI Class Manager to navigate to the Certification Template form:
   a) Navigate to **Configuration > CI Class Manager**.
   b) Click **Hierarchy** to display the CI Classes list. Select the class for which to create a certification template.
   c) In the class navigation bar, expand **Health** and then click **Compliance**. Click **Certification Template**.
3. Or, navigate using one of these paths:
   - Compliance > Architecture Compliance > Templates
   - Compliance > Desired State > Templates
   - Compliance > Templates
   - IT GRC > Audit Definitions > Templates

4. Click New or select a certification template to edit.
   The following fields are completed automatically:
   - **Number**: Each new template has a unique number. All versions of the same template use the same number.
   - **Active**: All new templates are set to Active.
   - **Version**: The version of a new template is set to 1.
   - **Audit type**: The system sets the default type to Architecture Compliance, Desired State, or Compliance, depending on the application in which the template was created. You can select a different type when you create the template, but the field becomes read-only when you submit the record. The system uses audit types to filter record lists for appropriate data and determine which conditions are visible on the template form.

5. Complete the following mandatory fields:
   - **Name**: Enter a descriptive name for this template. The name helps identify the purpose.
   - **Filter**: Select the filter that identifies the records to be certified. You can select either active or inactive filter versions. By default, the system presents only active versions for selection. If you start typing the name of a filter, the auto-complete feature displays all versions for selection. For architecture compliance and desired state templates, only filters that use a table extended from Configuration Item (cmdb_ci) appear on the choice list. All filters appear on the choice list for a compliance template. After you select a filter, the template condition builder appears. The template operates on the table specified in the filter.

![Filter Field](image)

6. Enter a **Description** for this template
7. Define certification conditions using the condition builders. All conditions are AND conditions.
   The audit type of the template determines which conditions are available.
   - **Certification Attribute Conditions**: (All audit types) Select configuration item attributes or specifications to certify, such as CPU count, memory, or disk space. Available fields in the attribute condition builder depend on the table from the filter. Typical ServiceNow conditions for attributes are available, including the between operator for setting numerical conditions with high and low boundary values. This operator was added specifically for desired state conditions.

   The **Show Related Fields** item supports dot-walking, allowing you to include referenced fields in a certification attribute condition. Click **Show Related Fields** or **Remove Related**
**Fields** to add or remove referenced fields (in the form of `<field> => <field>`). Select a referenced field to drill down to the next level of referenced fields.

See [Selecting fields on related tables using dot-walking](#).

- **Certification CI Relationship Conditions**: (Desired State audit types) Define the CI relationships to certify, such as Runs on or Depends on.
- **Certification User Relationship Conditions**: (Desired State audit types) Select the desired user relationship for this configuration item. The relationship provided in the base system is Log reviewed by.
- **Certification Group Relationship Conditions**: (Desired State audit types) Select the desired group relationship for this configuration item. The relationship provided in the base system is Backed up by.
- **Certification Related List Conditions**: (All audit types) Select field values from tables that reference the template table, or user-defined related lists which are created via custom relationships in the sys_relationship table. To create a condition that evaluates all servers in the Server (cmdb_ci_server) table for the presence of Microsoft Word 2007, as referenced in the Software Installation (cmdb_sam_sw_install) table. The resulting condition is (Software Installation->Installed on) (Display name) (is) (Microsoft Word 2007).

Check **All** to include all records in the condition requirements of the related list. If there are no records in the related list, then:

- If **All** is checked, the condition requirement is met.
- If **All** is unchecked, the requirement is not met.
Note: By default, the condition builders for relationships display only suggested relationships. To see all possible relationships, select the **Show all relationships** check box on the right side of the form.

**Clear Check**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Certification C Relationship Conditions</th>
<th>Certification Use</th>
<th>Certification Group</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Certification C</td>
<td>Certification Use</td>
<td>Certification Group</td>
</tr>
<tr>
<td>2</td>
<td>Certification C</td>
<td>Certification Use</td>
<td>Certification Group</td>
</tr>
<tr>
<td>3</td>
<td>Certification C</td>
<td>Certification Use</td>
<td>Certification Group</td>
</tr>
</tbody>
</table>

- **Box**
  - (a) Click **Insert a new row** to insert a condition. You cannot insert an empty condition.
  - (b) Click the green check mark icon to save a condition. Make sure to save the condition before performing any other operation. Updating the form does not save the condition.
  - (c) To delete a condition, click the red X beside the condition. The system marks the condition as inactive. The system marks the condition as inactive.
d) To reactivate a condition, click the gray X. If another condition for the same field exists, the system prevents reactivation and warns you of the conflict.

8. Click Submit.
   ServiceNow saves the template as version 1.

9. To create another version of this template, change the name, edit the conditions, or select a different filter. Updating the template Description does not create a new version.

   Note: If you select a filter whose table is incompatible with the existing template conditions, the system displays a warning that the conditions cannot be applied.

10. Click Update.
    The system saves a new version of the current template and makes it the Active version. The previous version is marked inactive.

**Certification Template Record List**

The default Templates list displays only the active version of each template, but users can update the breadcrumbs to display all template versions.

**Default Templates List**

The default Templates list displays only the active version of each template, filtered by Audit type.
Default Template

All Template Versions

To view all template versions for an audit type, click the arrow before Active=true to remove that condition from the breadcrumbs.
All Template Versions

Manage Certification template versions

You can view and manage all versions of a template from the Template form.

1. Open any version of a template.
   The Other Versions related list displays all other versions of this template, both active and inactive.

2. Click any version in the related list to display the record for that version.

3. Update the template to create a new version. The system increments a version of the template when you edit any field except Description and Active. You can manage the template versions without returning to the list view.

- Select an inactive version as the current version

**Related Links**

- Delete inactive versions
This action does:
- Deactivates the previously active version of the template.
- Copies the inactive template.
- Makes the new copy the current, active version.

5. Select the Audits related list to view all audits configured to use this template.

![Template Audits Related List](https://example.com/image.png)

6. Click New to create a new audit record with the template selection and table pre-populated.

**Clone a Certification template**

New templates can be cloned from an existing template.

1. Open the template record to be copied.
2. Make any necessary changes.
3. Change the template name or description to distinguish it from the original.
4. Click Clone.

ServiceNow increments the record number above the highest template number and sets the version of the new record to 1. A message appears under the header bar naming the source record for the clone.
Desired State Template Clone

Both templates are Active and appear in the record list. The record list allows you to see the entire history of the template.
Delete a Certification template

Certification templates can be deleted.

Only users with the certification_admin or admin role can delete template versions. You cannot delete a template version that is being used for an audit.

1. To delete a single template version, open that version record and click **Delete**.
   
   The system hides the **Delete** button for templates that are in use. If you delete the latest, active version of a template, the previous version of that template is reset to Active.

2. To delete all unused and inactive versions of a template, open any version of that template and click **Delete inactive versions** under **Related Links**. This control appears on all versions, whether they are used in an audit.
### Related Links

**Controls and tests management**

After you identify the risks, define controls with accompanying control tests to prevent issues from occurring.

This diagram illustrates the entire IT GRC control process.
Define a control

Define a control before you define a control test.

1. Navigate to **IT GRC > Controls > All**.
2. Click **New**.
3. Fill in the form, as appropriate (see table).
4. Click **Submit**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control ID</td>
<td>A unique identifier generated dynamically by the system.</td>
</tr>
<tr>
<td>Name</td>
<td>A name for the control.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Number of a record from any table in the system. This value defines the scope of the control.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Classification</td>
<td>The type of control.</td>
</tr>
<tr>
<td>Purpose</td>
<td>The approach that the control takes.</td>
</tr>
<tr>
<td>Control frequency</td>
<td>The basis for determining when the control is implemented.</td>
</tr>
<tr>
<td>State</td>
<td>A workflow field that determines where in the authoring process the control is.</td>
</tr>
<tr>
<td>Key control</td>
<td>Indicator that the control is considered key to preventing material risk, when selected.</td>
</tr>
<tr>
<td>Owning group</td>
<td>A reference to the group with ownership over the control.</td>
</tr>
<tr>
<td>Owner</td>
<td>A reference to the user with ownership over the control.</td>
</tr>
<tr>
<td>Owner delegate</td>
<td>A reference to the user who has ownership over the control when the specified owner is unavailable.</td>
</tr>
<tr>
<td>Description</td>
<td>A long-form description of the control.</td>
</tr>
</tbody>
</table>

### Define a control test

After you define a control, create control tests that run periodically and provide documented evidence of whether the associated control is operating correctly.

1. Navigate to IT GRC > Administration > Control Test Definitions.
2. Click New.
3. Fill in the form, as appropriate (see table).
4. Click Submit.
### IT GRC Control Test Def

<td>The result that occurs after these tests.</td>
</tr>
<tr>
<td>Include supporting data</td>
<td>Indicator whether sample data is taken from a particular table within the instance when the control test instance is generated.</td>
</tr>
</tbody>
</table>
| Data purpose                  | The purpose of the data being sampled if Include supporting data is selected. This selection influences how the control test is performed. Choices are:  
  * None  
  * Support test execution: Returns a random sampling of records.  
  * Identifies non compliance: Returns all the records that do not match the condition or conditions specified.  
  * Identifies compliance: Returns all the records that do match the condition or conditions specified. |
| Table                         | The table from which to sample when Include supporting data is selected. This field is read-only when Template is the Condition type. When you select a template to define test conditions, the certification filter used in the template sets the table and cannot be changed. |
| Fields                        | The list of fields to pull values from when determining whether records match the conditions when Include supporting data is selected. |
| Condition type                | The type of conditions applied to the table and fields. Choices are:  
  * Basic: Applies conditions to the table in question.  
  * Advanced: Uses condition collections to apply conditions to the table and to related tables.  
  * Template: Uses certification templates to apply conditions to the specified table. Select the template to use from the Template field. |
<p>| Sample size                   | An integer number of rows for a random sample if Include supporting data is selected. A sample size of zero returns all matching records. This field is available only if Condition type is set to Basic and Data purpose is set to Support test execution. |
| Control test conditions       | A condition builder that limits the sample data when Include supporting data is selected. This field is available only if Condition type is set to Basic. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>In scope definition</td>
<td>A reference to a condition collection if Include supporting data is selected and Condition type is set to Advanced.</td>
</tr>
<tr>
<td>Configuration to retrieve</td>
<td>Method for using the Configuration reference field if Include supporting data is selected and Condition type is set to Advanced or Template.</td>
</tr>
</tbody>
</table>
|                             | • None: Returns all records in scope.  
|                             | • Matching: Returns all matching records in scope.  
|                             | • Non-matching: Returns all non-matching records in scope.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|                             | For more information, see Defining Advanced Conditions.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Template                    | (Required) Certification template that defines conditions for this test definition. Only templates with an audit type of Compliance are available for selection. This field is available and mandatory when the value in the Condition type field is Template.                                                                                                                                                                                                                   |
| Configuration               | Condition collection to use. This field is available only if Include supporting data is selected, Condition type is set to Advanced, and Configuration to retrieve is set to anything except None.                                                                                                                                                                                                                                         |

**Advanced conditions**

Set the Condition type to Advanced on control tests to define more flexible conditions using condition collections.

Condition collections have one primary condition, which is applied to the selected table, and one or more supplemental conditions.

When a control test is performed, advanced conditions evaluate in this order:

1. The system processes the condition collection in the In scope definition reference in this order:  
   a. The primary condition is processed on the fields specified in Table and Fields on the control test definition, returning an array of elements.  
   b. For each element in the array returned by the primary condition, supplemental conditions are processed, filtering the array of elements further.  
   c. The In Scope field is updated with the number of elements in the array.

2. The condition collection in the Configuration reference is processed on the array of elements returned from the In scope definition. The choices for Configuration to retrieve are:  
   • None: These conditions are skipped. Supporting Data is all the elements that are in scope.  
   • Matching: The control test checks the array of elements, returning any elements that match the Configuration.  
   • Non-matching: The control test checks the array of elements, returning any elements where at least one condition did not match the Configuration.
3. The final array of elements is recorded as Supporting Data records.

Both the In Scope and Configuration fields refer to the Condition Collection [grc_condition_collection] table.

To define condition collections:
1. Navigate to IT GRC > Administration > Condition Collections.
2. Click New.
3. Populate these fields:
   - Name: Name of the condition collection.
   - Description: Description of the condition collection.
   - Type: Which Control Test Definition field references the condition collection. Choices are:
     - In Scope Definition
     - Configuration Definition

4. After the condition collection is defined, use the Add Condition related link to add these conditions:
   - Condition: Predefined condition definition from the Condition [grc_condition] table.
   - Condition type: The condition collection Type determines the choices:
     - In Scope Definition
       - Primary
       - Supplemental
     - Configuration Definition
       - Not Applicable

To define new condition records:
1. Navigate to IT GRC > Administration > Conditions.
2. Click New.
3. Populate these fields:
   - Name: Name of the condition collection.
   - Description: Description of the condition collection.
   - Table: Table on which the condition applies.
   - Reference Field: For supplemental conditions, the reference field for the table on which the primary condition is running.
   - Condition: Condition builder for defining the condition.

Control test processing

When performing a control test, processing dependencies are evaluated.

- If a control test definition is active, the system generates the control test instances dynamically, according to definition. To generate a control test manually:
  1. Navigate to IT GRC > Administration > Control Test Definitions.
2. Open a control test definition record.
3. Click Execute Now.
   ServiceNow generates a control test instance, marks it Pending, and assigns it to the group or individual responsible for the test according to the control test definition.

- If sample data was requested in the definition, any sample data that matches the conditions is found in the Supporting Data section. The Test Complete Data Values related list holds references to the records returned by the sample data query.
- If a control test has a condition type of Basic, the value in the Sample size field limits the number of failures that are stored as support data. If the result is passed or compliant, all the matching data is stored.
- If a control test has advanced conditions, the system evaluates them as follows:
  1. The condition collection in the In scope definition reference is processed.
     a. The primary condition is processed on the fields specified in Table and Fields on the control test definition and returns an array of elements.
     b. For each element in the array returned by the primary condition, supplemental conditions are processed, filtering the array of elements further.
     c. The In Scope field is updated with the number of elements in the array.
  2. The condition collection in the Configuration reference is processed on the array of elements returned from the In scope definition. The choices for Configuration to retrieve are:
     - None: These conditions are skipped. Supporting Data includes all the elements that were in scope.
     - Matching: The control test checks the array of elements, returning any elements that match the Configuration.
     - Non-matching: The control test checks the array of elements, returning any elements where at least one condition did not match the Configuration.
  3. The final array of elements is recorded as Supporting Data records.

Remediation Tasks

If the control test reveals problems in the process, create a task from the Remediation Task related list. You can relate remediation tasks to any task in the system with the related items tool from the Many to Many Task Relations plugin.

Scripted audits

A scripted audit enables users with the certification_admin role to conduct an audit from a script rather than using restrictive template conditions.

A scripted audit uses a certification filter to select the records to audit, and then creates standard follow-on tasks for remediation of any discrepancies. Use this type of audit to query for any values or states that a script can define. A scripted audit is a specific audit type that is activated together with the Desired State plugin. ServiceNow provides a sample audit script with configuration instructions.
Create a scripted audit

A scripted audit is an audit whose conditions are defined by a script.

1. Navigate to **Compliance > Scripted Audits > Audits**.
   
   An audit type of Scripted filters the list.

2. Click **New**.

3. Complete the form (see table).

4. Create the audit script.

   The Run this script field includes a sample script with instructions for performing the audit and generating the follow-on tasks. This field appears only when you access audits from the Scripted Audits module.

5. Click **Submit**.

Sample script:

```javascript
/*
 // This script works with Data Center Zones filter //

 var desiredFloorSpaceUsage = 30; // Value to audit against
 var assignToUser = '46d44a23a9fe19810012d100cca80666'; // Beth Anglin
 var assignToGroup = '8a5055c9c61122780043563ef53438e3'; // Hardware group
 var taskMsg = 'See the audit results below for the discrepancies that must be addressed';

 // API call to retrieve records based on the filter
 var gr = new SNC.CertificationProcessing().getFilterRecords(current.filter);

 // Loop over all records defined by the filter
 while(gr.next()) {
   var sysId = gr.getValue('sys_id'); // Sys ID of audited record
   var floorSpaceInUse = gr.getValue('floor_space_in_use'); // Value to audit

   // Determine if certification condition passes or fails
   if (floorSpaceInUse < desiredFloorSpaceUsage) {
     var columnNameSpace = gr.floor_space_in_use.getLabel(); // String value of column audited against

     // Call create Follow on Task API and save the returned sys_id for use in logging audit result fail
     // Params:
     // auditId - Sys id of the audit record executed
     // ciId Sys - id of the configuration item. Empty string if not a cmdb ci
     // assignedTo - Sys id of user to assign task to. Can be empty
     // assignmentGroup - Sys id of group to assign task to. Can be empty
     // shortDescr - Short description for the Follow On Task. Can be empty
     // Return value: Sys id of the created follow on task
     var followOnTask = new SNC.CertificationProcessing().createFollowOnTask(current.sys_id, sysId, assignToUser, '', taskMsg);

     // Call log failed result API
     // Params:
     // auditId - Sys id of audit record executed
     // auditedRecordId - Sys id of the record audited
```
new SNC.CertificationProcessing().logAuditResultFail(current.sys_id, sysId, followOnTask, columnNameSpace, 'greater than', desiredFloorSpaceUsage, floorSpaceInUse, true); }
} else { // If certification condition pass, write a Audit Result Pass via API
  // Params:
  // auditId - Sys id of audit record executed
  // auditedRecordId - Sys id of the record audited
  // isCI - True, if audited record is a CI. False, otherwise. Can be empty.
  // domainToUse - Sys domain of the "cert_audit" record. Can be empty.
  new SNC.CertificationProcessing().logAuditResultPass(current.sys_id, sysId, true);
}
*/
Scripted audit

New scripted audit table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for this audit.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Filter</td>
<td>Filter to use when the audit type is Scripted. This field is required for scripted audits, but is hidden for all other audit types.</td>
</tr>
<tr>
<td>Template</td>
<td>(Required) Template to use when this audit runs. Audit type filters the list of available templates and only the active versions of a template are available for selection. This field is hidden when the audit type is Scripted.</td>
</tr>
<tr>
<td>Table</td>
<td>(Read-only) Displays the table for the template.</td>
</tr>
<tr>
<td>Create tasks</td>
<td>Creates follow-on tasks for correcting discrepancies when selected. In a scripted audit, you can create the logic for either task state by using true to create a task or false if no task is created. By default, this check box is cleared (false) in a new audit record.</td>
</tr>
</tbody>
</table>
## Assignment type

A choice list to select how the audit assigns the follow-on tasks. This field is visible only when the Create task check box is selected. Choices are:

<table>
<thead>
<tr>
<th>Choice</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Field</td>
<td>Select a user reference field on the table being audited. As an example, select the user named in the Managed by field on the failed record to perform the tasks. This selection displays the Assigned to and Assign to empty fields. If the reference field on the record is empty, the value in the Assign to empty field is used.</td>
</tr>
<tr>
<td>Specific User</td>
<td>Select a specific user to perform the tasks. This selection displays the User field.</td>
</tr>
<tr>
<td>Group Field</td>
<td>Select a group reference field on the table being audited. As an example, select the Support group from the failed record to perform the tasks. This selection displays the Assign to group and Assign to empty fields. All members of the group from the reference field on the failed record are assigned to the tasks. If the reference field on the record is empty, the value in the Assign to empty field is used.</td>
</tr>
<tr>
<td>Specific Group</td>
<td>Select a specific group to perform the tasks. This selection displays</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| User         | The specific user this audit assigns to follow-on tasks. This field is available under these conditions:  
  - Assignment type is set to Specific User.  
  - Assign to empty is set to Create Assigned Task, and Assignment type is set to User Field.  
  Note: Ensure that the specified user has the [certification role](#). |
<p>| Assign to group | The group field that defines which group this audit assigns to the follow-on task. This field is available only when the Assignment type is Group Field. |
| Group        | The specific group this audit assign to follow-on tasks. This field is available only when the Assignment type is Specific Group and you have selected Group Field as the assignment type. |
| Assign to    | The user field that defines which user this audit assigns to the follow-on task. This field is available only when the Assignment type is User Field. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assign to empty</td>
<td>The behavior to use if the field selected in Assign to or Assign to group is blank on the record being audited. For example, if a follow-on task must be assigned to a manager, but no manager is identified, the value in this field determines what happens. This field appears only when the Assignment type is User Field or Group Field. The possible selections are:</td>
</tr>
<tr>
<td>Selection</td>
<td>Description</td>
</tr>
<tr>
<td>Do Not Create Task</td>
<td>No follow-on task is created when the Assign to or Assign to group field is empty.</td>
</tr>
<tr>
<td>Create Unassigned Task</td>
<td>Create a follow-on task, but do not assign it to any user or group. The task can be manually assigned later.</td>
</tr>
<tr>
<td>Create Assigned Task</td>
<td>Create a follow-on task and assign it to the user or group specified. If you selected an assignment type of User Field, the User field becomes available. If you selected the Group Field type, the Group field becomes available.</td>
</tr>
</tbody>
</table>

The audit automatically creates follow-on tasks for all records that have Assign to populated, regardless of which selection you make for Assign to empty.

<table>
<thead>
<tr>
<th>Short description</th>
<th>Brief description of the purpose of the audit.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task description</td>
<td>General description of the work required for the follow-on tasks created by this audit. All follow-on tasks created by this audit inherit this description.</td>
</tr>
<tr>
<td>Active</td>
<td>Activates this audit schedule and generates follow-on tasks at the scheduled date and time. Clear this check box to hide scheduling fields on the form (except Last run date) and not generate follow-on tasks.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Run</td>
<td>How often to run the schedule that generates the audit.</td>
</tr>
<tr>
<td></td>
<td>• Daily</td>
</tr>
<tr>
<td></td>
<td>• Weekly</td>
</tr>
<tr>
<td></td>
<td>• Monthly</td>
</tr>
<tr>
<td></td>
<td>• Periodically</td>
</tr>
<tr>
<td></td>
<td>• Once</td>
</tr>
<tr>
<td></td>
<td>• On demand</td>
</tr>
<tr>
<td>Day</td>
<td>• If Run is Weekly, the day of the week when the audit runs.</td>
</tr>
<tr>
<td></td>
<td>• If Run is Monthly, the day of the month when the audit runs. If the day is 29, 30 or 31, for shorter months the audit runs on the last day of the month.</td>
</tr>
<tr>
<td>Repeat Interval</td>
<td>If Run is Periodically, the frequency that the audit runs entered in time, days, or both. For example, set Days to 10 and Hours to 14:00:00 to run the audit every 10 days at 2:00pm.</td>
</tr>
<tr>
<td>Starting</td>
<td>If Run is Periodically or Once, the date and time when the audit runs.</td>
</tr>
<tr>
<td>Time</td>
<td>If Run is Daily, Weekly, Monthly, or Once, the time of day, on a 24-hour clock, when the audit runs.</td>
</tr>
<tr>
<td>Last run date</td>
<td>(Read-only) The last date and time the audit ran, either on its regular schedule or manually. Audit previews do not update this field.</td>
</tr>
<tr>
<td>Next scheduled run</td>
<td>(Read-only) The next date and time on which the audit runs. The system recalculates this field when you change the schedule.</td>
</tr>
<tr>
<td>Audit type</td>
<td>(Read-only) The type assigned to this audit. The system selects the audit type based on the application from which the audit was created and can be:</td>
</tr>
<tr>
<td></td>
<td>• Desired State</td>
</tr>
<tr>
<td></td>
<td>• Architecture Compliance</td>
</tr>
<tr>
<td></td>
<td>• Compliance</td>
</tr>
<tr>
<td></td>
<td>• Scripted</td>
</tr>
<tr>
<td>Run this script</td>
<td>Audit script to run. This field is available only when the audit type is Scripted. The Audit form includes a sample script with instructions for performing the audit and generating the follow-on tasks. See Script Methods for a list of the methods provided and the accepted parameters.</td>
</tr>
</tbody>
</table>
Script methods

ServiceNow provides four methods for creating the audit script.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>getFilterRecords</td>
<td>public GlideRecord</td>
<td>filterID: The sys_id of the filter to use.</td>
</tr>
<tr>
<td></td>
<td>getFilterRecords(String filterId)</td>
<td></td>
</tr>
<tr>
<td>logAuditResultPass</td>
<td>public void logAuditResultPass(String auditId,</td>
<td>auditId: Sys_id of audit record executed</td>
</tr>
<tr>
<td></td>
<td>String auditedRecordId, boolean isCI, String</td>
<td>auditedRecordId: Sys_id of the record audited.</td>
</tr>
<tr>
<td></td>
<td>domainToUse)</td>
<td>isCI: True, if the audited record is a CI, false if otherwise.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>domainToUse: Sys_domain of the cert_audit record.</td>
</tr>
<tr>
<td>logAuditResultFail</td>
<td>public void logAuditResultFail(String auditId,</td>
<td>auditId: Sys_id of audit record executed</td>
</tr>
<tr>
<td></td>
<td>String auditedRecordId, String followOnTask,</td>
<td>auditedRecordId: Sys_id of the record audited.</td>
</tr>
<tr>
<td></td>
<td>String columnDisplayName, String operatorLabel,</td>
<td>followOnTask: Sys_id of the follow-on task associated with the audited</td>
</tr>
<tr>
<td></td>
<td>String desiredValue, String discrepancyValue,</td>
<td>record and can be an empty string.</td>
</tr>
<tr>
<td></td>
<td>boolean isCI, String domainToUse)</td>
<td>columnDisplayName: Label of the column audited. For example, Disk space</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(GB).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>operatorLabel: Label of the operator used to audit the column. For example,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>is not empty or greater than can be the label.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>desiredValue: Desired value of the column.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>discrepancyValue: Discrepancy value.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>isCI: True, if the audited record is a CI, false if otherwise.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>domainToUse: Sys_domain of the cert_audit record.</td>
</tr>
</tbody>
</table>
## Data Certification

Data Certification manages scheduled and on-demand validations of the configuration management database (CMDB) data.

Information is added to the CMDB by Discovery, by importing from third-party tools, or manually. For regulatory or procedural reasons, information in the CMDB requires checks for accuracy and certification. The person or team responsible for certification can define what information requires verification and a verification schedule. The schedule then generates a checklist for verifying the data. Individuals assigned to certification tasks answer a series of questions to verify the data.

Data certification can be performed against specific fields on specific tables. Based on the certification schedule, certification tasks are automatically created and assigned. For example, you can set up a certification to validate key information fields, such as Operating System and CPU count, on all Windows servers located in Chicago. You can then assign the tasks to the appropriate team member automatically.

Domain separated systems can use the Data Certification application.

### Activate Data Certification

Activate the Data Certification plugin to access the application. Activating this plugin also activates the Version Management plugin, which manages certification filter versions.

Role required: admin

For evaluation, you can activate the plugin for an application that requires a purchased subscription on a non-production instance. To activate the plugin on production instances, you must purchase the subscription. To purchase a subscription, contact your ServiceNow account manager. For details on purchasing a plugin, see Purchase a plugin.

Some plugins require activation by ServiceNow personnel. Request these plugins through the HI Customer Service System instead of activating them yourself. For details, see Request a plugin.

For plugins that you can activate yourself, continue with the following steps.

1. Navigate to System Definition > Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the **Activate/Upgrade** related link.

If the plugin depends on other plugins, these plugins are listed along with their activation status.

If the plugin has optional features that depend on other plugins, those plugins are listed under **Some files will not be loaded because these plugins are inactive**. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).

4. Optional: If available, select the **Load demo data** check box.

Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.

You can also load demo data after the plugin is activated by clicking the **Load Demo Data Only** related link on the System Plugin form.

5. Click **Activate**.

### Installed With Data Certification

Activating the Data Certification plugin installs the following components.

Demo data is available with Data Certification. The demo data provides information including filters, schedules, instances, and tasks.

### Tables

Data Certification adds the following tables:

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Certification Audit Definition (cert_audit_definition)</td>
<td>Stores collections of certification schedules that can be run as a single entity.</td>
</tr>
<tr>
<td>Certification Audit Definition Elements (m2m_cert_audit_def_cert_sched)</td>
<td>Lists the certification schedules in each certification audit definition.</td>
</tr>
<tr>
<td>Certification Audit Instance (cert_audit_instance)</td>
<td>Stores the certification instances associated with a specific audit definition.</td>
</tr>
<tr>
<td>Certification Element (cert_element)</td>
<td>Stores the data elements that are grouped into certification tasks.</td>
</tr>
<tr>
<td>Certification Filter (cert_filter)</td>
<td>Stores the data that requires certification using a filtering condition for the certification.</td>
</tr>
<tr>
<td>Certification Instance (cert_instance)</td>
<td>Stores a collection of certification tasks representing a single instance of a scheduled certification. This table extends the Audit (cert_audit) table.</td>
</tr>
<tr>
<td>Certification Schedule (cert_schedule)</td>
<td>Stores certification for a specific set of information on a specific table, what user or group the tasks are assigned to, and how often this certification is done.</td>
</tr>
<tr>
<td>Certification Task (cert_task)</td>
<td>Stores individual certification tasks. Certification Task extends the Task table.</td>
</tr>
</tbody>
</table>
Script Includes

Data Certification adds the following script includes:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CertificationAjax</td>
<td>Provides utilities that enable individual certification elements to be certified, rejected, or reverted.</td>
</tr>
<tr>
<td>CertificationTaskCreate</td>
<td>Custom code that extends the standard code for certification tasks.</td>
</tr>
<tr>
<td>CertTaskEscalationTimerPercentage</td>
<td>Updates time and percentage complete information for a certification.</td>
</tr>
<tr>
<td>CertificationUtilities</td>
<td>Provides utility functions for certification.</td>
</tr>
</tbody>
</table>

Client Scripts

Data Certification adds the following client scripts:

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alert If Boxes Checked</td>
<td>Certification Task (cert_task)</td>
<td>Provides a warning if the certifier attempts to leave a record without certifying the checked elements</td>
</tr>
<tr>
<td>Check Table Name</td>
<td>Certification Schedule (cert_schedule)</td>
<td>Updates the table name when a different filter is selected.</td>
</tr>
</tbody>
</table>

UI Policies

Data Certification adds the following UI policies:

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hide next scheduled run</td>
<td>Certification Schedule (cert_schedule)</td>
<td>Hides the Next Scheduled Run field when the schedule is set to run once or on demand only.</td>
</tr>
<tr>
<td>• Hide &quot;run&quot; associated fields when active is set to false</td>
<td>Certification Schedule (cert_schedule)</td>
<td>Hides the Run field when Active is set to False.</td>
</tr>
<tr>
<td>• Hide Run When Not Active</td>
<td>Certification Schedule (cert_schedule)</td>
<td></td>
</tr>
<tr>
<td>Make table name read only</td>
<td>Certification Schedule (cert_schedule)</td>
<td>Makes the Table field read-only.</td>
</tr>
<tr>
<td>Hide Table field</td>
<td>Certification Element (cert_element)</td>
<td>Hides the Table field on the certification task form.</td>
</tr>
<tr>
<td>Make percent complete field read only</td>
<td>Certification Instance (cert_instance)</td>
<td>Makes the Percent complete field read only when the State is Work in Progress, Closed Complete, Closed Incomplete, or Cancelled.</td>
</tr>
</tbody>
</table>
### Now Platform Capabilities

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show Assign to fields</td>
<td>Certification Schedule</td>
<td>Shows the Assign To field when the assignment type is User and hides the</td>
</tr>
<tr>

### Business Rules

Data Certification adds the following business rules:

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adjust dates for cert tasks</td>
<td>Certification Instance (cert_instance)</td>
<td>Adjusts dates for tasks belonging to the certification instance when the</td>
</tr>
<tr>
<td></td>
<td></td>
<td>dates are changed for an active certification.</td>
</tr>
<tr>
<td>Cancel Instance</td>
<td>Certification Instance (cert_instance)</td>
<td>Cancels all open certification tasks when an active certification is</td>
</tr>
<tr>
<td></td>
<td></td>
<td>canceled.</td>
</tr>
<tr>
<td>certification audit instance</td>
<td>Certification Audit Instance</td>
<td>Sends an inserted event when an active certification audit instance is</td>
</tr>
<tr>
<td>events</td>
<td>(cert_audit_instance)</td>
<td>created. Sends a completed event when an active certification audit</td>
</tr>
<tr>
<td></td>
<td></td>
<td>instance is marked as complete or incomplete.</td>
</tr>
<tr>
<td>certification element events</td>
<td>Certification Element (cert_element)</td>
<td>Sends a failed event when an element of a certification is marked as failed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>certification instance events</td>
<td>Certification Instance (cert_instance)</td>
<td>Sends an inserted event when an instance of a certification is created.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Sends a completed event when an instance of a certification is completed.</td>
</tr>
<tr>
<td>Certification Instance Rollup</td>
<td>Certification Task (cert_task)</td>
<td>Updates the Percent complete field on the certification instance record.</td>
</tr>
<tr>
<td>certification task events</td>
<td>Certification Task (cert_task)</td>
<td>Sends an inserted event when a task is inserted. Sends a completed event</td>
</tr>
<tr>
<td></td>
<td></td>
<td>when a task is deactivated. Sends a canceled event when a task is canceled.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Certification Task Values</td>
<td>Certification Element (cert_element)</td>
<td>Updates the percent complete of the parent task when a certification element is updated.</td>
</tr>
<tr>
<td>Check Certification Audit Progress</td>
<td>Certification Instance (cert_instance)</td>
<td>Updates the completion status of the audit instance as a whole when a certification that is part of an audit is complete.</td>
</tr>
<tr>
<td>Clean Certification Views</td>
<td>Certification Instance (cert_instance)</td>
<td>Cleans all related records when a certification instance is deleted.</td>
</tr>
<tr>
<td>Copy certification schedule fields</td>
<td>Certification Instance (cert_instance)</td>
<td>Copies changes to the certification schedule to the certification instance.</td>
</tr>
<tr>
<td>Merge Certification Tasks</td>
<td>Certification Task (cert_task)</td>
<td>Merges two tasks together when a task is reassigned and there is another task for the same instance with the new user.</td>
</tr>
<tr>
<td>Prevent delete of Filter with Schedule</td>
<td>Certification Filter (cert_filter)</td>
<td>Prevents the deletion of a filter that is used in a schedule.</td>
</tr>
<tr>
<td>Reassign Notification</td>
<td>Certification Task (cert_task)</td>
<td>Sends out a notification to the new and previous assignees when a task is reassigned.</td>
</tr>
<tr>
<td>Rollup State</td>
<td>Certification Task (cert_task)</td>
<td>Updates all necessary parent items when task state is changed.</td>
</tr>
<tr>
<td>Update audit reference</td>
<td>Certification Task (cert_task)</td>
<td>Makes Data Certification records compatible with Desired State records. This rule makes sure that the Audit field is correctly completed when a record is inserted using Insert and Stay.</td>
</tr>
<tr>
<td>Update audit result</td>
<td>Certification Element (cert_element)</td>
<td>Makes Data Certification records compatible with Desired State records for reporting purposes. This rule puts certified values in the Desired value column when an audit is Certified. It also puts actual values in the Discrepancy value column when an audit is Failed.</td>
</tr>
<tr>
<td>Update follow_on_task &amp; audit references</td>
<td>Certification Element (cert_element)</td>
<td>Makes Data Certification records compatible with Desired State records for reporting purposes. This rule makes certification tasks compatible with follow-on tasks and displays all tasks, regardless of origin.</td>
</tr>
<tr>
<td>Update next run time</td>
<td>Certification Schedule (cert_schedule)</td>
<td>Updates the Next scheduled run field when a schedule runs Daily, Weekly, Monthly, or Periodically.</td>
</tr>
<tr>
<td>Name</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Verify Fields</td>
<td>Certification Schedule</td>
<td>Verifies that no field is used in both Display and Certification fields when the fields of a certification schedule are changed.</td>
</tr>
</tbody>
</table>

### Formatter

Data Certification adds the following formatter:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Certification Task Elements</td>
<td>Enables custom user interface formatting of elements on a certification task. For example, displays the green check mark and red exclamation point to use when certifying an element.</td>
</tr>
</tbody>
</table>

### Properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.ui.cert_task_activity.fields</td>
<td>System Properties (sys_properties)</td>
<td>Defines which journal field is the task activity field. Default: work_notes</td>
</tr>
</tbody>
</table>

### User Roles

Data Certification adds the following user roles:

<table>
<thead>
<tr>
<th>Role</th>
<th>Contains Roles</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>certification_admin</td>
<td>certification</td>
<td>Can:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Create and configure certifications</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Override provided answers</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Perform certification tasks for certification task owners</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Send certification task notifications to users and owners at any time</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Cancel or delete certifications in any state</td>
</tr>
<tr>
<td>Role</td>
<td>Contains Roles</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>certification_filter_admin</td>
<td>certification</td>
<td>Can create and manage all data certification filters.</td>
</tr>
<tr>
<td>certification</td>
<td>none</td>
<td>Can update active or incomplete tasks assigned to them or to groups of which they are a member. Can also update configuration items owned by them or by groups of which they are a member. Receives email notifications when assigned certification tasks.</td>
</tr>
</tbody>
</table>

**Events**

Data Certification adds the following events. The ServiceNow system uses these events to send email notifications to task owners and managers about changes in certification records.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cert_audit_instance.completed</td>
<td>A certification audit instance has been completed.</td>
</tr>
<tr>
<td>cert_audit_instance.inserted</td>
<td>A certification audit instance has been inserted.</td>
</tr>
<tr>
<td>cert_element.failed</td>
<td>A certification element has failed certification.</td>
</tr>
<tr>
<td>cert_instance.complete</td>
<td>A certification instance has been completed.</td>
</tr>
<tr>
<td>cert_instance.inserted</td>
<td>A certification instance has been inserted.</td>
</tr>
<tr>
<td>cert_task.cancelled</td>
<td>A certification task has been canceled.</td>
</tr>
<tr>
<td>cert_task.completed</td>
<td>A certification task has been completed.</td>
</tr>
<tr>
<td>cert_task.escalate</td>
<td>A certification task record has been escalated.</td>
</tr>
<tr>
<td>cert_task.inserted</td>
<td>A new certification task has been created.</td>
</tr>
<tr>
<td>cert_task.notifications</td>
<td>A certification task notification has been resent to a user.</td>
</tr>
<tr>
<td>cert_task.overdue</td>
<td>A certification task is past its specified completion date.</td>
</tr>
<tr>
<td>cert_task.reassign</td>
<td>A certification task has been reassigned.</td>
</tr>
<tr>
<td>cert_task.warning</td>
<td>A new task escalation point has been reached.</td>
</tr>
</tbody>
</table>

**Email Templates**

Data Certification adds the following email templates:

<table>
<thead>
<tr>
<th>Name</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>certification.task.cancelled</td>
<td>A certification task assigned to you/your group as part of the data certification and management process has been canceled.</td>
</tr>
<tr>
<td>Name</td>
<td>Message</td>
</tr>
<tr>
<td>--------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>certification.task.reminder.inserted</td>
<td>A certification task that has been assigned to you/your group as part of the data certification and management process requires attention.</td>
</tr>
<tr>
<td>certification.task.reminder.outstanding</td>
<td>A certification task that has been assigned to you/your group as part of the data certification and management process requires attention.</td>
</tr>
<tr>
<td>certification.task.reminder.overdue</td>
<td>A certification task that has been assigned to you/your group as part of the data certification and management process is overdue.</td>
</tr>
</tbody>
</table>

**Certification schedules**

A certification schedule defines the information that requires certification and the frequency of execution.

At each time interval specified, or on-demand, the certification schedule generates a set of certification tasks based on set conditions. Use the Preview Certification Tasks related link to preview the certification tasks generated from a certification schedule.
The minimum requirements for Unix Servers are:
- CPU Speed: 3GHz
- RAM: 156GB
- CPU Core Count: 4
Certification tasks

A certification task represents the work of verifying the data associated with a particular record. Task owners are responsible for performing the certification tasks. Tasks have an associated workflow that sends reminders to the task owner and, if necessary, the manager of the owner at regular intervals.
Certification task

Clean up invalid elements

Use the **Clean up invalid elements** UI action to query and delete certification elements that reference invalid records. Each certification task has a certification schedule, and each certification schedule has Table and Filter fields. When you use this UI action, it performs the following processing:

1. Collects all available records from Table field in the certification schedule with filters that are available in certification schedule.
2. Collects all certification elements associated with the current certification task.
3. Deletes the certification elements that are no longer available for the data collected in the previous step.
4. After deleting invalid records, it recomputes the certification completion percentage using the following formula:
   
   \[ (1 - \text{(number of certification elements pending / total no of certification elements associated)}) \times 100; \]

5. If there are no certification elements with a Pending status, it marks the associated certification task as Closed, and deactivates it.
6. If there are remaining certification elements with a Pending status, it activates the associated certification task and changes its status to Work in Progress.

Certification elements

Each element of each record being certified is tracked in its own certification element record.

Also tracked are the date and time when the element was certified, comments, and the original and certified values of the field. You can view elements on individual certification tasks.
Certification elements

Certification instances

A certification instance is the collection of certification tasks for one execution of a certification schedule.
Certification instances

Certification audit instances

A certification audit instance is a collection of the certification instances and tasks generated by a single execution of the certification audit definition.
Certification audit instance

Certification audit definition

A certification audit definition is a collection of certification schedules that can be run at once.
Certification audit definition

Name: Certify Servers and Groups
Days to complete: 14
Description: Annual certification of Servers and Groups

Data Certification Overview module

The Data Certification Overview module displays various data certification-related reports on the Data Certification Console homepage.

The Overview module is a type of homepage.

The different levels of access are:

<table>
<thead>
<tr>
<th>Role</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>certification</td>
<td>View (view overview page and refresh reports)</td>
</tr>
<tr>
<td>certification_admin</td>
<td>• View (view overview page and refresh reports)</td>
</tr>
<tr>
<td></td>
<td>• Customize (refresh, add, delete, and rearrange reports)</td>
</tr>
<tr>
<td></td>
<td>View, customize</td>
</tr>
<tr>
<td>admin</td>
<td>• View (view overview page and refresh reports)</td>
</tr>
<tr>
<td></td>
<td>• Customize (refresh, add, delete, and rearrange reports)</td>
</tr>
<tr>
<td></td>
<td>• Edit (can edit reports)</td>
</tr>
</tbody>
</table>

Data Certification Overview Module

The Overview module includes the following reports:

**Data Certification Overview Module Description**

<table>
<thead>
<tr>
<th>report</th>
<th>Description</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>30/60/90 Day Aging</td>
<td>Groups tasks by the number of days (30, 60, 90, and 90 and over) since the task was opened.</td>
<td>Certification Task</td>
</tr>
<tr>
<td>Certification Instances</td>
<td>Lists all certification instances.</td>
<td>Certification Instance</td>
</tr>
<tr>
<td>Certification Progress Report</td>
<td>Groups tasks by task owner, indicating task progress as a percentage.</td>
<td>Certification Task</td>
</tr>
<tr>
<td>Certification Task Completed Report</td>
<td>Groups tasks by task owner, indicating tasks that are complete.</td>
<td>Certification Task</td>
</tr>
<tr>
<td>Exceptions To Date</td>
<td>Lists all task elements that have comments added and a state of Failed or In Progress.</td>
<td>Certification Element</td>
</tr>
<tr>
<td>Report</td>
<td>Description</td>
<td>Table</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------------</td>

<td>Lists the managers that have groups with assigned certification tasks. The report is a horizontal bar chart, grouped by status, with each bar representing a manager of an assignment group.</td>
<td>Certification Task</td>
</tr>
<tr>
<td>Hierarchical Roll Up</td>
<td>Shows the managers that have employees with assigned certification tasks (task owners). The report is a horizontal bar chart, grouped by status, with each bar representing a manager of a task owner (identified in the Assigned to field).</td>
<td>Certification Task</td>
</tr>
<tr>
<td>Upcoming Schedules</td>
<td>Lists all schedules that are scheduled to run within the next 30 days.</td>
<td>Certification Schedule</td>
</tr>
</tbody>
</table>

**Use the Data Certification Overview module**

View the status of data certification tasks.

1. Navigate to **Data Certification > Overview**.
2. Click elements within the reports to obtain more information.
   - For example, click any of the colored bars in the **Functional Roll Up** bar chart and detailed information replaces the Data Certification Console screen.
3. Update some fields directly on the overview page.
   - For example, in the red box on the image shown, a certification schedule is being updated in the certification instances report.
Data certification overview module
Data Certification planning

Initial planning can make the certification process more successful.

By defining certification schedules and certification audit definitions, users with the certification_admin role establish when certifications are performed, who performs it, and what data must be certified.

Required Roles

Users with the certification_admin role can view filter versions. These users can create, update, and delete filters, if they have the proper access to necessary tables. In the base ServiceNow system, certification_admin users have limited system rights and do not have access to all the tables required for creating a filter. When assigning compliance resources, make sure to grant additional roles to the certification_admin user as needed. For example, this user requires roles that grant access to these tables:

- Company [core_company]
- Cost Center [cmn_cost_center]
- Schedule [cmn_schedule]

Planning Data Certification

Planning the data certification process requires defining:

- The certification schedule defines certification for a particular set of information on a particular table. It also generates certification tasks to perform that certification. One certification task is generated per task owner and a certification instance record groups the tasks.
- The optional certification audit definition groups some certification schedules to be performed together and generates certification audit instances to perform them.

The following questions require answers for each certification schedule:

- What information requires certification?
- When is the due date for certification?
- Who must perform the certification?

Create a certification filter

A filter is a subset of configuration items from any ServiceNow table that is created with a standard condition builder.

An example is a filter that selects all UNIX servers in the Australian data center.

With filters, you can:

- Create multiple versions of a filter and then select the version you want to use.
- Use one filter on multiple certification schedules.
- View the number of records that match your filter as you create the conditions.

**Note:** Be sure to create certification filters before creating certification schedules.

1. Navigate to Data Certification > Certification Filters.
2. Click **New**.
3. Fill in the form (see table).
4. Click **Submit**.
   
   This action saves the filter as version 1.

5. To create another filter version, modify the filter conditions and click **Update**.
   
   The system saves the new filter and increments the version number.
Certification filter V2

By default, the Certification Filters list shows only the current version of each filter. To see all filter versions, click All in the breadcrumbs.
Certification Filter List

6. To make an inactive filter the current version, open the inactive filter and click **Revert**.
Certification filter revert

This action creates a new, active version of the filter and makes all previous versions inactive.

7. To delete a single filter version, open that version record and click **Delete**.

8. To delete inactive versions of a filter, click **Delete inactive versions** under **Related Links** in that filter record.

You cannot delete a filter that is used in a schedule definition. The system displays a warning and the filter is not deleted.

Creating certification filters

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>(Required) Filter name.</td>
</tr>
<tr>
<td>Description</td>
<td>(Optional) Brief description of the filter.</td>
</tr>
<tr>
<td>Number</td>
<td>(Read-only) Automatically assigned filter identification number.</td>
</tr>
<tr>
<td>Table</td>
<td>Table containing the records to be filtered. Use of the Database View [sys_db_view] table is limited by version.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Control to make the filter available for use from the Filter field on the Certification Schedule form.</td>
</tr>
<tr>
<td>Version</td>
<td>Current version of this filter. Any significant changes to the filter make the current version inactive. The system copies the updated filter, marks it as active, and increments the version number. The system saves all versions of the filter and makes them available to users. More than one version of a filter can be marked active.</td>
</tr>
<tr>
<td>Filter condition</td>
<td>Field, operator, and value to create the condition. The available options depend on the table selected. You can view the number of records that match the filter by clicking the refresh icon.</td>
</tr>
</tbody>
</table>

**Define a certification schedule**

A certification schedule specifies the fields to display, the fields that require certification, certification task assignments, completion requirements for task owners, frequency of schedule, and detailed instructions.

Use the preview option to see what tasks are created before saving the schedule. If the tasks are not what you want, edit the schedule and preview the tasks again. The system creates certification tasks automatically when it executes a schedule.

To schedule a certification:

1. Navigate to **Data Certification > Schedule Definitions**.
2. Click **New**
3. Fill in the fields (see table).
4. Click **Submit**.

**Defining A Certification Schedule**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A schedule name.</td>
</tr>
<tr>
<td>Filter</td>
<td>A certification filter for this schedule.</td>
</tr>
<tr>
<td>Table</td>
<td>(Read-only) The table holding the records to be certified. To change the table name, select a different Filter or create a new Filter.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Display fields</td>
<td>The fields displayed in the Certification Task list to provide context. These do not require certification themselves. For example, although users are not required to certify the Name field of a record, it displays so that users know what record they are certifying.</td>
</tr>
<tr>
<td>Certification fields</td>
<td>The fields to certify on this certification schedule.</td>
</tr>
<tr>
<td>Assignment type</td>
<td>A choice list to select how the certification schedule assigns the certification tasks.</td>
</tr>
<tr>
<td>· User Field</td>
<td>Select a user reference field on the table being certified. As an example, select the user named in the Managed by field to identify the user who performs the task. This selection displays the Assign to and Assign to empty fields. If the reference field on the record is empty, the value in the Assign to empty field is used.</td>
</tr>
<tr>
<td>· Specific User</td>
<td>Select a specific user to perform the tasks. This selection displays the User field.</td>
</tr>
<tr>
<td>· Group Field</td>
<td>Select a group reference field on the table being certified. As an example, select the Support group field to identify the user who performs the task. This selection displays the Assign to group and Assign to empty fields. All members of the group from the reference field on the record are assigned to the tasks. If the reference field on the record is empty, the value in the Assign to empty field is used.</td>
</tr>
<tr>
<td>· Specific Group</td>
<td>Select a specific group to perform the tasks. This selection displays the Group field. All members of the named group are assigned to the tasks.</td>
</tr>
<tr>
<td>User</td>
<td>This field appears when:</td>
</tr>
<tr>
<td></td>
<td>· Assignment type is Specific User. This system assigns this user to all certification tasks for this schedule.</td>
</tr>
<tr>
<td></td>
<td>· The Assign to empty field is set to Create Assigned Task, and you have selected User Field as the assignment type. The system assigns this user to certification tasks containing unassigned records.</td>
</tr>
<tr>
<td></td>
<td>You can only select users with the certification role.</td>
</tr>
<tr>
<td>Assign to group</td>
<td>The group field that defines the group assigned to the certification tasks. This field is available only when the Assignment type is Group Field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Group</td>
<td>The specific group to which certification tasks are assigned for this schedule. This field is available only when the <strong>Assignment type</strong> is <strong>Specific Group</strong>.</td>
</tr>
<tr>
<td>Assign to</td>
<td>The user field that defines which user is assigned to the certification task. This field is available only when the <strong>Assignment type</strong> is <strong>User Field</strong>.</td>
</tr>
<tr>
<td>Assign to empty</td>
<td>The behavior to use if the field selected in <strong>Assign to</strong> or <strong>Assign to group</strong> is blank on the record being certified. For example, if a task must be assigned to a manager, but no manager is identified, the value in this field determines what happens. This field appears only when the <strong>Assignment type</strong> is <strong>User Field</strong> or <strong>Group Field</strong>. The possible selections are:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Do Not Create Task</strong>: No task is created when the <strong>Assign to</strong> or <strong>Assign to group</strong> field is empty.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Create Unassigned Task</strong>: Create a task, but do not assign it to any user or group. The task can be manually assigned later.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Create Assigned Task</strong>: Create a task and assign it to the user or group specified. If you selected an assignment type of <strong>User Field</strong>, the <strong>User</strong> field is available. If you selected the <strong>Group Field</strong> type, the <strong>Group</strong> field is available.</td>
</tr>
<tr>
<td>Days to complete</td>
<td><strong>(Required)</strong> The number of days that task owners have to complete the certification tasks. When the certification schedule is part of a certification audit definition, the <strong>Days to Complete</strong> audit definition value overrides the value set for the certification schedule.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to activate this certification schedule, generating certification tasks at the scheduled date and time. Clear this check box to hide scheduling fields on the form (except <strong>Last run date</strong>) and not generate certification tasks.</td>
</tr>
<tr>
<td>Run</td>
<td>How often to run the schedule that generates certification tasks:</td>
</tr>
<tr>
<td></td>
<td>- Daily</td>
</tr>
<tr>
<td></td>
<td>- Weekly</td>
</tr>
<tr>
<td></td>
<td>- Monthly</td>
</tr>
<tr>
<td></td>
<td>- Periodically</td>
</tr>
<tr>
<td></td>
<td>- Once</td>
</tr>
<tr>
<td></td>
<td>- On Demand</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Day</td>
<td>When Run is Weekly, the day of the week when the schedule runs and generates certification tasks. When Run is Monthly, the day of the month the schedule runs and generates certification tasks. If the day is 29, 30 or 31, the certification runs on the last day of the month for shorter months.</td>
</tr>
<tr>
<td>Repeat Interval</td>
<td>When Run is Periodically, the frequency that the schedule runs to generate certification tasks, entered in time, days, or both. For example, set Days to 10 and Hours to 14:00:00 to run the schedule and generate certification tasks every 10 days at 14:00.</td>
</tr>
<tr>
<td>Starting</td>
<td>When Run is Periodically or Once, the date and time the schedule runs and generates certification tasks.</td>
</tr>
<tr>
<td>Time</td>
<td>When Run is Daily, Weekly, Monthly, or Once, the time of day, on a 24-hour clock, the schedule runs and generates certification tasks.</td>
</tr>
<tr>
<td>Last run date</td>
<td>(Read-only) The date and time that the schedule ran last, either on its regular schedule or manually, and generated certification tasks.</td>
</tr>
<tr>
<td>Next scheduled run</td>
<td>(Read-only) The next date and time the schedule runs and generates certification tasks.</td>
</tr>
<tr>
<td>Task Description</td>
<td>A description to add to the Short Description field of the certification task.</td>
</tr>
<tr>
<td>Instructions</td>
<td>An HTML field for providing instructions to the user or group performing the certification.</td>
</tr>
</tbody>
</table>

**Preview a certification task**

Previewing certification tasks saves any changes to the Certification Schedule form and displays the tasks that are created when you execute the certification schedule.

Previewing tasks is especially useful if you want to test different combinations of options in the Assignment type, Assign to, and Assign to empty fields.

1. Navigate to Data Certification > Schedules > Schedule Definitions.
2. Click a certification schedule Name.
3. In Related Links, click Preview Certification Tasks.
   The tasks to be created appear at the top of the screen.
Use a certification schedule notification

After you define a certification schedule, the system automatically sends notifications to specific users based on the information in the schedule.

The following notifications are sent automatically:

Certification Schedule Notifications

<table>
<thead>
<tr>
<th>Time elapsed to end date</th>
<th>Email template name</th>
<th>Notification message is sent to</th>
</tr>
</thead>
<tbody>
<tr>
<td>0% (when task is created)</td>
<td>certification.task.reminder.inserted</td>
<td>Task owner or assignment group, if specified</td>
</tr>
<tr>
<td>50%</td>
<td>certification.task.reminder.outstanding</td>
<td>Task owner or assignment group, if specified</td>
</tr>
<tr>
<td>75%</td>
<td>certification.task.reminder.outstanding</td>
<td>Task owner, assignment group, if specified, and manager of the task owner, if specified</td>
</tr>
<tr>
<td>95%</td>
<td>certification.task.reminder.outstanding</td>
<td>Task owner, assignment group, if specified, and manager of the task owner, if specified</td>
</tr>
<tr>
<td>100%</td>
<td>certification.task.reminder.overdue</td>
<td>Task owner, assignment group, if specified, and manager of the task owner, if specified</td>
</tr>
</tbody>
</table>

The email templates used in the notifications can be edited, for example, to change the email message text.

Executing a Certification Schedule

Executing a certification schedule generates certification tasks based on the schedule.

1. Navigate to Data Certification > Schedules > Schedule Definitions.
2. Click a certification schedule Name.
3. Click Execute Now.

The related lists Certification Instances and Certification Tasks display the instances or tasks generated by the schedule. The amount of time it takes to generate all certification tasks depends on the size of the table selected and how many fields require certification.
Define and create a certification audit

A certification audit is a collection of certification schedules that can be run as a single entity. Certification audits can be useful when there are multiple certification schedules. After creating a certification audit definition, you can generate a certification audit instance. The certification audit instance is a collection of the certification instances and tasks generated by a single execution of the certification audit definition.

1. Navigate to **Data Certification > Audits > Audit Definitions.**
2. Click **New.**
3. Fill in the fields (see table).
4. Right-click the header bar and select **Save.**
5. In the **Certification Schedules** related list, click **Edit.**
6. In the **Collection** list on the left, select one or more schedules and click **Add.**
7. Click **Save.**
8. In **Related Links**, click **Create Certification Audit Instance.**

   The system generates an audit instance based on the certification schedules selected. All audit instances based on this audit definition are listed in the **Certification Audit Instances** related list.
Defining and Creating a Certification Audit

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the audit definition.</td>
</tr>
<tr>
<td>Days to Complete</td>
<td>The number of days that task owners have to complete the certification tasks created by this audit definition. Overrides the identical field on the certification schedule.</td>
</tr>
<tr>
<td>Description</td>
<td>A short description of the intended audit.</td>
</tr>
</tbody>
</table>

Track a certification audit instance

You can view a list of all certification audit instances at any time.
1. Navigate to Data Certification > Audits > Audit Instances.
2. View the Certification Instances related list.
   The list contains each of the associated instances generated as part of the audit.

Data certification performance

After the certification process has been planned, certification tasks can be performed according to defined schedules.

Users with the certification role can perform certification tasks. The certification tasks can be tracked as part of certification instances.

Fulfill certification tasks

After you execute a certification schedule manually or at a scheduled time, the ServiceNow system performs certain actions.

- Creates tasks for any records that meet the filter requirements in the specified table, like tasks from the Configuration Item \[cmdb_ci\] table.
- Assigns the new tasks to the user or group identified in one of these certification schedule fields:
  - Assign to
  - User
  - Assign to group
  - Group
- Places the new tasks in the Work in Progress state.
- Adds the certification schedule Short description and Assigned to values to the corresponding fields on the certification task record.
- Adds the certification schedule Days to complete and Complete by date fields to the certification task record, based on when the task is created.

Note: If the certification filter does not match any CIs, the system sets the State to Closed Complete and the Percent complete to 100.
To view tasks assigned to you, navigate to **Data Certification > Tasks > My Tasks**.

The following information is tracked on the certification task record:

### Certification task record

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>An identification number for the certification task.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>The user responsible for certifying the data.</td>
</tr>
<tr>
<td>Assignment group</td>
<td>The group responsible for certifying the data.</td>
</tr>
<tr>
<td>Complete by</td>
<td><em>(Read-only)</em> A date field containing a deadline for the task. This field is automatically filled in based on the Days to Complete field on the certification schedule.</td>
</tr>
<tr>
<td>State</td>
<td><em>(Read-only)</em> The current state of the certification task. The selections are: Work in Progress, Closed Incomplete, Closed Complete, and Cancelled.</td>
</tr>
<tr>
<td>Percent complete</td>
<td>The task progress as a percentage. This field is read-only when a task is in a Closed Incomplete, Closed Complete, or Cancelled state.</td>
</tr>
<tr>
<td>Escalation</td>
<td><em>(Read-only)</em> The escalation level of the task. When 0–49% of the time to Complete By has elapsed, this field is set to Normal. At 50%, this field changes to Moderate and an email reminder is sent to the task owner. At 75%, this field changes to High and an email reminder are sent to the task owner and the manager of the task owner. At 95%, this field remains set to High, but a second email reminder is sent to the task owner and manager.</td>
</tr>
<tr>
<td>Short Description</td>
<td>A short description of the task. This field is automatically filled in with the text from the certification schedule of the Task description field.</td>
</tr>
<tr>
<td>Work notes</td>
<td>Information about work performed on the certification.</td>
</tr>
</tbody>
</table>

### Export the certification list

Users with the certification_admin role can export the certifications list and save the list in Excel, CSV, XML, or PDF format. This list is useful when you have a long list of certification elements or if many different users are assigned to certify elements on a single certification schedule.

For general information and common export steps, see [List export](#).

1. Navigate to **Data Certification > Tasks > All Tasks**
2. Open a task.
3. Open any column context menu in the certification data list and complete the export.

### Certify an element

The Certification Task form contains a list of all elements to be certified.
Note: After you certify all the elements in a task, no elements can be reverted.

1. Navigate to **Data Certification > Tasks > My Tasks.**
2. Open a certification task with a State of Work in Progress.
3. In the upper right corner of the list, select records that require certification for this task or all records that are part of this certification task.

4. Select the check box beside a certification element.
5. In Optional comment for checked elements, above the list, enter information that would be useful to others.
6. **Do:**
   - Click the green check mark to certify the element.
   - Click the red exclamation point to fail the element.

7. To see the certified or failed element, set the view to Show All Records.
   A green check mark or red exclamation mark appears beside the element.

8. Point to an icon to see any certification comments.

9. Ensure that all elements have the correct certification, either accepted or rejected.
   After you certify all elements, no elements can be reverted. When all elements of a certification task are certified or rejected, the task State changes to Closed Complete.

**View an audit result**

View audit results after you certify the elements.

1. Navigate to **Data Certification > Schedules > Audit Results**.
   The list of data certification audit results appears, grouped by certification instances. Certified configuration items show the Original value only. Failed CIs contain the Certified value and the Original value.

2. Click the links in the list to open any of the related records.
Data cert audit results

Reset certifications

You cannot reset any element after all elements are certified.

- To reset individual certifications, right-click the element in the certification list and select Revert Certification.
- To reset the entire task to its starting point, click the Reset all Certifications to Pending related link.

Track a task with a certification instance

The Certification Tasks related list on the certification instance record provides information about associated tasks.

The State field on the certification instance record is read-only and is based on the cumulative states of the certification tasks associated with the instance. The Percent complete column allows
users with the certification_admin role to track task progress quickly. For more information, see Track Certification Tasks.

To track a certification instance:

1. Navigate to Data Certification > Schedules > Instances.
2. Click a certification instance Number.
3. View and edit the following fields as necessary.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>(Read-only) Automatically generated identification number for the instance.</td>
</tr>
<tr>
<td>Certification Schedule</td>
<td>The certification schedule used to create the certification instance.</td>
</tr>
<tr>
<td>State</td>
<td>(Read-only) Current state of the certification instance: Work in Progress, Complete, Closed Incomplete, or Cancelled. For more information, see Track Certification Tasks.</td>
</tr>
<tr>
<td>Created</td>
<td>(Read-only) Date and time the certification instance was created. Date is filled in automatically when the Execute Now button clicks the associated certification schedule.</td>
</tr>
<tr>
<td>Complete by</td>
<td>(Required) Date and time when the certification instance must be completed. The system updates this field when it executes the schedule, using the deadline specified on the instance. All certification tasks associated with the certification instance must be marked Complete, Closed Incomplete, or Cancelled before the instance is complete.</td>
</tr>
<tr>
<td>Percent complete</td>
<td>Percentage of the instance that has reached the Closed Complete state. This field is automatically filled in based on the Percent Complete fields on the associated certification tasks.</td>
</tr>
<tr>
<td>Task Description</td>
<td>Information about the certification instance. This field automatically displays the text from the Task description field of the associated certification schedule.</td>
</tr>
<tr>
<td>Instructions</td>
<td>Field for providing instructions to the user or group performing the certification. This field is automatically filled in with information from the Instructions field on the associated certification schedule.</td>
</tr>
</tbody>
</table>

**Cancel a certification instance**

Users with the certification_admin role can cancel a certification instance.

The instance must have a State of Work in Progress. Canceling a certification instance:

- Changes the certification instance State to Cancelled.
Changes all associated Work in Progress certification tasks to Cancelled.

To cancel a certification instance:
1. Navigate to Data Certification > Schedules > Instances.
2. Click a certification instance Number.
3. Click Cancel.

Track a certification task

Use the certification task state to track the progress of a task.

The available task states are Work in Progress, Closed Complete, Closed Incomplete, and Cancelled.

When the state of a certification task changes, the certification instance state also changes in the following cases:
- If any certification task is in Work in Progress state, the certification instance is placed in Work in Progress state.
- If all certification tasks are in Cancelled state, the certification instance is placed in Cancelled state.
- If all certification tasks are in Cancelled or Closed Complete state, the instance is placed in a Closed Complete state. For example, if three certification tasks are Cancelled, and one task is Closed Complete, the instance state is changed to Closed Complete.
- When one certification task is Closed Incomplete and the remainder of the tasks are Cancelled or Closed Complete, the instance is placed in Closed Incomplete.

To view the state of certification tasks:
1. Navigate to Data Certification > Tasks and select My Tasks or All Tasks.
2. View the State column for each task.

Escalate a certification task

Users with the certification_admin role can escalate a task in the Work in Progress state. To escalate a task, the task owner identified in the Assigned to field on the task record must have an associated manager.

Personalize the User form to see the Manager field.

Escalating a task:
- Sends an email message to the task owner and the manager of the task owner stating that the task has been escalated.
- Sets the manager as the new task owner.

The event that triggers the escalation is named cert_task.escalate and the email notification is named Escalation Notification. To edit the text of the email message that is sent, edit the Escalation Notification email notification directly.

For more information, see Email and SMS notifications.

To escalate a certification task from the Certification Task form:
1. Navigate to Data Certification > Tasks > All Tasks.
2. Click a certification task Number.
3. Click Escalate. If the Escalate button is not available, the user in the Assigned to field does not have an associated Manager.

**Escalate a certification task from the certification task list**

1. Navigate to Data Certification > Tasks > All Tasks.
2. Select the check box to the left of a certification task Number. Multiple check boxes can be selected.
3. From the Actions on Selected Rows menu below the list, select Escalate. If the Escalate button is not available, the user in the Assigned to field does not have an associated Manager. Select multiple tasks from the list. The menu option shows how many tasks are not eligible for escalation, such as Escalate (4 of 6).

**Reassign a certification task**

If you have the certification_admin role, you can reassign any certification task in the Work in Progress state. Tasks in Closed Complete, Closed Incomplete, or Cancelled state cannot be reassigned. When a task is reassigned, the current task owner and the new task owner are sent a message.

Role required: certification_admin

The event associated with the reassignment is named cert_task.reassign and the email notification is named Certification Task Reassignment. To edit the text of the email message that is sent, edit the Certification Task Reassignment email notification directly.

For more information, see [Email and SMS notifications](#).

To reassign a certification task:

1. Navigate to Data Certification > Tasks > All Tasks.
2. Click a certification task Number.
3. Enter a new name in the Assigned to field.

**Send certification task reminders**

The Certification Task Escalations workflow sends automatic email reminders.

The Certification Task Escalations workflow sends automatic email reminders to the:

- Certification task owner.
- Assignment group, if the assignment group was specified on the Certification Task form.
- Manager of the certification task owner, if necessary and if a manager was specified on the User form.

The reminders are based on the Complete by field on the certification task record. If the Complete by date is changed, the reminder schedule automatically adjusts to reflect the new date.
Certification task reminders

<table>
<thead>
<tr>
<th>Time elapsed to end date</th>
<th>Email reminder is sent to</th>
<th>Escalate field on task record reads</th>
</tr>
</thead>
<tbody>
<tr>
<td>50%</td>
<td>task owner and assignment group (if specified)</td>
<td>Moderate</td>
</tr>
<tr>
<td>75%</td>
<td>task owner, assignment group, and manager of the task owner</td>
<td>High</td>
</tr>
<tr>
<td>95%</td>
<td>task owner, assignment group, and manager of the task owner</td>
<td>High</td>
</tr>
<tr>
<td>100%</td>
<td>task owner, assignment group, and manager of the task owner</td>
<td>High</td>
</tr>
</tbody>
</table>

To set reminders for different or more intervals, edit the workflow Certification Task Escalations. In addition to the email reminders sent automatically, users with the certification_admin role can send email reminders manually at any time.

Send an email reminder from the certification task form

How to manually send email reminders from the Certification Task form.

1. Navigate to Data Certification > Tasks > All Tasks.
2. Click a certification task Number.
3. Right-click the header bar and select Resend email notifications.

Send an email reminder from the certification task list

How to manually send email reminders from the Certification Task list.

1. Navigate to Data Certification > Tasks > All Tasks.
2. Select the check box to the left of a certification task Number. Multiple check boxes can be selected.
3. From the Actions on Selected Rows menu below the list, select Resend email notifications. Select multiple tasks from the list. The menu option shows how many notifications are outstanding and how many were sent, such as Resend email notifications (15 of 18).

Mark a certification task as closed incomplete

Mark a task as closed incomplete if, for example, only some of the elements can be certified. The following users can mark a task as closed incomplete:

- Users with the certification_admin role.
- User identified in the Assigned to field on the certification task record.

To mark a task as closed incomplete:

1. Navigate to Data Certification > Tasks and select All Tasks, or My Tasks.
2. Click a certification task Number.
3. In Work Notes, enter information about why the task could not be completed.
4. Click Close Incomplete.
If at least one task on a certification instance is marked Closed Incomplete, the Completed date and Percent complete fields on the certification instance record are not updated. A user with the certification_admin role can:

- Complete the incomplete task or tasks.
- Cancel the incomplete task or tasks.

When all tasks on the certification instance are Closed Complete or Cancelled:

- The system sets the Completed date field on the certification instance record to the current date and time.
- The Percent complete field on the certification instance record is set to 100 percent.

**Certification tasks cancellation**

Users with the certification_admin role can cancel a certification task in the Work in Progress or Closed Incomplete state.

When a certification task is cancelled, a notification email is sent to the task owner or assignment group assigned to the task. The task owner or assignment group manager is not notified.

**Cancel an individual task**

1. Navigate to Data Certification > Tasks > All Tasks.
2. Find a task with a State of Work in Progress.
3. Click the task Number.
4. Click Cancel.

**Cancel all tasks in an instance**

1. Navigate to Data Certification > Schedules > Instances.
2. Find an instance with a State of Work in Progress.
3. Click the instance Number.
4. Click Cancel.

All tasks in the instance with a state of Work in Progress are cancelled. The task owner or assignment group is notified.

The email template used for the notification is named certification.task.cancelled. The email templates can be edited to change the email message text, for example.

**Domain separation and Data Certification**

This is an overview of domain separation and Data Certification processing. Domain separation allows you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.
Overview

Support: Data only

Domain separation in this application is supported at the Data only level, meaning it supports the data security model of separating visibility of data from one domain to another. To learn more, see Application support for domain separation.

Content Management System

The Content Management System (CMS) is a ServiceNow application that primarily enables users to create a custom interface for the ServiceNow platform and ServiceNow applications.

The CMS application is powerful and flexible. Customers use it for a wide variety of projects, from creating entire websites to integrating with other products. The Content Management application is active by default.

This video provides an overview of the CMS application.

A CMS typically requires a systems administrator or a web developer to set up and add features. Non-technical users can use the CMS application as a tool for website maintenance. You also want to consider the timing of the addition of content management, and the maturity level of ServiceNow data. For more information, see CMS Planning.

Following are several CMS project ideas:

- Design a company-wide service catalog that offers a collection of services.
- Present a customized UI for a knowledge base.
- Create customized login pages, search pages, views of lists, tables, charts, or graphs.
- Design a complete website.
- Integrate ServiceNow with other company applications.
- Build a tailored self-service portal for end users that is in compliance with a corporate style guide.

Example CMS sites

There are two common interface approaches within the ServiceNow community:

- An image and text-based interface similar to Amazon.com
- A search-based interface similar to Google

Both approaches have been used successfully. The approach you select depends on the needs of the people using the data and how easy it is to train them. While the two design philosophies are different, both approaches share the common goal of UI simplicity.

Content Management design

Before building a website in the CMS, it is important to have a good understanding of what to build and who the audience is.

A high volume of content can heavily influence the look and feel of the site and the site hierarchy. When deciding the content, design for ease of maintenance for the people who take care of the system. This level of planning can be time-consuming, but is important.
Review website design prerequisites to help you set expectations, scope deliverables, and define reasonable timelines. Consider both the planning and execution of site design, to understand how sites are built, and to provide a working overview of the CMS.

Timing is important when considering the addition of content management. Successful deployments of the content management system usually take place after phase 1 processes (for example, Incident, Problem, Change, Catalog, and Knowledge) are in place. This is especially true if the team has limited website design experience. Waiting until phase 2 of deployment gives administrators time to work in ServiceNow and to understand how the organization uses the system and what business needs it meets.

Also consider the maturity level of data in the ServiceNow system. Depending on the ITIL processes used, content management is only useful and effective once the data within ServiceNow is established. Ensure that hierarchies, tasks, and workflows are well-defined. For example, before creating a catalog interface, confirm that the service catalog has been in place for some time, has been used, and contains data. The same is true for a knowledge management interface, particularly when high ratings or view counts define article placement on the page.

**Content organization**

Before you begin to build the CMS website, list all the content that you want to include and take the time to organize it.

A site created in CMS relies on two different types of content.

- CMS site information, such as site pages, images, and menus
- System information, such as knowledge base articles and catalog items

**CMS content**

Begin by listing all the content you want to host on the CMS pages. Examples include help pages, My Requests, My Approvals, and specific catalog items. Think about current solutions that you can implement immediately, and note ideas for future implementation phases.

Within CMS, you group pages to define the top-down menu structure. You establish a home or starting page, and other pages in the site reference the home page in the Parent Page reference field.

There are several ways to group, such as by audience or the purpose of the website. After listing the content to host, group it logically and identify a common name for each group, as shown in the following examples.

**IT environment groups**

<table>
<thead>
<tr>
<th>Content built for</th>
<th>Common name</th>
</tr>
</thead>
<tbody>
<tr>
<td>End user</td>
<td>End User Page</td>
</tr>
<tr>
<td>IT professional</td>
<td>IT Professional Page</td>
</tr>
</tbody>
</table>

**General groups**

<table>
<thead>
<tr>
<th>Purpose of site</th>
<th>Common name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reports</td>
<td>Reporting Page</td>
</tr>
<tr>
<td>Help and knowledge</td>
<td>Knowledge page</td>
</tr>
</tbody>
</table>
System content

Organize the content so the interface is easy to navigate and understandable to the user. Determine the organization based on the data that you are leveraging, both in the CMS (using sites, parent pages, pages, and navigational menus) and throughout the rest of the system. For example, within the catalog you have "category," and in the knowledge base you have "category" and "subcategory." You can use these hierarchies with filtered lists for good search results.

Organizing CMS content logically is important for long-term maintenance of the site, however, the data typically comes from other ServiceNow applications. Communicate with the administrators for these applications, such as the knowledge base, service catalog, and business service portfolio. Work with them to offer the application data appropriately through the CMS pages you create. For example, the team that created the ServiceNow corporate website in CMS began by evaluating the naming conventions used in the corporate knowledge base.

Branding elements

Branding refers to the logo, name, colors, and symbols that identify an organization. It imposes consistency in design and use of terms. Your marketing department defines branding elements and can provide them to you as you plan your CMS pages. Consider how to incorporate the following branding elements.
- Logos
- Color palette
- Tag line
- Trademarked elements
- Graphics

Site design

During planning, consider providing a core set of features with a standard appearance throughout the site. The following web design elements are often used to create a consistent look.
- Page templates
- Navigation schemes
- Header
- Breadcrumbs
- Footer
- Forms

ServiceNow features

Analyze and organize the following ServiceNow features in your instance if you plan on using any of them with CMS pages.
- Account settings
- Email
- Workflow approvals
- Filters
Team member identification

Identify the team members who assist you with website design, branding, and development.

Engage team members for each listed function before you begin to build pages for the CMS website. Each function can be performed by the same or different people.

- Gather corporate style design guidelines.
- Define the written terminology and content for the site.
- Gather and define the site flow.
- Manage the CMS project as the webmaster. The CMS webmaster is responsible for executing the design and making the site work. The following skills are required:
  - Basic ServiceNow administration skills
  - HTML
  - CSS
  - Graphic design
  - Web design

After you identify the project team members, establish who is responsible to complete the tasks involved in building the CMS website.

- Determine who owns each page.
- Set a page update schedule so owners do not overwrite each other.
- Formalize content management processes, including content review and page updates.

Data preparation

It is important that there is enough data in the ServiceNow instance before you begin to build the CMS website.

Ensure that the necessary data and content are available in the instance by taking the following actions.

- Review the ITIL processes that you intend to implement in the CMS. Ensure that the data in the instance is a mature representation of the applications being used, for example, service catalog, knowledge management, and incident management.
- Review the defined hierarchies, such as the categories and subcategories for the knowledge base or service catalog. You use these categories to design the entry page into the application.

Corporate style guide

When you build a CMS website, you design the look and feel based on guidelines in the corporate style guide.

A corporate style guide provides detailed information for designing any corporate interface, including corporate websites.

Corporate design team

Many organizations have a web development team that designed the corporate website. Contact this team and involve the designers early in the planning, as they provide help and give their approval to the interface you design. Without approval, there is the risk of having to redesign the entire site because it does not adhere to the organizational guidelines.
**Corporate style guide**

A corporate style guide takes the guesswork out of designing the CMS website. The example style guide shown is defined down to the pixel. Creating a site with the style guide makes it easy to create clean CSS and HTML. Without the style guide, building the site can take a great deal of time.

**Design considerations**

Some modifications to the base design for forms may be necessary. The content area of any CMS design should be no smaller than 860px, or service catalog forms are clipped. The sample style guide entry specifies the content area to be 576px, which clips service catalog forms.
Columns and topics:

1. Navigation (levels 2–4)
2. Main content
3. Info snippets
Prototypes and rapid web design

Many user interface designers use prototypes and rapid web design techniques to visualize the final product before it is developed.

Design revisions are the most time consuming and expensive phase of site design. When the team analyzes and then uses prototypes to create pages, revisions to the published pages are minimal.

Develop the prototype and print it. Review the design with the appropriate team members and annotate the prototype, and annotate what to update on each page.

Define the following elements within the prototype.
- The site map for the entire site.
- A detailed prototype of every intended page, including elements such as links, link destinations, content, page names, and page descriptions.

Content Management navigation

After you design the hierarchical structure of the site, begin planning site navigation.

Consider the following as you plan site navigation.
- Placing navigation elements on every page.
- Locating navigation elements in the same place on every page.
- Using either text or images for navigation.
- Providing visitors with an easy way to understand where they are in the site, for example, with breadcrumbs or a specific color scheme.
- Adding a site map, which is a one-page, hyperlinked, hierarchical outline of the site.
- Providing a link to the home page from every site page, as visitors often enter the site on a page other than the home page.
- Designing navigation to help visitors find information quickly with as few clicks as possible.

In the CMS, navigation menus define your site navigation. Build menus as navigational blocks to create navigation paths. The menu chosen for the task depends on the size and complexity of your site. Available menu options include the following items.
- List menus
- Two types of tab menus
- Vertical, clickable list, usually placed on the left side
- Horizontal blocks
- Vertical blocks
- Super menu (a menu of menus)

System content management

Most of the content in a CMS site is managed in different locations throughout the system.

For example, if you are building a knowledge website, the pages and blocks exist in CMS, but the knowledge articles are authored and managed in the Knowledge application. The same is true for any other type of content you plan to leverage. It is important to take time to understand the table structure of data to become acquainted with content.

Links to content are typically static, however, take time to look at the document tree and review how field values are formatted for use within the CMS. To understand the information provided below, right-click within forms in the platform and select Show XML to view the document tree for...
the referenced table. To see the table values for each field, right-click the form label and choose Show - (field name) or Configure Dictionary for reference.

Look at several internet news sites for ideas on how to format dynamic list data and also the full article detail. Research blog sites, shopping sites, and any other site you find easy to use, as layout and usability design can be time-consuming. If you find a site that inspires you, emulate it in your design.

- This New York Times example has two separate list formats.
- The CNN example has several list formats on the page.
- Several different list formats are used on the ServiceNow website.

### Knowledge articles - kb_knowledge table

When you right-click and select Show XML on any form within the system, the document tree for the referenced database table becomes reference-able. Review the following selected subset of the document tree so you can acquaint yourself with the content readily available to your site design.

```xml
<kb_knowledge>
  <active>true </active>
  <author display_value= "First Last Name" >Use this field value if author name is important </author>
  <short_description>Use this field value as the link to the full article detail </short_description>
  <description>Provide this field value as a 1-2 sentence summary of the article </description>
  <number>Unique ID can be leveraged in a number of different ways </number>
  <published>Published time stamp of the article </published>
  <rating>This field value provides a 1 to 5 star rating similar to iTunes </rating>
  <sys_updated_on>Add to supplement article published timestamp </sys_updated_on>
  <sys_view_count>8 </sys_view_count>
  <topic>Useful field value in creating hierarchical breadcrumbs </topic>
  <category>Also useful in organizing articles hierarchically </category>
  <use_count>Use this similar to Facebook's "like" feedback, answer to the question was this useful </use_count>
</kb_knowledge>
```

```xml
<j:jelly trim = "false" xmlns:j = "jelly:core" xmlns:g = "glide" xmlns:j2 = "null" xmlns:g2 = "null">
  <div class = "cms_knowledge_list customer_success">
    <g:for_each_record file = "${current}" max = "${jvar_max_entries}"
      ><br />
      <table cellspacing = "0" cellpadding = "0" border = "0" class = "background_transparent">
        <tr><td class = "cms_knowledge_list_image">
          <j:if test = "${current.u_logo.getDisplayValue() != ''}"
            >
            <a href = "knowledge.do?sysparm_document_key=kb_knowledge,${current.sys_id}"
              >
              <img src = "${current.u_logo.getDisplayValue()}" alt = "${current.text}" width = "110px" />
            </a>
          </j:if>
        </td><td class = "cms_knowledge_list_text">
          <j:jelly trim = "false" xmlns:j = "jelly:core" xmlns:g = "glide" xmlns:j2 = "null" xmlns:g2 = "null">
            <div class = "knowledge_article_info" >
              <a href = "knowledge.do?sysparm_document_key=kb_knowledge,${current.sys_id}"
                >
                ${current.text}
              </a>
            </div>
          </j:jelly>
        </td></tr>
      </table>
    </g:for_each_record>
  </div>
</j:jelly>
```
Domain separation in the Content Management System

This is an overview of domain separation in the Content Management System. Domain separation allows you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

Support: Data only

Domain separation in this application is supported at the Data only level, meaning it supports the data security model of separating visibility of data from one domain to another. To learn more, see Application support for domain separation.

Activate the Content Management System

The Content Management System (CMS) application and the Service Management Portal application, which is implemented within Content Management, are automatically installed on new instances. If they are not active on your instance, administrators can activate them.

Role required: admin

For evaluation, you can activate the plugin for an application that requires a purchased subscription on a non-production instance. To activate the plugin on production instances, you must purchase the subscription. To purchase a subscription, contact your ServiceNow account manager. For details on purchasing a plugin, see Purchase a plugin.

Some plugins require activation by ServiceNow personnel. Request these plugins through the HI Customer Service System instead of activating them yourself. For details, see Request a plugin.

For plugins that you can activate yourself, continue with the following steps.

1. Navigate to System Definition > Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the **Activate/Upgrade** related link.

   If the plugin depends on other plugins, these plugins are listed along with their activation status.

   If the plugin has optional features that depend on other plugins, those plugins are listed under **Some files will not be loaded because these plugins are inactive**. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).

4. Optional: If available, select the **Load demo data** check box.

   Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.

   You can also load demo data after the plugin is activated by clicking the **Load Demo Data Only** related link on the System Plugin form.

5. Click **Activate**.

### Installed with Content Management

Several types of components are installed with the Content Management application.

Demo data is available for this feature.

### Tables installed with Content Management

Tables are added with activation of Content Management.

Content Management adds the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content Page (content_page)</td>
<td>Provides an inventory list of pages within the system</td>
</tr>
<tr>
<td>Content Css (content_css)</td>
<td>Stores internal or external CSS for the page</td>
</tr>
<tr>
<td>Content Theme (content_theme)</td>
<td>Made up of a collection of CSS files</td>
</tr>
<tr>
<td>Content Link (content_link)</td>
<td></td>
</tr>
<tr>
<td>Content Page Rule (content_page_rule)</td>
<td></td>
</tr>
<tr>
<td>Content Block Programmatic (content_block_programmatic)</td>
<td></td>
</tr>
<tr>
<td>Content Block (content_block)</td>
<td></td>
</tr>
<tr>
<td>Content Block Detail (content_block_detail)</td>
<td></td>
</tr>
</tbody>
</table>
### Table

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content Site (content_site)</td>
<td>Provides and inventory list of sites within the system</td>
</tr>
<tr>
<td>Content Block Static (content_block_static)</td>
<td></td>
</tr>
<tr>
<td>Content Type Detail (content_type_detail)</td>
<td></td>
</tr>
<tr>
<td>Content Page Meta (content_page_meta)</td>
<td></td>
</tr>
<tr>
<td>Content Config (content_config)</td>
<td></td>
</tr>
<tr>
<td>Content Type (content_type)</td>
<td></td>
</tr>
<tr>
<td>Content Theme Css (_content_theme_css)</td>
<td></td>
</tr>
<tr>
<td>Content Block Lists (content_block_lists)</td>
<td></td>
</tr>
<tr>
<td>Content Block Sized (content_block Sized)</td>
<td></td>
</tr>
</tbody>
</table>

### Roles installed with Content Management

Roles are added with activation of Content Management.

Content Management adds the following roles.

<table>
<thead>
<tr>
<th>Role title (name)</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content administrator</td>
<td>Can read, write, and configure all elements of the Content Management Application</td>
<td>none</td>
</tr>
<tr>
<td>(content_admin)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Script includes installed with Content Management

Script includes are added with activation of Content Management.

Content Management adds the following script includes.

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMSCopyAjax</td>
<td>Support for copying CMS pages</td>
</tr>
<tr>
<td>CMSEntryPage</td>
<td>Creates an entry page</td>
</tr>
<tr>
<td>ContentPageClone</td>
<td>Copy support for CMS pages</td>
</tr>
<tr>
<td>ContentSiteClone</td>
<td>Copy support for CMS sites</td>
</tr>
<tr>
<td>CMSAjax</td>
<td>CMS Ajax utilities</td>
</tr>
</tbody>
</table>
Client Script installed with Content Management

Client scripts are added with activation of Content Management.

Content Management adds the following client script.

<table>
<thead>
<tr>
<th>Client script</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header Color Change</td>
<td>Content Block Header</td>
<td>Changes the background color of the control to what the user selected</td>
</tr>
<tr>
<td></td>
<td>(content_block_header)</td>
<td></td>
</tr>
</tbody>
</table>

Business Rules installed with Content Management

Content Management adds the following business rules.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Replace Stub</td>
<td>Content Block</td>
<td>Replaces a placeholder widget with a content widget.</td>
</tr>
<tr>
<td></td>
<td>(content_block)</td>
<td></td>
</tr>
<tr>
<td>Unload Page</td>
<td>Page</td>
<td>Unloads content from the page.</td>
</tr>
<tr>
<td></td>
<td>(content_page)</td>
<td></td>
</tr>
<tr>
<td>Bump Parent if Content</td>
<td>Portal</td>
<td>Replace content in the current page.</td>
</tr>
<tr>
<td></td>
<td>(sys_portal)</td>
<td></td>
</tr>
<tr>
<td>Remove Block from Pages</td>
<td>Content Block</td>
<td>Removes a block from pages where it is placed.</td>
</tr>
<tr>
<td></td>
<td>(content_block)</td>
<td></td>
</tr>
<tr>
<td>Validate Suffix</td>
<td>Content Page</td>
<td>Validates a suffix so that a page name or a page suffix cannot match a table name.</td>
</tr>
<tr>
<td></td>
<td>(content_page)</td>
<td></td>
</tr>
</tbody>
</table>

Configure Content Management sites

Planning a CMS site involves obtaining resources, communicating with others about design, and gathering content.

Role required: content_admin or admin

The following steps are a high-level overview of how to set up a site.

1. Plan and design your content.
2. Create a site.
   - The site is the container that holds all the content. To simplify your process, you can copy an existing site and edit its components. For more information on creating a site, see Create a site. For more information on copying a site, see Copy a site.
3. Add pages to the site.
   - Pages contain blocks of information for the site. For more information, see Create a content page.
4. Create content blocks to customize the layout, headers, menu navigation, lists, and static and dynamic content.
   - Content blocks are chunks of actual HTML that make up the content page. There are various content block types available to help with your customization. For more information, see Content blocks.
5. Add style to your site using themes, style sheets, and frames. Neither content sites or content pages reference style sheets directly. Configure them using the Themes or Style Sheets options. For more information, see Style in Content Management.

6. Test the site. After you create or modify a site, test the site to ensure that content displays properly and all links work correctly. For more information, see Test the site.

Content sites

A content site is a group of related content pages that have the same basic theme, layout, and URL suffix.

Content sites are made up of a series of basic building blocks. The Employee Self-Service site is an out-of-box sample site that is included in the CMS activation. It provides existing, working examples or each CMS component, which you can use like a template to build your own site.

Site components

Create a site

Configure a site by either creating a new site with CMS or by editing a copy of either the ESS Portal or the Service Management Portal.

Role required: content_admin or admin

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
If you are creating a catalog site in CMS, follow the steps in Manage catalog sites in Service Catalog.

1. Navigate to Content Management > Sites.
2. Click New.
3. Complete the form.

Since you have not yet created pages, you cannot select the Home, Search, Login, and Gauge target pages. Add them to the site record after you create them.

### Site fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the site.</td>
</tr>
<tr>
<td>URL suffix</td>
<td>The URL suffix that identifies the site. The URL suffix is case-sensitive, the suffix you enter impacts the CMS site URL used to launch the site. It is incorporated into the URL as follows: http://&lt;instance name&gt;.service-now.com/url_suffix/page.do</td>
</tr>
<tr>
<td>Note: Do not use portal and cms in the URL suffix. They are reserved terms and return a Page not found if you use them.</td>
<td></td>
</tr>
<tr>
<td>Home page</td>
<td>The page to display when the user does not specify a page name in their URL: http://&lt;instance name&gt;.service-now.com/url_suffix/</td>
</tr>
<tr>
<td>Search page</td>
<td>The page that displays search results when a user searches from any page within the site.</td>
</tr>
<tr>
<td>Login page</td>
<td>The page to use for logging in to the site. If specified, users must log in to access the pages on the site. If left blank, no login is required to access the pages within the site.</td>
</tr>
<tr>
<td>Gauge target page</td>
<td>The page that displays gauge content. When the user clicks a gauge on the new site, the gauge target page opens to show the gauge content. The gauge target page replaces the CMS page in the current tab.</td>
</tr>
<tr>
<td>Title</td>
<td>A title for the site. The title can be the same as or different from the Name.</td>
</tr>
<tr>
<td>Description</td>
<td>A full description of the site.</td>
</tr>
<tr>
<td>Default layout</td>
<td>The layout for pages to use by default. Any page in the site that has a blank Layout field uses the layout selected in this field.</td>
</tr>
<tr>
<td>Default theme</td>
<td>The theme for pages to use by default. Any page in the site that has a blank Theme field uses the theme selected in this field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Simple catalog display</td>
<td>Selecting this option simplifies catalog pages in the site by hiding the search bar, breadcrumbs, and the results per page choice list. It also prevents you from adding attachments from record producers to your CMS site.</td>
</tr>
<tr>
<td>Use external cart</td>
<td>Option to omit the default cart when rendering catalog pages within a site that contains catalog pages. Provide a catalog cart block somewhere on the site to allow users to make catalog requests.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

The following is the site record for the ESS Portal:
Copy a site

To create a new site quickly, you can copy an existing site.

Role required: content_admin or admin

The site copy option creates a complete standalone copy of the site and all its resources. If you are copying a site to create a second site, use this option after the first site is complete, tested, and production ready. This consideration is important because the blocks, CSS, and pages are duplicated to support the new site. There are various reasons why site copying is useful, such as site versioning, branding, or creating a backup.
Images are not included when you use the Copy Site option. They are stored separately in the sys_attachments table.

To copy just a few pages without duplicating all the resources (CSS, blocks, menus), use the page copy option. Page copy duplicates the page but not the resources used in the page. For more information, see Copy a page.

1. Navigate to Content Management > Sites > (Site Name).
2. On the Site form, click Copy.
3. In the dialog box that opens, type a name for the new site.
   This name is a prefix for all the site elements that are duplicated. Do not use Portal or CMS in the site name.
   A progress bar shows the copy process. When the process is complete, the Site form shows information for the new site.

**Content Management security**

There are several methods for securing CMS sites and pages. Site security is set in the Login page field on the site record. You can control if a page is public or private through the URL.

Every content page has its own URL that users can access outside of the platform. Depending on how the Login page or roles are defined, the URL may or may not be public.

- If the content page has no defined Read role or there is no defined Login page, any internet user can navigate to the URL and view the content page.
- If there is a defined Read role, then anyone who goes to the URL is asked to log in before they can view the site.
- If there is a defined Login page on the site record, all pages in the site are private.

**Content Management URLs**

The format for Content Management URLs is as follows.

```
<path to the instance> + /<site suffix> + /<page suffix> + .do
```

The <site suffix> is defined by the URL Suffix field on the site form. The <page suffix> is defined by the URL Suffix field in the page form. The URL suffix is case-sensitive.

For example, the page Austere - Site Entry has a site URL Suffix of austere and a page URL Suffix of entry. The constructed URL looks like the following URL.

```
<instance name>.service-now.com/austere/entry.do
```

If the site URL Suffix field is left blank, the <site suffix> is cms, as shown in this example:

```
instance.service-now.com/cms/page.do
```

If the page URL Suffix is left blank, the name of the page is used as shown in this example:

```
instance.service-now.com/austere/Page Name.do
```

Special characters in the name of the page have to be escaped.

**Login pages instead of login rules**

You set a login page on the site record to allow users to log in or out directly through the content site.
Login rules were used in earlier versions to dictate what users saw after logging in, based on their roles or permissions. Login rules still work, but their use is deprecated.

**Configure CMS sites to use single sign-on (SSO)**

To configure CMS to use SSO, make the view_content page private.

Because public pages do not require login, and CMS sites are public by default, CMS pages do not use SSO. Use the following procedure to turn off public-facing content pages and enable SSO.

1. Navigate to Public Pages (sys_public.list).
2. For the view_content page, set **Active to false**.

**Content pages in CMS**

Content pages are the core of the Content Management System. A content page is a web page that displays blocks of content.

Pages are built from content blocks and organized into sites. Pages display as regular webpages that are rendered in HTML. Constructing a content page requires a basic knowledge of HTML. Content pages are formed by arranging content blocks in predefined layouts. They can be used to present login pages, search pages, or ServiceNow content.

**Create a content page**

Pages are built from content blocks and organized into sites.

Role required: content_admin or admin

1. Navigate to **Content Management > Sites**.
2. Open the site to add the page.
3. In the **Pages** related list, click **New**.
4. Complete the form.

**Page form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the page. Prefix each page name with the name of the site followed by a dash and the page function. For example, <strong>ESS - Catalog Detail</strong> and <strong>ESS - Search Results</strong> are page names within the <strong>ESS</strong> site.</td>
</tr>
<tr>
<td>URL suffix</td>
<td>The URL suffix that identifies the page. It is incorporated into the URL as follows: <a href="http://instance">http://instance</a> name.service-now.com/site/url_suffix.do</td>
</tr>
<tr>
<td>Parent page</td>
<td>The existing page that is the parent of the current page. Parent pages keep sections sortable on the site list of pages and are used to create breadcrumbs dynamically. Use CSS to define menus that give the Parent page context within the user interface.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Layout</td>
<td>The layout to use for the page. Layouts define dropzones where content blocks can be added to the page. If this field is left blank, the page inherits the default layout of the site. If the site does not have a default layout, there is a single dropzone for the entire page.</td>
</tr>
<tr>
<td>Content theme</td>
<td>The theme to use for the page. Themes bundle CSS style sheets that are applied to all content within the page. If this field is left blank, the page inherits the default theme of the site. Use the default theme unless the page requires a different set of CSS style sheets from the other pages in the site.</td>
</tr>
<tr>
<td>Frame buster</td>
<td>Select the check box to remove any restrictions placed by frames that contain the page. This way you avoid frame-within-frame issues that sometimes occur with improper linking.</td>
</tr>
<tr>
<td>Content site</td>
<td>The site associated with the content page. If you created the page from the related list in the site, the value defaults. The content site provides the <code>&lt;site_suffix&gt;</code> in the page URL, as follows: http://&lt;instance_name&gt;.service-now.com/site_suffix/page_suffix.do</td>
</tr>
<tr>
<td>Read roles</td>
<td>Users with the selected roles can view the page. Click the lock icon to select roles.</td>
</tr>
<tr>
<td>Model document</td>
<td>A document ID of a record to display by default.</td>
</tr>
<tr>
<td>Page status</td>
<td>The status for the page, such as Draft or Published.</td>
</tr>
<tr>
<td>Created by</td>
<td>The user who created the page. If your role has higher privileges than your user name and you enter your user name, the field defaults to the role. For example, if you are logged in as an Admin and you type your name, which has lower privileges, this field displays Admin.</td>
</tr>
<tr>
<td>Title</td>
<td>The title for the page. The title displays on the browser tab when the page is accessed.</td>
</tr>
<tr>
<td>Description</td>
<td>Type a description of the page that displays for users when they access the page.</td>
</tr>
</tbody>
</table>

5. Click Submit.
Add content to a page

After you define the page settings, set the content of the page by adding content blocks. Setting content blocks is similar to how you add content to homepages.

Role required: content_admin or admin

Note: Do not add any type of report, such as a calendar, to iFrames. For more information on adding a report directly onto a page without using iFrames, see Embedding reports in Jelly.

2. Click Add Content.
3. Select a content block from the picker.
4. Select the dropzone where the content goes.
   Create content blocks by adding one of the content blocks named *New (block type)* to the page.
Copy a page

Copying pages is an efficient way to avoid duplicating the same work and to create pages quickly from a guiding master template.
Role required: content_admin or admin

1. Navigate to Content Management > Sites and select the site.
2. Select the page to copy.
3. Click Copy.
4. Rename the page.

**Note:** Do not use service_catalog to rename a page. It is already a valid page in the system.

5. Edit the page fields.
6. Click Update.

### Assign a page to a site

If you have created multiple sites, you can add pages from one site to another site.

Role required: content_admin or admin

1. Navigate to Content Management > Sites.
2. Select a site.
3. In the Pages related list, click Edit.
4. Select other pages to include in the site.
5. Click Save.
6. Update the site.

### Add a page to an application

Homepages and content pages are not added automatically to update sets and applications. They must be manually added.

Role required: content_admin or admin

1. Navigate to Content Management > Pages.
2. Right-click a content page record.

   The page is added to the current application and to the current update set.

### Configure a private UI page for CMS links

With single sign-on (SSO) in place, you can generate email links that take users directly to tickets and applications through the CMS interface.

Role required: content_admin or admin

You accomplish this procedure by creating a private UI page to redirect CMS links. Because the page is not public, it requires authentication and redirects to SSO appropriately.

1. Check that your CMS site is private by completing the following steps.
   a) Navigate to Content Management > Sites > (Your Site)
   b) Verify that the Login page field has a page listed.

2. Create a new UI page by completing the following steps.
   a) Navigate to System UI > UI Pages.
b) Click **New**.

c) Enter a **Name**, for example, **redirector**.

d) Enter the following Adobe Jelly code into the **HTML** field.

```xml
<?xml version="1.0" encoding="utf-8"?><j:jelly trim="true"
xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null"
xmlns:g2="null"><script type="script/javascript">
    window.location.href="${sysparm_uri}";</script></j:jelly>
```

The CMS now supports email links with following format:

http://<path to instance>/<UI page>.do?uri=/<CMS suffix>/<record
type>.do%26sys_id=<record ID>

For example:

http://<instance>name>.service-now.com/redirector.do?sysparm_uri=/ess/ incident.do%26sys_id=46e3e949a9fe19810069b824ba2c761a

**Note:** If you are using SAML 2.0 update 1 for SSO, use the UI page **saml_redirector** instead of creating a new UI page. For example, an email link to a SAML 2.0 redirector page would use the URL format: http://<instance name>.service-now.com/saml_redirector.do?sysparm_uri=/ess/ incident.do%26sys_id=46e3e949a9fe19810069b824ba2c761a.

## Content Management templates

Templates are content pages that are reused to provide a consistent look and feel.

Templates are useful when creating CMS sites for the following reasons.

<table>
<thead>
<tr>
<th>Create new pages rapidly without risk by copying pages</th>
<th>Using a template to create new pages saves time because you do not have to keep repeating the same steps.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Provide a restore point for pages within the system</td>
<td>Have a working template available if something goes wrong in one of the blocks or in the theme CSS. It is often easier to start over from the template instead of trying to undo complex changes.</td>
</tr>
<tr>
<td>Provide a functional reference for editors on the site project</td>
<td>Having the template as a reference ensures that pages continue to conform to the style guide.</td>
</tr>
</tbody>
</table>

## Page templates

Every page that is part of the site needs a template.

## Critical page reference fields

When you build a new site, there are four page reference fields on the site record that are critical. Understanding these pages and how they are used helps you define page templates and site defaults.

- **Home page:** landing page for the site. A home page is mandatory.
- **Search page:** page that displays search results when a user searches from any page within the site. A search page is mandatory for your site to have a Search Results block.
- Login page: a standalone login page, which is useful to force authentication for the entire CMS site.
- Gauge target page: page used to display the drill-through content from a gauge. When the user clicks a gauge, the gauge target page opens showing the drill-through content for that gauge.

### Critical page reference fields

#### Detail pages

Depending on the data or tables that you plan to use, you may need detail pages. These detail pages use one of the content types in the following list:

- Knowledge detail page: displays a full knowledge article detail (mandatory for a knowledge site).
- Incident page: detail page for an incident record.
- Catalog page: detail page for all items, content items, order guides, and record producers.

#### Templates for creating sections

There are two page templates you can use when creating sections:

- Parent page: keeps sections within large sites organized and sortable on the site list of pages. Parent pages are also used to create breadcrumbs dynamically.
- Detail page: differs from the parent page in that the content area displays a full article or detail instead of a selection of related content. Detail pages must have a Current Document block.
These pages are mandatory if you plan on accessing system data. For example, if you plan on showing the service catalog in your CMS, you need the following items.

- A service catalog content type that references the (sc_cat_item table).
- A detail page that provides the full view of the item.

**New templates**

If the base system sample site pages are not suitable, you can create a template from scratch. Create a page and then use it as a template. For more information, see *Create a Content Page*.

When you save a new template, include the word “template” in the page name.

**Configure a master template**

An easy way to create a master template is to copy the existing ESS sample site and customize it to suit your own needs. You can also configure a master template from scratch.

Role required: content_admin or admin

Follow these steps to create a single master page and generate all important components within the site.

1. Design a layout.
   Regardless of the interface, a site can be distilled into a few simple layouts.
2. Create a theme.
   The theme defines the structure of the layouts in CSS and the base styles, such as fonts and colors. For more information, see *Design themes*.
3. Build the common blocks.
   Pages are composed of content blocks. Most content blocks are reused on multiple pages. For the master template, build basic blocks such as a header, side navigation, and some basic content for the main content area of the page. More detailed content can be added later, but define content for reuse on many of the site pages here. For more information, see *Content blocks*.
4. Build a site entry page.
   Use the common content blocks you just created to design the first page that users see when they enter the site. For more information, see *Create a content page*.
5. Build a detail page.
   Design the detail pages to determine how pages such as knowledge articles, catalog items, and search results are displayed. You can build a detail page by copying the site entry page and adding additional content blocks. For more information, see *Copy a page*.
6. Assign the pages created to the new site.
   Create the site and apply the layout and theme to the site defaults. Then, navigate to the All Pages list and specify the master template site in the Site column for each of the master template pages. For more information, see *Create a site*.

**Customize a copy of a page template**

One good source for templates is the base system sample site. It is easy to copy pages and restyle them into new page templates to meet different business requirements.

The Employee Self-Service portal is provided as a working example and design template in the following procedure.

1. Navigate to **Content Management > Sites > Employee Self-Service**.
2. Select a page.
For example, to copy the ESS sample site homepage, select Portal.

3. Click Copy.
4. Rename the page.
5. Right-click in the header and select Save.
7. Point your cursor to the content block to change and click the edit icon that appears on the right.
   For example, change the menus, alter the layout, or add a different logo.
8. Click Update.
9. Use the page in other sites you created by assigning pages to a site.

Content types

Content types provide site-specific control of how system data defined by templates is rendered.

In the site, one page displays a list of knowledge articles, and another page displays catalog items or incidents or a combination of the two. Different themes can be used for types of content and each theme can provide different user interaction. Content types define the pages that display content from a table. Each content type corresponds to a table.

Every type of document that the CMS displays has an associated content type. Changing the content type requires knowledge of Apache Jelly scripting. However, the common content types (such as service catalog or knowledge base) come in the base system. Content types can be associated with particular sites. This association allows different sites to use different detail pages for the same content type.

Content types define three features of associated documents:

- What does a link to one of these documents look like? For example, if a list of these documents is displayed on a page, how does each entry appear?
- What does a detailed view of one of these documents look like?
- What detail page is used to display the document? This decision is important and is often an area of confusion for new CMS users.

The document content type determines the page that a list of documents points to, the list itself does not determine the page. The content from a link is displayed in a detail content block on a page. The content type determines in which detail block on a page the document content is displayed.

For example, the list block Catalog Top 5 displays the top five items in the Service Catalog table (sc_cat_item). Because the table is (sc_cat_item), the content type sc_cat_item controls how the Catalog Top 5 list is displayed. Clicking any item in the list displays the Service Catalog Detail page with the item displayed on it according to the detail template script. These content types are applied:

- in search results to link to the correct page.
- in the Current Document block to display the current record.
- in links on lists and other places that link to record types.

Several content types are available by default for tables such as Catalog Item (sc_cat_item), Gauge (sys_gauge), and Page (content_page).

Content type defaults that are set for CMS can be overridden for individual sites. Use the Content Types related list on the site record to customize content types.
Configure a content type

Users with the content_admin role can create a content type.

Role required: content_admin or admin

1. Navigate to **Content Management > Content Types**.
2. Click **New**.
3. Complete the Content Type form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select the table whose content will be rendered in Content Management.</td>
</tr>
<tr>
<td>Content site</td>
<td>Select the site that will use this content type.</td>
</tr>
<tr>
<td>Media type</td>
<td>Enter one of the following media types to use with this content type.</td>
</tr>
<tr>
<td></td>
<td>- doctype: UI15 desktop interface only</td>
</tr>
<tr>
<td></td>
<td>- m: Smartphone interface only (not for CMS use)</td>
</tr>
<tr>

</tbody>
</table>

CMS gauge support

Gauges are a graphical way to display information from an instance.

A gauge might, for example, show a bar chart breaking down all open incidents by category. Gauges are fully supported within the CMS system. This means:

1. **You can put a gauge on a CMS page**
2. **You can control what will happen when a user clicks on a cell within that gauge**

**Put a gauge on a CMS page**

You have control over the gauges on a CMS page.

1. Bring up the CMS page in edit mode.
2. Click **Add Content**.
3. Select the gauge you want to add.
4. Place the gauge on the page in the desired location.

Control what happens on a click
Since a CMS system uses multiple pages you have to tell the system which page to use to display drill through content.

In the normal (non CMS) system, when you click a bar in a bar chart or a wedge on a pie chart, you drill through and your current screen is replaced with a list of records meeting the chart’s criteria. For example, if you have a gauge of Incidents by Category and you click the bar labeled Hardware you drill through to a list of all incidents with a category=hardware.

Within the CMS system, there is a similar drill through mechanism at work, but you must manually specify which page to display.

There are two different models of the drill through, use an in-place target frame to receive the content, or use another page to display the content.

Using an In-Place Target

An in-place target is a named iframe on the same CMS page as the gauge. When the gauge is clicked, the drill-through content appears within that iframe rather than changing out the CMS page. The gauge (and the rest of the page other than the target) remain in place and active.

Using a Gauge Target Page

A gauge target page is a separate CMS page that is used to display the drill-through content from a gauge. When a gauge is clicked, the current CMS page is replaced with the gauge target page and the drill-through content is rendered within that second page.

- **Gauge Target Page**
  
  To set a site default, select Gauge Target Page, on the site configuration page. This page is used as the drill-through target for any gauges in the system that do not have a more specific gauge page specified in their content type.

- **Gauge Page**
  
  To set a content-type specific page, you can specify a Gauge Page, on a content type page. Any gauges for this type of content then use that page for any drill through.

  **Note:** The gauge target on a particular content type overrides the default, site level, gauge target.

- **Gauge Target block**
  
  A gauge target page is a normal CMS page, with one special requirement. Somewhere on that page, there must be a Gauge Target block. This market block tells the system where to output the drill through data.

View content types

The following is an example of where you might use Content Types.

This example uses the out-of-box Employee Self-Service (ESS) site as an example.

Role required: content_admin or admin

Use any out-of-box instance of a CMS site.

   The Issue Status, or incident_status CMS page contains two content blocks: Common Answer and Current issues. These content blocks both use Content Types to render results.

   This block matches the Common Answers section of the Issue Status page. The Table field describes the Content Type associated with Common Answers.

4. Use the link to view existing Content Types.

5. Click the Content Type to view the XML that determines how the list and record are rendered in CMS.
   The Default Detail Page field indicates a CMS page that displays a record selected from a List of Content block.

6. Click the Information icon next to the Default Detail Page, to go to that page.

7. From the Default Detail Page, under Related Links, click Edit Page.
   The Detail Block contains a content type formatter. When editing or viewing the page, it is looking for a URL to be passed to determine the record to display, which is why it says ‘Detail record could not be located’.

8. Click the pencil icon to edit and view the Detailed Content block.
   The Type drop down list has “Show the page’s current document” selected, which indicates that the document_id must be passed to this block from the CMS pages, then it can display the record based on the content type listed in the document_id.

9. From the Common Answers block, on the Self Service page, select a record.
   The page opens with a URL similar to: https://<instance name>.service-now.com/ess/knowledge.do?sysparm_document_key=kb_knowledge,02255450d731310013ab49547e61038e
   The table sysparm_document_key=kb_knowledge and sys_id 02255450d731310013ab49547e61038e determine the record. The associated content type, kb_knowledge, renders the content on the Default Detail Page, Portal - Knowledge Detail / url_suffix=knowledge.

**Content blocks**

A block is a defined piece of content within the system that can be reused.

A content page is constructed by arranging customized blocks of content on a page. Content blocks are an important part of a CMS site. Existing content such as reports, gauges, and record lists are automatically available as content blocks and more can be created within the CMS.

After defining content blocks, use them on any content page by adding them to drop zones. For more information, see Add content to a page.

Create content blocks after sites and pages have been designed.

**Configure a content block**

To configure a content block, define it in the appropriate form.

Role required: content_admin or admin

1. Perform one of the following actions to create a content block.
   - Navigate to Content Management > Blocks > (Block type) > New. The form for creating the selected block type opens.
   - Navigate to Content Management > Blocks > All and select the type of content to create from the list.
• Edit a content page and add a stub block of the desired content block type. Click the link in the stub block.

2. Complete the content block form and save it.
3. Add the content block to any content page.

**View CMS block tags**

A CMS block tag is used for advanced block creation and site flexibility.

Role required: content_admin or admin

It is constructed as `<g:content_block> {{Jelly_Tags|Jelly}}` and can be used in either of the following ways.

- Blocks: to display a block inside a block.
- Layouts: to display a block inside a layout.

The tag appears in the format, `<g:content_block type="type" id="sys_id"/>`.

An example of the block tag is included in the ESS Portal sample site.

1. Navigate to **Content Management > Design > Frames**.
2. Click **cms_admin_home_frame**.
3. View the code.

```html
<style>
DIV.cms_administration_home {
  background: url(gray_${current_page.getURLSuffix()}.pngx) no-repeat right top;
}
</style>

<div class="cms_administration_home">
<body>

<!-- Would you like to pivot off of parent page instead?  try this snippet -->

<j:if test="${current_page.getParentPage().getURLSuffix()=='administration'}">
  <g:content_block type="content_block_menu" id="7afc342def002000914304167b2256ac"/>
</j:if>

  The defaults use the page URL suffix to define sub menus
  -->

  <j:if test="${current_page.getURLSuffix()=='administration'}">
    <g:content_block type="content_block_menu" id="7afc342def002000914304167b2256ac"/>
  </j:if>

  <j:if test="${current_page.getURLSuffix()=='community_inspired'}">
    <g:requires name="ess.portal.globals.jsdbx" />
    <g:content_block type="content_block_menu" id="ccd4b8c7efb70000914304167b22566e"/>
  </j:if>

</div>
```

4. To see what the page looks like, navigate to the ESS Portal administration page. For example, http://instance name.service-now.com/ess/administration.do.

Types of content blocks

Content blocks, which make up content pages, are reusable pieces of content defined within the system.

Each content block can be used for a different type of content.

Configure a header block

A header block is a visual element placed at the top of pages. It provides a place for branding and other important site-wide functionality.

Role required: content_admin or admin

Some of the options that are available in headers include, global search, text size toggle, menus for navigational purposes, and the user name with logout link.

1. Navigate to Content Management > Blocks > Headers.
2. Click New.
3. Complete the form.

Header form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the header block.</td>
</tr>
<tr>
<td>Background</td>
<td>Select a background for the header logo and menus.</td>
</tr>
<tr>
<td></td>
<td>• None - No background is rendered.</td>
</tr>
<tr>
<td></td>
<td>• Gradient/Image - Specify an image or gradient image to serve as the background.</td>
</tr>
<tr>
<td></td>
<td>• Colored Bars - Specify colors for three different sections of the header, top, middle, and bottom.</td>
</tr>
<tr>
<td>Image</td>
<td>If Background is Gradient/Image, upload an image for the header block background. For gradients, upload a gradient image.</td>
</tr>
<tr>
<td>Top bar color</td>
<td>If Background is Colored Bars, enter a CSS color or color name to use as the background for the top menu.</td>
</tr>
<tr>
<td>Middle bar color</td>
<td>If Background is Colored Bars, enter a CSS color or color name to use as the background for the logo and text.</td>
</tr>
<tr>
<td>Bottom bar color</td>
<td>If Background is Colored Bars, enter a CSS color or color name to use as the background for the bottom menu.</td>
</tr>
<tr>
<td>Logo</td>
<td>Select a logo image. The image is also a link to the main page.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the block available for use.</td>
</tr>
<tr>
<td>Text</td>
<td>Type the text to display beside the logo.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Conditional</td>
<td>Select the check box and type any scripted conditions to apply in the <strong>Condition</strong> script field that appears.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the header block. The category also determines the detail page in which header block links open. Detail pages often display information in different ways.</td>
</tr>
<tr>
<td>Top Menu</td>
<td>Select a navigational menu block to use as a menu above the logo.</td>
</tr>
<tr>
<td>Bottom Menu</td>
<td>Select a navigational menu block to use as a menu below the logo.</td>
</tr>
<tr>
<td>Height</td>
<td>Specify the height for the header.</td>
</tr>
<tr>
<td>Search</td>
<td>Select this check box to add a search element in the header.</td>
</tr>
<tr>
<td>Font sizer</td>
<td>Select this check box to include text sizing controls in the header.</td>
</tr>
<tr>
<td>Login</td>
<td>Select this check box to include a login link in the header. If the user is logged in, this element displays the user name and a logout link. If you specify a login page on the site record, it is important to include a login link so users can enter their username and password.</td>
</tr>
<tr>
<td>Chat Queue</td>
<td>Select the chat queue that users access by clicking the <strong>Help Desk Chat</strong> button in the header. Clear the field to remove the button. This field appears only if the Chat plugin is active.</td>
</tr>
</tbody>
</table>

**Create a navigation menu block**

Navigation menu blocks enable you to create a menu of links to different content pages.

Role required: content_admin or admin

The following three objects define navigation menus.

- **Menu block**: The menu block defines the entire menu block and how it displays.
- **Menu section**: The menu sections define groups of links displayed within the block.
- **Menu item**: The menu items define the links within each menu section.

1. **Navigate to** Content Management > Navigation Menus.
2. **Click New**.
   A gallery of available navigation menu blocks displays.
CMS menu options

3. Select the desired menu block style.
4. Complete the Navigation Menu form to define the block.

**Navigation Menu form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the block.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the type of navigation menu, which determines how the links are displayed.</td>
</tr>
<tr>
<td>Frame</td>
<td>Select a border style for the navigation menu block.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Select this check box to enable the use of scripted conditions. If selected, the <strong>Condition</strong> and <strong>Logged On</strong> fields appear.</td>
</tr>
<tr>
<td>Logged on</td>
<td>Select this check box to display the navigation menu block only if the user is logged on. This field appears only if <strong>Conditional</strong> is selected.</td>
</tr>
</tbody>
</table>
Configure menu sections

Menu sections define groups of links displayed within the navigation menu block.

Role required: content_admin or admin

1. Navigate to Content Management > Blocks > Navigation Menus and select a block.
2. In the Menu Sections related list, click New.
3. Complete the Menu Section form.

Menu Section form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the menu section.</td>
</tr>
<tr>
<td>Content block menu</td>
<td>Select the navigation menu on which this menu section appears.</td>
</tr>
<tr>
<td>Redirect to</td>
<td>Select what appears when a user clicks the menu section name and icon.</td>
</tr>
<tr>
<td>URL</td>
<td>Click the lock icon to open the edit field, then enter the URL to display when a user clicks the menu section title and icon. This field is available only if Redirect to is set to The specified URL.</td>
</tr>
<tr>
<td>Detail page</td>
<td>Select the content page to open when a user clicks the menu section title or icon. This field is available only if Redirect To is set to A content page.</td>
</tr>
<tr>
<td>Left image DB</td>
<td>Select the image database where your site images are stored.</td>
</tr>
<tr>
<td>Right image DB</td>
<td></td>
</tr>
<tr>
<td>Left image</td>
<td>Select icons to appear on the left and on the right of the name.</td>
</tr>
<tr>
<td>Right image</td>
<td></td>
</tr>
<tr>
<td>Second level text</td>
<td>Enter a description to appear beside the menu section title.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the menu section available for use.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number to indicate where this section appears on the menu relative to other menu sections.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Logged on</td>
<td>Select this check box to display the menu section only if the user is logged on.</td>
</tr>
<tr>
<td>Roles</td>
<td>Click the lock to open a list, then select the roles that can access this menu section if you restrict access by role.</td>
</tr>
<tr>
<td>Category</td>
<td>Select the category in which the menu section belongs.</td>
</tr>
<tr>
<td>Open In</td>
<td>Select the behavior of clicked links.</td>
</tr>
<tr>
<td>iFrame</td>
<td>Enter the name of the iFrame where the link opens when a user clicks the menu section title and icon. Make sure that there is an iFrame on the page where the link opens. This field is available only if Open In is set to Named iFrame.</td>
</tr>
<tr>
<td>Header</td>
<td>Enter header information for the menu section.</td>
</tr>
<tr>
<td>Footer</td>
<td>Enter footer information for the menu section.</td>
</tr>
</tbody>
</table>

4. **Click Submit.**

**Configure menu items**

Menu items are the links that appear within each menu section.

Role required: content_admin or admin

Not all navigation menu sections require menu items. Use menu items to link users to other pages or additional information. These steps use the ESS sample portal site as an example.

1. Navigate to **Content Management > Blocks > Navigation Menus** and select a navigation menu.
   
   For example, select the **Documentation Menu**.

2. From the **Menu Sections** related list, select a menu section.
   
   For example, select **Getting Started**.

3. From the **Menu Items** related list, click **New**.

4. Complete the form.

**Menu Item form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the menu item.</td>
</tr>
<tr>
<td>Menu section</td>
<td>Select the menu section in which this item appears.</td>
</tr>
<tr>
<td>Redirect to</td>
<td>Select what appears when the menu item name and icon are clicked.</td>
</tr>
<tr>
<td>URL</td>
<td>Click the lock icon to open the edit field, then enter the URL to open when the menu item title and icon are clicked. This field is available only if Redirect to is set to The specified URL.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Detail page</td>
<td>Select the content page to open when the name or icon is clicked. This field is available only if <strong>Redirect To</strong> is set to <strong>A content page</strong>.</td>
</tr>
<tr>
<td>Image</td>
<td>Select an icon to appear with the name.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the menu item available for use.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number to indicate where this item appears on the menu relative to other menu items.</td>
</tr>
<tr>
<td>Logged on</td>
<td>Select this check box to display the menu item only if the user is logged on.</td>
</tr>
<tr>
<td>Roles</td>
<td>Click the lock to open a list, then select the roles that can access this menu item to restrict access by role.</td>
</tr>
<tr>
<td>Category</td>
<td>Select the category in which the menu item belongs.</td>
</tr>
<tr>
<td>Open in</td>
<td>Select the behavior of clicked links.</td>
</tr>
<tr>
<td>iFrame</td>
<td>Type the name of the iFrame where the link opens when a user clicks the menu item name and icon. Make sure that there is an iFrame on the page. This field is available only if <strong>Open In</strong> is set to <strong>Named iFrame</strong>.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Menu types**

By changing the **Type** field on the navigation menu block, you can format the same menu in different ways.

**Menu types**

<table>
<thead>
<tr>
<th>Type</th>
<th>Image</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Super Menu for Headers</td>
<td><img src="image" alt="Super Menu" /></td>
<td>The super menu is a hybrid between the drop-down menu and the tabbed system. The user can use a super menu to create a menu from any number of menus.</td>
</tr>
<tr>
<td>Type</td>
<td>Image</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Drop-Down Menu for Headers</td>
<td><img src="image1.png" alt="Image" /></td>
<td>The drop-down menu renders the menu sections as drop-down list. Use the mouse to point to the menu name and view the menu items.</td>
</tr>
<tr>
<td>Tab Menu for Headers</td>
<td><img src="image2.png" alt="Image" /></td>
<td>The tab menu renders the menu sections as tabs. Use the mouse to click the tab and view the menu items.</td>
</tr>
<tr>
<td>Horizontal Blocks</td>
<td><img src="image3.png" alt="Image" /></td>
<td>The horizontal blocks menu renders the menu sections as block headings with menu items as links within the blocks. The blocks are arranged horizontally.</td>
</tr>
<tr>
<td>Type</td>
<td>Image</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Tab Content Block</td>
<td><img src="image1.png" alt="Image" /></td>
<td>The tab content block (horizontal) menu renders the menu sections as tabs with menu items as links within the block.</td>
</tr>
<tr>
<td>Vertical List</td>
<td><img src="image2.png" alt="Image" /></td>
<td>The vertical list menu renders the menu sections as headings with menu items as links below them.</td>
</tr>
<tr>
<td>Vertical Blocks</td>
<td><img src="image3.png" alt="Image" /></td>
<td>The vertical blocks menu renders the menu sections as block headings with menu items as links within the block. The blocks are arranged vertically.</td>
</tr>
</tbody>
</table>

**Menu style customization**

You can customize menu styles in the style sheets your site uses.

Navigate to **Content Management > Design > Style Sheets** to customize style sheets.
Supplementary page navigation menu example code

In the following example, look at the CSS class selectors and rules. Also, review how the block containers (div.cms_menu_section_blocks) are defined based on the outer container (TD.layout_content_submenu_column). The outer container is actually a part of the site layout.

This concept is clearer if you compare the styles to the styles used in the super menu further down in the example. This example shows that there is no need to make a completely new menu system. You can use CSS to change the look and feel of existing menus.

```css
/**
 * SUB MENU VARIATIONS FOR HORIZONTAL MENUS - Section Blocks Menu
 * (cms_menu_section_blocks UI Macro)
 */

TD.layout_content_submenu_column DIV.cms_menu_section_blocks {
  width: 156px;
  height: auto;
  float: left;
  position: relative;
  border-style: solid;
  margin: 0px 0px 0px 0px;
  border: 0px solid #e0e0e0;
  padding: 0px;
  background: none;
  padding: 24px 12px 0px 12px;
}

TD.layout_content_submenu_column DIV.sub_menu_section {
  width: 156px;
  height: 20px;
  float: left;
  border-style: solid;
  border: 0px solid #e0e0e0;
  padding: 0px;
  background: none;
  padding: 0px 12px 0px 12px;
}

SPAN.cms_sub_menu_list_link, TD.submenu_cell A {
  color: #FFF;
}

TD.layout_content_submenu_column IMG.menu_bullet {
  display: none;
}

TD.cms_menu_section_blocks_title h2, TD.cms_menu_section_blocks_title h2 a, TD.cms_menu_tab_blocks_text h2 {
  margin:0;
  padding: 0px;
  font-size: 11px;
  text-transform: uppercase;
  color: #42C4DD;
  font-weight: normal;
  white-space: nowrap;
}

TD.layout_content_submenu_column a.cms_menu_block_item {
  margin:0;
  padding: 0px;
  font-size:11px;
}
Super menu sections example code

The following menu is a simple float grid. The defaults are written first. Then, below the "SUPER MENU VARIATIONS..." comment, the defaults are overwritten by adding a containing div with a unique class. In the code that renders the header for the base system, the bottom menu resides in a table cell with the class of cms_header_bottom_menu (refer to the TD.cms_header_bottom_menu CSS selector).

```html
TD.layout_content_submenu_column DIV.cms_menu_section_blocks {
    width: 156px;
    height: auto;
    float: left;
    position: relative;
    border-style: solid;
    margin: 0px 0px 0px 0px;
    border: 0px solid #e0e0e0;
    padding: 0px;
    background: none;
    padding: 24px 12px 0px 12px;
}

TD.layout_content_submenu_column DIV.sub_menu_section {
    width: 156px;
    height: 20px;
    float: left;
    border-style: solid;
    border: 0px solid #e0e0e0;
    padding: 0px;
    background: none;
    padding: 0px 12px 0px 12px;
}

SPAN.cms_sub_menu_list_link, TD.submenu_cell A {
    color: #FFF;
}

TD.layout_content_submenu_column IMG.menu_bullet{
    display: none;
}

TD.cms_menu_section_blocks_title h2, TD.cms_menu_section_blocks_title h2 a, 
TD.cms_menu_tab_blocks_text h2 {
    margin:0;
    padding: 0px;
    font-size: 11px;
    text-transform: uppercase;
    color: #42C4DD;
}```
4.2 2. Super Menu Sections Example Code

This menu is essentially a simple float grid. The defaults are written first. Then, below the "SUPER MENU VARIATIONS..." comment, the defaults are overwritten by adding a containing div with a unique class. In the code that renders the header for the base system, the bottom menu resides in a table cell with the class of "cms_header_bottom_menu" (note the TD.cms_header_bottom_menu CSS selector).

/ *******************************************************************************************
Section Blocks Menu (cms_menu_section_blocks UI Macro)
******************************************************************************************* /

div.cms_menu_section_blocks {
    width: 260px;
    height: 260px;
    float: left;
    border-style: solid;
    margin: 0px 0px 12px 12px;
    border: 1px solid #e0e0e0;
    padding: 10px;
    background: url(blue/portal_horizontal_bkg.pngx) repeat-x center bottom;
}

p.cms_menu_separator {
    border-top:1px dotted #ccc;
    margin-top: 6px;
    margin-bottom: 6px;
}

  border-left: 1px solid #DDD;
  border-top: 1px solid #EEE;
}
Example menu items and content links

The method for choosing a link target (current window, iFrame, or new window) and referencing the item linked (page, attachment, or URL) are similar. Review examples of how to link within these elements.

- A content page reference helps you select the desired page. For example, the value `home.do` links to the site homepage.
- An attachment reference allows you to reference a single file attached to the menu item or section record. If there is more than one attachment, only the first attachment is referenced. The link is then generated automatically and displays a Browser File Save prompt.
- The specified URL reference allows you to link to a full URL string in your instance or from another system. For example, `com.glideapp.servicecatalog_cat_item_view.do?sysparm_id=66c313e7c0a8016b008eb618e3d97f5&sysparm_nameofstack=b654d15bef921000914304` links to the Ask a Question record producer. Use this reference to link to a page in an existing intranet system.

Menu items can be seen as featured links from each section. There are many choices in URL definitions and link options. Links within the ESS Portal open content pages within the site. In turn, each page has an iFrame or set of blocks that houses the corresponding data. This method is useful for rapid prototyping, but consider where to create dynamic detail pages and use the available linking options.
Menu items are similar to content links except they are called by the list block, not as part of a navigation menu block. Menu items and content links function the same as far as how they are defined and the options available for linking to items. Content links are meant to be called through a list block that calls the Content Link (content_link) table. Content links do not have the **Logged in** field or the **Roles** option used to control the UI experience for various roles.
View menu and list examples

Menu sections define groups of links and how the links behave.

Role required: content_admin or admin

For example, link behavior determines which page opens when the link is clicked and how it opens, such as in a new page or a new frame. Use the following procedure to view a sample menu section.

2. Click Portal - Block Menu.
3. In Menu Sections related list, click Order Things.
4. Click the reference icon next to Detail Page to open the page.
5. In Related Links, click Edit Page.
   By default, the link goes to the Order Things page with the Portal - Order Splash Menu (Vertical Block Menu) in the page content area.
   In most default CMS menus, the menu section has the menu title with secondary text, a separation line, and the links you define as menu items. Although the design is versatile and flows well between pages, there could be questions about linking and scalability to large catalogs. This practice may only be useful for a small catalog with limited items.
6. To view an example of dynamic content, follow these steps to look at the request catalog list/grid view on the ESS Portal.
   a) Add /ess/manage.do to your instance URL.
      For example, https://<instance name>.service-now.com/ess/manage.do.
   b) In the Code Example Demos section, click Request Catalog List / Grid View.
   c) Browse the catalog items.
Configure dynamic blocks

Use dynamic blocks to use scripting or to pull information from the system. Dynamic blocks are where most of your content resides.

Role required: content_admin or admin

A good use of dynamic blocks is job postings. Store the postings in knowledge articles and display the postings with a dynamic block.

Several dynamic blocks are predefined, including the following items.

- **New Content**: Each of the new content blocks allows for creating blocks while editing content pages.
- **Clean Login**: The default login page requesting user name and password, which includes a "Remember Me" check box. After the user logs in, this block triggers login rules.
- **Login**: An area that allows a logged out user to log in and a logged in user to log out. This block is especially useful on publicly available content pages.
- **Search**: The global text search field. Currently, global text search is the only form of search that can be included in a content page.
- **Search Results**: An area for displaying global text search results.

For information about Apache Jelly, see [Jelly tags](#).

1. Navigate to **Content Management > Dynamic**.
2. Click **New**.
3. Complete the Dynamic Content form.

### Dynamic Content form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the dynamic content block.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the dynamic block. The category also determines the detail page in which dynamic block links open.</td>
</tr>
<tr>
<td>Frame</td>
<td>Select a border styling for the dynamic block. For more information, see <a href="#">Format a frame</a>.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the block available for use.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Enter any scripted conditions to be applied. If selected, adds a Condition script field to the form.</td>
</tr>
<tr>
<td>Two phase</td>
<td>Select this check box to allow two phase <a href="#">Jelly tags</a>.</td>
</tr>
<tr>
<td>Dynamic content</td>
<td>Enter the XML script field that determines the behavior of the dynamic block.</td>
</tr>
</tbody>
</table>

Catalog cart block

The catalog cart block is a dynamic block provided in the base system.

This block provides the same cart that is available within the service catalog. If the site definition has the **Use external cart** option selected, include this block in the site so users can interact with their catalog cart.
Catalog cart block is available when the `glide.sc.use_cart_layouts` property is set to false.

*Customize the list block*

List blocks are content blocks that dynamically generate a list of links to records within the instance. When a user clicks a link in a list block, the associated information is displayed in a detail page determined by its content type.

Role required: content_admin or admin

Make the list using a simple query on any table or by scripting a more advanced query. Lists are powerful and flexible. Here are some places that allow you to have complete control over the list display.

**List control**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frames</td>
<td>Frames provide a method to create decorative containers for content blocks and other elements within the site. When frames are used with the <strong>Type</strong> field, the designer has complete control over list placement.</td>
</tr>
<tr>
<td>List Type</td>
<td>The List Definitions module defines the type of lists available for content pages. On the List Block form, select a list definition in the <strong>Type</strong> field.</td>
</tr>
<tr>
<td>List Filtering</td>
<td>Provides every field in the referenced table for more granular results.</td>
</tr>
<tr>
<td>Max Entries</td>
<td>Limits the results from a table to fit the design of the block.</td>
</tr>
<tr>
<td>Order and Order Direction</td>
<td>Allows sorting by any field in the referenced table, in either ascending or descending order.</td>
</tr>
</tbody>
</table>

You can also use list blocks to create a list of links to information outside your instance. Create the external links as records on the Content Link (`content_link`) table, and then follow the steps in this procedure.

1. Navigate to **Content Management > Lists**.
2. Click **New**.
3. Complete form.

**List Block fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the list content block. It is used to identify the record in the instance and is not displayed on the content page. Use the <strong>Title</strong> field for that purpose.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the list content block.</td>
</tr>
<tr>
<td>Type</td>
<td>Select a list definition UI macro to format the list of links. For more information, see <a href="#">Configure list definitions</a>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Frame</td>
<td>Select a border style for the list block. For more information, see <a href="#">Create a frame UI macro</a>.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to enable generating a list from a script, rather than from a simple filtered query.</td>
</tr>
<tr>
<td>Query</td>
<td>Filters the results using a condition builder.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the block available for use.</td>
</tr>
<tr>
<td>Title</td>
<td>Enter the name to display at the top of the list block when it appears in a content page.</td>
</tr>
<tr>
<td>Maximum entries</td>
<td>Set the maximum number of entries to display in this list block.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table to query for the list items. The table determines which detail page displays when a user clicks a link in the list block. For more information, see <a href="#">Configure a content type</a>.</td>
</tr>
</tbody>
</table>

**Note:** The list shows only tables and database views that are in the same scope as the list block.

| Conditional | Select this check box to enable the use of scripted conditions. If selected, a Condition script field appears. Other fields that appear include the Logged On and Omit if empty check boxes. |

4. Click **Submit**.

**Configure list definitions**

List definitions, similar to content management frames, are decorative containers that control the look and feel of lists.

Role required: content_admin or admin

Specifically, list definitions are UI macros that use Adobe Jelly script to define how a list is rendered inside a list block. Site design often requires multiple list styles within the layout. Lists are often the primary form of navigation within a site, so it is important to have control over their formatting.

Configuring list definitions requires a knowledge of Adobe Jelly.

1. Navigate to **Content Management > Configuration > List Definitions > ..**
2. Click **New**.
3. Complete the List Definition form.

**Configure a static HTML block**

Use static blocks for text that does not change. For example, use a static block for a site footer with only the company or organization name. A static HTML block allows any HTML code to be run within a page.

Role required: content_admin or admin
Anyone who edits their own HTML, Jelly, or Javascript may find the HTML editor in the static block limited. The HTML editor can also add tags or formats that advanced coders find unnecessary. For more advanced options, use dynamic blocks.

1. Navigate to Content Management > Blocks > Static HTML.
2. Click New.
3. Complete the Static Content form.

### Static content form

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the static HTML content block.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the static HTML block. The category also determines the detail page in which static HTML block links open. Detail pages often display information in different ways.</td>
</tr>
<tr>
<td>Frame</td>
<td>Select a border styling for the static HTML block. For more information, see Format a frame.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the block available for use.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Enter any scripted conditions to be applied. If selected, adds a Condition script field and Logged on check box to the form.</td>
</tr>
<tr>
<td>Static Content</td>
<td>Enter HTML code that determines the behavior of the static HTML block.</td>
</tr>
</tbody>
</table>

4. Click Submit.

Format an image as a static HTML block
An easy way to add an image to a CMS page is to use a static HTML block. After the block is created, you can reuse it throughout the site.

Role required: content_admin or admin

1. Navigate to Content Management > Design > Images.
2. Click New.
3. Select a Category to help organize the images.
4. Type the file name of the image, including the extension (such as .png).
5. Upload the file by selecting Click to add and browsing for the image.
6. Click OK.
7. Click Update.
9. Paste the following code into the HTML block, substituting the image name as uploaded in the previous step.

   The "x" at the end of the filename is required for image caching.

   ```html
   <img src="<image_name>.gifx"/>
   ```

Now the image is a static HTML block and you can add it to any content page. Use standard HTML code to alter the image in the content block.
Configure Flash movie blocks
Use a Flash movie block to embed any Flash movie (.swf file) as an attachment or by referencing a URL in a content page.

Role required: content_admin or admin

To add streaming video or Flash video (.flv), for example, to a knowledge article, see Embed videos in HTML fields.

1. Navigate to Content Management > Specialty Content > Flash Movies.
2. Click New.
3. Complete the Flash Movie form.

Flash Movie form

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the Flash movie block.</td>
</tr>
<tr>
<td>Source</td>
<td>Specify where the Flash movie is found.</td>
</tr>
<tr>
<td>· Attachment: If this choice is selected, upload the Flash movie to this record.</td>
<td></td>
</tr>
<tr>
<td>· Link to External Object: If this choice is selected, a URL field appears. Specify the Flash movie URL and ensure that the Flash movie is publicly accessible.</td>
<td></td>
</tr>
<tr>
<td>Height</td>
<td>Enter the height of the Flash movie in pixels.</td>
</tr>
<tr>
<td>Width</td>
<td>Enter the width of the Flash movie in pixels.</td>
</tr>
</tbody>
</table>

4. Click Submit.

Configure content links
Content links are the predecessors to navigation menus. You can use content links to create navigational links to information outside of your instance.

Role required: content_admin or admin

After the content link is configured, it must be defined in a list block. List blocks use content links to reference information outside of your CMS.

1. Navigate to Content Management > Specialty Content > Content Links.
2. Click New.
3. Complete the Content Link form.

Content Link form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the content link</td>
</tr>
<tr>
<td>Redirect to</td>
<td>Select the location of the external link</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the list content block.</td>
</tr>
<tr>
<td>URL</td>
<td>Click the lock icon to open the edit field, then enter the site URL to open when the link is clicked. This field is available only if Redirect to is set to The specified URL.</td>
</tr>
</tbody>
</table>
4. Click Submit.
5. From Content Management > Blocks > Lists, create a list block that references the content links by selecting Content Link in the table field.
6. Create a query to determine which external links display on the page. For example, the query Category is Search displays any external links that have a category defined as Search.
7. Click Update.

Configure iFrames
An iFrame embeds a URL on a page within a frame. It can embed external pages or render ServiceNow content.

Role required: content_admin or admin

Configure an iFrame with forms you create in the instance and link to the page in which the iFrame resides.

Note: Do not add any type of report, such as a calendar, to iFrames. For more information on adding a report directly onto a page without using iFrames, see Embedding reports in Jelly.

Note: The ServiceNow login portlet is the only content supported within an iframe HTML element. To deliver ServiceNow content from a web page, see Service Portal instead.

1. Navigate to Content Management > Specialty Content > iFrames.
2. Click New.
3. Complete the iFrame form fields.

iFrame form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the iFrame block.</td>
</tr>
<tr>
<td>Frame name</td>
<td>Type a name for the frame on the page. When you use iFrames to present</td>
</tr>
<tr>
<td></td>
<td>ServiceNow content such as forms or lists, the frame name must be gsft_main.</td>
</tr>
<tr>
<td></td>
<td>This name allows links within the iFrame to open within the iFrame.</td>
</tr>
</tbody>
</table>
Integrate Live Feed with CMS

You can provide access to Live Feed from pages built in the Content Management System (CMS). For example, allow an end user to access your company feed via the ESS portal.

The ESS Portal template includes the Portal - Live page and Live Feed dynamic block (requires the Live Feed plugin). To provide access to Live Feed from CMS pages, add the Live Feed dynamic block to a CMS page or include the Portal - Live page in a site.

1. Navigate to Content Management > Specialty Content > iFrames.
2. Click New.
3. Complete the iFrame block form with the following values.

### iFrame values

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name: Live Frame</td>
</tr>
<tr>
<td>Frame name</td>
<td>Type a frame name: live_frame</td>
</tr>
</tbody>
</table>

---

**Note:** Some browsers suppress iFrames because they use an X-Frame-Options header value of SAMEORIGIN. The X-Frame-Options header was introduced in Internet Explorer 8 RC1, to help detect and prevent frame-based redressing. The SAMEORIGIN value causes the browser to render a blank page instead of the target page of the <frame> or <iframe> when the frame target is not on the same origin as the page itself. Support for this header has been implemented in Safari 4.0, Chrome 4.1.249.1042, and Firefox 3.6.9 and above.
### Field | Input value
--- | ---
URL | Enter `https://instance name/live_feed.do?sysparm_doctype=true`. Replace instance name with your instance URL, for example, `<myinstance>.service-now.com`.

### Sizing
Select **Fixed Size** and enter height and width pixel dimensions according to the page on which you plan to display the feed. For example, enter a width of 1024 and height of 768.

4. Click **Submit**.
5. Complete the steps in [Add the block to a page](#).

**iFrame methods**

The following examples show how system records are pulled into an iFrame that is placed on a content page.

For system lists or forms, use the frame name `gsft_main` so that links work properly.

- **Order Hardware** is an example of linking to a catalog category.
  - **URL:** `com.glideapp.servicecatalog_category_view.do?sysparm_parent=d258b953c611227a0146101fb1be7c31&sysparm_view=`
  - **Frame name:** `gsft_main`

- **My Approvals List** is an example of linking to a list with a view filter and a JavaScript that reference the authenticated user.
  - **URL:** `sysapproval_approver_list.do?sysparm_query=approver=javascript:getMyApprovals()&sysparm_view=ess`
  - **Frame name:** `gsft_main`

- **Service Catalog Home Page (system)** references the system catalog page within the Service Catalog application. If you are satisfied with the way the catalog looks, this method is an easy way to bring the page into a CMS design.
  - **URL:** `catalog_home.do?sysparm_view=catalog_default`
  - **Frame name:** `gsft_main`

- **Problem Management Overview** references a homepage. `../` makes the URL string relative to system homepages. Without it, the URL string resolves to the default CMS homepage reference in the site.
  - **URL:** `../home.do?sysparm_view=problem_overview`
  - **Frame name:** `gsft_main`

**Configure a detailed content block**

A detailed content block displays the content of an existing document, such as an incident, knowledge article, or service management request. The document type determines the page that a list of documents points to.

**Role required:** content_admin or admin

The block works with content types in the **Default detail page** field. For more information, see [Configure a content type](#).
If you plan to use a script to find a document, configure the form to add the **Script** field if it is not displayed.

1. Navigate to **Content Management > Configuration > Page Detail Settings.**
2. Click **New.**
3. Complete the Detailed Content form.

### Detailed Content form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the Detailed Content block.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the detailed content block. If the block <strong>Type</strong> is <strong>Show the page’s current document</strong>, the category displays content from any link of the same type.</td>
</tr>
<tr>
<td>Frame</td>
<td>Select a border styling for the detailed content block. For more information, see <a href="#">Format a frame</a>.</td>
</tr>
<tr>
<td>Model Document</td>
<td>Select the document to display by default.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the block available for use.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the behavior for the block.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Show a Specific Document</strong>: Displays the <strong>Model Document</strong>.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Show the page’s current document</strong>: Displays the currently selected document.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Use a script to find a document</strong>: Uses the <strong>Script</strong> field to select a particular document.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Select the check box and enter any scripted conditions to be applied. Selecting this check box adds a <strong>Condition</strong> script field and <strong>Logged on</strong> check box to the form.</td>
</tr>
<tr>
<td>Script</td>
<td>Enter a script to find an appropriate document if the <strong>Type</strong> is set to <strong>Use a script to find a document</strong>. Set the <strong>Return</strong> to the GlideRecord of the desired document.</td>
</tr>
</tbody>
</table>

4. Click **Submit.**

### Content Management and the Apache Jelly engine

Apache Jelly is a Java-based and XML-based scripting and processing engine for turning XML into executable code.

The Apache Jelly engine closely resembles XML and should be comfortable for developers familiar with JavaScript, XML, XHTML, or HTML. In the ServiceNow instance, the Apache Jelly engine renders items such as forms, lists, and UI Pages. Apache Jelly code renders well within a dynamic content block, but can have issues when used in static blocks. You can use Jelly tags, calls, and statements, but HTML acts just like XHTML.

```xml
<?xml version= "1.0" encoding= "utf-8" ?>
```
Ensure that all tags are closed. If the tag is not a naturally closing tag, then place a forward slash before the end bracket. For example, a `<BR />` or an `<IMG src="cms.png" />`.

If you are unfamiliar with Jelly scripting, review these topics:

- **Jelly tags**
- **Extensions to Jelly syntax**
- **Jelly escaping types**

Include the following tag with all Apache Jelly scripts.

```xml
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null" xmlns:g2="null">
</j:jelly>
```

The tag looks complex, but keep the following information in mind.

- **Apache Jelly script uses multiple namespaces.**
- **There are two types of prefixes in tags: j and g.** The j prefix is used for tags that are natively part of Apache Jelly. The g prefix is used for tags that the ServiceNow platform created and is using for platform purposes.

The j2 and g2 prefixes are just like j and g, except that they are processed in a second phase. The Apache Jelly script parser runs through each j and g tag respectively. For example:

```xml
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null" xmlns:g2="null">
  <j:set var="jvar_phase1" value="Hello" />
  <j2:set var="jvar_phase2" value="World" />
  ${jvar_phase1} ${jvar_phase2}
</j:jelly>
```

In phase 1, the parser runs through all the j and g tags. It then caches the result. Before it runs the second phase, it takes the j and g namespaces and moves the namespaces to the second phase. It looks something like the following code.

```xml
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="jelly:core" xmlns:g2="glide">
  <j2:set var="jvar_phase2" value="World" />
  Hello ${jvar_phase2}
</j:jelly>
```
For subsequent calls of this script, only phase 2 is parsed.

**Note:** If you plan to use phase 2 Jelly tags (g2 and j2) on the Content Type (content_type) or Dynamic Content (content_block_programmatic) tables, select the **Two phase** option on the content form.

Another example is to create a report of all open incidents assigned to each group. For this purpose, you could use a report and save time, but it is a good example for learning Jelly. Start with the Jelly tag:

```jelly
<j:jelly trim= "false" xmlns:j= "jelly:core" xmlns:g= "glide" xmlns:j2= "null" xmlns:g2= "null" >
</j:jelly>
```

First, you need a list of open incidents. Use a `g2:evaluate` tag. The `evaluate` tag runs the script. Anything inside the tag is parsed like a business rule, so, for example, you can call global business rules, script includes, and gliderecord.

```jelly
<j:jelly trim="false" xmlns:j= "jelly:core" xmlns:g= "glide" xmlns:j2= "null" xmlns:g2= "null">
  <g:evaluate var="jvar_groups" object="true">
    var gr = new GlideRecord("sys_user_group");
    gr.orderBy('name');
    gr.query();
    gr;
  </g:evaluate>
</j:jelly>
```

This script is in phase 1 because frequent changes to incident assignment groups are not expected. Also notice the `var` attribute on the `evaluate` tag. This attribute specifies what variable is set from this block. At the end of the script, there is a `gr` on a line by itself. That last line is what sets the variable.

You can omit the `jvar_groups` variable, but then all the variables in the `evaluate` tag become Apache Jelly variables. The `object=true` specifies that the variable is not a primitive data type. If `object=true` is omitted, the script would break because `jvar_groups` would only be able to hold items like integers and strings.

After the `evaluate` tag, loop through these groups and find the incidents for each one.

```jelly
<j:jelly trim="false" xmlns:j= "jelly:core" xmlns:g= "glide" xmlns:j2= "null" xmlns:g2= "null">
  <g:evaluate var="jvar_groups" object="true">
    var gr = new GlideRecord("sys_user_group");
    gr.orderBy('name');
    gr.query();
    gr;
  </g:evaluate>
  <table>
    <tr>
      <th>Name</th>
      <th>Incidents</th>
    </tr>
    <j:while test="${jvar_groups.next()}">
      <tr>
        <td>${HTML:jvar_groups.getValue('name')}</td>
      </tr>
    </j:while>
  </table>
</j:jelly>
```
You can include normal XML in the Apache Jelly script at any time. Since there is no namespace, the Apache Jelly script does not try to parse the XML tags. Notice the j:while loop. It is a normal while loop and can iterate through a GlideRecord object. Also notice that you output a value with $\{HTML:jvar_groups.getValue('name')\}. Here are the important elements:

- The outer brackets, $\{\}$, specify the output of the variable and the phase in which the variable is output: $\{\}$ means first phase, $\{[\} means second phase.
- HTML before the expression is for escaping the output. The expression jvar_groups.getValue('name') is being escaped for HTML. For other types of escaping, there are JS (Javascript), NS (No Script), and some other options.

To select only one record and not iterate through many records, the code looks like the following example:

```xml
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null" xmlns:g2="null">
  <g:evaluate var="jvar_groups" object="true">
    var gr = new GlideRecord("sys_user_group");
    gr.orderBy('name');
    gr.query();
    gr;
  </g:evaluate>
  <j:if test="${jvar_groups.next()}">
    We found ${HTML:jvar_groups.getValue('name')}
  </j:if>
</j:jelly>
```

Content management and Jelly code examples

Code examples

**Header Example Code**

This dynamic content block needs to be active and have the 'Two Phase' option clicked. The g:requires tag is including the UI script defined in the system whose name is 'servicenow.website.globals'. The file extension in the call is .jsdbx and is used only in the call to the UI script, not in the name of the script in the system. For JSDBX, the file being called is a JavaScript(.js) defined within the database (db) that needs to be cached (x).

```xml
<?xml version= "1.0" encoding= "utf-8" ?>
<j:jelly trim = "false" xmlns:j = "jelly:core" xmlns:g = "glide" xmlns:j2 = "null" xmlns:g2 = "null" >
  <g:requires name = "servicenow.website.globals.jsdbx" />
</j:jelly>
```

**Page Title and Description Example Code**

This dynamic content block needs to be active. There are two actions within this code snippet. First is a forward-looking string container that allows site translation, the $\{gs.getMessage(©Your Text©)\} string call). The second action pulls in the page title and description, $\{current_page.getName()\} and $\{current_page.getDescription()\}.  

```xml
<?xml version= "1.0" encoding= "utf-8" ?>
<j:jelly trim = "false" xmlns:j = "jelly:core" xmlns:g = "glide" xmlns:j2 = "null" xmlns:g2 = "null" >
  <j:if test = "${current_page.getName()=='Solutions'}" >
    <h1 class = "page_name" > <b> <a href = "solutions.do?" title =
```
List Block Pulling From Knowledge Articles Example Code

This code example contains one of the best tricks in the CMS. Using the type field with draws from a number of defined list definitions to make slight, or very dramatic changes, to list display. Because the UI is open to configuration and innovation, this is a good opportunity to use design skills. Anyone who can use HTML and CSS knows that a basic list can be turned into a float grid or be made inline. The combinations are limited only by what the designer can dream up and code.

In the code example, there is a custom logo field (u_logo) added to the Knowledge form. The custom field displays customer logos, partner logos, and award images on the awards page. There are a number of different sections that use this list definition so efficient reuse is taking place.

- div class="cms_knowledge_list customer_success" - Begin by creating an outer container with a unique class name that can be used as a basis for CSS style selectors and rules. From the outer container, many of the child elements can be accessed for theming.
- <g:for_each_record file="${current}" max="${jvar_max_entries}"> - Loop for list creation that calls the selected table record and the entries set on the list form.
- <a href="knowledge.do?sysparm_document_key=kb_knowledge,${current.sys_id}"><img src="${current.u_logo.getDisplayValue()}" alt="${current.text}" width="110px"/> - Defines linking to the article detail in the knowledge base. For further reference, look at content types within the site definition and you will see some similarities. The knowledge.do? portion of the URL points to the knowledge detail page which (as mentioned above) is mandatory if you plan to call the knowledge base in your CMS site. The rest of the URL represents the syntax for calling a knowledge article by its sys_id. Each and every item housed within the system has a unique sys_id.
- ttt>${SP}-${SP}${current.author.first_name}${SP}${current.author.last_name}</tt> - This example is commented out and not used, but it is still interesting in that it has a jelly call ${SP} and it pulls the knowledge article’s author by first and last name.
Style in Content Management

Content pages can be styled with CSS, just like any HTML website. Three elements control CSS styles:

- **Style Sheets** are records containing CSS declarations.
- **Themes** are groups of style sheets that can be invoked together.
- **Frames** are UI macros that define the outer border of individual content blocks as they appear on a content page. Frames work by calling on particular definitions in the style sheets.

**Style sheets**

Styles sheets are standard Cascading Style Sheets (CSS) that define the look and feel of all elements within the interface. Cascading Style Sheets (CSS) can either be internal (stored in the database) or external (hosted on the server), based on organizational needs. To define an internal style sheet, use standard CSS in the style field. Using external CSS allows the Content Management System to use the same CSS as a corporate website or other online resource.

Use an external style sheet by defining a URL that points to the .cssx file. If you upload a .cssx file to the platform, you can reference the .cssx file using a URL.

Content pages do not reference style sheets directly. To invoke a style sheet, you assign the style sheet to a Theme using the related list on the Theme form.

**Design themes**

Design themes are the convergence of structure and styling, making them a critical tool for creating a powerful user interface.

For a successful project, review the corporate style guide and communicate with the corporate website art team. If the organization has an art or design department that maintains branding, include them in this process.

A theme is a collection of one or more style sheets (CSS files) that define a consistent look for a set of pages. In most environments, many pages share a few themes. Use multiple themes within a site to create stylistic differentiators between site areas. You can also use a single theme to create one unified look and feel for the site.

**Customize a design theme**

A theme is a collection of one or more style sheets (CSS files) that define a consistent look for a set of pages.

Role required: content_admin or admin

Themes can be invoked in any of the following ways.

- Directly by content pages.
- As the default theme of a content site.
- On the configuration page as a global default.

1. Navigate to Content Management > Design > Themes.
2. Click New.
3. Type a name for the theme and mark it as Active.
4. Right-click the form header and click Save
   The Style Sheet related list appears.
5. Use the Style Sheet related list to add style sheets to the theme.

Doctypes

The view_content html page template on which all CMS is based defaults to doctype=html.

The code looks like the following HTML source code.

```html
<!DOCTYPE HTML>
```

If your CMS site does not render properly, remove the doctype from the page by setting the following property:

- glide.html.doctype.pages =
  chat_desktop, live_feed, live_feed_small, navigator, navpage11, image_browse

The following is the default for this property.

- glide.html.doctype.pages =
  chat_desktop, live_feed, live_feed_small, navigator, navpage11, image_browse, view_content

Setting this doctype offers these benefits for building new sites:

- Incorporating common practice: Use a practice that is becoming widely adopted across the Internet and can prevent certain browsers from running in quirks mode.
- Cleaner CSS and markup: Write more standards-based CSS and markup to promote code sharing.
- A step towards browser compatibility: Find solutions that work across browsers and avoid browser-specific workarounds.

Format a frame

Frames provide a way to manage decorative containers for content blocks and any other elements within the site. For example, one frame can be a container, made of div or span tags, that is styled with rounded corners.

Role required: content_admin or admin

Individual content blocks use a frame UI macro to define the frames. When viewing a content block form, the Frame field offers a choice between the different frame UI macros. The frame UI macro does not, however, have the definition for the frame within its Jelly script. Instead, it references a particular frame as defined in a style sheet.

Configuring a new frame is a two-step process.

1. Define the frame in a style sheet.
2. Create the frame UI macro to invoke the frame definition.

Define a frame in a style sheet

Add style definitions for any custom frame UI macro you create.

Role required: content_admin or admin

Each frame has its own class name.

1. Navigate to Content Management > Design > Style Sheets.
2. Select a style sheet to contain the frame definition.
   Base system themes use a separate Frames style sheet.
3. Add the following code, substituting the desired frame name and style:
   
   ```
   div.FRAMENAME{border:STYLE;}
   ```
4. Click Update.

Create a frame UI macro
Copy an existing frame UI macro to display content in a custom frame.
Role required: content_admin or admin
Create a custom frame UI macro if you want to control the style of the frame with your own style sheet definitions.

1. Navigate to Content Management > Design > Frames and select one of the existing frame UI macros.
2. Change the name to match the FRAMENAME you used in the style sheet.
3. Right-click the header bar and select Insert and Stay.
4. Update the frame name in the XML field as shown:
   
   ```
   <div class="FRAMENAME">
   ```
5. Click Submit.

- In any content block form, select the UI macro.
- Define the frame in a style sheet.

Content Management meta tags
Meta tags are special tags in web pages that contain information about the page but are not rendered with the page. You can define custom meta tags for content pages.

Meta tags are not noticeable to a page visitor unless the visitor looks at the page source code. Web search engines read meta tags as they "crawl" the web, identifying and organizing content. Modern website designers often use meta tags to embed "hints" to search engines about how to index or otherwise crawl the site.

Structurally, a meta tag consists of a tag and a name/content pair and looks similar to the following code.

```
<meta name="generator" content="MediaWiki 1.16wmf4" />
```

The Content Management System allows you to define both site level and page level tags.

Configure a page level meta tag
A page level tag is a meta tag defined on a specific page and included on only that page.
Role required: content_admin or admin
If an individual page has a specific tag with the same name as the site, the page tag takes precedence.

1. Navigate to Content Management > Pages.
2. Open the page.
3. If not already included, add the Meta Tags related list to the form.
4. In the Meta Tags related list, click New.
Configure a site level meta tag

A site level tag is a meta tag is defined on a site and included on every page within that site.
Role required: content_admin or admin
If an individual page has a specific tag with the same name as the site tag, the page tag takes precedence.
1. Navigate to Content Management > Sites.
2. Open the site.
3. If not already included, add the Meta Tags related list to the form.
4. In the Meta Tags related list, click New.
5. Enter a Name and Content for the tag.
6. Click Submit.

Configure DIV-based layouts

After you create your site, you can change the site layout with DIV tags.
Role required: content_admin or admin
Many web page layouts use tables for a consistent look and feel. Tables are effective for numbers and statistics, but can be limiting for designing other types of information. DIV tags are flexible block-element tags. To use DIV tags for layouts, give the tag an ID and assign attributes using CSS.

Changing to CSS and DIV tags help in the following ways:
- simplify code
- reduce the amount of code
- increase page load speed
- separate content from presentation
- help pages adapt to different device resolutions
- make pages easier for search engines to crawl
- make code more compliant with evolving web page design standards

A theme named Administration Theme - Charcoal is included as an example of CSS-driven, DIV-based layouts. To view the Administration Theme - Charcoal DIV-based layout, complete the following steps.
1. Navigate to Content Management > Design > Layouts.
2. Click Admin 1 Column
3. Review the code.

Content meta tag hierarchy

Page and site level meta tags are included in a content meta tag hierarchy.

Site and page level tags

CMS supports page level and site level tags. The system behavior is to show the sum of all page level and site level tags. For example, if you have two tags on the site and one tag on the page, all with different names, you see three tags on the page. Two are from the site and one is from the page. If both the site and the page have a tag of the same name, only the page tag is used.
Note: The Content Management System does not support some commonly used meta tags. For example, you cannot use the X-UA-Compatible meta tag, which allows you to specify which version of Internet Explorer a site should be rendered in.

Example: all tags have unique names

<table>
<thead>
<tr>
<th>Site Level Name</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>breakfast</td>
<td>eggs</td>
</tr>
<tr>
<td>lunch</td>
<td>sandwich</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Page Level Name</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>dinner</td>
<td>steak</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Output Name</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>breakfast</td>
<td>eggs</td>
</tr>
<tr>
<td>lunch</td>
<td>sandwich</td>
</tr>
<tr>
<td>dinner</td>
<td>steak</td>
</tr>
</tbody>
</table>

Example: page level tag overrides site level tag

<table>
<thead>
<tr>
<th>Site Level Name</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>breakfast</td>
<td>eggs</td>
</tr>
<tr>
<td>lunch</td>
<td>sandwich</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Page Level Name</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>lunch</td>
<td>tacos</td>
</tr>
<tr>
<td>dinner</td>
<td>steak</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Output Name</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>breakfast</td>
<td>eggs</td>
</tr>
<tr>
<td>lunch</td>
<td>tacos</td>
</tr>
<tr>
<td>dinner</td>
<td>steak</td>
</tr>
</tbody>
</table>

Content Management integration points

Integration points use content blocks in CMS to link different applications together using static and dynamic methods.

By using integration points, users can connect to different systems from a single page. The power of the CMS is that it can display any data within the ServiceNow platform. The ESS portal, for example, connects users to a service catalog, a knowledge base, and a help and incident reporting site. Each section contains a set of links to additional content. List blocks offer the easiest way to display data dynamically. Content types define how lists link to the detailed data they reference.

Generating lists from the ServiceNow platform is straightforward, especially if you use filtering. When the CMS was first introduced, lists were the only method available to create navigational
systems for sites. Content types define system record links using specific templates to define the list and the details.

- Summary template: defines the list
- Detail template: defines the detail as it is rendered in a page.

The templates work together to pass data attributes or unique record identifiers (sysid) into a single detail page that manages the data. Any attribute variations use the URL sent to the page.

Understanding how content types work can mean the difference between a site with 20 pages versus a site with 200 pages. There is a time for both types of data calls. Depending on the task, there are appropriate times to use static content and times for dynamic methods.

**View links between system elements and URLs**

You can view the links between your system elements and their URLs to render more specific content within your site.

Role required: content_admin or admin

See the Navigate to a record or module using a URL page for an overview of URL syntax in the ServiceNow platform.

The Incidents list offers a quick example of viewing a form within its own tab. This viewing method illustrates how to append the URL string to render more specific content within your site.

1. Navigate to **Incident > All**.
2. Right-click in a blank area within the content frame and select **Open Frame in New Window** or **Open Frame in New Tab**.

The URL returned looks similar to this example.

```
<instance_name>/incident_list.do?
sysparm_userpref_module=b55b4ab0c0a80009007a9c0f03fb4da9
```

The URL is comprised of the following elements.

- **incident_list.do?** is the call to the list with no parameters passed into it. Explore context menu options and list filtering variations to see how the URL string is appended with each action.
- **incident_list.do?sysparm_query=&sysparm_view=ess** is an example of how the view is passed in the URL string.
- **incident_list.do?sysparm_query=GROUPBYactive&sysparm_view=** is how the URL looks when the **group by** option is chosen from the context menu.
- **incident_list.do?sysparm_query=category%3Dsoftware** is the result of applying a category is software filter to the list.

Explore all the options available within the right-click menu. Click through to the Incident form itself (incident.do) to see what the URL string does when parameters are passed into it.

**Element link examples**

View examples that show how to create a site pointing to various system data in several different data tables.

The following examples illustrate setting up access to the following system data.

- Knowledge: building a versatile front end for a knowledge base, from overview page to variations on the list definitions used in the site.
- Catalog: ideas for a business-to-consumer shopping experience that pulls various items and forms from your service catalog.
- Service Portfolio: using the business service portfolio to contain all defined services offered by your organization.
- Featured reports: methods for linking to the most important reports.

Example links to system data

Page source view

Use the tools available in your browser to view the frame source page and understand what URL address bars pass between system frame sets.
The Firefox browser, for example, has the developer tools option. This option provides an easy way to view records that render within the main content frame (gsft_main) of the ServiceNow platform. Also, Firefox quickly builds menus and links to records within the system.

This Firefox functionality is useful when stepping through the menu items section.

Frame view

**Static methods**

Static methods in the CMS application were created for ease of use.

Form-based menu management and WYSIWYG code editing can be useful to both advanced and entry-level users. The technical ability of subject matter experts (SMEs) managing the language of your site can vary considerably. Letting SMEs write the content and having a technical resource manage the linking expedites menu and link creation within the system.
Navigation Menu Links

Use base system templates to group similar links for placement on the page. Though the terminology is different (menu sections and menu items), this type of linking behaves the same way as content links. For more information on creating a navigation menu block, see Create a navigation menu block.

Static HTML Details

Content blocks that are useful for areas administered by developers unfamiliar with HTML or markup. Anyone familiar with markup can use dynamic blocks because they are extendable. For more information on static HTML, see Using Content Blocks.

Content Links

The predecessors to navigation menus from when the CMS was first introduced. Use content links to make navigational links by defining several content links under the same category. Then, call the links as a list referencing the Content Link (content_link) table.

iFrame Details
Used both dynamically and statically throughout the system. Using them is an easy way to bring any form or list into your CMS pages. For more information on iFrame methods, see Using Content Blocks.

**Dynamic methods**

While static methods are a powerful navigational tool, you have more control over data rendering using the dynamic methods.

Reference common code in the system to make long-term maintenance of the site easier. Coding skills are useful when implementing dynamic methods.

---

**Static and dynamic methods**

**Dynamic Blocks**

These blocks are where the majority of your work resides. For more information, see Configure dynamic blocks.

**Frames**

Frames are meant to be decorative wrappers around any block in the system. They are mentioned with dynamic blocks because frames are essentially UI macros with the category
Frames apply the \$\{body\} variable to a block and define where the block is inserted when rendered on the page.

Lists

Lists generate links to records based on the filtering rules you define. Lists can be sorted for presentation by any field in the corresponding record. Lists help supplement navigation and pull data from outside the CMS. For more information, see Customize the list block.

Content Types

Content types provide site-specific control of how system data defined as templates is rendered. The rendering of lists is considered first (summary templates). The next consideration is the detail template, which allows control over the record rendering.

List Definitions

List definitions enable you to extend the summary template defaults defined on the site level. Used with frames, list definitions render the same data differently based on the placement on the page or site. For more information, see Configure list definitions.

Detailed Content

Detailed content in page detail settings) are blocks that display the content of an existing document as a block on a content page. For more information, see Configure a detailed content block.

Example integration points

Each element on the page links to a specific URL point.

Integration points
Business Services links to a content page (CMS page referenced: Business Service Portfolio, URL: \( \text{business_service_category.do} \)) that pulls the system service catalog homepage into a frame within the content area. Each link within this section uses the browse by category page, where you pass in the name of the category to return results.

- **Target page iFrame URL:** \( \text{catalog_home.do?sysparm_nameofstack=aabdae07ef22100914304167b22567d&sysparm_view=business&sysparm_clear_stack=yes} \)
- **Target page frame name:** gsft_main
- **Desktop Computing URL:** \( \text{category_browse.do?category=Desktop \ Computing} \)
- **Business Applications URL:** \( \text{category_browse.do?category=Business \ Applications} \)
- **Communications Services URL:** \( \text{category_browse.do?category=Communications \ Services} \)
- **Infrastructure Services URL:** \( \text{category_browse.do?category=Infrastructure \ Services} \)
- **Hosting Services URL:** \( \text{category_browse.do?category=Hosting \ Services} \)

Featured Services links to a content page which pulls a small subset of services into an iFrame.

- **IFrame URL:** \( \text{com.glideapp.servicecatalog_category_view.do?sysparm_parent=d67c446ec0a80165000335aa37eafbc1&sysparm_view=} \)
- **Frame name:** gsft_main
- **Install Software URL:** \( \text{catalog.do?uri=com.glideapp.servicecatalog_cat_item_view.do?sysparm_id=10d69689c611227600ffe4a1c664824} \)
- **Email Account URL:** \( \text{catalog.do?uri=com.glideapp.servicecatalog_cat_item_view.do?sysparm_id=d67a866b6ca80165009386c752cd4a09} \)
- **Electronic Messaging URL:** \( \text{catalog.do?uri=com.glideapp.servicecatalog_cat_item_view.do?sysparm_id=533798810a0a0b2600f1a03593e19058} \)
- **VPN RSA Token URL:** \( \text{catalog.do?uri=com.glideapp.servicecatalog_cat_item_view.do?sysparm_id=d67b099ac0a80165019d0c276b772502} \)
- **Shared Storage (SAN) URL:** \( \text{catalog.do?uri=com.glideapp.servicecatalog_cat_item_view.do?sysparm_id=cedd458a0a0b8300c3be32e7a3ac2} \)

Reporting links to a content page that pulls the reports page into an iFrame. All links within this menu leverage homepage definitions in the system, which creates an issue with the home.do URL. Notice in the following links that .. is used to create a relative URL outside of the CMS site home.do definition. Without this path, the site homepage would render within the iFrame.

- **IFrame URL:** \( \text{report_home.do} \)
- **Frame name:** gsft_main
- **Cost Management Overview URL:** \( \text{../home.do?sysparm_userpref_homepage=fa81ae91c0a805c64c0942ab2e4b852b} \)
- **Administration Overview URL:** \( \text{../home.do?sysparm_userpref_homepage=8b7b11f6c611228901ff3fcfbd3cc8f} \)
- **Portfolio Overview URL:** \( \text{catalog_home.do?sysparm_view=business} \)
- **Service Availability URL:** \( \text{../home.do?sysparm_userpref_homepage=8ee772000a0bad00c38eb7e68b93d0} \)
Content Management testing

Test your site to ensure that all pages display correctly, links go to the specified address, and images are not broken. It is important to test the site as you build it. Do not wait until just before launch to begin testing.

Also, test templates as you create them so any issues are resolved before creating other content based on the templates. Recruit as many people as possible to help you test.

Here are some general site testing guidelines:

- Test on the browsers and platforms your site visitors use
- Test on various monitors (for example, LCD and CRT)
- View pages using different screen resolutions
- View pages using different color settings
- Test all navigation and links
- Test items that can be downloaded (for example, PDF files)
- Test the search functionality
- Test site security
- If necessary, test for accessibility (for guidelines, see the W3C Website Accessibility Initiative)

Global search in Content Management

When you add global search to a CMS site, two different search result blocks can display, depending on the user role: global or no global.

Roles are defined at System Properties > Global Text Search.

- Search Results (Global): For users with permission to use the global search within the normal frame set. The normal frame set is defined as the default, non-CMS user interface with the set of frames.
- Search Results (No Global): For users without permission to use the global search. Searches only the knowledge base and the catalog.

The header search bar and the Search dynamic block in the base system both automatically handle the permissions and direct the user to the appropriate search results. In the base system, the search result blocks are deployed on the same Search Results content page.

In order for the global search to work properly, it is important to ensure that the DEFAULT directs users to a working content page. If not, the results from the global search link back to the frame set, not to pages within the CMS site.

Note: The global search is similar to the normal frame set user interface and ties to the same roles (Set global text search properties).

Search Results (Global)

Before you use the Search Results (Global) dynamic block, define content types to control the behavior a search result is clicked. If no content type is defined for a table, selecting a link on that table renders the results according to the DEFAULT content type. It is good practice to point
the **DEFAULT** content type to a page with a normal "Current Document" detailed block. Set the content type detail (**Detail Template** field) to have just an iFrame.

The **Search Results (No Global)** dynamic block does not require any additional configuration.

**CMS translation**

You can translate CMS sites by activating internationalization plugins and manually translating custom interface strings.

Two tables support the translation of a CMS site into other languages.

- Translated Name / Field (**sys_translated**): Stores strings that are shared or commonly used within a site. These include menu section names, menu item names, site breadcrumb names, link names, and footer menu links. Internationalization plugins typically provide translations for these strings. See [Localization settings](#).
- Translated Text (**sys_translated_text**): Stores unique string translations which you create when you manually translate interface elements. See [Translate the interface](#).

**View a translated CMS site**

Activating an internationalization plugin provides a quick way to see translated strings for CMS menus, breadcrumbs, and links. For a full translation, you must translate the instance manually.

The following example explains how to view a translated site in Japanese.

1. Navigate to **System Definition > Plugins**.
2. In the **Go to** filter, select **Name**, enter **I18N**, and then press the Enter key.
3. Activate both the **I18N - Japanese Translations** and the **I18N: Knowledge Management Internationalization Plugin v2** plugins.
4. Refresh the browser.
5. In the **Language** picker in System Settings, select **Japanese**.
6. Browse the site to see the translated language strings.
8. Browse the site to see the translated language strings in the ESS Portal.

**Credentials and connection information**

Credentials and connection information are required to gain access to a computer or network device for Discovery, Service Mapping, and Cloud Management or to perform work using Orchestration. When adding content to Share or AppStore, you can configure connections and credentials relevant to your environment without modifying built content.

### Explore

Introduction to credentials, connections, and aliases

All application integrations in ServiceNow require connection information, credentials, and aliases to their respective applications to access resources.

Before you can execute an application integration in ServiceNow, you must create and configure the corresponding connection information and credentials.

**Connection**

A connection is an integration with a system, such as an IP address or endpoint with protocols. It contains specific details, such as database particulars, when integrating with a database.

**Credential**

The credential is the authentication data required to make the connection.

**Alias**

Connection information and credentials can vary between QA/Development/Production environments for the same integration. The tight coupling between this data and application metadata, such as workflow or job scheduling, make application metadata obsolete when you change environments. An alias alleviates this problem, for connections and credentials, by decoupling this data from application metadata.

**Connection and Credential Alias**

This alias associates a credential to a connection, which resolves during runtime.

**Credential Alias**

This alias associates to credential data only, and resolves during runtime.

In addition to the alias data model, you can also use a scriptable API which can get connection and credential data during runtime. Additionally, there are business rules that enforce certain constraints on these aliases. Names should contain alphabets, numbers, and underscores but cannot have special characters. The alias must be unique in a scope. If you have multiple active connections, you can have more than one active connection in the same domain. If you do not choose this option, you can have only one active connection in per domain.

**Note:** If you enable multiple active connections, when the connection records resolve, your application picks one connection based on an established order. The order of the connections depends on the API you use to retrieve connection data.

You can add additional connection attributes to an alias, which are available in connection data during runtime. Variables overridden by connection administration during run time should not affect the alias.
Benefits to using Connections, Credentials, and Aliases

- Central location to store and manage credentials to an external service
- Define once and reuse for multiple platform features
- Minimize configuration of other platform features
- Allow non-administrators to use predefined connections and credentials
- Increased security

Features using Connections, Credentials, and Aliases

- Cloud Management
- Discovery
- Flow Designer
- IntegrationHub
- Orchestration
- Service Mapping

Upgrading credential tags

In the Kingston release, the upgrade process migrates credential tags to credential aliases. All credential tags in the Credentials table have a corresponding credential alias, made of:

- Name: alias name
- Scope: global
- ID: alias name

The credential tag field type changes from string to GlideList in the Credential table and the credential alias field refers to the created alias records.

Credential synchronization with MID Servers

Each MID server on your network synchronizes with your instance keeps what is essentially a copy of every credential that you create. This synchronization is done to speed up the reading of credentials when applications like Discovery or Service Mapping need to access multiple devices on the network. The MID Servers synch when they find a credentials_reload job in the ECC Queue. The reload job instructs the MID Server to make a SOAP call to the instance to get the entire list of credentials, including all the field values, in the Credentials (discovery_credentials) table.

The SOAP response that your instance sends to each MID Server also includes custom fields that you added to any credential form that you customized. If you added reference fields, the data in the referenced table is also sent as part of the SOAP response.

Using Aliases

Define an alias to label a credential or connection record.

An alias defines a label to a connection and credential record, or a label to just a credential record. It extends from the sys_metadata table and requires the admin role. The credential_admin and connection_admin have read access to sys_alias. This alias contains:

Name
Name of the alias.

**ID**
This field is based on the format ‘scope name.alias name’. Unique index on ID to ensure unique record based on scope name + name. If the scope is global, the ID is the alias name.

**Type**
You can select either ‘Credential’ or ‘Connection and Credential’. The default is Connection and Credential.

**Connection type**
There are three connection types: HTTP, JDBC, JMS. The default is HTTP.

If you create a workday alias in global scope, the ID is set to workday.

If you create a workday alias in the HR app scope, the ID is set to `x_hr_app.workday`.

- Name can only contain alphabets, numbers, and underscore.
- During an upgrade to Kingston, the tag in credential record migrates to a Connection & Credential Alias. If the credential tag contains special characters other than alphabets, numbers, and underscores, the tag name is preserved after the upgrade. You can still use this migrated alias, but you cannot update the alias until you change the name to meet the naming restrictions.

**Using credentials with your instance**
Several applications require credentials to access resources during discovery, including Discovery, Orchestration, Service Mapping, and Cloud Management.

**Credential table**
The credential table (discovery_credential) defines credentials that can be used for integration. In previous releases, the Credential table contains a string-type tag field, which labels a credential and the tag is used in orchestration activities. Starting with the Kingston release, we rename tag to credential alias, and change the type from string to GlideList, which is a reference to the connection alias table.

**Credential types**
The following credential types are provided:

<table>
<thead>
<tr>
<th>Credential type</th>
<th>Description</th>
<th>Supports Test Credential option</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applicative Credentials</td>
<td>The credentials to explore the applications on a device or computer. Patterns often need applicative credentials.</td>
<td>No</td>
</tr>
<tr>
<td>Credential type</td>
<td>Description</td>
<td>Supports Test Credential option</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------------------------------</td>
</tr>
<tr>
<td>AWS Credentials</td>
<td>The Amazon Web Services (AWS) master account, access key ID, and secret access key.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Note: You cannot test AWS credentials through the Test</td>
<td></td>
</tr>
<tr>
<td>Azure Service Principal</td>
<td>The Azure service principals required for an Azure subscription.</td>
<td>No</td>
</tr>
<tr>
<td>Basic Authentication Credentials</td>
<td>A user name and password.</td>
<td>No</td>
</tr>
<tr>
<td>CIM Credentials</td>
<td>The user name and password required to access a CIMOM - Common Information Model Object Manager (CIM) server, which obtains information about VMware ESX servers.</td>
<td>No</td>
</tr>
<tr>
<td>Cloud Management Credential</td>
<td>Credentials that Orchestration uses to access cloud resources.</td>
<td>No</td>
</tr>
<tr>
<td>JDBC Credentials</td>
<td>A user name and password to access a Java Database Connectivity (JDBC) connection.</td>
<td>Yes</td>
</tr>
<tr>
<td>JMS Credentials</td>
<td>A user name and password to access to a Java Message Service (JMS).</td>
<td>Yes</td>
</tr>
<tr>
<td>OAuth 2.0 credentials</td>
<td>OAuth 2.0 credentials enable ServiceNow to obtain access to user accounts on an HTTP service.</td>
<td></td>
</tr>
<tr>
<td>SNMP Community Credentials (Password Only)</td>
<td>The community string to access devices via SNMP.</td>
<td>Yes</td>
</tr>
<tr>
<td>SNMPv3 Credentials</td>
<td>The user name and keys required to access devices on your SNMP v3 network.</td>
<td>Yes</td>
</tr>
<tr>
<td>SSH Credentials</td>
<td>The user name and password to access Linux and Unix devices.</td>
<td>Yes</td>
</tr>
<tr>
<td>SSH Private Key Credentials</td>
<td>The private key credentials to access Linux and Unix devices. However, SSH private key credentials are recommended over SSH password credentials for security reasons.</td>
<td>Yes</td>
</tr>
<tr>
<td>VMware Credentials</td>
<td>Credentials to access vCenter resources. These credentials are required for any work that is performed on vCenter, such as cloning a virtual machine.</td>
<td>Yes</td>
</tr>
<tr>
<td>Windows Credentials</td>
<td>The user name and password required to access Windows computers. Several permission requirements must be satisfied to use Windows credentials.</td>
<td>Yes</td>
</tr>
</tbody>
</table>

How MID Servers use credentials

By default, Windows MID Servers use the login credentials of the MID Server service on the host machine to discover Windows devices in the network. You should configure these service credentials so that they have at least local administrator privileges. For Linux and UNIX machines
and network devices, the MID Server uses the SSH and SNMP credentials configured in the instance in **Discovery > Credentials**.

MID Servers that Orchestration uses must have access to the necessary credentials to execute commands on computers in the network as specified by the **Workflow activities**. Orchestration can use the same SSH and SNMP credentials as Discovery, but has two additional credentials designed for specific Workflow activities: Windows (for **PowerShell**) and VMware.

### Encryption and decryption

The platform stores credentials in an encrypted field on the Credentials (discovery_credentials) table. Once they are entered, they cannot be viewed.

When credentials are requested by the MID Server, the platform decrypts the credentials using the following process:

1. The credentials are decrypted on the instance with the password2 fixed key.
2. The credentials are re-encrypted on the instance with the MID Server’s public key.
3. The credentials are encrypted on the load balancer with SSL.
4. The credentials are decrypted on the MID Server with SSL.
5. The credentials are decrypted on the MID Server with the MID Server’s private key.

**Note:** The platform does not have separate encryption keys for multi-tenant instances.

### Credential order

Credentials can be assigned an order value in the **Credentials Form**, which forces the application to try all the credentials at their disposal in a certain sequence. If you do not specify an order value, the application tries the credentials in the Credentials (discovery_credentials) table randomly, until it finds one that works, such as when Orchestration attempts to run a command on an SSH server (such as a Linux or UNIX machine), or when Discovery attempts to query an SNMP device (such as a printer, router, or UPS).

After identifying the credentials for a device, Discovery and Orchestration create an affinity between the credentials and the device using the Credential Affinity [dscy_credentials_affinity] table. All subsequent discoveries or Orchestration activities attempt to match the credentials in this table with a device for which an affinity exists. If credentials for a device change, Discovery and Orchestration try all available credentials again until they create a new affinity.

**Note:** If Orchestration and Discovery are installed, and credential alias is enabled, multiple affinities can exist. In this case, the platform looks up credentials for each affinity and inserts the credential for the affinity with the lowest order into the probe.

Ordering credentials is useful in the following situations:

- The credentials table contains many credentials, with some used more frequently than others. For example, if the table contains 150 SSH credentials, and 5 of those are used to log into 90% of the devices, it is good practice to configure those five with low order numbers, which places them at the top of the execution list. Discovery and Orchestration will work faster if they try these common credentials first. After the first successful connection, the system knows which credentials to use the next time for each device.
• The system has aggressive login security. For example, if the Solaris database servers in the network only allow three failed login attempts before they lock out the MID Server, configure the database credentials with a low order value.

Credential alias

Credential alias allows flow and workflow creators to:

• Assign individual credentials to any activity in an Orchestration workflow
• Assign individual credentials to any action in Flow Designer
• Assign different credentials to each occurrence of the same activity type in an Orchestration workflow.
• Assign different credentials to each occurrence of the same action in designer flow.

Credential alias also works with credential affinities.

External credential stores

If you do not want credentials stored in your instance, you can use external credential repositories. External credential stores save the credentials in an external site that your instance can access. Only CyberArk is supported.

Setting up a JMS, JDBC, or HTTP(s) connection to a host

Use the connections table to setup a JMS, JDBC, or HTTP(s).

Connection Table

The Connection table (sys_connection) is the base table for all connection tables. You can setup connections for the following protocols:

• JDBC
• JMS
• HTTP(s)

The connection table references the connection alias table, which couples the connection alias to connection information. Every connection records the following information:

<table>
<thead>
<tr>
<th>Base connection properties</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the connection. This field must be unique on the table.</td>
</tr>
<tr>
<td>Credential</td>
<td>Specify the credential to use with this connection. This is optional.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>The connection alias resolves your connection and credentials at run time. Only one connection is active per Connection alias at any one time.</td>
</tr>
<tr>
<td>Active</td>
<td>Check to make the current connection active.</td>
</tr>
</tbody>
</table>
Credential is unique across active connections, if not empty

**Upgrading connection information**

- The JDBC connection (jdbc_connection) and JMS connection (orch_jms_ds) tables are existing Orchestration connection tables that now extend from the Connection (sys_connection) table. The tables originally extended from sys_metadata. The sys_metadata related data will be removed.
- The tables move from the Orchestration run time plugin (com.snc.runbook_automation.runtime) to the Credentials & Connections plugin.
- The upgrade process obtains JDBC and JMS connection information and creates corresponding connection aliases and assigns the alias to its corresponding connection.
- JDBC field name changes:
  - JDBC server is renamed to host
  - Database port is renamed to port
  - Data of the JDBC server and database migrates to host and port during the upgrade

**Create a JMS connection**

Configure your system to use Java Messaging Service (JMS) with a custom JMS activity or action. Role required: connection_admin

The MID Server must have the correct JMS connection factories for your organization. Configure those values in the **mid.property.jms.command.allowed_factory_names** property, found in **MID Server > Properties**. The default values for this property can be changed to any value or comma-separated list of values that the third-party JMS provider advertises.

1. Navigate to **Credentials & Connections > Connections**.
2. Click **New**, select **JMS Connection**, add the following, and click **Submit**:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of this connection factory.</td>
</tr>
<tr>
<td>Credential</td>
<td>Add credentials for JMS provider.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Add a connection alias.</td>
</tr>
<tr>
<td>Initial Context Factory</td>
<td>Name of the JNDI class that is used to create the InitialContext.</td>
</tr>
</tbody>
</table>

**Note:** For example, to connect to ActiveMQ V5.10 (JMS Provider), the value is `org.apache.activemq.jndi.ActiveMQInitialContextFactory`.

<table>
<thead>
<tr>
<th>Provider URL</th>
<th>Location of the running JMS provider installation.</th>
</tr>
</thead>
</table>
| **Note:** For example, to connect to ActiveMQ V5.1: tcp://ipAddressOrHostName:61616.
Create a JDBC connection

The JDBC Connection provides the information custom JDBC actions or activities use to connect to various target databases.

You must have an appropriate JAR file, whether it is supplied with the instance or a custom JAR file.

Note: The ServiceNow instance supplies mysql-connector-java-5.1.21.jar, sql-server-jdbc-4.0.jar, and ojdbc6.jar files as part of the current release, which supports MySQL, SQLServer, and Oracle databases. Other databases, such as Sybase or DB2 Universal, must use a custom JAR file that must be uploaded to the instance before setting the JDBC connection.

Role required: connection_admin

JDBC credentials are retrieved separately by the activity designer template and support external credential storage, such as CyberArk.

1. Navigate to Credentials & Connections > Connections, click New and select JDBC Connection.
2. Complete the form using the fields in the table.

The database selection in the Format field determines which fields are available.

### JDBC connection fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Database Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>All</td>
<td>Unique name of this JDBC connection. For example, you might enter JDBC MySQLProd.</td>
</tr>
<tr>
<td>Credential</td>
<td>All</td>
<td>Add credentials for JDBC provider.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>All</td>
<td>Add a connection alias.</td>
</tr>
<tr>
<td>Query timeout</td>
<td>All</td>
<td>Maximum elapsed time the JDBC query is allowed to run without a response.</td>
</tr>
<tr>
<td>Connection timeout</td>
<td>All</td>
<td>Maximum elapsed time for the JDBC activity to wait while attempting to connect to the target database.</td>
</tr>
<tr>
<td>Active</td>
<td>All</td>
<td>Check the box to make this an active connection.</td>
</tr>
</tbody>
</table>

4. Click New, select JMS Credentials, and provide the user name and password the MID should use to communicate with the JMS provider.
   For more information, see JMS credentials.
5. Click Submit.
   You are ready to create a custom JMS action or activity.
<table>
<thead>
<tr>
<th>Field</th>
<th>Database Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Domain</td>
<td>All</td>
<td>Domain for this table. By default, the JDBC Connection (jdbc_connection) table runs in the <strong>global</strong> domain.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>All</td>
<td>Check to use a MID server for this action or activity.</td>
</tr>
<tr>
<td>Format</td>
<td>All</td>
<td>Database type for this connection. The default choices are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• MySQL</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Oracle</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• SQLServer</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• None</td>
</tr>
<tr>
<td></td>
<td></td>
<td>You can add <strong>Sybase</strong> or <strong>DB2 Universal</strong> to the choice list by uploading the appropriate JDBC driver JAR file to the instance. Orchestration automatically recognizes these drivers when they are loaded into the system and adds them to this list.</td>
</tr>
<tr>
<td>Host</td>
<td>Oracle, MySQL, SQLServer</td>
<td>Host name or IP address of the database server.</td>
</tr>
<tr>
<td>Oracle sid</td>
<td>Oracle</td>
<td>The Oracle database site identifier. The default value is <strong>orcl</strong>.</td>
</tr>
<tr>
<td>Oracle port</td>
<td>Oracle</td>
<td>Port that the Oracle database is using. The default value is <strong>1521</strong>.</td>
</tr>
<tr>
<td>Database name</td>
<td>MySQL, SQLServer</td>
<td>Name of the database.</td>
</tr>
<tr>
<td>Port</td>
<td>MySQL, SQLServer</td>
<td>Port that the selected database is using.</td>
</tr>
<tr>
<td>Instance name</td>
<td>SQLServer</td>
<td>Instance name for the selected SQLServer</td>
</tr>
<tr>
<td>Connection URL</td>
<td>All</td>
<td>URL that the MID Server uses to connect to the specified database. The URL is created automatically when you save the form, and is read-only for the default databases.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> If the format selected is not one of the default databases, you must create the connection URL manually so that the MID Server knows how to create the connection.</td>
</tr>
<tr>
<td>JDBC driver</td>
<td>None, DB2 Universal, Sybase</td>
<td>The JDBC driver to use for this connection when it is not a default database.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> If you add a Sybase or DB2 Universal database, you must enter the driver name in this field and upload the driver JAR file to the instance.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.
Create an HTTP(s) connection

The HTTP(s) connection provides the information custom HTTP(s) actions or activities use to connect.

Role required: connection_admin

1. Navigate to Credentials & Connections > Connections, click New, and select HTTP(s) Connection.
2. Add the following connection information and click Submit:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of this HTTP(s) connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Add credentials for connections.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Add a connection alias.</td>
</tr>
</tbody>
</table>
| URL builder          | Either manually enter the connection URL or use system to build the URL based on the inputs. Default is unchecked. If checked, the connection URL is calculated from the following fields:  
  - Mutual authentication — Check box if mutual authentication is used.  
  - Protocol — If mutual authentication is not used, enter protocol. The default is HTTPS.  
  - Protocol profile — If mutual authentication is used, enter protocol profile from sys_protocol_profile.  
  - Host  
  - Port  
  - Base path — Path of the connection string. |
| Connection URL       | If URL builder is unchecked, enter the connection URL into this field.      |
| Active               | Check the box to make this connection active.                               |
| Domain               | Determine the scope the action or activity runs in.                         |
| Use MID server       | Check to use a MID Server for this action or activity.                      |

Note: If mutual authentication is checked, connection URL is built: Protocol + :// + host:port +URL. If mutual authentication is unchecked, connection URL is built: Protocol profile + :// + host:port +URL.

3. Click Submit.

You are ready to create a custom HTTP(s) action or activity.

Domain separation for Credentials and Connections

This is an overview of domain separation for Credentials and Connections. Domain separation allows you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.
Overview

Support: Level 1

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

Credentials are tied to various ServiceNow features which access systems outside the instance. Credentials follow the domain separation tied to the feature employing the credentials.

Connections are protocol-specific information referencing a target host outside the instance. A connection can specify the domain to run an activity.

How domain separation works in Credentials and Connections

Credentials access resources outside of the instance, and are used by the Discovery, Orchestration, Service Mapping, and Cloud Management applications. The credentials are not tied to a specific domain, rather, they can be bound to an application and then follow the domain separation that the application uses. Credentials can also be assigned to a MID Server, and then follow the domain separation specified by the MID Server configuration.

Connections access a target host using a JMS, JDBC, or HTTP(s) connection. You can specify global or a specific domain to which the connection belongs.

Create and test your credentials

Create and test the credentials that Discovery, Service Mapping, Cloud Management, and Orchestration require to access hardware and software in your network.

Role required: admin

Refer to the documentation for your credential type for details on specific fields and requirements.

Supported credential types

<table>
<thead>
<tr>
<th>Applicative credentials</th>
<th>Basic authentication credentials</th>
<th>Chef server credentials</th>
</tr>
</thead>
<tbody>
<tr>
<td>CIM credentials</td>
<td>Cloud credentials</td>
<td>Infoblox credentials</td>
</tr>
<tr>
<td>JDBC credentials</td>
<td>JMS credentials</td>
<td>OAuth 2.0 credentials</td>
</tr>
<tr>
<td>SAP credentials</td>
<td>SNMP credentials</td>
<td>SSH credentials</td>
</tr>
<tr>
<td>VMware credentials</td>
<td>Windows credentials</td>
<td></td>
</tr>
</tbody>
</table>

1. Navigate to one of these modules:
   - Discovery > Credentials
   - Service Mapping > Credentials
   - Orchestration > Credentials

2. Click New.

3. On the Credentials page, click a link for the credential type and complete the form. Refer to the documentation for the credential type you selected for details.

   You can submit a credential record first and then test it later, or test the credential immediately before saving it.

   Credential testing is supported for these credential types:
- SSH (including private keys)
- Windows
- SNMP (including v3)
- VMware
- JDBC
- JMS

4. Under Related Links, click Test credential.

   **Note:** Credentials are encrypted at all times during the test.

5. Complete the fields in the Test Credential dialog box.

   ![Test Credential](image)

   **Test credentials dialog box**

   **Credential test fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Credential type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target</td>
<td>Target host on which these credentials are run. This value must be an IP address for all credential types except VMware, which can be the host URL.</td>
<td>All</td>
</tr>
</tbody>
</table>

   **Note:** For JMS, this is the provider URL. The information in this URL tells JNDI how to find and access the JMS Provider. An example value for connecting to ActiveMQ V5.1 is `tcp://ipAddressOrHostName:61616`.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Credential type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port</td>
<td>Port on the target to use for this test. The system pre-populates this field with the default port for the selected credential type.</td>
<td>All</td>
</tr>
<tr>
<td>MID Server</td>
<td>MID Server to use for this test. You must use a Windows MID Server to test Windows credentials. Only Up and Validated MID Servers are available.</td>
<td>All</td>
</tr>
<tr>
<td>DB Type</td>
<td>Type of database on which to test these credentials.</td>
<td>JDBC</td>
</tr>
<tr>
<td>DB Name</td>
<td>Name of the database on which to test these credentials.</td>
<td>JDBC</td>
</tr>
<tr>
<td>Initial Context Factory</td>
<td>Name of the JNDI class that is used to create the InitialContext. Using this Initial Context Factory, various JMS objects, such as JMS Connection, are created. For example, to connect to ActiveMQ V5.10, (JMS Provider), the value in this field would be org.apache.activemq.jndi.ActiveMQInitialContextFactory</td>
<td>JMS</td>
</tr>
</tbody>
</table>

6. Click **OK** to begin the test.

   An indicator appears, showing that the system is attempting to contact the target using the credentials you have provided. When the instance connects to the target it displays a success message. If the instance encounters a problem with the test inputs you have provided, it displays the appropriate error message. The following are some common error messages.

- Incorrect target or port number:

  ![TCP connection failure](image)

  TCP connection failure

- Incorrect user name or password:
Authentication failure

- Incorrect MID Server for Windows credentials:

MID Server error

7. Click **Retry** to open the test Credential dialog box and correct the input error.
8. When your credentials test is successful, click **Submit** to save the record.

**Important:** Testing credentials does not ensure that the credentials have the necessary privileges required for the intended Discovery or Orchestration workflow tasks.

**Applicative credentials**

Some applications require credentials in addition to the credentials that the host machine requires. Credentials required to access these applications are referred to as applicative credentials.

A typical credential contains a user name and a password for logging into a device or application. While most applications require only one credential for accessing them, sometimes hosts and applications have separate credentials for extra security. For example, ABAP SAP Central Services (ASCS) requires applicative credentials in addition to the SSH or Windows host credentials for the server that hosts ASCS.

**Note:** In Service Mapping and Discovery, devices and applications are referred to as configuration items (CIs).

Just like with host credentials, you assign applicative credentials to MID Servers.

You create applicative credentials per CI type, for example the CI type for ASCS is SAP ASCS Application (cmdb_ci_appl_sap_asc). The preconfigured pattern for discovering CIs belonging to this CI type contains commands that require a MID Server to use the applicative credential for this CI type. If there is more than one credential configured for this CI type, the MID Server tries using these credentials in the order you define until it finds the credential that fits.
Check the discovery requirements information in the ServiceNow documentation to determine if you need to configure applicative credentials for specific application CIs. There is no need to configure applicative credentials, if discovery prerequisites do not mention it.

### Applicative credentials form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the credential. Use a descriptive name like Oracle DB or London Oracle DB (for an Oracle database).</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to use this credential.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter the actual user name of the applicative credential.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the actual password of the applicative credential.</td>
</tr>
<tr>
<td>CI type</td>
<td>Select a CI type to which the CI belongs.</td>
</tr>
</tbody>
</table>

#### Credential alias

Enter the table name for the CI type whose applicative credentials the application uses. Applications may use applicative credentials of a CI type different from their own.

<table>
<thead>
<tr>
<th>For this application</th>
<th>Select this table</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABAP SAP Central Services (ASCS)</td>
<td>cmdb_ci_appl_sap_asc_s</td>
</tr>
<tr>
<td>IBM Security Access Manager appliance</td>
<td>cmdb_ci_app_server_webseal</td>
</tr>
<tr>
<td>SAP Central Instance</td>
<td>cmdb_ci_appl_sap_asc_s</td>
</tr>
<tr>
<td>SAP Central Services (SCS)</td>
<td>cmdb_ci_appl_sap_asc_s</td>
</tr>
<tr>
<td>SAP Evaluated Receipt Settlement (ERS)</td>
<td>cmdb_ci_appl_sap_asc_s</td>
</tr>
<tr>
<td>SAP Java Cluster</td>
<td>cmdb_ci_appl_sap_asc_s</td>
</tr>
<tr>
<td>SAP NetWeaver Dialog Instance</td>
<td>cmdb_ci_appl_sap_asc_s</td>
</tr>
<tr>
<td>Microsoft Exchange Mailbox (for Microsoft Exchange)</td>
<td>cmdb_ci_exchange_mailbox</td>
</tr>
<tr>
<td>Microsoft SQL Database</td>
<td>cmdb_ci_db_mssql_instance</td>
</tr>
<tr>
<td>MySQL Server</td>
<td>cmdb_ci_db_mysql_instance</td>
</tr>
<tr>
<td>Oracle Advanced Queue Queue</td>
<td>cmdb_ci_db_ora_instance</td>
</tr>
<tr>
<td>Oracle Database</td>
<td>cmdb_ci_db_ora_instance</td>
</tr>
<tr>
<td>Oracle E-Business Suite</td>
<td>cmdb_ci_db_ora_instance</td>
</tr>
<tr>
<td>Oracle WebLogic Module</td>
<td>cmdb_ci_app_server_weblogic</td>
</tr>
<tr>
<td>Tibco EMS Queue</td>
<td>cmdb_ci_appl_tibco_message</td>
</tr>
<tr>
<td>Tibco Enterprise Message Service (EMS)</td>
<td>cmdb_ci_appl_tibco_message</td>
</tr>
</tbody>
</table>

#### Applies to

Select whether to apply these credentials to **All MID servers** in your network, or to one or more **Specific MID servers**. Specify the MID Servers that should use these credentials in the **MID servers** field.
### Basic authentication credentials

The Basic Auth credential type manages access to store basic authentication credentials. This credential type is available for Discovery and Orchestration.

These fields are available in the Credentials form for basic authentication.

**Basic Auth credentials form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential. For example, you might call it Basic Authentication.</td>
</tr>
<tr>
<td>User Name</td>
<td>Enter the user name.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password.</td>
</tr>
<tr>
<td>Credential ID</td>
<td>Enter the unique key configured for these credentials in the CyberArk external credential storage system. The credential ID may be used as a</td>
</tr>
<tr>
<td></td>
<td>safe override when multiple safes are in use. By default, the syntax in the Credential ID field is this: <code>&lt;safe name&gt;:&lt;Credential ID&gt;</code>. If the</td>
</tr>
<tr>
<td></td>
<td>safe name is omitted, there must be a safe name defined in the config.xml file. To change the separator character from the default colon to another</td>
</tr>
<tr>
<td></td>
<td>character, override the value with the optional ext.cred.safe_name parameter. The Credential ID field has a limit of 40 characters.</td>
</tr>
<tr>
<td></td>
<td>This field is only visible when the External storage check box is selected.</td>
</tr>
<tr>
<td>External credential store</td>
<td>Select this check box to use an external credential storage system. When you select this option the User name and Password fields are replaced with the</td>
</tr>
<tr>
<td></td>
<td>Credential ID field. Currently, the only supported external storage system is CyberArk.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter the order (sequence) in which the platform tries this credential as it attempts to log on to devices. The smaller the number, the higher in the</td>
</tr>
<tr>
<td></td>
<td>list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login</td>
</tr>
<tr>
<td></td>
<td>attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order.</td>
</tr>
</tbody>
</table>
Chef server credentials

Chef server credentials access chef integrations with the instance.

These fields are available on the Credentials form for Chef server type credentials. This information comes from the settings you configured when you performed Chef server installation.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>Admin Name</td>
<td>Provide the administrator name that you created during Chef server installation.</td>
</tr>
<tr>
<td>Admin Key</td>
<td>Enter the RSA private key that the Chef server generated when you created the administrator.</td>
</tr>
<tr>
<td>Validator Name</td>
<td>Enter the validator.</td>
</tr>
<tr>
<td>Validator Key</td>
<td>Enter the RSA private key that the Chef server generated when you created an organization.</td>
</tr>
<tr>
<td>Cert Name</td>
<td>Enter the certification name.</td>
</tr>
<tr>
<td>Cert Key</td>
<td>Enter the certification key.</td>
</tr>
</tbody>
</table>

CIM credentials

The CIM credential type manages access to a CIM server (also referred to as a CIMOM - Common Information Model Object Manager) for information about VMware ESX servers. This credential type is available for Discovery.

These fields are available in the Credentials form for CIM.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter the user name to create in the Credentials table. Avoid leading or trailing spaces in user names. A warning appears if the platform detects leading or trailing spaces in the user name. For CIM discovery, the user must have the admin role.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password.</td>
</tr>
<tr>
<td>Credential ID</td>
<td>Enter the unique key configured for external credentials in the JAR file uploaded to the MID Server for an external credential system. The Credential ID field has a limit of 40 characters. This field is only visible when the External credential store check box is selected.</td>
</tr>
</tbody>
</table>
### Table: Credential Management

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Credential alias</td>
<td>Allow workflow creators to assign individual credentials to any activity in an Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow. To use the credential for discovering CIs not belonging to this CI type using Service Mapping and Discovery patterns, enter the table name for the CI type to which the CI belongs, for example cmdb_ci_apache_web_server. For more information, see <a href="#">Change credentials to non-default</a>.</td>

</tbody>
</table>

### Configure NetApp storage devices for CIM credentials

NetApp storage devices require additional configuration in order for Discovery to explore them.  
**Role required:** admin

1. Install the [SMI-S agent](#) on the storage device host. See the [Data ONTAP SMI-S Agent 5.2 Installation and Configuration Guide](#) for instructions and requirements.

**Note:**

© 2020 ServiceNow, Inc. All rights reserved.  
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
2. Create a user account and password for the SMI-S agent.
3. Create a credential record for the SMI-S agent credentials. Set the credential type to CIM.

Cloud credentials

Cloud credential types manage access to cloud-based applications, including Amazon Web Services (AWS) and the Microsoft Azure cloud.

AWS Credentials

AWS credentials form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential. For example, you might call it <strong>AWS Main Account</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Enter the access key ID generated from the AWS Management Console, for example, APIAIOSFODNN7EXAMPLE.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Enter the secret access key ID generated from the AWS Management Console for example, wPairXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY.</td>
</tr>
</tbody>
</table>

Azure Service Principal credentials

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the service principal to register with the instance.</td>
</tr>
</tbody>
</table>
| Tenant ID and Client ID| Paste the values that you obtained from the Azure portal:  
  - The Tenant ID is the Directory ID in Azure.  
  - The Client ID is the Application ID of the application that you registered in Azure. |
| Authentication Method | Select **Client secret**. Note: **Client assertion** is not supported. |
| Secret key           | Paste the secret key that was generated while creating the Azure Service Principal.  
This field appears when **Authentication method** is **Client secret**. |
Azure Enterprise Agreement credentials

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Enrollment number</td>
<td>Enter the enrolment number from Azure.</td>
</tr>
<tr>
<td>Access Key</td>
<td>Paste in the access key that Azure provides you.</td>
</tr>
</tbody>
</table>

Cloud Management credentials

These fields are available in the Credentials form for cloud management.

Cloud Management credentials form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential. For example, you might call it <strong>Cloud Atlanta</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>Type</td>
<td>Specify <strong>AWS</strong>.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter the CIM user name to create in the Credentials table. Avoid leading or trailing spaces in user names. A warning appears if the platform detects leading or trailing spaces in the user name.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the CIM password.</td>
</tr>
<tr>
<td>SSH Passphrase</td>
<td>Enter a memorable phrase for key generation. For example, you might enter <strong>Friday is a good day</strong>.</td>
</tr>
<tr>
<td>SSH private key</td>
<td>Enter the SSH private key.</td>
</tr>
<tr>
<td>Authentication protocol</td>
<td>Select the <strong>MD5</strong> or <strong>SHA</strong> authentication protocol that was used to generate the Authentication Key.</td>
</tr>
<tr>
<td>Authentication Key</td>
<td>Enter a SSH-generated authentication key.</td>
</tr>
<tr>
<td>Privacy protocol</td>
<td>Enter one of the following privacy protocols that describes encryption for the Privacy Key:</td>
</tr>
<tr>
<td></td>
<td>• <strong>3DES</strong> for Triple Data Encryption Standard (DES)</td>
</tr>
<tr>
<td></td>
<td>• <strong>AES128</strong> for Advanced Encryption Standard (AES) with 128 bit encryption</td>
</tr>
<tr>
<td></td>
<td>• <strong>AES192</strong> for AES with 192 bit encryption</td>
</tr>
<tr>
<td></td>
<td>• <strong>AES256</strong> for AES with 256 bit encryption</td>
</tr>
<tr>
<td></td>
<td>• <strong>DES</strong> for legacy DES encryption</td>
</tr>
<tr>
<td></td>
<td>Enter an additional privacy key.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Allow workflow creators to assign individual credentials to any activity in an Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow.</td>
</tr>
<tr>
<td>Field</td>
<td>Input value</td>
</tr>
<tr>
<td>------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>External credential store</td>
<td>Select this check box to use an external credential storage system. When you select this option the User name and Password fields are replaced with the Credential ID field. Currently, the only supported external storage system is CyberArk.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select whether to apply these credentials to All MID servers in your network, or to one or more Specific MID servers. Specify the MID Servers that should use these credentials in the MID servers field.</td>
</tr>
<tr>
<td>Classification</td>
<td>Enter the Application Classification for CI discovery.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter the order (sequence) in which the platform tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order.</td>
</tr>
</tbody>
</table>

Cloud Management (CMP) node credentials

Cloud Management (CMP) node credentials associate credentials for a virtual server that Cloud Management provisions. The Cloud Management application automatically creates these credentials.

**Note:** You might need to deactivate these credentials if you no longer want them used, change the order precedence, or select a MID Server that is allowed to access them. Otherwise, you do not need to manually create or modify this type of credential.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The automatically generated name based on the datacenter where the virtual machine is located.</td>
</tr>
<tr>
<td>Active</td>
<td>If the credentials are active.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Choose whether this credential is available to a specific MID Server or a all MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter the order (sequence) in which the platform tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order.</td>
</tr>
<tr>
<td>User Name and Password</td>
<td>The virtual server user name and password.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SSH passphrase and SSH private key</td>
<td>The private key and the passphrase that protects the key if the virtual server requires it.</td>
</tr>
<tr>
<td>Authentication Protocol and Authentication Key</td>
<td>The private key and the passphrase that protects the key if the virtual server requires it.</td>
</tr>
<tr>
<td>Privacy Protocol and Privacy Key</td>
<td>The encryption protocol used with the virtual server and enter the privacy key.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Allow workflow creators to assign individual credentials to any activity in an Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow.</td>
</tr>
</tbody>
</table>

**Cloud Management (CMP) SSH key pair credentials**

Cloud Management (CMP) SSH key pairs store the keys that the Cloud Management application automatically generates when users provision stack resources.

**Note:** You might need to deactivate these credentials if you no longer want them used. Otherwise, you do not need to manually create or modify this type of credential.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The automatically generated name.</td>
</tr>
<tr>
<td>Active</td>
<td>If the credentials are active.</td>
</tr>
<tr>
<td>SSH Public Key</td>
<td>The public key.</td>
</tr>
<tr>
<td>SSH Private Key</td>
<td>A secure private key that can be used instead of a password for SSH logins.</td>
</tr>
</tbody>
</table>

**Infoblox credentials**

Infoblox credentials are required to set up IP pools (IPAM) in the Cloud Management application. These fields are available on the Credentials form for Infoblox type credentials.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Choose whether this credential is available to a specific MID Server or a all MID Servers.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Order</td>
<td>Enter the order (sequence) in which the platform tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order.</td>
</tr>
<tr>
<td>wAPI Version</td>
<td>Enter the version of wAPI you are using.</td>
</tr>
<tr>
<td>User Name and Password</td>
<td>Enter the InfoBlox user name and password.</td>
</tr>
</tbody>
</table>

**JDBC credentials**

The JDBC credential type manages access to a Java Database Connectivity (JDBC) connection. This credential type is available for Discovery and Orchestration.

These fields are available in the Credentials form for JDBC type credentials.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter the user name to create in the Credentials table. Avoid leading or trailing spaces in user names. A warning appears if the platform detects leading or trailing spaces in the user name. For CIM discovery, the user must have the admin role.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password.</td>
</tr>
<tr>
<td>Credential ID</td>
<td>Enter the unique key configured for external credentials in the JAR file uploaded to the MID Server for an external credential system. The Credential ID field has a limit of 40 characters. This field is only visible when the External credential store check box is selected.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Allow workflow creators to assign individual credentials to any activity in an Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow. To use the credential for discovering CIs not belonging to this CI type using Service Mapping and Discovery patterns, enter the table name for the CI type to which the CI belongs, for example cmdb_ci_apache_web_server. For more information, see Change credentials to non-default.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>External credential store</td>
<td>Select this check box to use an external credential storage system. When you select this option the <strong>User name</strong> and <strong>Password</strong> fields are replaced with the <strong>Credential ID</strong> field. External credential storage is only available when the <strong>External Credential Storage plugin</strong> is activated.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Currently, the only supported external storage system is <strong>CyberArk.</strong></td>
</tr>
<tr>
<td><strong>Applies to</strong></td>
<td>Select whether to apply these credentials to <strong>All MID servers</strong> in your network, or to one or more <strong>Specific MID servers</strong>. Specify the MID Servers that should use these credentials in the <strong>MID servers</strong> field.</td>
</tr>
<tr>
<td><strong>MID servers</strong></td>
<td>Select one or more MID Servers from the list of available MID Servers. The credentials configured in this record are available to the MID Servers in this list. This field is available only when you select <strong>Specific MID servers</strong> from the <strong>Applies to</strong> field.</td>
</tr>
<tr>
<td><strong>Order</strong></td>
<td>Enter the order (sequence) in which the platform tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order.</td>
</tr>
</tbody>
</table>

**JMS credentials**

The JMS credentials type manages access to a Java Message Service (JMS). This credential type is available for Discovery and Orchestration.

These fields are available in the Credentials form for JMS.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter the user name to create in the Credentials table. Avoid leading or trailing spaces in user names. A warning appears if the platform detects leading or trailing spaces in the user name. For CIM discovery, the user must have the admin role.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Credential ID</td>
<td>Enter the unique key configured for external credentials in the JAR file uploaded to the MID Server for an external credential system. The Credential ID field has a limit of 40 characters. This field is only visible when the External credential store check box is selected.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Allow workflow creators to assign individual credentials to any activity in an Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow. To use the credential for discovering CIs not belonging to this CI type using Service Mapping and Discovery patterns, enter the table name for the CI type to which the CI belongs, for example cmdb_ci_apache_web_server. For more information, see Change credentials to non-default.</td>
</tr>
<tr>
<td>External credential store</td>

<tr>
<td>MID servers</td>
<td>Select one or more MID Servers from the list of available MID Servers. The credentials configured in this record are available to the MID Servers in this list. This field is available only when you select Specific MID servers from the Applies to field.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter the order (sequence) in which the platform tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order.</td>
</tr>
</tbody>
</table>

**OAuth 2.0 credentials**

OAuth 2.0 credentials enable ServiceNow to obtain access to user accounts on an HTTP service. These fields are available in the Credentials form for OAuth 2.0.
OAuth 2.0 credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential. For example, you might call it OAuth2 credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Specify whether this credential is active.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>An OAuth profile is a combination of a grant type and at least one scope.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Specify whether the credential is for all MID Servers, or specific MID servers. If specific, add the MID servers as necessary.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter the order (sequence) in which the platform tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Specify the credential alias you want to tie to the OAuth 2.0 credential.</td>

</tr>
</tbody>
</table>

**SNMP credentials**

Discovery explores many kinds of devices (switches, routers, printers, etc.) using the SNMP protocol. Credentials for SNMP do not include a user name, just a password, called the community string.

The default read-only community string for many SNMP devices is public, and Discovery will try that automatically. Enter the appropriate SNMP credentials if they differ from the public community string.

Discovering SNMP uses all community strings that are configured. This behavior does not apply to discovering SNMPv3.
The default Orchestration activity SNMP Query returns the object identifier (OID) of a device and requires SNMP credentials.

**SNMP community credentials**

The SNMP Community credential type manages access to discover many kinds of devices (switches, routers, printers, etc.) using the SNMP protocol. This credential type is available for Discovery, Service Mapping, and Orchestration.

Credentials for SNMP do not include a user name, just a password (the community string). The default read-only community string for many SNMP devices is public, and the system will try that automatically. Enter the appropriate SNMP credentials if they differ from the public community string.

These fields are available in the Credentials form for SNMP community.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter the user name to create in the Credentials table. Avoid leading or trailing spaces in user names. A warning appears if the platform detects leading or trailing spaces in the user name. For CIM discovery, the user must have the admin role.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password.</td>
</tr>
<tr>

<td>Select this check box to use an external credential storage system. When you select this option the User name and Password fields are replaced with the Credential ID field. External credential storage is only available when the External Credential Storage plugin is activated.</td>
</tr>
</tbody>
</table>

**Note:** Currently, the only supported external storage system is CyberArk.
### SNMPv3 credentials

SNMP credentials accept a privacy protocol and an additional privacy key and are available for Discovery and Orchestration.

Discovering SNMP uses all community strings that are configured. This behavior does not apply to discovering SNMPv3. These fields are available in the Credentials form for SNMPv3.

#### SNMP v3 form

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique and descriptive name for this credential. For example, you might call it <strong>SNMP Community Atlanta</strong>.</td>

<td>External credential store</td>
<td>Select this check box to use an external credential storage system. When you select this option the <strong>User name</strong> and <strong>Password</strong> fields are replaced with the <strong>Credential ID</strong> field. External credential storage is only available when the <strong>External Credential Storage plugin</strong> in activated.</td>
</tr>
</tbody>
</table>

**SSH credentials**

Discovery and Orchestration explore UNIX and Linux devices by using SSH credentials to execute commands over Secure Shell (SSH). SSH commands must run with root privileges, either with root credentials or through the use of sudo.
# Privileged commands

The platform provides default privileged commands for the MID Server to use and the ability to add additional commands to the system. For details about using sudo and other privileged commands, see [Privileged commands for the MID Server](#).

## Commands that require root privileges for Discovery and Orchestration

These examples assume that the user name is `Disco`. Substitute the actual user name and ensure that the paths for the commands match the paths on the system.

**Note:** Sudo commands do not work with private key credentials, because there is no password to supply to the sudo command. A solution is to add the NOPASSWD option to the sudo configuration. For example, you might enter: `disco ALL=(root) NOPASSWD:/usr/sbin/dmidecode,/usr/sbin/lsof,/sbin/ifconfig`.

### UNIX and Linux commands requiring root privileges

<table>
<thead>
<tr>
<th>Command</th>
<th>Platform</th>
<th>Purpose</th>

</tbody>
</table>
For both Discovery and Service Mapping, see *Service Mapping commands requiring a privileged user* for a list of the commands that require elevated rights to discover and map Unix-based hosts in your organization.

## Granting root privileges

Use either of these approaches to allow users to run SSH commands with root privileges:

- **Give root credentials.** These are obviously the most powerful credentials, but may not be desirable from a security perspective. If Discovery or Orchestration have the root credentials to any UNIX or Linux system, no further configuration is required.
- **Give other credentials for Discovery or Orchestration, but grant the user in those credentials the right to execute certain commands with root privileges, using `sudo`.** This is a secure way to grant limited privileges. Discovery or Orchestration use sudo on any probe that has the `must_sudo` parameter set to `true` (it defaults to `false`). However, each system must be configured to allow sudo to work. This is done by editing the `/etc/sudoers` file using the `visudo` command.

## Access Requirements for Non-Root Credentials

If you do not provide Discovery with root access credentials, you must provide credentials with the following access requirements.

<table>

If all the credentials have the same order number (or none), the instance tries the credentials in a random order.</td>
</tr>
</tbody>
</table>

**SSH private key credential type**

**Note:** SSH private key credentials provide better security than SSH password credentials.

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique and descriptive name for this credential. For example, you might call it SSH Atlanta.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter a UNIX or Linux user name. Avoid leading or trailing spaces in user names. A warning appears if the platform detects leading or trailing spaces in the user name.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the UNIX or Linux password. For SSH Private Key type credentials, enter the sudo password if one is required for the user name.</td>
</tr>
<tr>
<td>SSH passphrase</td>
<td>Type a secure SSH passphrase. This field is available only for SSH Private Key credentials.</td>
</tr>
<tr>
<td>Field</td>
<td>Input value</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| SSH private key             | Enter a secure, private key that can be used instead of a password for SSH logins. The private key must be entered in the proper format to ensure it is correctly encrypted. The private key must start with the string "-----BEGIN."

Here is an example of a correctly formatted private key:

```plaintext
-----BEGIN RSA PRIVATE KEY-----
MIIEogIBAAKCAQEAsEK65scPssPSobpDFMpR+Btv3MS4Q7NF8ERaStRZsh3IWz+x... 
7hrxV2dbSug60FahyupGWBGtPnXm5PaE2X5WPlUj94v
-----END RSA PRIVATE KEY-----
```

The Now Platform supports private keys in the PEM format generated by the OpenSSH ssh-keygen utility. To convert PK keys that were generated by PuTTY:

- Open your private key in PuTTYGen.
- Export it in OpenSSH format from the menu Conversions > Export OpenSSH key.
- Save the new OpenSSH key.

</tbody>
</table>
VMware credentials

The VMware credentials type manages access to vCenter credentials. Applications that access VMware cloud resources need access to VMware credentials. For example, the VMware credential type allows Discovery to explore VMware’s vCenter running on a Windows machine to discover ESX machines, virtual machines, and resource pools. The VMware Discovery and automation API (vCenter API) now provides the globally unique serial number for computer CIs. CIM credentials are not needed to allow access to each VMware host.

**Note:** Windows credentials are not necessary for vCenter Discovery, when valid VMware credentials are used.

**Important:** Do not use VMware Type credentials for Orchestration activities that perform work on the individual virtual machines cloned by vCenter (for example, restarting a Linux VM). For these activities, the credential Type depends on the operating system of the virtual machine (either SSH or Windows).

</tbody>
</table>

Windows credentials

Windows credentials provide access to Windows computers. This credential type is available for Discovery and Orchestration.
Credential requirements

Discovery and Orchestration have the following requirements for Windows credentials:

- Install a MID Server on a Windows host as a service.
- Add Windows credentials to one of these locations:
  - An entry in the Credentials [windows_credentials] table
  - A MID Server service account to run as a specific Windows user or domain account.

Granting proper permissions

To provide sufficient permissions, Windows credentials must be one of the following:

- A domain user with local administrator access on the target Windows hosts.
- A local account that has administrator privileges and User Access Control (UAC) disabled on the same target host.
- A user who meets the requirements of Windows probes and permissions (Discovery only).
- A user who meets the requirements of the Orchestration activity to be run (Orchestration only).

Workgroup computers

To run Powershell commands to discover a Workgroup computer, configure the MID Server credentials for either of these users:

- Built-in administrator account on the Workgroup computer.
- Domain user on the Workgroup computer.

Multi-domain configuration

To enable Windows credentials to function across multiple domains, make sure to use the correct name formats and MID Server configuration.

Discovery and Orchestration support Windows domain credentials in both User Principal Name and Down-Level Logon Name user name formats. For example, Domain\UserName or Username@example.domain.com. You can provide Windows workgroup credentials in the following format: WORKGROUP\UserName.

Note: You can also provide a local account by using the .\user name.

These additional actions are required to enable credentials to function across multiple Windows domains.

<table>

</tr>
</tbody>
</table>

**Configure Windows credentials for the MID Server**

Configure the MID Server to use either the credentials of its own Windows service or credentials from the Credentials (discovery_credentials) table.

Role required: admin

1. Configure the MID Server to use credentials from the MID Server service account.
   a) Set the **MID Server service account** to a user who meets the permission requirements.
   b) Verify the user name meets the name format requirements.
   c) Fill in the fields on the form, as appropriate.
   d) Verify the credentials meet domain requirements.

2. Configure the MID Server use credentials from the Credentials (discovery_credentials) table.
   a) Add individual Windows credentials to the Credentials [windows_credentials] table.
      - Verify each credential meets the permission requirements.
      - Verify each username meets the name format requirements.
      - Verify each credential meets the Windows domain requirements.
   b) (Optional) Configure the MID Server to use Powershell by setting the mid.use_powershell parameter to true. See **MID Server Configuration**.
   c) (Optional) By default, Discovery automatically uses the MID Server service account credentials if all credentials in the Credentials table fail. If you do not want to use the MID Server service credentials as a fall back, set the mid.powershell.local_mid_service_credential_fallback parameter to false.

**Credential affinity for Discovery and Orchestration**

Credential affinity is an association between a set of credentials and a device on your network.

When Discovery or Orchestration first attempts to access a device, they try all available credentials until they find the correct ones. After identifying the credentials for a device, Discovery and Orchestration create an affinity between the credentials and the device using the Credential Affinity [dscy_credentials_affinity] table. All subsequent discoveries or Orchestration activities attempt to match the credentials in this table with a device for which an affinity exists. If
credentials for a device change, Discovery and Orchestration try all available credentials again until they create a new affinity.

**Credential Affinity diagram**

**Note:** If Orchestration and Discovery are installed, and credential alias is enabled, multiple affinities can exist. In this case, the platform looks up credentials for each affinity and inserts the credential for the affinity with the lowest order into the probe.

**Credential alias for Orchestration activities**

Credential alias gives an administrator more control over the credentials used in Orchestration activities.

This is useful when an activity requires specific credentials to perform a task. You can use a credential tag to assign individual credentials to any activity in a Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow.

Credential alias interacts with [credential affinity](#) to determine which credentials should be used for an Orchestration activity.

**How credential alias works**

A [business rule](#) called Insert Discovery Affinity (renamed from Insert Credential Affinity in the Geneva release) runs when a record is inserted into the ECC Queue. This rule determines whether a credential affinity exists for the device and identifies the proper credential_id (the sys_id of the record in the Credentials [discovery_credentials] table) to use. When the platform encounters an affinity with a credential alias value defined (credential_alias in the business rule), the business rule determines if the credential referenced by the affinity has the specified alias. If it does, the business rule selects the credential_id of the credential alias and passes that value to the MID Server. If the credential does not have the specified credential alias, any other affinities that exist for the target system will be checked. If no affinity references an appropriately tagged credential, the MID Server iterates through the Credentials (discovery_credentials) table and selects the credential with the appropriate tag. The MID Server then creates a new affinity for this credential.
Check IP service affinity for Discovery and Orchestration

You can check the IP Services table for a list of IP addresses that are associated with a protocol.

Role required: admin

The IP Services table maps a port to a protocol. Several mappings are provided by default for commonly used port-protocol combinations, such as port 80 for HTTP, port 22 for SSH, and port 161 for SNMP.

A system property called `glide.discovery.ip_service_affinity` allows Discovery to remember the last port of the IP address that was discovered. This property is set to `false` by default.

Caution: You should not modify IP services unless your organization uses custom ports.

1. Navigate to Discovery > Discovery Definition > IP Services.
2. Filter the list to find the appropriate IP service.
3. Click the name of the service to go to that IP service page.
4. Click the IP Service Affinities tab for the list of IP addresses associated with that service.
IP Service Affinities
External credential storage

An instance can store credentials used by Discovery, Orchestration, and Service Mapping in an external credential repository rather than directly in a ServiceNow credentials record.

The instance maintains a unique identifier for each credential, the credential type (such as SSH, SNMP, or Windows), and any credential affinities. The MID Server obtains the credential identifier from the instance, and then uses a customer-provided JAR file to resolve the identifier from the repository into a usable credential. Currently, the ServiceNow® platform supports the use of the CyberArk vault for external credential storage.

Components installed with External Credential Storage

Business rule

The External Credential Storage business rule performs the following tasks when an administrator makes any change to the external credential storage property:

- Changes the view for the Credentials record list and form to the External Storage view. This view enables users to see the Credential ID column in the list.
- Instructs the MID Server to refresh its credentials cache in preparation for a change in the way credentials are obtained.

Property

A property called Enable External Credential Storage (com.snc.use_external_credentials) enables or disables the External Credential Storage plugin after it is activated. The property is located in Discovery Definition > Properties and Orchestration > MID Server Properties, and is enabled when you activate the plugin.

If you disable external credential storage with the system property, the system automatically sets all the external credentials to inactive in the instance. If you re-enable the feature with this property, the system does not reset the external credential records to active. You must reactivate each credential record manually.

External credential storage log

The MID Server posts log messages about external credential storage.

If the repository encounters an error while attempting to resolve a credentials request, the MID Server posts log messages with this prefix: Problem with client’s CredentialResolver:

Activate external credential storage for Discovery and Orchestration

The External Credential Storage plugin is available by request.

Role required: none

Request the plugin through the HI Service Portal.

1. In the HI Service Portal, click Service Requests > Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
</tbody>
</table>
Specify the date and time you would like this plugin to be enabled | Date and time must be at least 2 business days from the current time.

| Note: Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments. |

| Reason/Comments | Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows. |

3. Click Submit.

**External credential storage architecture**

External credential storage requires a properly configured MID Server to retrieve the credentials from the external store.

**Credential process flow**

The MID Server retrieves credentials from an external store using this process:

1. MID Server downloads credential objects from the ServiceNow Credentials (discovery_credentials) table that contain the corresponding credential ID from the target vault.
2. MID Server checks to see if there are probes to execute from Discovery or Orchestration jobs.
3. MID Server determines if the relevant credentials, such as SSH, Windows or SNMP, are available for the specified probe target. If not, the MID Server uses the Credential Resolver JAR to make a call to the vault to get the actual user name and password. The details about the correct credential object to retrieve from the vault are determined by the Credential Resolver JAR file. Information such as credential ID, target IP address, or credential type are available to the JAR file. If a credential has been retrieved from a previous probe, the credential is cached and is not retrieved again, unless the MID Server is restarted or specifically directed to flush the credential cache.
4. MID Server executes the probe with the appropriate credential.

| Note: Credential affinity still applies. The mechanism remains the same, since the only real difference from the MID Server's perspective is that the real credential details (user name and password) come from the third party vault. |
Architecture
Configure AWS credentials on a CyberArk vault

Configure your CyberArk vault with the AWS credentials to be retrieved for use by your instance.

Store the credentials as an SSH key on the CyberArk vault. When you configure access to the vault on your instance, the name you give to the SSH key must also be used as the credential ID.

1. In CyberArk, go to Accounts > Add SSH Key.
2. Enter the following information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device Type</td>
<td>Select Cloud Service.</td>
</tr>
<tr>
<td>Platform Name</td>
<td>Select Amazon Web Services - AWS - Access Keys.</td>
</tr>
<tr>
<td>AWS Access Key ID</td>
<td>Enter the AWS Access Key, as provided by AWS.</td>
</tr>
<tr>
<td>AWS IAM Username</td>
<td>Enter the AWS IAM Username, as you configured in CyberArk.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the AWS Secret Access Key, as provided by AWS.</td>
</tr>
<tr>
<td>Name</td>
<td>Enter a name for this key.</td>
</tr>
</tbody>
</table>

3. Choose Save.

If you have not done so already, create a credential identifier on your instance to configure access to the CyberArk vault. For more details, see Configure access to external credential storage for AWS.

External credential storage configuration

Configure your instance to obtain credentials from a remote repository.

These procedures assume that you already have an external repository configured with the credentials you want to protect. The credential identifier configured in the ServiceNow instance must be mapped to the actual credential in the repository through the JAR file.

To configure External Credential Storage, complete these tasks in order.

Create a JAR file to resolve credentials

Create a JAR file to resolve credential identifiers sent from the MID Server into actual credentials from the repository.

Make sure to include all the credential elements that the instance expects, such as the private key.

1. Use this sample Java file as a template:

```java
package com.snc.discovery;
import java.util.*;
import java.io.*;
/**
```
* Basic implementation of a CredentialResolver that uses a properties file.
*/

public class CredentialResolver {
    
    private static String ENV_VAR = "CREDENTIAL_RESOLVER_FILE";
    private static String DEFAULT_PROP_FILE_PATH = "C:\"\dummycredentials.properties";

    // These are the permissible names of arguments passed INTO the resolve() method.
    // the string identifier as configured on the ServiceNow instance...
    public static final String ARG_ID = "id";
    // a dotted-form string IPv4 address (like "10.22.231.12") of the target system...
    public static final String ARG_IP = "ip";
    // the string type (ssh, snmp, etc.) of credential as configured on the instance...
    public static final String ARG_TYPE = "type";
    // the string MID server making the request, as configured on the instance...
    public static final String ARG_MID = "mid";

    // These are the permissible names of values returned FROM the resolve() method.
    // the string user name for the credential, if needed...
    public static final String VAL_USER = "user";
    // the string password for the credential, if needed...
    public static final String VAL_PSWD = "pswd";
    // the string pass phrase for the credential if needed:
    public static final String VAL_PASSPHRASE = "passphrase";
    // the string private key for the credential, if needed...
    public static final String VAL_PKEY = "pkey";
    // the string authentication protocol for the credential, if needed...
    public static final String VAL_AUTHPROTO = "authprotocol";
    // the string authentication key for the credential, if needed...
    public static final String VAL_AUTHKEY = "authkey";
    // the string privacy protocol for the credential, if needed...

            propFilePath = DEFAULT_PROP_FILE_PATH;
        }
        File propFile = new File(propFilePath);
        if (!propFile.exists() || !propFile.canRead()) {
            System.err.println("Can't open "+propFile.getAbsolutePath());
        } else {
            InputStream propsIn = new FileInputStream(propFile);
            fProps.load(propsIn);
        }
        fProps.load(CredentialResolver.class.getClassLoader().getResourceAsStream("dummycredentials.properties"));
    } catch (IOException e) {
        System.err.println("Problem loading credentials file:");
        e.printStackTrace();
    }
}

/**
 * Resolve a credential.
 */
public Map resolve(Map args) {
    loadProps();
    String id = (String) args.get(ARG_ID);
    String type = (String) args.get(ARG_TYPE);
    String keyPrefix = id+"."+type+".";
    if(id.equalsIgnoreCase("misbehave"))
        throw new RuntimeException("I've been a baaaaaaaaad CredentialResolver!");
    // the resolved credential is returned in a HashMap...
    Map result = new HashMap();
    result.put(VAL_USER, fProps.get(keyPrefix + VAL_USER));
    result.put(VAL_PSWD, fProps.get(keyPrefix + VAL_PSWD));
    result.put(VAL_PKEY, fProps.get(keyPrefix + VAL_PKEY));
    result.put(VAL_PASSPHRASE, fProps.get(keyPrefix + VAL_PASSPHRASE));
    result.put(VAL_AUTHPROTO, fProps.get(keyPrefix + VAL_AUTHPROTO));
    result.put(VAL_AUTHKEY, fProps.get(keyPrefix + VAL_AUTHKEY));
    result.put(VAL_PRIVPROTO, fProps.get(keyPrefix + VAL_PRIVPROTO));
    result.put(VAL_PRIVKEY, fProps.get(keyPrefix + VAL_PRIVKEY));
    System.err.println("Resolving credential id/type["+id+"/"+type+"] -> "+result.get(VAL_USER)+"/"+result.get(VAL_PSWD)+"/"+result.get(VAL_PASSPHRASE)+"/"+result.get(VAL_PKEY)+"/"+result.get(VAL_AUTHPROTO)+"/"+result.get(VAL_AUTHKEY)+"/"+result.get(VAL_PRIVPROTO)+"/"+result.get(VAL_PRIVKEY));
    return result;
/**
 * Return the API version supported by this class.
 */
public String getVersion() {
    return "1.0";
}

public static void main(String[] args) {
    CredentialResolver obj = new CredentialResolver();
    obj.loadProps();

    System.err.println("I spy the following credentials: ");
    for (Object key : obj.fProps.keySet()) {
        System.err.println(key + ": " + obj.fProps.get(key));
    }

    }
}

2. Create a properties file to store the external credentials for the script. Use the sample below to add the necessary credentials.

#dummycredentials.properties
#set the environment variable CREDENTIAL_RESOLVER_FILE to the fully qualified path to this file (including file name)
#If the environment variable isn't set, it defaults to C:/Mid Servers/Credentials/dummycredentials.properties
#CREDENTIAL_ID.TYPE.user=
#CREDENTIAL_ID.TYPE.pswd=
#CREDENTIAL_ID.TYPE.pkey=
#CREDENTIAL_ID.TYPE.passphrase=
#CREDENTIAL_ID.snmpv3.authprotocol=
#CREDENTIAL_ID.snmpv3.authkey=
#CREDENTIAL_ID.snmpv3.privprotocol=
#CREDENTIAL_ID.snmpv3.privkey=

#CREDENTIAL_ID is the value in the "Credential ID" field on the instance. #TYPE is one of
#ssh_password
#ssh_private_key
#snmp
#snmpv3
#vmware
#windows
#mssql
#cim

PublicSnmp.snmp.pswd=public
TestingSnmp.snmp.pswd=Muffins

ExampleDomain.windows.user=EXAMPLEDOMAIN\administrator
ExampleDomain.windows.pswd=Password1

ExampleLinux.ssh_password.user=root
ExampleLinux.ssh_password.pswd=Rootpass123

#For VMWare on 10.0.103.14
ExampleVMWare.vmware.user=administrator
ExampleVMWare.vmware.pswd=vmpass123##$#@

#### Examples ######
# No Authorization with no Privileges
User1.snmpv3.user=user1
# Md5 Authorization with no Privileges
User2.snmpv3.user=user2
User2.snmpv3.authprotocol=md5
User2.snmpv3.authkey=1234567890abcdef

# Sha Authorization with no Privileges
User3.snmpv3.user=user3
User3.snmpv3.authprotocol=sha
User3.snmpv3.authkey=1234567890abcdef

# Authorization with Privileges
User4.snmpv3.user=user4
User4.snmpv3.authprotocol=md5
User4.snmpv3.authkey=1234567890abcdef
User4.snmpv3.privprotocol=aes_128
User4.snmpv3.privkey=1234567890abcdef

Import a JAR file to resolve credentials

Import a JAR file created to resolve credential identifiers sent from the MID Server into actual credentials from the repository.

After you [create the JAR file](#), import it into the instance, where it becomes accessible to the MID Server.

1. After creating the JAR and properties files, copy the properties file to the MID Server.
2. Navigate to MID Server > JAR Files.
3. Click New.
4. Complete the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique and descriptive name for identifying the file in the instance.</td>
</tr>
<tr>
<td>Version</td>
<td>A version number for the file, if one is available.</td>
</tr>
<tr>
<td>Source</td>
<td>Location of the JAR file for reference purposes. Source information is not used by the system.</td>
</tr>
<tr>
<td>Description</td>
<td>Short description of the JAR file and its purpose in the instance.</td>
</tr>
</tbody>
</table>

5. Click the paper clip icon in the banner and attach the JAR file to the record.

6. Click Submit.
7. Restart the MID Server service.
The platform makes the JAR file available to any MID Server configured to communicate with the instance.

**Configure the credential identifier**

Configure the credential identifier in the instance.

Role required: admin

Verify the following items:

- The [External Credential Storage](#) plugin must be active.
- The [Enable External Credential Storage](#) Discovery property is enabled.

1. Navigate to **Discovery > Credentials** or **Orchestration > Credentials**.
2. Click **New**.
3. Select a credential type.
4. Select the [External credential store](#) check box.
   - The **User name** and **Password** fields disappear, and the **Credential ID** field appears.
5. Complete the Credentials form using the fields from the table.
6. Click **Submit**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
</tbody>
</table>
| Credential ID | Enter the unique key configured for external credentials in the JAR file uploaded to the MID Server for an external credential system. This is the ID passed to the Java class in the parameter map:  

```java
public static final String ARG_ID = "id";
```

The MID Server uses this identifier to resolve the actual credentials on the repository.

**Note:** This field is only visible when the [External credential store](#) check box is selected.

| Tag        | Allow workflow creators to assign individual credentials to any activity in an Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow. |
### ServiceNow: Kingston: Now Platform Capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| **External credential store** | Select this check box to use an external credential storage system. When you select this option the **User name** and **Password** fields are replaced with the **Credential ID** field. External credential storage is only available when the **External Credential Storage plugin** is activated.  

**Note:** Currently, the only supported external storage system is **CyberArk**. |
| **Applies to** | Select whether to apply these credentials to **All MID servers** in your network, or to one or more **Specific MID servers**. Specify the MID Servers that should use these credentials in the **MID servers** field. |
| **MID servers** | Select one or more MID Servers from the list of available MID Servers. The credentials configured in this record are available to the MID Servers in this list. This field is available only when you select **Specific MID servers** from the **Applies to** field. |
| **Order** | Enter the order (sequence) in which the platform tries this credential as it attempts to log onto devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), Discovery or Orchestration tries the credentials in a random order. |

---

**Configure the credential identifier for AWS**

Configure your instance to obtain credentials from a remote repository.

**Role required:** cloud_admin

Verify that the External Credential Storage plugin has been activated and a MID server has been installed.

These procedures assume that you already have an external repository configured with the credentials you want to protect. The credential identifier configured in the instance must be mapped to the actual credential in the repository through the JAR file.

1. Navigate to **Discovery > Credentials**, and create an AWS type credential.
2. Fill out the form fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>A unique and descriptive name for this credential. For example, Amazon Web Services.</td>
</tr>
<tr>
<td><strong>Active</strong></td>
<td>Check box to enable or disable the credential.</td>
</tr>
</tbody>
</table>
### ServiceNow® Now Platform Capabilities

#### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWS Account</td>
<td>Master AWS account to which this credential belongs.</td>
</tr>
<tr>
<td>External credential store</td>
<td>Select this check box to use an external credential storage system. When you select this checkbox, the Access Key ID and the Secret Access Key fields disappear and are replaced by Credential ID and MID servers.</td>
</tr>
<tr>
<td>Credential ID</td>
<td>Enter the Name as stored in CyberArk.</td>
</tr>
<tr>
<td>MID servers</td>
<td>Select one or more MID Servers.</td>
</tr>
</tbody>
</table>

3. **Click Submit.**

### CyberArk credential storage integration

The MID Server integration with the CyberArk vault enables Orchestration, Discovery, and Service Mapping to run without storing any credentials on the instance.

### Introduction to CyberArk

CyberArk’s Application Identity Management (AIM) product uses the Privileged Account Security solution to eliminate the need to store application passwords embedded in applications, scripts or configuration files, and allows these highly-sensitive passwords to be centrally stored, logged and managed within the CyberArk vault. This approach enables organizations to comply with internal and regulatory requirements of periodic password replacement and to monitor activities associated with all types of privileged identities, whether on-premise or in the cloud.

The instance maintains a unique identifier for each credential, the credential type (such as SSH, SNMP, or Windows), and any credential affinities. The MID Server obtains the credential identifier, credential type, and IP address from the instance, and then uses the CyberArk vault to resolve these elements into a usable credential.

The CyberArk integration requires the ServiceNow® External Credential Storage plugin, which is available by request.

### Installed with CyberArk

- **Business rule:** The External Credential Storage business rule performs the following tasks when an administrator makes any change to the external credential storage property:
  - Changes the view for the Credentials record list and form to the External Storage view. This view enables users to see the Credential ID column in the list.
  - Instructs the MID Server to refresh its credentials cache in preparation for a change in the way credentials are obtained.

- **System property:** A property called Enable External Credential Storage (com.snc.use_external_credentials) enables or disables the External Credential Storage plugin after it is activated. This property is located in Discovery Definition > Properties and Orchestration > MID Server Properties, and is enabled when you activate the plugin.

**Note:** If you disable external credential storage with the system property, the system automatically sets all the external credentials to inactive in the instance. If you re-enable...
the feature with this property, the system does not reset the external credential records to active. You must reactivate each credential record manually.

### Supported credential types

The CyberArk integration supports these ServiceNow credential types:

- CIM
- JMS
- SNMP Community
- SSH
- SSH Private Key (with key only)
- VMware
- Windows

Orchestration activities that use these network protocols support the use of credentials stored on a CyberArk vault:

- SOAP (with basic authentication overrides)
- REST (with basic authentication overrides)
- JDBC
- SSH
- PowerShell
- JMS
- SFTP

**Important:** You cannot manage credentials stored on a CyberArk vault and a custom external credential storage system using the same MID Server. To use both types of external storage, install and configure a dedicated MID Server for each. The MID Server must be installed on the same machine as the CyberArk AIM API/client.
CyberArk architecture
How the MID Server handles Windows accounts

Credential lookup initially attempts to match the specified credential ID to an existing value in the CyberArk vault Name field. If a match is found, that credential is returned. If no match is found, the credential lookup attempts to find a match using the IP address. If the IP address lookup matches more than one credential, such as Windows and Tomcat on the same server, the lookup fails. To avoid this issue, set the ext.cred.typeSpecifier parameter in the MID Server config.xml file to true to force CyberArk to return credentials that match both the credential type and the IP address. For example, if an IP address is shared by both Windows and Tomcat, a credential type of Windows returns the Windows credential only.

CyberArk integration configuration

These procedures include both CyberArk and ServiceNow configuration tasks, including references to the appropriate CyberArk documentation.

The credential identifier configured in the ServiceNow instance must be mapped to the credential name in the CyberArk vault. When looking up a credential, the MID Server first tries to find the credential by matching by name, which must be unique, and then by IP address. For credential lookups in versions at Kingston Patch 12 and later, the MID Server finds the credential by matching the credential identifier to a name in vault, which must be unique. If the Credential identifier field is blank, then the MID Server finds the credential by IP address. To identify the credential by IP address, the system looks at the credential type to ensure that there is only one credential of that type at that address. An example of this might be when a Windows server and vCenter are both running on the same IP address. To support strict credential requirements like this in an SSH environment, a MID Server configuration parameter allows you to require that the credential type requested matches the type returned by CyberArk.

To configure your instance to obtain credentials from a CyberArk vault, complete these tasks in the order in which they appear below.

Configure the CyberArk vault and install the AIM API
Configure the CyberArk vault to allow MID Server access and install the CyberArk AIM API on the MID Server machine.
Role required: admin

Before starting this procedure, ensure that the External Credential Storage plugin is activated.

1. Configure the CyberArk vault with the application ID and authentication details that all MID Servers requesting credentials will use.
   For details, refer to the CyberArk Credential Provider and ASCP Implementation Guide.
   a) Ensure that CyberArk is configured to allow the MID Server to access the vault by creating an App-ID in CyberArk called ServiceNow_MID_Server.
   b) Make sure that every credential the MID Server needs is granted access to the ServiceNow_MID_Server App-ID.

   Note: You can override the default ServiceNow_MID_Server App-ID in the MID Server config.xml file using the ext.cred.app_id parameter. If you change the value in this parameter, make sure to configure a matching value in the vault.

2. Install the CyberArk Credential Provider, including the AIM API, on each machine that hosts a MID Server service that is used to access the credential store.

3. Provision CyberArk accounts and set permissions for application access.
   For details, refer to the CyberArk Privileged Account Security Implementation Guide.
a) In the CyberArk Password Safe, create the privileged accounts required by Discovery, Orchestration, or Service Mapping to access different devices and ensure that these accounts are members of the safes in which the necessary credentials are stored.

b) Add the Credential Provider and application users as members of the Password Safes where the application passwords are stored.

**Import the CyberArk JAR file**

Import the CyberArk JavaPasswordSDK.jar file into the instance to make it accessible to the MID Server.

Role required: agent_admin or admin

Before starting this procedure, ensure that CyberArk is configured to allow the MID Server access to credentials. Ensure that the CyberArk AIM API is installed on each server hosting a MID Server that is used to access the vault.

Use this process even if the JavaPasswordSDK.jar file already exists on the MID Server.

1. Navigate to **MID Server > JAR Files**.
2. Click **New**.
3. Complete the form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique and descriptive name for identifying the file in the instance.</td>
</tr>
<tr>
<td>Version</td>
<td>Optional version number for the file, if one is available.</td>
</tr>
<tr>
<td>Source</td>
<td>Provider of the JAR file. Source information is not used by the system.</td>
</tr>
<tr>
<td>Description</td>
<td>Optional short description of the JAR file and its purpose in the instance.</td>
</tr>
</tbody>
</table>

4. Attach the JAR file to this record.

   The AIM JavaPasswordSDK.jar file comes with the AIM SDK installation files and is typically located on the MID Server in the AIM installation directory at `<install_dir>/CyberArk/ApplicationPasswordSdk`.

5. Click **Submit**.
6. Restart the MID Server service.

   The platform makes the JAR file available to any MID Server configured to communicate with the instance.

**Configure the MID Server for CyberArk**

Configure the `config.xml` file to grant the MID Server access to the CyberArk vault.

Role required: admin

Before starting this procedure, import the `JavaPasswordSDK.jar` file into the instance.

Manually configure the MID Server `config.xml` file with these parameters.

This configuration cannot be done from the instance.
Required configuration parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ext.cred.safe_folder</td>
<td>NameOfFolder</td>
<td>Folder to use for all credential lookups. For example, root.</td>
</tr>
<tr>
<td>ext.cred.use_cyberark</td>
<td>true</td>
<td>Boolean parameter indicating that this MID Server is integrated with CyberArk.</td>
</tr>
</tbody>
</table>

Optional configuration parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ext.cred.safe_timeout</td>
<td>5 (sec)</td>
<td>Timeout of each credential lookup in the vault, specified in seconds.</td>
</tr>
<tr>
<td>ext.cred.safe_name</td>
<td>NameOfSafe</td>
<td>Default safe name used for all credential lookups. If parameters are in multiple safes, the credential ID may be specified in the format <code>&lt;safeName&gt;:&lt;CredentialID&gt;</code>. When configured like this, the NameOfSafe field is ignored. If all external credentials have their credential IDs specified in this format, then leave out the NameOfSafe field.</td>
</tr>
<tr>
<td>ext.cred.app_id</td>
<td>ServiceNow_MID_Server</td>
<td>Specifies the App-ID used to grant permission to the MID Server to access the CyberArk vault. The default value, ServiceNow_MID_Server, must be defined in the CyberArk vault. You can use this parameter to override the default and specify your own App-ID. If you edit the App-ID in this parameter, make sure to configure CyberArk to match.</td>
</tr>
</tbody>
</table>

Note: By default the separator character in this format is a colon. To assign any character you want as a separator, add this line to the CredMap.properties file: `safe.cred.split.string=<string>`. 
Configure CyberArk for SNMPv2 credentials

If your system uses SNMPv2, you can create a special file to map the attribute in a credential to the community string.

Role required: admin

Before starting this procedure, configure the MID Server to have access to the CyberArk vault.

Note: If the community string appears in the password field of the CyberArk credential, it is not necessary to perform this procedure.

SNMPv2 is not natively supported in CyberArk. If your organization has created custom SNMPv2 credentials in which the community string does not appear in the password field of the credential, use this procedure to map the attribute in the credential to the community string.

1. In a text editor, create a file called `CredMap.properties`, containing this code:
   ```
   SNMPv2.Community=attribute_name
   ```
2. Save the file to the `/agent` directory of your MID Server installation.

   On credential lookup, the MID Server attempts to find this attribute for the credential. If the attribute is not found, the MID Server then looks in the password field. If the password field is empty, the credential lookup fails.

Configure the CyberArk credential identifier

Create the unique key that CyberArk can use to identify specific credentials in the external repository.

Role required: admin

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| ext.cred.type_specifier | true  | Forces an IP address lookup to return credentials that match both the CyberArk platform ID and the IP address. For example, if an IP address is shared by both Windows and Tomcat, a credential with a platform ID starting with **Win** returns the Windows credential only. When this parameter is set to true, CyberArk looks for platform IDs that begin with:
   - Win: Windows
   - Unix: SSH
   - VMWare: VMware |
| ext.cred.check_ssh_type | false | When set to true, requires that the type of SSH credential returned from CyberArk matches the type of credential requested. For example, if a normal SSH username/password credential is requested and only SSH keys are available, the credential lookup fails. |
Before starting this procedure, ensure that the External Credential Storage plugin is activated, and the `com.snc.use_external_credentials` system property is set to true.

1. Navigate to Discovery > Credentials or Orchestration > Credentials.
2. Click New.
3. From the list of credential types, select a type that supports CyberArk external storage.
4. Complete the form using the fields from your credential type.
5. Select the External credential storage check box.
   
The User name and Password fields are replaced with the Credential ID field.
6. In the Credential ID field, enter an expression using one of these formats:
   - If all your credentials are in the same safe, configure this safe name in the MID Server `config.xml` file using the `ext.cred.safe_name` parameter, and then specify the credential ID by name only, as `<credential ID>`.
   - To name credentials for a given platform that reside in a specific safe, define the credential ID as `<safe>:<credential ID>:<platform ID>`.
   - If your credentials are in multiple safes, specify the credential ID in this format: `<safe>:<credential ID>`.
   - If you want CyberArk to look up the credential by IP address, using an alternate safe, specify the credential ID in this format: `<safe>:.`.
   - If you want CyberArk to look up the credential for an alternate platform ID in the same safe, use this format: `::<platform ID>`.
   - If you want CyberArk to look up the credential in a configured safe by the IP address rather than the credential ID, leave this field blank. This is the best practice for handling installations in which each server has a unique credential. Without this type of lookup, you must create a credential ID record in your instance for every server in your environment.

| Note: The credential ID must match the value in the Name field of the credential in the CyberArk vault. The Credential ID field has a limit of 40 characters. |

7. Click Submit.

Configure AWS credentials on a CyberArk vault

Configure your CyberArk vault with the AWS credentials to be retrieved for use by your instance.

Store the credentials as an SSH key on the CyberArk vault. When you configure access to the vault on your instance, the name you give to the SSH key must also be used as the credential ID.

1. In CyberArk, go to Accounts > Add SSH Key.
2. Enter the following information:

**CyberArk credentials**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device Type</td>
<td>Select Cloud Service.</td>
</tr>
<tr>
<td>Platform Name</td>
<td>Select Amazon Web Services - AWS - Access Keys.</td>
</tr>
<tr>
<td>AWS Access Key ID</td>
<td>Enter the AWS Access Key, as provided by AWS.</td>
</tr>
<tr>
<td>AWS IAM Username</td>
<td>Enter the AWS IAM Username, as you configured in CyberArk.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the AWS Secret Access Key, as provided by AWS.</td>
</tr>
</tbody>
</table>
### Credentials troubleshooting

Review the `<credentials_debug>` section of the ECC queue payload to troubleshoot issues with credentials.

Certain probes support credential debugging, starting with the Istanbul release. Credential debugging inserts a `<credentials_debug>` section in the payload that the MID Server returns to the instance ECC queue. You can view the `<credentials_debug>` section to see detailed information about the credential lookup.

The `<credentials_debug>` section appears in the payload if:

- Credentials fail for WMIRunner, PowerShell, JMS, or SSHCommand.
- You set the `credentials_debug` parameter to true for the WMIRunner, PowerShell or SSHCommand probes. If you set the parameter to true, the `<credentials_debug>` section appears even if the credential lookup is successful.

The `<credentials_debug>` section shows:

- Information about the credential search, such as the credential types, tags, and affinities.
- The IP address targeted.
- Information about each credential (in order) that the MID server used, including the type, classification, tag, name, Sys ID, and external credential ID if present.
Sample payload showing invalid credentials

Additional details appear for PowerShell and SSHCommand:

- For the PowerShell parameter:
  - If the local MID Server credentials were used after all the Windows credentials failed, and also if that succeeded.
  - If the credentials were skipped because you are trying to discover the same machine that the MID Server is on, or if the `mid.powershell.use_credentials` parameter is set to true.

- For the SSHCommand:
  - If the credential search was skipped because the target IP is blacklisted.
If the target IP was added to the blacklist.

**Note:** The MID Server saves IP addresses for failed credential searches in a blacklist in cache memory. This blacklist specifies which devices the MID Server should stop trying to access. By default, the IP addresses stay on the blacklist for five minutes, or until the credentials change or the MID Server is restarted, which clears the cache. You cannot change this time length.

### Edge Encryption

ServiceNow® Edge Encryption™ encrypts sensitive data on your company premises before sending it over the Internet to your ServiceNow instance (encrypted in flight) where it remains encrypted at rest.

### Understanding Edge Encryption

Edge Encryption is a network encryption system that resides in your network that encrypts and decrypts sensitive data as it travels between your data center and the ServiceNow cloud.

### What is Edge Encryption

The Edge Encryption proxy server is a network encryption application that, through encryption in motion, encrypts data within your network before it is sent over the Internet to your instance, where it remains encrypted at rest. When requested, the encrypted data is sent back to the Edge Encryption proxy server, which in turn decrypts your data before serving it to your web browser.
Who uses Edge Encryption

Encrypted data can only be viewed in clear text by a user logged in to the instance through a proxy server in your network. Likewise, Edge Encryption can only be configured and administered by a security_admin user logged in to an instance through a proxy server in your network.

Because the proxy server resides in your network, you own and manage the encryption keys—they are never sent to the instance. As a result, sensitive data is never displayed in clear text to ServiceNow.

Edge Encryption can encrypt or tokenize your data

Edge Encryption supports both encryption and tokenization as a means of protecting your sensitive information.

Encryption configurations

You can encrypt individual fields using encryption configurations. Edge Encryption supports AES with 128-bit and 256-bit encryption keys. Standard, equality-preserving, and order-preserving encryption types are supported.

In addition to attachments, the following field types can be encrypted:

- String
- Journal
- Journal Input
- URL

If a Journal field marked for encryption is added to the activity stream, all user input to the field is encrypted in the activity stream.

Note: Multi-byte characters within supported field types can be encrypted.

Encryption patterns

You can use encryption patterns to tokenize strings that match regular patterns such as social security and credit card numbers. While encryption configurations should be the primary method of encryption, use encryption patterns as a supplement to secure sensitive information found outside of encrypted fields.

Note: The Edge Encryption proxy server requires a MySQL database in your network only if using order preserving encryption or encryption patterns. Clear text values are stored in the proxy database in your network. For this reason, it is critical that you secure and regularly back up your proxy database. For recommendations, see Edge Encryption components.
Edge Encryption on the Now Platform

Edge Encryption acts as a gateway between your browser and your ServiceNow instance. Traffic from your browser passes through the gateway on its way to the ServiceNow instance. The gateway, in turn, is configured to encrypt outbound data that is marked for encryption. Inbound traffic is decrypted through the gateway, and the end user sees clear text in the browser. The advantage of this implementation from a security control perspective is that the encryption and key management are handled externally from ServiceNow.

Because encryption and tokenization change the nature of your data, Edge Encryption can affect other instance processes. Before using Edge Encryption, carefully consider the impact on your instance by reviewing Planning for Edge Encryption.
What to know before you begin

Because the proxy server is installed and maintained in your network, Edge Encryption requires network administration and management. Review the network requirements to ensure a smooth implementation.

Learn more

This podcast offers more information about Edge Encryption.

Edge Encryption components

Edge Encryption is comprised of the Edge Encryption proxy server that runs on a server in your network, and the Edge Encryption plugin that must be installed on your ServiceNow instance. If using order-preserving encryption types or encryption patterns, a proxy database must also be installed in your network.

Proxy application

When going through the Edge Encryption proxy server, the Edge Encryption plugin allows you to specify which fields, patterns, and attachments should be encrypted. You can also manage encryption rules to encrypt specific requests and schedule mass encryption jobs.

Proxy server

The Edge Encryption proxy server uses encryption rules to identify in an HTTP request what, if anything, needs to be encrypted and encrypts it before forwarding the request to the instance. For decryption, the Edge Encryption proxy server looks at the HTTP responses for any encrypted data and decrypts it before sending the response back to the client. In order for this to happen, all HTTP requests and responses must go through the Edge Encryption proxy server. This includes any requests originating from a browser, as well as any SOAP or REST requests.

Proxy database

If using order preserving encryption or encryption patterns, your proxy servers rely on a MySQL database located in your network. All proxy servers in your network must use the same database.

The proxy database contains these tables:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>db_id</td>
<td>Unique database ID</td>
</tr>
<tr>
<td>edge_token_map</td>
<td>Encryption pattern data</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>---------------------------------------</td>
</tr>
<tr>
<td>token_map</td>
<td>Order-preserving encryption data</td>
</tr>
</tbody>
</table>

**Backing up your proxy database**

Because encryption patterns rely on tokenization, clear text values are stored in your proxy database. If the database is lost, clear text values cannot be restored. It is critical that you maintain regular backups. To avoid data loss, back up your proxy database according to ServiceNow recommendations.

- Back up your database every 24 hours.
- Retain MySQL database binary log files for at least two days. After a backup has been restored, use the binary log to regenerate any data lost since the most recent backup. Refer to MySQL database backup best practices for your database version.

**Key management**

You are responsible for providing and managing the encryption keys used by Edge Encryption.

When obtaining and creating encryption keys to support the encryption types used by Edge Encryption, consider the following:

- Whether to use AES 128-bit or AES 256-bit. You must define a default AES 128-bit encryption key even if it is not used.
- Whether to use file store, Java KeyStore, or NAE.
- When to rotate encryption keys.
- When and if to use a mass encryption job to re-encrypt data using the new key.

Before removing a key from the proxy configuration files and the keystore, it is critical that you decrypt all data on the instance that uses the key. You can do this by adding a new encryption key and scheduling a mass key rotation job.

**Keystores**

Edge Encryption supports the following types of key storage.

**Java KeyStore**

Keys are stored in Java's JCEKS KeyStore. A Java KeyStore is protected by a password so it is more secure than storing keys in a file in the file system. A single Java KeyStore can store multiple keys and the keys are identified by a key alias, making it easier to manage multiple keys.

**NAE (Network Attached Encryption) key store**

Keys are stored and retrieved with SafeNet's KeySecure key management.

**File system**

Keys are stored in a file in a file system that is accessible by the Edge Encryption proxy. Encryption keys stored in a file are not encrypted so it is your responsibility to protect these files.

The Edge Encryption proxy ships with the Java JCEKS KeyStore file named `keystore.jceks` in the `keystore` directory. This keystore file contains the ServiceNow public key used to validate encryption rules signed by ServiceNow.
Note: If using a keystore other than the base system Java JCEKS KeyStore, you must import the ServiceNow public key into your keystore. The public key alias is servicenow.

In addition to the encryption keys, the Java JCEKS KeyStore is used to store the RSA key pair for digitally signing the encryption configuration and encryption rules that are stored in the instance, and the digital certificate that the Edge Encryption proxy uses to establish a secure connection with the browsers and any other clients.

Encryption configurations and patterns

With Edge Encryption, you can encrypt fields and tokenize strings.

Encryption configurations

You can encrypt individual fields using encryption configurations. Edge Encryption supports AES with 128-bit encryption keys. If the Java Cryptography Extension (JCE) Unlimited Strength Jurisdiction Policy files are installed, Edge Encryption supports 256-bit encryption keys for each encryption type. Edge Encryption supports the following types of encryption configurations.

Standard encryption

The encrypted value of a field is different each time the field is encrypted, even when the field value remains the same. Standard encryption is the most robust form of encryption. Fields using standard encryption cannot be sorted, grouped by, or filtered on.

Equality-preserving encryption

The encrypted value of a field is the same when the field value remains the same. Supports equality comparisons and group by operations on a field.

Note: When equality-preserving encryption is selected for a field that already contains data, performing a group by action on the field may not group fields with the same value if one is encrypted and the other is not.

Order-preserving encryption

Uses tokens and encryption to secure data in your proxy database. Supports equality comparisons, group by operations, and the ability to sort data. The order preserving encryption type is only supported if there is a MySQL database configured for the Edge Encryption proxy server.

Note: When using order-preserving encryption and the proxy database is down, updates can be made to fields using order-preserving encryption. However, the sort order will not be correct when trying to sort data based on those fields. Groups also will not work as expected. When the proxy database is again operational, schedule an order token repair job to repair missing tokens.

Encryption types

The following encryption types are listed in decreasing security quality.

<table>
<thead>
<tr>
<th>Encryption type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Standard AES 256</td>
<td>Fields cannot be filtered, sorted, or compared.</td>
</tr>
<tr>
<td>Standard AES 128</td>
<td>Fields cannot be filtered, sorted, or compared.</td>
</tr>
<tr>
<td>Encryption type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>-----------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Equality preserving AES 256</td>
<td>Fields can be filtered using equality comparisons.</td>
</tr>
<tr>
<td>Equality preserving AES 128</td>
<td>Fields can be filtered using equality comparisons.</td>
</tr>
<tr>
<td>Order preserving AES 256</td>
<td>Fields can be sorted and equality comparison filtering can be used. Requires the use of a MySQL database in your network.</td>
</tr>
<tr>
<td>Order preserving AES 128</td>
<td>Fields can be sorted and equality comparison filtering can be used. Requires the use of a MySQL database in your network.</td>
</tr>
</tbody>
</table>

### Encryption Patterns

You can secure sensitive data found in strings using encryption patterns. Once an encryption pattern is stored and activated, the Edge Encryption proxy server identifies strings that match the pattern in requests. Once located, the clear text string is stored in the proxy database and replaced on the instance with a token. Use encryption patterns to tokenize strings that match regular patterns such as social security and credit card numbers. While we recommend that encryption configurations be the primary method of encryption, use encryption patterns as a supplement to locate and secure sensitive information found outside of encrypted fields.

**Note:** The Edge Encryption proxy server requires a MySQL database in your network only if using order preserving encryption or encryption patterns. Clear text values are stored in the proxy database in your network. For this reason, it is critical that you secure and regularly back up your proxy database. For recommendations, see [*Edge Encryption components*](#).

### Installed with Edge Encryption

Edge Encryption installs tables to store encryption-related data, system properties to configure default behavior, and the edge_encryption role to administer Edge Encryption.

### Tables

Edge Encryption adds the following tables.

#### Tables for Edge Encryption

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edge Encryption Configuration</td>
<td>Contains encrypted fields and tables for which attachments are encrypted.</td>
</tr>
<tr>
<td>(sys_encryption_configuration)</td>
<td></td>
</tr>
<tr>
<td>Edge Encryption Rule</td>
<td>Contains a record for each rule. A rule has a name, the condition when it is used, a script, and an order field.</td>
</tr>
<tr>
<td>(sys_encryption_rule)</td>
<td></td>
</tr>
<tr>
<td>Edge Encryption Invalid Insert Log</td>
<td>Contains log messages created for attempts to save unencrypted data to an encrypted field.</td>
</tr>
<tr>
<td>(sys_edge_encryption_invalid_insert_log)</td>
<td></td>
</tr>
<tr>
<td>Edge Encryption Proxy</td>
<td>Contains information about the encryption proxy application.</td>
</tr>
<tr>
<td>(sys_encryption_proxy)</td>
<td></td>
</tr>
</tbody>
</table>
### Table

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edge Proxy Encryption Type</td>
<td>Used for enabling and disabling encryption types on the encryption form.</td>
</tr>
<tr>
<td>(sys_proxy_encryption_type)</td>
<td></td>
</tr>
<tr>
<td>Encryption Job Execution</td>
<td>Supports mass encryption jobs.</td>
</tr>
<tr>
<td>(sys_encryption_job_execution)</td>
<td></td>
</tr>
<tr>
<td>Encryption Job Execution Chunk</td>
<td>Supports mass encryption jobs.</td>
</tr>
<tr>
<td>(sys_encryption_job_execution_chunk)</td>
<td></td>
</tr>
<tr>
<td>Scheduled Encryption Job</td>
<td>Lists scheduled jobs for encryption, decryption, key rotation, order token repair, and database recovery.</td>
</tr>
<tr>
<td>(sysauto_encryption_job)</td>
<td></td>
</tr>
<tr>
<td>Encryption Key Configuration</td>
<td>Lists default encryption keys.</td>
</tr>
<tr>
<td>(sys_encryption_key_configuration)</td>
<td></td>
</tr>
<tr>
<td>Encryption Key</td>
<td>Lists available keys and key attributes.</td>
</tr>
<tr>
<td>(sys_encryption_key)</td>
<td></td>
</tr>
<tr>
<td>Proxy Encryption Key</td>
<td>Lists proxy encryption keys.</td>
</tr>
<tr>
<td>(sys_encryption_proxy_key)</td>
<td></td>
</tr>
</tbody>
</table>

### Properties

Edge Encryption adds the following properties.

**Note:** To open the System Properties (sys_properties) table, enter `sys_properties.list` in the navigation filter.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.edge.pattern.disallowed.chars</td>
<td>A list of characters that are not allowed in patterns.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type</strong>: a string of a comma-separated list of values</td>
</tr>
<tr>
<td></td>
<td>• <strong>Location</strong>: System Properties (sys_properties) table</td>
</tr>
<tr>
<td>glide.edge.pattern.min.size</td>
<td>The minimum pattern size allowed. Allowing smaller patterns means finding more matches, which increases overhead.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type</strong>: number</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value</strong>: 5</td>
</tr>
<tr>
<td></td>
<td>• <strong>Location</strong>: System Properties (sys_properties) table</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| sn_edge_encryption.logging.destination | Where messages are logged.  
* **Type:** string  
* **Default value:** file  
* **Location:** System Properties (sys_properties) table |
| sn_edge_encryption.logging.verbosity | The logging level to use.  
* **Type:** string  
* **Default value:** info  
* **Location:** System Properties (sys_properties) table |
| sn_edge_encryption.encryption.proxy.buildtag | The proxy version registered with your instance.  
* **Type:** string  
* **Location:** System Properties (sys_properties) table |
| sn_edge_encryption.cleartext.allowed | When true, allows clear text to be saved in an encrypted field. This happens when a user is accessing the instance without going through the Edge Encryption proxy. When false, the system prevents clear text from being saved in an encrypted field.  
* **Type:** Boolean  
* **Default value:** false  
* **Location:** System Properties (sys_properties) table |

### Roles installed with Edge Encryption

<table>
<thead>
<tr>
<th>Role title</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>edge_encryption</td>
<td>Edge Encryption proxies log into the instance as a user, with a user name and password. The user must have this role assigned.</td>
<td>None</td>
</tr>
</tbody>
</table>

### Planning for Edge Encryption

Successful implementation of Edge Encryption requires planning and preparation. Answer the following questions in the planning stage.

- Which fields are to be encrypted?
- Which encryption types are to be used?
- How many Edge Encryption proxies are needed? See [Sizing your Edge Encryption environment](#) for recommendations and considerations.
- If an order preserving encryption type or encryption patterns are to be used, where is the MySQL database located?
• Which key management system is to be used?

System administrators, network administrators, and security team members have different tasks to fulfill for implementing Edge Encryption.

• System administrators need the security-admin role. The system administrator needs to:
  • Download the Edge Encryption proxy application.
  • Set up an Edge Encryption user account for the proxies to use to connect to the instance. The user must be assigned the edge_encryption role.
  • Configure encryption keys, and set the default keys.
  • Configure Edge Encryption on the instance.
  • Schedule encryption jobs.
  • Monitor Edge Encryption.
  • Create and edit encryption rules.

• Your network administrator needs to:
  • Install the Edge Encryption proxy application.
  • Know the network addresses for the proxy servers and the proxy database used for order-preserving encryption and encryption patterns.
  • Install the proxy database to be used for order-preserving encryption and encryption patterns.
  • Start and stop the proxy applications.
  • Perform encryption key management.
  • Determine how to map users to encryption proxy applications. This can be done with DNS settings or routing rules, and is specific to each network.
  • Manage multiple proxy servers.
  • Configure load balancer pools and settings.

• Your security administrator must determine the encryption types to be assigned to each field.

Edge Encryption system requirements

The Edge Encryption proxy application can run on servers or virtual machines running Windows or Linux.

Java requirements

Java minimum requirements

The host machine installing or running the Edge Encryption proxy server must maintain a supported version of Java:

• Java 8 update 121 (8u121)
• Java 8 update 141 (8u141)
• Java 8 update 151 (8u151) or higher

Note: Java 8 update 131 (8u131) is not supported.
Important: Before installing the Edge Encryption proxy server, check that the $JAVA_HOME variable is pointing to a supported version of Java for each user that will run the proxy server. For example, if installing the proxy server as a local administrator on Windows, check that the $JAVA_HOME variable is pointing to the correct version of Java system-wide. If installing on Linux, check that each user that will run the proxy server has this variable correctly defined. If a supported version of Java is not found, the Edge Encryption proxy server will not run.

If using AES 256-bit encryption with Java 8 update 141 (8u141) or lower, you must install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server host. Add these files to the $<Java-home-directory>/jre/lib/security folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption policy files, see Enable AES 256-bit encryption for Java 8 update 141 (8u141) or lower.

If using AES 256-bit encryption with Java 8 update 151 (8u151) or higher, a java.security file is downloaded with the update. You can simply edit the java.security file to enable AES 256-bit encryption. See Enable AES 256-bit encryption for Java 8 update 151 (8u151) or higher.

Note: If upgrading an Edge Encryption proxy server running on Windows to a new version of Java, you may need to copy the JCE policy files from your previous Java folder to the new Java folder.

Important: Java does not automatically allow unlimited strength keys.

Proxy server minimum configuration

The minimum configuration includes:

- A minimum of 4 GB of available RAM per proxy server (6 GB is recommended for most deployments).

Note: The host machine running the proxy server must have at least 1 more GB of RAM available for OS services than is needed to run the proxy server. Specifically, if a proxy server is set to use 4 GB of RAM, the VM or hardware must have at least 5 GB of RAM installed.

- 3+ GHz CPU, with a 4-core CPU preferred.
- Multiple proxy servers behind a load balancer. The number of proxy servers will depend on the number of application nodes, number of simultaneous users, and failover needs. See Sizing your Edge Encryption environment for considerations.
- Ability to ride-along with other services, depending on the server utilization and resource availability.
- Java 8 is required to run the installer.

Proxy server supported systems

The following systems are supported.

- Windows Server 2012, 2012-R2, and 2016 editions
  - Virtual machines or physical hardware
• 64-bit systems

• Linux
  • Virtual machines or physical hardware
  • 64-bit systems

**Note:** Because the proxy server requires at least 4 GB of memory, 32-bit JREs and 32-bit operating systems are no longer supported starting with the Kingston release.

On 64-bit Linux systems, you must install the 32-bit GNU C library (glibc). The installation command for CentOS is: `yum install glibc.i686`

### Proxy server connection requirements

The proxy server that runs the Edge Encryption application must be able to communicate with machines in your network. Make sure that the proxy server has these network privileges:

- **Firewall access:** Configure any firewalls between the proxy server and the client devices to allow a connection. If your network uses a DMZ, and if your network security protocols limit port access from within the network to the DMZ, you might have to deploy a proxy server to a machine within the DMZ.

- **Network access:** Configure each client to let the proxy server connect with it. If network security prevents you from configuring new machines that can connect to the clients, install the proxy server on an existing machine with connection privileges.

- **Instance access:** Ensure network access to the instance from the proxy server. Make sure that the network used by the proxy server is configured to allow traffic over TCP port 443.

- **Network account:** Install the proxy server with the proper account, either local or domain administrator.

### Order-preserving and tokenization database system requirements

Order-preserving encryption and encryption patterns require a MySQL database configured for the Edge Encryption proxy. Use a dedicated machine to run the order-preserving and tokenization database. The minimum requirements include:

- **Version:** MySQL database versions 5.5 to 7.x
- **OS:** 64-bit systems
- **CPU:** 2+ GHz CPU, with a 4-core CPU preferred
- **RAM:** 16 GB
- **Disk:** SAN or local storage (RAID 10 recommended)
- **Size:** Determined by the number of potential records multiplied by record size. [Calculate the order-preserving and tokenization database size.](#)
- **Configuration:** High Availability cluster. If you are unsure of how to configure your MySQL server, contact MySQL for configuration information.

### Sizing your Edge Encryption environment

Choosing the number of proxy servers for your environment is an important task. Consider the number of users, redundancy needs, and acceptable latency.
Redundancy

Maintain redundant proxy servers in case of hardware failure. Proxy servers should be located behind a load balancer to provide a functional path for all users if a proxy server is unreachable. At a minimum, ensure that two proxy servers are always available.

Size

Size refers to the number of proxy servers required to avoid additional latency that the encryption of data produces. Depending on use, you may want to reduce the amount of latency by adding additional proxy servers. For example, if regular mass encryptions are run, add additional proxy servers to handle the load, or run the mass encryptions when the user load is light. In addition, the hardware that the proxy server runs on influences performance and latency. Proxy servers running on hardware with faster CPUs, more CPUs, and more RAM have higher throughput than slower, limited systems.

The following guidelines assume that your proxy server is running on at least the minimum hardware requirements. To determine the number of proxy servers:

- Consider setting up one proxy server for every two application nodes on the instance.
- For redundancy, set up a minimum of two proxy servers behind a load balancer.
- Add an extra proxy server for every 500 simultaneous users.
- Depending on the desired redundancy, add additional proxy servers for failover.

For example, for an instance with 2,000 users, you should have at least five proxy servers behind a load balancer. This calculation includes one proxy server for every 500 users, with an extra proxy server for failover. Determine ahead of time when you will approach a threshold of 500 users and place another proxy server in the load balancer pool.

Load balancers

To balance requests and improve server response time, distribute proxy servers in a load balancer pool. Configure load balancers to use the "least connections" method. This method connects requests to the proxy server with the fewest active connections, preventing the overloading of a single proxy.

CPU utilization

Because data encryption and tokenization are CPU intensive operations, CPU spikes while encrypting data are normal and expected. When CPU utilization is over 80% for several minutes at a time, it likely means that the proxy server has too much work to do. When this happens, latency increases for the period that the CPU utilization is high. If latency persists, adding another proxy server may help decrease the latency.

Memory

The proxy server must have a minimum of 4 GB of RAM available (6 GB recommended). Set the proxy server initial and upper bound memory limits to the recommended settings.
Calculate the order-preserving and tokenization database size

If using order-preserving encryption or encryption patterns, determine the size of your MySQL database by multiplying the number of potential records by record size.

Note: Use a dedicated machine to run the order-preserving and tokenization database. Do not run the database on the same hardware as the proxy server.

1. Determine the potential number of records that could include fields encrypted with order-preserving encryption.
   a) Multiply the number of encryption configurations using order-preserving encryption by the number of records each configuration is applied to.
   b) To allow for growth, multiply the result by three.

2. Multiply the result of step 1 by 1,536.  
   1,536 is the average size of a record in bytes.

3. If using encryption patterns, perform steps 1–2 for tokenized records and add the result to the total.

The calculated value is the recommended size in bytes for your order-preserving and tokenization database.

Edge Encryption limitations

Edge Encryption impacts system functions. Carefully evaluate the impact of encrypting a field.

Field type restrictions

Restrictions on encrypting field types.

- The following field types can be encrypted:
  - String
  - Journal
  - Journal Input
  - URL

Choice fields, virtual fields, and any fields other than string and journal fields cannot be encrypted. See Field types for more information.

- Fields in system tables, except for certain fields in sys_user, cannot be encrypted.
- System fields in tables cannot be encrypted.
- Fields named “number” and fields associated with an auto-numbering scheme cannot be encrypted.
- When a Journal field is encrypted, the Post button is disabled, even if there are multiple Journal fields and only one of those fields is encrypted.
- Encrypted fields are not available in Go to and header filter boxes.
- When encrypting fields used as an index, only order preserving and equality preserving encryption types can be used. Indexed fields cannot be encrypted using the standard encryption type.
Configuration restrictions

Restrictions and behavior of encryption configurations.

- After a field has been added to the Edge Encryption Configuration table, the configuration record cannot be deleted. If you no longer want a field to be encrypted, deactivate the record in the Edge Encryption Configuration table and schedule an encryption job to decrypt the data.
- If a field in a parent table is marked to be encrypted, the field in all inherited tables is also encrypted. For example, if the short description field in the Task table is encrypted, then the contents of the short description field in the Incident table are encrypted.
- If a field inherited from a parent table is marked to be encrypted, the field in the parent table cannot be encrypted. For example, if short description in the Incident table is marked to be encrypted, then short description in the Task table cannot be encrypted. In the example, you can encrypt the short description in the Problem table.
- When a field with an encryption configuration defined is exported to any format, the output includes encrypted values even when exported through the proxy server. Importing data to a field with an encryption configuration defined is not supported.

Instance restrictions

Impact of using Edge Encryption on the instance.

- Back-end logic cannot process encrypted data. When the instance contains encrypted data, any business rule, back-end script, or back-end feature that relies on evaluating the data in the encrypted field does not run correctly.

  Note: Data encrypted with equality preserving encryption will still pass equivalence checks when compared against an identical encrypted value.

- Scripts run on the server cannot change encrypted data.
- Global search is not supported. Because global search attempts to search both encrypted and clear text data, the results may not be as expected.
- Encrypted data cannot be copied and pasted into a record where the field is not encrypted.
- Depending on the type of encryption selected, the user interface functionality for the encrypted fields is reduced. For example, being able to compare, group by, sort, and search may be impacted. Generally, the stronger the encryption selected, the more functionality is reduced.
- Other than file store, Java KeyStore, and SafeNet, no third-party software or hardware encryption key management is supported.
- While multiple proxy servers connected to a single instance are supported, encryption proxy cluster management and monitoring are not available. Each proxy must be managed separately.
- System configurations such as workload and the number of encrypted fields can impact the performance of encrypted fields.
- The Edge Encryption proxy server can only connect to a single instance.
- If your instance uses an Oracle database and the string field you are marking to be encrypted is greater than 2925 characters, that field cannot be sorted even when order preserving encryption is selected.
- If your instance uses an Oracle database, Unicode AL32UTF8 is the only supported character set.
- Encrypted values included in emails are encrypted.
- Encrypted data cannot be used in reports.
Edge Encryption installation

You can install an Edge Encryption proxy manually or using the Edge Encryption interactive installer.

Java requirements

The host machine installing or running the Edge Encryption proxy server must maintain a supported version of Java:

- Java 8 update 121 (8u121)
- Java 8 update 141 (8u141)
- Java 8 update 151 (8u151) or higher

Note: Java 8 update 131 (8u131) is not supported.

Important: Before installing the Edge Encryption proxy server, check that the $JAVA_HOME variable is pointing to a supported version of Java for each user that will run the proxy server. For example, if installing the proxy server as a local administrator on Windows, check that the $JAVA_HOME variable is pointing to the correct version of Java system-wide. If installing on Linux, check that each user that will run the proxy server has this variable correctly defined. If a supported version of Java is not found, the Edge Encryption proxy server will not run.

Installing the proxy server

Installing Edge Encryption includes these steps.

- Install the Edge Encryption proxy application on a server in your network using the interactive installer or the manual installer.
- Generate the RSA key pair for digitally signing encryption configurations and encryption rules.
- Install the Java Cryptography Extension (JCE), if you plan to use AES 256 encryption.
- If you are using a secure SSL connection, obtain a server certificate and import it to the Java KeyStore.
- Set up your keystore and encryption key.
- If order preserving encryption types or encryption patterns are to be used, set up a MySQL database on a machine in your network.
- Set the desired properties. Properties are located in the edgeencryption.properties configuration file.

Accessing the proxy server

Once installation is complete, point each user’s browser to an Edge Encryption proxy using the URL format: <host>:<port>. Values are determined by the host and port properties in the edgeencryption.properties file.

As an example with the following values:

<table>
<thead>
<tr>
<th>Property</th>
<th>Example value</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.proxy.host</td>
<td>hostname.mycompany.com</td>
</tr>
</tbody>
</table>
A client will access the proxy server using the following address: http://hostname.mycompany.com:8081/.

**Note:** DNS settings and routing rules may be used. Host and port values are determined by your network administrator.

### Request Edge Encryption

The Edge Encryption plugin (com.glide.edgeencryption) is available as a separate subscription. To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization’s production and sub-production instances, generally within a few days.

If you do not have an account manager, decide to delay activation after purchase, or want to evaluate the product on a sub-production instance without charge, follow these steps.

**Role required:** none

1. In the HI Service Portal, click **Service Requests > Activate Plugin**.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Property</th>
<th>Example value</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.proxy.http.port</td>
<td>8081</td>
</tr>
</tbody>
</table>

- **Target Instance**: Instance on which to activate the plugin.
- **Plugin Name**: Name of the plugin to activate.
- **Specify the date and time you would like this plugin to be enabled**: Date and time must be at least 2 business days from the current time.

**Note:** Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments**.

| Reason/Comments | Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows. |

3. Click **Submit**.

### Set up an Edge Encryption user account

The Edge Encryption proxies connect to the instance as a user to obtain and update encryption configuration information. Create a user account for this purpose and give the edge_encryption role to the user.

The Edge Encryption plugin must be installed before you can assign the role.
Role required: admin
1. On your ServiceNow instance, create a user account to be used by the Edge Encryption proxy applications.
2. Assign the edge_encryption role to the user.

Download the Edge Encryption proxy server

Download the Edge Encryption proxy server application from your instance, and then copy the file to each computer that is to run the Edge Encryption proxy server.

Before starting this procedure, the Edge Encryption plugin must be installed and activated on your instance.

**Note:** The Edge Encryption proxy is officially supported only on Oracle JRE.

Role required: security-admin

1. Navigate to Encryption Configuration > Installation & Downloads > Downloads.
2. If using the interactive installer, click Download. If manually installing the proxy server, select the OS version for your proxy server.

**Note:** As the proxy server requires at least 4 GB of memory to run, 32-bit JREs and 32-bit operating systems are no longer supported starting with the Kingston release.

3. Copy the installer to each computer that is to run the Edge Encryption proxy server. If manually installing the Edge Encryption proxy server, copy the ZIP file to each computer that is to run the Edge Encryption proxy server.

After downloading the Edge Encryption installer, *Install the Edge Encryption proxy server using the interactive installer*. If installing manually, *Install the Edge Encryption proxy server using the command line installer*.

Install the Edge Encryption proxy server using the interactive installer

You can install the Edge Encryption proxy server on a Windows or Linux computer using the interactive installer.

The Edge Encryption plugin must be installed and activated on your instance before you start this procedure. Ensure that Java 8 is installed on the machine running the Edge Encryption installer.

Role required: security_admin on your ServiceNow instance and local administrator on the host machine.

After installing a new proxy server, you can run the installer again to perform tests to detect issues with an installation or modify current settings. Your options include:

- **Install New**: Install a new proxy server.
- **Verify Installation**: Perform tests to detect and fix issues in a previous installation.
- **Reinstall Existing**: Perform tests to detect and fix issues in a previous installation and view or modify existing settings.

**Note:** If installing the proxy server on a Linux machine on a privileged port (port 80 or 443), you must run the installer as a root user with full file system access. To restrict file system access after the proxy server is installed, you can use the SetUID feature in the proxy installer. To enable this feature, start the installer as root or sudo. When prompted by the
installer, provide the username and usergroup of an unprivileged user. The proxy server will install with file system privileges of the given user. You can skip this step to continue the default installation with root privileges.

Use the installer to install multiple proxies for your instance on multiple machines, ensuring the following criteria applies:

- All proxies must have the same encryption keys and the same RSA key pair used to digitally sign encryption configurations and rules.
- The encryption key must be the default key configured on the instance.
- When a proxy database is set up as part of the installation, all proxies must use the same proxy database.

Note: SafeNet KeySecure keystore files are not supported by the Edge Encryption installer. To use a SafeNet KeySecure keystore, manually install the proxy server.

After installing the Edge Encryption proxy server, set the proxy server initial memory limit and upper bound memory limit.

Install the Edge Encryption proxy server

Install the Edge Encryption proxy on a Windows or Linux computer.

1. Download the Edge Encryption proxy server installer.
2. Open the Edge Encryption proxy installer.

Note: If installing on a Windows machine, you must run the installer as Administrator.

a) To run the installer as Administrator on a Windows machine, right-click the Command Prompt and select Run as administrator.

b) From the command line, navigate to the directory that contains the downloaded .jar file.

c) Run the following command: java -jar <file name>.jar.
3. To install a new proxy server, select **Install New**.

If a proxy is already installed, you can run the installer to:
- **Verify Installation**: Perform tests to detect and fix issues in a previous installation.
- **Reinstall Existing**: Perform tests to detect and fix issues in a previous installation and view or modify existing settings.

4. Configure the **Installation Location** and **Target ServiceNow Instance**.
   a) Click **Browse** to select an installation location or manually enter an installation path.
   b) Enter the URL of the target ServiceNow instance. Include the protocol and port number.
      `https://example.servicenow.com:443`
   c) Enter the user name and password for a user with the edge_encryption role on the target ServiceNow instance.

5. Click **Next**.
6. Configure the **Connection Settings** and **Proxy Settings**.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proxy Host</td>
<td>Fully qualified domain name of the machine on which you are installing the proxy server.</td>
</tr>
</tbody>
</table>
|                          | ![Note: Click Detect FQDN to look up the machine's fully qualified domain name and auto-populate the Proxy Host field.](image)
|                          | Along with the port, this property defines the URL used by the client to access the proxy server. |
| HTTP Port                | Port on the proxy for HTTP communication.                                   |
| HTTPS Port               | Port on the proxy for HTTPS communication.                                 |
| Proxy Name               | Name of the proxy and the service. The proxy name must be unique.          |
| Proxy Poll Interval      | Poll interval in seconds. With the default setting, it takes 5 seconds for the proxy to learn of encryption configuration changes. Larger values cause the instance to take longer to detect proxies that have come online. |
|                          | ![Note: Changing the default setting of the Proxy Poll Interval can result in detection delays when a proxy comes online.](image) |
| Proxy Keep-Alive Ping Interval | Time in seconds between pings issued by the proxy to the instance. Pings are issued periodically to verify connectivity between the proxy and the instance. The default value is 10. The minimum value is 5. |

7. Click **Install**.
   The Edge Encryption proxy server installs. The installation may take a few minutes.
Configure the signature key

Configure the signature key after installing the proxy server through the Edge Encryption proxy installer.

The signature key signs changes to configurations and properties made by the proxy server. The signature key must be an asymmetric RSA key pair in a JCEKS KeyStore.

**Note:** If installing multiple proxies, each proxy must use the same signature key.

1. On the Signature Key page of the Edge Encryption installer, select the keystore on the host machine to store the signature key.
   - **Create New Java KeyStore:** Enter the directory location, name, and password for the new keystore.
   - **Use Existing Keystore:** Enter the keystore file location and password.
2. Click Next.
3. Select or create a signature key.
   - **New Key:** Create a signature key for this proxy.
   - **Use Existing Key:** Use an RSA key-pair from the selected keystore.
   - **Import Existing Key:** Import an RSA key-pair from a different keystore. Browse to the keystore file, enter the password for the keystore, and select the key alias. Provide a new alias for the key.
4. Click Next.

Configure the HTTPS certificate

To enable clients to connect to the Edge Encryption proxy server using a secure SSL connection, import the HTTPS certificate to the proxy server.

The Edge Encryption proxy provides the HTTPS certificate to clients trying to connect.

1. On the HTTPS Certificate page of the Edge Encryption installer, select the keystore to store the certificate.
   - **Create New Java KeyStore:** Enter the directory location, name, and password for the new keystore.
   - **Use Existing Keystore:** Enter the keystore file location and password.
2. Click Next.
3. Select or import a certificate.
   The key alias is the given alias for the certificate.
   - **Use Existing Certificate:** Use an existing certificate in the selected keystore.
   - **Import from File or KeyStore:** Import a certificate from a different keystore or a .cer file. Browse to the keystore or .cer file, enter the password, and select the alias. You must provide a new alias for the certificate.
4. Click Next.

Configure the 128-bit encryption key

After the HTTPS certificate is configured through the Edge Encryption proxy installer, configure the AES 128-bit encryption key. Use the encryption key to encrypt your data.
The encryption key is either a plain text file inside the /keys directory or a secret key inside a keystore. If you use a keystore for your 128-bit and 256-bit encryption keys, they must both use the same keystore.

1. Select the location to store the encryption key.
   - **File Store**: Use a file to store a single encryption key. Use an existing file in the /keys directory or generate a new file. To generate a new file, enter an alias and click **Generate**. A file containing an encryption key is created.
     
     **Note**: This step selects both the key storage and the encryption key. If File Store is selected, click **Next** and go to step 5.
   
   - **Create New Java KeyStore**: Create a keystore to store the encryption key.
   - **Java KeyStore File**: Store the encryption key in an existing Java KeyStore file.

2. Click **Next**.

3. Select or create the encryption key.
   - **New Key**: Create an encryption key and alias.
     
     **Note**: The alias name (key name, key alias) must use lowercase letters and numbers, per Java KeyStore requirements. To find out more about the keytool utility, see the [Java SE Documentation](#).
   
   - **Use Existing Key**: Use an existing encryption key in the selected keystore.
   - **Import Existing Key**: Import an encryption key from a different keystore.

4. Click **Next**.

5. Configure the key on the instance according to the requirements defined in your installer.
   To configure the key on the instance, navigate to the instance and define a default key. See [Configure encryption keys on the instance](#). Ensure that the key alias, size, and type match the requirements defined in the installer.
Once the key is configured on the instance, return to the installer and click **Next**.
Configure the 256-bit encryption key

After the 128-bit key is configured through the Edge Encryption proxy installer, you can optionally configure the AES 256-bit encryption key and set it as the default key. Use the encryption key to encrypt your data.

The encryption key is either a plain text file inside the /keys directory or a secret key inside a keystore. If you use a keystore for your 128-bit and 256-bit encryption keys, they must both use the same keystore. If you do not want to configure a 256-bit encryption key, click Skip.

1. Select the encryption key location.
   - **File Store**: Use a file to store a single encryption key. Use an existing file in the /keys directory or generate a new file. To generate a new file, enter an alias and click Generate. A file containing an encryption key is created.
     
     **Note**: This step selects both the key storage and the encryption key. If File Store is selected, click Next and go to step 5.
   - **Create New Java KeyStore**: Create a keystore to store the encryption key.
   - **Java KeyStore File**: Store the encryption key in an existing Java KeyStore file.

2. Click Next.

3. Select or create the encryption key.
   - **New Key**: Create an encryption key and alias.
     
     **Note**: The alias name (key name, key alias) must use lowercase letters and numbers, per Java KeyStore requirements. To find out more about the keytool utility, see the Java SE Documentation.
   - **Use Existing Key**: Use an existing encryption key in the selected keystore.
   - **Import Existing Key**: Import an encryption key from a different keystore.

4. Click Next.

5. (optional) If you want to use AES 256-bit encryption, do the following:
   - **Java 8 update 141 or lower**: Install the Java Cryptography Extension (JCE) and overwrite the policy files in the Java home directory. See Enable AES 256-bit encryption for Java 8 update 141 (8u141) or lower.
   - **Java 8 update 151 or higher**: Edit the java.security policy file to allow the use of unlimited strength keys. See Enable AES 256-bit encryption for Java 8 update 151 (8u151) or higher.

6. (optional) If you want to use AES 256-bit encryption, you must also configure the AES 256-bit default encryption key on the instance by navigating to the instance and defining a default key. See Configure encryption keys on the instance. Ensure that the key alias, size, and type match the requirements defined in the installer.

7. Once the key is configured on the instance, return to the installer and click Next.

Configure the Edge Encryption proxy database (optional)

If using order-preserving encryption types or encryption patterns, configure the Edge Encryption proxy database properties.

To use order-preserving encryption types or encryption patterns, a MySQL database running in your network is mandatory. This task connects the proxy to the database, but it does not install or configure the database.
1. Confirm or change the database URL. This URL is the location of the proxy database.
2. In the Name field, enter the name of the proxy database. The default value is edgeencryption.
3. Enter the username and password for accessing the proxy database.
4. Click Next.

Launch the Edge Encryption proxy server

After an Edge Encryption proxy is installed and configured, you can start the proxy from the installer.

1. After configuring keys on the instance and optionally configuring the proxy database, return to the Edge Encryption proxy installer and click Launch.
2. If an issue is detected, or to check the status of your proxy server, you can click Check Status to verify that the proxy is running.
   A message displays the proxy status.
Congratulations!

The Edge Encryption Proxy is ready to launch. If you would like to launch it now, hit the "Launch" button. Your instance through the Proxy is available at:

https://localhost:8082

If you encounter any errors, check to make sure that your setup is correct. If the problem persists, contact ServiceNow support.

Successful launch!
Verify and troubleshoot the Edge Encryption proxy server installation

After your Edge Encryption proxy is installed, you can verify the installation to locate problems or start and stop the proxy.

1. Open the Edge Encryption proxy installer.
2. Select Verify Installation.
3. Click Proxy Directory and select the proxy directory.
4. Click Run Tests.
   Test results display.
Edge Encryption proxy installation tests

5. Click Next.
If an issue is encountered, you can move through the installer to correct the configuration. If no issues are encountered, the installer jumps to the Launch page. You can check the proxy status, stop the proxy, or start the proxy from the Launch page.

### Install the Edge Encryption proxy server using the command line installer

Manually install multiple Edge Encryption proxy servers in your network.

Roles required: security_admin on your ServiceNow instance and local administrator on the host machine.

If order preserving encryption types or encryption patterns are to be used, set up a MySQL database on a machine in your network if not already present.

First, set up a single Edge Encryption proxy server. After your first proxy server is successfully running, add additional proxy servers for one instance to ensure an optimal environment. See Sizing your Edge Encryption environment to determine the number of additional proxy servers needed.

### Install the Edge Encryption proxy server

You can install an Edge Encryption proxy on a 64-bit Windows or Linux computer.

Java 8 is required to run the installer.

Install the Edge Encryption proxy server on a machine in your network using the appropriate command for your target machine. If installing the Edge Encryption proxy server on a Windows machine, you must additionally install the proxy server as a Windows service.

1. Create the installation directory.
2. Download the Edge Encryption proxy archive file to the installation directory.
3. Open the terminal and change to the installation directory.

**Note:** If installing on a Windows machine, you must start the Windows Command Prompt with administrator privileges.

4. Run the appropriate command for the target machine and change the variables according to your configuration.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows</td>
<td>java -jar edgeencryption-dist-&lt;version&gt;-windows-x86-64.zip -m install -n &lt;ProxyName&gt; --instancehost &lt;host&gt; -p &lt;port&gt; --protocol https</td>
</tr>
<tr>
<td>Linux</td>
<td>java -jar edgeencryption-dist-&lt;version&gt;-linux-x86-64.zip -m install -n &lt;ProxyName&gt; --instancehost &lt;host&gt; -p &lt;port&gt; --protocol https</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>The version number of the Edge Encryption release.</td>
</tr>
<tr>
<td>ProxyName</td>
<td>The name of the encryption proxy instance.</td>
</tr>
<tr>
<td>host</td>
<td>Your instance.</td>
</tr>
<tr>
<td>Variable</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>port</td>
<td>The port of your instance. When the protocol is https, the port is normally 443.</td>
</tr>
</tbody>
</table>

To see the help screen, execute the appropriate command without arguments:

- **Windows**: `java -jar edgeencryption-dist-<version>-windows-x86-64.zip`
- **Linux**: `java -jar edgeencryption-dist-<version>-linux-x86-64.zip`

5. If installing on a Windows machine, install the Edge Encryption proxy as a Windows service.
   a) Optionally change the name of the service. Open the `conf/wrapper.conf` file on the new proxy and set the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wrapper.ntservice.name</td>
<td>Unique name of the Edge Encryption proxy service.</td>
</tr>
<tr>
<td>wrapper.ntservice.displayname</td>
<td>Edge Encryption proxy service display name.</td>
</tr>
<tr>
<td>wrapper.ntservice.description</td>
<td>(Optional) Proxy server description.</td>
</tr>
</tbody>
</table>

   If this step is not performed, the Edge Encryption proxy service installs under the name **Edge Encryption**.

   b) Save and close the file.

   c) Open the Windows Command Prompt and cd to `ServerName_port/bin`.

   d) Execute `edgeencryption.bat install`.

   The `ProxyName_port` directory is created in the current directory. The `edgeencryption.properties` file is updated with the host, port, and protocol values from the command line.

**Create and configure the RSA key pair for the digital signature**

Create an RSA key pair that the proxy server can use to create the digital signature for signing changes to the encryption properties and configuration.

To generate and validate the digital signature, an RSA key pair must be generated and stored in the JCEKS Java KeyStore and each proxy must be configured to use this key pair. Generate an encryption key pair using the keytool command.

To use the keytool utility with a proxy installed on SElinux (e.g. CentOS), you must enable loading of shared libraries from the proxy java-installation directory. To do this, run the following command as root:

```
chcon -R -t texrel_shlib_t proxy_install_dir/java/jre /lib
```

You must use the Java 1.8 version of the keytool utility. A copy of the utility can be found in `<proxy install dir>java/jre/bin/keytool`.

1. Change to the KeyStore directory in the proxy download directory.
2. Change the default password.
The default password is **changeme**.

```
keytool -keystore keystore.jceks -storetype jceks -storepasswd -new <newpassword>
```

3. Create an encryption key pair.

   **Note:** Do not enter a password for the key when the keytool utility prompts for one.

   Enter this command on a single line.

   ```
   keytool -genkeypair -alias <key alias> -keyalg rsa -keystore keystore.jceks -storetype jceks -storepass <keystore password> -keysize 2048
   ```

4. Update the encryption proxy property file (**edgeencryption.properties**).

   a) Change to the `<installation directory>/conf/` directory.

   b) Open the **edgeencryption.properties** file.

   c) Enter the properties for the **digital signature**.

   These properties must be the same for all proxies.

5. Save and close the **edgeencryption.properties** file.

---

**Import and configure the certificate for secure SSL connection**

To use a secure SSL connection, import a server certificate and add it to the Java KeyStore.

You must obtain the server certificate before you can add it to the Java KeyStore.

1. Add a server certificate to the Java KeyStore.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you have the RSA private key in the Java Keystore and generated the certificate from that key.</td>
<td>keytool -import -alias keyname -file server.cert -storetype JCEKS -keystore keystore.jceks -storepass pwd</td>
</tr>
<tr>
<td>If you have a PKCS12 (.pfx) file that contains the RSA key and the certificate.</td>
<td>keytool -importkeystores -destkeystore keystore.jceks -deststoretype jceks -srckeystore &lt;PKCS12 filename&gt; -srckeystore pkcs12</td>
</tr>
</tbody>
</table>

Make sure that the private key password is the same as the Java KeyStore password.

You can run this command to change the password.

```
keytool -keypasswd -keystore keystore.jceks -alias <key alias>
```

For testing, you can use this command to generate a self-signed certificate.

```
keytool -genkeypair -alias cert -keystore keystore.jceks -storetype jceks -keyalg rsa
```

2. Update the **edgeencryption.properties** file.

   a) Change to the `<installation directory>/conf/` directory.

   b) Open the **edgeencryption.properties** file.

---

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
c) Enter the properties for the SSL certificate.
   The certificate must be the same for all proxies connecting to the same instance.

3. Save and close the edgeencryption.properties file.

Enable AES 256-bit encryption

Enabling AES 256-bit encryption depends on the Java update installed on each Edge Encryption proxy server host machine.

**Important:** Edge Encryption supports only AES 128-bit and AES 256-bit keys.

*Enable AES 256-bit encryption for Java 8 update 141 (8u141) or earlier*

Install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the Java home directory of each Edge Encryption proxy server host machine.

Your Java home directory includes the AES 128-bit policy files by default. To enable AES 256-bit encryption, you must overwrite the Java home directory policy files with the AES 256-bit policy files. It is only necessary to download the JCE once, but every Edge Encryption proxy server host machine must be updated.

**Important:** Java does not automatically allow unlimited strength keys.

1. Download the JCE policy 8 ZIP file from Oracle.
2. Unzip the file.
3. On each proxy server host machine, copy the local_policy.jar and US_export_policy.jar files into the <Java-home-directory>/jre/lib/security folder.

You can now use AES 256-bit encryption on the proxy server host machine.

*Enable AES 256-bit encryption for Java 8 update 151 (8u151) or later*

Edit the java.security policy file to allow the use of unlimited strength keys. Alternately, you can overwrite the Java home directory policy files with the AES 256-bit policy files, as described below for Java 8 update 141 (8u141) or lower, but editing the java.security file is simpler.

Role required: admin

Perform this task in the Java home directory of each Edge Encryption proxy server host machine on which you want to enable AES 256-bit encryption.

**Important:** Java does not automatically allow unlimited strength keys.

1. Navigate to <jre_home>/lib/security/java.security on the proxy server host machine, where **JRE_HOME** is an environment variable for both Windows and Linux.
2. Open the java.security policy file and find the line for the crypto.policy parameter, which is commented out by default.
3. Remove the # character from the beginning of the crypto.policy line to uncomment the line, and then save the file.

You can now use AES 256-bit encryption on the proxy server host machine.

**Note:** If you do not uncomment the crypto.policy line, Java uses crypto.policy=limited, which restricts encryption to AES 128-bit keys.
Set up a keystore and encryption keys

Set up the keystore and encryption keys used by the Edge Encryption proxy server.

1. Carefully determine the appropriate type of keystore to use based on your organization’s needs.

<table>
<thead>
<tr>
<th>Supported keystore</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Java KeyStore</td>
<td>A Java KeyStore:</td>
</tr>
<tr>
<td></td>
<td>· Stores keys in a Java JCEKS KeyStore.</td>
</tr>
<tr>
<td></td>
<td>· Is password protected and more secure than storing keys in a file in the file system.</td>
</tr>
<tr>
<td></td>
<td>· Can store multiple keys. A key alias represents each key, making it easier to manage multiple keys.</td>
</tr>
<tr>
<td></td>
<td>The Edge Encryption proxy ships with the Java JCEKS KeyStore file named keystore.jceks in the keystore directory. This keystore file contains the ServiceNow public key used to validate encryption rules signed by ServiceNow.</td>
</tr>
<tr>
<td>NAE (Network Attached Encryption) key store</td>
<td>Keys are stored and retrieved with SafeNet KeySecure key management.</td>
</tr>
<tr>
<td></td>
<td>You must secure a license with Gemalto, download the libraries, and install the SafeNet KeySecure keystore on a host machine in your network before configuring the keystore on the Edge Encryption proxy server.</td>
</tr>
<tr>
<td>File system</td>
<td>Keys are stored in a file in a file system accessed by the Edge Encryption proxy server. Because encryption keys stored in a file are not encrypted, it is your responsibility to protect these files.</td>
</tr>
</tbody>
</table>

**Note:** If using a keystore other than the base system Java JCEKS KeyStore, you must import the ServiceNow public key into your keystore. The public key alias is servicenow.

2. Set up the keystore and encryption keys in your local network.

**Set up a Java KeyStore keystore**

You can use a Java KeyStore keystore to store encryption keys.

You must use the Java 1.8 version of the keytool utility. A copy of the utility can be found in `<proxy install dir>/java/jre/bin/keytool`.

The Edge Encryption proxy ships with the Java JCEKS KeyStore file named keystore.jceks in the keystore directory. This keystore file contains the ServiceNow public key used to validate encryption rules signed by ServiceNow.

1. Set up the keystore properties.
   a) Change to the `<installation directory>/conf/` directory.
   b) Open the edgeencryption.properties file.
c) Enter the properties for the Java KeyStore.

2. Save and close the `edgeencryption.properties` file.

After setting up the Java KeyStore, **Create encryption keys using the Java KeyStore keytool**.

You can use the keytool shipped with the encryption proxy distribution to create AES 128-bit and AES 256-bit encryption keys.

You must use the Java 1.8 version of the keytool utility. A copy of the utility can be found in `<proxy install dir>/java/jre/bin/keytool`.

To find out more about the keytool utility, see the [Java SE Documentation](#).

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AES 128</td>
<td><code>keytool -genseckey -alias 128bitkey -keyalg aes -keysize 128 -keystore keystore.jceks -storetype jceks</code></td>
</tr>
<tr>
<td>AES 256</td>
<td><code>keytool -genseckey -alias 256bitkey -keyalg aes -keysize 256 -keystore keystore.jceks -storetype jceks</code></td>
</tr>
</tbody>
</table>

You add the alias on the instance when you assign default keys.

- **Note:** The key password must be the same as the keystore password.

### Set up a SafeNet KeySecure keystore

If you are using a SafeNet keystore, copy a set of libraries into the proxy distribution directory.

You must install and set up the SafeNet keystore before performing this step. Secure a license with Gemalto in order to download the libraries.

- **Note:** On Linux, file paths use a forward slash.

1. Copy these files to `<installation directory>/lib` directory:
   - `ingrianNAE-<version>.jar`
   - `ingrianlog4j-api-<version>.jar`
   - `ingrianlog4j-core-<version>.jar`

2. Change to the `<installation directory>/conf/` directory, and open the `edgeencryption.properties` file.
3. Enter the properties for the SafeNet keystore.

   An example for a SafeNet keystore using username and password authentication.

```
edgeencryption.nae.retries = 3
edgeencryption.nae.enabled = true
edgeencryption.nae.server = url
edgeencryption.nae.port = 9000
edgeencryption.nae.protocol = ssl
edgeencryption.nae.keystore.path = keystore/safenet_truststore
edgeencryption.nae.keystore.password = password
edgeencryption.nae.user = safenet_user
edgeencryption.nae.password = safenet_password
```

An example for a SafeNet keystore using client certificate authentication. This authentication method eliminates the need to store the SafeNet server username and password in the properties file.

```
edgeencryption.nae.retries = 3
edgeencryption.nae.enabled = true
edgeencryption.nae.server = url
edgeencryption.nae.port = 9000
edgeencryption.nae.protocol = ssl
edgeencryption.nae.keystore.path = keystore/safenet_clientcert
edgeencryption.nae.keystore.password = password
edgeencryption.nae.client.certificate = cert_name
```

4. Add or create a key in the SafeNet keystore.
   You add the key name (alias) on the instance when you assign default keys.

5. Save and close the `edgeencryption.properties` file.

Create an encryption key stored in a file
You can use a simple text file as a keystore. Each file holds a single encryption key.

This step creates both the key storage and the encryption key.

![Note:](image)

The name of the key file must match the key alias specified in the encryption keys table in the instance. See Configure encryption keys on the instance.

1. Create a file in the `/keys` folder of the proxy server installation directory.
2. Add the encryption key to the file.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AES 128</td>
<td>Place the encryption key, exactly 16 bytes, into the file.</td>
</tr>
<tr>
<td>AES 256</td>
<td>Place the encryption key, exactly 32 bytes, into the file.</td>
</tr>
</tbody>
</table>

3. Update the `edgeencryption.properties` file.
   a) Change to the `<installation directory>/conf/` directory.
   b) Open the `edgeencryption.properties` file.
   c) Enter the properties for the file store.
   d) Save and close the file.
Configure encryption keys on the instance

Edge Encryption provides the tools to manage encryption keys without taking the proxy offline.

Role required: security-admin

Before setting up new encryption keys on the instance, you must do the following.

1. Create the encryption key.
2. Make the new key available to all encryption proxies. You can accomplish this by either copying the file or Java KeyStore file to each proxy, or ensuring that each proxy has access to the Java KeyStore or NAE device.

Key aliases must be unique. Each key alias must have the same key size and type on each proxy, or the key cannot be assigned as the default.

1. Navigate to Edge Encryption Configuration > Encryption Key Configuration > Set Up Keys
   The Encryption Key Configuration - Created form is shown.
2. Add new keys
   Rows in the list with an X in the left column can be deleted. Keys that have been used as the default, or are in the Available state cannot be deleted.
   a) In the row that says Insert a new row... double-click. An edit box is shown.
   b) Enter a name for the key, then click the check mark. Key aliases are lowercase letters and numbers. Capital letters are changed to lowercase letters when you click Submit. Key aliases must be unique.
   c) In the same row, double-click in the Key size column. A select box is shown.
   d) Select a key size, either 128 bits or 256 bits, then click the check mark.
   e) In the same row, double-click in the Type column. A select box is shown.
   f) Select a key type, either File, Keystore, or SafeNet, then click the check mark.
   g) When you are done adding keys, click Next Step. You must specify an alias, key size, and key type for each key before moving on. The form moves to the Key Status step.
3. When the key status becomes Available, click Next Step.
   The instance tracks the status of every encryption key available to any proxy. When a key alias is available on all proxies, its state becomes Available. If, after a few minutes, the state does not change, check to ensure that the key is available on all proxies. If the state remains Unavailable, one or more of the proxies does not have the key alias.

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Available</td>
<td>All online proxies have the key.</td>
</tr>
<tr>
<td>Unavailable</td>
<td>This is a new key and the proxies have not yet loaded the key, or at least one proxy failed to load the key.</td>
</tr>
</tbody>
</table>
4. On the Change Default Keys tab, either type in the key alias, or click the spy glass icon and select an alias, and then click Next Step. The form moves to the Schedule Key Rotation step.

5. If desired, create and run a mass encryption job to encrypt existing data using the new encryption key.
   If you do not run a mass encryption job, existing data remains encrypted with the old key until the data is accessed again.

**Configure additional properties in the Edge Encryption properties file**

After installing the Edge Encryption proxy server in your network and setting up your keystore and keys, configure the additional Edge Encryption properties.

1. Open the `<installation directory>/conf/edgeencryption.properties` file and configure the following Edge Encryption proxy server properties:
   - Target (instance) properties
   - User account properties
   - Proxy properties
   - If using order preserving encryption types or encryption patterns, configure the proxy database properties
   - Clear text and static IV properties

2. Save and close the file.

**Configure a web proxy**

If your network uses a web proxy, you can set up the Edge Encryption proxy to use the web proxy.

If your network does not use a web proxy, leave the web proxy properties in the configuration file commented out.

The Edge Encryption proxy server supports HTTP connection to and basic authentication with the web proxy.

1. Change to the `<installation directory>/conf/` directory.
2. Open the `edgeencryption.properties` file.
3. Configure the web proxy properties.
4. Save and close the `edgeencryption.properties` file.
5. If the web proxy is using a customer-specific server certificate, add this certificate to the JVM used by the Edge Encryption proxy server to establish trust between the web proxy and the Edge Encryption proxy server.
   a) `cd` to `<Java home directory>/jre/lib/security/cacerts`
   b) Execute the command: `keytool -keystore cacerts -importcert -alias <chooseAlias> -file <certificateFile>`

**Set the proxy server initial memory limit and upper bound memory limit**

Set the initial memory limit and upper bound memory limit to specify how much memory the proxy server can consume. Set these limits to avoid performance issues in your Edge Encryption implementation.

As a guideline, set both the initial memory limit and the upper bound memory limit to the same value. On any machine, allocate 2 GB of the physical memory to the operating system (OS). Then allocate the rest of the physical memory to the heap using the initial memory limit and upper
bound memory limit properties. For example, on a machine with 8 GB of memory, allocate 2 GB to the OS, and allocate the remaining 6 GB (6144 m) to the initial and upper bound memory.

**Important:** If your Edge Encryption proxy server is running, you must stop and restart the proxy server after updating these properties.

1. In your proxy server directory, open `<install dir>/conf/wrapper.conf`.
2. To set the initial memory limit, add the following line at the end of the file:
   
   ```
   wrapper.java.additional.<number>=-Xms<min_memory_in_MB>m
   ```
   
   Set `<number>` to the next available `<number>` in the sequence of `wrapper.java.additional.<number>` properties defined in the `wrapper.conf` file.

   For example, you have the following list of `wrapper.java.additional.<number>` properties:

   ```
   wrapper.java.additional.1=
   wrapper.java.additional.2=
   ```

   The maximum `<number>` in the above list is 2. When you add the `wrapper.java.additional.<number>=-Xms<min_memory_in_MB>m` line, set `<number>` to 3, the next available number.

   **Important:** Do not leave gaps in the numbering sequence.

   Set `<min_memory_in_MB>` to the number of megabytes of memory remaining after allocating 2 GB of memory to the OS.

3. Set the upper bound memory limit.

   Because an upper bound memory limit is not set in the base system, the proxy server can use all available memory. If other services are running on the server, you may want to set the upper bound memory limit.

   Add the following line at the end of the file:

   ```
   wrapper.java.additional.<number>=-Xmx<max_memory_in_MB>m
   ```

   Set `<number>` to the next available `<number>` in the sequence of `wrapper.java.additional.<number>` properties defined in the `wrapper.conf` file.

   For example, you have the following list of `wrapper.java.additional.<number>` properties:

   ```
   wrapper.java.additional.1=
   wrapper.java.additional.2=
   ```

   The maximum `<number>` in the above list is 2. When you add the `wrapper.java.additional.<number>=-Xmx<max_memory_in_MB>m` line, set `<number>` to 3, the next available number.

   **Note:** Do not leave gaps in the numbering sequence.

   Set `<max_memory_in_MB>` to the number of megabytes of memory remaining after allocating 2 GB of memory to the OS.

4. Save and close the file.

**Example: Setting proxy server initial and upper bound memory limits**

```java
wrapper.java.additional.1 = -Djava.io.tmpdir=../tmp
```
Start the Edge Encryption proxy

Start the Edge Encryption proxy

After an Edge Encryption proxy is installed and configured, you can start the proxy from the command line.

Before starting the encryption proxy, verify the following:

- The Edge Encryption plugin is activated on the instance.
- The `edgeencryption.properties` file on this machine has been configured.
- If using an order preserving encryption type or encryption patterns, the proxy database is running.

**Note:** The first time you set up the `edgeencryption.properties` file or change properties, you may not want to set the password encryption property. After you have verified that everything is working, you can set the password encryption property, shut down the proxy, and then restart the proxy.

1. Run the proxy server.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>On a Linux machine</td>
<td>1. cd to ServerName_port</td>
</tr>
<tr>
<td></td>
<td>2. Execute ./startup.sh</td>
</tr>
<tr>
<td>On a Windows machine</td>
<td>1. cd to ServerName_port/bin</td>
</tr>
<tr>
<td></td>
<td>2. Execute edgeencryption.bat start</td>
</tr>
</tbody>
</table>

2. Check the log on the proxy server to verify that the proxy is running.

Obfuscate passwords in the properties file

You can obfuscate passwords in the `edgeencryption.properties` file to share the properties file without revealing clear text passwords.

Make sure that the Edge Encryption proxy server is set up and successfully running before you set this property. Before setting this property, Stop the Edge Encryption proxy.

Setting this property may make it difficult to debug connection and access issues during initial startup. Only set this property in production environments after the proxy has been set up and tested successfully.

1. Change to the `<installation directory>/conf/` directory.
2. In the `conf` directory, create a text file containing a complex string or phrase that can be used as a passphrase which the proxy uses to obfuscate the passwords in the `edgeencryption.properties` file. This passphrase should be a random and complex phrase not related to the passwords themselves.
3. Open the `edgeencryption.properties` file.
4. Set the **password encryption property**.
5. Save and close the **edgeencryption.properties** file.

After setting this property, you can **Start the Edge Encryption proxy.**

**Manually add an additional proxy**

After the first Edge Encryption proxy is properly configured and tested, you can set up additional proxies on a Linux or Windows machine. Installing multiple proxies on the same machine is not recommended.

Add additional proxy servers on additional machines to ensure an optimal environment. See [Sizing your Edge Encryption environment](#) to determine the number of additional proxies needed.

**Note:** Make sure that all proxies have the same encryption keys and the same RSA key pair used to digitally sign encryption configuration and encryption rules. If a proxy database was set up as part of the installation, all proxies must use the same proxy database.

1. Install the proxy using the appropriate command. See [Install the Edge Encryption proxy server](#).
2. Copy all the encryption keys and the **edgeencryption.properties** file from the first proxy to the new proxy.
   Encryption keys may be located in the proxy keystore, in the `/keys` directory, or in a SafeNet KeySecure keystore.
3. Open the **edgeencryption.properties** file on the new proxy.
4. Change the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>edgeencryption.proxy.name</code></td>
<td>Unique name of the proxy server</td>
</tr>
<tr>
<td><code>edgeencryption.proxy.host</code></td>
<td>The server name, IP address, or fully-qualified domain name of the computer running the proxy.</td>
</tr>
<tr>
<td><code>edgeencryption.proxy.http.port</code></td>
<td>Port on the proxy for HTTP communication. Must be unique across all processes on the machine.</td>
</tr>
<tr>
<td><code>edgeencryption.proxy.https.port</code></td>
<td>Port on the proxy for HTTPS communication. Must be unique across processes on the machine.</td>
</tr>
</tbody>
</table>

5. If installing the proxy server on a Windows machine, you must change the name of the service. Open the `conf/wrapper.conf` file on the new proxy and add the following properties.

   **Caution:** You must perform this step before launching the proxy server.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>wrapper.ntservice.name</code></td>
<td>Unique name of the Edge Encryption proxy service.</td>
</tr>
<tr>
<td><code>wrapper.ntservice.displayname</code></td>
<td>Edge Encryption proxy service display name.</td>
</tr>
<tr>
<td><code>wrapper.ntservice.description</code> (Optional)</td>
<td>Proxy server description.</td>
</tr>
</tbody>
</table>

6. Save and close the file.
7. Launch the proxy using the appropriate command. See [Start the Edge Encryption proxy](#).
Stop the Edge Encryption proxy

You can stop an Edge Encryption proxy from the command line.

1. **Stop the proxy server.**
   
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>On a Linux machine</td>
<td>Execute ./shutdown.sh</td>
</tr>
<tr>
<td>On a Windows machine</td>
<td>Execute edgeencryption.bat stop</td>
</tr>
<tr>
<td></td>
<td>To remove the Windows service, execute</td>
</tr>
<tr>
<td></td>
<td>edgeencryption.bat remove</td>
</tr>
</tbody>
</table>

2. Check the log on the proxy server to verify that the proxy has stopped.

Uninstall the Edge Encryption proxy on Linux

You can uninstall the Edge Encryption proxy. If you are upgrading the proxy, it is not necessary to shut down and uninstall the current version.

You must have access to the computer running the Edge Encryption proxy.

Before shutting down the Edge Encryption proxy, ensure that no users are connected to the instance using the proxy.

The encryption proxy running on Linux operates as a single process. You can end this process to accommodate such tasks as redeploying the encryption proxy to another host machine, updating the proxy version, updating the Java version, or changing the unique name of the encryption proxy when deploying the encryption proxy on multiple proxy servers.

1. You may want to save the edgeencryption.properties file before deleting the distribution directory.
2. Execute the shutdown.sh shell script.
3. Check the log on the proxy server to verify that the proxy server is shut down.
4. Delete the files in the distribution folder.

Uninstall the Edge Encryption proxy on Windows

You can uninstall the Edge Encryption proxy. If you are upgrading the proxy, it is not necessary to shut down and uninstall the current version.

You must have access to the computer running the Edge Encryption proxy.

Before shutting down the Edge Encryption proxy, ensure that no users are connected to the instance using the proxy.

1. You may want to save the edgeencryption.properties file before deleting the distribution directory.
2. Execute edgeencryption.bat stop
3. Execute edgeencryption.bat remove
4. Check the log on the proxy server to verify that the proxy server is shutdown.
5. Delete the files in the distribution folder.

Set up multiple provider SSO with Edge Encryption

If implementing multiple provider single sign-on (SSO) with Edge Encryption enabled, some users may need to log in to your instance through the Edge Encryption proxy server, while other users
may not. Set up multiple provider SSO to enable logging in through the Edge Encryption proxy server URL or the instance URL.

- Role required: admin
- Enable the Edge Encryption plugin (com.glide.edgeencryption) and ensure that one or more proxy servers are set up in your network.
- Determine the URL for the Edge Encryption proxy server that users will log in through using multiple provider SSO. To determine the URL of an Edge Encryption proxy server, see Edge Encryption installation.

- If routing all users through the Edge Encryption proxy server, set up your identity provider record and define the proxy server URL in the ServiceNow Homepage, Entity ID / Issuer, and Audience URI fields.
- To route some users through the proxy server and some users to the instance, create two identity provider records. Both records use the same value in the Identity Provider URL field. However, one of the records routes through the proxy server, while the other routes to the instance.

1. Enable the duplication of identity provider URLs in identity provider records.
   A unique constraint prevents duplication of the identity provider URL in two different identity provider records. You can enable duplication of the identity provider URL in multiple IdP records by setting a field to false.
   a) Navigate to System Definition > Dictionary.
   b) Open the definition record for the idp field of in the Identity Providers table (saml2_update1_properties).
   c) Configure the form to add the Unique field.
   d) Ensure that the value of the Unique field is set to false.

2. Navigate to Multi-Provider SSO > Identity Providers.
3. Create two identity provider records for the same identity provider: one using the instance URL and one using the Edge Encryption proxy server URL.
   To create an identity provider record, see Create and update identity providers.
   a) For the Edge Encryption proxy server URL, complete the form using these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identity Provider URL</td>
<td>Imported from IdP metadata.</td>
</tr>
<tr>
<td>ServiceNow Homepage</td>
<td>The URL for your proxy server homepage. For example: https://&lt;proxy hostname&gt;:&lt;port&gt;/navpage.do</td>
</tr>
<tr>
<td>Entity ID / Issuer</td>
<td>https://&lt;proxy hostname&gt;:&lt;port&gt;</td>
</tr>
<tr>
<td>Audience URI</td>
<td>https://&lt;proxy hostname&gt;:&lt;port&gt;</td>
</tr>
</tbody>
</table>

b) Click Submit.

c) For the instance URL, complete the form using these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identity Provider URL</td>
<td>Imported from IdP metadata.</td>
</tr>
<tr>
<td>Field</td>
<td>Value</td>
</tr>
<tr>
<td>---------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>ServiceNow Homepage</td>
<td>https://&lt;instance&gt;.service-now.com/navpage.do</td>
</tr>
<tr>
<td>Entity ID / Issuer</td>
<td>https://&lt;instance&gt;.service-now.com/navpage.do</td>
</tr>
<tr>
<td>Audience URI</td>
<td>https://&lt;instance&gt;.service-now.com/navpage.do</td>
</tr>
</tbody>
</table>

d) Click **Submit**.

4. Optional: If using more than one identity provider, modify the MultiSSO installation exit.
   a) Navigate to **System Definition > Installation Exits**. The system displays the current list of installation exits.
   b) Open the **MultiSSO** installation exit.
   c) Locate the following statement in the **Script** field.

   ```javascript
   var samlResponseTxt = request.getParameter("SAMLResponse");
   if (!GlideSession.get().isLoggedIn() && GlideStringUtil.notNil(samlResponseTxt)) {
       var idpRecord = this.getIdPRecord(request);
       if (idpRecord) {
           SSO_Helper.debug("IdP found based on SAML response: " + idpRecord.getUniqueValue());
           return new SSO_Helper(idpRecord.getUniqueValue(), false, null, true);
       }
   }
   ``

   d) Replace the statement with the following code.

   ```javascript
   var samlResponseTxt = request.getParameter("SAMLResponse");
   if (!GlideSession.get().isLoggedIn() && GlideStringUtil.notNil(samlResponseTxt)) {
       /* // You have two profiles that use the same IdP entity id it cannot use
           // the IdP issuer / entity id from the response otherwise it may result in the
           // wrong IdP profile. IdP initiated login will not work
           var idpRecord = this.getIdPRecord(request);
           if (idpRecord) {
               SSO_Helper.debug("IdP found based on SAML response: " + idpRecord.getUniqueValue());
               return new SSO_Helper(idpRecord.getUniqueValue(), false, null, true);
           }*/
       return new SSO_Helper(null, true);
   }
   ```

   e) Click **Update**.

5. Optional: If using more than one company, **Configure users for Multi-Provider SSO**. Update the sys_id of the identity provider record depending on the user.

**Note:** IdP initiated login does not work in this configuration.
- To configure a user to log in through the Edge Encryption proxy server, use the sys_id of the identity provider record that uses the Edge Encryption proxy server URL.
- To configure a user to log in to the instance, use the sys_id of the identity provider record that uses the instance URL.

### Login URLs

<table>
<thead>
<tr>
<th>URL</th>
<th>Login destination</th>
</tr>
</thead>
<tbody>
<tr>
<td>https://&lt;instance name&gt;.service-now.com/login_with_sso.do?glide_sso_id=&lt;sys_id of IdP record for the instance URL&gt;</td>
<td>Logs in through the instance.</td>
</tr>
</tbody>
</table>

### Edge Encryption proxy server properties

The edgeencryption.properties configuration file located in the `<installation directory>/conf/` folder contains properties used to configure your environment.

#### Target (instance) properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.target.host</td>
<td>Host name for the instance. Must be the same for all encryption proxies connecting to the same instance. This property is set when the proxy is installed. For example, <code>instancename.servicenow.com</code></td>
</tr>
<tr>
<td>edgeencryption.target.port</td>
<td>Instance port. Must be the same for all encryption proxies connecting to the same instance. This property is set when the proxy is installed.</td>
</tr>
</tbody>
</table>
| edgeencryption.target.protocol | Instance protocol. Must be the same for all encryption proxies connecting to the same instance. This property is set when the proxy is installed. Options include:  
  - http  
  - https |

#### User account properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.target.username</td>
<td>User name that the proxy uses to log in to the instance. The user must have the edge_encryption role. See <a href="#">Set up an Edge Encryption user account</a>.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>edgeencryption.target.password</td>
<td>Password that the proxy uses to log in to the instance.</td>
</tr>
<tr>
<td></td>
<td><strong>Proxy properties</strong></td>
</tr>
<tr>
<td>edgeencryption.proxy.host</td>
<td>Server name, IP address, or fully qualified domain name of the computer running the proxy. Along with the port, this property defines the URL used by the client to access the proxy server.</td>
</tr>
<tr>
<td>edgeencryption.proxy.name</td>
<td>Proxy name. It must be unique for each proxy.</td>
</tr>
<tr>
<td>edgeencryption.proxy.http.port</td>
<td>Port on the proxy for HTTP communication.</td>
</tr>
<tr>
<td>edgeencryption.proxy.https.port</td>
<td>Port on the proxy for HTTPS communication.</td>
</tr>
<tr>
<td></td>
<td><strong>SSL certificate properties</strong></td>
</tr>
<tr>
<td>edgeencryption.proxy.https.cert.alias</td>
<td>Alias of the certificate provided by the proxy server to connecting clients.</td>
</tr>
<tr>
<td>edgeencryption.proxy.https.keystore.path</td>
<td>Path to the keystore that contains the HTTPS certificate.</td>
</tr>
<tr>
<td>edgeencryption.proxy.https.keystore.password</td>
<td>Password for the keystore that contains the HTTPS certificate.</td>
</tr>
<tr>
<td></td>
<td><strong>Proxy configuration locked property</strong></td>
</tr>
<tr>
<td>edgeencryption.proxy.locked</td>
<td>When true, the proxy does not accept encryption configuration changes or encryption rule changes from the instance. Set this property on the production instance after all encryption configurations and rules are final.</td>
</tr>
<tr>
<td></td>
<td><strong>Proxy database properties</strong></td>
</tr>
<tr>
<td>edgeencryption.db.url</td>
<td>Proxy database location. Must be the same for all encryption proxies connecting to the same instance.</td>
</tr>
<tr>
<td>edgeencryption.db.user</td>
<td>User name for accessing the proxy database. Must be the same for all encryption proxies connecting to the same instance.</td>
</tr>
<tr>
<td>edgeencryption.db.password</td>
<td>Password to access the proxy database. Must be the same for all encryption proxies connecting to the same instance.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| edgeencryption.db.name    | Proxy database name. Must be the same for all encryption proxies connecting to the same instance.  
|                           |   - Default value: edgeencryption                                            |
| edgeencryption.db.bootstrap.file | Bootstrap file for the proxy database. The file is relative to the sql/ directory. Must be the same for all encryption proxies connecting to the same instance.  
|                           |   ![Note: Under normal circumstances, this parameter should not be changed.]|

**Digital signature properties**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.proxy.signature.keystore.path</td>
<td>Path and Java KeyStore file name.</td>
</tr>
<tr>
<td>edgeencryption.proxy.signature.keystore.password</td>
<td>Password. The default password is &lt;changeme&gt;. Change the password after installing the Java KeyStore.</td>
</tr>
<tr>
<td>edgeencryption.proxy.signature.keystore.keyalias</td>
<td>The key alias given as the -alias argument when the RSA key pair is generated.</td>
</tr>
</tbody>
</table>

**NAE device keystore**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.nae.retries</td>
<td>Number of retries to make.</td>
</tr>
<tr>
<td>edgeencryption.nae.enabled</td>
<td>Setting indicates whether an NAE device is available.</td>
</tr>
<tr>
<td>edgeencryption.nae.server</td>
<td>Name of the NAE server.</td>
</tr>
<tr>
<td>edgeencryption.nae.port</td>
<td>Port used by the NAE server.</td>
</tr>
<tr>
<td>edgeencryption.nae.protocol</td>
<td>Protocol used by the NAE server.</td>
</tr>
<tr>
<td>edgeencryption.nae.keystore.path</td>
<td>Path to the key store on the NAE server.</td>
</tr>
<tr>
<td>edgeencryption.nae.keystore.password</td>
<td>NAE keystore password.</td>
</tr>
<tr>
<td>edgeencryption.nae.username</td>
<td>User name to use to authenticate with the NAE device.</td>
</tr>
<tr>
<td>edgeencryption.nae.password</td>
<td>Password to use to authenticate with the NAE device.</td>
</tr>
<tr>
<td>edgeencryption.nae.client.certificate</td>
<td>Certificate located in the keystore on the NAE server. Set this property to authenticate using a certificate instead of a username and password.</td>
</tr>
</tbody>
</table>
## Clear text and static IV properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.customer.assigned.known.cleartext</td>
<td>Clear text to let the instance verify that all proxies are using the same keys. At startup, the proxy encrypts the clear text and sends the encrypted text to the instance. The instance does not know the clear text, nor are keys sent to the instance. This property must be the same for all proxies.</td>
</tr>
<tr>
<td>edgeencryption.encrypter.static.iv</td>
<td>Static IV (initialization vector) used in equality-preserving and order-preserving encryption. This property must be the same for all proxies and it must be exactly 16 bytes (16 ASCII characters).</td>
</tr>
</tbody>
</table>

## Password property

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.encrypter.properties.password</td>
<td>Name of the file in the conf folder that contains a string used within a secure process to obfuscate passwords in the edgeencryption.properties file. If this property is not set, passwords in your properties file appear in clear text. Leave this property blank until after the proxy configuration has been set up and tested.</td>
</tr>
</tbody>
</table>

## Web proxy properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.webproxy.host</td>
<td>Web proxy name or IP address.</td>
</tr>
<tr>
<td>edgeencryption.webproxy.port</td>
<td>Port on the web proxy.</td>
</tr>
<tr>
<td>edgeencryption.webproxy.user</td>
<td>User name used to connect to the web proxy. If your web proxy does not use authentication, leave this property commented out.</td>
</tr>
<tr>
<td>edgeencryption.webproxy.password</td>
<td>Password to use to connect to the web proxy. If your web proxy does not use authentication, leave this property commented out.</td>
</tr>
</tbody>
</table>

## Java KeyStore properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.keystore.path</td>
<td>Path to the Java KeyStore. If using a file store or a SafeNet KeySecure keystore, leave this property commented out. Example: edgeencryption.keystore.path = keystore/keystore.jceks</td>
</tr>
</tbody>
</table>

## ServiceNow Now Platform Capabilities

### Property | Description
---|---
edgeencryption.keystore.password | Password the proxy uses to connect to the Java KeyStore. If using a file store or a SafeNet KeySecure keystore, leave this property commented out.

### File store properties

#### Property | Description
---|---
edgeencryption.keyfile.directory | The directory specifies where key files are stored. If using the Java KeyStore or a SafeNet KeySecure keystore, leave this property commented out.

*Example:*  
```plaintext
edgeencryption.keyfile.directory=keys
```

### General configuration properties

#### Property | Description
---|---
edgeencryption.config.poll.interval | Poll interval in seconds. The default setting means that it takes 5 seconds for the proxy to learn of encryption configuration changes. Larger values cause the instance to take longer to detect an offline proxy.

*Note:* Do not change this property. Changing the default setting of the Proxy Poll Interval can result in detection delays when a proxy comes online.

edgeencryption.rules.dir | Folder where the encryption rules are stored on the proxy.

edgeencryption.encryption.order_preserving.cache.enable | Setting determines whether caching is used to support order-preserving encryption types.

edgeencryption.encryption.order_preserving.cache.size | Maximum cache size, in bytes.

edgeencryption.jobs.concurrency | Maximum number of mass encryption jobs that can run concurrently on this proxy.

edgeencryption.jobs.requests_per_second | Number of http job requests per second that can be sent to the instance by this proxy.

edgeencryption.attachments.request.timeout.seconds | Attachment upload request timeout in seconds.

edgeencryption.request.buffer.size | Size of an encryption request. If an encryption request is larger than this size, the excess is saved to disk.

*Note:* Do not change this property.

© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. <table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.httpclient.request.buffer.size</td>
<td>Size of the client request. If the client request is larger than this size, the excess is saved to disk. <strong>Note:</strong> Do not change this property.</td>
</tr>
<tr>
<td>edgeencryption.proxy.idle.timeout</td>
<td>Time in seconds after which a transaction times out. The default value is 300.</td>
</tr>
<tr>
<td>edgeencryption.proxy.keepalive.interval</td>
<td>Time in seconds between pings issued by the proxy to the instance. Pings are issued periodically to verify connectivity between the proxy and the instance. The default value is 10. The minimum value is 5.</td>
</tr>
<tr>
<td>edgeencryption.register.retry.count</td>
<td>Maximum number of times the proxy will ping the instance to try to register. The default is 0 (no limit).</td>
</tr>
<tr>
<td>edgeencryption.tokenization.exclusion.list</td>
<td>Encryption patterns cannot tokenize strings found in these fields.</td>
</tr>
</tbody>
</table>

**Proxy server performance properties**

Proxy server performance properties are not present in the configuration file by default. To change the default values, you must add the properties and restart the proxy server. For more information, see *Edge Encryption diagnostics and performance*.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| edgeencryption.stat.collection.enabled      | Enables the collection of statistics used by the Edge Encryption proxy server performance dashboard.  
   - Default value: true  
   Add this property and set the value to false to disable the collection of statistics used by the Edge Encryption proxy server performance dashboard. After adding proxy server performance properties, you must restart the proxy server for the change to take effect. |
| edgeencryption.stat.collection.interval     | Interval length in seconds during which the Edge Encryption proxy server collects statistics. The value cannot be less than 30 seconds.  
   - Default value: 30  
   After adding proxy server performance properties, you must restart the proxy server for the change to take effect.                                                                                     |
Using a load balancer with the Edge proxy server

You can use a load balancer to balance the load across the proxy servers in your Edge Encryption proxy setup. However, you must either configure the environment to return responses to the load balancer instead of the proxy server and configure load balancer iRules, or run the proxy servers on the same port as the load balancer. Otherwise, users cannot view the responses to their requests.

**Important:** All production environments should include at least two Edge Encryption proxy servers for redundancy.

Edge request processing without a load balancer

If you are not using a load balancer, a request is processed as described below.

1. The user issues a request from a browser.
2. The browser sends the request to the Edge proxy server.
3. The proxy server sends the request to the ServiceNow instance.
4. The ServiceNow instance returns the response to the proxy server.
5. The proxy server adds its own port number in the response header before returning the response to the user's browser.

The request is completed successfully because the user can view the response from the proxy server at the port number specified in the response header.

Edge request processing with a load balancer

However, if you are using a load balancer, the user's browser communicates directly with the load balancer, not with the proxy server. A request is processed as described below.

---

### Deprecated proxy encryption properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>edgeencryption.encrypter.default.key128</code></td>
<td>Specifies the name of the current AES 128 key. An AES 128 key must be available even if it is not used. Must be the same for all proxies.</td>
</tr>
<tr>
<td><code>edgeencryption.encrypter.default.key256</code></td>
<td>Specifies the name of the current AES 256 key. Must be the same for all proxies.</td>
</tr>
<tr>
<td><code>edgeencryption.encrypter.key</code></td>
<td>Specifies the key name. This property is specified for each key and is used to specify the default keys. This is the key alias integrated with the metadata that is included with each encrypted item and, therefore, is stored on the instance. The key name must use lowercase letters.</td>
</tr>
<tr>
<td><code>edgeencryption.encrypter.type</code></td>
<td>Specifies the type of encryption keystore system.</td>
</tr>
<tr>
<td><code>edgeencryption.encrypter.file</code></td>
<td>Specifies the path and file name of the text file associated with the key.</td>
</tr>
<tr>
<td><code>edgeencryption.encrypter.password</code></td>
<td>Specifies the password for accessing the keystore.</td>
</tr>
</tbody>
</table>
**Note:** The following example uses 1025 as the proxy server port number.

1. The user issues a request from a browser.
2. The browser sends the request to a load balancer Virtual IP (VIP), also known as a Virtual Server.
3. The VIP is configured to point to the proxy server (for example, 10.2.200.148:1025), so the load balancer forwards the request to the proxy server.
4. The proxy server sends the request to the ServiceNow instance.
5. The ServiceNow instance returns the response to the proxy server.
6. The proxy server rewrites the location header in the response with values configured in the properties for the Virtual Server.
   - **Host:** edgencryption.proxy.host
   - **HTTP port:** edgencryption.proxy.http.port
   - **HTTPS port:** edgencryption.proxy.https.port
7. The proxy server forwards the response to the load balancer with the location header pointing to the proxy server port.

The outcome depends on whether the load balancer and proxy servers are using the same port.

- If the load balancer and proxy servers are using the same port, the request succeeds because the user receives the response on the same port identified in the response header.
- If the load balancer and proxy servers are using different ports, the request fails because the user's browser communicates only with the load balancer, but the response is on the proxy server.

**Solutions**

To return responses from the load balancer to the clients in your network, determine whether to use proxy servers on the same port as the load balancer, or to configure the load balancer environment instead.

**Use proxy servers on the same port as the load balancer**

Because the proxy servers and load balancer use the same port, the client browser receives the response on the same port identified in the response header. This solution requires less maintenance and is more performant than configuring the load balancer environment.

Verify that the host and port properties in the edgencryption.properties file point to the port running both the load balancer and Edge proxies. The host must point to the load balancer. Properties to configure include:

- **edgencryption.proxy.host:** Set the value to the load balancer host machine.
- **edgencryption.proxy.http.port:** Set the value to the port used by both the load balancer and the Edge proxies.
- **edgencryption.proxy.https.port:** Set the value to the port used by both the load balancer and the Edge proxies.

For more information on Edge Encryption properties, see [Edge Encryption properties](#).

**Configure the load balancer to rewrite the response**
If the load balancer and proxy servers are using different ports, configure the load balancer to rewrite the response before forwarding it to the client browser. The load balancer must terminate the SSL connection with the Edge proxy, rewrite the response using an iRule, and recertify and forward the response to the browser. This solution enables you to configure proxy servers on different ports from the load balancer, but can cost more in maintenance and performance. In this configuration:

1. The instance sends a response to the Edge proxy, which forwards the response to the load balancer.
2. The load balancer terminates the SSL connection.
3. The load balancer uses an iRule to rewrite the response, changing the port in the response location header to the load balancer port.
4. The load balancer recertifies the response and forwards it to the client browser. To recertify the response, the load balancer must host the servicenow certificate and private key.

**Configure the load balancer**

If the load balancer and proxy servers are using different ports, configure the load balancer to rewrite the response before forwarding it to the client browser. The load balancer must terminate the SSL connection with the Edge proxy, rewrite the response using an iRule, and recertify and forward the response to the browser. This solution enables you to configure proxy servers on different ports from the load balancer, but can cost more in maintenance and performance.

Role required: admin

1. Add the servicenow certificate and private key to the load balancer. These files must be maintained and up-to-date.
2. Configure the load balancer to terminate the SSL connection, modify the response from the instance, and recertify and forward the response to the client browser. Create scripts or iRules on the load balancer to rewrite the response location header to use the load balancer port. This enables the client browser communicating with the load balancer to receive the response. To learn more about iRules, see F5 load balancer documentation.

The load balancer intercepts each response from the proxy server and rewrites the response location header before forwarding it to the client.

**Domain separation in Edge Encryption**

Edge Encryption provides the ability to encrypt data from within the customer's environment through the use of specific configurations, rules, and keys defined on the Edge Encryption proxy. The Edge Encryption proxy is not domain aware and cannot support domain-specific settings. Domain separation allows you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

**Overview**

**Support: Data only**

Domain separation in this application is supported at the Data only level, meaning it supports the data security model of separating visibility of data from one domain to another. To learn more, see Application support for domain separation.
How domain separation works in Edge Encryption

Edge Encryption can be used where domain-specific keys, configurations, and rules are not required.

Edge Encryption upgrades

You can schedule an upgrade to enable the instance to upgrade the Edge Encryption proxy server, or manually upgrade the proxy server at any time.

Scheduled upgrade

Schedule an upgrade to allow the instance to upgrade the proxy server at the scheduled time. This functionality is available by default after upgrading. A scheduled upgrade includes these events:

1. The proxy server checks with the instance to see if there is a new version available for upgrade. New versions generally become available when the instance is upgraded.
2. The administrator receives a notification upon logging in when a new version of the proxy server is available.
3. The administrator can schedule an Edge Encryption proxy server upgrade for each proxy server.

**Note:** Only users with the security_admin role can create an upgrade schedule through the proxy server.

4. Once the upgrade is scheduled, the proxy server automatically upgrades at the scheduled time. During the upgrade, the proxy server is offline for only a short time.

**Note:** Because the proxy server restarts during the upgrade, it is offline for a short time. The amount of time is determined by your environment and how long it takes to stop and restart the proxy service.

5. During the scheduled upgrade, a new proxy directory is created and your configuration files are copied to the new directory. New properties are written to your existing properties file. The following files or directories in your old proxy directory are copied to the new proxy directory.
   - /conf directory
   - /keys directory
   - /keystore directory
   - java/jre/lib/security/cacerts file

As a result, your keys, keystores, settings, and certificates are preserved.

**Caution:** Only the above files are copied to the new proxy directory. Any other customized files in the proxy server directory will not be preserved during a scheduled upgrade. The upgrade log file can be found in the original proxy directory in the following folder: `<original-proxy-directory>/tmp/upgrade-wrapper/bin`.

Manual upgrade
Instead of creating an upgrade schedule, you can manually upgrade each proxy server through the command line. See Manually upgrade an Edge Encryption proxy server running on Linux or Manually upgrade an Edge Encryption proxy server running on Windows.

Proxy build status

You can easily identify whether a proxy server is out of date by navigating to Edge Encryption Configuration > Proxies > All. The status of your proxy build is indicated in the Proxy build column by the following colors:

**Green**
Your proxy server is up-to-date.

**Yellow**
Your proxy server is out-of-date and an upgrade is needed.

**Orange**
Upgrade failed. Your proxy server reverts back to the old version to ensure that there is no downtime.

Troubleshoot a failed scheduled upgrade

When a scheduled upgrade fails, the proxy server reverts to the version you are upgrading from. All original data, keys, and configuration files are preserved. This process may take several minutes. Contact ServiceNow Technical Support to ensure a successful upgrade.

To determine the reason for the failure, you can check the Failure Reason in the upgrade schedule. In addition, the installation directory for the failed upgrade is maintained so that log files are available for troubleshooting.
**Caution:** Before deleting any extra proxy directories, always confirm which directory is current by reviewing the log files. If the log files have recent activity, the proxy might be connected to your instance.

If a scheduled upgrade fails repeatedly, you can manually upgrade your proxy server. See [Manually upgrade an Edge Encryption proxy server running on Linux](#) and [Manually upgrade an Edge Encryption proxy server running on Windows](#).

**Java minimum requirements**

The host machine installing or running the Edge Encryption proxy server must maintain a supported version of Java:

- Java 8 update 121 (8u121)
- Java 8 update 141 (8u141)
- Java 8 update 151 (8u151) or higher

**Note:** Java 8 update 131 (8u131) is not supported.

**Important:** Before installing the Edge Encryption proxy server, check that the `$JAVA_HOME` variable is pointing to a supported version of Java for each user that will run the proxy server. For example, if installing the proxy server as a local administrator on Windows, check that the `$JAVA_HOME` variable is pointing to the correct version of Java system-wide. If installing on Linux, check that each user that will run the proxy server has this variable correctly defined. If a supported version of Java is not found, the Edge Encryption proxy server will not run.

If using AES 256-bit encryption with Java 8 update 141 (8u141) or lower, you must install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server host. Add these files to the `<Java-home-directory>/jre/lib/security` folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption policy files, see [Enable AES 256-bit encryption for Java 8 update 141 (8u141) or lower](#).

**Mixed proxy-version environments**

While an environment running old versions of the proxy server with up-to-date versions of the proxy server is not recommended, it is supported if all proxy servers are within the same version family as your instance. For example, if you have an instance on the Kingston release, your environment supports proxy servers from any Kingston patch or hot fix. However, the following limitations apply.

- If one proxy server supports functionality that another proxy does not support, you will see inconsistent behavior depending on which proxy server is used.
- If a proxy server is out-of-date, it may not include recent security enhancements.

If a proxy server from a previous release is registered with a newer release of the instance, you will receive regular notifications that the proxy server is out-of-date. To ensure an optimal and secure environment, ServiceNow recommends always upgrading your proxy server to the most recent version of the software supported by your instance.
Schedule an Edge Encryption proxy server upgrade

Create an upgrade schedule to enable the instance to upgrade an out-of-date proxy server.

To schedule an upgrade, you must be logged in to your instance through the proxy server.

If using AES 256-bit encryption with Java 8 update 141 (8u141) or lower, you must install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server host. Add these files to the `<Java-home-directory>/jre/lib/security` folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption policy files, see Enable AES 256-bit encryption for Java 8 update 141 (8u141) or lower.

Role required: security_admin

Once the upgrade is scheduled, the proxy server automatically upgrades at the scheduled time. During the upgrade, the proxy server is offline for only a short time.

**Note:** Because the proxy server restarts during the upgrade, it is offline for a short time. The amount of time is determined by your environment and how long it takes to stop and restart the proxy service.

During the scheduled upgrade, a new proxy directory is created and your configuration files are copied to the new directory. New properties are written to your existing properties file. The following files or directories in your old proxy directory are copied to the new proxy directory.

- `/conf` directory
- `/keys` directory
- `/keystore` directory
- `java/jre/lib/security/cacerts` file

As a result, your keys, keystores, settings, and certificates are preserved.

**Caution:** Only the above files are copied to the new proxy directory. Any other customized files in the proxy server directory will not be preserved during a scheduled upgrade. The upgrade log file can be found in the original proxy directory in the following folder: `<original-proxy-directory>/tmp/upgrade-wrapper/bin`.

If multiple proxy servers are out-of-date, you must schedule an upgrade for each proxy server individually.

**Note:** Avoid hosting multiple proxy servers on the same machine. However, if your environment includes this configuration, do not schedule upgrades to multiple proxies on the same machine at the same time.

1. Navigate to Edge Encryption Configuration > Proxies > Upgrade Schedules.
2. Click New.
3. Complete the form.

### Edge Encryption Proxy Upgrade Schedule form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proxy server</td>
<td>Proxy server being upgraded.</td>
</tr>
</tbody>
</table>
### ServiceNow Now Platform Capabilities

#### Field | Description
--- | ---
**Target version** | Version to which you are upgrading your proxy server. This value is read-only and set to the most up-to-date proxy version available for your instance.

**Scheduled Start Time** | Date and time on which to start the upgrade.

**Active** | Whether the scheduled upgrade is active. If this field is not selected, the upgrade will not perform on the scheduled date and time.

**Status** | The status of the upgrade. This value is read-only. Possible statuses include:
- Pending
- Running
- Complete
- Failed

4. **Click Submit.**

After an upgrade is executed, you can review the upgrade details to learn more about it. If your upgrade failed, review the **Failure Reason** to determine next steps.

### Upgrade details

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Version</td>
<td>The version that the server was upgraded from.</td>
</tr>
<tr>
<td>To Version</td>
<td>The version that the server was upgraded to.</td>
</tr>
<tr>
<td>Actual Start Time</td>
<td>Time that the upgrade began.</td>
</tr>
<tr>
<td>End Time</td>
<td>Time that the upgrade ended.</td>
</tr>
<tr>
<td>Failure Reason</td>
<td>Reason that the upgrade failed.</td>
</tr>
</tbody>
</table>

### Manually upgrade an Edge Encryption proxy server running on Linux

Update a proxy running on Linux.

If using AES 256-bit encryption with Java 8 update 141 (8u141) or lower, you must install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server host. Add these files to the `<Java-home-directory>/jre/lib/security` folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption policy files, see [Enable AES 256-bit encryption for Java 8 update 141 (8u141) or lower](#).

**Role required:** security_admin or local administrator on the host machine.

1. Copy the Edge Encryption update-archive file to the installation directory.
2. Change to the installation directory.
3. Run the following command:

   ```bash
   java -jar edgeencryption-dist-<version>-linux-x86-64.zip -m dist-upgrade -c <proxy directory>
   ```

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
If you want to see the help screen, execute this command without arguments: `java -jar edgeencryption-dist-<version>-linux-x86-64.zip` A new proxy directory is created with a current timestamp and the old proxy directory is maintained as a backup. The old proxy shuts down and the new proxy starts up. Any open connections/transactions on the old proxy server are terminated.

4. Check the proxy log in the new directory and the instance to verify that the new proxy is running.

**Manually upgrade an Edge Encryption proxy server running on Windows**

Update a proxy running on Windows.

If using AES 256-bit encryption with Java 8 update 141 (8u141) or lower, you must install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server host. Add these files to the `<Java-home-directory>/jre/lib/security` folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption policy files, see [Enable AES 256-bit encryption for Java 8 update 141 (8u141) or lower](#).

Role required: security_admin or local administrator on the host machine.

1. Download the Edge Encryption proxy-update archive file to the installation directory.
2. Start the Windows cmd terminal program with administrator privileges.
3. Change to the installation directory.
4. Run the following command:

   ```
   java -jar edgeencryption-dist-<version>-windows-x86-64.zip -m dist-upgrade -c <proxy directory>
   ```

If you want to see the help screen, execute this command without arguments: `java -jar edgeencryption-dist-<version>-windows-x86-64.zip` A new proxy directory is created with a current timestamp and the old proxy directory is maintained as a backup. The old proxy shuts down and the new proxy starts up. Any open connections/transactions on the old proxy server are terminated.

5. Check the proxy log in the new directory and the instance to verify that the proxy has been updated and is running.

**Roll back an Edge Encryption proxy server upgrade**

If a proxy upgrade is unsuccessful, you can go back to the earlier version.
If an upgrade fails when using the scheduled upgrade feature in the Kingston release, the proxy server will automatically roll back to the old version. The old proxy server is stored unmodified in a backup directory.

If you would like to roll back a manual upgrade, you can follow these steps.

1. Shut down the proxy.
2. Delete the new proxy directory.
3. Rename the backup directory to the proxy name.
   The backup directory is in the proxy installation directory with the name `<proxy name>_backup`
4. Start the proxy.
5. Check the proxy log and the instance to verify that the proxy is online.

### Edge Encryption configuration

After the Edge Encryption proxy server is installed and running, manage Edge Encryption through the proxy server.

You must complete all the steps in **Edge Encryption installation** before creating encryption configurations and encryption patterns on the instance.

**Note:** To access Edge Encryption configuration, you must log in through the proxy server and elevate to the security_admin role.

### Rotate encryption keys

You can perform encryption key rotation from the instance. You can add a new key, change the default key assignment, and then schedule a mass key rotation job.

Before setting an encryption key as the default key, make the key available to each proxy. This ensures that the proxies have the key to encrypt data when the key is assigned as the default key. All proxies must have access to a key before it can be assigned as the default key.

**Note:** Before removing a key from the proxy, ensure that no data on the instance uses the key. You can do this by setting up and running a mass key rotation job.

### Schedule a single key rotation job

You can schedule a job to find data encrypted using a specified key alias and then re-encrypt the data with the current default encryption key. The data is decrypted before it is re-encrypted with the default key.

Role required: security-admin

Before scheduling this job, make sure you update the default key in **Edge Encryption Configuration > Encryption Key Configuration > Set Default Keys**.

1. Navigate to **Edge Encryption Configuration > Maintenance > Schedule Single Key Rotation**.
2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select <strong>Single Key Rotation</strong>.</td>
</tr>
</tbody>
</table>
Schedule a mass key rotation job

You can schedule a job to find data encrypted with old keys and then re-encrypt the data with the current default encryption keys. The data is decrypted before it is re-encrypted with the current default key.

Role required: security-admin

1. Navigate to Edge Encryption Configuration > Maintenance > Schedule Mass Key Rotation.
2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Mass Key Rotation.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select Save.
4. To see an estimated count of records to be updated, click Estimate Record Count.

Schedule an attachment key rotation job

You can schedule a job to find attachments encrypted using a specified key alias and then re-encrypt the attachments with the current default encryption key. The attachment is decrypted before it is re-encrypted with the default key.

Role required: security-admin

1. Navigate to Edge Encryption Configuration > Maintenance > Schedule Attachment Key Rotation.
2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Attachment Key Rotation.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select Save.
4. To see an estimated count of records to be updated, click Estimate Record Count.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Clear the check mark if you want to deactivate this job.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select **Save**.
4. To see an estimated count of records to be updated, click **Estimated Record Count**.
5. To run the job immediately, click **Execute Now**.

**Encrypt fields using encryption configurations**

Encrypt fields by creating encryption configurations.

To configure Edge Encryption, you must be connected to the instance through the proxy. Test all changes on a non-production instance before making the changes to the production instance.

**Define encryption keys**

After setting up one or more proxies and configuring a default encryption key, the instance verifies that the keys are available to all proxies. You cannot make an encryption key the default key unless all proxies have the key. Once a default key is defined, you can create encryption configurations.

**Assign fields and attachments to be encrypted**

Assigning fields and attachments to be encrypted means assigning an encryption type to the field or attachment. Before marking a field as encrypted, evaluate these issues.

- Determine what system features might be impacted.
- Examine all scripts for use of the field.
- Make any desired adjustments to the field’s size. After a field has been configured for encryption, the field size cannot be changed.

Marking a field to be encrypted expands the field size to hold the extra space needed to store the encrypted data. The process of expanding the field size can take a long time depending on the number of records in the table.

**Create an encryption configuration**

Select the fields to be encrypted and identify the encryption type.

Role required: security-admin

1. Navigate to **Edge Encryption Configuration > Edge Encryption Configurations > Create New**.
2. Fill in the fields on the form, as appropriate.
### Edge Encryption configuration

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>The table containing the field to be encrypted.</td>
</tr>
<tr>
<td>Type</td>
<td>Whether to encrypt a table column or attachments for the table. Select <strong>Column</strong>.</td>
</tr>
<tr>
<td>Column</td>
<td>The table field to be encrypted. This field appears when the <strong>Type</strong> is <strong>Column</strong>.</td>
</tr>
<tr>
<td>Encryption type</td>
<td>The encryption type to use.</td>
</tr>
</tbody>
</table>

**Note:** A specific table and field combination can only have one active configuration at a time.

3. Click **Submit**.

After the encryption record has been added, you can create an encryption job to encrypt existing data. If you do not run an encryption job, the existing data is encrypted the next time it is changed.

### Deactivate an encryption configuration

After configuring a field or a table's attachments to be encrypted, you can stop encryption by deactivating the encryption configuration. After deactivating encryption, you can run a Decryption job for fields or an Attachment Decryption job for attachments to remove the encrypted data from the instance.

**Role required:** security-admin

**Warning:** Deactivating an encryption configuration does not delete the encryption record and the encryption type cannot be changed.

1. Navigate to **Edge Encryption Configuration > Edge Encryption Configurations > All**. The **Edge Encryption Configurations** list is shown.
2. Click on the encryption configuration to be deactivated. The **Edge Encryption Configuration** form is shown.
3. Click on the **Active** box. The **Active** box is clear.
4. Click **Update**. The **Edge Encryption Configurations** list is shown.

You can run a Decryption or Attachment Decryption job to decrypt data on the instance. If you do not run a job, the encrypted data is decrypted the next time it is changed.

### Schedule an encryption job

You can schedule a job to find and encrypt any unencrypted data in a specified field, using the default encryption key configured for the field. If you do not create an encryption job after configuring a field for encryption, the records are encrypted as they are saved to the instance.

**Role required:** security-admin

1. Navigate to **Edge Encryption Configuration > Encryption Configurations > All**.
2. Click the field that you want to schedule an encryption job for.

The Scheduled Encryption Job form is shown with all fields populated. The bottom of the form shows records for any previous job executions.

4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Encryption.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Column</td>
<td>Select a column.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

5. Click the menu icon in the form header and select Save.
6. To see an estimated count of records to be updated, click Estimate Record Count.
7. To run the job immediately, click Execute Now.

Schedule a decryption job

You can schedule a job to decrypt data in an encrypted field, to store clear data in the instance.

Note: You must mark the encryption record for the field as inactive (clear the Active box) before the decryption job runs, otherwise, nothing happens.

Role required: security-admin

1. Navigate to Edge Encryption Configuration > Encryption Configurations > All.
2. Click the field that you want to decrypt.

The Scheduled Encryption Job form is shown with all fields populated. The bottom of the form shows records for previous job executions.

4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Decryption.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Column</td>
<td>Select a column.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>
5. Click the menu icon in the form header and select Save.
6. To see an estimated count of records to be updated, click Estimate Record Count.
7. To run the job immediately, click Execute Now.

Encrypt attachments using standard encryption

You can encrypt attachments for specific tables.

All attachments to a table use the same encryption type. Encrypted attachments are not searched when performing a text search. Only the standard encryption types are allowed for attachments. The order preserving or equality preserving encryption types are not allowed.

For a session bypassing the Edge Encryption proxy:
- On a record with attachment encryption activated:
  - The user can see that there are attachments and the attachment names.
  - The user cannot open or download the attachments.
  - The user cannot add new attachments.
- On a record without attachment encryption activated:
  - The user can open and download existing attachments.
  - The user can add new attachments.

For a session using the encryption proxy, the user can open and download existing attachments and add new attachments.

Configure attachment encryption

Select the tables whose attachments are to be encrypted and identify the encryption type.

Role required: security-admin

2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table whose attachments are to be encrypted.</td>
</tr>
<tr>
<td>Type</td>
<td>Whether to encrypt a table column or attachments for the table. Select Attachment.</td>
</tr>
<tr>
<td>Column</td>
<td>The table field to be encrypted. This field appears when the Type is Column, and not when Type is Attachment.</td>
</tr>
<tr>
<td>Encryption type</td>
<td>The encryption type to use. For attachments, only Standard AES128 and Standard AES256 are allowed.</td>
</tr>
</tbody>
</table>

3. Click Submit.
After the encryption record has been added, you can create an attachment encryption job to encrypt existing attachments. If you do not run an attachment encryption job, the system encrypts new attachments when you attach them.

**Schedule an attachment encryption job**

You can schedule a job to find and encrypt any unencrypted attachments for a specified table, using the default encryption key configured for the table.

Role required: security-admin

1. Navigate to [Edge Encryption Configuration > Encryption Configurations > All.](#)
2. Click the table you want to schedule an encryption job for.

The **Scheduled Encryption Job** form is shown with all fields populated. The bottom of the form shows records for previous job executions.

4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Attachment Encryption.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

5. Click the menu icon in the form header and select Save.
6. To see an estimated count of records to be updated, click Estimate Record Count.
7. To run the job immediately, click Execute Now.

**Schedule an attachment decryption job**

You can schedule a job to decrypt any encrypted attachments for a specified table, to store clear attachments in the instance.

![Note: You must mark the encryption record for the table as inactive (clear the Active box) before the decryption job runs, otherwise, nothing happens.](#)

Role required: security-admin

1. Navigate to [Edge Encryption Configuration > Encryption Configurations > All.](#)
2. Click the table with the attachments that you want to decrypt.

The **Scheduled Encryption Job** form is shown with all fields populated. The bottom of the form shows records for previous job executions.

4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Attachment Decryption.</td>
</tr>
<tr>
<td>Field</td>
<td>Value</td>
</tr>
<tr>
<td>---------</td>
<td>-----------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Clear the check mark if you want to deactivate this job.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

5. Click the menu icon in the form header and select **Save**.
6. To see an estimated count of records to be updated, click **Estimate Record Count**.
7. To run the job immediately, click **Execute Now**.

**Change a field or attachment’s encryption type**

You can change a field or attachment’s encryption type by selecting a new encryption type in the existing encryption configuration record. A specific table and field combination can only have one active configuration at a time.

Role required: security_admin

1. Navigate to **Edge Encryption Configuration > Encryption Configurations > All**. The **Edge Encryption Configurations** list is shown.
2. Open the record for the encryption configuration to be changed.
3. Click the **Encryption type** dropdown and select a new encryption type.

Note: For attachments, only Standard AES128 and Standard AES256 are allowed.

4. If needed, run an **encryption** or **attachment encryption** job.

It is not necessary to run an encryption job. If you do not run an encryption job, the field or attachment is encrypted using the new encryption type the next time the field or attachment is changed.

**Tokenize strings using encryption patterns**

You can replace string patterns with tokens before they are sent to and stored in the instance.

To use encryption patterns, you must install and set up a MySQL database in your network. This is the same database used for order-preserving encryption. To create or edit encryption patterns, you must be connected to the instance through the proxy.

Role required: security-admin

You can use base system patterns, or create your own patterns. Base system patterns are advanced patterns. Encryption patterns include the following limitations.

- A pattern of all alpha characters is not allowed.
- The minimum pattern size is five characters. You can change this setting using a system property.
- The * and + quantifiers are forbidden in encryption patterns.
- Encryption patterns match complete words, not parts of strings embedded in a larger string. Words are defined by spaces and characters not available for inclusion in a pattern.
- If the same string is sent to the instance multiple times, it is replaced with the same token.
- Text search on exact matches is supported. The query string is exchanged with a token when sent to the instance, the search is performed on tokens, and when the search results are returned to the proxy server, the tokens are replaced with the clear text. Features such as stemming are not supported.

When using patterns, the clear text never leaves your network. When the proxy server matches a pattern in a request going to the instance, the proxy replaces the string with a token of the same size. The token is sent to instance instead of the clear text string. When the response is sent from the instance to the proxy server, the proxy replaces the token with the string. When viewed through the proxy server, the string displays as clear text.

**Note:** Encrypted fields are not checked for encryption patterns.

1. Navigate to Edge Encryption Configuration > Encryption Patterns > Create New. Alternatively, you can navigate to Advanced Patterns to activate or edit a preconfigured pattern.
2. Enter the pattern name.
3. Define the Edge pattern input type.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Basic</td>
<td>A series of character types. In the Basic Pattern Input tab, click Add and select a character type. The Sample pattern displays the pattern as characters are added. Click New Block to move the next character to the next line. This enables you to group characters in a long pattern. Click X to delete the last character in the pattern.</td>
</tr>
<tr>
<td>Advanced</td>
<td>A Java RegEx expression. If advanced is selected, you cannot change the input type back to basic. In the Sample match field, enter a sample pattern to test the RegEx expression. In the Pattern field, enter a Java RegEx expression. Click Validate to verify that the expression matches the sample pattern.</td>
</tr>
</tbody>
</table>

The input type defines how you are going to enter the pattern. It does not impact how the pattern is used.

4. Click Submit.

**Repair or recover order-preserving encrypted data**

If you have the security-admin role, you can schedule jobs performed by the Edge Encryption proxy to repair or recover fields that use order preserving encryption.

You can schedule jobs to:
- Repair order tokens.
- Recreate the proxy database.

Running these jobs can be a time-consuming operation which might impact the performance of the Edge Encryption proxy. Schedule these jobs at a time when no users or a minimum set of users are using the system, such as midnight on the weekend.
Schedule an order token repair job

You can schedule a job to find and repair fields where the order token is missing.

Role required: security-admin

Use these jobs to repair individual fields in a table or to repair all fields using order preserving encryption. Run this job when the proxy database has been offline while the instance has been running, which results in order preserving fields that are missing order tokens.

1. Navigate to **Edge Encryption Configuration > Maintenance > Schedule Order Token Repair**.
2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select <strong>Order Token Repair</strong>.</td>
</tr>
<tr>
<td>All fields</td>
<td>Select this check box to repair all tables.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Column</td>
<td>Select a column.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select **Save**.
4. To see an estimated count of records to be updated, click **Estimated Record Count**.

Schedule a proxy-database recovery job

Run this job when the proxy database has lost data. This job finds all records that have been encrypted with a token (order preserving encryption type) and sends them to the proxy so that the proxy database can be rebuilt.

Role required: security-admin

1. Navigate to **Edge Encryption Configuration > Maintenance > Schedule Database Recovery**.
2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for this job.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select <strong>Database Recovery</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run this job for the first time.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select **Save**.
4. To see an estimated count of records to be updated, click **Estimate Record Count**.
Blacklist requests from an IP address in your network

Because the Edge Encryption proxy server resides in your network, it may be subject to vulnerability scans by your network software. To prevent IP scanner or other requests from being forwarded to your ServiceNow instance, you can blacklist IP addresses, IP ranges, or network masks. Any connection to the proxy server from a blacklisted address is terminated and is not forwarded to your instance.

Role required: security_admin

To blacklist an IP address, you must be logged in to your instance through the proxy server.

Important: Ensure that you understand your network topology before blacklisting IP addresses in your network. If an IP address is added to the blacklist, any user with that IP address will be blocked from accessing the Edge Encryption proxy server.

1. Navigate to Edge Encryption Configuration > Maintenance > Blacklist IP Addresses. The Encryption Proxy IP Blacklists (edge_encryption_ip_blacklist) list view opens.

2. Click New.

3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proxy server</td>
<td>The Edge Encryption proxy server that is prevented from forwarding requests from blacklisted addresses.</td>
</tr>
<tr>
<td>IP, IP range, or net-mask</td>
<td>Requests from this IP address, range, or network mask are not forwarded to your ServiceNow instance. Example values include:</td>
</tr>
<tr>
<td></td>
<td>• IP address: 10.10.10.5</td>
</tr>
<tr>
<td></td>
<td>• IP range: 10.10.10.1-15</td>
</tr>
<tr>
<td></td>
<td>• Network mask: 10.10.0.0/24</td>
</tr>
<tr>
<td>Active</td>
<td>Whether the record is active. Only IP addresses from active records are prevented from sending requests to the instance.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the blacklist record.</td>
</tr>
</tbody>
</table>

4. Click Submit.

5. Repeat these steps for all other proxies for which an IP address should be blacklisted.

The Edge Encryption proxy server terminates any connection from a blacklisted IP addresses, range, or network mask and cannot forward the request to the instance.

Encrypt data from a record producer

Record producers allow end users to create task-based records, such as incident records, from the Service Catalog and Service Portal. If a record producer attempts to insert data into a field marked for encryption, an invalid insert message displays and the data is not saved to the field. To configure your Edge Encryption proxy server to allow inserts from a record producer, create encryption rules from the record producer record.

Role required: security_admin

Encrypting data from a record producer requires an encryption configuration defined for the target field. Check that you have created an encryption configuration for the target field and table before creating an encryption rule from a record producer. See Create an
encryption configuration. To encrypt attachments from a record producer, Configure attachment encryption.

1. Log in to your instance through the Edge Encryption proxy server.
2. Navigate to Service Catalog > Catalog Definitions > Record Producers.
3. Create a record producer record or open an existing record producer record.

Two inactive encryption rules are automatically created to encrypt data sent from the record producer to the field marked for encryption.

<table>
<thead>
<tr>
<th>Encryption rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;RecordProducerName&gt;</code></td>
<td>Rule created to process POST parameters from the Service Catalog and map variables to fields in the instance.</td>
</tr>
<tr>
<td><code>&lt;RecordProducerName&gt;Json</code></td>
<td>Rule created to process a JSON payload from the Service Portal and map variables to fields in the instance.</td>
</tr>
</tbody>
</table>

5. Activate the necessary encryption rules created by the record producer.
   a) Navigate to Edge Encryption Configuration > Rules > All.
   b) Depending on where the record producer will be used, open the associated encryption rule created by the record producer and select the Active flag.

   If using the record producer in the Service Catalog, activate the `<RecordProducerName>` encryption rule. If using the record producer in the Service Portal, activate the `<RecordProducerName>Json` encryption rule.

6. Optional: Examine the Encryption rule Action field and add any necessary field names or statements.

   If a record producer directly maps a variable to a field in a table, the encryption rule automatically maps the variable to the correct field. However, if a variable is indirectly mapped through various scripts on the platform, you may need to update the rules to map each variable to the correct field.

   The below encryption rule was created from the Report Outage record producer and processes POST parameters from the Service Catalog to map variables to fields in the instance. Replace 'FILL ME IN' with the target field.
The below encryption rule was created from the Report Outage record producer and processes a JSON payload from the Service Portal to map variables to fields in the instance. Add additional statements to map any scripted variables to the target fields.
```javascript
function ReportOutageJsonCondition(request) {
  if (request.path.indexOf("/api/now/v1/servicecatalog/items") > -1 && request.path.split('/').length > 1) {
    return true;
  }
  return false;
}
```

```javascript
function ReportOutageJsonAction(request) {
  var tableName = 'INCIDENT';
  // Some fields are set in script, additional parameter lines may need to be added
  // current.comments is accessed via script from notes; // assignment to current.comments does NOT replace existing values
  // current.description is accessed via script from current.short_description;
  // current.letter_id is accessed via script from gp.getterID();
  var iscurrent = request.getParam('currentContent');
  var jsonelement = iscurrent.getiterator('variables');
  jsonelement.hasNext();
  var jsonelement = jsonelement.next();
  isonelement.setValue(tableName, isonelement.getName());
}
```
When the payload from the record producer is examined, the `error_message` element contains the value for the `short_description` field. By adding the following statement, you can map the scripted variable `error_message` to the `short_description` field:

```javascript
if (jsonElement.getName() == 'error_message')
    jsonElement.valueFor(tableName, 'short_description');
```

The value of the **Action** field becomes:

```javascript
function ReportOutageJsonAction(request) {
    var tableName = 'incident';
    // Some fields are set in script, additional parameter lines may need to be added
    // current.comments is accessed via script from notes; // assignment to current.comments does NOT replace existing values
    // current.short_description is accessed via script from short_description;
    // current.description is accessed via script from current.short_description;
    // current.caller_id is accessed via script from gs.getUserID();
    var jsonContent = request.getAsJsonContent();
    for (var jsonElementItr = jsonContent.getIterator('variables');
         jsonElementItr.hasNext();)
    {
        var jsonElement = jsonElementItr.next();
        if (jsonElement.getName() == 'error_message')
            jsonElement.valueFor(tableName, 'short_description');
        else {
            jsonElement.valueFor(tableName, jsonElement.getName());
        }
    }
}
```

The two encryption rules enable the record producer to insert values into fields marked for encryption from either the Service Catalog or Service Portal.

**Define a custom encryption rule**

It may be necessary to identify and encrypt sensitive information in HTTP requests on the way to your instance. You can write encryption rules to identify, interpret, and encrypt data in such requests, mapping fields in the request to table-field names on your instance.

**What is an encryption rule**

Encryption rules are scripts executed on the Edge Encryption proxy server to map fields in a request to fields in a table on your ServiceNow instance. An encryption rule tells the Edge Encryption proxy server how to encrypt data in custom payloads.

**Note:** Encryption rules only support ECMAScript 3 and below.

**When to use custom rules**

A set of encryption rules is installed as part of the Edge Encryption plugin. These rules handle core platform use cases such as editing a field from the list edit form, updating a record from the record form, managing direct web services, and processing data from the REST API. Applications created using standard forms and lists should work without custom encryption rules.
If you develop scripted processors, scripted web services, scripted REST APIs, UIs, or Ajax scripts that contain data that must be encrypted, you must write encryption rules to find and map the data to Glide table-field names.

**Format of an Encryption rule**

Rules include three parts:

- **Condition**: Identifies the type of request.
- **Action**: Maps fields in the request to fields in a table, encrypting values that map to fields with encryption configurations defined.
- **Order**: Priority of the rule. The lowest priority rule with a satisfied condition is the only rule that runs. Like business rules, rules run from lowest to highest.

Except for attachment requests, when an HTTP request hits the Edge Encryption proxy server, the Edge Encryption proxy server evaluates all encryption rule conditions in priority order until either all conditions return false, or one condition returns true. When a condition returns true, the action is executed on the request and the result is forwarded to the instance. No other conditions are evaluated. As a result, encryption rule conditions should be as specific as possible. A generic rule might evaluate as true for a request meant to be processed by another rule, causing the request to be processed by the wrong action. If a generic condition is unavoidable, the rule should be marked with a high-order value so that more specific rules are evaluated first.

**Encryption rule APIs**

Encryption rules are written in JavaScript and utilize Edge Encryption APIs to locate and encrypt sensitive information in the body of a request. The API uses expressions similar to XPath to navigate through both JSON and XML content.

Edge Encryption APIs process the request off the stream as it is being written to the output stream. Stream parsing allows encryption rules to be network performant. However, fetching and parsing content from the body multiple times could lead to unexpected results. To account for this, requests should be processed by the action in a single pass.

When creating encryption rules, you cannot use Glide APIs, script includes, business rules, or any global parameters such as `current`. Because the rules are created for HTTP objects, a global `request` object is available.

When creating encryption rules, you cannot use APIs from the white list manager or scoped applications.

**Error handling**

If an encryption rule condition or action throws an exception, check the proxy log for troubleshooting information.

**Inspect the client request**

Before creating a custom encryption rule, you must determine the format of the client request entering the Edge Encryption proxy server.

Because encryption rules iterate over client requests and determine what, if anything, needs to be encrypted, you must understand the type of request you are creating a rule for. The format of the
client request determines the structure of your encryption rule and the APIs available for use in the rule.

1. Inspect the client request.

   Depending on the source of the request, the following tools are available to inspect the request and determine the format.

<table>
<thead>
<tr>
<th>Source of request</th>
<th>Available tools</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client browser</td>
<td>Use the developer console in your browser to inspect the client request. Useful tools include:</td>
</tr>
<tr>
<td></td>
<td>· Firefox Network Monitor</td>
</tr>
<tr>
<td></td>
<td>· Chrome Network Panel</td>
</tr>
<tr>
<td>Third-party/external source</td>
<td>Use an HTTP protocol analyzer to inspect the request. Useful tools include:</td>
</tr>
<tr>
<td></td>
<td>· Wireshark</td>
</tr>
<tr>
<td></td>
<td>· HTTP Scoop</td>
</tr>
<tr>
<td></td>
<td>Alternatively, you can often use documentation for the external source to determine the format of the request.</td>
</tr>
</tbody>
</table>

2. From the client request, inspect the packet and determine:
   - The client request method
   - The URL path of the request
   - The URL parameters
   - The POST parameters, if any
   - The format of the request body, if included

Inspecting the request provides an understanding of the fields you need to filter for and iterate over in your encryption rule. To understand the fields in the request object, see request.

Create an encryption rule

Encryption rules are used by the proxy to find content in HTTP requests that should be encrypted.

Role required: security_admin

Before creating an encryption rule, you must Inspect the client request to determine the format.
To create or edit encryption rules, you must be connected to the instance through an encryption proxy.

1. Navigate to Edge Encryption Configuration > Rules > Create New.
2. In the Name box, enter a name.
3. In the Request Type, select an HTTP method.
   - HTTP Post
   - HTTP Get
   - HTTP Put
   - HTTP Patch
   - HTTP Delete

   **Note:** Pre-Jakarta instances allow only HTTP Get and HTTP Post methods.

4. In the Condition box, enter a JavaScript statement defining when the rule should run.
5. In the Action box, enter a JavaScript function to be executed when the condition is true.
6. In the Order box, enter the relative priority of the rule.
7. Click Submit, or save the form.

Encryption rule conditions

Encryption rule conditions determine if the rule should be executed.

An encryption rule condition must return true if the rule is to handle the HTTP request; otherwise, it must return false.

As you build your condition, keep in mind that only one rule is executed per request. As a result, the condition must be as general or specific as needed to run under the intended circumstances.

**Note:** Be careful when performing checks on content in the condition. Excessive checks can be expensive for the proxy server and may cause increased latency when handling complex requests.

The condition can use the method type, content type, URL path, or any URL query string parameters to determine if the rule should handle the request. The condition has access to these fields via the request object. Be sure that, prior to creating an encryption rule condition, you have inspected the client request and understand the conditions needed to trigger the rule.

**Note:** To build efficient rules, consider easy ways to rule out requests that you do not want to be evaluated by a rule. Build your condition to return false for those requests first. This method increases performance and quickly routes the request to the correct rule faster.

Encryption rule objects and APIs are available to encryption rule conditions.

Example using path and postParams

```javascript
/*This condition checks if the request coming in has a path ending in "/sample_processor.do" and if a post parameter exists in that request called myPostParam */

function SampleCondition(request) {
    if (endsWith(request.path, "/sample_processor.do") &&
    request.postParams.myPostParam) {
        return true;
    }
}
```
Example using urlParams and contentType

```javascript
/* This condition checks if a url parameter exists in the query called myUrlParam and if the content type contains 'xml' (if so, you can expect the body to be an XML payload). Then, it checks if the xml payload contains myXmlTag */

function SampleCondition2(request) {
    if (request.urlParams.myUrlParam && request.contentType.indexOf('xml') > -1 && request.xmlContains('myXmlTag')) {
        return true;
    }
    return false;
}
```

Encryption rule actions

An encryption rule maps fields in a client request to fields in a table on your instance and identifies fields marked for encryption.

An encryption rule action only runs when the encryption rule condition returns true. An encryption rule identifies the data to be encrypted in your request payload. Because the rule iterates over the content in the request object, you must understand the form and structure of your request body and determine what in the request needs to be encrypted. The data to be encrypted might be located within:

- A POST or URL parameter.
- JSON or XML content within a POST or URL parameter.
- A JSON payload.
- An XML payload.

Before writing an encryption rule action, be sure to:

- Inspect the client request.
- Identify where the sensitive data is located in the request object.
- Determine the field and table name to insert data into, or understand how to dynamically pull this from the request.

Encryption rule objects and APIs are available to encryption rule actions and conditions.

Encryption rule objects and APIs

Use encryption rule APIs to parse and encrypt values in requests moving through the Edge Encryption proxy server to the instance.

The APIs available for your encryption rule depend on the format of the request object. For example, if the contentType parameter of the request object is XML, you can use the XML APIs to parse and encrypt values in the payload. After you determine the type of object in your request, you can build an encryption rule using the available APIs.

Encryption rule APIs are available in both encryption rule condition and action scripts.

The request object is a global object available in Edge Encryption rule action and condition scripts.
The request object is a JavaScript object that represents the client request coming in to the Edge Encryption proxy server. You must build your encryption rule to parse the request object, map request object values to fields in a table on the instance, and encrypt any sensitive data in the request object.

The request object includes the following attributes and data from the client request:

### Request object fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>The path portion of the URL.</td>
</tr>
<tr>
<td>requestMethod</td>
<td>GET, POST, PUT, PATCH, DELETE.</td>
</tr>
<tr>
<td>contentType</td>
<td>The Content-Type header field.</td>
</tr>
<tr>
<td>urlParams</td>
<td>The parameters in the query string. This can also be evaluated to a String.</td>
</tr>
<tr>
<td>postParams</td>
<td>If this is a form post, this contains the post parameters.</td>
</tr>
</tbody>
</table>

request - getAsJsonContent()

Returns the request as an iterable object of type JsonNode.

This method is available only in an Edge Encryption rule if the request body is a valid JSON payload. If you are not sure what format the request body includes, check the contentType field on the request object.

Once the request is returned as a JsonNode object, you can use the JSON APIs to iterate over the object and encrypt fields.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNode</td>
<td>The request as an iterable JsonNode.</td>
</tr>
</tbody>
</table>

request - getAsXmlContent()

Returns the request content as an iterable object of type XMLContent.

This method is available only in an Edge Encryption rule if the request body is a valid XML payload. If you are not sure what format the request body includes, check the contentType field on the request object.

Once the request is returned as an XMLContent object, you can use the XML APIs to iterate over the object and encrypt fields.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLContent</td>
<td>The request content as an iterable XMLContent.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLContent</td>
<td>The request as an iterable object of type XMLContent.</td>
</tr>
</tbody>
</table>

request - XMLContains(String path)

Returns true if the given path exists in the XML DOM.

This method is available only if the request body is a valid XML payload. If you are not sure what format the request body includes, check the contentType field on the request object.

Parameters

<table>
<thead>
<tr>

POST and URL parameter APIs

POST and URL parameters can be accessed as properties of the request object using request.postParams and request.urlParams.

Any single parameter can be accessed as a property of the postParams and urlParams parent objects by calling request.postParams.myParam. Any parameter accessed this way is an object of the underlying class ParameterValue. Any APIs in this class can be called on any parameter.

After inspecting the client request, it may be necessary to access and encrypt parameter values from the request object. Depending on the data in the client request, you can encrypt values and map them to fields on the instance in multiple ways.

Encrypt the value of a known table and field

If you know the name of the instance table and field that will hold the encrypted data, you can explicitly define them in the encryption rule. For example, you may know that the request will be processed on the instance to create an incident and you want to encrypt the text parameter in the description field. In this case, you can create the following action.

```
function SampleAction1() {
    request.postParams.text.valueFor('incident', 'description');
}
```

Encrypt the value of a dynamically defined table and field

If, conversely, you do not know the name of the field that the encrypted data will populate, you can dynamically define them using tableName and fieldName.
The below example processes a generic request that might store data in different task tables (such as incident, problem, and change_request) on the instance.

```javascript
function SampleAction2() {
    var tableName = request.urlParams.table;
    for (var parameter in request.postParams) {
        var currentParam = request.postParams[parameter];
        var fieldName = currentParam.toString();
        if (fieldName == 'text') {
            currentParam.valueFor(tableName, 'description')
        } else {
            currentParam.valueFor(tableName, fieldName);
        }
    }
}
```

This action:
- Gets the destination table from the URL parameters.
- Iterates over the URL parameters.
- Asks the Edge Encryption proxy server to encrypt any URL parameter with a name that matches a field marked for encryption.
- Looks for a specific parameter called `text` and asks the Edge Encryption proxy to encrypt the value based on the encryption configuration for the description field on the incident table.

In this example, the `valueFor()` method is not actually performing any encryption. Rather, the method asks the Edge Encryption proxy server to check whether the table/field pair in the request object is marked for encryption with an encryption configuration and, if applicable, encrypt it.

**Encrypt JSON or XML within a parameter**

A POST or URL parameter might include JSON or XML content. In this case, you can process the content within the parameter, iterate over the values, and encrypt required fields. In this example, the `tableName` is still accessed from a POST parameter, but the value of the field is the JSON object `data`.

```javascript
function SampleAction3() {
    var tableName = request.postParams.table;
    var data = request.postParams.data;
    var dataIterator = data.getAsJsonContent().iterator();
    while (dataIterator.hasNext()) {
        var jsonElement = dataIterator.next();
        var fieldName = jsonElement.getName();
        if (fieldName == 'text') {
            jsonElement.valueFor(tableName, 'description');
        } else {
            jsonElement.valueFor(tableName, fieldName);
        }
    }
}
```

An example of an encryption rule action that processes XML within a POST parameter.

```javascript
function SampleAction4() {
    var tableName = request.postParams.table;
    var data = request.postParams.data;
    var dataIterator = data.getAsXmlContent().getIteratorOverAllChildren();
    while (dataIterator.hasNext()) {
        var jsonElement = dataIterator.next();
```
Encrypt a query

You might encounter an encoded query within a parameter in the client request that contains sensitive data. To match a field in a query to an encrypted value in the instance database, you must create an encryption rule that asks the proxy to check whether a field in the query is marked for encryption. The `encodedQueryFor()` method parses an encoded query on a given table, and checks if any fields in the query have encryption configurations.

In this example, the rule iterates over the parameters looking for the `filter` parameter, which is expected to be a Glide encoded query.

```javascript
function SampleAction5() {
    var tableName = request.urlParams.table;
    for (var parameter in request.postParams) {
        var currentParam = request.postParams[parameter];
        var fieldName = currentParam.toString();
        if (fieldName == 'filter') {
            currentParam.encodedQueryFor(tableName);
        } else {
            currentParam.valueFor(tableName, fieldName);
        }
    }
}
```

For example, if the value of `filter` is: `short_description=My sensitive information^number=INC000056^category=Outage`, the query would become `short_description=<Encrypted(My sensitive information)>^number=INC000056^category=Outage` on the instance.

ParameterValue - `toString()`

Converts the POST or URL parameter value to a string.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

ParameterValue - `getAsJsonContent()`

Returns the request as an iterable object of type `JsonNode`.

© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
This method is available only in an Edge Encryption rule if the request body is a valid JSON payload. If you are not sure what format the request body includes, check the contentType field on the request object.

Once the request is returned as a JsonNode object, you can use the JSON APIs to iterate over the object and encrypt fields.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNode</td>
<td>The request as an iterable JsonNode.</td>
</tr>
</tbody>
</table>

**ParameterValue - getAsXmlContent()**

Returns the request content as an iterable object of type XMLContent.

This method is available only in an Edge Encryption rule. This method assumes that the request body is a valid XML payload. You can check the contentType to make sure.

Once the request is returned as an XMLContent object, you can use the XML APIs to iterate over the object and encrypt fields.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLContent</td>
<td>The request as an iterable object of type XMLContent.</td>
</tr>
</tbody>
</table>

**ParameterValue - encodedQueryFor(String tableName)**

Specifies that the value of the element is an encoded query on the specified table.

Calling this function on a parameter tells the proxy that the value of the parameter is an encoded query for the specified table. The proxy parses the encoded query and encrypts the fields in the encoded query that must be encrypted.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table that you expect the query to run on.</td>
</tr>
</tbody>
</table>
ParameterValue - valueFor(String tableName, String fieldName)

Specifies that the value of the element maps to the specified field in the specified table.

Calling this method on an element value tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then checks if the field must be encrypted.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table name.</td>
</tr>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The field name.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

XML APIs

XML APIs can be used after calling getAsXmlContent() on either the request object or a ParameterValue property.

When using XML APIs to write your encryption rule, you can follow a general format:

1. Call getAsXmlContent() on the request object or ParameterValue property. This returns an iterable object of the XMLContent underlying class.
2. Call getIterator() or getIterator(String xPath) on the XMLContent object. This returns an XMLElementIterator object that can be used to iterate over XML elements.
3. Call the hasNext() method on the XMLElementIterator object to determine whether another element is available.
4. Call next() on the XMLElementIterator object to return the next XML element. You cannot call next() without first calling hasNext().
5. Call valueFor(String tableName, String fieldName) on the XML element. This method tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then checks if the field must be encrypted.

**Note:** To determine if you want to call valueFor(String tableName, String fieldName) on an XML element, you can use the getName() method to return the name of the element.
Mapping to a known table-field on the instance

In this example, the XML payload will be processed on the instance to insert records in the incident table. The description field will populate short_description on the incident.

```xml
<data>
  <record>
    <name>'Test Record 1'</name>
    <description>'Test Record 1 Description'</description>
    <tag>critical</tag>
  </record>
  <record>
    <name>'Test Record 2'</name>
    <description>'Test Record 2 Description'</description>
    <tag>security</tag>
  </record>
</data>
```

The following encryption rule action can apply:

```javascript
function sampleXmlAction1() {
  var xmlContent = request.getAsXmlContent();
  // This loop iterates over all description tags that match the given path
  var xmlElementIterator = xmlContent.getIterator('data/record/description');
  while (xmlElementIterator.hasNext()) {
    var xmlElement = xmlElementIterator.next();
    xmlElement.valueFor('incident', 'short_description');
  }
}
```

This action iterates through the `description` tags and asks the proxy server to encrypt the values and insert them into `incident.short_description` on the instance.

**Note:** This rule finds all `description` tags within all `record` tags in the XML payload. If there is only one occurrence of a tag to encrypt, the rule still uses the XPath and iterator structure. However, it iterates only once in the loop.

Mapping to an unknown table-field on the instance

In this example, the rule iterates over the `record` tags, but does not know what tags to expect within the `record` tag. The only known is that the tags within the `record` tags match the names of the columns specified in the table URL parameter.

The rule also specifies that, if the table is incident, then the data in the `description` tag should be encrypted and stored in the `short_description` field on the instance.

```javascript
function sampleXmlAction2() {
  var xmlContent = request.getAsXmlContent();
  var tableName = request.urlParam.table;
  // This first iterator will iterate over all record elements
  var xmlElementIterator = xmlContent.getIterator('data/record');
  while (xmlElementIterator.hasNext()) {
    var xmlElement = xmlElementIterator.next();
    encryptFieldsInRecord(xmlElement);
  }
}
```

```
function encryptFieldsInRecord(xmlElement) {
  // Encrypt fields in the record...
}
```
// Then, iterate over all tags representing fields in the table
var fieldIterator = xmlElement.getIteratorOverAllChildren();
while (fieldIterator.hasNext()) {
    var field = fieldIterator.next();
    var fieldName = childElement.getName();
    // if table is incident, then description is encrypted for the short_description field
    if (tableName == 'incident' && fieldName == 'description') {
        field.valueFor(tableName, 'short_description');
    } else {
        // if table is not incident, ask the proxy to check if the given field is encrypted for the given table
        field.valueFor(tableName, fieldName);
    }
}

In the encryptFieldsInRecord() function, the valueFor() method is called on a table and a field that are dynamically assigned based on the request. Even though the table and field names can change, the rule asks the proxy to check whether the field in the table must be encrypted based on the encryption configurations defined.

If the field is not configured for encryption, or if the tag does not match a field in the table, the proxy skips that tag. If the tag matches a field marked for encryption, then the Edge Encryption proxy server encrypts the value.

Using an encoded query

In this example, all tags have the filter attribute, which indicates whether the tag contains an encoded query.

```xml
<data>
    <record>
        <name filter="false">'Test Record 1'</name>
        <description filter="false">'Test Record 1 Description'</description>
        <query filter="true">category=1^name=edge</query>
    </record>
    <record>
        <name filter="false">'Test Record 2'</name>
        <description filter="false">'Test Record 2 Description'</description>
        <query filter="true">category=2^severity=3</query>
    </record>
</data>
```

The following encryption rule action can apply:

```javascript
function sampleXmlAction3() {
    var xmlContent = request.getAsXmlContent();
    var tableName = request.urlParam.table;
    // This first iterator will iterate over all record elements
    var xmlElementIterator = xmlContent.getIterator('data/record');
    while (xmlElementIterator.hasNext()) {
        encryptFieldsInRecord(xmlElementIterator.next());
    }
}

function encryptFieldsInRecord(xmlElement) {
    // this time we want to iterate over all tags representing fields in the table
    var fieldIterator = xmlElement.getIteratorOverAllChildren();
```
while (fieldIterator.hasNext()) {
    var field = fieldIterator.next();
    var fieldname = childElement.getName();
    // let's look at the filter attribute, if true, then encrypt as encoded query
    if (field.getAttributeValue('filter') == 'true') {
        field.encodedQueryFor(tableName);
    } else {
        // if it is false then check if the field should be encrypted
        field.valueFor(tableName, fieldName);
    }
}

If the filter attribute value is true, the rule asks the proxy server to encrypt the values in the encoded query. If false, the rule asks the proxy to check whether the field should be encrypted.

**XMLContent**

A global object that provides methods to iterate over the XML content.

You can access an XMLContent object by calling `getAsXmlContent()` on a request object.

You access XML data in a POST or URL parameter by calling `request.postParams.<parameter name>.getAsXmlContent()` or `request.urlParams.<parameter name>.getAsXmlContent()`.

**XMLContent - getIterator()**

Returns an XMLElementIterator object for the XML content.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>XMLElementIterator</td>
</tr>
</tbody>
</table>

**XMLContent - getIterator(String xPath)**

Returns an XMLElementIterator object for the XML content based on the specified parameter.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>xPath</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>XMLElementIterator</td>
</tr>
</tbody>
</table>
XMLElementIterator
Provides methods for iterating over XML elements.

You get an XMLElementIterator object by calling the getIterator() method of the XMLContent class.

XMLElementIterator - hasNext()
Determines if there is another element available.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if another element is available.</td>
</tr>
</tbody>
</table>

XMLElementIterator - next()
Returns the next element in the iterator.

You cannot call next() without first calling hasNext().

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElement</td>
<td>The next XML element.</td>
</tr>
</tbody>
</table>

XMLElement
Provides methods for iterating through XML elements and mapping values to fields in a table.

You get an XMLElement object by calling the next() method of an XMLElementIterator object.

XMLElement - getIterator(String xPath)
Returns an XMLElementIterator object for the XML element based on the specified parameter.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xPath</td>
<td>String</td>
<td>An xPath-like expression that specifies where in the XMLElement object to start.</td>
</tr>
</tbody>
</table>
XMLElement - getIteratorOverAllChildren()

Returns an `XMLElementIterator` object that includes all sub-elements for the XML element based on the specified parameter.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>null</td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>XMLElementIterator</code></td>
<td>An object that can be used to iterate over elements in the <code>XMLElement</code> object.</td>
</tr>
</tbody>
</table>

XMLElement - valueFor(String tableName, String fieldName)

Specifies that the value of the element maps to the specified field in the specified table. Calling this method on an element value tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then checks if the field must be encrypted. If the table and field names are unknown, you can call the `valueFor()` method on a table and a field that are *dynamically assigned* based on the request.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table name.</td>
</tr>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The field name.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

XMLElement - encodedQueryFor(String tableName)

Specifies that the value of the element is an encoded query for the specified table. Calling this function on an element tells the proxy that the value of the element is an encoded query for the specified table. The proxy parses the encoded query and encrypts the fields in the encoded query that must be encrypted.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table that you expect the query to run on.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

XMLElement - getName()

Returns the element name.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The element name.</td>
</tr>
</tbody>
</table>

XMLElement - getAttributeValue(String attribute)

Returns the value of the specified attribute.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute</td>
<td>String</td>
<td>Attribute name.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The attribute value.</td>
</tr>
</tbody>
</table>

JSON APIs

JSON APIs can be used after calling `getAsJsonContent()` on either the request object or a ParameterValue property.

When using JSON APIs to write your encryption rule, you can follow a general format:

1. Call `getAsJsonContent()` on the request object. This returns an iterable object of the JsonNode underlying class.
2. Call `getIterator()` or `getIterator(String xPath)` on the JsonNode object. This returns a JsonNodeIterator object that can be used to iterate over nodes in the JSON object.
3. Call the `hasNext()` method on the JsonNodeIterator object to determine whether another element is available.
4. Call `next()` on the `JsonNodeIterator` object to return the next JSON element. You cannot call `next()` without first calling `hasNext()`.

5. Call `valueFor(String tableName, String fieldName)` on the JSON element. This method tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then checks whether the field must be encrypted.

**Note:** To determine if you want to call `valueFor(String tableName, String fieldName)` on a JSON element, you can use the `getName()` method to return the name of the element.

**Mapping to a known table-field on the instance**

In this example, the JSON payload is processed on the instance to insert records in the incident table. The description field populates `short_description` on the incident.

```json
{
  data: {
    records: [
      {
        "name": "Test Record 1",
        "description": "Test Record 1 Description",
        "tag": "security"
      },
      {
        "name": "Test Record 1",
        "description": "Test Record 1 Description",
        "tag": "security"
      }
    ],
    query: "assigned_to=3D4860165813e63a00d00abd322244b092^category=vulnerability"
  },
  "source": "10.11.13.14"
}
```

The following rule can apply:

```javascript
function sampleJsonAction1() {
  var jsonContent = request.getAsJsonContent();
  // This loop iterates over all description elements in the records array
  var jsonNodeIterator = jsonContent.getIterator('/data/records/description');
  while (jsonNodeIterator.hasNext()) {
    var jsonNode = jsonNodeIterator.next();
    jsonNode.valueFor('incident', 'short_description');
  }
}
```

This action iterates through the `description` nodes and asks the proxy server to encrypt the values and insert them into `incident.short_description` on the instance.

**Note:** This rule finds all `description` nodes within the JSON payload. If there is only one occurrence of a node to encrypt, the rule still uses the XPath and iterator structure. However, it iterates only once in the loop.
Mapping to an unknown table-field on the instance

In this example, the rule iterates over records, but is not sure what nodes to expect. The only known is that for each object within records, the nodes match the names of the columns specified in the table URL parameter.

The rule also specifies that, if the table is incident, then the data in the description node should be encrypted and stored in the short_description field on the instance.

```javascript
function sampleJsonAction2() {
    var jsonContent = request.getAsJsonContent();
    var tableName = request.urlParam.table;
    // This first iterator will iterate over all record elements
    var jsonNodeIterator = jsonContent.getIterator('data/records');
    while (jsonNodeIterator.hasNext()) {
        encryptFieldsInRecord(jsonNodeIterator.next());
    }
}

function encryptFieldsInRecord(jsonNode) {
    //this time we want to iterate over all nodes
    var fieldIterator = jsonNode.iterator();
    while (fieldIterator.hasNext()) {
        var field = fieldIterator.next();
        var fieldname = childElement.getName();
        if (fieldName == 'description') {
            field.valueFor(tableName, 'short_description');
        } else {
            field.valueFor(tableName, fieldName);
        }
    }
}
```

In the encryptFieldsInRecord() function, the valueFor() method is called on a table and a field that are dynamically assigned based on the request. Even though the table and field names can change, the rule asks the proxy to check whether the field in the table must be encrypted based on the encryption configurations defined.

If the field is not configured for encryption, or if the node name does not match a field in the table, the proxy skips that node. If the node name matches a field marked for encryption, then the proxy encrypts the value.

Using an encoded query

```javascript
function sampleJsonAction3() {
    var jsonContent = request.getAsJsonContent();
    var tableName = request.urlParam.table;
    // This first iterator will iterate over all record elements
    var jsonNodeIterator = jsonContent.getIterator('data/records');
    while (jsonNodeIterator.hasNext()) {
        var jsonNode = jsonNodeIterator.next();
        if (jsonNode.getName() == 'records') {
            encryptRecords(jsonNodeIterator.next());
        } else if (jsonNode.getName() == 'query') {
            jsonNode.encodedQueryFor(tableName);
        }
    }
}

function encryptRecords(jsonNode) {
    //we iterate over all fields in the node
    var recordIterator = jsonNode.iterator();
```
In this example, the rule iterates over data. As it finds records, it performs the same logic as in the second example, iterating over fields in each node. When it finds the query node, it calls encodedQueryFor() to encrypt values that should be encrypted in the query.

JsonNode
A global object that provides methods to iterate over the JSON content.

You can access a JsonNode object by calling getAsJsonContent() on a request object. You access JSON content from a POST or URL parameter by calling request.postParms.<parameter name>.getAsJsonContent() or request.urlParms.<parameter name>.getAsJsonContent().

JsonNode - getIterator(String xPath)
Returns a JsonNodeIterator object for the JSON content.
This method can only be used on the root node, but can be used to traverse deep into the JSON object. Subsequent traversals must use the iterator() method.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xPath</td>
<td>String</td>
<td>An xPath expression.</td>
</tr>
</tbody>
</table>

JsonNode - iterator()
Returns a JsonNodeIterator object that iterates over all child nodes of the current node.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
JsonNode - getAsListAdapter()

Returns the current node value as an object.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td></td>
</tr>
</tbody>
</table>

JsonNode - getAsListAdapter(String propertyName)

Returns the object value of the specified property.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>propertyName</td>
<td>String</td>
<td>Name of the property.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td></td>
</tr>
</tbody>
</table>

JsonNode - getAsDateString()

Returns the current node value as a string.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td></td>
</tr>
</tbody>
</table>

JsonNode - getAsString()

Returns the string value of the specified property.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>propertyName</td>
<td>String</td>
<td>Name of the property.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td></td>
</tr>
</tbody>
</table>

JsonNode - getName()

Returns the name of the current JSON node.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td></td>
</tr>
</tbody>
</table>

JsonNode - valueFor(String tableName, String fieldName)

Specifies that the JSON property maps to the specified field in the specified table.
Calling this method on a JSON property tells the proxy that the value for this property maps to the specified field in the specified table. The proxy then decides if the field must be encrypted. If the table and field names are unknown, you can call the `valueFor()` method on a table and a field that are *dynamically assigned* based on the request.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table name.</td>
</tr>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The field name.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

#### JsonNode - encodedQueryFor(String tableName)

Specifies that the value of the JSON property is an encoded query for the specified table.

Calling this function on a JSON node tells the proxy that the value is an *encoded query* for the specified table. The proxy parses the encoded query and encrypts the values for fields in the encoded query that must be encrypted.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table that you expect the query to run on.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

#### JsonNodeIterator

You get a `JsonNodeIterator` object by calling the `getIterator()` or `iterator()` methods of the `JsonNode` class.

#### JsonNodeIterator - hasNext()

Determines if there is another property available.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if another property is available.</td>
</tr>
</tbody>
</table>
JsonNodeIterator - next()
Returns the next property in the iterator.

You cannot call next() without first calling hasNext().

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNode</td>
<td>The next JsonNode.</td>
</tr>
</tbody>
</table>

print(String message)
Prints a message to the wrapper log file: `<proxy server directory>/logs/wrapper_<date>.log`.

This method is available only in an Edge Encryption rule action script.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>The message to be written to the wrapper log file.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

Prohibited keywords
The Edge Encryption proxy validates encryption rule scripts before saving the rule. Many JavaScript keywords are not allowed in encryption rule scripts.

<table>
<thead>
<tr>
<th>Prohibited keywords</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DIR</strong></td>
</tr>
<tr>
<td><strong>FILE</strong></td>
</tr>
<tr>
<td><strong>LINE</strong></td>
</tr>
<tr>
<td><strong>parent</strong></td>
</tr>
<tr>
<td><strong>proto</strong></td>
</tr>
<tr>
<td>Error</td>
</tr>
<tr>
<td>eval</td>
</tr>
<tr>
<td>getClass</td>
</tr>
<tr>
<td>getPrototypeOf</td>
</tr>
</tbody>
</table>
Edge Encryption dictionary attributes

You can add Edge Encryption dictionary attributes to tables and fields. To set an Edge Encryption dictionary attribute to true, you must enter attribute=true in the Attributes field. To add a dictionary attribute to a record, see Dictionary attributes.

**Edge Encryption Excluded (edge_encryption_excluded)**

When set to true, the field or table cannot be encrypted.

- **Value:** true/false
- **Target element:** field or table
- **Default value:** false

**Edge Encryption Enabled (edge_encryption_enabled)**

When set to true, the field is eligible for encryption through an encryption configuration. Because this attribute is used by the system and cannot be modified, it is not always displayed to the user.

**Note:** This attribute does not indicate that a field is encrypted, nor does it trigger any encryption logic on the field. Rather, the attribute determines the possibility of the field being encrypted by a user.

- **Value:** true/false
- **Target element:** field
- **Default value:** true for String fields

**Edge Encryption Clear Text Allowed (edge_encryption_clear_text_allowed)**

When set to true, allows server-side scripts to append non-encrypted data to an encrypted string within the field for user actions performed through the proxy server, or any server-side automated scripts, such as scheduled jobs.
Data integration with Edge Encryption

To integrate third-party data with an instance using Edge Encryption, you must route the data through the Edge Encryption proxy server using supported integrations. Supported integrations use base system encryption rules that map data in each payload to fields in a table.

Upload data to fields marked for encryption

Edge Encryption does not support importing data from or exporting data to Excel, CSV, XML, or other file types to or from fields with encryption configurations defined.

ODBC driver

Encrypt requests and query data through the Edge Encryption proxy server using the ODBC driver.

Learn more: Edge Encryption ODBC driver integration

MID Server

You can configure the MID Server to route data through an Edge Encryption proxy server. However, some restrictions apply.

Learn more: Edge Encryption MID Server integration

REST/SOAP web services

Use REST/SOAP web services to update or retrieve record data through the Edge Encryption proxy server.

Learn more: Web services

JSONv2 web service

Use JSONv2 web service APIs to update or retrieve record data through the Edge Encryption proxy server. Base system encryption rules support data retrieval and data modification APIs.

- To insert a single record using the data modification API, use the `insert()` or `insertMultiple()` methods.
- To insert multiple records using the data modification API, use the `insertMultiple()` method.

Learn more: JSONv2 Web Service

To encrypt data from custom third-party integrations not listed above, create custom encryption rules. See Define a custom encryption rule.

Upload attachments to records marked for encryption

Attachments can be uploaded to tables with attachment encryption configured using REST and SOAP web services.
**Edge Encryption ODBC driver integration**

Configure your ODBC driver to query data encrypted by Edge Encryption. The Edge Encryption proxy server encrypts ODBC driver requests to the ServiceNow instance when Edge Encryption is integrated with the ODBC driver.

Encrypted responses from the instance are decrypted through the Edge Encryption proxy server before passing to the ODBC driver in your network.
For a successful integration, the ODBC driver must trust the Edge Encryption proxy server certificate. If the Edge Encryption proxy server certificate is signed by a Certificate Authority trusted by the ODBC driver, the Edge Encryption proxy server is automatically trusted. However, if a Certificate Authority trusted by the ODBC driver has not signed the Edge Encryption proxy server certificate, you must import the self-signed certificate to the ODBC truststore.

**Import a self-signed certificate to the ODBC truststore**

If a Certificate Authority trusted by the ODBC driver has not signed the Edge Encryption proxy server certificate, you must import a self-signed certificate to the ODBC truststore. You can export the certificate from the Edge Encryption proxy server and import it into the ODBC truststore.

To determine whether a Certificate Authority trusted by the ODBC driver has signed the Edge Encryption proxy server certificate, run the following command in the keystore directory in the proxy home directory to view a list of Certificate Authorities trusted by the ODBC driver:

```bash
keytool -keystore "<ODBC directory>\ip\Java\jre\lib\security\cacerts" -list
```

1. Change to the keystore directory in the proxy home directory.
2. Check the keystore for the self-signed certificate.
   a) To check the keystore for the certificate, you can run the following command to list all the items in the keystore.
   ```bash
   keytool -list -keystore keystore.jceks -storetype jceks -v
   ```
   b) Locate the key alias in the list of items.
3. Using the key alias, export the certificate to a .cer file.
   ```bash
   keytool -export -alias <key alias> -keystore keystore.jceks -storetype jceks -rfc -file <file name>.cer
   ```
4. Change to your ODBC truststore directory: ODBC\ip\Java\jre\lib\security\cacerts.
5. Import the certificate to your ODBC truststore.
   ```bash
   keytool -keystore cacerts -importcert -alias $<key alias> -file <file name>.cer
   ```

**Set the ODBC driver properties**

Set the ODBC driver properties to route requests through the Edge Encryption proxy server.

1. In Windows, navigate to **Start > Programs > ServiceNow ODBC Management Console**.
2. Expand the console tree root to: ServiceNow ODBC Manager\Manager\<installation location>\Services\ServiceNow_ODBC\Data Source Settings\ServiceNow\IP Parameters.
3. Double-click the **DataSourceIPProperties** attribute.
4. Change the **Value** to the URL of your Edge Encryption proxy server, such as **https://<IP address>:<port>**
5. Click OK.

The ODBC driver is now configured to route requests to the instance through the Edge Encryption proxy server.

**Edge Encryption MID Server integration**

Configure the MID Server to route data through an Edge Encryption proxy server.

When integrated with the MID Server, the Edge Encryption proxy server acts as the MID Server’s endpoint. The Edge Encryption proxy server then encrypts and decrypts data passing between the ServiceNow instance and the MID Server.

**Limitations when integrating with the MID Server**

When MID Server data is configured to pass through the Edge Encryption proxy server, the following limitations apply:

- Encryption of ECC Queue fields is not supported.
- Encrypted data cannot be used with Discovery or Service Mapping.

**Point the MID Server to the Edge Encryption proxy server**

To pass data from the MID Server through the Edge Encryption proxy server, update the MID Server configuration file to point the MID Server to the Edge Encryption proxy server.

When configuring the MID Server to pass through the Edge Encryption proxy server, you cannot use the web proxy properties in the MID Server configuration file to route traffic through the Edge Encryption proxy server to your instance. Instead, you must set the Edge Encryption proxy server as the MID Server’s endpoint.

1. Navigate to your local MID Server directory and open the `config.xml` file.
2. Find the element `<parameter name="url" value="https://YOUR_INSTANCE.service-now.com" />` and change the value property to the URL of your Edge Encryption proxy server. For example, `http://hostname.mycompany.com:8081`.
   This step directs the MID Server to pass traffic to the Edge Encryption proxy server instead of the instance. The Edge Encryption proxy server in turn encrypts any necessary fields and passes the payload to the instance.
3. Save and close the file.
4. If running, restart the MID Server.

**Edge Encryption diagnostics and performance**

Monitor Edge Encryption proxy server performance trends and drill into errors generated by the Edge Encryption proxy server.

**Edge proxy performance**

View key Edge Encryption proxy server performance trends using the Edge Proxy graph set on the ServiceNow Performance homepage. Monitored trends include:

- Maximum and average response times between the client, proxy server, and instance.
- CPU, disk space, and memory usage of the host machine.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
• Maximum and average network latency between the proxy server and the ServiceNow instance.

**Note:** Edge Encryption proxy servers with duplicate names do not report performance trends.
Maximum and average time in milliseconds to process a request. These data points are general trends over time.

- **Total Time**: Time for the proxy server to receive a request from a client and send a response. This data point is the sum of the subsequent data points.
- **Proxy Response**: Time for the proxy server to process a response from the instance.
- **Proxy-Instance Round Trip**: Time for the proxy server to send a request to the instance and receive a response. Includes network latency between the proxy server and the instance and time spent by the instance to process the request.
- **Rules**: Time for the proxy server to evaluate a request using defined encryption rules.
- **Proxy Request**: Time for the proxy server to process a client request and forward it to the instance.

**Edge Proxy Performance (Max and Average)**

Maximum and average percentage of resources used on the host machine.

- CPU Usage
- Memory Usage
- Disk Usage

**Edge Proxy Latency**

Maximum and average network latency in milliseconds at a given point in time. Latency is determined by round-trip time for a proxy server to send a simple ping to the instance and receive a response.

**Proxy Error Reports**

Navigate to [Edge Encryption Configuration > Diagnostics and Troubleshooting > Proxy Error Reports](#) to view all proxy server errors collected over the past seven days.
Errors are collected over a one-minute period. Each minute, an error report is generated. The vertical axis displays the number of error reports over the last seven days that include each error. For example, even if the DEFAULT_ERROR_CODE error is thrown multiple times over a one-minute report period, the DEFAULT_ERROR_CODE bar will only reach one on the **Number of Error Reports** axis.

From this view, you can:

- Click each proxy error code bar to see the report on a single error for each proxy server. From this view, you can click the bar again to view the error text in the Edge Encryption Proxy Stat table (edge_encryption_stat). Follow links in the error text to see more information and possible remediation steps.
- Click **Other** to see page two of the error report.

**Note:** If you have more than one proxy server with the same name, a single DUPLICATE_PROXY_NAME error appears in the Proxy Error Report. No other errors are reported for proxy servers with duplicate names. If you encounter this error, make sure that all proxy servers have unique names.

**Additional monitoring resources**

The instance tracks all encryption proxies. Each Edge Encryption proxy server registers when it starts up. The instance is notified when:

- A new Edge Encryption proxy server starts up.
- An Edge Encryption proxy server is intentionally shut down.
If an Edge Encryption proxy server attempts to register with an instance that does not have Edge Encryption installed, the proxy does not start.

All encryption configuration files are audited. Deleted records are audited on all encryption configuration files. Audit records are put in the sys_audit table. To view the history of a specific configuration record, view the record, and click History > List in the menu. The Mass Encryption Job is not audited.

Use the following additional resources to monitor your proxy servers.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
</table>
| Invalid Insert Attempts (sys_edge_encryption_invalid_insert) | List of attempts to save the following data to encrypted fields:  
  · Unencrypted data.  
  · Data that did not come from an Edge Encryption proxy.  
  The instance rejects and logs any attempts to save this data. If you have the security-admin role, you can view the logs in the Invalid Insert Attempts list. |
| Job Failures (sys_encryption_job_execution) | A list of jobs that did not execute successfully. |
| System logs | The instance periodically checks for messages from each registered proxy server. If a proxy server has not sent a message in the required time frame, an error is logged. The log message contains information about the encryption proxy and the last time the proxy pinged the instance. If the instance determines that none of the encryption proxies are online, it logs a message. These messages are added to the system log. |

**Disable or reduce Edge Proxy statistic collection**

Prevent the Edge Encryption proxy server from sending Edge Proxy Graph Set statistics to the ServiceNow Performance homepage, or reduce the frequency of statistic collection.

Role required: admin or security_admin

By adding properties in the edgeencryption.properties configuration file, you can:

- Disable the Edge Proxy graph set.
- Change the interval during which statistics are collected by the Edge Encryption proxy server. By default, statistics are collected every 30 seconds.

1. In your proxy server installation directory, open the edgeencryption.properties configuration file located in the <installation directory>/conf/ folder.
2. Add one of the following properties.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.stat.collection.enabled</td>
<td>Enables the collection of statistics used by the Edge Encryption proxy server performance dashboard.</td>
</tr>
<tr>
<td></td>
<td>- Default value: true</td>
</tr>
<tr>
<td></td>
<td>Add this property and set the value to false to disable the collection of statistics used by the Edge Encryption proxy server performance dashboard. After adding proxy server performance properties, you must restart the proxy server for the change to take effect.</td>
</tr>
<tr>
<td>edgeencryption.stat.collection.interval</td>
<td>Interval length in seconds during which the Edge Encryption proxy server collects statistics. The value cannot be less than 30 seconds.</td>
</tr>
<tr>
<td></td>
<td>- Default value: 30</td>
</tr>
<tr>
<td></td>
<td>After adding proxy server performance properties, you must restart the proxy server for the change to take effect.</td>
</tr>
</tbody>
</table>

3. Restart the proxy server.

**Flow Designer**

Flow Designer is a Now Platform feature that enables rich process automation capabilities in a consolidated design environment. It enables process owners to use natural language to automate approvals, tasks, notifications, and record operations without having to code.

You can expand the Flow Designer solution to integrate with external instances and third-party applications with a separate subscription to *IntegrationHub*.

**Benefits**

Flow Designer provides process owners and developers these benefits.

- Consolidates multiple Now Platform automation capabilities into a single environment so process owners and developers can build and visualize business processes from a single interface.
- Consolidates configuration and runtime information into a single environment so process owners and developers can create, operate, and troubleshoot flows from a single interface.
- Provides natural-language-descriptions of flow logic to help non-technical users understand triggers, actions, inputs, and outputs.
- Promotes process automation by enabling subject matter experts to develop and share reusable actions with flow designers.
- Reduces upgrade costs, with upgrade-safe Now Platform® logic replacing complex custom script.
- Reduces development costs by providing a library of reusable actions.
- Allows extending Flow Designer content by subscribing to IntegrationHub or installing spokes.
Interactions with existing automation processes

While learning Flow Designer, make sure that you understand how existing Now Platform automation processes such as business rules and workflows change records to avoid creating conflicting logic. See the Architecture Overview to understand how Flow Designer works within the Now Platform. Avoid duplicating existing business logic from business rules and workflows. If you are replacing an existing automation process, you may need to deactivate it before replacing it with Flow Designer flows and actions.

Flow Designer content

Flow Designer consists of the following content types.

Flows

A flow is an automated process consisting of a sequence of actions and a trigger. Flows automate business logic for a particular application or process. For example, the VTB Sample Flow creates and assigns a VTB card whenever a priority 1 incident is created. Flows require some familiarity with the Now Platform tables and fields the application or process uses. Process analysts can create flows using available actions or copy an existing flow to use it as a template. You can add application-specific flows by activating the associated spoke.

Actions

An action is a reusable operation that enables process analysts to automate Now Platform features without having to write code. For example, the Create Record action allows process analysts to generate records in a particular table with particular values when certain conditions occur. Core actions like Create Record require some familiarity with Now Platform tables and fields. Action designers can create application-specific actions to pre-set configuration details. For example, creating a Create Incident Task action ensures that the process analyst uses the correct table and field configuration each time the action is used. You can add application-specific actions by activating the associated spoke.

Core actions

A core action is a ServiceNow-provided action available to any flow that cannot be viewed or edited from the Action Designer design environment. For example, the Ask for Approval action is a core action that allows process analysts to use Now Platform approvals. Flow Designer provides a set of core actions to automate Now Platform processes. You can add application-specific core actions by activating the associated spoke.

Action steps

An action step or step is a single reusable operation within an action. For example, the Create Record step allows action designers to specify the table and field values to use during record creation. Action steps require subject matter expertise with application tables, fields, and business logic. Application developers or IT generalists add action steps to actions from the Action Designer design environment. Flow Designer provides a set of core action steps to automate Now Platform processes. You can add application-specific action steps by activating the associated spoke.

Spokes

A spoke is a scoped application containing Flow Designer content dedicated to a particular application or record type. For example, the ITSM Spoke contains actions for managing Task records such as the Create Task action. Spokes are activated when their parent application is activated. For example, the ITSM Spoke is activated when the Incident, Problem, and Change applications are activated. Creating a spoke requires familiarity with application development
as developers must add Flow Designer content to a scoped application. See [Spokes](#) for a list of available spokes.

**Consolidated design and operation environment**

The design environment consists of these components.

**Landing page**

Access or create flows, actions, or flow executions.

**Flow Designer**

Create and edit flows by defining a trigger and adding actions. Test flows to see if they complete successfully and to review the runtime values they generate. Activate flows to make them available for execution on your instance and to preserve their current actions, inputs, and sequence as a snapshot separate from further configuration changes.

**Action Designer**

Create and edit actions by defining inputs and adding action steps. Copy actions to use existing actions as templates. Publish actions to activate them, which makes them available to activated flows and to preserve their current action steps, variables, and sequence as a snapshot separate from further configuration changes.

**Flow execution details**

View runtime information about a flow directly from the design environment such as the current state, actions run, and values produced. Open related records from embedded Now Platform editors or in a new tab.

**Operations dashboard**

Identify and troubleshoot potential issues by reviewing flow executions, the event queue, and the operations dashboard.

**User access and security considerations**

Administrators can grant users access to Flow Designer by assigning delegated development permissions or directly assigning a user role.

**Granting access by assigning delegated development permissions**

Administrators can grant users access to Flow Designer by creating an application and assigning users as developers with the Flow Designer [delegated development](#) permission. Delegated development allows administrators to control whether flow designers can access features normally restricted to admin users such as assigning user roles, creating access controls, or creating scripts. See [Developer permissions](#).

**Granting access by assigning user roles**

Administrators can also grant access to Flow Designer by directly assigning users the flow_designer [user role](#), which includes the role to view flow execution details.

**Warning:** Directly granting a user the flow_designer role is equivalent to giving the user the admin role, because Flow Designer runs as the System user, which has access to all tables and all database operations.
Architecture Overview

Understand how Flow Designer works within the Now Platform to activate, trigger, and process flows and actions.

A flow consists of a trigger and one or more actions. The trigger specifies when to start the flow, which can either be record-based or schedule-based. Record-based triggers run a flow after a record has been created, updated, or deleted. The flow can use the triggering record as input for actions. Schedule-based triggers run a flow at the specified date and time. The flow can use the execution time as input for actions.

Flow processing

Flow processing occurs in this sequence.

1. When the flow trigger conditions occur, the system creates an entry in the event queue to start the flow.
2. The scheduler processes the event and starts the flow in the background.
3. The system builds a process plan from the flow.
4. The system runs the process plan using the record that triggered the flow.
5. The system stores the execution details in a context record.

1. Process Flow Triggers
2. Process Events in the Queue
3. Build Process Plan
4. Run Process Plan

1. Process flow triggers

Each time trigger conditions are met, Flow Designer creates an event entry. The system processes triggers after database operations. To learn more, see Execution order of scripts and engines. Typically, business rules and workflows that run synchronously run before a triggered flow.

2. Process events in the queue

Each flow event contains a reference to the flow to start and a reference to either the triggering record or the execution time. The system processes these events using Standard event.
**processing** where a scheduler periodically works through the current items in the event queue in the order in which they were added. Depending on what other events are in the queue, the system may not immediately start a flow. Flow designers should expect some lag time between when the trigger conditions occur and when the flow actually starts.

3. **Build the process plan**

When Flow Designer pulls an event from the queue, it builds a *process plan* to actually run the flow. A process plan contains all the information necessary to execute a flow such as the sequence of published actions, the input values for each action, the action steps to run for each action, and the data provided by the trigger.

Flow Designer uses a just-in-time compilation scheme to ensure that process plans contain the latest changes to flows and actions. If no changes are detected, Flow Designer uses a cached copy of the process plan. Otherwise, it builds a new process plan.

By automatically checking for updated flows and actions with process plans, Flow Designer enables you to apply changes from update sets and upgrades without having to edit current flows. If you move published actions to a target instance, every flow that uses the published action will automatically update the next time it is executed.

**Warning:** If changing actions used in activated flows, do not change the inputs and outputs used in the action. Changing inputs and outputs may cause errors when the activated flow is next triggered because it has not been configured to use the new inputs and outputs. Any currently running flows are unaffected by changes to inputs or outputs as the flow uses the compiled actions from the process plan.

4. **Run the process plan**

Flow Designer runs the process plan as the *System* user within the flow application scope.

When running a flow with a record-based trigger, Flow Designer stores the triggering record in memory as an *instance* that is represented in the interface as a *data pill*.

The instance contains the record values from when the flow started, which may be different than the current record stored in the database. For example, suppose that creating an incident record triggers a flow. Any changes a user makes to the incident record after the flow has started do not update the triggering record unless an action specifically looks up the current record value.

5. **Store flow execution details**

Flow Designer stores flow execution details in a *flow context record*, which contains this information.

- Flow outcome state
- Flow runtime duration
- Flow log messages
- Flow configuration and runtime values

Each time a flow runs, Flow Designer adds an entry to the *Flow Executions* list. Each entry has its own context record and matching execution details page.

A flow can have one of these outcome states.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete</td>
<td>The flow completed successfully.</td>
</tr>
<tr>
<td>In Progress</td>
<td>The flow is running. By default, a transaction quota rule prevents flows from running longer than an hour.</td>
</tr>
</tbody>
</table>
### State and Description

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Waiting</td>
<td>The flow is waiting for another event to occur. For example, a user must update a task or approval, or a record must reach a specific state. When in the waiting state, the flow is quiesced and serialized into a context record.</td>
</tr>
<tr>
<td>Canceled</td>
<td>The flow was canceled by a user.</td>
</tr>
<tr>
<td>Error</td>
<td>The flow encountered an error and has stopped running. For example, an action is missing an input value, or a quota transaction rule has stopped the flow.</td>
</tr>
</tbody>
</table>

### Flow and action life cycle

Flow Designer uses the flow or action status to describe the current state of configuration changes.

#### Flow status and activation state

The **Status** field indicates whether there is a process plan associated with the flow.

<table>
<thead>
<tr>
<th>Flow status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>Indicates that there are unsaved changes to a flow. Modified flows have not been saved.</td>
</tr>
<tr>
<td>Draft</td>
<td>Indicates that there are saved changes to a flow, which have not been stored in a process plan. Draft flows have been saved but not activated.</td>
</tr>
<tr>
<td>Published</td>
<td>Indicates that there is a stored process plan for the flow. Published flows have either been activated or deactivated.</td>
</tr>
</tbody>
</table>

The **Active** field indicates whether the system runs a flow.

<table>
<thead>
<tr>
<th>Active</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>True</td>
<td>Indicates that the flow is active and runs when triggered or called. The flow has been activated. Active flows run when the trigger conditions are met.</td>
</tr>
<tr>
<td>False</td>
<td>Indicates that the flow is inactive and will not run when triggered or called. An inactive flow has either never been activated or has been deactivated.</td>
</tr>
</tbody>
</table>

When working with flows, you can:

- **Save** a flow: Creates a draft of the flow.
- **Activate** a flow: Enables the flow trigger and transforms the flow into a process plan.
- **Deactivate** a flow: Disables the flow trigger and prevents new flow executions. Currently running flows continue to run.
Action status

The Action Designer interface does not display the configuration status of actions. To view action status, navigate to the Action Types table (sys_hub_action_type_definition) and display the Draft state field.

<table>
<thead>
<tr>
<th>Action Draft status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Draft</td>
<td>Indicates that there are changes to an action that have not been published. Draft actions are only available to flows when the Show draft actions option is enabled. You cannot activate a flow containing draft actions.</td>
</tr>
<tr>
<td>Published</td>
<td>Indicates that the action has been published. Published actions are available to all flows and allow flows to be activated.</td>
</tr>
</tbody>
</table>

When working with actions, you can:

- **Save** an action: Creates a draft of the action that is only available to flows when Show draft actions is enabled. If the action is modified after being published, the action moves into a draft state. Any active flows that use the action only run the published action.
- **Publish** an action: Enables you to activate a flow containing the action. Publishing adds the action to the list of available actions in a flow. Only actions in a published state run during flow execution.

Application development

When designing an action or a flow, use these design considerations as a guide.

Use standard Now Platform application development capabilities to create, manage, protect, and deploy Flow Designer content. Flow and action designers typically perform these application development tasks.

- Create a custom application to store flows and actions.
- Set application permissions to share or restrict access to application data.
- Grant application developers access to Flow Designer.
- Publish custom applications to the application repository to deploy flows and actions on other instances.

**Security**

Control access to Flow Designer processes and records.

- Administrators can grant users access to Flow Designer by creating an application and assigning users as developers with the Flow Designer delegated development permission. Delegated development allows administrators to control whether flow designers can access features normally restricted to admin users such as assigning user roles, creating access controls, or creating scripts. See Developer permissions.

- Administrators can also grant access to Flow Designer by directly assigning users the flow_designer user role, which includes the role to view flow execution details.

  **Warning:** Directly granting a user the flow_designer role is equivalent to giving the user the admin role, because Flow Designer runs as the System user, which has access to all tables and all database operations.

- Flow and action designers can use standard Application access settings to manage how their content interacts with other applications.

**Action limit**

By default, flows can have no more than 20 actions. To change the default behavior, increase the value of the sn_flow_designer.max_actions system property. However, consider the performance impact that a large flow may have on your instance.

**Trigger options for record updates**

Flow designers can specify how often a flow can update a particular record with the Run Trigger option. Use the Once option when you want a flow to run only once. The first time a record is updated, the flow runs, but any further record updates do not trigger the flow. Use the Always option when you want the flow to run every time a record is updated and there is not already an active flow running for it. For example, you might set a flow that assigns an incident record to run only once, and set a flow that notifies the incident watch list to always run. The Run Trigger field is only available for these trigger types.

- Created or Updated
- Updated

**Data pill population**

Each time you add an action to a flow, Flow Designer adds a data pill to store its results. The data pill name indicates its sequence in the flow and its data type. Flow designers use action result data pills to provide input for other actions. Flow designers can use the sequence value in the data pill name to ensure they select the correct data pill as an input value. When a flow runs an action, it generates the data pill runtime value, which remains the same for the duration of the flow. For example, a data pill for (Trigger->Incident record) always contains the incident record values from when the flow started.
Flow Designer populates data pill values as soon as the data becomes available regardless of where the data pill is located in the flow sequence. For example, suppose that you have a flow triggered by the creation of an incident record with the following actions.

1. **Update (Incident) Record** that adds a text string to **(Trigger->Incident Record->Short description)**.
2. **Log** the value of **(Trigger->Incident Record->Short description)**.
3. **Log** the value of **(1->Incident Record->Short description)**.

Action-1 and Action-2 both use the data pill **(Trigger->Incident Record->Short description)**. Since the trigger record is available as soon as the flow starts, these values are set before running these actions.

### Flow and action testing

Testing a flow bypasses the trigger conditions and immediately runs it. Testing a flow with a record-based trigger requires selecting a specific record to act as the trigger. Flow designers should generate appropriate sample records prior to testing.

During the design phase, you can test an inactive flow and unpublished actions by setting **Show draft actions** on the flow. If testing with draft actions, use these guidelines.

- Design flows and actions on a non-production instance. Only deploy active, working flows to your production instance.
- Leave **Show draft actions** set to true until your draft is in a final state. Once final, publish each action, set **Show draft actions** to false, and activate the flow.

**Warning:** Disabling **Show draft actions** before publishing your actions removes all draft actions from your flow.

- Any change you make to an active flow or published action causes it to return to a draft state. If the flow is triggered, the system only runs the activated flow and published actions, and the flow execution details only display what was run. When there is a draft of an active flow, the trigger and actions listed in the flow execution details may be different than those listed in the draft flow.

### Domain separation in Flow Designer

Flow Designer is not domain separated and does not support manually adding a domain field. Domain separation allows you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

#### Overview

Domain separation is not supported in this application. For more information, see [Application support for domain separation](#).

#### Getting started with flows

Create a sample flow with a trigger and base system actions that requires an approval.

Role required: admin
Note: While Flow Designer is designed to use the flow_designer and delegated_developer roles in most scenarios, this tutorial uses the admin role to illustrate functionality without requiring additional roles to set up records and approve requests.

The ITSM application is required to access the Task table.

A flow can include these components:

- **Trigger:** An activity that initiates the flow, such as a record created in a specified table or a scheduled job.
- **Conditions:** Statements that determine when or how an action runs. For example, run an action only if a field is over a certain value.
- **Actions:** Operations executed by the system, such as a field value updated, approval requested, or a value logged.

To understand basic flows, create an expense approval flow. This flow:

1. Runs when an Expenses record is created.
2. Uses the total amount to determine which action to run.
3. Approves the request if it is under the specified dollar amount.
4. Requires manager approval if it is over a specified dollar amount. Another approver can be manually added.

1. Create a custom application for the flow. Creating flows and actions within an application enables you to publish flows and actions to an application repository and deploy them on other instances. While this example does not use delegated development, you can optionally delegate action and flow designer development by assigning developers to the application.
   a) Navigate to System Applications > Studio.
   b) Create a custom application called Expenses Getting Started.

2. In Studio, create an Expenses table.
   a) Click Create Application File.
   b) Under Data Model, select Table and click Create.
      A Table form opens.
   c) Complete the form with the following values.
      - Label: Expenses
      - Extends table: Task
   d) Save the form.
   e) Add three additional columns to the table.

<table>
<thead>
<tr>
<th>Column label</th>
<th>Type</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amount</td>
<td>Floating point number</td>
<td>None</td>
</tr>
<tr>
<td>Destination</td>
<td>String</td>
<td>None</td>
</tr>
<tr>
<td>Requested for</td>
<td>Reference</td>
<td>User (sys_user)</td>
</tr>
</tbody>
</table>

3. Add four records to the Expenses table to use in Flow Designer tests. When you test your flow in later steps, you can specify which record is used as the trigger, enabling you to test specific record values.
a) On the Expenses table record, click the Show list related link.

b) Click New.

c) Configure the form to add the Amount, Destination, and Requested for fields, and the Approvers related list.

d) Complete the Destination and Requested for fields. In the Amount field, add a value under 100.00.

Make sure that the user in the Requested for field in the test record has a manager assigned in the system. If the user in the test record does not have a manager, configure the User form to add the Manager field, and assign a manager to the user.

e) Submit the form.

f) Add another record to the table with an amount under 100.00.

g) Add two more records to the table with a value over 100.00 in the Amount field.

4. In Studio, create a new flow.

a) Click Create Application File.

b) Under Flow Designer, select Flow and click Create.

c) Select the Flow option, click Next.

d) In the Flow Name field, enter Expense Approval.

e) Click Submit.

An Expense Approval flow is created in the Expenses Getting Started scope.

5. Create a trigger that runs the flow when a record is created in the Expenses table.

   • Trigger: Created
   • Table: Expenses (x_expenses_getting_expenses)

6. Add an if condition to the flow.

a) Select Flow Logic > If.
b) In the right-hand pane, expand the **Trigger - Record Created** category and the **(Expenses Record)** pill. Drag-and-drop the **(Amount)** pill into **Condition 1**. A data pill represents the value of a record or a field at a particular stage in your flow. Dragging the **(Amount)** data pill from the trigger populates the condition with the value of the field in the triggering record.

c) Set **Condition 1** to **(Trigger->Expenses Record->Amount) (less than) (100.00)**.

![.condition1](image1)

7. Underneath action 1, click + to add an action that runs when the If condition is met.

![addactionorflowlogic](image2)

8. Create an Update Record action that approves the request.
   - **Action**: **Update Record**
   - **Record**: Expand the **Trigger - Record Created** category and drag the **(Expenses Record)** data pill from the right-hand pane.
   - **Table**: Set to **Expenses (x_expenses_getting_expenses)**.
• Fields:
  • Approval: **Approved**
  • Work notes: Auto-approved. Amount less than $100.00

9. Add an else condition to the flow.
   a) Select **Flow Logic > Else**.

10. Underneath action 2, click + to add an Ask for Approval action that runs when the Else condition is met.
    a) Complete the fields in the Ask for Approval step.
       • Action: **Ask for Approval**
       • Record: Expand the (Trigger - Record Created) category and drag the (Expenses Record) data pill from the right-hand pane.
       • Table: Set to **Expenses (x_expenses_getting_expenses)**.
       • Approval Field: Set to **Approval**.
- Journal Field: Set to Approval history.

b) Define the rules in the Ask for Approval step.

- **(Approve)** when *(Anyone approves)* from the field *(Trigger->Expenses Record->Requested for->Manager)*. (OR)
- *(Anyone approves)* from the *(Manual User(s))* list. Allow manual users by selecting.

A manual approver is a user manually added to the Approvers related list who can then approve the request. Allowing manual users enables a user to manually add a subject matter expert to a task who is able to approve the request. To learn more about adding manual approvers, see [Generate approvals using the approvers related list](#).

Select **Add another OR rule set** to define rejection rules. When defining approvals, make sure to include rejection rules to avoid creating flows that remain in a waiting state if there are no matching approval rules.

- **(Reject)** when *(Anyone rejects)* from the field *(Trigger->Expenses Record->Requested for->Manager)*. (OR)
- *(Anyone rejects)* from the *(Manual User(s))* list.
c) Define a due date to automatically approve, cancel, or reject an approval if the request is not approved or denied by the designated time. Adding a due date ensures that the flow does not remain in a waiting state.

- **(Approve)** if pending by (Relative date) (1) (Days) from (action->Request->Created).
- Days schedule (8-5 weekdays excluding holidays).

This due date automatically approves all requests that have not been approved or denied within one day from when the request was created.

11. Click **Save**.
12. Test the flow using a record with an amount below the designated limit.
   a) From the flow, click **Test**.
      The Test flow modal appears.
   b) In the **Record** field, select a record you created in earlier steps that has value in the **Amount** field under the 100.00 limit. This field is a reference to the table defined in the trigger.

**Note:** Testing a flow bypasses the trigger conditions and immediately runs it. To test a flow with a record-based trigger, you must select a specific record to act as the trigger.
c) Select Run Test.
d) After the flow executes, click Flow has been executed. To view the flow, click here. The Execution Details open.

Because the amount is less than 100.00, the first condition is met and the request is approved.

13. Navigate back to the flow and run the test again using a record with an amount over the designated amount.

14. After the flow executes, open the flow Execution Details. Because the amount is over the designated limit, the request must be approved. Until a manager or a manual approver approves the request, the state is Waiting.
15. Approve the request. In an active flow, a user from the Approvers list would approve or reject the request. However, because the flow is being tested, an admin can approve the flow.
   a) Navigate to the test record.
      The associated manager appears in the Approvers related list with Requested in the State field. Alternatively, you can edit the list to add manual approvers.
   b) Change the value of the State field in the Approvers related list to Approved.
   c) Navigate back to the flow Execution Details and refresh the browser.
      Because the request is approved, the flow completes.
Transform the Ask for Approval action into a reusable action using Action Designer. Actions enable flow designers to add complex actions to multiple flows with minimal configuration. See [Getting started with actions](#).

### Getting started with actions

Transform the Ask for Approval action into a reusable action that always requires manager approval.

**Role required:** admin

**Note:** While Action Designer is designed to use the action_designer and delegated_developer roles in most scenarios, this tutorial uses the admin role to illustrate functionality without requiring additional roles to set up records and approve requests.

Complete the steps in [Getting started with flows](#). This tutorial replaces the Ask for Approval action in the Expense Approval flow.

Actions are made up of:

- **Inputs:** Data variables used in your action.
- Steps: Operations on the inputs or results from a prior step that generate data that can be used in later steps.
- Outputs: Data variables that represent the results of the action. These results are available to other actions in a flow.

Unlike the core Ask for Approval action where flow designers must manually configure the approval rules, this custom action always uses the same approval rules when added to a flow. You might create a reusable action if your flow designers often use an action with the same configuration. For example, if your flow designers always use the request manager approval and due date options, this action automatically uses them and therefore requires less flow configuration.

1. Open the Expenses Getting Started application in Studio.
   Alternatively, you can navigate to Flow Designer > Designer and select New Action to access Action Designer in the platform. In the Action Properties, select your scoped application in the Application field.

2. Create an action.
   a) Click Create Application File.
   b) Under Flow Designer, select Action and click Create.
   c) In the Name field, enter Ask for Manager Approval.
   d) In the Description field, enter Approve or reject a request based on manager approval or rejection. Allow manual approvers to be added.
   e) Click Submit.
   An Ask for Manager Approval action is created in the Expenses Getting Started scope.

3. Define the inputs in the Ask for Manager Approval action.
   a) Select + Create Input and add the following values.
      - Name: Request
      - Type: Reference
      - Reference Table: Expenses (x_expenses_getting_expenses)
This input enables you to reference any field or record from the Expenses table. Use the data pills on the right-hand side to add the record or its fields to action steps.

4. Add an Ask for Approval step.
   a) Click the + underneath Inputs in the Action Outline.
   b) Select Ask for Approval.
   c) Complete the fields in the Ask for Approval step.
      - Record: Under the Input Variables category, drag the (Request) data pill from the right-hand pane.
      - Table: Set to Expenses (x_expenses_getting_expenses).
      - Approval Field: Set to Approval.
      - Journal Field: Set to Approval history.

d) Define rules in the Ask for Approval step. You can use the data pill picker, or drag the data pills from the right-hand pane to select the data you need.
   - (Approve) when (Anyone approves) from the field (action->Request->Requested for->Manager), (OR)
   - (Anyone approves) from the field (Manual User(s)).

Select Add another OR rule set to define rejection rules:
   - (Reject) when (Anyone rejects) from the field (action->Request->Requested for->Manager), (OR)
   - (Anyone rejects) from the field (Manual User(s)).
e) Define a due date in the Ask for Approval step.

- **(Approve)** if pending by **(Relative date)** (1) **(Days)** from **(action->Request->Created)**.
- Days schedule **(8-5 weekdays excluding holidays)**.

This due date automatically approves all requests that have not been approved or denied within one day from when the request was created.

5. Define the outputs in the Ask for Manager Approval action. Adding an output makes data available to a flow. For example, this action outputs the approval state of the record.
   a) Select + **Create Outputs** and add the following values.
      - Name: **Approval state**
- Value: In the right-hand pane, expand the **Ask for Approval step** category and drag the **(Approval State)** data pill.

b) Click **Save**.

6. Add a custom icon for your application that displays in Flow Designer. All actions in the application scope use the custom icon.
   a) In Studio, navigate to **File > Settings**. The application settings open.
   b) In the **Logo** field, select **Click to add...**.
   c) Upload an icon to use with your reusable actions.

7. Test the reusable action within your flow.
   a) Return to the Expense Approval flow.
   b) Remove the 2.1 Ask for Approval action from the flow. This action will be replaced by the reusable Ask for Manager Approval action.
   c) Set **Show draft actions** to true.
   d) Add the Ask for Manager Approval action to your flow.
   e) In the right-hand pane, expand the **Trigger - Record Created** category and drag the **(Expenses Record)** data pill into the **Request (Expenses)** field.
8. Click **Save**.
9. Test the flow using a record with an amount below the designated limit.
   a) From the flow, click **Test**.
      The Test flow modal appears.
b) In the **Record** field, select a record you created in earlier steps that has value in the **Amount** field under the 100.00 limit. Verify that you have not already run tests using this record.

c) Select **Run Test**.

d) After the flow executes, click **Flow has been executed. To view the flow, click here**. The Execution Details open.

Because the amount is less than 100.00, the first condition is met and the request is approved. The Else condition is not evaluated.

---

**10.** Test a record with an amount over the designated limit. Verify that you have not already run a test on the test record.

Because the amount is over the designated limit, the second condition is evaluated.
11. Approve the request.
   a) Navigate to the test record and change the value of the **State** field in the Approvers related list to **Approved**.
   b) Navigate back to the flow execution details and refresh the browser. Because the request is approved, the flow completes.
12. Navigate to the Ask for Manager Approval action and click **Publish**. Publishing an action enables you to activate any flow that uses it.

13. Navigate to the flow and set **Show draft actions** to false.

14. Click **Activate**. Activating a flow sets it to run every time the trigger conditions are met.

The Expense Approval flow runs every time a record is created in the Expenses table. Now that the flow is activated and working as expected, you can publish it to the application repository and deploy it to other instances.

**Flow Designer landing page**

Access or create flows, actions, or flow executions.

**Flows**

The Flows screen contains all the flows that your installation of Flow Designer can use. Opening a flow brings up the flow on a tab beside the home tab. You can see the scope the flow was created in, whether the flow is published or in draft status, whether the flow is active, and update information.

**Actions**
The Actions screen contains all the actions that your installation of Flow Designer can use. Opening an action brings up the action on a tab beside the home tab. You can see the scope the action was created in, where the action is accessible from, whether the action is active, and update information.

**Flow Executions**

The Flow Executions screen shows a history of flow runs, including the current state and duration of the run.

**Help**

The Help landing page contains links to Flow Designer Guided Tour, Documentation, Videos, and Community Discussion.

**+ New**

You can create a new flow or action by selecting an action from the list.

---

**Flow Designer roles**

Grant users one or more Flow Designer roles to enable them to create flows, create actions, or see flow execution details.
### Flows

Automate processes with a sequence of reusable actions such as manage records, ask for approvals, create tasks, and send notifications. Define trigger conditions to start a flow and variables to pass information between actions.

All flows consist of **properties**, a **trigger**, a sequence of **actions**, and the **data** collected or created.

#### Flow properties

The flow properties specify the flow name, application, description, and status. Flow designers can update the flow name and description at any time, but can only set the application during flow creation. The flow status is set when you save or activate a flow.

#### Triggers

The trigger specifies the conditions that start the flow. When the trigger condition is true, the system starts the flow.

Flow Designer supports record-based and schedule-based trigger types.

![Note: To prevent collisions, avoid placing multiple triggers on a single table. Flows are processed asynchronously, so they might not run in the order you expect.]

### Record-based triggers

<table>
<thead>
<tr>
<th>Trigger</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created</td>
<td>Starts a flow when a record is created in a specific table.</td>
</tr>
<tr>
<td>Updated</td>
<td>Starts a flow when a record is updated in a specific table. Requires selecting whether to always run the trigger or to only run it once.</td>
</tr>
</tbody>
</table>
## Trigger

<table>
<thead>
<tr>
<th>Trigger</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created or Updated</td>
<td>Starts a flow when a record is either created or updated in a specific table. Requires selecting whether to always run the trigger or to only run it once.</td>
</tr>
</tbody>
</table>

**Note:** Flows including approval actions should only run the trigger once.

### Schedule-based triggers

<table>
<thead>
<tr>
<th>Trigger</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Daily</td>
<td>Starts a flow at a specific time every day.</td>
</tr>
<tr>
<td>Weekly</td>
<td>Starts a flow at a specific time every week.</td>
</tr>
<tr>
<td>Monthly</td>
<td>Starts a flow at a specific time every month.</td>
</tr>
<tr>
<td>Run Once</td>
<td>Starts a flow once at a specific time but does not repeat.</td>
</tr>
<tr>
<td>Repeat</td>
<td>Starts a flow at regular intervals you define.</td>
</tr>
</tbody>
</table>

## Actions

Each action is a set of reusable business logic that produces a specific outcome when provided with its input values. Flow designers configure actions by specifying where they go in a flow sequence and by selecting the data they use as input values. As a flow runs, actions earlier in the sequence generate outcomes or output values that become available as data to actions later in the flow.

By default, the system provides a collection of core actions that can be added to any flow. Core actions cannot be viewed or edited from the Action Designer interface. Some applications include spokes which add application-specific flows and actions. Spoke actions are typically read-only but can be copied and customized. Developers may also create their custom actions from the Action Designer interface.

## Flow data

Flows store any data gathered or generated as variables in the Data pane. Each variable has its own pill that Flow designers can use to drag-and-drop the variable value to an action input or output. Flow Designer generates the pill name based on the contents and its data type. The system specifies the variable data type next to the pill.
Flow logic

Flows may contain flow logic to specify conditional or repeated actions. The system provides these flow logic options.

<table>
<thead>
<tr>
<th>Flow logic</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>For each</td>
<td>Applies actions to each record in a list of records. Flow designers must specify the list of records from the flow data.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> To optimize performance, avoid iterating over lists with more than one thousand records. If you need to iterate over large lists, divide the lists into smaller sections and use multiple flows.</td>
</tr>
<tr>
<td>If</td>
<td>Applies actions when a list of conditions is met. Flow designers can use flow data to specify the conditions.</td>
</tr>
</tbody>
</table>
Testing flows

After adding a trigger and one or more actions, flow designers can test a flow. Testing a flow sets the trigger conditions to true and runs all actions. For flows that have record-based triggers, flow designers may specify an existing test record to use as input. Flow designers should always test flows on non-production instances containing relevant demonstration data since testing a flow creates or changes records on the instance.

Flow execution details

The system generates flow execution records, log messages, and reports for each flow run. The flow context is a related record containing the current state and runtime values of the flow. The system generates a context record each time a flow is run.

Roles

To access Flows, a user must have the flow_designer or admin roles.

Design considerations

Use an action or a schedule-based trigger to control flow timing

To pause a flow until a record value condition is met, use the `Wait For Condition` action. To run a flow at a specific time, use a schedule-based trigger. Avoid using the `gs.sleep()` method to control flow timing.

Create a flow

Automate a process to run one or more actions when a trigger condition occurs.

- Role required: flow_designer or admin
- *Create a custom application* to store Flow Designer content.

Flow designers should know the application table structure and be aware of any existing business logic associated with the target tables of a flow. Be sure to disable any conflicting business rules or workflows before creating a flow.

Creating a custom application to contain your Flow Designer content allows you to *deploy* it using the application repository or the ServiceNow Store.

1. Navigate to **Flow Designer > Designer**.
2. Click **+ New > New Flow**.
   The Flow properties dialog displays.
3. Fill in the following properties:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>App Scope</td>
<td>Select the application scope to create your flow in. Global is the default.</td>
</tr>
<tr>
<td>Flow Name</td>
<td>Create a name for your flow.</td>
</tr>
<tr>
<td>Description</td>
<td>Add a description of your flow.</td>
</tr>
</tbody>
</table>

The system displays the flow designer page.
4. Add a trigger.
   a) Click **Click to add a trigger**. The system displays the trigger choice list.
   b) Select the type of trigger.
      To create a trigger that occurs when a table record changes, choose from the **Data**
      category. To create a trigger that occurs at a specific time or interval, choose from the
      **Schedule** category.
      The system displays a set of fields depending on the type of trigger you selected.
      a) Fill in the fields to specify the trigger. For a Data trigger, for example, fill in the table and
      conditions.
      b) Click **Done**.

5. Add actions.
   a) Click **Click to add an Action or Flow Logic**.
   b) Click **Action**.
   c) Select the action to run. Flow Designer includes a set of **Actions** available to flows. 
      Alternatively, an action designer can create additional actions to add to flows. The
      **IntegrationHub** and **spoke** plugins install additional actions.
      The system displays a set of fields depending on the action you selected.
   d) Fill in the fields to specify the action.
   e) Click **Done**
   f) Repeat adding actions until you have added all the actions you want for this flow.

6. Click **Save**.
   Flow Designer saves a draft of the flow, trigger, and actions.

Test the flow until it is ready to be activated.

**Note:** The system only triggers active flows.

### Activate a flow

Activate a flow to make it available to other users.

Role required: flow_designer or admin

When you save a flow, you can test it, but no other users on the instance can see or run it. To 
make the flow available to other users, activate it:

1. Navigate to **Flow Designer > Designer**.
2. Double click the row for the flow you want to display it on the flow designer page.
3. Click **Activate**.

### Edit a flow

Edit an existing flow.
Role required: flow_designer or admin

1. If necessary, navigate to **Flow Designer > Designer**, then double click the row for the flow you want to edit.
   The system displays the flow designer page.

2. Take the appropriate actions to edit the flow.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change the flow name or description</td>
<td>Click <strong>Edit Properties</strong>, enter the values you want into the appropriate fields, then click <strong>Update</strong>.</td>
</tr>
<tr>
<td><strong>Note:</strong> You cannot change the scope of an automationHub flow after you have saved it.</td>
<td></td>
</tr>
<tr>
<td>To edit the trigger</td>
<td>Click the trigger description, fill in the fields as desired, then click <strong>Done</strong>.</td>
</tr>
<tr>
<td><strong>Note:</strong> Modifying triggers can result in the deletion of referenced action configurations.</td>
<td></td>
</tr>
<tr>
<td>To edit an existing action</td>
<td>Click the action description, fill in the fields as desired, then click <strong>Done</strong>.</td>
</tr>
<tr>
<td>To add a new action</td>
<td>Click the plus icon in the ACTION section then proceed as you would for adding an action to a new flow.</td>
</tr>
</tbody>
</table>

3. To save your changes, click **Save**.

**Delete a flow**

Delete a flow that you no longer need.

Role required: flow_designer or admin

You can only delete records that are in the same application scope as the current session.

1. If necessary, navigate to **Flow Designer > Designer** to display the flow designer page.
2. Check the selection box for the row corresponding to the flow you want to delete.
3. Click **Actions on selected rows . . .**, then click **Delete**.

**Test a flow**

Before activating a flow so other users can access it, test to make certain it works the way you expect.

Role required: flow_designer or admin. Save the flow.

1. If necessary, navigate to **Flow Designer > Designer**, then double click the row for the flow you want to test.
2. Click **Test**.
   The system displays the Test flow dialog. The contents of the Test flow dialog depend on the type of trigger: Data or Schedule. If the trigger is a Data trigger, the dialog asks for a record to use for the test.
3. If the trigger is a Data trigger, select a record to use for the test.
When you test a flow, the system does not execute the trigger. In other words, for a trigger that fires when a record is added to a particular data, the test does not create a new record. It behaves as if a record was created. By selecting a record on the Test flow dialog, you are asking the system to act as if that record was just created.

Actions

Actions can be added to any flow, enabling process analysts to automate Now Platform features without having to write code.

An action is a reusable operation that enables process analysts to automate Now Platform features without having to write code. For example, the Create Record action allows process analysts to generate records in a particular table with particular values when certain conditions occur. Core actions like Create Record require some familiarity with Now Platform tables and fields. Action designers can create application-specific actions to pre-set configuration details. For example, creating a Create Incident Task action ensures that the process analyst uses the correct table and field configuration each time the action is used. You can add application-specific actions by activating the associated spoke.

In Flow Designer, a process analyst adds actions to a flow and defines the configuration options.

Core actions

A core action is a ServiceNow-provided action available to any flow that cannot be viewed or edited from the Action Designer design environment. For example, the Ask for Approval action is a core action that allows process analysts to use Now Platform approvals. Flow Designer provides a set of core actions to automate Now Platform processes. You can add application-specific core actions by activating the associated spoke.

Custom actions

Using a core action enables the process analyst to configure the desired behavior within the flow. To create an action with a pre-set configuration, or to define custom configuration options, a subject matter expert can create a custom action in Action Designer.

Action limit

By default, flows can have no more than 20 actions. To change the default behavior, increase the value of the sn_flow_designer.max_actions system property. However, consider the performance impact that a large flow may have on your instance.

Ask for Approval action

Request approval for a record with an approval field. You can configure a rule set for an approval, rejection, or cancellation. If a due date is added to an approval, the approval is automatically approved, rejected, or canceled if the approvers have not responded by the designated time.

Approvals is a platform feature that enables users or groups to approve or reject a task.
Roles and availability

- Available as a Flow Designer core action. Process analysts use the flow_designer role to add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Select a record under the data panel and drag the record pill into the Record field. If selecting a table with an approval field already configured, the Approval field is set to the correct field.</td>
</tr>
<tr>
<td>Table</td>
<td>Set to the table name associated with the record.</td>
</tr>
<tr>
<td>Approval field</td>
<td>Select a field from the designated table to use for approval.</td>
</tr>
<tr>
<td>Journal field</td>
<td>Select a field from the designated table to use for journal.</td>
</tr>
</tbody>
</table>

Rules

Define the approval and rejection rules. Approval rules determine which users can approve or reject requests, and what happens after approval or rejection. Approval or rejection rules include:

- Anyone approves
- All users approve
- All responded and anyone approves
- % of users approve
- # of users approve

In the field beside the approval rule, add the desired approvers. To add approvers:

- Select individual users or groups.
- Drag-and-drop or select a field from a record.

Select to enable manual approvers. Any user manually added to the Approvers related list can approve the request.

Define rejection rules by adding another OR rule set. When defining approvals, include rejection rules that run when there are no matching approvals. Such rejection rules prevent the flow from remaining in a waiting state. For example, if an approval can be approved by anyone, create a time-based rejection rule in case no one approves it.

Note: If you set an approval rule with no rejection rule (or vice versa) and the expected approval state is not met, the runtime value will be canceled.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Due Date  | Define a due date to ensure that the flow does not remain in a waiting state if the request is not approved or denied.  
  - None: The approval is not dependent on a specific date.  
  - Approve: Automatically approve the step if an action is still pending by the specified date.  
  - Reject: Automatically reject the step if an action is still pending by the specified date.  
  - Cancel: Automatically cancel the step if an action is still pending by the specified date. |
Example

TRIGGER

[Incident] Created or Updated

ACTION

1. Ask For Approval

- **Action:** Ask For Approval
- **Record:** Trigger ➔ Incident Record
- **Table:** Incident [incident]
- **Approval Field:** Approval
- **Journal Field:** Approval history
- **Rules:**
  - Approve
  - Anyone approves
  - When: Trigger ➔ Incident Record ➔ Assigned to ➔ Manager
  - OR
  - Reject
  - Anyone rejects
  - When: Trigger ➔ Incident Record ➔ Assigned to ➔ Manager
  - **Due Date:** Approve if pending by Relative date 1 Days
  - **Days schedule:** 8-5 weekdays

Create Record action
Creates a record on any table. You can dynamically add and configure fields for the record.

Roles and availability
- Available as a Flow Designer core action. Process analysts use the flow_designer role to add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Field Values</td>
<td>Set the values of fields in the record to be created. For example, to set the short description to a certain value, select <strong>Short description</strong> and set the desired value.</td>
</tr>
</tbody>
</table>

Create Task action
Create a task on any ServiceNow task table. After you choose the task table, you can dynamically select the fields to configure the action. Defining the Parent field associates the task to a parent record.

Roles and availability
- Available as a Flow Designer core action. Process analysts use the flow_designer role to add an action to a flow and define configuration details.
## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a task table.</td>
</tr>
<tr>
<td></td>
<td>• Catalog Task (sc_task)</td>
</tr>
<tr>

<td>• Service Task (service_task)</td>
</tr>
<tr>
<td></td>
<td>• Stale CI Remediation (stale_ci_remediation)</td>
</tr>
<tr>
<td></td>
<td>• Standard Change Proposal (std_change_proposal)</td>
</tr>
<tr>
<td></td>
<td>• Ticket (ticket)</td>
</tr>
</tbody>
</table>

| Field Values     | Set the values of fields in the task to be created. For example, to set the short description to a certain value, select **Short description** and set the desired value. To associate the task with a parent record, define the **Parent** field. |

| Wait             | Waits to complete the action until the task completes and is no longer active (active=false). Alternatively, you can add a wait condition by dragging-and-dropping a true/false field from the data panel into the **Wait** field. The flow only waits for the task to complete when the condition field is true. |

Delete Record action
Deletes a record on any table.

Roles and availability
- Available as a Flow Designer core action. Process analysts use the flow_designer role to add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>The record to be deleted. Drag-and-drop a record data pill or use the data pill picker to select a record.</td>
</tr>
</tbody>
</table>

Log action
Logs a message in the Flow Designer log table.

Roles and availability
- Available as a Flow Designer core action. Process analysts use the flow_designer role to add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log level</td>
<td>Level of importance of the log message.</td>
</tr>
<tr>
<td></td>
<td>- Error</td>
</tr>
<tr>
<td></td>
<td>- Warn</td>
</tr>
<tr>
<td></td>
<td>- Info</td>
</tr>
<tr>
<td>Log message</td>
<td>Message to display in the log. Enter text or drag-and-drop data pills into the field.</td>
</tr>
</tbody>
</table>

Look Up Record action
Look up a record from any table based on defined conditions.

Roles and availability
- Available as a Flow Designer core action. Process analysts use the flow_designer role to add an action to a flow and define configuration details.
### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Table</strong></td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td><strong>Conditions</strong></td>
<td>Conditions to be met by the returned record. When building a condition that looks up the value of a reference field, use a data pill that explicitly provides the Sys ID value. Ensure the condition has the format (reference field)(is)(Reference type data pill-&gt;Sys ID). For example, both the Change and Incident tables contain a reference field to the User table. To look up change records where the requester is the caller from an incident record, create the condition (Requested by)(is)(Trigger-&gt;incident record-&gt;Caller-&gt;Sys ID).</td>
</tr>
</tbody>
</table>
| **If multiple records are found** | Determines what is returned if more than one record matches the defined conditions.  
  • Return only the first record  
  • Fail the step |
Example

TRIGGER
[Incident] Created or Updated

ACTION

1. Look Up [Incident] Record

   Action: Look Up Record
   Table: Incident [incident]

   Conditions: All of these conditions must be met
   - Active: is true
   - State: is New
   - Short description: contains Email

   If multiple records are found action: Return only the first record

Look Up Records action
Look up multiple records on any table using defined conditions.
Roles and availability

- Available as a Flow Designer core action. Process analysts use the flow_designer role to add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Conditions to be met by the returned records. When building a condition that looks up the value of a reference field, use a data pill that explicitly provides the Sys ID value. Ensure the condition has the format (reference field)(is)(Reference type data pill-&gt;Sys ID). For example, both the Change and Incident tables contain a reference field to the User table. To look up change records where the requester is the caller from an incident record, create the condition (Requested by)(is)(Trigger-&gt;incident record-&gt;Caller-&gt;Sys ID).</td>
</tr>
<tr>
<td>Max Results</td>
<td>Maximum number of results returned.</td>
</tr>
</tbody>
</table>
Example

Send Email action

Send an email to specified users or groups as an action in a flow.
Roles and availability

- Available as a Flow Designer core action. Process analysts use the flow_designer role to add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>To</td>
<td>The main recipients of the email. Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field, such as a User record. For example, if your action involves an incident record and you want to send an email to the group assigned to the incident, drag the <strong>Assignment group</strong> data pill from the data panel.</td>
</tr>
<tr>
<td>CC</td>
<td>Additional recipients copied on this email. Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field.</td>
</tr>
<tr>
<td>BCC</td>
<td>Additional recipients of this email, who are visible only to the sender (blind copied). Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field.</td>
</tr>
<tr>
<td>Subject</td>
<td>Subject of the email. You can enter text or drag-and-drop data pills into the field.</td>
</tr>
<tr>
<td>Body</td>
<td>The content of the message body. You can enter text or drag-and-drop data pills into the field.</td>
</tr>
</tbody>
</table>

**Note:** Flow Designer does not support the ${URI} parameter for creating a link to a record in the email message body. Instead, consider inserting the information from the record in the email body using data pills, or create a notification step.

Testing the email action

To verify that the email was generated when testing the action, review the email record in the Email (sys_email) table. The **Headers** field indicates whether the email was successfully generated. For example:

```
X-ServiceNow-Source:FlowDesigner-9ad2747b0b710300f4eb8bf637673a1e
Message-ID:<193756824.0.1508534586438@[10.0.66.70]>
X-ServiceNow-Generated:true
```

ACL restrictions apply to the Send Email action. If you configured your flow to run as the user who initiates the session, ensure that the user has access control to send email. To test access controls for a Send Email action, impersonate a typical email sender and manually trigger the flow.
Update Record action
Update an existing record in a table. You can dynamically add and configure fields for the record.

Roles and availability
- Available as a Flow Designer core action. Process analysts use the flow_designer role to add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>The record to be updated. Drag-and-drop a record data pill or use the data pill picker to select a record.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only. Set to the table associated with the record.</td>
</tr>
<tr>
<td>Field Values</td>
<td>Set the values of fields in the record to be updated. For example, to set the short description to a certain value, select Short description and set the desired value.</td>
</tr>
</tbody>
</table>

Wait For Condition action
Pause the flow until the record value conditions are met.

Roles and availability
- Available as a Flow Designer core action. Process analysts use the flow_designer role to add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Drag-and-drop an input record or a record from a previous step.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only. Set to the table associated with the record.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Select the record values necessary to resume running the flow. For example, if the condition is (State)(is)(Closed), the flow pauses until the condition is met. Once met, the flow moves on to the next step or action.</td>
</tr>
</tbody>
</table>
Example

**Action Designer**

Automate a task with a sequence of related steps such as lookup a record, create a record, and log details about the record creation. Actions separate complexity from the Flow Designer environment, enabling flow designers to add actions to multiple flows with minimal configuration.
Using Action Designer, subject matter experts can:

- Create application-specific actions with pre-set configuration details, enabling process analysts to easily add actions to a flow with little configuration.
- Create scripted actions that appear code-less when added to a flow.
- Build integrations using IntegrationHub.

Custom actions

Unlike core actions where flow designers must manually configure flow logic, custom actions always use the same configuration when added to a flow. If your flow designers often use an action with the same configuration, you might create a reusable action.

A reusable action includes these components.

**Inputs**

Inputs are data variables used in your action. For example, if an action step creates a record in the incident table, your input might be a reference to the incident table. Once added as an input, the table and its fields are available to steps and outputs in the flow.

Each input you define for an action becomes a configuration option in the Flow Designer interface. To use the action in a flow, flow designers must define a value for each mandatory input. The more inputs an action has, the more data flow designers must define and the more familiar they must be with the underlying data model to use the action effectively.

**Action steps**

An action step or step is a single reusable operation within an action. For example, the Create Record step allows action designers to specify the table and field values to use during record creation. Action steps require subject matter expertise with application tables, fields, and business logic. Application developers or IT generalists add action steps to actions from the Action Designer design environment. Flow Designer provides a set of core action steps to automate Now Platform processes. You can add application-specific action steps by activating the associated spoke.

**Outputs**

Outputs are data variables that represent the results of the action. These results are available to other actions in a flow.

**Action Designer environment**

Subject matter experts build custom actions in Action Designer.
Create and edit actions by defining inputs and adding action steps. Copy actions to use existing actions as templates. Publish actions to activate them, which makes them available to activated flows and to preserve their current action steps, variables, and sequence as a snapshot separate from further configuration changes.

Roles

To create custom actions, a user must have the action_designer or admin roles.

Action input and output data types

You can define input variables for your Flow Designer actions. Input variables and data used in action steps can be defined as output variables.

Action inputs are data variables with a name and data type. You must associate some data types with a reference table, which makes the record and fields available to the action steps. Available data types include:

- Audio
- Choice
- Color
- Condition String
- Conditions – Reference table required
- Currency
- Data Structure
- Date
- Date/Time
- Document ID – Reference table required
- Due Date
- Duration
- Encrypted Text
- Field Name
- Floating Point Number
- HTML
- IP Address (Validated IPV4, IPV6)
- Icon
- Image
Create an action

Create a reusable component to automate one or more steps of a process.

- Role required: action_designer or admin
- Create a custom application to store Flow Designer content.

Action designers should know the application table structure and be aware of any existing business logic associated with the target tables of an action. Be sure to disable any conflicting business rules or workflows before creating an action.

Creating a custom application to contain your Flow Designer content enables you to deploy it using the application repository or the ServiceNow Store.

1. Navigate to Flow Designer > Designer.
2. Click the Actions tab and select New Action.
3. Fill in the Action Properties and click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of action.</td>
</tr>
<tr>
<td>Accessible From</td>
<td>Accessible from all application scoped or only within the specified application scope.</td>
</tr>
</tbody>
</table>
An empty action opens.

4. Define action inputs to make data available to the action steps and outputs.
   a) Select **Create Input** and complete the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the input. This value is used as the name of the data pill in the right-hand pane.</td>
</tr>
<tr>
<td>Type</td>
<td>Data type of the input. For supported data types, see <a href="#">Action input and output data types</a>.</td>
</tr>
<tr>
<td>Reference Table</td>
<td>Reference table for the data type. Only required for the following data types:</td>
</tr>
<tr>
<td></td>
<td>· Conditions</td>
</tr>
<tr>
<td></td>
<td>· Document ID</td>
</tr>
<tr>
<td></td>
<td>· Records</td>
</tr>
<tr>
<td></td>
<td>· Reference</td>
</tr>
<tr>
<td></td>
<td>· Template Value</td>
</tr>
</tbody>
</table>

Inputs are represented as data pills in the right-hand pane. You can add inputs to steps and outputs in the flow by dragging and dropping data pills.

5. Add an action step to perform an operation on the action inputs.
   a) Click the + underneath Inputs in the Action Outline.
   b) Select the step you would like to perform.
   c) Complete the fields in the step.

6. Add action outputs to make data available to a flow.
   a) Select **Create Outputs** and complete the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the output. This value is the name of the data pill in the right-hand pane when the action is added to a flow.</td>
</tr>
<tr>
<td>Value</td>
<td>Data used previously in the action either in a step or input. Adding a variable to the output makes the value available to the flow.</td>
</tr>
</tbody>
</table>

7. Click **Save**.
Action Designer saves a draft of the action.

Test the action by adding it to a flow that has **Show draft actions** set to true. To add the action to a published flow, or a flow that has **Show draft actions** set to false, you must first click **Publish**.

**Note:** By default, the system only runs published actions.

### Ask for Approval step

Request approval for a record with an approval field. You can configure a rule set for an approval, rejection, or cancellation. If a due date is added to an approval, the approval is automatically approved, rejected, or canceled if the approvers have not responded by the designated time.

**Approvals** is a platform feature that enables users or groups to approve or reject a task.

### Roles and availability

- Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Select a record under the data panel and drag the record pill into the Record field. If selecting a table with an approval field already configured, the Approval field is set to the correct field.</td>
</tr>
<tr>
<td>Table</td>
<td>Set to the table name associated with the record.</td>
</tr>
<tr>
<td>Approval field</td>
<td>Select a field from the designated table to use for approval.</td>
</tr>
<tr>
<td>Journal field</td>
<td>Select a field from the designated table to use for journal.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Rules   | Define the approval and rejection rules. Approval rules determine which users can approve or reject requests, and what happens after approval or rejection. Approval or rejection rules include:  
  - Anyone approves  
  - All users approve  
  - All responded and anyone approves  
  - % of users approve  
  - # of users approve  
  In the field beside the approval rule, add the desired approvers. To add approvers:  
  - Select individual users or groups.  
  - Drag-and-drop or select a field from a record.  
  Select to enable manual approvers. Any user manually added to the Approvers related list can approve the request.  
  Define rejection rules by adding another OR rule set. When defining approvals, include rejection rules that run when there are no matching approvals. Such rejection rules prevent the flow from remaining in a waiting state. For example, if an approval can be approved by anyone, create a time-based rejection rule in case no one approves it.  
  Note: If you set an approval rule with no rejection rule (or vice versa) and the expected approval state is not met, the runtime value will be canceled.  |
| Due Date| Define a due date to ensure that the flow does not remain in a waiting state if the request is not approved or denied.  
  - None: The approval is not dependent on a specific date.  
  - Approve: Automatically approve the step if an action is still pending by the specified date.  
  - Reject: Automatically reject the step if an action is still pending by the specified date.  
  - Cancel: Automatically cancel the step if an action is still pending by the specified date.  |
**Example**

**Create Record step**

Creates a record on any table. You can dynamically add and configure fields for the record.

**Roles and availability**

- Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
</tbody>
</table>
### Field Values

Set static or dynamic values of fields in the record. For example, to set the short description to a static value, select **Short description** and set the desired value.

To enable flow designers to dynamically define field values, define an input of type Template Value and drag-and-drop the data pill into the **Field Values** field. Use the input name to help flow designers understand the purpose of the field. You can define both static and dynamic values in the same step.

**Note:** If a static field value in the action step conflicts with a dynamic value defined when the action is added to a flow, the static value defined in the action step is honored.

---

**Create Task step**

Create a task on any ServiceNow task table. After you choose the task table, you can dynamically select the fields to configure the action. Defining the Parent field associates the task to a parent record.

**Roles and availability**

- Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.
### Fields

<table>
<thead>

- Service Order Task (sm_task)  
- Service Task (service_task)  
- Stale CI Remediation (stale_ci_remediation)  
- Standard Change Proposal (std_change_proposal)  
- Ticket (ticket) |

| Field Values | Set static or dynamic values of fields in the record. For example, to set the short description to a static value, select **Short description** and set the desired value. To enable flow designers to dynamically define field values, define an input of type Template Value and drag-and-drop the data pill into the **Field Values** field. Use the input name to help flow designers understand the purpose of the field. You can define both static and dynamic values in the same step. |

**Note:** If a static field value in the action step conflicts with a dynamic value defined when the action is added to a flow, the static value defined in the action step is honored.

To associate the task with a parent record, define the **Parent** field.
### Delete Record step

Deletes a record on any table.

**Roles and availability**

- Available as an Action Designer action step. Subject matter experts use the `action_designer` role to create a custom action with one or more action steps.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>The record to be deleted. Drag-and-drop a record data pill or use the data pill picker to select a record.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only. Set to the table associated with the record.</td>
</tr>
</tbody>
</table>

### Log step

Logs a message in the Flow Designer log table.

**Roles and availability**

- Available as an Action Designer action step. Subject matter experts use the `action_designer` role to create a custom action with one or more action steps.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log level</td>
<td>Level of importance of the log message.</td>
</tr>
<tr>
<td></td>
<td>· Error</td>
</tr>
<tr>
<td></td>
<td>· Warn</td>
</tr>
<tr>
<td></td>
<td>· Info</td>
</tr>
<tr>
<td>Log message</td>
<td>Message to display in the log. Enter text or drag-and-drop data pills into the field.</td>
</tr>
</tbody>
</table>
Look Up Record step

Look up a record from any table based on defined conditions.

Roles and availability

- Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Set static or dynamic conditions to filter records. To define a static condition applied each time the action runs, define the conditions with the condition builder. To enable flow designers to dynamically apply conditions, define an input of type Conditions and drag-and-drop the input data pill into the Conditions field. When building a condition that looks up the value of a reference field, use a data pill that explicitly provides the Sys ID value. Ensure the condition has the format (reference field)(is)(Reference type data pill-&gt;Sys ID). For example, both the Change and Incident tables contain a reference field to the User table. To look up change records where the requester is the caller from an incident record, create the condition (Requested by)(is)(action-&gt;incident-&gt;Caller-&gt;Sys ID) where incident is an input variable for an incident record.</td>
</tr>
</tbody>
</table>
| If multiple records are found | Determines what is returned if more than one record matches the defined conditions.  
  - Return only the first record  
  - Fail the step |
Example

1. Look Up Record step

- **Table**: Incident [incident]
- **Condition**: All of these conditions must be met
  - **Active**: is true
  - **State**: is New
  - **Short description**: contains Email

**Look Up Records step**

Look up multiple records on any table using defined conditions.

**Roles and availability**

- Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
</tbody>
</table>
### Conditions
Set static or dynamic conditions to filter records. To define a static condition applied each time the action runs, define the conditions with the condition builder. To enable flow designers to dynamically apply conditions, define an input of type Conditions and drag-and-drop the input data pill into the Conditions field.

When building a condition that looks up the value of a reference field, use a data pill that explicitly provides the Sys ID value. Ensure the condition has the format `(reference field)(is)(Reference type data pill->Sys ID)`. For example, both the Change and Incident tables contain a reference field to the User table. To look up change records where the requester is the caller from an incident record, create the condition `(Requested by)(is)(action->incident->Caller->Sys ID)` where `incident` is an input variable for an incident record.

### Max Results
Maximum number of results returned.

---

**Example**

### 1. Look Up Records step

<table>
<thead>
<tr>
<th>Table</th>
<th>Incident [incident]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conditions</td>
<td><strong>All of these conditions must be met</strong></td>
</tr>
<tr>
<td></td>
<td><strong>AND</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Assigned to</strong> is</td>
</tr>
<tr>
<td></td>
<td><strong>State</strong> is</td>
</tr>
<tr>
<td></td>
<td><strong>Max Results</strong> 1000</td>
</tr>
</tbody>
</table>

**Notification step**

Trigger a notification as a step within an action by selecting a record (such as an incident, change request, problem, or user record) to trigger a notification and defining the associated notification.

*Notifications* is a platform feature. Before triggering a notification as an action step in Flow Designer, ensure that the notification is set up for use in the platform.

- When you create or update the notification, set the Send when field in the When to send tab of the Notification form to Triggered.
- Verify that your users have an active primary email channel and that all their notifications are active.
Roles and availability

- Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Drag-and-drop an input record or a record from a previous step. This is the record that will trigger a notification.</td>
</tr>
<tr>
<td>Note:</td>
<td>Some notifications are not associated with a specific record or table, such as the Passwords Require Updating notification. If configuring such a notification, leave this field blank.</td>
</tr>
<tr>
<td>Table name</td>
<td>Read-only. Set to the table of the triggering record.</td>
</tr>
<tr>
<td>Notification</td>
<td>Select the notification to be triggered. The notifications that can be selected are associated with the table of the specified record. If no record was selected, you can select a notification that does not have an associated record or table. To create notifications, see Create an email notification.</td>
</tr>
</tbody>
</table>

Example

1. Notification step

   - Record: action > incident
   - Table Name: Incident [incident]
   - Notification: Incident Priority Raised

REST step

Add a REST step to an action in Action Designer to send an outbound REST web service request to an external system.

Note: REST step is not available on base systems and requires the IntegrationHub plugin. When the IntegrationHub plugin is activated, the step is visible under Utilities.

Outbound REST web service is a platform feature that allows you to retrieve, create, update, or delete data on a web services server that supports the REST architecture.
Roles and availability

- Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Type of connection to use.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Define Connection Inline</strong>: Define connection information within the REST step.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Use Connection Alias</strong>: Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you do not have to update your custom action.</td>
</tr>
<tr>
<td>To learn more about connections and credentials, see credentials, connections, and aliases.</td>
<td></td>
</tr>
<tr>
<td>Connection and Credential Alias</td>
<td>If <strong>Use Connection Alias</strong> is selected, select a connection alias or click + to create a new connection. If you selected <strong>Define Connection Inline</strong>, click + to create a new credential.</td>
</tr>
<tr>
<td>HTTP Method</td>
<td>HTTP method for the request.</td>
</tr>
<tr>
<td></td>
<td>- GET</td>
</tr>
<tr>
<td></td>
<td>- POST</td>
</tr>
<tr>
<td></td>
<td>- PUT</td>
</tr>
<tr>
<td></td>
<td>- PATCH</td>
</tr>
<tr>
<td></td>
<td>- DELETE</td>
</tr>
<tr>
<td>Base URL</td>
<td>The base URL for the REST request. If <strong>Use Connection Alias</strong> is selected, this field is read-only and displays the base URL associated with alias. If <strong>Define Connection Inline</strong> is selected, enter a base URL for the connection.</td>
</tr>
<tr>
<td>Resource Path</td>
<td>The path for the resource.</td>
</tr>
<tr>
<td>Query Parameters</td>
<td>Name-value pairs to pass to the REST endpoint. You can create these parameters manually, or drag input variables into the parameter fields, and then assign a value.</td>
</tr>
<tr>
<td>Headers</td>
<td>Headers to send with the request. You can create headers manually, or drag input variables into the parameter fields, and then assign a value.</td>
</tr>
<tr>
<td>Body</td>
<td>The body of the request in the format that the content type specifies. This field is available if using the POST, PUT, or PATCH HTTP methods.</td>
</tr>
</tbody>
</table>

If the size of a REST response is larger than 5 MB, the system generates an error. To increase the maximum allowed size of a response, add the `glide.pf.rest.response_payload_max_size` property and increase the value to a maximum of 10 MB.
Script step

Add custom JavaScript to execute within a reusable action. While most core actions and steps fit common use cases, you can build a Script step to execute behavior not satisfied by the core steps.

Note: The IntegrationHub plugin further enhances the Script step to enable you to create integrations with external systems.

Roles and availability

- Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.

Fields

The JavaScript step includes separate input and output variables that enable you to map JavaScript data to Flow Designer data. By defining input and output variables within the step, you can define what Flow Designer data is available within your script, and which scripting variables are available to other steps in your action.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input variables</td>
<td>Name-value pairs that represent data from the action, enabling you to use action inputs and data from other steps within a script.</td>
</tr>
<tr>
<td>Script</td>
<td>Script that executes within the action. To access input and output variables in your script, use the global objects <code>inputs</code> and <code>outputs</code>. For example, <code>inputs.myVariable</code>. Scripts in Flow Designer execute on the server. For available classes and methods, see <a href="#">JavaScript API reference</a>.</td>
</tr>
<tr>
<td>Output variables</td>
<td>Map JavaScript output to Flow Designer data pills. Define output variables when you want other steps in the action to use the script output.</td>
</tr>
</tbody>
</table>

Example

This example builds a JSON payload that can be easily updated or changed and added to a subsequent REST step.

Note: REST step is not available on base systems and requires the IntegrationHub plugin.
By creating an output variable that represents the payload, you can drag the (Payload) data pill into the REST step Body field.

**Send Email step**

Send an email to specified users or groups as an action in a flow.

**Roles and availability**

- Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.
**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>To</td>
<td>The main recipients of the email. Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field, such as a User record. For example, if your action involves an incident record and you want to send an email to the group assigned to the incident, drag the <strong>(Assignment group)</strong> data pill from the data panel.</td>
</tr>
<tr>
<td>CC</td>
<td>Additional recipients copied on this email. Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field.</td>
</tr>
<tr>
<td>BCC</td>
<td>Additional recipients of this email, who are visible only to the sender (blind copied). Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field.</td>
</tr>
<tr>
<td>Subject</td>
<td>Subject of the email. You can enter text or drag-and-drop data pills into the field.</td>
</tr>
<tr>
<td>Body</td>
<td>The content of the message body. You can enter text or drag-and-drop data pills into the field.</td>
</tr>
</tbody>
</table>

**Note:** Flow Designer does not support the $$\{\text{URI}\}$$ parameter for creating a link to a record in the email message body. Instead, consider inserting the information from the record in the email body using data pills, or create a notification step.

**Testing the email step**

To verify that the email was generated when testing the action, review the email record in the Email (sys_email) table. The **Headers** field indicates whether the email was successfully generated. For example:

```
X-ServiceNow-Source:FlowDesigner-9ad2747b0b710300f4eb8bf637673a1e
Message-ID:<193756824.0.1508534586438@[10.0.66.70]>
X-ServiceNow-Generated:true
```

ACL restrictions apply to the Send Email action. If you configured your flow to run as the user who initiates the session, ensure that the user has access control to send email. To test access controls for a Send Email action, impersonate a typical email sender and manually trigger the flow.

**Update Record step**

Update an existing record in a table. You can dynamically add and configure fields for the record, or use a template to set field values.
Roles and availability

- Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>The record to be updated. Drag-and-drop a record data pill or use the data pill picker to select a record.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only. Set to the table associated with the record.</td>
</tr>
</tbody>
</table>

Field Values

- Set static or dynamic values of fields in the record. For example, to set the short description to a static value, select **Short description** and set the desired value. To enable flow designers to dynamically define field values, define an input of type Template Value and drag-and-drop the data pill into the **Field Values** field. Use the input name to help flow designers understand the purpose of the field. You can define both static and dynamic values in the same step.

Note: If a static field value in the action step conflicts with a dynamic value defined when the action is added to a flow, the static value defined in the action step is honored.

Wait For Condition step

Pause the flow until the record value conditions are met.

Roles and availability

- Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Drag-and-drop an input record or a record from a previous step.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only. Set to the table associated with the record.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Conditions that the flow waits for. For example, if the condition is <strong>(State)is(Closed)</strong>, the flow pauses until the condition is met. Once met, the flow moves on to the next step or action. Set static or dynamic conditions to filter records. To define a static condition applied each time the action runs, define the conditions with the condition builder. To enable flow designers to dynamically apply conditions, define an input of type Conditions and drag-and-drop the input data pill into the <strong>Conditions</strong> field.</td>
</tr>
</tbody>
</table>
Spokes

Add application-specific content to Flow Designer by installing spokes.

A spoke is a scoped application containing Flow Designer content dedicated to a particular application or record type. For example, the **ITSM Spoke** contains actions for managing Task records such as the **Create Task** action. Spokes are activated when their parent application is activated. For example, the **ITSM Spoke** is activated when the Incident, Problem, and Change applications are activated. Creating a spoke requires familiarity with application development as developers must add Flow Designer content to a scoped application.

### Default spokes available

<table>
<thead>
<tr>
<th>Spoke</th>
<th>Description</th>
<th>Plugin</th>
<th>Included with</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Benchmarks Spoke</strong></td>
<td>Provides read-only actions for the read-only Benchmark Recommendation Evaluator flow.</td>
<td>(com.sn_bm_client.spoke)</td>
<td><strong>Benchmarks application</strong></td>
</tr>
<tr>
<td><strong>Connect spoke</strong></td>
<td>Provides actions to automate the creation of conversations, to add users to a conversation, and to send messages to a conversation. These actions work with Connect API version 3 and later.</td>
<td>(com.glide.connect_v3plus.core.ah)</td>
<td><strong>Now Platform</strong></td>
</tr>
<tr>
<td><strong>Customer Service Spoke</strong></td>
<td>Provides actions for flow designers to use when creating Customer Service Management business processes.</td>
<td>(com.snc.customer_service.spoke)</td>
<td><strong>Customer Service Management</strong> application</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Spoke</th>
<th>Description</th>
<th>Plugin</th>
<th>Included with</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field Service Spoke</strong></td>
<td>Provides actions for flow designers to use when creating Field Service Management business processes.</td>
<td>(com.snc.field_service.spoke)</td>
<td>Field Service Management application</td>
</tr>
<tr>
<td><strong>ITSM spoke</strong></td>
<td>Provides flow and actions associated with ITSM. Requires the ITSM application suite.</td>
<td>(com.snc.itsm.spoke)</td>
<td>IT Service Management application</td>
</tr>
<tr>
<td><strong>Visual Task Board (VTB) Spoke</strong></td>
<td>Provides VTB actions for flow designers to manage the boards, lanes, cards, board members, and assignees.</td>
<td>(com.glide.ui.vtb.ah)</td>
<td>Now Platform</td>
</tr>
</tbody>
</table>

### IntegrationHub spokes

These spokes require an IntegrationHub subscription.

<table>
<thead>
<tr>
<th>Spoke</th>
<th>Description</th>
<th>Plugin</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>HipChat spoke</strong></td>
<td>The HipChat Spoke provides actions which automate the creation of conversations, add users to a conversation, and send messages to a conversation.</td>
<td>(com.sn.hipchat.ah)</td>
</tr>
<tr>
<td><strong>Microsoft Teams spoke</strong></td>
<td>The Microsoft Teams Spoke provides actions to automate sending messages about incidents and problems to MS Teams channel.</td>
<td>(com.sn.ms_teams.ah)</td>
</tr>
<tr>
<td><strong>ServiceNow eBonding spoke</strong></td>
<td>The ServiceNow eBonding Spoke provides some common integration design patterns through a common use case of synchronizing incidents across ServiceNow instances.</td>
<td>(com.glide.sn.ebonding.ah)</td>
</tr>
<tr>
<td><strong>REST step</strong></td>
<td>Enables the REST action step in Flow Designer.</td>
<td>(com.glide.hub.action_step.rest)</td>
</tr>
<tr>
<td><strong>Slack spoke</strong></td>
<td>The Slack Spoke provides actions that facilitate sending messages about incidents and problems to a channel.</td>
<td>(com.sn.slack.ah)</td>
</tr>
</tbody>
</table>
**Benchmarks Spoke**

Provides read-only actions for the read-only Benchmark Recommendation Evaluator flow. The Benchmarks Spoke is designed for the Recommendations feature of the Benchmarks application.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Action Inputs</th>
<th>Action Outputs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Recommendation Activity Records</td>
<td>Create or update recommendation activity records.</td>
<td>• Recommendation</td>
<td>N/A</td>
</tr>
<tr>
<td>Delete Recommendation Evaluations</td>
<td>Delete recommendation evaluations for the specified month.</td>
<td>• Activity record</td>
<td>N/A</td>
</tr>
</tbody>
</table>
| Evaluate Recommendation Condition | Evaluate the conditions and script specified for the recommendation. | • Record count  
• Threshold  
• Direction  
• Recommendation  
• Activity record | • Result  
• Score |

**Connect Spoke**

Provides actions to automate the creation of conversations, to add users to a conversation, and to send messages to a conversation. These actions work with Connect API version 3 and later.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Group Users to Task Conversation</td>
<td>Create a task conversation, and add all users of a group to it.</td>
</tr>
<tr>
<td>Add User to Task Conversation</td>
<td>Create a task conversation, and add a user to it.</td>
</tr>
<tr>
<td>Send Message to Task Conversation</td>
<td>Send a message to all users of a task conversation.</td>
</tr>
</tbody>
</table>

**Customer Service Spoke**

Provides actions for flow designers to use when creating Customer Service Management business processes. Requires the Customer Service Management (com.sn_customerservice) plugin.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get Case</td>
<td>Retrieve a case record using the case number. If multiple records are found, only the first record is returned.</td>
</tr>
<tr>
<td>Create Case</td>
<td>Create a case using one or more attributes. This action mimics the structure of the Case table (sn_customerservice_case) and exposes the fields present on the Case table.</td>
</tr>
<tr>
<td>Create Quick Case</td>
<td>Create a case using the customer, description, channel, priority, and category attributes.</td>
</tr>
<tr>
<td>Create Task on Case</td>
<td>Create a case task and optionally associate it with a case.</td>
</tr>
<tr>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Update Case</td>
<td>Update a case by providing the case reference and the fields that you want to update.</td>
</tr>
<tr>
<td>Assign Case</td>
<td>Assign a case using matching rules. To use this action, you must first define the matching rules that match cases with resources (assignment groups, agents).</td>
</tr>
<tr>
<td>Escalate Case</td>
<td>Request case escalation. This action does not automatically approve escalation. Approval is based on the selected escalation template.</td>
</tr>
<tr>
<td>Escalate Account</td>
<td>Request account escalation. This action does not automatically approve escalation. Approval is based on the selected escalation template.</td>
</tr>
<tr>
<td>Add Work Note to Task</td>
<td>Add a work note to a task or to task extended objects (for example, a case or case task).</td>
</tr>
<tr>
<td>Add Comment to Task</td>
<td>Add a comment to a task or to task extended objects (for example, a case or case task).</td>
</tr>
</tbody>
</table>

**Field Service Spoke**

Provides actions for flow designers to use when creating Field Service Management business processes.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get Work Order</td>
<td>Retrieve a work order record using the work order number. If multiple records are found, only the first record is returned.</td>
</tr>
<tr>
<td>Create Work Order</td>
<td>Create a work order and optionally associate it with a case.</td>
</tr>
<tr>
<td>Update Work Order</td>
<td>Update a work order by providing the work order reference and the fields that you want to update.</td>
</tr>
<tr>
<td>Get Work Order Task</td>
<td>Retrieve a work order task record using the work order task number. If multiple records are found, only the first record is returned.</td>
</tr>
<tr>
<td>Create Work Order Task</td>
<td>Create a work order task and optionally associate it with a work order.</td>
</tr>
<tr>
<td>Update Work Order Task</td>
<td>Update a work order task by providing the work order task reference and the fields that you want to update.</td>
</tr>
<tr>
<td>Add Work Note to Task</td>
<td>Add a work note to a task or to task extended objects (for example, a work order or work order task).</td>
</tr>
</tbody>
</table>

**ITSM spoke**

Provides flow and actions associated with ITSM. Requires the ITSM application suite.
<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Comment</td>
<td>Adds a comment to a task record.</td>
</tr>
<tr>
<td>Add Worknote</td>
<td>Adds a work note to a task record.</td>
</tr>
<tr>
<td>Assign Incident to CI Support Group</td>
<td>Updates an incident record to assign it to the CI Support Group.</td>
</tr>
<tr>
<td>Create Catalog Task on Request</td>
<td>Creates a Catalog Task record from a Request record.</td>
</tr>
<tr>
<td>Create Catalog Task on Request Item</td>
<td>Creates a Catalog Task record from a Request Item record.</td>
</tr>
<tr>
<td>Create Change Task on Change Request</td>
<td>Creates a Change Task record from a Change Request record.</td>
</tr>
<tr>
<td>Create Emergency Change Request</td>
<td>Creates a Change Request record of type Emergency.</td>
</tr>
<tr>
<td>Create Emergency Request from Incident</td>
<td>Creates a Change Request record of type Emergency from an Incident record.</td>
</tr>
<tr>
<td>Create Incident</td>
<td>Creates an Incident record.</td>
</tr>
<tr>
<td>Create Incident Task on Incident</td>
<td>Creates an Incident Task record from an Incident record.</td>
</tr>
<tr>
<td>Create Normal Change Request from Incident</td>
<td>Creates a Change Request record of type Normal from an Incident record.</td>
</tr>
<tr>
<td>Create Problem from Incident</td>
<td>Creates a Problem record from an Incident record.</td>
</tr>
<tr>
<td>Create Request</td>
<td>Creates a Request record.</td>
</tr>
<tr>
<td>Create Standard Change Request</td>
<td>Creates a Change Request record of type Standard.</td>
</tr>
<tr>
<td>Create Task (Core Action)</td>
<td>Creates a child task record for a Task table record. For example, creates an Incident Task record for an Incident record.</td>
</tr>
<tr>
<td>Create Standard Change Request from Incident</td>
<td>Creates a Change Request record of type Standard from an Incident record.</td>
</tr>
<tr>
<td>Update Assignee</td>
<td>Updates the Assigned to field of a Task table record.</td>
</tr>
<tr>
<td>Update Assignment Group</td>
<td>Updates the Assignment Group field of a Task table record.</td>
</tr>
</tbody>
</table>

**Security Operations spoke**

**Security Incident Response flow templates**

The Security Incident Response flow templates are created using the Flow Designer.
**Note:** Each of the flows is triggered when the **Category** in a security incident is set or changed.

<table>
<thead>
<tr>
<th>Template</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Security Incident Confidential Data Exposure flow template</td>
<td>Perform a series of tasks designed to handle the exposure of sensitive data.</td>
</tr>
<tr>
<td>Security Incident Denial of Service flow template</td>
<td>Perform a series of tasks designed to handle Denial of Service (DOS) attacks.</td>
</tr>
<tr>
<td>Security Incident Lost Equipment flow template</td>
<td>Perform a series of tasks designed to handle lost equipment.</td>
</tr>
<tr>
<td>Security Incident Malicious Software flow template</td>
<td>Perform a series of tasks designed to handle malicious software on your network.</td>
</tr>
<tr>
<td>Security Incident Phishing flow template</td>
<td>Perform a series of tasks designed to handle spear phishing emails on your network.</td>
</tr>
<tr>
<td>Security Incident Policy Violation flow template</td>
<td>Perform a series of tasks designed to handle security policy violations.</td>
</tr>
<tr>
<td>Security Incident Reconnaissance flow template</td>
<td>Perform a series of tasks designed to handle reconnaissance on your network.</td>
</tr>
<tr>
<td>Security Incident Rogue Server or Service flow template</td>
<td>Perform a series of tasks designed to handle activity from rogue servers or services affecting your network.</td>
</tr>
<tr>
<td>Security Incident Spam flow template</td>
<td>Perform a series of tasks designed to handle email spam on your network.</td>
</tr>
<tr>
<td>Security Incident Unauthorized Access flow template</td>
<td>Perform a series of tasks designed to handle unauthorized access to your network.</td>
</tr>
<tr>
<td>Security Incident Web/BBS Defacement flow template</td>
<td>Perform a series of tasks designed to handle vandalism directed against one of your organization's BBS or web sites.</td>
</tr>
</tbody>
</table>

**Visual Task Board (VTB) Spoke**

Provides VTB actions for flow designers to manage the boards, lanes, cards, board members, and assignees.

**Board Management Actions**

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Action Inputs</th>
<th>Action Outputs</th>
</tr>
</thead>
</table>
| Create Freeform VTB   | Creates a Freeform VTB for any task type. The default lanes are: Todo, Doing, and Done. These lanes can be modified with actions: Add Lane, Rename Lane, Reorder Lane, and Delete Lane | • Name  
• Board Owner  
• Default view  
• Label visibility  
• Picker visibility  
• Background color | • Board record |
<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Action Inputs</th>
<th>Action Outputs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Flexible VTB</td>
<td>Creates a Flexible VTB bound to a single Task table. The default lanes are:</td>
<td>• Name&lt;br&gt;• Task table&lt;br&gt;• Filter&lt;br&gt;• Board Owner&lt;br&gt;• Default view&lt;br&gt;•</td>
<td>• Board record</td>
</tr>
<tr>
<td>Action</td>
<td>Todo, Doing, and Done. These lanes can be modified with actions: Add Lane,</td>
<td>Label visibility&lt;br&gt;• Picker visibility&lt;br&gt;• Background color</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Rename Lane, Reorder Lane, and Delete Lane</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Create Guided VTB</td>
<td>Creates a data-driven VTB bound to a single Task table along with the fields</td>
<td>• Name&lt;br&gt;• Task table&lt;br&gt;• Land field&lt;br&gt;• Filter&lt;br&gt;• Board Owner&lt;br&gt;• Default view&lt;br&gt;•</td>

</table>
## Card Management Actions

<table>
<thead>
<tr>
<th>Flow/Action</th>
<th>Description</th>
<th>Action Steps</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create VTB Card</td>
<td>Create a VTB card on a Freeform board for a task.</td>
<td>• Lane record • Task record</td>
<td>Card record</td>
</tr>
<tr>
<td>Assign VTB Card</td>
<td>Assign a user to a VTB card.</td>
<td>• Card record • User record</td>
<td>N/A</td>
</tr>
<tr>
<td>Move VTB Card</td>
<td>Move a VTB card from one lane to another lane.</td>
<td>• Card record • Lane record</td>
<td>N/A</td>
</tr>
<tr>
<td>Remove Assignee from VTB Card</td>
<td>Remove an assignee from a card.</td>
<td>• Card record</td>
<td>N/A</td>
</tr>
</tbody>
</table>

**Note:** For Flexible boards, use the Update Record action to change the state of the underlying task. For Guided boards, this action changes the field on the task associated with that card.

## Flow execution details

View runtime information about a flow directly from the design environment such as the current state, actions run, and values produced. Open related records from embedded Now Platform editors or in a new tab.

Each time a flow runs, the system stores information about the configuration and runtime values produced, which process analysts can view from the Flow Designer design environment **Flow Executions** tab. Select a flow execution to open its associated execution details page.

**Sample execution details of the VTB Sample Flow**

Each execution details page displays:

- Flow state
- Related record options
- Flow Statistics
Flow state

All active flows are in one of these states.

**Completed**

The flow successfully ran all actions. The flow statistics display configuration and run-time details for each action.

**Waiting**

The flow paused on an action that is waiting for some condition to be met before continuing. The flow statistics display configuration and run-time details for completed actions and configuration details for any actions waiting for a condition to be met. Flows in the Waiting state display a Cancel Flow UI action in the header.

**Error**

The flow stopped with an error. The flow statistics display configuration and run-time details for completed actions and configuration details for the action that produced the error. Flows in the Error state display a Go to error UI action in the header.

Related record options

From the Execution details page, you can access records related to the current flow.

**Open Flow**

Use this option to make configuration changes and publish a new instance of the flow. Changing the flow configuration does not change any currently active flow.

**Open Context Record**

Use this option to view the flow state, run duration, and related log entries from a standard form view. This option opens the context record in a new tab.

**Open Flow Logs**

Use this link to view detailed log information about each action. This link opens the log entries list in a new tab.

**Open Current Record**

For flows that have a record-based trigger, use this link to view the triggering record in a pop-up window.

**Open Action**

Use this link to make configuration changes and publish a new instance of the action. Changing the action configuration does not change any currently active flow. This link is unavailable for ServiceNow-provided core actions.

Flow statistics

Use flow statistics to see configuration details and run-time values for each flow component. Clicking a trigger or action expands the row and displays configuration and run-time details about it.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
The following types of execution details are available.

**Configuration Details**

Use the list of input variables to identify any configuration errors with the action. Each variable has its own row displaying its name, data type, configuration settings, and run-time value. The configuration settings display dynamic values as pills. The run-time values display generated records as a link.

**Output Data**

Use the list of output variables to identify any configuration errors with the action.

**Logs**

Use the log entries to identify potential processing or performance issues. Each log entry has its own row displaying the creation date, log level, and log message. If the action does not generate any logs, the statistics displays the string **No Logs**.

**Steps**

Use the list of steps to identify any configuration errors with the action. Each step has its own row displaying the variable name, data type, configuration settings, and run-time value. Core actions do not display steps because users cannot change their configuration.

**Run duration**

Use the run duration to identify potential processing or performance issues. Each action and step displays the duration in milliseconds. System quota rules prevent any action from running longer than a minute.

**Embedded text viewer**

Flow Designer displays large text-based configuration and runtime output records such as email output, XML payloads, or script steps using an embedded text viewer. The embedded text viewer can format text as HTML, plain text, or color-coded JavaScript. For script steps, the text viewer highlights code lines containing errors.
function execute(inputs, outputs) {
  var vtbLane = new GlideRecord('vtb_lane');
  vtbLane.addQuery('board', inputs.vtbBoard.sys_id)
  vtbLane.query();
  vtbLane.next();

  var vtbCard = new GlideRecord('vtb_card');
  vtbCard.task = inputs.task.sys_id;
  vtbCard.board = inputs.vtbBoard.sys_id;
  vtbCard.lane = vtbLane.sys_id;
  vtbCard.insert();

  outputs.vtbCard = vtbCard;
}(inputs, outputs);
Viewing results for each item in flow logic

Flow Designer displays a selector control to view the configuration and run-time results for each item processed by flow logic. Select a record number to see its configuration and run-time details.
Flow administration modules
Identify and troubleshoot potential issues by reviewing flow executions, the event queue, and the operations dashboard.
Flow Designer provides administrators and flow operators these modules to manage flows.

Today’s Executions
Displays a list of flow context records for flows run today. Use this information to identify flows run today.

Active flows
Displays a list of flow context records for running flows where the State is Waiting. Use this information to identify flows that are waiting for a trigger or condition to continue.

Event Queue
Displays a filtered list of event records where the Queue is flow_engine and the State is Ready. Use this information to identify flows that are waiting on event processing.

Operations Dashboard
Displays a responsive dashboard containing a count of flows run and the average flow runtime. View statistics for today or over the last 30 days. Use this information to determine the health and performance of flow execution.

IntegrationHub
Automate integration tasks using ServiceNow-built components for Flow Designer, or develop custom integrations. Requires a separate subscription.

Capabilities
IntegrationHub enables execution of third-party APIs as a part of a flow when a specific event occurs in ServiceNow. These integrations, referred to as spokes, are easy to configure and enable you to quickly add powerful actions without the need to write a script. For example, you can post a message and incident details in a Slack channel when a high priority incident is created.
IntegrationHub provides the following functionality:

Spokes for base system integrations
Using IntegrationHub actions in Flow Designer, you can:
- Post messages and ServiceNow incident, problem, and change record details to HipChat, Slack, or Microsoft Teams communications channels.
- Synchronize data across multiple production instances using the eBonding spoke as an example.

Create custom integrations
Build custom integrations with Action Designer using a REST step or a Script step.
Connection and Credentials

IntegrationHub takes advantage of aliases to manage connection information and credentials when integrating with external systems. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. IntegrationHub only requires an alias, which then resolves to use the correct credentials and connection information during runtime. Learn more about Introduction to credentials, connections, and aliases.

Benefits

IntegrationHub provides process owners and developers these benefits.

- Extends Flow Designer content to integrate business processes with external systems.
- Promotes business process automation by enabling subject matter experts to develop and share spokes with flow designers.
- Provides natural-language-descriptions of integration logic to help non-technical users understand triggers, actions, inputs, and outputs.

Development process

When developing a custom integration, develop all actions for the integration within a scoped application. When deployed to a target instance, these actions are grouped as a spoke in Flow Designer. Brand the spoke by adding a custom icon to the application record. To learn more about application development, see Applications.

When developing spokes, flow and action designers typically perform these application development tasks.

1. Create a scoped application on a development instance to build spokes.
2. Publish a test version of the scoped application to the application repository.
3. Deploy the scoped application to a test instance from the application repository.
4. Test the scoped application on the test instance.
5. When working as expected, publish the scoped application in one of the following ways.
   - Publish to the application repository for deployment on production instances.
   - Publish to the ServiceNow Store as an application that customers can request for their environments.
   - Publish to ServiceNow Share to provide content to other customers in the ServiceNow community.

Review Flow Designer design considerations in the Architecture Overview.

Request IntegrationHub

Flow Designer is a Now Platform feature that enables you to automate processes within a single ServiceNow instance. Use base system actions or Action Designer steps to manipulate records, send emails, trigger notifications, and expose scripts as code-less components. Create integrations with external systems by requesting IntegrationHub. IntegrationHub enables base system components in Action Designer, such as the Script step, to call external systems using integration APIs and activates protocol steps like REST.
The ServiceNow IntegrationHub Installer plugin (com.glide.hub.integrations) requires a separate subscription and must be activated by ServiceNow personnel. This plugin includes demo data and activates related plugins if they are not already active.

**Note:** You must have an IntegrationHub subscription to make any outbound API calls triggered by a flow, including calls that a flow indirectly triggers through business rules or other scripts. For example, suppose a flow updates a record in a table that has a business rule applied. If the business rule includes outbound API calls and is triggered by the flow’s record update, you must have an IntegrationHub subscription.

### Plugins for ServiceNow IntegrationHub Installer

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HipChat Spoke for ServiceNow IntegrationHub (com.sn.hipchat.ah)</td>
<td>The HipChat Spoke for ServiceNow IntegrationHub provides actions that a Process Analyst can use when designing flows. The actions allow them to automate the creation of conversations, add users to a conversation, and send messages to a conversation.</td>
</tr>
<tr>
<td>Slack Spoke for ServiceNow IntegrationHub (com.sn.slack.ah)</td>
<td>The Slack Spoke for ServiceNow IntegrationHub provides actions that a Process Analyst can use when designing flows. The actions allow them to send messages about Incidents and Problems to a channel.</td>
</tr>
<tr>
<td>Microsoft Teams Spoke for ServiceNow IntegrationHub (com.sn.ms_teams.ah)</td>
<td>The Microsoft Teams Spoke for ServiceNow IntegrationHub provides actions that a Process Analyst can use when designing flows to automate sending messages about Incidents and Problems to a MS Teams channel.</td>
</tr>
<tr>
<td>ServiceNow eBonding Spoke for ServiceNow IntegrationHub (com.glide.sn.ebonding.ah)</td>
<td>The ServiceNow ebonding Spoke for the ServiceNow IntegrationHub provides Actions that enable process analysts to compose flows that help in ebonding with remote ServiceNow instances.</td>
</tr>
</tbody>
</table>

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization’s production and sub-production instances, generally within a few days.

If you do not have an account manager, decide to delay activation after purchase, or want to evaluate the product on a sub-production instance without charge, follow these steps.

1. In the HI Service Portal, click **Service Requests > Activate Plugin**.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
</tbody>
</table>
Specify the date and time you would like this plugin to be enabled

Date and time must be at least 2 business days from the current time.

Note: Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.

Reason/Comments

Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows.

3. Click Submit.

IntegrationHub available spokes

Review the integration-specific flows and actions available to each spoke.

Spokes list and compatibility

<table>
<thead>
<tr>
<th>Spoke name</th>
<th>Tested against</th>
</tr>
</thead>
<tbody>
<tr>
<td>HipChat spoke</td>
<td>HipChat API version v2</td>
</tr>
<tr>
<td>Microsoft Teams spoke</td>
<td>Microsoft teams API version v1</td>
</tr>
<tr>
<td>ServiceNow eBonding spoke</td>
<td>ServiceNow API version v1</td>
</tr>
<tr>
<td>Slack spoke</td>
<td>Slack Incoming Webhooks</td>
</tr>
</tbody>
</table>

HipChat spoke

The HipChat spoke provides actions which post messages and ServiceNow incident, problem, and change record details to a HipChat conversation.

HipChat actions

The HipChat spoke is an available integration through IntegrationHub. You can specify the following HipChat actions within a flow:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Post a Message</td>
<td>Send a message to a HipChat room. Specify the Room Notification URL, Auth Token, and Message to send.</td>
</tr>
<tr>
<td>Post Change Details</td>
<td>Send details about a ServiceNow change record to a HipChat room. Specify the Room Notification URL, Auth Token, and Change record to send.</td>
</tr>
<tr>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Post Incident Details</td>
<td>Send details about a ServiceNow incident record to a HipChat room. Specify the Room Notification URL, Auth Token, and Incident record to send.</td>
</tr>
<tr>
<td>Post Problem Details</td>
<td>Send details about a ServiceNow problem record to a HipChat room. Specify the Room Notification URL, Auth Token, and Problem record to send.</td>
</tr>
</tbody>
</table>

HipChat Inputs

The following inputs are common to the HipChat actions:

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Required) Room Notification URL</td>
<td>The HipChat notification REST API URL. Example: <a href="https://api.hipchat.com/v2/%7Broom">https://api.hipchat.com/v2/{room</a> name}/ah-test/notification</td>
</tr>
<tr>
<td>(Required) Auth Token</td>
<td>You need an access token to send notifications. Refer to the HipChat API access token guide for details.</td>
</tr>
<tr>
<td>(Optional) Additional Message</td>
<td>Add a message to the record details.</td>
</tr>
<tr>
<td>(Optional) Override Default Field</td>
<td>You can provide a comma-separated list of field names to send instead of the default fields. Default fields are Short Description, Category, State, Priority, and Assignment Group.</td>
</tr>
</tbody>
</table>

Example

You can add a HipChat Post Incident Details action to a flow which identifies high priority incidents and who they are assigned to.
Microsoft Teams spoke

The Microsoft Teams spoke provides actions which post messages and ServiceNow incident, problem, and change record details to Microsoft Teams channels.

Microsoft Teams actions

The Microsoft Teams spoke is an available integration through IntegrationHub. You can specify the following Microsoft Teams actions within a flow:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Post a Message</td>
