<th>Action Inputs</th>
<th>Action Outputs</th>
</tr>
</thead>
</table>
| Create Flexible VTB Action | Creates a Flexible VTB bound to a single Task table. The default lanes are: Todo, Doing, and Done. These lanes can be modified with actions: Add Lane, Rename Lane, Reorder Lane, and Delete Lane | • Name  
• Task table  
• Filter  
• Board Owner  
• Default view  
• Label visibility  
• Picker visibility  
• Background color | • Board record |
| Create Guided VTB Action | Creates a data-driven VTB bound to a single Task table along with the fields the lanes are derived. | • Name  
• Task table  
• Land field  
• Filter  
• Board Owner  
• Default view  
• Label visibility  
• Picker visibility  
• Background color | • Board record |
| Add VTB Member Action | Add a user to a VTB. Only members of the VTB can access the board. Any VTB member can add other members. | • Board record  
• User record | N/A |
| Remove VTB Member Action | Remove a user from a VTB. Only members of a VTB can access the board. Any VTB member can remove other members. | • Board record  
• User record | N/A |

**Lane Management Actions**

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Action Steps</th>

</table>

**Flow execution details**

View runtime information about a flow directly from the design environment such as the current state, actions run, and values produced. Open related records from embedded Now Platform editors or in a new tab.

Each time a flow runs, the system stores information about the configuration and runtime values produced, which process analysts can view from the Flow Designer design environment **Flow Executions** tab. Select a flow execution to open its associated execution details page.
Sample execution details of the VTB Sample Flow

Each execution details page displays:

- Flow state
- Related record options
- Flow Statistics
Flow state

All active flows are in one of these states.

**Completed**

The flow successfully ran all actions. The flow statistics display configuration and run-time details for each action.

**Waiting**

The flow paused on an action that is waiting for some condition to be met before continuing. The flow statistics display configuration and run-time details for completed actions and configuration details for any actions waiting for a condition to be met. Flows in the Waiting state display a **Cancel Flow** UI action in the header.

**Error**

The flow stopped with an error. The flow statistics display configuration and run-time details for completed actions and configuration details for the action that produced the error. Flows in the Error state display a **Go to error** UI action in the header.

Related record options

From the Execution details page, you can access records related to the current flow.

**Open Flow**

Use this option to make configuration changes and publish a new instance of the flow. Changing the flow configuration does not change any currently active flow.

**Open Context Record**

Use this option to view the flow state, run duration, and related log entries from a standard form view. This option opens the context record in a new tab.

**Open Flow Logs**

Use this link to view detailed log information about each action. This link opens the log entries list in a new tab.

**Open Current Record**

For flows that have a record-based trigger, use this link to view the triggering record in a pop-up window.

**Open Action**

Use this link to make configuration changes and publish a new instance of the action. Changing the action configuration does not change any currently active flow. This link is unavailable for ServiceNow-provided core actions.

Flow statistics

Use flow statistics to see configuration details and run-time values for each flow component. Clicking a trigger or action expands the row and displays configuration and run-time details about it.
### Flow Designer

**VTB Sample Flow**

**Flow Statistics**
- **State**: Completed
- **Start Time**: 2017-11-02 11:15:21
- **Duration**: 460ms

**Trigger**
- [Incident] Created

**Actions**
- **Create Freeform VTB**
  - **State**: Completed
  - **Start Time**: 2017-11-02 11:15:21
  - **Duration**: 180ms

#### Configuration Details

<table>
<thead>
<tr>
<th>Variable Name</th>
<th>Type</th>
<th>Configuration</th>
<th>Runtime Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>String</td>
<td>P1 Incidents</td>
<td>P1 Incidents</td>
</tr>
<tr>
<td>Owner</td>
<td>Reference</td>
<td>Trigger INCIDENT_RECORD Assigned to</td>
<td>46d446239fe10810012d100201006686</td>
</tr>
</tbody>
</table>
The following types of execution details are available.

**Configuration Details**

Use the list of input variables to identify any configuration errors with the action. Each variable has its own row displaying its name, data type, configuration settings, and run-time value. The configuration settings display dynamic values as pills. The run-time values display generated records as a link.

**Output Data**

Use the list of output variables to identify any configuration errors with the action.

**Logs**

Use the log entries to identify potential processing or performance issues. Each log entry has its own row displaying the creation date, log level, and log message. If the action does not generate any logs, the statistics displays the string **No Logs**.

**Steps**

Use the list of steps to identify any configuration errors with the action. Each step has its own row displaying the variable name, data type, configuration settings, and run-time value. Core actions do not display steps because users cannot change their configuration.

**Run duration**

Use the run duration to identify potential processing or performance issues. Each action and step displays the duration in milliseconds. System quota rules prevent any action from running longer than a minute.

**Embedded text viewer**

Flow Designer displays large text-based configuration and runtime output records such as email output, XML payloads, or script steps using an embedded text viewer. The embedded text viewer can format text as HTML, plain text, or color-coded JavaScript. For script steps, the text viewer highlights code lines containing errors.
(function execute(inputs, outputs) {
    var vtblLane = new GlideRecord('vtb_lane');
    vtblLane.addQuery('board', inputs.vtbBoard.sys_id)
    vtblLane.query();
    vtblLane.next();

    var vtbcCard = new GlideRecord('vtb_card');
    vtbcCard.task = inputs.task.sys_id;
    vtbcCard.board = inputs.vtbBoard.sys_id;
    vtbcCard.lane = vtblLane.sys_id;
    vtbcCard.insert();

    outputs.vtbcCard = vtbcCard;
})(inputs, outputs);
Viewing results for each item in flow logic

Flow Designer displays a selector control to view the configuration and run-time results for each item processed by flow logic. Select a record number to see its configuration and run-time details.

Flow administration modules

Identify and troubleshoot potential issues by reviewing flow executions, the event queue, and the operations dashboard.

Flow Designer provides administrators and flow operators these modules to manage flows.

Today's Executions
Displays a list of flow context records for flows run today. Use this information to identify flows run today.

Active flows
Displays a list of flow context records for running flows where the State is Waiting. Use this information to identify flows that are waiting for a trigger or condition to continue.

Event Queue
Displays a filtered list of event records where the Queue is flow_engine and the State is Ready. Use this information to identify flows that are waiting on event processing.

Operations Dashboard
Displays a responsive dashboard containing a count of flows run and the average flow runtime. View statistics for today or over the last 30 days. Use this information to determine the health and performance of flow execution.

IntegrationHub

Automate integration tasks using ServiceNow-built components for Flow Designer, or develop custom integrations. Requires a separate subscription.

Capabilities

IntegrationHub enables execution of third-party APIs as a part of a flow when a specific event occurs in ServiceNow. These integrations, referred to as spokes, are easy to configure and enable you to quickly add powerful actions without the need to write a script. For example, you can post a message and incident details in a Slack channel when a high priority incident is created.

IntegrationHub provides the following functionality:

Spokes for base system integrations
Using IntegrationHub actions in Flow Designer, you can:

- Post messages and ServiceNow incident, problem, and change record details to HipChat, Slack, or Microsoft Teams communications channels.
- Synchronize data across multiple production instances using the eBonding spoke as an example.

Create custom integrations
Build custom integrations with Action Designer using a REST step or a Script step.
Connection and Credentials

IntegrationHub takes advantage of aliases to manage connection information and credentials when integrating with external systems. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. IntegrationHub only requires an alias, which then resolves to use the correct credentials and connection information during runtime. Learn more about Introduction to credentials, connections, and aliases.

Benefits

IntegrationHub provides process owners and developers these benefits.

- Extends Flow Designer content to integrate business processes with external systems.
- Promotes business process automation by enabling subject matter experts to develop and share spokes with flow designers.
- Provides natural-language-descriptions of integration logic to help non-technical users understand triggers, actions, inputs, and outputs.

Development process

When developing a custom integration, develop all actions for the integration within a scoped application. When deployed to a target instance, these actions are grouped as a spoke in Flow Designer. Brand the spoke by adding a custom icon to the application record. To learn more about application development, see Applications.

When developing spokes, flow and action designers typically perform these application development tasks.

1. Create a scoped application on a development instance to build spokes.
2. Publish a test version of the scoped application to the application repository.
3. Deploy the scoped application to a test instance from the application repository.
4. Test the scoped application on the test instance.
5. When working as expected, publish the scoped application in one of the following ways.
   - Publish to the application repository for deployment on production instances.
   - Publish to the ServiceNow Store as an application that customers can request for their environments.
   - Publish to ServiceNow Share to provide content to other customers in the ServiceNow community.

Review Flow Designer design considerations in the Architecture Overview.

Request IntegrationHub

Flow Designer is a Now Platform feature that enables you to automate processes within a single ServiceNow instance. Use base system actions or Action Designer steps to manipulate records, send emails, trigger notifications, and expose scripts as code-less components. Create integrations with external systems by requesting IntegrationHub. IntegrationHub enables base system components in Action Designer, such as the Script step, to call external systems using integration APIs and activates protocol steps like REST.
Role required: none

The ServiceNow IntegrationHub Installer plugin (com.glide.hub.integrations) requires a separate subscription and must be activated by ServiceNow personnel. This plugin includes demo data and activates related plugins if they are not already active.

**Note:** You must have an IntegrationHub subscription to make any outbound API calls triggered by a flow, including calls that a flow indirectly triggers through business rules or other scripts. For example, suppose a flow updates a record in a table that has a business rule applied. If the business rule includes outbound API calls and is triggered by the flow's record update, you must have an IntegrationHub subscription.

### Plugins for ServiceNow IntegrationHub Installer

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HipChat Spoke for ServiceNow IntegrationHub (com.sn.hipchat.ah)</td>
<td>The HipChat Spoke for ServiceNow IntegrationHub provides actions that a Process Analyst can use when designing flows. The actions allow them to automate the creation of conversations, add users to a conversation, and send messages to a conversation.</td>
</tr>
<tr>
<td>Slack Spoke for ServiceNow IntegrationHub (com.sn.slack.ah)</td>
<td>The Slack Spoke for ServiceNow IntegrationHub provides actions that a Process Analyst can use when designing flows. The actions allow them to send messages about Incidents and Problems to a channel.</td>
</tr>
<tr>
<td>Microsoft Teams Spoke for ServiceNow IntegrationHub (com.sn.ms_teams.ah)</td>
<td>The Microsoft Teams Spoke for ServiceNow IntegrationHub provides actions that a Process Analyst can use when designing flows to automate sending messages about Incidents and Problems to a MS Teams channel.</td>
</tr>
<tr>
<td>ServiceNow eBonding Spoke for ServiceNow IntegrationHub (com.glide.sn.ebonding.ah)</td>
<td>The ServiceNow eBonding Spoke for the ServiceNow IntegrationHub provides Actions that enable process analysts to compose flows that help in eBonding with remote ServiceNow instances.</td>
</tr>
</tbody>
</table>

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization’s production and sub-production instances, generally within a few days.

If you do not have an account manager, decide to delay activation after purchase, or want to evaluate the product on a sub-production instance without charge, follow these steps.

1. In the HI Service Portal, click **Service Requests > Activate Plugin**.
2. Fill out the form:

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
</tbody>
</table>
Specify the date and time you would like this plugin to be enabled

Date and time must be at least 2 business days from the current time.

Note: Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.

Reason/Comments

Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows.

3. Click Submit.

IntegrationHub available spokes

Review the integration-specific flows and actions available to each spoke.

Spokes list and compatibility

<table>
<thead>
<tr>
<th>Spoke name</th>
<th>Tested against</th>
</tr>
</thead>
<tbody>
<tr>
<td>HipChat spoke</td>
<td>HipChat API version v2</td>
</tr>
<tr>
<td>Microsoft Teams spoke</td>
<td>Microsoft teams API version v1</td>
</tr>
<tr>
<td>ServiceNow eBonding spoke</td>
<td>ServiceNow API version v1</td>
</tr>
<tr>
<td>Slack spoke</td>
<td>Slack Incoming Webhooks</td>
</tr>
</tbody>
</table>

HipChat spoke

The HipChat spoke provides actions which post messages and ServiceNow incident, problem, and change record details to a HipChat conversation.

HipChat actions

The HipChat spoke is an available integration through IntegrationHub. You can specify the following HipChat actions within a flow:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Post a Message</td>
<td>Send a message to a HipChat room. Specify the Room Notification URL, Auth Token, and Message to send.</td>
</tr>
<tr>
<td>Post Change Details</td>
<td>Send details about a ServiceNow change record to a HipChat room. Specify the Room Notification URL, Auth Token, and Change record to send.</td>
</tr>
<tr>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Post Incident Details</td>
<td>Send details about a ServiceNow incident record to a HipChat room. Specify the Room Notification URL, Auth Token, and Incident record to send.</td>
</tr>
<tr>
<td>Post Problem Details</td>
<td>Send details about a ServiceNow problem record to a HipChat room. Specify the Room Notification URL, Auth Token, and Problem record to send.</td>
</tr>
</tbody>
</table>

**HipChat Inputs**

The following inputs are common to the HipChat actions:

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Required) Room Notification URL</td>
<td>The HipChat notification REST API URL. Example: <a href="https://api.hipchat.com/v2/%7Broom">https://api.hipchat.com/v2/{room</a> name}/ah-test/notification</td>
</tr>
<tr>
<td>(Required) Auth Token</td>
<td>You need an access token to send notifications. Refer to the HipChat API access token guide for details.</td>
</tr>
<tr>
<td>(Optional) Additional Message</td>
<td>Add a message to the record details.</td>
</tr>
<tr>
<td>(Optional) Override Default Field</td>
<td>You can provide a comma-separated list of field names to send instead of the default fields. Default fields are Short Description, Category, State, Priority, and Assignment Group.</td>
</tr>
</tbody>
</table>

**Example**

You can add a HipChat Post Incident Details action to a flow which identifies high priority incidents and who they are assigned to.
Microsoft Teams spoke

The Microsoft Teams spoke provides actions which post messages and ServiceNow incident, problem, and change record details to Microsoft Teams channels.

Microsoft Teams actions

The Microsoft Teams spoke is an available integration through IntegrationHub. You can specify the following Microsoft Teams actions within a flow:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Post a Message</td>
<td>Send a message to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL, Title, and Message to send.</td>
</tr>
<tr>
<td>Post Change Details</td>
<td>Send details about a ServiceNow change record to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL and Change record to send.</td>
</tr>
<tr>
<td>Post Incident Details</td>
<td>Send details about a ServiceNow incident record to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL and Incident record to send.</td>
</tr>
<tr>
<td>Post Problem Details</td>
<td>Send details about a ServiceNow problem record to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL and Problem record to send.</td>
</tr>
</tbody>
</table>

Microsoft Teams Inputs

The following inputs are common to the Microsoft Teams actions:

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Required) Webhook URL</td>
<td>The Microsoft Teams webhook for sending a message. Set up the webhook before configuring this action. Refer to the custom incoming webhook for Microsoft Teams documentation.</td>
</tr>
<tr>
<td>(Optional) Title</td>
<td>Title of the message.</td>
</tr>
<tr>
<td>(Optional) Additional Message</td>
<td>Add a message before the record details.</td>
</tr>
<tr>
<td>(Optional) Override Default Fields</td>
<td>You can provide a comma-separated list of field names to send instead of the default fields. Default fields are Short Description, Category, State, Priority, and Assignment Group.</td>
</tr>
<tr>
<td>(Optional) Theme Color (Hex)</td>
<td>Hex code value of color to highlight the message.</td>
</tr>
</tbody>
</table>
Example

You can add a Microsoft Teams Post Incident Details action to a flow which identifies newly created high priority incidents and a specified theme color.

![Example Diagram]

**ServiceNow eBonding spoke**

The ServiceNow eBonding spoke demonstrates some common integration design patterns through a common use case of synchronizing incidents across ServiceNow instances.

**Base system eBonding actions**

If you have multiple production instances in your environment, you might have a need to synchronize data across these instances. For example, one instance might manage internal applications (your source system) and another manages external customer-facing applications (your target system). A common use case is an incident which initially opens on the source system, but it requires a correlated incident to be created and tracked on the target instance. The ServiceNow eBonding integration contains the following OOB actions to assist in creating the synchronization:

**Create Remote Incident action**

This action uses the source system incident details to create a new incident on the target instance. It passes the source incident number as the Correlation ID on the target system. It takes the target system incident number and updates the Correlation ID of the source system.

**Lookup Remote Incident action**
This action takes the remote incident number as input and retrieves more details about that incident, such as: short description, description, priority, etc.

**Update Remote Incident action**

This action uses the source incident details to update the remote incident with details from source instance. Look up of remote incident is performed using Correlation ID in source instance’s incident.

**Credential and Connection information for eBonding**

When building actions, you must decouple the connection and credential information from the action so there is a seamless transition from distinct production environments. This also makes it easier to share content and create content through the ServiceNow store.

As part of eBonding example, you can associate an OOB connection alias (sn_ebonding_ah.ServiceNow). Create an HTTP connection record and associate it with this alias. For credentials, ServiceNow web services supports a multitude of authentication mechanisms. Create a BasicAuth credential to start with, however, that login ID must have permissions to create, read, and update an incident on your remote system. An example HTTP connection:

**Additional eBonding Script**

The Payloadbuilder script is included with this example. It builds a payload by reading a set of fields from an incident table used in the REST steps for these actions.

**Slack spoke**

The Slack spoke provides actions which post messages and ServiceNow incident, problem, and change record details to Slack channels.

**Slack actions**

The Slack spoke is an available integration through IntegrationHub. You can specify the following Slack actions within a flow:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Post a Message</td>
<td>Send a message to a Slack channel using an Incoming Webhook. Specify the Webhook URL and Message to send.</td>
</tr>
<tr>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Post Change Details</td>
<td>Send details about a ServiceNow change record to a Slack channel using a Webhook Connector. Specify the Webhook URL and Change record to send.</td>
</tr>
<tr>
<td>Post Incident Details</td>
<td>Send details about a ServiceNow incident record to a Slack channel using a Webhook Connector. Specify the Webhook URL and Incident record to send.</td>
</tr>
<tr>
<td>Post Problem Details</td>
<td>Send details about a ServiceNow problem record to a Slack channel using a Webhook Connector. Specify the Webhook URL and Problem record to send.</td>
</tr>
</tbody>
</table>

**Slack Inputs**

The following inputs are common to the Slack actions:

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>(Required)</em> Webhook URL</td>
<td>The Slack webhook for sending a message. Set up the webhook before configuring this action. Refer to the custom incoming webhook for Slack documentation.</td>
</tr>
<tr>
<td><em>(Optional)</em> Message</td>
<td>Title of the message.</td>
</tr>
<tr>
<td><em>(Optional)</em> Additional Message</td>
<td>Add a message before the record details.</td>
</tr>
<tr>
<td><em>(Optional)</em> Channel</td>
<td>Specify the Slack channel to post information.</td>
</tr>
<tr>
<td>Username</td>
<td>Specify a username to include in your post.</td>
</tr>
<tr>
<td><em>(Optional)</em> Override Default Field</td>
<td>You can provide a comma-separated list of field names to send instead of the default fields. Default fields are Short Description, Category, State, Priority, and Assignment Group.</td>
</tr>
<tr>
<td><em>(Optional)</em> Icon</td>
<td>Add an icon to the communication.</td>
</tr>
</tbody>
</table>

**Note:** If you do not specify a Username, Channel, or Icon, it will post the message using the defaults as configured in your webhook. If you specify them here, they will override those defaults.

**Example**

You can add a Slack Post Incident Details action to a flow which identifies newly created high priority incidents, a username, and a specific slack channel.
REST step

Add a REST step to an action in Action Designer to send an outbound REST web service request to an external system.

**Note:** REST step is not available on base systems and requires the IntegrationHub plugin. When the IntegrationHub plugin is activated, the step is visible under Utilities.

*Outbound REST web service* is a platform feature that allows you to retrieve, create, update, or delete data on a web services server that supports the REST architecture.
Roles and availability

- Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Type of connection to use.</td>
</tr>
<tr>
<td></td>
<td>- Define Connection Inline: Define connection information within the REST step.</td>
</tr>
<tr>
<td></td>
<td>- Use Connection Alias: Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you do not have to update your custom action.</td>
</tr>
<tr>
<td></td>
<td>To learn more about connections and credentials, see <a href="#">credentials, connections, and aliases</a>.</td>
</tr>
<tr>
<td>Connection and Credential Alias</td>
<td>If Use Connection Alias is selected, select a connection alias or click + to create a new connection. If you selected Define Connection Inline, click + to create a new credential.</td>
</tr>
<tr>
<td>HTTP Method</td>
<td>HTTP method for the request.</td>
</tr>
<tr>
<td></td>
<td>- GET</td>
</tr>
<tr>
<td></td>
<td>- POST</td>
</tr>
<tr>
<td></td>
<td>- PUT</td>
</tr>
<tr>
<td></td>
<td>- PATCH</td>
</tr>
<tr>
<td></td>
<td>- DELETE</td>
</tr>
<tr>
<td>Base URL</td>
<td>The base URL for the REST request. If Use Connection Alias is selected, this field is read-only and displays the base URL associated with alias. If Define Connection Inline is selected, enter a base URL for the connection.</td>
</tr>
<tr>
<td>Resource Path</td>
<td>The path for the resource.</td>
</tr>
<tr>
<td>Query Parameters</td>
<td>Name-value pairs to pass to the REST endpoint. You can create these parameters manually, or drag input variables into the parameter fields, and then assign a value.</td>
</tr>
<tr>
<td>Headers</td>
<td>Headers to send with the request. You can create headers manually, or drag input variables into the parameter fields, and then assign a value.</td>
</tr>
<tr>
<td>Body</td>
<td>The body of the request in the format that the content type specifies. This field is available if using the POST, PUT, or PATCH HTTP methods.</td>
</tr>
</tbody>
</table>

If the size of a REST response is larger than 5 MB, the system generates an error. To increase the maximum allowed size of a response, add the `glide.pf.rest.response_payload_max_size` property and increase the value to a maximum of 10 MB.
Knowledge Management

The ServiceNow® Knowledge Management (KM) application enables the sharing of information in knowledge bases. These knowledge bases contain articles that provide users with information such as self-help, troubleshooting, and task resolution.

Knowledge Management has significantly changed with Knowledge v3, which is enabled by default for all instances starting with the Fuji release.

Knowledge Management supports processes for creating, categorizing, reviewing, and approving articles. Users can search and browse articles as well as provide feedback.

To support multiple groups, knowledge bases can be assigned to individual managers. Separate workflows can be used for publishing and retiring articles, and separate access controls can be used to control reading and contributing.

Knowledge Management setup guide for admins

Before users in your organization can start creating knowledge bases and knowledge articles, you must set up Knowledge Management. Work with stakeholders to define requirements for setting up Knowledge Management effectively to meet the needs of users. For this task, you must be an administrator with the admin role.
Requirements

Role required
admin

Before you begin

Meet with the following stakeholders

<table>
<thead>
<tr>
<th>Stakeholder</th>
<th>Responsibilities</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge manager</td>
<td>Defines and oversees the knowledge management processes for day-to-day operations related to content publishing and usage.</td>
</tr>
<tr>
<td>Knowledge admin</td>
<td>Configures advanced settings for specific Knowledge Management features</td>
</tr>
<tr>
<td>Knowledge coach</td>
<td>Enables users to adhere to content standards.</td>
</tr>
<tr>
<td>Knowledge domain expert</td>
<td>Provides domain knowledge expertise.</td>
</tr>
<tr>
<td>Version author</td>
<td>Contributor to a particular version of an article.</td>
</tr>
<tr>
<td>Content creators and reviewers</td>
<td>Create, review, and update articles in the knowledge bases.</td>
</tr>
<tr>
<td>Community managers</td>
<td>Focus on the creation and curating of social content.</td>
</tr>
<tr>
<td>Line managers</td>
<td>Manage teams that create and use knowledge articles</td>
</tr>
</tbody>
</table>

With stakeholders, determine the following requirements

- Who are the consumers of the content in the knowledge bases?
- Who are the writers, editors, and managers for the knowledge base articles?
- What are the required workflows to publish and retire articles?
- What are the unique behaviors required for your knowledge management implementation? For example, should attachments appear in search results?
- Do knowledge articles need to be translated into other languages?

What to do

Assign knowledge roles to users and groups
Determine which Knowledge Management roles are appropriate for each user, and then assign those roles.

Create custom Knowledge workflows
If the default knowledge workflows for publishing and retiring knowledge articles are not appropriate for knowledge bases, create custom workflows for those knowledge bases.

Configure Knowledge properties
If the default knowledge properties do not fulfill the requirements of users, reconfigure the properties as necessary.

**Activate support for other languages besides English**

If languages other than English must be supported, activate the Knowledge Management Internationalization plugins.

**Coordinate with knowledge managers for knowledge base setup**

Let knowledge managers and administrators know that they can start configuring their knowledge bases. For details, refer them to the Knowledge base setup guide for knowledge admins and managers.

**Next steps**

Depending on any other requirements for the knowledge bases, you may be asked to help with additional tasks, such as configuring knowledge homepages.

**Knowledge base setup guide for knowledge admins and managers**

After basic Knowledge Management setup is completed, you can set up a knowledge base for users to create and publish knowledge articles.

Multiple knowledge bases can be created for different groups within your organization to share information within and between those groups.

Administrators create knowledge bases, and assign them to individual managers responsible for controlling the behavior and organization scheme of each knowledge base.

Each knowledge base contains knowledge articles that provide information for users, such as policy, release notes, or instructions for a task. Each knowledge base can also use a separate workflow for publishing and retiring articles.

**Requirements**

**Role required**

knowledge_administrator, knowledge_manager, or admin

**Before you begin**

**Determine the following requirements for each knowledge base that you want to set up:**

- Who are the knowledge base managers that are responsible for approving articles?
- Who are the users and contributors for that knowledge base? Access for these users is defined through user criteria.
- What are the categories to be used to classify articles? Will users be able to create categories?
- Will users of the knowledge base be able to create new content?
- Will Social Q&A be leveraged for this knowledge base?
What to do

Set up the knowledge base

1. Create the knowledge base.
2. Set up which users can read, create, or edit knowledge articles by selecting user criteria for the knowledge base.
3. Define the approval process for articles using workflows.
4. Define the knowledge categories that are needed for organizing articles in the knowledge base.
5. If you want to enable users to ask and answer questions in the knowledge base, activate Social Q&A.
6. If you want a custom knowledge homepage, ask your ServiceNow administrator to create it.

Next steps

Let users in your organization know that they can start creating and searching articles in the knowledge base. For details, refer users to the Knowledge Management guide for users.

If you have the knowledge_manager role, there are many other tasks that you can perform to maintain the knowledge base. You can pin articles so they are featured prominently in the search results and on homepages. You can also assign other users as managers of a knowledge base. For details, see Knowledge manager.

Activate the Knowledge Management Advanced plugin

Activate the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) to enable advanced features for Knowledge Management.

Role required: admin

The Knowledge Management Advanced plugin includes feature code and demo data.

The Knowledge Management Advanced Installer plugin (com.snc.knowledge_advanced.installer) is used to activate the Knowledge Management Advanced plugin.

Note: The Knowledge Management Advanced plugin is not automatically activated with the Knowledge Management v3 application.

The Knowledge Management Advanced plugin activates the following features:

- Article Versioning
  Customers must migrate to Knowledge Management v3 completely to use article versioning.
- Article Subscriptions
  The Knowledge Management Advanced plugin activates the Subscriptions and Activity Feed Framework plugin (com.snc.activity_subscriptions).
- Article Quality Index
- Article Templates
- In-Context Article Creation
- External Content Integration
Activating the Knowledge Management - External Content Integration plugin automatically activates the Knowledge Management Advanced Installer plugin.

This plugin performs two validation steps prior to activation.

- Determines if there are any active Knowledge Management v2 knowledge bases.
- Determines if there is a unique database index on the Number field. If a unique constraint has been added to the Number field, the plugin activation fails. Follow the instructions listed in KB0634959 to perform corrective steps to resolve the issue.

You need access to Hi to be able to view KB articles.

Demo data is included as part of the Knowledge Management Advanced plugin. If the validation step performed by the Knowledge Management Advanced Installer plugin completes successfully, the Knowledge Management Advanced plugin is activated automatically. However, the demo data is not included in this activation. To load the demo data, go to the Knowledge Management Advanced plugin page, click the Load Demo Data Only related link, and then click OK.

1. Navigate to System Definition > Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.

If the plugin depends on other plugins, these plugins are listed along with their activation status.

If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).

4. Optional: If available, select the Load demo data check box.

Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.

You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.

5. Click Activate.

Knowledge Management roles

Certain roles are required to use Knowledge Management functionality.

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>knowledge</td>
<td>Users with the knowledge role can contribute to the default knowledge base and access the Knowledge application menu.</td>
</tr>
<tr>
<td>knowledge_manager</td>
<td>Knowledge managers perform administrative functions for knowledge bases they manage such as defining categories, pinning important articles, and approving changes to articles. Users selected as managers of a knowledge base receive this role automatically.</td>
</tr>
<tr>
<td>Role</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>knowledge_admin</td>
<td>Knowledge administrators can create new knowledge bases and manage all knowledge bases.</td>
</tr>
<tr>
<td>knowledge_coach</td>
<td>Knowledge coaches perform AQI surveys on articles and can write, edit and review knowledge management articles.</td>
</tr>
<tr>
<td>knowledge_domain_expert</td>
<td>Knowledge domain experts perform AQI surveys on articles and can write, edit and review knowledge management articles.</td>
</tr>
<tr>
<td>admin</td>
<td>Administrators can configure knowledge workflows, set knowledge properties, and manage knowledge forms and homepages.</td>
</tr>
</tbody>
</table>

Administrators assign these roles to the users and groups who maintain the knowledge content.

**Knowledge homepage**

The Knowledge homepage displays knowledge articles and social Q&A questions organized by knowledge base and category, as well as featured content and popular articles.

To view the default knowledge homepage navigate to **Self-Service > Knowledge**.

**Note:**

The knowledge homepage is not compatible with Internet Explorer 9 or earlier. Using one of these browsers will cause you to be redirected to the legacy knowledge portal.

The Knowledge V3 home page is not customizable. Use the **Knowledge Management Service Portal** for an easily configurable user experience.
The Knowledge homepage

If you access knowledge from a service management application, the knowledge homepage for the associate application opens.

From the homepage, you can import a Word document to a knowledge base using the **Import Articles** button. You can also create a new article using the **Create An Article** button, or ask a question using the **Post a Question** button.

- Import a Word document
- Create an article
- Ask a question
You can select a knowledge base to browse articles and questions within that knowledge base. You can view only knowledge bases you can access.

You must have user criteria "Can contribute" permission for at least one active knowledge base, otherwise these buttons do not appear. See Knowledge Management v3 migration and Knowledge manager.

Browsing articles by category

Articles and questions are organized by category or by tag. Categories are listed alphabetically. While browsing, you can filter content by type to view only knowledge articles, only social Q&A questions, or only unanswered questions. You can sort content by most recent update or by number of views.

An administrator can configure the knowledge homepage to display the number of articles and questions within each category. This count includes articles and questions from subcategories. To display the article and question count, set the knowledge homepage property Display or hide the count of articles and questions in the category and child categories (glide.knowman.show_number_on_categories) to true.
Knowledge search

You can search for knowledge articles and social Q&A questions from the knowledge homepage using the search bar at the top of the page.

Search results include only articles and questions you are authorized to read. The search results count does not take into consideration any security rules set for the articles; therefore, the number of articles you could access may be lower than count displayed in the search results page. The documents that are attached to articles are also listed in the search results (for those articles to which you have access).

![Note: To change how the attachments are displayed in the search results, set the How to display attachments in Knowledge Search Results glide.knowman.search.attachment property. Attachments can be displayed with a snippet, link only, or not at all.](#)

To use wildcards in your search, using the application navigator, navigate to Contextual Search > Search Contexts > Knowledge Base Search and enable wildcard search.

You can sort knowledge content by relevancy, most recent update, or number of views.

You can filter results using the check boxes that appear. Filtering options appear depending on the search text.

- **Filtering options**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select if you want to view knowledge articles, social Q&amp;A questions, or both. This option is only available if Social Q&amp;A is enabled.</td>
</tr>
<tr>
<td>Knowledge Bases</td>
<td>Select a knowledge base to search. You can select only knowledge bases you can access. If you do not select a specific knowledge base, search results include articles and questions from all knowledge bases that you can access. You can also select a knowledge base from the choice list in the search bar. For pinned articles, only those in the selected knowledge base in the corresponding language appear.</td>
</tr>
<tr>
<td>Categories</td>
<td>Select one or more knowledge categories. Categories are listed alphabetically.</td>
</tr>
<tr>
<td>Authors</td>
<td>Select one or more authors.</td>
</tr>
<tr>
<td>Language</td>
<td>The multi-language search feature is available when more than one supported language is enabled. When you enable the language plugin and set the system property for multi-language search to True, the search query returns the results in all available languages simultaneously. If you set the system property for multi-language to False, the search query returns the results based on the language selected with this filter option. Refer to Knowledge search properties for more information.</td>
</tr>
</tbody>
</table>
Filtering a search

Domain separation in Knowledge Management

This is an overview of domain separation and Knowledge Management. Domain separation allows you to separate data, processes, and administrative tasks into logical groupings called
domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

Support: Level 2

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

How domain separation works in Knowledge Management

Domain separation works differently at different access levels of an application. In Knowledge Management the following rules apply:

Data: At the data level of domain separation, data visibility is separated from one domain to another. Knowledge bases, user criteria, articles, categories, article feedback, article versions, article templates, and external sources are domain separated in the base system.

**Note:** The data in one domain cannot be seen in any other domain. For example, if you create a Knowledge Management article in a domain A using an article template which is not in domain A, the article will not be visible in domain A. Similarly, if you create a Knowledge Management article in the global domain using a template that is not in global, the article might not be visible in all the domains.

Requester: Requester activities are supported within tenant domains. Users can search; view; comment; and rate articles of their domain, any child domain, and global domains, provided that feedback is enabled and the knowledge base settings grant them read access to articles.

- Users in the global domain can access articles in all the domains if read access is granted at knowledge base and/or article level.
- Users in the parent domain can access articles in that domain, global, and all of its child domains if read access is granted at knowledge base and/or article level.
- Users in the child domain can access articles in that domain and the global domain if read access is granted at knowledge base and/or article level.

Fulfiller: The application can be used by the Fulfiller within the tenant domains as a tenant domain-owned application. Users are allowed to author articles in knowledge bases of their domain, any child domain, and the global domain if the knowledge base has user criteria set up to grant contribute access.

- Articles are automatically saved to the user’s current domain when the article is created.

See Select user criteria for a knowledge base to learn how to control which users create, read, write, and retire knowledge articles within a knowledge base.

See Select user criteria for an article to learn how to control read access to users at the article level.

Use cases

This image demonstrates a basic domain hierarchy that is available in the base system.
### Requester use cases

</tbody>
</table>
### Known Issues

- Knowledge Searches (ts_query_kb), Views (kb_use), and Uses (kb_use) are not domain separated.
- The following AQI tables are not domain separated:
  - AQI Checklist (kb_quality_checklist)
  - Checklist Question (kb_checklist_question)
  - Article Checklist Summary (kb_article_checklist_summary)
  - Article Checklist Answer (kb_article_checklist_answer)

**Note:** The Article Checklist Answer table does not contain the Order field. The application shows the list in a random order.
- Comment provided by a user on an article is stored in article's domain instead of user domain.

**Social Q&A**

If Social Q&A is activated for a knowledge base, you can ask questions and respond to questions from other users. You can also vote on helpful questions and answers.

Social Q&A extends the Knowledge application. All questions and answers are associated with a knowledge base. Social Q&A uses Knowledge access controls, search, and the knowledge homepage.

Social Q&A is available on mobile devices using the mobile knowledge interface. You can perform all Social Q&A functions on mobile, such as asking and answering questions.

**Note:** Social Q&A is not compatible with Internet Explorer 9 or earlier. Navigating to a Social Q&A page using one of these browsers will cause a browser support warning to appear.

**Enable social Q&A for a knowledge base**

As a knowledge manager, you can enable social Q&A for a knowledge base you manage.

Role required: knowledge_manager

You can set the limit for the number of times users can post questions, answers, and comments, or subscribe to the questions using the Knowledge Social Q&A properties.

All Social Q&A questions and answers are associated with a knowledge base. The Enable social questions and answers check box on the Knowledge Base form controls if users can view and ask questions.

Social Q&A uses user criteria from the knowledge base to determine which users have access to questions. A user must meet the criteria defined in the knowledge base Can Read related list to view or contribute to Social Q&A questions, answers, and comments associated with that knowledge base.

**Note:** The Can Contribute related list does not control the ability to contribute to Social Q&A. Users that meet the Can Read criteria for a knowledge base can also contribute questions, answers, and comments.

1. Navigate to Knowledge > Knowledge Bases.
2. Select a knowledge base you manage.
3. Select the Enable social questions and answers check box.
   - This check box only appears if the Social Q&A plugin has been activated.
4. Click Update.

You can disable Q&A for a knowledge base by clearing the Enable social questions and answers check box. Disabling Q&A does not delete existing questions and answers associated with this knowledge base, but prevents users from browsing or searching for those questions and answers.

**Social Q&A questions**

Social Q&A organizes information by question.
You can browse and search for questions from the Knowledge homepage (Self-Service > Knowledge). Questions appear along with knowledge articles organized by knowledge base, category, and tags.

Click on a question to view the question details, as well as responses and comments. You can add responses and comments, vote on existing responses, share questions, and edit your own questions and answers from the question details.

**Ask a social Q&A question**

As a Social Q&A user, you can ask questions that other users can respond to.

Roles required: None

1. Navigate to **Self-Service > Knowledge**.
2. Click **Post a Question**.
3. Enter a value for the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Enter the question you have.</td>
</tr>
<tr>
<td>Question details</td>
<td>Enter additional details about the question that may help other users provide an answer.</td>
</tr>
<tr>
<td>Knowledge base</td>
<td>Select the knowledge base this question relates to. You can select only knowledge bases configured to allow Q&amp;A.</td>
</tr>
<tr>
<td>Category</td>
<td>Select the knowledge category this question relates to. You can select only categories within the selected knowledge base. Questions without a category appear on the knowledge homepage in the (empty) category.</td>
</tr>
<tr>
<td>Tags</td>
<td>Enter one or more tags that describe the question.</td>
</tr>
</tbody>
</table>

4. Click **Post Question**.

To accept the answer, click the **Accept** link from within the answer. The accepted answer moves to the top of the list of answers. You can unaccept an answer by clicking **Unaccept**.

**Note:** You must be the owner of the question or the knowledge manager to accept an answer.

**Answer a question**

As a user, you can answer a question another user has asked. The owner of the question or the knowledge manager can then accept the answer.

Roles required: None

As a knowledge manager or the owner of a question, you can accept an answer as the correct answer. That answer then appears above other answers for the question.

1. Navigate to **Self-Service > Knowledge**.
2. Select a question.
3. Enter an answer in the **Your answer** field.
4. Click **Submit**.

**Comment on a question or answer**

You can comment on a question or an answer to provide additional information relevant to that question or answer.

Roles required: None

1. Navigate to **Self-Service > Knowledge**.
2. Select a question.
3. Within the question or answer you want to comment on, click the **Comment** link.
4. Enter the comment text.
   - Comments have a maximum length of 140 characters.
5. Click **Post comment** or press the Enter key.

**Edit a question, answer, or comment**

You can edit questions, answers and comments you submit, or in knowledge bases you manage.

Role required: None

1. Navigate to **Self-Service > Knowledge**.
2. Select a question.
3. Within the question, answer, or comment you want to edit, click **Edit**.
4. Edit the details as needed.
5. Optional: When editing a question, click **Advanced** to make changes to the question record.
6. Click **Update**.
   - Click **Undo** to discard the changes and close the editor.

**Vote on a question or answer**

As a Social Q&A user you can vote on a question or answer to promote it.

Role required: None

Vote up questions that you want users to answer, and answers that you believe accurately resolve questions. Alternatively, vote down questions that you do not find useful, or answers that you believe are incorrect. You can vote for each question or answer only once, but you can change your vote.

Answers with a higher score appear above answers with a lower score when viewing a question. A pinned answer appears above other answers regardless of votes.

**Note:** You cannot vote for your own questions or answers.

1. Navigate to **Self-Service > Knowledge**.
2. Select a question.
3. Click the up or down arrow next to the question or answer you want to vote on.
   - The score for that question or answer changes depending on your vote.

You can change your vote by clicking the other arrow.
Subscribe to a question

You are automatically subscribed to any question you ask, so you receive notifications when another user votes on, comments on, or answers the question. If you want to receive notifications for a question asked by another user, you can manually subscribe to the question.

Role required: None

You automatically subscribe to any question you ask.

1. Navigate to **Self-Service > Knowledge**.
2. Select a question.
3. Click the subscribe icon (➕).

If you want later to stop receiving notifications about this question, click the unsubscribe icon (➖).

Delete a question, answer, or comment

You can delete questions, answers, or comments that you submitted.

You can delete only questions, answers, and comments you submitted. Knowledge managers can delete any question, answer, or comment within knowledge bases they manage.

Role required: none

1. Navigate to **Self-Service > Knowledge**.
2. Select a question or answer.
3. Within the question, answer, or comment you want to delete, click the Delete link.

Deleting a question also deletes all answers and comments associated with that question.
Deleting an answer also deletes all comments associated with that answer.

Share a question

You can generate a URL directly to a question and related answers.

Role required: None

1. Navigate to **Self-Service > Knowledge**.
2. Select the question that you want to share.
3. Click Share.

Some browsers do not allow adding content directly to the clipboard. You may need to manually copy the URL from the popup that appears.

Distribute the URL to share the question.

Social Q&A internationalization support

The Social Q&A questions and answers are automatically associated with the language that is set for the interface.

You can only browse and search for questions in the language currently set for the interface. For example, if a Social Q&A user has set French as the interface language, any questions that the user asks is associated with the French language. All Social Q&A users who want to view those questions must have their interface language set to French.
Note: For Social Q&A internationalization to take effect, you must clear the platform cache and browser cache after selecting the desired language.

Social Q&A search

Users can search for specific questions from the knowledge homepage.

Social Q&A uses knowledge search to provide search results. Searching knowledge returns questions that contain the search terms in the question title or the question details, or in the accepted answer.

By default, knowledge search results include both knowledge articles and questions. You can filter results using knowledge search controls, such as filtering by knowledge base or author.

Social Q&A results also appear with knowledge articles when using global search.

Social Q&A uses the Contextual Search feature to generate search results. Questions appear in Contextual Search results, such as when creating an incident. The Social QA Question Search Context and Social QA Question Searcher records define the Social Q&A search. To ensure Social Q&A search functions as intended, do not modify these records.

Social Q&A tags

Tags organize questions and provide information about the question subject matter.

Social Q&A shares available tags with other applications allowing you to organize records consistently across the instance. Tags are stored on the Tags (label) table.

You can view a list of tags and filter by tag from the knowledge homepage. Clicking on a tag displays a list of knowledge articles and questions with that tag.

Only users who can edit a question can edit the associated tags. By default, only the question owner and knowledge managers can add or remove tags on questions.

Knowledge feedback

You can view and contribute to feedback on knowledge articles.

Feedback options

Enable or disable the feedback options using the Knowledge properties.

You can submit feedback for knowledge articles in these ways:

- Flag an article as incorrect or inappropriate.
- Provide a rating value for the article.
- Mark an article as helpful or not helpful.
- View comments, add a new comment, or reply to existing comments.

Users can view comments directly on the article. Knowledge managers can view the other types of feedback by navigating to Knowledge > Feedback.

Administrators and knowledge managers can disable some feedback options using fields on the Knowledge Base form. Administrators can configure feedback options using properties.
Flagging articles

You can flag an article for incorrect or inappropriate content. Click Flag Article in the article header to open a new window, allowing you to enter suggested changes.

The glide.knowman.use_live_feed property controls the display of knowledge article comments.

- If enabled, the system uses live feed to manage and display feedback on knowledge articles. Flagged comments do not appear on the Article View page. Users with the admin, knowledge_admin, and knowledge_manager roles can access flagged articles by navigating to Knowledge > Articles > All Flagged. Users with the knowledge role can access their flagged articles by navigating to Knowledge > Articles > My Flagged.
- If disabled, the author of the article and users with the admin, knowledge_admin, and knowledge_manager roles can see all flagged comments. Other users can see only their own flagged comments.

Note: You cannot disable flagging for an article until you have disabled the flagging for all feedback comments for that article.

Flagged comments are stored in the Knowledge Feedback (kb_feedback) table but not the Live Feed Messages (live_message) table.

Rating articles

The five stars below the article title allow you to indicate the article's effectiveness on a scale of 1 to 5.

Marking articles

The question Helpful? at the bottom of the article allows you to indicate the usefulness of the article with a simple Yes or No answer.

Comments

Knowledge comments at the bottom of the article use live feed to enable a conversation around a knowledge article. For example, you can post replies to comments, add attachments, or Like comments.

Request a knowledge base

If existing knowledge bases do not fit your needs, you can request a new knowledge base through the service catalog. If the request is approved, you are added as the owner of the new knowledge base.

Role required: none

If no knowledge base exists that fit your needs, all users can request a new knowledge base.

1. Navigate to Self-Service > Service Catalog.
2. Select Can We Help You?.
3. Select the Request Knowledge Base catalog item.
4. Enter the reason you want the knowledge base, and a name for the knowledge base.
5. Click **Submit**.

You are notified when the request is approved or rejected. If the request is approved, you are added as the owner of the new knowledge base. You can then assign managers and manage articles in the new knowledge base.

Knowledge bases created through this request process are inactive by default, so you must activate the knowledge base to make it available for users.

**Create a knowledge article**

Knowledge contributors can create and edit knowledge articles within a knowledge base to share information across your organization.

Users with at least one role can create and edit knowledge. These users are known as knowledge contributors. Users without any role can read articles and submit feedback, but cannot create or edit articles.

Some knowledge bases may allow only certain users to contribute. For example, a member of the IT department can create knowledge articles in the IT knowledge base, such as desktop support information or articles describing company IT processes.

1. Navigate to **Self-Service > Knowledge**.
2. Click **Create An Article**.

![Create an Article](image)

**Note:** You must have user criteria "Can contribute" permission for at least one active knowledge base, otherwise the **Create An Article** button does not appear. See [Knowledge Management v3 migration](#) and [Knowledge manager](#).

3. Select an article template.

**Note:** To view an article template, you must activate the article templates feature and enable the desired templates. For more information, see [Knowledge article templates](#).

4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Base</td>
<td>The knowledge base selected for this article.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> An article can only be associated with one knowledge base.</td>

<tr>
<td>Category</td>
<td>The category for this article. Select a Knowledge Base before you can select a category. Articles without a category appear on the knowledge homepage in the (empty) category.</td>
</tr>
<tr>
<td>Published</td>
<td>The date this knowledge article was published. This value is set when the article is published.</td>
</tr>
<tr>
<td>Valid to</td>
<td>The date this knowledge article expires. Articles do not appear in search results after the valid to date, or if the valid to date is empty.</td>
</tr>
<tr>
<td>Article type</td>
<td>The type of article, either HTML or wiki.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is only visible in the standard template.</td>
</tr>
<tr>
<td>Workflow</td>
<td>(Read-Only) The publication state of the article, such as Draft or Published. When inserting a new article from an existing article, the state of the new article is reset to Draft.</td>
</tr>
<tr>
<td>Source</td>
<td>The task this knowledge article was created in response to, if any. This field is set automatically when you create the knowledge article from a task record.</td>
</tr>
<tr>
<td>Attachment link</td>
<td>Check box for downloading an attached file automatically when a user accesses the article, instead of opening the article view. Add one or more attachments to the article to use this option.</td>
</tr>
<tr>
<td>Note:</td>
<td>You may attach multiple files, but most web browsers permit users to download only the first one. To ensure download of all the files, bundle them into an archive, such as with WinZip, and attach the archive. The Attachment link option applies to articles accessed from search links only. Articles accessed from links within other knowledge articles will not automatically download an attached file.</td>
</tr>
<tr>
<td>Display attachments</td>
<td>Check box for displaying attachments to users viewing this knowledge article. Attachments appear below the article text. Add one or more attachments to the article to use this option.</td>
</tr>
<tr>
<td>Short description</td>
<td>The title of the article. This title appears when browsing and searching knowledge, and at the top of the article.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Text</td>
<td>Content for the article. Use the HTML editor to create content. A preview of the content appears when browsing and searching knowledge.</td>
</tr>
</tbody>
</table>

5. Click **Submit** to create the article.

After saving the article record, you can add tags to further organize the article.

Any additional steps required to publish the article, such as approvals, depend on the publishing workflow for the knowledge base.

- If there is no approval workflow set up, the article is immediately published.
- If there is an approval workflow set up: If the article is approved, it is published. If rejected, the article state is changed to Draft.

**Edit a knowledge article**

Knowledge contributors can edit/update knowledge articles within a knowledge base to update information shared across your organization.

Role required: knowledge

Users with at least one role can edit knowledge. These users are known as knowledge contributors. Users without any role can read articles and submit feedback, but cannot edit articles.

However, Knowledge managers can configure User Criteria to restrict access to certain Knowledge bases. For example, only members of the IT department can create or edit knowledge articles in the IT knowledge base, such as desktop support information or articles describing company IT processes.

**Note:** If you have user criteria “Can contribute” permission for the specified knowledge base, but are not the article author, and do not have a knowledge base admin or manager role: The installed Knowledge Management Advanced Installer plugin requires the glide.knowman.versioning.enabled property (from the System Property [sys_properties] table) to be set to false to enable you to be able to make changes to unpublished articles within the knowledge base.

Edit an article using one of these options.

- Edit published/unpublished articles with Versioning enabled:
  1. Navigate to **Knowledge > Articles**
  2. Select an article from the **Published** or **Unpublished** category.
  3. From the article, click **Checkout** and edit the article.
  4. To save changes to:
     - an unpublished article, and to publish it at the same time, click **Publish**.
     - a published article, or to save changes to an unpublished article without publishing it, click **Update**.

- Edit published articles from the Knowledge homepage or Service Portal:
  1. Navigate to one of the following modules:
2. From the Knowledge homepage, search for and select the article to edit.
3. From the article, click **Edit**, then from the Knowledge form record, edit the desired editable fields.

4. Click **Update** to save changes.

If you edited an unpublished article, any additional steps required to publish an article, such as approvals, depend on the publishing workflow for the knowledge base.

**Select a knowledge article category**

Knowledge articles within a knowledge base are grouped by category. These groups can help you define the knowledge base taxonomy, and can help users find articles within that knowledge base.

As a knowledge contributor, when editing a knowledge article you can select categories using the Category picker, and add or edit categories if enabled for the knowledge base.

1. Click the reference lookup icon beside the **Category** field.
2. Select an existing category, or click the add category icon (+) to add a new category.
   After you select a category, you can click the pen icon to rename that category. Press the enter key or click outside the selected category to save the change.

   **Note:** Clicking **Cancel** while selecting a category cancels selecting a new category, but does not revert any changes you make to the categories such as renaming or adding new categories.

3. Fill in the fields on the form, as appropriate.
4. Optional: Select or add a subcategory.
5. Click **OK**.

**Move a knowledge article**

You can move articles between knowledge bases.

1. Edit a knowledge article.
2. Change the **Knowledge Base** field value.
   After moving an article, the Apply Default Values dialog box prompts you to populate certain fields in the article with default values from the new knowledge base. If the new knowledge base has no default values, the dialog box does not appear.
3. Click **OK** to overwrite fields with the default values, or **Cancel** to leave all fields unchanged.
   A knowledge manager can define default values for articles in knowledge bases you manage using the **Set default knowledge field values** field on the Knowledge Base form.
4. Click **Update**.

**Retire a knowledge article**

Retired knowledge articles are not available to users except for administrators and knowledge administrators who can view them.

A knowledge article has an associated retirement workflow, similar to the publishing workflow. This allows administrators to configure these workflows, defining an approval and review process for retiring knowledge if appropriate.
When editing an article, click **Retire** to launch the retirement workflow associated with that article. If the article requires approval prior to retirement, the article goes to a pending approval state, and the workflow either finishes upon approval or cancels if rejected by a required approver.

**Note:** Retired knowledge articles cannot be searched for by external users or customers. To reuse a retired article, create a new article with the same content, which is published once approved.
Instant retire and Approval retire workflows

Create knowledge from an incident or problem

To create knowledge from an incident or problem, select the Knowledge check box on the incident or problem form and close the incident or problem record.
For detailed information on creating knowledge from an incident, refer to Create a knowledge article from an incident.

The short description from the incident or problem becomes the knowledge article title. Articles created this way are added to the knowledge base specified in the property glide.knowman.task_kb.

Depending on the value of the glide.knowman.submission.workflow property, knowledge created from an incident or problem may require additional approval. When this property is true, a submission record is created instead of a knowledge article. A user with the knowledge role must approve the submission to create a knowledge article.

Approving a submission creates a new knowledge article using the submission content.

1. Navigate to Knowledge > Open Submissions.
2. Select a submission record.
3. Review the submission to ensure the content and settings are correct.
4. Click Create Article.
   A new draft knowledge article is created. Articles created this way are added to the knowledge base specified in the property glide.knowman.task_kb.

You can edit the new knowledge article before publishing it, such as to select a category.

---

**Import a Word document to a knowledge base**

Import a Microsoft Word document to create a new knowledge article.

Role required: None. You must have user criteria "Can contribute" permission for at least one active knowledge base. If you cannot contribute, the Import Articles button does not appear.

**Note:** An administrator can control the visibility of the Import Articles button by setting the other knowledge property Hide the 'Import' functionality (button and drag-n-drop) for all users (glide.knowman.import.hide_import_functionality) to true.

Importing documents to knowledge is available only from a computer browser. You cannot import documents from a mobile device.

You can import Microsoft Word .doc and .docx files.

**Note:** The file extension must be lowercase.

When you import a document, text content from the document is used to create the knowledge article. The articles support all editing functions supported by the TinyMCE editor. All HTML supported by TinyMCE such as tables, lists, and links, as well as styling such as bold and italics, are preserved. Images from the document are added as attachments to the knowledge article and embedded in the article body.

**Note:**

You can import multiple files at a time. Closing the browser or navigating away cancels any in-progress uploads but does not delete articles created from completed imports. You cannot import documents to knowledge from mobile devices.

The following styles and elements are preserved when importing a .doc or .docx file into a knowledge base. Styles and elements not included in this list may not be preserved when importing a document.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Navigate to **Self-Service > Knowledge**.

1. Perform one of the following actions.
   - Click **Import Articles** and select one or more document files.
   - Drag one or more document files onto the knowledge homepage.

2. Select the **Knowledge base** to add the new article to.
   You can select only knowledge bases you can contribute to.

3. Optional: Select a **Category** from within that knowledge base.
   - **Note:** Use the category picker to add a category. The picker does not differentiate between the different category levels. You can select a category or sub category and add it to the **Category** field.

4. Optional: Select the **Publish** check box to start the publishing workflow for each imported article immediately after the import finishes.

   This check box applies only when importing to v3 knowledge bases and only if the **Show publish checkbox on the knowledge import pop-up** property is set to **Yes** on the Knowledge Management properties form. You cannot automatically publish articles imported to v2 knowledge bases.

   Knowledge v2 articles go into **Draft** state. Knowledge v3 articles go into **Review** or **Published** state, depending on the workflow attached to the knowledge base (Approval Publish or Instant Publish).

   **Note:** Only default heading settings are supported. Custom heading styles are imported using the default settings for those styles. Table styling and borders are not supported.

5. Click **Import**.

   A new article is created in the selected knowledge base and category using the content from the uploaded document. If you uploaded multiple documents, one article is created for each. If you use knowledge internationalization, the language of the new article is set to the currently selected system language.

   After the upload completes, a popup window appears displaying the number and short description of the newly-created articles. Click an article to view the full record.

   If any errors occur during the upload, a popup window appears to display the error.

**Create a knowledge article from a customer service case**

Reuse information from a customer service case by creating knowledge articles from cases.

Your administrator must enable creation of articles from customer service cases.
Role required: sn_customerservice_agent or knowledge

1. Navigate to Customer Service > Cases > All.
2. Select a case from which you want to create a knowledge article.
3. Click Create Knowledge.
   The relevant fields are automatically copied from the case to the record that opens.
4. In the Knowledge base field, enter the name of the knowledge base in which you want this article to display.
5. Click Submit.

Knowledge manager

Having multiple knowledge bases allows an organization to spread management responsibilities across multiple users, known as knowledge managers.

As a knowledge manager, you can assign other managers, define category structures, configure which users can read and contribute articles, move and pin articles, and modify most fields on the Knowledge Base form. You can also approve the publishing or retiring of knowledge articles in those knowledge bases. You can enable Social Q&A for your knowledge bases if the Social Q&A application is active.

The primary manager of a knowledge base is the owner of that knowledge base. Each knowledge base must have one owner. There may be any number of additional managers for each knowledge base. All managers of a knowledge base, including the owner, automatically receive the knowledge_manager role.

Pin a knowledge article

You can pin a knowledge article to appear in the Featured content section of the knowledge homepage and at the top of knowledge search results page.

Role required: knowledge_manager, knowledge_admin, or admin

Pinning associates an article to specific keywords. You can search a keyword in the knowledge service portal or search results page to display articles in the Featured content section or at the top of the knowledge search results list.

Note: The articles added to the Featured content section do not appear in the global search results and Virtual Agent conversations.

- To display articles in the Featured content section, add a default keyword in the glide.knowman.default_keyword property Value field and add the same keyword to all articles you want to display in that section.
- To display articles at the top of the knowledge search results list, add a list of keywords to each article you want to display at the top of the list.

1. Navigate to Knowledge > Knowledge Bases.
2. Select a knowledge base.
3. In the Featured content related list, click New.
4. In the Knowledge field, search for and select the desired article.
5. In the Keywords field, click the lock/unlock toggle icon.
6. Click the lookup icon to open the Knowledge keywords list.

Note: Each keyword must be a single word and cannot contain spaces.
7. Select the keyword to add for this article.
   - Add the default keyword to display this article in the Featured content section during search.
   - Add all related keywords for the article to display it at the top of the knowledge search results page during search.

   **Note:** You can create knowledge keywords, if it does not already exist in the list, and then add it to the article.

8. Click the lock/unlock toggle icon to add the keywords to the article.
9. Click **Submit**.

### Create a user criteria record in Knowledge Management

You can create or modify a user criteria record in Knowledge Management. User criteria is used to control what users, groups, roles, companies, locations, and/or departments can access knowledge bases and articles.

Role required: user_criteria_admin

1. Navigate to **Knowledge > Administration > User Criteria**.
2. Click **New** or open a record.
3. Fill out the fields on the form as required.
   - For field descriptions, refer to **Create a user criteria record in Service Catalog**

   **Note:** Including scripts in user criteria records can decrease performance, because scripts are evaluated dynamically.

4. Click **Submit**.

### Select user criteria for a knowledge base

You can specify user criteria to control which users can create, read, write, and retire knowledge articles within a knowledge base.

Role required: knowledge_manager, knowledge_admin, or admin

User criteria refers to knowledge base records that determine the users who can read or contribute to a knowledge base. User criteria definitions:

- **canRead**
  users who can read all knowledge base articles

- **cantRead**
  users who cannot read, create, or modify articles in the knowledge base

- **canContribute**
  users who can read, create, and modify articles in the knowledge base

- **cantContribute**
  users who cannot create or modify articles in the knowledge base

- **No User Criteria**
If a knowledge base has no user criteria, all users can read its articles. Any user having at least one role can create and edit articles, unless they are members of the `cantContribute` user criteria.

If a knowledge base has `canRead` user criteria, but no `canContribute` user criteria, all users with at least one role can access and modify the knowledge base. This video demonstrates how to control Knowledge Management access through user criteria.

This video demonstrates how to control Knowledge Management access through user criteria.

**Important:** After making user criteria additions or changes, you may need to log out and back in to clear the prior configuration.

1. Navigate to Knowledge > Knowledge Bases.
2. Select a knowledge base you manage.
3. Access one of these related lists, and then select or create user criteria records.

<table>
<thead>
<tr>

Enable user criteria system property to override role read access

Add the `glide.knowman.search.apply_role_based_security` system property to enable user criteria to control read access of knowledge bases or articles over roles.

Role required: admin

1. Follow the steps to [Add a system property](#).
2. Add the `glide.knowman.search.apply_role_based_security` property, and set the property value to `false`. This enables specified user criteria to override canRead access specified for roles.

Select user criteria for an article

You can specify user criteria for an article to control which users can read the article.

If an article has no user criteria selected, the article is available to all users who have access to that knowledge base (based on the user criteria for the knowledge base). Knowledge base user criteria restrictions override article-level user criteria. For example, a knowledge base that is configured to restrict user access overrides any access granted at the article level.

If a user has contribute access to the knowledge base, article-level user criteria are not evaluated and the user can read all articles in the knowledge base. If a user has read access to the knowledge base, article-level user criteria are evaluated to determine if the user has read access to the article.
On the article level, if **Can read** user criteria is defined, only those users specified can read the article. If an article has **Cannot read** user criteria defined, those users specified are denied reading the article. **Cannot read** user criteria overrides **Can read** user criteria for articles.

1. Navigate to **Self-Service > My Knowledge Articles**.
2. Select an article.
3. Select the desired user criteria for the **Can Read** and **Cannot Read** fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can Read</td>
<td>Users who meet one of these criteria can read the article.</td>
</tr>
<tr>
<td>Cannot Read</td>
<td>Users who meet one of these criteria are denied reading the article (regardless of the <strong>Can Read</strong> setting for the user).</td>
</tr>
</tbody>
</table>

**Note:** If the **Can Read** and **Cannot Read** fields are not visible, add the fields to the form by configuring the form layout (click the form context menu icon and select **Configure > Form Layout**).
### Knowledge base level

<table>
<thead>
<tr>
<th>Access</th>
<th>Read</th>

</tbody>
</table>

### Define a knowledge article category

Each knowledge base has a hierarchy of categories that organizes the articles. You must have CanContribute access to the knowledge base or have a knowledge_admin or admin role.

You can define a hierarchy for categories by creating parent-child relationships. The category hierarchy is saved in the Full category field in the Knowledge Category (kb_category) table.

You can create and edit categories separately for each knowledge base.

1. Navigate to Knowledge > Knowledge Bases.
2. Select a knowledge base you manage.
3. Choose an option.

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create a top-level category.</td>
<td>Navigate to the Knowledge Categories related list and click <strong>New</strong>.</td>
</tr>
<tr>
<td>Create a child category.</td>
<td>Expand an existing category and click <strong>New</strong> within the expanded section.</td>
</tr>
</tbody>
</table>

---

**Note:**

- When article-level read access is assigned to an article, only the user who belongs to that particular user criteria can read the article. Other users are restricted.
- Users with contribute access to a knowledge base can also read articles even if they are not in the defined Can Read user criteria.
- Ownership group users who are either members or managers of groups assigned to an article will have access to contribute to articles even if they don’t have contribute access to the knowledge base.
4. Enter a **Label** for the category. The label appears as the name of the category.
5. Optional: Enter a **Value** you can use when referencing the category in scripts.
6. Click **Submit**.

In addition to using categories defined by a knowledge manager, knowledge contributors can add and edit categories when editing an article.

**Assign a knowledge base manager**

You can assign users as managers of a knowledge base.
Role required: knowledge_admin, or admin

1. Navigate to Knowledge > Knowledge Bases.
2. Select a knowledge base you manage.
3. In the Managers field, click the unlock icon.
4. Add one or more users.
5. Click Update.

After you save the knowledge base record, users selected as managers automatically receive the knowledge_manager role if they do not have it already.

You can remove a knowledge base manager by removing that user from the Managers field. If the user is not a manager of any other knowledge base, the knowledge_manager role is removed from that user.

Knowledge administration

As an administrator, you are responsible for setting up knowledge bases, configuring knowledge workflows, and customizing knowledge homepages. Most day-to-day management functions are performed by knowledge managers.

The following podcast offers additional information on using the Knowledge Base Application.

Create a knowledge base

Create a knowledge base to provide a self-service platform for users to store, share, and manage content. Configure knowledge bases into product or service categories and manage user access based on permissions. Customize workflows for publishing and retiring articles in the knowledge base.

Understand the requirements for setting up a knowledge base.

Role required: knowledge_admin or admin

1. Navigate to Knowledge > Administration > Knowledge bases.
2. In the Knowledge Bases list, click New.
3. On the form, fill in the following fields as appropriate:

<table>
<thead>
<tr>
<th>Knowledge base form</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Title</strong></td>
<td>Unique name for the knowledge base.</td>
</tr>
<tr>
<td><strong>Icon</strong></td>
<td>An image that provides a visual reference to describe the knowledge base. This image is displayed next to all articles from this knowledge base in the article search results page.</td>
</tr>
<tr>
<td><strong>Disable commenting</strong></td>
<td>Check box to disable commenting. If selected, users cannot comment on articles in the knowledge base.</td>
</tr>
<tr>
<td><strong>Disable suggesting</strong></td>
<td>Check box to disable edit suggestions. If selected, users cannot suggest edits to articles in the knowledge base.</td>
</tr>
<tr>
<td>Title</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Disable category editing</td>
<td>Check box to disable editing of knowledge categories. If selected, only knowledge managers can add or edit knowledge categories for the knowledge base.</td>
</tr>
<tr>
<td>Checklist</td>
<td>Checklist to evaluate the quality of articles in the knowledge base.</td>
</tr>
<tr>
<td>Owner</td>
<td>The user responsible for the knowledge base. A knowledge base owner can assign other roles to the knowledge base.</td>
</tr>
<tr>
<td>Manager</td>
<td>Users who perform administrative functions on the knowledge base.</td>
</tr>
<tr>
<td>Publish workflow</td>
<td>The workflow for publishing the articles in the knowledge base.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Knowledge - Instant Publish</strong>: publishes articles in the knowledge base without requiring an approval.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Knowledge - Approval Publish</strong>: requests approval from the manager of the knowledge base before moving the articles to the published state.</td>
</tr>
<tr>
<td>Retire workflow</td>
<td>The workflow for retiring the articles in the knowledge base.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Knowledge - Instant Retire</strong>: retires articles in the knowledge base without requiring an approval.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Knowledge - Approval Retire</strong>: requests approval from the manager of the knowledge base before moving the articles to the retired state.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to make the knowledge base visible to all users.</td>
</tr>
<tr>
<td>Enable social questions and answers</td>
<td>Check box to enable social Q&amp;A for articles in the knowledge base.</td>
</tr>
<tr>
<td>Description</td>
<td>A short description to describe the knowledge base.</td>
</tr>
<tr>
<td>Set default knowledge field values</td>
<td>Default configuration settings for the knowledge base.</td>
</tr>
<tr>
<td>Related products</td>
<td>List of products related to the knowledge base content.</td>
</tr>
</tbody>
</table>

4. Right-click the form header and click **Save**.
5. In the related list section, view or configure the following items related to the knowledge base:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge</td>
<td>List of knowledge articles stored in this knowledge base.</td>
</tr>
<tr>
<td>Questions</td>
<td>List of Social Q&amp;A questions stored in this knowledge base.</td>
</tr>
</tbody>
</table>
Name | Description
--- | ---
Can Read | The Can Read user criteria list for this knowledge base.
Can Contribute | The Can Contribute user criteria list for this knowledge base.
Featured Content | List of knowledge articles that appear in the homepage **Featured Content** section based on the corresponding keyword search set for each article.
Knowledge Categories | List of knowledge categories associated with this knowledge base.

6. **Click Submit.**

**Knowledge workflows**

The publishing and retirement processes for a knowledge article are controlled by workflows defined for the knowledge base that the article belongs to.

You can assign different workflows to each knowledge base.

You can use one of the default workflows, or create your own workflows to define custom publishing and retirement processes for different types of knowledge.

For the workflows that require approval, you can configure which users can approve or reject by editing the `getApprovers()` function in the `KBWorkflow` script include.

**Default knowledge workflows**

<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge - Approval Publish</td>
<td>Requests approval from a manager of the knowledge base before moving the article to the published state. The workflow is canceled and the article remains in the draft state if any manager rejects the request.</td>
</tr>
<tr>
<td>Knowledge - Approval Retire</td>
<td>Requests approval from a manager of the knowledge base before moving the article to the retired state. The workflow is canceled and the article remains in the published state if any manager rejects the request.</td>
</tr>
<tr>
<td>Knowledge - Instant Publish</td>
<td>Immediately publishes a draft article without requiring an approval.</td>
</tr>
<tr>
<td>Knowledge - Instant Retire</td>
<td>Immediately retires a published article without requiring an approval.</td>
</tr>
<tr>
<td>Knowledge - Publish Knowledge</td>
<td>A subflow that moves the knowledge article to the published state. You can use this subflow when defining your own workflow.</td>
</tr>
<tr>
<td>Knowledge - Retire Knowledge</td>
<td>A subflow that moves the knowledge article to the retired state. You can use this subflow when defining your own workflow.</td>
</tr>
</tbody>
</table>
**Knowledge properties**

As an administrator, you can configure the look and functionality of many knowledge base features with knowledge properties.

You can access knowledge properties by navigating to **Knowledge > Administration > Properties**.

**Knowledge portal properties**

Knowledge portal properties control the look and functionality of the legacy portal page. This portal page lists recent knowledge articles and their publishing dates, organized by topic.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>Base (glide.knowman.show_home_if_one_kb)</td>
<td></td>
</tr>
</tbody>
</table>
### Property | Description
--- | ---
Default header title for the pinned articles section on knowledge home pages. ([glide.knowman.default_pinned_section_header_title](#)) | Enter a title for the Featured Content section of the knowledge homepage.

### Other knowledge properties

Additional knowledge properties let you control general knowledge management features.

### Property | Description
--- | ---
When attaching an article to an incident, copy the content into this field. ([glide.knowman.attach.fields](#)) | When a user searches knowledge from a task form (such as an incident, problem, or change) and clicks the **Attach to Task** button for an article, the system copies the article number and content into the field specified here. You can specify a separate field for each table you want to attach articles to as a comma-separated list. Use dot walking to copy the article content into related records. If a specified field does not exist, that field is ignored.

Knowledge Management logo to display if running out of the ServiceNow frames. ([glide.knowman.frameless_logo](#)) | Click the reference lookup tool ([Icon Reference Lookup](#)) and choose an image file to be displayed on knowledge pages that are used outside of the ServiceNow application frames. For example, the logo image selected here appears if you create a Content Management System site that includes knowledge pages. You can also enter the **Name** of an image stored in the database to use that image.

Note: This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages.

Hide the ‘import’ functionality (button and drag-n-drop) for all users. ([glide.knowman.import.hide_import_functionality](#)) | Select **Yes** to hide the **Import Articles** button. If you have not yet migrated to Knowledge v3 and are using legacy Knowledge v2, you can configure the visibility of the **Import Articles** button to prevent users from importing articles to knowledge bases.

Show publish check box on the knowledge import pop-up. ([glide.knowman.import.show_publish_checkbox](#)) | Select **No** to remove the **Publish** check box on the knowledge import form so that an article cannot be published as part of the import process. Default is yes.

<tr>
<td></td>
<td>If you have large number of articles in your knowledge base, setting this property to true will negatively impact performance.</td>
</tr>
</tbody>
</table>

**Knowledge Social Q&A properties**

The system administrator can set the limit for the number of times users can ask, answer, or subscribe to Social Q&A questions, or comment on the questions and answers using the Social Q&A system properties.

To open the System Properties (sys_properties) table, enter sys_properties.list in the navigation filter.

**Note:** If the Value field for the any of the Social Q&A properties is left blank, then a rate limit does not apply for that particular property.
### Article versioning properties

The knowledge administrator can set configuration properties that enable users to edit specific fields on published articles without creating new versions.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable article versioning feature. (glide.knowman.versioning.enabled)</td>
<td>Select the <strong>Yes</strong> check box to enable the article versioning feature.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Type</strong>: true</td>
</tr>
<tr>
<td></td>
<td>- <strong>Default value</strong>: true</td>
</tr>
<tr>
<td></td>
<td>- <strong>Location</strong>: Knowledge &gt; Administration &gt; Properties</td>
</tr>
<tr>
<td>Enable minor edits to a published article without creating a new version. (glide.knowman.versioning.enable_minor_edits)</td>
<td>Select the <strong>Yes</strong> check box to enable minor edits to published articles without creating a new version.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Type</strong>: true</td>
</tr>
<tr>
<td></td>
<td>- <strong>Default value</strong>: false</td>
</tr>
<tr>
<td></td>
<td>- <strong>Location</strong>: Knowledge &gt; Administration &gt; Properties</td>
</tr>
</tbody>
</table>

**Note:** This feature is available for the following users: the knowledge administrator, the knowledge base manager, and the knowledge base owner.
### Knowledge subscription properties

The knowledge administrator can set configuration properties that enable users to subscribe to knowledge bases and knowledge articles.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable subscribe feature for KM</td>
<td>Select the Yes check box to enable the Knowledge subscription feature.</td>
</tr>
<tr>
<td>List of roles (comma-separated) who can have subscription feature</td>
<td>Enter the roles in a comma-separated list that can use the Knowledge subscription feature.</td>
</tr>
<tr>
<td>List of workflow states (comma-separated) that can have subscription feature</td>
<td>Enter the workflow states for knowledge articles in a comma-separated list that users can subscribe to.</td>
</tr>
</tbody>
</table>

### Article quality index properties

The knowledge administrator can set the pass score for AQI reviews using the knowledge properties page.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pass score for AQI reviews.</td>
<td>Enter the fields in a comma-separated list that can be edited on published articles without creating a new version.</td>
</tr>
</tbody>
</table>

• Default value: application/octet-stream,application/x-apple-diskimage,application/vnd.microsoft.portable-executable  

| Note: This property is read-only and takes precedence over allowed content types. |  
| sn_km_intg.glide.knowman.external.reject_content_types | |
| **UI Label for indicating external articles in Search Results and Article View Pages.** | | • Type: string  
• Default value: External Content  

| sn_km_intg.glide.knowman.external.ui_label_for_external_content | |

Create a custom knowledge homepage

As a system administrator, you can create a module allowing users to open a knowledge homepage for a specific knowledge base or category.

Role required: admin

1. Right-click the application label in the application navigator and select Edit Application.
2. In the **Modules** related list click **New**.
3. Enter a **Title** for the module.
4. In the **Link type** field, select **URL (from Arguments)**.
5. In the **Arguments** field, append one or more of the following values to `$knowledge.do#/ search?`.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| sysparm_kb=<knowledge base sys_id> | Enter the sys_id of a knowledge base to show knowledge articles from that knowledge base by default.  
If the specified knowledge base does not exist, the default knowledge homepage appears when accessing the custom homepage module. |
| sysparm_category=<knowledge category sys_id> | Enter the sys_id of a knowledge category to show knowledge articles from that category by default.  
If the specified category does not exist, the default category for the selected knowledge base appears when accessing the custom homepage module. |
| sysparm_order=<view_count, last_modified, or relevancy> | Enter the default sort order for articles to appear in. |

To create a homepage for a **Facilities** knowledge base with a **sys_id** of `d582764047022100158b949b6c9a7145` and sorting by last modified date, enter `$knowledge.do#/ search? sysparm_kb=d582764047022100158b949b6c9a7145&sysparm_order=last_modified` in the **Arguments** field on the Module form.

### I18N - Knowledge internationalization

Organizations with knowledge users who speak multiple languages can activate the optional knowledge internationalization features.

Activating internationalization plugins for any of the available languages automatically activates the **I18N: Knowledge Management Internationalization Plugin v2** plugin (com.glideapp.knowledge.i18n2).

Enabling any of the **I18N** language plugins automatically enables the **I18N: Knowledge Management Internationalization Plugin v2** plugin (com.glideapp.knowledge.i18n2).

When active, knowledge internationalization enables the knowledge management team to create language-specific knowledge articles and keep translations of the same article related to each other so they are easy to manage. Users can view and search within their own language while still being able to view articles in other languages when necessary.
To set the default language for searching articles to a language different from the logged in language of the user, specify the desired language in the `glide.knowman.search.default_language` system property.

For example, if you are logged in using the French language and would like the default language for searched articles to be English, specify English in the system property. You can then switch to French from within the UI to see French articles.

If no language is specified in the system property, articles default to the logged in language of the user.

Refer to [Knowledge search](#) for information on performing a search on all available languages simultaneously.

Social Q&A does not use language-specific questions and answers. All questions and answers appear in the language they were created in. For example, a question in English is not translated when the current user’s selected language is French.

Activate the knowledge management internationalization plugin

To enable translation of knowledge articles, you must activate multiple plugins.

- I18N:Knowledge Management Internationalization v2 plugin
- Internationalization plugins for each appropriate language

See [Activate a plugin](#) for more information activating plugins.

Installed Components

Activating the Knowledge Management Internationalization plugin installs these components:

- A relationship named Translated Versions that creates a related list on the Knowledge form showing other articles that have the same parent article.
- A business rule named knowledge query that automatically filters the knowledge portal and search results based on the user’s selected language.
- A UI macro named kb_languages. )
- Two fields, named Language and Parent, in the Knowledge [kb_knowledge] table and the Knowledge form.

Knowledge Form Changes

Activating knowledge management internationalization adds these fields to the Knowledge form.

- Language: select the language for the article.
- Parent: enter the number of the article that represents the base language. This setting keeps translations of the same article related to each other. Consider choosing the same language consistently for the parent article.

Additionally, the Translated Versions related list is automatically added to the Knowledge form after you save an article.
Create a translation for a knowledge article

Create a translation for an article from the Translated Versions related list on the knowledge article record. Before creating a translation, activate the internationalization plugin for the desired language which, in turn, activates the I18N: Knowledge Management Internationalization Plugin v2 (com.glideapp.knowledge.i18n2).

1. Open the knowledge article record.
2. In the Translated Versions related list, click New.
3. Select the desired language for the translation in the Language field.
4. Provide a description in the Short Description field.
5. Click Submit.

The translation is created and added to the Translated Versions related list.

Duplicate knowledge article numbers

Importing knowledge articles into an instance can create articles with duplicate numbers.

The Knowledge Number field is auto-generated and is incremented every time you create a new article in an instance. The initial value for the Number field is 10,000. To customize this number:

1. Navigate to System Definition > Number Maintenance.
2. Search for Knowledge in the Table column.
3. Click the Controls related list tab.
4. Enter a new Number and click Update.

Importing knowledge articles from another instance or as part of the demo data for another application may introduce an article with a number that is already in use. Because the Knowledge Number field is not uniquely indexed, the import completes without error.

With duplicate knowledge article numbers present, links to article view pages that use the knowledge number can behave inconsistently. For example, if there are two articles with the same Knowledge number KB0000033, the following link may open either of these two articles randomly: kb_view.do?sysparm_article=KB0000033. This can happen in Knowledge search results where clicking on a result opens a different article instead of the article displayed in the search results.

Avoiding duplicate Knowledge article numbers

To avoid inserting Knowledge articles with duplicate numbers into a production environment:

- Do not import demo data articles in production environment.
- Verify the numbers of the articles to be inserted to make sure they are not already in use.
- Create a before insert business rule on the Knowledge table (kb_knowledge) to ensure the new number is not already in use.

You can also update the initial value for the Knowledge Number field so that newly created articles do not conflict with existing articles.

1. Navigate to System Definition > Number Maintenance.
2. Search for Knowledge in the Table column.
3. Click the Knowledge link to open the Knowledge table form.
4. Click the Controls related list tab.
5. In the Number field, update the count to a number greater than the largest value already in the system.
6. Click Update.

Enable search on all knowledge bases

Configure the knowledge base search source in the service portal to perform a search on all knowledge bases.

Role required: admin

By default, the knowledge base search source in the service portal is set to search only a single knowledge base, which by default is set to the IT knowledge base.

1. Navigate to Service Portal > Portals > Service Portal.
2. Clear the entry in the Knowledge base field.
3. Click Update.
4. In the Search Source related list, select Knowledge Base.
5. In the Data Source tab, go to the Data fetch script field and delete or comment out line 7.
```javascript
(function(query) {
    var results = [];
    // Here goes the logic. Compute results.
    var kb = new GlideRecord('kb_knowledge_base');
    kb.addQuery('workflow_state', 'publish');
    kb.addQuery('valid_to', '>=', (new GlideDate()).getLocalDate().getValue());
    kb.addQuery('123TEXTQUERY321', query);
    kb.setLimit(data.limit);
    kb.query();
    data.article_count = kb.getRowCount();

    var kbCount = 0;
    while (kb.next() && kbCount < data.limit) {
        // Does user have permission to see this?
        if (!$sp.canReadRecord("kb_knowledge_base", kb)) {
            continue;
        }

        var article = {};
        $sp.getRecordDisplayValues(article, 'sys_id,number,short_description,published,article.publishedUTC = kb.getVal...
6. Click Update.
   When you perform a keyword search in the service portal, the knowledge base search source performs the search on all knowledge bases.

Enable creating an article from a customer service case

You can enable authors to reuse information in a case by copying case details into an article template. Use the pre-defined customer service source case table to article template target table configuration or create custom configurations between the two tables to copy information from a case to an article.

- The Knowledge Management Advanced plugin must be active.
- The KCS for Customer Services Management property must be enabled
- The pre-defined KCS article template or a newly created article template must be active.

Note: You can do one of the following to create an article from a case:

- Use the pre-defined Case KCS Article mapping as is or modify the field mappings between the case source table and article template target table.
- Create a new article template target table and map it to the case source table and customize the field mappings between them. For information on creating article templates, refer to Create an article template.

- Knowledge users use the Create Knowledge button in a case form to create an article from a case and must have "can contribute" permission for at least one active knowledge base to create an article from a case. For information on user permissions, see Knowledge Management roles.

Role required: sn_customerservice.customer_admin or admin

The pre-defined Case KCS Article mapping is stored in the CSM Table Map (csm_table_map) table. This configuration has the sn_customerservice_case source case table configured to the kb_template_kcs_article target article template table with the four field mappings pre-configured between the tables. You can customize the existing field mappings or map additional fields between the tables.

1. In the application filter navigator, type csm_table_map.list.
2. Click Case KCS Article.
3. From the Target Table list, use the pre-defined KCS article template table or select the newly created article template table.
4. Map each customer service case field that must be used to create knowledge articles.
   a) In the Basic Field Mapping related list, click New.
      To map fields, fill in the following fields:

      | Field                  | Instructions                                                                 |
      |------------------------|-----------------------------------------------------------------------------|
      | Source Field           | Select the field in the source case table that contains the information to  |
      |                        | be copied to the field in the article template target table.                |
b) Click **Submit**.

c) To map fields using advanced scripts, select the **Advanced Field Mapping** check box and then map the fields between the source and the target table using advanced scripts in the **Advanced Field Mapping** tab.

**Note:**
If the same source or target field is configured in both the basic and advanced field mappings, the advanced field mapping overrides the basic field mapping.

If the fields configured in the basic and advanced field mapping are different, the field configurations in the advanced field mapping are appended to the field configurations in the basic field mapping.

d) To customize when and how the **Create Knowledge** button is displayed, use the condition builder in the **Condition** tab or select **Use Advanced Condition** check box and configure using advanced scripts.

**Note:** If you change the target table in the Case KCS Article mapping, also update the scripts with the configuration changes for display of this button.

5. Click **Update**.

**Use knowledge on mobile devices**

All users can access knowledge from mobile devices to search for and view knowledge articles and social Q&A questions.

**Browse knowledge on mobile devices**

You can browse knowledge bases using a mobile device.

Navigate to **SELF-SERVICE > Knowledge Base**.
Mobile Knowledge View

Browse Knowledge by tapping on a category and browsing articles or subcategories.
Mobile Knowledge Categories

Note: Select the desired category and click the close icon (×) for the selected category to reflect in the search results.

View knowledge articles and questions on mobile devices

You can read knowledge content using a mobile device.

Tap a title to view the article or question.
Note: You cannot edit or add comments to knowledge articles on the mobile interface. If using Social Q&A, you can perform all functions such as adding and editing questions, answers, and comments through the mobile interface.

Search knowledge on mobile devices
Find a specific article or question by searching on a particular term.
Knowledge Management v3 migration

Knowledge management has significantly changed with the introduction of knowledge v3 starting with the Fuji release.

Knowledge v3 has several key differences from knowledge v2, the version of knowledge management that was available until Eureka release. The knowledge v3 plugin is activated by default starting with the Fuji release.

The following podcast provides more information on what is new in Knowledge Management v3.

When upgrading from Eureka or earlier versions, if you intend to use the new features available in knowledge v3, you have to migrate legacy knowledge content and any customizations you have made to the Knowledge Base applications.

The following video provides more information on how to migrate from Knowledge Management v2 to v3.
Key differences

<table>
<thead>
<tr>
<th>Legacy Knowledge</th>
<th>Knowledge v3</th>
</tr>
</thead>
<tbody>
<tr>
<td>One knowledge base.</td>
<td>Multiple knowledge bases.</td>
</tr>
<tr>
<td>A single lifecycle workflow shared by all articles.</td>
<td>Separate, customizable workflows available for each knowledge base.</td>
</tr>
<tr>
<td>Two-level organizational structure with Topic and Category. A single organizational taxonomy shared by all articles.</td>
<td>Category structure with any number of levels. Each knowledge base has a unique category taxonomy.</td>
</tr>
<tr>
<td>Permissions defined per article using roles and ACLs.</td>
<td>Permissions defined per knowledge base or article using user criteria.</td>
</tr>
</tbody>
</table>

Knowledge Management v3 migration process

When you upgrade from Eureka or earlier, consider a multi-step migration process. This process ensures you can access existing knowledge content and allows you to fully migrate at your own pace.

Review automatic changes before upgrading. These changes are applied immediately when upgrading and may impact existing functionality.

1. Migrate knowledge functionality to use your customized functionality with the knowledge v3 enhancements.
2. Migrate knowledge content to use the knowledge v3 enhancements with your existing knowledge articles.

After migration to Knowledge v3

These items are relevant to getting the full range of new functionality after you migrate.

- You must configure knowledge access controls based on user criteria to ensure that users can access existing knowledge content. Since access control in knowledge v3 is intended to be based on user criteria alone, users may be unable to access v2 or v3 knowledge articles, or have restricted access, with preexisting ACLs.
- If the home page was customized in knowledge v2, custom layout and links are not saved in knowledge v3.
- Images added using the Image field in a knowledge article form do not display in the Knowledge v3 or Knowledge Service Portal pages. The article search results page displays the knowledge base icon next to all articles from the knowledge base.

Automatic changes after KMv3 migration

Upgrading to Knowledge v3 automatically changes knowledge functionality including the knowledge user interface and security model.

Default knowledge base

When you upgrade from Eureka or earlier, a default knowledge base is created, titled Knowledge, that contains all knowledge articles from the previous version.

After the upgrade, you can add and edit articles in this knowledge base.
Articles in the default knowledge base continue to use legacy functionality, such as role-based access controls. Any customizations you made to knowledge functionality before the upgrade are preserved in the default knowledge base.

**Knowledge search changes**

By default, the legacy knowledge portal uses knowledge v3 search with limited filtering options. You can filter results only by knowledge base. Search results include only those articles the current user can view based on user criteria. ACLs do not restrict search results.

**Knowledge security changes**

Knowledge v3 manages access to articles with user criteria rather than roles and ACLs. Existing ACLs on the Knowledge (kb_knowledge) table are preserved, but with the following changes.

- A version of 3 indicates that a knowledge base uses the knowledge v3 functionality.
- A version of 2 indicates that a knowledge base uses legacy functionality.

New ACLs introduced by knowledge v3, such as field-level controls, apply to all knowledge bases. When you upgrade from Eureka or earlier, any custom ACLs you implemented for the Knowledge table still apply to any knowledge records in the default knowledge base. Knowledge v3 updates ACLs that exist before upgrade so they only apply to Knowledge (kb_knowledge) records where this field value is 2.

**Note:** These changes affect the default knowledge base. Even if you are not using the new knowledge functionality, the legacy knowledge behavior may change if you have made customizations to ACLs on the Knowledge (kb_knowledge) table. Ensure you configure knowledge access controls after upgrading to prevent unexpected behavior.

Because Knowledge v3 introduces ACLs for the Knowledge (kb_knowledge) table, if you do not have high security enabled, you may notice differences in default behavior. See KB0549970 for information about configuring Knowledge v3 without high security.

**Knowledge article view changes**

The Knowledge application uses the kb_view UI page to display knowledge articles.

**UI page**

The following changes apply automatically when you upgrade from Eureka or earlier:

- The existing kb_view page is renamed to kb_view_customer. The kb_view_customer page is used to display articles in the default knowledge base, preserving the legacy user experience.

  **Note:** By default, the kb_view_customer page is publicly accessible. As an administrator, you can change this behavior by modifying the sys_public table record for this page and clearing the Active field in the record.

- A new kb_view page is used. This becomes the primary page used to display articles that are not in the default knowledge base.

You should review all customizations introduced around the legacy kb_view UI page.
• URLs should not be updated as the new kb_view page redirects to the correct page depending on the article.
• Customizations made to the kb_view UI page are automatically copied to the kb_view_customer page on upgrade.
• Other customizations that affect kb_view may need to be copied or modified to apply to kb_view_customer. For example, an ACL defined for kb_view may need to be duplicated to provide security coverage for kb_view_customer.

Feedback

Legacy feedback functionality is retained for knowledge articles displayed in the legacy article view. Users can continue to use the feedback options to view, add, and reply to comments on these legacy articles. Legacy comments are retained in the Knowledge Feedback (kb_feedback) table.

To retain the legacy comment functionality with new knowledge articles, set the Use Live Feed for Knowledge feedback property (glide.knowman.use_live_feed) to false. This property is set to true by default.

Knowledge portal changes

While the legacy knowledge portal, kb_home, has not changed in Knowledge v3, we strongly recommend that you consider moving to the new Knowledge v3 home page, $knowledge.do.

UI page

You can search articles from the knowledge portal and filter search results by knowledge base, and by language if the instance uses knowledge management internationalization. This portal also appears for users on older browsers, such as Internet Explorer 9, instead of the knowledge homepage.

Navigation add-ons are available in the legacy knowledge portal. Navigation add-ons of the Link type appear in the top-right of the portal. To add navigation add-ons of the Search type, you must customize the kb_home UI page.

Search

By default, the legacy knowledge portal uses knowledge v3 search with limited filtering options. You can filter results only by knowledge base. Search results include only those articles the current user can view.

Access a knowledge base or search engine

You can add new search engines to the advanced search function or add links at the top of knowledge pages.

Role required: admin

This feature lets you configure access to a knowledge base, either public or private, or to a public search engine.

1. Navigate to Knowledge > Administration > Navigation Add-ons.
2. Click New.
3. Complete the form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the search engine name or link text.</td>
</tr>
<tr>
<td>Type</td>
<td>Select Search or Link.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number to indicate the sequence of this search option or link.</td>
</tr>
<tr>
<td>URL</td>
<td>For a link, enter the URL. Leave blank for a search engine.</td>
</tr>
<tr>
<td>Script</td>
<td>For a search engine, enter a script that opens the search engine's results page for the search text. Leave blank for a link.</td>
</tr>
</tbody>
</table>

4. Click Submit.

Knowledge submissions

Knowledge submissions created from tasks continue to work in knowledge v3 with minor changes.

By default, the Topic and Category fields no longer appear on the Submission form due to the knowledge v3 category changes.

The property glide.knowman.submission.workflow no longer appears on the knowledge properties UI page. To enable knowledge submissions, set this property to true on the System Properties (sys_properties) table.

See creating knowledge from incidents and problems for instructions on using knowledge submission in knowledge v3.

Migrating Knowledge access controls

Access to knowledge articles is controlled based on the user criteria for the knowledge base.

Important: If you do not migrate existing knowledge ACLs to user criteria, users may be unable to access knowledge articles, or may be able to access restricted articles.

User criteria records, rather than ACLs, control basic create, read, update, and delete operations for knowledge articles as well as which search results appear. This may lead to unexpected behavior if your configuration depends on ACLs to control access.

To ensure users are able to access the correct knowledge articles, migrate any ACL-based security settings to user criteria. This process may include creating additional knowledge bases and moving existing content to these knowledge bases, depending on your security model. For a detailed explanation and migration examples, refer to KB0550924 Understanding User Criteria and ACLs in Knowledge v3.

This video demonstrates how to manage article-level access controls during migration from Knowledge Management v2 to v3.

Knowledge functionality migration

You can migrate knowledge functionality to use your customized functionality with the knowledge v3 enhancements.
Replaced knowledge modules

When you are ready to migrate to knowledge v3, you can activate the v3 modules and deactivate the legacy modules.

Use the tables below to identify which knowledge v3 modules to activate and which legacy modules to deactivate. When activating a knowledge v3 module, deactivate the knowledge v2 module with the same name to ensure users access the correct module.

You can use the `enablev3anddisablev2menus.txt` backup script to enable knowledge v3 menus and disable knowledge v2 menus.

### Knowledge v3 modules

<table>

</tbody>
</table>
### Knowledge article publish and retire workflows

With knowledge v3, article state is controlled by workflows.

In the legacy knowledge base, article state was controlled by UI actions. UI actions from previous versions are available only in the default knowledge base.

To preserve your article publishing and retirement process in new knowledge bases, create workflows that follow these processes. To create these workflows, copy the default workflow that best matches your process and modify that copy. After creating workflows that use your article publishing and retirement processes, use these workflows as the Publish workflow and Retire workflow for the new knowledge bases.

### Knowledge article category structure

With knowledge v3, all knowledge articles are organized by category and subcategory within knowledge bases.

The default knowledge base uses the legacy category structure; knowledge articles are organized by topics and categories.

Before you migrate articles, create a category structure for these articles in the destination knowledge bases. This structure can reproduce your legacy topic and category structure or can be extended to take advantage of the knowledge v3 category functionality.

### Knowledge content migration

To use the new functionality available in knowledge v3 with legacy articles, you must migrate these articles out of the default knowledge base.

To migrate knowledge content, move articles out of the default knowledge base by changing the Knowledge Base value for each article. The state of the article remains unchanged when moving articles. After selecting a new knowledge base, assign a category to each article using the category structure defined in the new knowledge base.

After you migrate a knowledge article, the legacy feedback functionality is automatically replaced with the new knowledge feedback mechanisms. Legacy feedback is copied to the Live Feed Message (live_message) table to ensure previously submitted feedback is available for knowledge v3 articles.
Out-of-the-box Knowledge Management Performance Analytics Solutions

Performance Analytics Solutions contain preconfigured best practice dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

**Note:** You can activate Performance Analytics solutions and in-form analytics on instances that have not licensed Performance Analytics to evaluate the functionality. However, to start collecting data you must license Performance Analytics.

Performance Analytics Solutions

Use the Performance Analytics widgets on the dashboard to visualize data over time, analyze your business processes, and identify areas of improvement. With solutions, you can get value from Performance Analytics for your application with minimal setup.

**Note:** Solutions include some dashboards that are inactive by default. You can activate these dashboards to make them visible to end users according to your business needs.

To enable the solution for Knowledge Management, an admin can navigate to Performance Analytics > Guided Setup. Click Get Started then scroll to the section for Knowledge Management. The guided setup takes you through the entire setup and configuration process.

Article versioning

Use the Knowledge Management article versioning feature to create and maintain multiple versions of a knowledge article.

Knowledge contributors can create a new version of a knowledge article from an existing published version. This existing version can be either the latest published version or an older outdated version. All changes are stored in the new version of the article and the information in the existing article remains the same.

Activate the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) to use the knowledge subscription feature.

If you import published knowledge articles from a ServiceNow instance that does not support article versioning, you must run the Initialize Versions on Articles fix script to enable article checkout and editing.

With the article versioning feature, knowledge users can:

- Check out the latest version of a published article and create a new version.
- Select a previously published (outdated) version of an article and make it current.
- Recall an article that is being reviewed.
- Retire the latest published version of an article.

There are two types of article revisions: major and minor. Minor revisions include updates to an article that has not yet been published. Major revisions include updates to an article that has been published and is available to customers. To track the different revisions, the article versioning feature introduces version numbering.

With the article versioning feature, the knowledge article number also includes the version number. All references to knowledge articles use this number format. For example, KB0010003 v2.0.
Manually update customized files

If you have customized any of the files that are updated as part of the Knowledge Management Advanced Installer plugin, these files are skipped during plugin activation and must be updated manually.

Manually update your customization to include the article versioning-related changes.

- Add the **Version** field to the Knowledge form layout and the Knowledge list view, if it is not already present.
- Add the **outdated** choice to the **Workflow** choice list field on the Knowledge form, if it is not already present. Keep the value as **outdated** because of dependencies that article versioning functionalities have on this choice.
- Update the **Knowledge > My Flagged** and **Self-Service > My Knowledge Articles** modules to include the following condition in the **Filter** field, if these modules do not already reflect this change: **Revised by is (dynamic) me**.

If you have customized any of the Knowledge Management Overview dashboard reports, these files are also skipped during plugin activation and must be updated manually.

Article versioning changes

Article versioning introduces new actions that allow knowledge users to create and revise versions of existing articles. It also introduces new fields and related lists to the Knowledge form, new columns to the Knowledge list, and updates to Knowledge dashboard reports.

New user actions

As part of creating article versions, users can:

- Check out a published article and create a new version by clicking **Checkout** on the Knowledge form.

  **Note:** Only the author, knowledge base owner, and users with the **knowledge_admin** role can edit an article in the draft state.

- Recall an article that is being reviewed by clicking **Recall** on the Knowledge form.
- Select a previously published article in the Outdated state and make it the current published version by clicking **Make this current** in the Knowledge form header.

  **Note:** To edit a published article without having to create a new version, make sure the **glide.knowman.versioning.enable_minor_edits** property is enabled.

Changes to the Knowledge list

The article versioning feature adds the following to the Knowledge list:

- The **Version** column displays the article version number. The Knowledge list displays multiple versions of an article.
- The **Workflow** column includes the new **Outdated** state.
Changes to the Knowledge form

The article versioning feature adds the following to the Knowledge form:

- The **Version** field displays the article version number.
- The **Display number** field displays a combination of the article number and the version number. For example, KB0010004 v1.02. All references to a knowledge article use this display number.
- The **Base Version** field displays the knowledge article number and version on which the current article is based.
- The **Revised By** field displays the name of the user who checked out a published article and created a new version.
- The **Article Versions** related list displays a list of all versions for an article. From this list, you can:
  - Click the **Version** to view a specific version of an article.
  - Click the **View Article** related link to see the article page view.

**Note:** If necessary, configure the form to display the fields and the related list.

Changes to Knowledge modules

The article versioning feature introduces the following Knowledge module changes:

- **My Knowledge Articles**
  - For a knowledge user, this module includes records for the articles authored by the user as well as records for each article revised by the user.
  - For a knowledge reviser, this module includes records for the articles published by the user as well as records for each article revised by the user.

- **My Flagged**
  - For a knowledge user, this module includes records for each revision made to articles authored by the user.
  - For a knowledge reviser, this module includes records for each article revised by the user.

**Note:** Users that have customized these modules do not see these changes.

Changes to Knowledge Management dashboard reports

The Knowledge Management Overview dashboard reports have been updated to include article versioning-related changes when the Knowledge Management Advanced plugin is activated.

- Articles Flagged in the Last 30 Days
- Articles Marked Not Useful in the Last 30 Days
- Articles Used per Month
- Knowledge use
- Knowledge view
- Knowledge updated in past 30 days
- Knowledge flagged in past 30 days
- Knowledge by Workflow state

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
• Knowledge created by Author
• Knowledge created in past 30 days
• New Knowledge Articles Created in the Last 30 Days
• Knowledge Ratings for past 30 days

Versioning information available in the Knowledge Management Service Portal

Knowledge search results show the article number and the version number for each article.

Note:
To display the article version number next to the article number in the search results, enable the `glide.knowman.search.show_article_number` property in the Knowledge Search Properties section of the Knowledge Management Properties page.

If you are accessing an article from the base system or knowledge service portals using the URL to a KB article, you must also include the article version number in the URL. For example, to access the KB0000005 knowledge article, instead of using the `https://<instance name>/sp?id=kb_article&sys_id=KB0000005` as the URL, you must use `https://<instance name>/sp?id=kb_article&sys_id=KB0000005%20V1.0` to view the article.

The article view page shows a version history section for articles that have been updated. This section includes the version numbers, date updated, and the name of the author or reviser.

• Click Latest version or the version number and current state to expand the version history section.
• Click the version number to open that particular version of the article.
• When viewing an outdated article, a message informs the user that a newer updated version is available. The message includes a link to the latest version.

Feedback on article versions

With the article versioning feature, users can view and contribute to feedback on the current versions of knowledge articles.

For more information about feedback options, see Knowledge feedback.

<table>
<thead>
<tr>
<th>Feedback option</th>
<th>How this option works with article versioning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rating an article</td>
<td>The average rating for an article is carried over to the checked out version. The average rating calculation updates and displays on the current version of the article.</td>
</tr>
<tr>
<td>Marking an article as helpful</td>
<td>The helpfulness percentage of a previous version of an article is also considered for a new version when displayed in the helpfulness column on the homepage.</td>
</tr>
<tr>
<td>Comments</td>
<td>The Comments section at the bottom of an article displays comments from previous versions unless Live Feed is enabled. Live Feed only shows comments for the current version.</td>
</tr>
<tr>
<td>Feedback option</td>
<td>How this option works with article versioning</td>
</tr>
<tr>
<td>-------------------------</td>
<td>----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Flagging an article</td>
<td>Checking out an article or setting a previous version to the current version resets the flagged value to false.</td>
</tr>
<tr>
<td>View count</td>
<td>The view count is carried over to the checked out article. Any view of a version of an article increments the view count of all subsequent versions. Views to a newer version of an article do not affect the view count of previous versions.</td>
</tr>
<tr>
<td>Use count</td>
<td>The use count is carried over to the checked out article. Any use of a version of an article increments the use count of all subsequent versions. Any use of a newer version of an article does not affect the use count of previous versions.</td>
</tr>
</tbody>
</table>

**Knowledge article version numbers**

Knowledge article version numbers follow a specific pattern. Increments to the version number depend on the revision type.

Article version numbers follow the pattern `major.minor`. The type of revision being made to an article determines the increment. A minor revision increments the version number by 0.01. A major revision, such as publishing an article, increments the version to the next whole number, for example, from version 2.02 to 3.0.

The following example illustrates the life cycle of a versioned article and the changes to the version number.

<table>
<thead>
<tr>
<th>User action</th>
<th>Article state</th>
<th>Version number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge author creates a new article</td>
<td>Draft</td>
<td>0.01</td>
</tr>
<tr>
<td>Knowledge author makes a change and updates the article.</td>
<td>Draft</td>
<td>0.01</td>
</tr>
<tr>
<td>Knowledge author submits the article for review.</td>
<td>Review</td>
<td>0.02</td>
</tr>
<tr>
<td>Knowledge author recalls the article to make another change.</td>
<td>Draft</td>
<td>0.03</td>
</tr>
<tr>
<td>Knowledge article submits the article for review</td>
<td>Review</td>
<td>0.04</td>
</tr>
<tr>
<td>Approver rejects the article and requests a change.</td>
<td>Draft</td>
<td>0.05</td>
</tr>
<tr>
<td>Knowledge author makes the change and submits the article for review.</td>
<td>Review</td>
<td>0.06</td>
</tr>
<tr>
<td>Approver approves the article</td>
<td>Published</td>
<td>1.0</td>
</tr>
<tr>
<td>Knowledge author checks out the published article.</td>
<td>Draft</td>
<td>1.01</td>
</tr>
<tr>
<td>Knowledge author submits the article for review.</td>
<td>Review</td>
<td>1.02</td>
</tr>
</tbody>
</table>
Any change to the state of an article results in a version increment, except to and from the Pending retirement, Retired, and Outdated states.

### Knowledge article version information

Users can view version information for a knowledge article from the Knowledge view page. The knowledge article number and the version number appear at the top of the article, just below the title. Clicking the version number expands the version history section, which includes a list of the available article versions. User roles determine what is included in this list:

- Users with read access to a knowledge base can see the latest published version and previous major versions.
- Users with read and contribute access to a knowledge base can see the latest published version, previous major versions, and any draft or review versions.

You can view any of the previous versions of an article by clicking the version number in the list. When you view a previous version, a message at the top of the article indicates that an updated version is available.

At the bottom of a knowledge article, you can see additional information about an article, including the name of the author or revisor and the date that the article was last modified.

### Knowledge article states

A versioned knowledge article can be in one of several states as it progresses through the creation cycle.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Draft</td>
<td>The article is in the process of being created.</td>
</tr>
<tr>
<td>Review</td>
<td>The draft version of the article is sent to reviewers to approve or reject.</td>
</tr>
<tr>
<td>Published</td>
<td>The article is approved and published. When the state of an article changes to Published, the state of any previous published versions of that article changes to Outdated.</td>
</tr>
<tr>
<td>Pending retirement</td>
<td>The published article is selected for retirement, pending approval.</td>
</tr>
<tr>
<td>Retired</td>
<td>The published article is retired. Retired knowledge articles cannot be searched for by external users or customers. To reuse a retired article, create a new article with the same content, which is published once approved.</td>
</tr>
<tr>
<td>State</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Outdated</td>
<td>A more recent version of the article has been published. End users can read published articles as well as the outdated versions.</td>
</tr>
</tbody>
</table>

**Article versioning properties**

The knowledge administrator can set configuration properties that enable users to edit specific fields on published articles without creating new versions.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable article versioning feature. (glide.knowman.versioning.enabled)</td>
<td>Select the <strong>Yes</strong> check box to enable the article versioning feature.</td>
</tr>
<tr>
<td></td>
<td>- Type: true</td>
</tr>
<tr>
<td></td>
<td>- Default value: true</td>
</tr>
<tr>
<td></td>
<td>- Location: Knowledge &gt; Administration &gt; Properties</td>
</tr>
<tr>
<td>Enable minor edits to a published article without creating a new version. (glide.knowman.versioning.enable_minor_edits)</td>
<td>Select the <strong>Yes</strong> check box to enable minor edits to published articles without creating a new version.</td>
</tr>
<tr>
<td></td>
<td>- Type: true</td>
</tr>
<tr>
<td></td>
<td>- Default value: false</td>
</tr>
<tr>
<td></td>
<td>- Location: Knowledge &gt; Administration &gt; Properties</td>
</tr>
<tr>
<td>A comma-separated list of fields that can be edited on published articles without creating a new version. (glide.knowman.versioning.minor_edit_fields)</td>
<td>Enter the fields in a comma-separated list that can be edited on published articles without creating a new version.</td>
</tr>
<tr>
<td></td>
<td>- Type: string</td>
</tr>
<tr>
<td></td>
<td>- Default value: valid_to</td>
</tr>
<tr>
<td></td>
<td>- Location: Knowledge &gt; Administration &gt; Properties</td>
</tr>
</tbody>
</table>

**Note:** This feature is available for the following users: the knowledge administrator, the knowledge base manager, and the knowledge base owner.

**Check out a published article and create a new version**

Create a new version of a knowledge article by checking out the latest published version.

Users with canContribute permissions, including the knowledge owner, knowledge manager, and knowledge administrator, can check out a published article unless there is already a checked out version. If a version has been checked out, the **Checkout** button does not appear on the Knowledge form header.
Note: Outdated articles can be checked out by first using Make this current, provided a version has not already been checked out.

1. Navigate to Knowledge > Articles > Published.
2. Select the desired article from the list.
3. Click Checkout in the Knowledge form header.
   The system creates a new version of the knowledge article and displays a message to the user. The article number for the new version remains the same, the version number is increased by 0.01, and the state changes to Draft. The new version of the article is added to the Knowledge list and to the Article Versions related list on the Knowledge form.

Approve an article that is being reviewed

Approve an article that is being reviewed and create a new published version.

When an article is in the Review state, only those users who are included in the Approvals related list can modify the article.

1. Navigate to Knowledge > Articles > Unpublished.
2. Open an article in the Review state and review the text.
3. In the Approvals related list, click Requested in the State column to display the Approval form for the article.
4. Click Approve.
   The system displays the Knowledge form. The version number of the article increments to the next whole number (for example, from 2.02 to 3.0) and the state changes to Published. The new published version of the article is added to the Knowledge list and to the Article Versions related list on the Knowledge form.

Revert an outdated article to the current state

Use an outdated version of an article to create a new version.

Roles required: knowledge base owner, knowledge_manager, knowledge_admin

This action is available for earlier published version that have a state of Outdated and only when there is no checked out version. If a version has been checked out, the Make this current button does not appear on the Knowledge form header.

1. Navigate to Knowledge > Articles > All.
2. Open an article in the Outdated state.
3. Click Make this current in the Knowledge form header.
   The system displays the Knowledge form. The version number increments to the latest version number plus 0.01 and the state changes to Draft. For example, if the latest published version of an article is 3.0 and you select the outdated 1.0 version to become the current version, the version number increments to 3.01.

Recall an article that is being reviewed

Recall an article that is being reviewed to make additional changes.

When a revised article is in the Review state, only the corresponding versions reviser can recall the article to make additional changes. When a newly created article is in the Review state, only
the author can recall the article. Recalling an article in the Review state results in a minor version increment.

1. Navigate to Knowledge > Articles > All.
2. Open an article in the Review state.
3. Click Recall in the Knowledge form header.
   The system returns the state of the article to Draft, increments the version number by 0.01, and displays a message to the user.

View all versions of an article

View a list of all available versions for a selected knowledge article and then view the selected version in a new tab.

The list of all available versions for a selected knowledge article is displayed in the Article Versions related list on the Knowledge form. Users with read access can see major versions. Users with contribute access can see major and minor versions.

1. Navigate to Knowledge > Articles > All.
2. Open the desired article.
3. Click the Article Versions tab to display the related list.
4. Click Version to display the desired article version in a new tab.
5. If desired, click the View Version related link to see the article view page.

Compare two versions of an article

Select and compare two versions of a knowledge article.

Role required: knowledge_manager, knowledge_admin

1. Navigate to a knowledge article with multiple versions.
2. In the Article Versions related list, select two versions of the article to compare.
3. In the Actions choice list below the list, select Compare.
   The Compare Versions page opens in a new tab and lists the fields for the selected articles in a side-by-side format. Differences between the two articles are highlighted.
4. When you are finished comparing the two versions, click Done to return to the Knowledge form.

Retire a versioned article

You can retire the latest published version of a knowledge article. Retiring a knowledge article does not create a new version. It simply marks the article as Retired.

This action is available only when there is no checked out version. If a version has been checked out, the Retire button does not appear on the Knowledge form header.

Note: For the Knowledge - Approval Retire workflow, this happens only when the retire request is approved.

In addition to the knowledge administrator and the knowledge manager, the following users can retire a versioned article:

- knowledge owner
- author of the versioned knowledge article
• reviser of the versioned knowledge article

Users can still access outdated articles that have been attached to incidents by navigating to the article view page with the sys_id of the article. Outdated articles include a message that an updated article is available.

If versioning is disabled, only the latest version of the article is shown in search results and list views.

Retired knowledge articles cannot be searched for by external users or customers. To reuse a retired article, create a new article with the same content, which is published once approved.

1. Navigate to Knowledge > Articles > Published.
2. Open the desired article.
3. Click Retire in the Knowledge form header.
   The system returns to the Knowledge list. The state of the article changes to Pending retirement and the state of previously published versions change to Outdated.

   **Note:** You cannot check out or edit a retired article.

**Disable the article versioning feature**

Users with the system administrator role can disable the article versioning feature by setting a property.

Role required: admin

The **Enable article versioning feature** property controls the article versioning feature. Setting this property to false disables the article versioning feature. Once disabled:

• The Version field is removed from the Knowledge form. The Version column remains on the Knowledge list and can be removed manually.
• The Article Versions related list is removed from the Knowledge form.
• The Recall, Checkout, and Make this current buttons are removed from the Knowledge form.
• Outdated articles are removed from Knowledge list views.
• The version history does not appear on the article view page.

Articles continue to be versioned in the background. Minor versions are incremented until an article is published and then the version number is increased to the next major version.

Users can still access outdated articles that have been attached to incidents. Outdated articles include a message that an updated article is available.

1. Navigate to Knowledge > Administration > Properties.
2. Locate the Enable article versioning feature property in the Article Versioning Properties section.
3. Click the check box to disable the property.
4. Click Save.

**Knowledge Management guide for users**

After knowledge bases are set up, you can start searching and creating articles. If Social Q&A was activated for the knowledge base, you can also submit answers or answer questions for other users.
Requirements

Role required
None. All users can read, create, and edit knowledge articles in a knowledge base, unless the knowledge manager has restricted access to it.
If you need these permissions, contact the knowledge manager for the knowledge base.

What to do

Create knowledge articles
If you have the required permissions for a knowledge base, you can create articles for it. You can create articles from the Self-Service application menu or by importing Word documents.
You can also create knowledge articles from incidents and problems.

Search for knowledge articles
From the Knowledge homepage, you can select a knowledge base to search for articles and answers. You can view only the knowledge bases to which you have access.
You can also search knowledge from within an incident.
Access to knowledge using your mobile device is supported.

Ask and answer questions
If Social Q&A was activated for a knowledge base, you can ask and answer questions. You can also browse and vote on answers.

Next steps
After articles are created, you can perform the following tasks to make sure that articles are organized in the right knowledge bases and retired when appropriate. If existing knowledge bases do not fit your needs, you can request a new knowledge base.

- Move a knowledge article
- Retire a knowledge article
- Request a knowledge base

Knowledge Management Service Portal
The Knowledge Management Service Portal enables users to perform the same operations that are available with the Knowledge Management V3 plugin. From the portal, users can view knowledge bases and articles, search for information, sort and filter search results, and provide feedback.
System administrators can customize portal pages and configure widgets for searching, sorting, and filtering knowledge base information.
To use the Knowledge Management Service Portal:

1. Activate the Knowledge Management - Service Portal plugin (com.snc.knowledge_serviceportal).
2. Configure the Knowledge Management Service Portal properties, including the property that directs users to the Knowledge Management Service Portal homepage.

Customizing the Knowledge Management Service Portal

The Knowledge Management Service Portal is comprised of three pages and multiple widgets. Users with the system administrator role can customize the pages and widgets as desired.

- To customize this portal, navigate to Service Portal > Portals and click Knowledge Portal. See Service Portal for more information about creating a custom interface.
- To configure widget instance options and customize the search, sort, and filter features, see Knowledge Management Service Portal widgets.

Section 508 compliance features

Users can view and interact with the Knowledge Management Service Portal article view page using Section 508 compliance features. See Set up Section 508 compliance features for more information.

Activate the Knowledge Management Service Portal plugin

You can activate the Knowledge Management - Service Portal plugin (com.snc.knowledge_serviceportal) if you have the admin role.

Role required: admin

This plugin requires the following plugins:

- Knowledge Management V3 (com.snc.knowledge3)
- Service Portal for Enterprise Service Management (com.glide.service-portal.esm)

1. Navigate to System Definition > Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   If the plugin depends on other plugins, these plugins are listed along with their activation status.
   If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. Optional: If available, select the Load demo data check box.
   Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
   You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.
5. Click Activate.

Knowledge Management Service Portal properties

Knowledge Management Service Portal properties determine how information is displayed on the Knowledge portal. You must have the admin role to set configuration properties.

The following system properties are set to direct users to the Knowledge Management Service Portal homepage, and to specify the URL suffix for the homepage.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sn_km_portal.glide.knowman.serviceportal.enable_redirect</td>
<td>Directs users to the desired Knowledge homepage. Set to <code>true</code> to direct users to the Knowledge Management Service Portal homepage. Set to <code>false</code> to direct users to the Knowledge Management v3 homepage.</td>
</tr>
</tbody>
</table>

Note: This property is not honored for the following use cases:
- Contextual search in the Incident form
- Connect

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sn_km_portal.glide.knowman.serviceportal.portal_url</td>
<td>The URL suffix for the Knowledge Management Service Portal. The default is <code>kb</code>.</td>
</tr>
</tbody>
</table>

The Knowledge Management Service Portal supports the Knowledge Management V3 properties. Configuring widget instance options on the portal pages can override these properties.

Knowledge Management Service Portal pages

The Knowledge Management Service Portal includes a homepage, a search results page, and an article view page.

Homepage

The Knowledge Management Service Portal landing page. This page includes a search bar, knowledge bases, and lists of knowledge articles.
- Users can search for information, explore knowledge bases, and view featured articles.
- Administrators can customize the page layout, add knowledge bases, and add article collections (for example, a list of the most viewed articles).

Search results page

This page displays a list of search results and includes several options for sorting and filtering the information.
- Users can sort and filter search results in multiple ways.
- Administrators can customize the page layout, configure the sort and filter widgets to use any field on the Knowledge (kb_knowledge) table, and also configure the filter widgets to use custom queries.

Article view page
This page displays the selected knowledge article or social Q&A item.

- Users can view articles and provide comments and ratings. If enabled, users can subscribe to articles, view article versions, and create incidents for articles that are rated as not helpful. Users can also view and edit questions and provide comments or answers.
- Administrators can customize the page layout and enable or disable user actions, such as creating an incident for an article. Administrators can also activate the plugins to enable article versioning and article subscriptions.

Knowledge Management Service Portal homepage

The Knowledge Management Service Portal homepage displays knowledge articles and social Q&A items organized by knowledge base and category, as well as featured content and popular articles.

To view the Knowledge Management Service Portal homepage, navigate to one of the following:
- Self Service > Knowledge
- Knowledge > Homepage

Note: To use the Knowledge Management Service Portal, activate the Knowledge Management - Service Portal plugin (com.snc.knowledge_serviceportal) and enable the glide.knowman.serviceportal.enable_redirect property.
The Knowledge Management Service Portal homepage includes the following:

**Header**

The header contains a search bar and counters that display the number of available knowledge bases and the total number of knowledge articles and social Q&A items.

**Knowledge bases**

Each knowledge base is represented by a tile that includes the knowledge base icon and name. Icons and counters below the knowledge base name display the number and type of items stored in the knowledge base, such as articles and questions. By default, tiles are ordered alphabetically by knowledge base name.

**List collections**

Lists of articles, including featured, most useful, and most viewed articles. By default, these lists display articles by the article Short description and include information such as the author name, number of views, and average rating.

---

**Note:** The Knowledge Management Service Portal homepage is mobile responsive.

---

**Using the homepage**

From the Knowledge Management Service Portal homepage, you can do the following.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Search for information</td>
<td>Use the search bar to search knowledge bases and social Q&amp;A.</td>
</tr>
<tr>
<td>View knowledge bases</td>
<td>Knowledge bases available to the user are arranged in alphabetical order.</td>
</tr>
<tr>
<td>View articles</td>
<td>Select articles from the article collection lists.</td>
</tr>
<tr>
<td>Ask a question</td>
<td>This action is available to logged in users with the knowledge role. Click Ask a Question, which opens a question page. Fill in the Question and Question details fields, and click Post question to post the question.</td>
</tr>
<tr>
<td>Create an article</td>
<td>This action is available to logged in users with the knowledge role. Click the Overflow icon (···) and select Create Article, which opens a new Knowledge record with an assigned number. Fill in the fields and click Submit to return to the Knowledge Management Service Portal.</td>
</tr>
<tr>
<td>Subscribe to a knowledge base</td>
<td>This action is available to logged in users; availability is based on knowledge subscriptions user roles. Click Subscribe at the top of a knowledge base tile to subscribe to that knowledge base. Unsubscribe by clicking Unsubscribe. See Knowledge subscriptions for more information.</td>
</tr>
</tbody>
</table>
Knowledge Management Service Portal search results page

The Knowledge Management Service Portal search results page displays a list of search results as well as options for sorting and filtering the items in the list.
The Knowledge Management Service Portal search results page includes the following:

**Search results list**

The search results list includes knowledge articles, pinned articles, and social Q&A items. For knowledge articles, the search results include articles in which the short description, text content, or attached file content includes the search term. For social Q&A items, search results include answered and unanswered questions, and questions with accepted answers. The following information displays for each list item:

- The article short description or the question.
- The knowledge base in which the item is stored.
- The first two lines of text from the article or question or surrounding the relevant keywords from your search.
- Information about the item such as the author name, the number of views, and rating information.
- An icon that represents the type of item.

**Search results list header**

The header displays the number of search results, which updates as the user selects and de-selects filters. Selected filter options appear just below the number of search results. The header also includes the available sort options.

**Filter facet widgets**

A number of filter facet widgets appear to the left of the search results list. Each filter facet widget includes a list of selectable options that can be used to refine the search results.

- Knowledge Base: lists the available knowledge bases
- Category: lists the available knowledge categories
- Author: lists the names of the authors for the knowledge articles included in the search results list
- Tags: lists the available knowledge tags
- Resource: lists the types of items available, such as knowledge articles and social Q&A
- Rating: lists article ratings from 0-5 stars (clicking a rating displays articles that have the selected rating and higher)
- Last Modified: lists selections based on the timing of knowledge item modifications such as Past Month or Past Week
- View Count: lists the knowledge item view counts such as More Than 50 or Less Than 10. Set the number of days to consider when calculating view count using the glide.knowman.view_age.days property.

**Using the search results page**

From the Knowledge Service Portal homepage, you can do the following.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Perform a search</td>
<td>Use the search bar at the top of the page to search for additional information.</td>
</tr>
<tr>
<td>Sort the search results</td>
<td>Click a sort option in the search results list header to sort list items by relevance to the search term, number of views, newest, or alphabetical. Items are sorted in ascending order. Click the option again to sort in descending order.</td>
</tr>
<tr>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Filter the search results</td>
<td>Select options in the filter facet widgets to filter the items in the search results list. Clear selected filter options by:</td>
</tr>
<tr>
<td></td>
<td>• Deleting a single option from the search results list header.</td>
</tr>
<tr>
<td></td>
<td>• Clicking <strong>Clear all</strong> in the search results list header.</td>
</tr>
<tr>
<td></td>
<td>• Clicking <strong>Clear</strong> in the filter facet widget header.</td>
</tr>
</tbody>
</table>

**Knowledge Management Service Portal article view page**

The Knowledge Management Service Portal article view page displays the selected knowledge article, including the article number, short description, and article content.

If users select a question, the article view page displays the question, any answers to the question, and a text box for providing an answer.
Create An Email Signature

To create a personalized email signature:

1. Open a new message. On the Message tab, in the Include group, click Signature.
2. On the E-mail Signature tab, click New.
3. Type a name for the signature, and then click OK.
4. In the Edit signature box, type the text that you want to include in the signature.
5. To format the text, select the text, and then use the style and formatting buttons.
6. To add elements besides text, click where you want the element to appear, and then select the option. The following options are available:

<table>
<thead>
<tr>
<th>Options</th>
<th>How to</th>
</tr>
</thead>
<tbody>
<tr>
<td>To add an electronic business card</td>
<td>Click <strong>Business Card</strong>, and then click a contact in the <strong>Filed As</strong> box.</td>
</tr>
<tr>
<td>To add a hyperlink</td>
<td>Click <strong>Insert Hyperlink</strong>, type in the information or browse to a web page.</td>
</tr>
<tr>
<td>To add a picture</td>
<td>Click <strong>Picture</strong>, browse to a picture, click to select it, and then include .bmp, .gif, .jpg, and .png.</td>
</tr>
</tbody>
</table>

1. To finish creating the signature, click **OK**.

NOTE:

The signature that you just created or modified won't appear in the currently open message.
The Knowledge Management Service Portal article view page includes the following:

**Header**

For knowledge articles, the header includes the knowledge article number and enabled user actions. For questions, the header includes the question text.

**Knowledge article meta data**

Article information including the short description and author name, the date that the article was last modified, the number of views, and the average rating. If configured, it also includes article version information.

**Article or question content**

The text and images of the knowledge article or question.

**Feedback options**

Article feedback options include marking the article as helpful, rating the article, and providing a comment. Question feedback options include sharing a question, commenting on a question, providing an answer, and accepting an answer.

**List widgets**

The article view page includes the following list widgets for articles and questions:

- Most Recent Tasks
- Affected Products
- Most Viewed
- Most Useful
- Question Stats
- Recent Questions

From the Knowledge Service Portal article view page, you can do the following.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View content</td>
<td>View a knowledge article or question.</td>
</tr>
<tr>
<td>Edit an article</td>
<td>Users with contribute access can edit an article.</td>
</tr>
<tr>
<td>Flag an article</td>
<td>Users with contribute access can flag an article that contains incorrect or inappropriate content.</td>
</tr>
<tr>
<td>Subscribe to an article</td>
<td>This action is available to logged in users; availability is based on knowledge subscriptions user roles. Click Subscribe in the article header to subscribe to that knowledge article. Unsubscribe by clicking Unsubscribe. See Knowledge subscriptions for more information.</td>
</tr>
<tr>
<td>Create an incident</td>
<td>If configured, the Create Incident link appears at the bottom of the article after the article is rated as not helpful.</td>
</tr>
<tr>
<td>Provide feedback to an article</td>
<td>Feedback options include marking an article as helpful, providing a rating from one to five stars, and adding a comment. See Knowledge feedback for more information.</td>
</tr>
</tbody>
</table>

Note: Use the widget instance option for the article view page to enable the display of this link.
<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Post a question</td>
<td>All users can post a question.</td>
</tr>
<tr>
<td>Answer a question</td>
<td>All users can provide an answer to a question.</td>
</tr>
<tr>
<td>Accept an answer</td>
<td>The knowledge manager or the owner of a question can accept an answer as the correct answer.</td>
</tr>
<tr>
<td>Comment on a question or answer</td>
<td>All users can add a comment to a question or to an answer.</td>
</tr>
<tr>
<td>Edit a question, answer, or comment</td>
<td>All users can edit the questions, answers, and comments that they submit. Knowledge managers can edit questions, answers, and comments for the knowledge bases that they manage.</td>
</tr>
</tbody>
</table>

Note: For more information, see [Social Q&A questions](#).

Enable external or public users to view knowledge articles from the Knowledge Service Portal

Enable knowledge articles on the Knowledge Management Service Portal to be visible to external or public users.

The Knowledge Management Service Portal plugin (com.snc.knowledge_serviceportal) must be enabled.

Role required: admin

1. Navigate to Service Portal > Pages.
2. Search for kb_home and open it.
3. You have to be in the Global application to edit. If a message appears, click here to edit.
4. Perform one of the following actions.

<table>
<thead>
<tr>
<th>To Make knowledge service portal pages visible to public users</th>
<th>Do this</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1. Select the Public check box.</td>
</tr>
<tr>
<td></td>
<td>2. Click Update.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>To Make knowledge service portal pages visible to external users</th>
<th>Do this</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1. Click the edit user roles icon.</td>
</tr>
<tr>
<td></td>
<td>2. Select snc_external and click Done.</td>
</tr>
<tr>
<td></td>
<td>3. Click Update.</td>
</tr>
</tbody>
</table>

5. Repeat these steps for kb_article_view and kb_search.
6. Perform one of the following actions.

<table>
<thead>
<tr>
<th>To Enable access to the knowledge base for public users</th>
<th>Do this</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Ensure that no Can Read user criteria is defined in the knowledge bases you want to give access to.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>To Enable access to the knowledge base for external users</th>
<th>Do this</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Add Can Read access to the knowledge base.</td>
</tr>
</tbody>
</table>
Knowledge Management Service Portal widgets

The Knowledge Management Service Portal uses a number of widgets to enable searches, display search results, and display articles and social Q&A.

The Knowledge Management Service Portal homepage, search results page, and article view page honor the Knowledge Management V3 system properties. If configured, widget instance options can override the system properties.

Users with the knowledge_admin or admin role can configure the widget instance options used on the Knowledge Management Service Portal pages. Use the control + right-click menu to access the widget instance options and configure a widget instance.

Note: Before configuring widget instance options, switch to the Knowledge Management - Service Portal scope.

Homepage widgets:
- Knowledge Homepage Search
- Knowledge Bases Browse
- Knowledge Featured Articles
- Knowledge Most Useful Articles
- Knowledge Most Viewed Articles

Search results page widgets:
- Knowledge Breadcrumbs
- Knowledge Search
- Knowledge Facet Header
- Knowledge Field Facet
- Knowledge Tags Facet
- Knowledge Resource Facet
- Knowledge Query Facet
- Knowledge Result Sort
- Knowledge Selected Filter
- Knowledge Result

Article view page widgets:
- Knowledge Breadcrumbs
- Knowledge Article Content
- Knowledge Article Helpful
- Knowledge Article Comments
- Knowledge Attachments
- Knowledge Attached Tasks
- Knowledge Affected Products
- Knowledge Most Viewed Articles
- Knowledge Most Useful Articles

Configure search widget instance options

Configure widget instance options for the search widgets on the Knowledge Management Service Portal homepage and search results page.

Role required: knowledge_admin or admin
The homepage uses the Knowledge Homepage Search widget and the search results page uses the Knowledge Search widget. Use the widget instance options to customize the search feature for these pages.

1. Navigate to the Knowledge Management Service Portal homepage or search results page.
2. Control + right-click the search bar.
3. Click **Instance Options**.
4. Configure the desired settings for the search widgets.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title of the search widget. The default for the homepage is <strong>Welcome to Knowledge</strong>.</td>
</tr>
<tr>
<td>Glyph</td>
<td>An icon that appears in the search bar.</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>The color of the search widget.</td>
</tr>
<tr>
<td>Bootstrap size</td>
<td>The size of the search widget.</td>
</tr>
<tr>
<td>CSS</td>
<td>See <a href="#">widget CSS</a> for details.</td>
</tr>
<tr>
<td>Search Placeholder</td>
<td>Default text that appears in the search bar.</td>
</tr>
<tr>
<td>Allow Empty Search</td>
<td>Allow empty knowledge base searches. The default for the homepage uses the system property. The default for the search results page is <strong>Yes</strong>. For an empty search, the search results page returns all results.</td>
</tr>
<tr>
<td>Allow Instant Search On Keypress</td>
<td>Enables instant search results as you type a search term. The default for the search results page uses the system property.</td>
</tr>
<tr>
<td>Minimum Number of Characters for Search</td>
<td>The minimum number of characters required to generate a search.</td>
</tr>
<tr>
<td>Wait time (ms) between searches, if instant search is enabled</td>
<td>The time, in milliseconds, to wait between searches if the instant search feature is enabled. The default wait time is <strong>500 ms</strong>.</td>
</tr>
<tr>
<td>Alternate URL Parameters for Search</td>
<td>Alternate parameters that appear in the search results URL. By default these parameters include keyword and query.</td>
</tr>
<tr>
<td>Alternate URL Parameters for Language</td>
<td>Alternate parameters that appear in the URL denoting the selected language.</td>
</tr>
</tbody>
</table>

5. Click **Save**.

**Configure knowledge base tile widget instance options**

Configure widget instance options for the knowledge base tile widgets on the Knowledge Management Service Portal homepage.

Role required: knowledge_admin or admin

The homepage uses the Knowledge Bases Browse widget to display knowledge base tiles.

1. Navigate to the Knowledge Management Service Portal homepage.
2. Control + right-click a knowledge base tile.
3. Click **Instance Options**.
4. Configure the desired settings for the knowledge base tile widgets.
### Instance option

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title that appears above the knowledge base tiles. The default is <em>Explore our Knowledge Bases</em>.</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>The color of the widget.</td>
</tr>
<tr>
<td>CSS</td>
<td>See <a href="#">widget CSS</a> for details.</td>
</tr>
<tr>
<td>Order By</td>
<td>The order in which the knowledge base tiles appear on the homepage. Use any field on the Knowledge table. If this field is empty, tiles are displayed in alphabetical order. Other available options include article_count.</td>
</tr>
<tr>
<td>Reverse Order</td>
<td>Enable this check box to display knowledge base tiles in the reverse order.</td>
</tr>
<tr>
<td>Post Question Label</td>
<td>The label on the button used to post a question. The default is <em>Ask a Question</em>.</td>
</tr>
<tr>
<td>Create Article Label</td>
<td>The label on the button used to create an article. The default is <em>Create Article</em>.</td>
</tr>
<tr>
<td>Post Question URL</td>
<td>The parameters that appear in the URL when posting a question.</td>
</tr>
<tr>
<td>Create Article URL</td>
<td>The parameters that appear in the URL when creating an article.</td>
</tr>
</tbody>
</table>

5. Click **Save**.

### Configure sort widget instance options

Configure widget instance options for the knowledge sort widget on the Knowledge Management Service Portal search results page.

**Role required:** knowledge_admin or admin

The search results page uses the Knowledge Result Sort widget to provide sort options for the returned list of results. Use the widget instance options to customize the sort options.

1. Navigate to the Knowledge Management Service Portal search results page.
2. Control + right-click the sort options at the top of the results list.
3. Click **Instance Options**.
4. Configure the desired settings for the sort widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap color</td>
<td>The color of the search widget.</td>
</tr>
<tr>
<td>CSS</td>
<td>See <a href="#">widget CSS</a> for details.</td>
</tr>
<tr>
<td>Hide Relevancy</td>
<td>Removes the relevancy sort option.</td>
</tr>
<tr>
<td>Table</td>
<td>The table that contains the fields used to sort the list of knowledge items. The default table is <em>Knowledge</em>.</td>
</tr>
<tr>
<td>Sort Fields</td>
<td>The fields used for sorting the list of knowledge items.</td>
</tr>
</tbody>
</table>
### Sort Field Labels

The labels for the fields that appear in the sort options. The default is `Views:desc,Newest:desc,Alphabetical`. The sort order for the sort field labels is ascending. To use a descending order, denote `.desc`.

5. **Click Save.**

### Configure article list widget instance options

Configure widget instance options for the article lists on the Knowledge Management Service Portal homepage.

**Role required:** `knowledge_admin` or `admin`  
The homepage uses the Article List widget to display different lists of articles, including Featured, Most Useful, and Most Viewed.

1. Navigate to the Knowledge Management Service Portal homepage.  
2. Control + right-click one of the article list headers.  
3. **Click Instance Options.**  
4. Configure the desired settings for the article list widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Title</strong></td>
<td>The title of the article list.</td>
</tr>
<tr>
<td><strong>Bootstrap color</strong></td>
<td>The color of the widget.</td>
</tr>
<tr>
<td><strong>Glyph</strong></td>
<td>An icon that appears in the widget.</td>
</tr>
<tr>
<td><strong>CSS</strong></td>
<td>See <a href="#">widget CSS</a> for details.</td>
</tr>
<tr>
<td><strong>Table</strong></td>
<td>The table that stores the list articles.</td>
</tr>
<tr>
<td><strong>Display Field</strong></td>
<td>The title displayed for each article in the list. By default, this is the article short description.</td>
</tr>
<tr>
<td><strong>Secondary Fields</strong></td>
<td>Additional information displayed for each article in the list below the title. By default, this information includes the author, view count, the date that the article was last modified, and the article rating.</td>
</tr>
<tr>
<td><strong>Max number of records to show</strong></td>
<td>The maximum number of articles to include in the list.</td>
</tr>
<tr>
<td><strong>Show even when empty</strong></td>
<td>Enable this check box to display the article list even if it does not contain any articles.</td>
</tr>
<tr>
<td><strong>Show Secondary Fields Label</strong></td>
<td>Enable this check box to display the field labels for the additional information displayed for each article.</td>
</tr>
<tr>
<td><strong>Knowledge Base</strong></td>
<td>To restrict the articles that appear in this list to a specific knowledge base, select the knowledge base from the knowledge base list.</td>
</tr>
</tbody>
</table>

5. **Click Save.**
Configure search results list widget instance options

Configure widget instance options for the results list widget on the Knowledge Management Service Portal search results page.

Role required: knowledge_admin or admin

The search results page uses the Knowledge Result widget to provide display options for the returned list of results. Use the widget instance options to customize the display options.

1. Navigate to the Knowledge Management Service Portal search results page.
2. Control + right-click the list of returned search results.
3. Click **Instance Options**.
4. Configure the desired settings for the results list widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Glyph</td>
<td></td>
</tr>
<tr>
<td>CSS</td>
<td>See <a href="#">widget CSS</a> for details.</td>
</tr>
<tr>
<td>Show Relevancy Score</td>
<td>Shows how relevant each search result is based on the search term. The default setting uses the system property.</td>
</tr>
<tr>
<td>Breadcrumb: Hide Categories</td>
<td>Hides the category in the breadcrumb that appears below the article short description or question in the results list. The default setting uses the system property.</td>
</tr>
<tr>
<td>Breadcrumb: Knowledge Base Separator</td>
<td>The character used as a separator between the knowledge base and the category in the breadcrumb.</td>
</tr>
<tr>
<td>Breadcrumb: Category Separator</td>
<td>The character used as a separator between categories in the breadcrumb.</td>
</tr>
<tr>
<td>Default Sort Order</td>
<td>The default sort order for the list of returned results. The default sort order is <code>sys_view_count:desc</code>, which sorts the results by the number of views in descending order.</td>
</tr>
<tr>
<td>How to Display Attachments in Knowledge Search Results</td>
<td>How attachments are shown in the list of returned results. The default uses the system property.</td>
</tr>
<tr>
<td>Label for Show Pinned Articles Link</td>
<td>The text used for the pinned articles link.</td>
</tr>
<tr>
<td>Maximum number of articles in first fetch</td>
<td>The maximum number of items included when the search results list is first displayed.</td>
</tr>
<tr>
<td>Maximum number of articles in subsequent fetches on scroll</td>
<td>The maximum number of items included when the search results list updates as the user scrolls to the bottom.</td>
</tr>
<tr>
<td>Table</td>
<td>The table that stores the information returned in the search results.</td>
</tr>
<tr>
<td>Knowledge Secondary Fields</td>
<td>Fields that display additional information for each article in the search results.</td>
</tr>
<tr>
<td>Social Secondary Fields</td>
<td>Fields that display additional information for each social Q&amp;A item in the search results.</td>
</tr>
</tbody>
</table>
Configure filter facet widget instance options

Configure widget instance options for the filter facet widgets on the Knowledge Management Service Portal search results page.

Role required: knowledge_admin or admin

The homepage uses several widgets to filter the items in the search results list. There are two types of facet widgets:

- Simple field facets based on the Knowledge table fields
- Advanced query facets based on custom queries of the Knowledge table

Use the widget instance options to customize these facet widgets:

- Knowledge Field Facet (for filtering by knowledge base, knowledge category, and author)
- Knowledge Tags Facet (for filtering by tag)
- Knowledge Resource Facet (for filtering by resource, such as articles and social Q&A)
- Knowledge Query Facet (for filtering by rating, last modified, and number of views)

1. Navigate to the Knowledge Management Service Portal search results page.
2. Control + right-click a filter facet widget.
3. Click **Instance Options**.
4. Configure the desired settings for the selected type of facet widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title of the filter facet widget.</td>
</tr>
<tr>
<td>Glyph</td>
<td>An icon that appears to the left of the title.</td>
</tr>
<tr>
<td>Order</td>
<td>The order in which the filter facet widgets appear on the left side of the search results page. If empty, the filter facet widgets sort alphabetically.</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>The color of the filter facet widget header.</td>
</tr>
<tr>
<td>CSS</td>
<td>See <a href="#">widget CSS</a> for details.</td>
</tr>
<tr>
<td>Source Table</td>
<td>The table that contains the <strong>Source Field</strong> used to provide the filter facet widget options. The default table is Knowledge (kb_knowledge).</td>
</tr>
<tr>
<td>Source Field</td>
<td>The field in the <strong>Source Table</strong> that provides the filter facet widget options. Field types that can be used as a source field include string, choice, integer, reference, and boolean.</td>
</tr>
<tr>
<td>Facet Identifier</td>
<td>A unique name for the custom query facet that can be used in script code.</td>
</tr>
<tr>
<td>Instance option</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Facet Template                  | The selected template determines the type of facet interaction. Knowledge Field Facet widget templates:  
|                                 | - **Single Select**: users can select only one filter from this widget.  
|                                 | - **Multi Select**: users can select more than one filter from this widget.  
|                                 | - **Dropdown Select**: users can select more than one filter from a drop down menu. Knowledge Query Facet widget templates  
|                                 | - **Simple Query**: shows a label for each facet value.  
|                                 | - **Rating**: shows rating stars.                                                                                                            |
| Custom Template                 | A custom template that determines facet interaction and value selection.                                                                          |
| Facet Options                   | A custom query in JSON format for the label, ID, order, and query for each facet value. Includes the table, value (encoded query), and display value (encoded query). |
| Order by                        | Determines the sort order of the filter options within the facet widget. The default order is **label**, which sorts the options in alphabetical order. For reference fields, you can also state an order from the reference field table. |
| Minimum results for showing filter search bar | The minimum number of results required to display a search bar at the top of the filter facet widget.                                                    |
| Minimum results for showing scroll bar | The minimum number of results required to display a scroll bar in the filter facet widget.                                                       |
| Maximum length for string field | Only fields whose maximum length is less than this value are allowed to be added as a filter facet.                                                |
| Alternate URL Parameters        | The names of the URL parameters used to initialize this filter facet, if it is used in the URL as a search parameter.                           |
| Fetch Maximum Values            | If enabled, fetches all facet values instead of only those facets applicable for the initial load of results. Disabling this instance option can reduce the load time for the filter facet. Based on the glide.knowman.search.facet_depth property. |
| Show Empty Value                | If enabled, shows an empty filter facet option that users can select to filter for articles that do not have this field set.  
|                                 | For example, if an article does not have an assigned category, clicking the empty option lists all articles with no assigned category. |
5. Click **Save**.

**Configure a user action for the article view page**

Configure a user action for the Knowledge Management Service Portal article view page.

**Role required:** admin

The article view page uses the Knowledge Article Content widget to provide user actions. Use the widget instance options to customize these actions.

Ensure that the application scope on the Now Platform is set to Knowledge Management Service Portal.

User actions available for the article view page appear in a menu after clicking the overflow icon (###) in the article header. These actions enable users to flag an article, edit an article, or create an incident for an article.

1. Navigate to the Knowledge Management Service Portal article view page.
2. Control + right-click the article header.
3. Click **Instance Options**.
4. Configure the desired settings for the Knowledge Article Content widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show Only Facet Values Matching Results</td>
<td>Creates a dynamic filter facet widget that displays only those filter values that match the search results rather than showing all values. Disabling this instance option can reduce the time needed to load the filter facet data.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Bootstrap color</th>
<th>The color of the widget header.</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSS</td>
<td>See <code>widget_css</code> for details.</td>
</tr>
<tr>
<td>Hide All Actions</td>
<td>Hides the user actions in the article header including the <strong>Subscribe/Unsubscribe</strong> button and the overflow icon.</td>
</tr>
<tr>
<td>Show Version Information</td>
<td>Displays version information for the selected article. Requires the Knowledge Management Advanced plugin (com.snc.knowledge_advanced).</td>
</tr>
<tr>
<td>Show Create Incident Action</td>
<td>Displays the <strong>Create Incident</strong> user action when a user clicks the overflow icon in the article header.</td>
</tr>
<tr>
<td>Create Incident Action Label</td>
<td>The label for the user action that appears in the overflow icon menu. The default is <strong>Create Incident</strong>.</td>
</tr>
<tr>
<td>Create Incident Action URL</td>
<td>The target URL for the <strong>Create Incident</strong> user action. If no URL is specified, the system uses the URL in the <code>glide.knowman.create_incident_link</code> system property.</td>
</tr>
</tbody>
</table>
5. Click Save.

**Knowledge Management Service Portal navigation**

Navigate to the various sections of the service portal to find the information you need.

From the homepage, navigate to:

- The search results page by entering a word or term in the search bar and pressing Enter.
- A knowledge base by clicking a knowledge base tile.
- A knowledge article by clicking the article short description in the Featured, Most Useful, or Most Viewed article lists.

From the search results page, navigate to a knowledge article or a question by clicking the short description in the search results list.

From an article view page, navigate to recent tasks, affected products, or other articles listed in the widgets to the right of the article.

**Use the breadcrumb**

The breadcrumb appears at the top of the Knowledge Service Portal search page and article view page. The breadcrumb displays the location of the page or article currently in view.

Click links in the breadcrumb to move to the homepage, knowledge base, or search results page.

**Knowledge Management Service Portal searching**

Enter one or more words in the search bar on the Knowledge Management Service Portal homepage to view all search results.

Users can enter a search term and press the Enter key, which redirects to the search results page. The search results include items in which the short description, content, or attached files include the search term. By default, knowledge search results include articles, pinned articles, and social Q&A.

Users can search for information on the Knowledge Management Service Portal homepage as well as filter the search results.

**Search auto-correct feature**

The Knowledge Management Service Portal homepage search tool also includes an auto-correct feature. When enabled, users can auto-correct a typing error in a search term by clicking one of the suggestions.

When a search term contains a misspelling, the search tool displays the search results page and includes one or more suggested terms at the top of the page under the heading Did you mean. Clicking one of these suggestions shows all of the search results that match the selected term.

Users with the system administrator role can enable this feature.

1. Navigate to **System Properties > Text Search**.
2. Set the following properties to true:
   - Suggest alternate search spellings for knowledge or global search (glide.ts.dym.enable_spell_correct)
• Suggest related searches for knowledge or global search (glide.ts.dym.enable_chain_suggest)

3. Click Save.

Knowledge Management Service Portal sorting

Use the sort feature on the search results list page to sort knowledge articles and social Q&A in a variety of ways.

Sort the items in a knowledge base or search results list using the **Sort by** options at the top of the list.

- **Views**: sorts by number of article views.
- **Newest**: sorts by the date created or updated.
- **Alphabetical**: sorts alphabetically by the article **Short description** field.
- **Relevancy**: sorts by relevance to the search term.

By default, the selected option sorts in descending order. Click the option again to sort in ascending order.

The system saves the last selected sort option. When you navigate away from the search results page and then return, this sort option is retained.

Sorting by language

You can also sort articles by language if the I18N: Knowledge Management Internationalization Plugin v2 (com.glideapp.knowledge.i18n2) is activated.

Activating this plugin adds a language link at the top of the search results page. To sort by language, click this link and select the desired language from the drop-down menu. The search results list displays items in the selected language.
Knowledge Management Service Portal filtering

Filter knowledge base information or a list of search results using the filter facet widgets on the search results page.

The search results page includes multiple ways to filter the results using filter facet widgets. These widgets are listed in a column on the left side of the page and can be expanded and collapsed as needed. Refine results by expanding a filter and selecting specific items. Selections appear at the top of the search results list. By default, you can filter by:

- Knowledge Base: lists the available knowledge bases
- Category: lists the available knowledge categories
- Author: lists the names of the authors for the knowledge articles included in the search results list
- Tags: lists the knowledge tags for the items in the search results list.
- Resource: lists the types of items available, such as knowledge articles and social Q&A. For social Q&A, you can also filter for unanswered and answered questions, and question with answers that have been accepted.
- Rating: lists article ratings from 0-5 stars (clicking a rating displays articles that have the selected rating and higher)
- Last Modified: lists selections based on the timing of knowledge item modifications such as Past Month or Past Week
- View Count: lists the knowledge item view counts such as More Than 50 or Less Than 10

The selections that you make filter the items displayed in the search results list. The search results list updates to display only those items that match your selections. Deleting a selection reverses the
filtering in the list. The number of matching results displayed at the top of the list changes as you add and remove filters.

Clear filter selections in the following ways:

- The **Clear** button at the top of a filter widget clears all of the selections in that widget.
- The **Clear all** button at the top of the search results list clears all of the widget selections.
- Clear individual filters at the top of the search results list by clicking the X in the filter name.

**Integrating new knowledge portal pages with the service portal**

Using the base system service portal, access the improved version of the knowledge portal that features an enhanced landing page with multiple knowledge bases, an article view page that includes new article widgets, and the search results page that displays global knowledge search results.

To access the **enhanced knowledge portal pages** from the service portal, as a system administrator, you can configure the following in the service portal:

- **Configure the Knowledge header menu and the Knowledge Base tile widget to point to the new Knowledge Management Service Portal homepage.**
- **Configure the knowledge portal URL to link to the article view page.**
- **Add a knowledge search widget to perform a highly configurable global knowledge search in the Knowledge Management Service Portal search results page.**
- **Replace the Top Rated article widget with one of the new widgets provided in the Knowledge portal.**

**Configure the knowledge header menu and tile widget**

Access the new knowledge portal home page using the Knowledge header menu and the Knowledge Base tile widget in the service portal.

Role required: admin

1. Configure the Knowledge header link to point to the [knowledge portal home page].

   **Knowledge link on service portal header**

   To configure:
   a) Navigate to Service Portal > Portals.
   b) In the Service Ports list, select the Service Portal record.
   c) In the KB home page field, enter kb_home.
   d) Click Update.

   When you click Knowledge in the service portal header menu, it takes you to the knowledge portal home page.

2. Configure the Knowledge Base tile widget to link to the knowledge portal home page.
Knowledge tile widget

To configure:

a) Navigate to the service portal page.

b) Control + right-click the knowledge base tile widget and select **Instance Options**. The Knowledge Base form appears.

c) In the **Page** field, change the value from **kb_view** to **kb_home**.

d) Click **Save**.

When you click the Knowledge Base tile widget in the service portal page, it takes you to the knowledge portal homepage.

**Configure the knowledge portal URL to link to the article view page**

Use the service portal to access the new knowledge portal article view page that features type ahead search and a highly configurable search results page.

Role required: admin

You must configure the type ahead knowledge portal link and knowledge global search results link in the knowledge base search source and in the service catalog search source, to point to the Knowledge Management Service Portal article view page.

1. Complete the following steps to configure the type ahead knowledge portal link and the knowledge global search results link in the knowledge base search source.

a) Navigate to **Service Portal > Search Sources** and click the **Knowledge Base** search source.

b) In the **Search page template** field, change the following line of code from:

```
?id=kb_article_view&amp;sys_kb_id={{item.sys_id}}
```

to

```
?id=kb_article&amp;sys_id={{item.sys_id}}
```
c) In the **Data Source** tab, go to the **Data fetch script** field and add the following line of code:

```javascript
article.url = '?id=kb_article_view&sys_kb_id=' + kb.sys_id;
```
```javascript
var kbCount = 0;
while (kb.next() && kbCount < data.article_count) {
  // Does user have permission
  if (!$sp.canReadRecord("kb_<id>")) {
    continue;
  }

  var article = {};
  $sp.getRecordDisplayValues(article, 'sys_id,number,short_description,public', kb.article.publishedUTC = kb.get('publishedUTC'), kb.article.type = "kb";
  if (!kb.article.text) {
    kb.article.text = "";
  }
  kb.article.text = $sp.stripHTML(kb.article.text);
  kb.article.score = parseInt(kb.article.score);
  kb.article.label = kb.article.short_description;
  kb.article.primary = kb.article.short_description;
  kb.article.url = '?id=kb_article_' + kb.article.sys_id;
  results.push(kb.article);
  kbCount++;
}
$sp.logSearch('kb_knowledge', data);
return results;
```
d) Right-click the form header and click **Save**.

2. Complete the following steps to configure the type ahead knowledge portal link and the knowledge global search results link in the service catalog search source.
   a) Navigate to **Service Portal > Search Sources** and click the **Service Catalog** search source.
   b) In the **Search page template** field, change the **href** tag to the following:

```html
<a ng-if="item.content_type == 'kb'" ng-href="?id=kb_article&sys_id={{::item.kb_article}}" class="h4 text-primary m-b-sm block">
```

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
c) In the **Data Source** tab, go to the **Data fetch script** field and change the code in line 45 to the following, as shown in image below:

```javascript
item.url = '?id=kb_article_view&sys_kb_id=' + kb.sys_id;
```
3. Click **Update**.
The knowledge results from type ahead and global search in the service portal point to the new knowledge portal article view page.

Enable search on all knowledge bases.

Add a knowledge search widget to the Service Portal

Create and add a new widget to the service portal search results page to navigate to the enhanced knowledge search results page.

Role required: admin

Create and add a Search Within knowledge widget to the service portal and link it to the Knowledge global search results page.

1. Create a new widget with the name Search Within using the following settings:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
</table>
| HTML Template          | `<div role="list" class="list-group">  
                          <span class="list-group-item active">${Search Within}</span>  
                          <a role="link" class="list-group-item" ng-href=""{{data.url}}">${Knowledge}"</a>  
                      </div>` |

| Server Script          | (function() {  
                          var q = encodeURIComponent($sp.getParameter('q'));  
                          var kb = $sp.getValue('kb_knowledge_base') || "";  
                          data.url = '/sp?id=kb_search';  
                          if(q)  
                              data.url += "&keyword="+q;  
                          if(kb)  
                              data.url += "&kb_knowledge_base="+kb;  
                      })(); |

2. Add the widget to the service portal search results page.

   To add the widget:

   a) Navigate to the service portal search page (https://<instance>.service-now.com/sp?id=search) in designer mode.

   b) In the Filter Widget search box, search for the Search Within widget and drag it into the container in the location you want the widget to appear in the service portal search results page.
The **Search Within** widget is added to the service portal search results page. In the service portal, when you click **Knowledge** in the **Search Within** widget, and search for a keyword, it redirects you to the knowledge global search results page.

### Add knowledge quick-access widgets

Add Featured Articles, Most Useful Articles, and Most Rated Articles knowledge widgets to the service portal page.

Role required: admin

Replace the existing Top Rated knowledge widget in the service portal with one or more of the knowledge quick-access widgets.

The following knowledge quick-access widgets are available to be added to the service portal:

- Featured Articles
- Most Useful Articles
- Most Viewed Articles

1. Navigate to the service portal home page in designer mode.
2. In the **Filter Widget** search box, search for the widget you had created and drag it into the container in the location you want the widget to appear in the service portal home page.

   **Note:** You can click **Preview** to verify the location and appearance of the newly added widget.

   When you click a link in the newly added quick-access widget from the service portal, it takes you to the knowledge portal page.
Knowledge subscriptions

Subscribe to knowledge bases and knowledge articles and receive email notifications about new articles and article revisions or comments.

- **Subscribed to a knowledge base:**
  - Knowledge base owners are auto-subscribed to all articles in the knowledge bases they own. They receive email notifications when new articles are created or revised (published) in the knowledge base.
  - Users who subscribe to a knowledge base receive email notifications when new articles are created in the knowledge base or if the existing articles are revised (published).

- **Subscribed to a knowledge article:**
  - Knowledge authors are auto-subscribed to the articles they create. They receive email notifications when the articles they created are checked out or revised (published) by other authors, and if the articles receive user comments.
  - Users who subscribe to an article receive email notifications when the article is revised (published).

Users can set their Knowledge notification preferences using **System Settings**.

The knowledge subscription feature is available for both the Knowledge Management v3 user interface and the Knowledge Management Service Portal.

Activate the **Knowledge Management Advanced plugin** (com.snc.knowledge_advanced) to use the knowledge subscription feature. The Knowledge Management Advanced plugin activates the Subscriptions and Activity Feed Framework plugin (com.snc.activity_subscriptions).

**Note:** The Knowledge Management Advanced plugin is not activated by default.

If the article versioning feature is enabled, the following notifications are also sent:
- An article is checked out
- An article is revised
- A new version of an article is published

Before using the article subscription feature, the system administrator must:

1. Activate the Knowledge Management Advanced plugin.
2. Configure the knowledge subscription properties.
3. If necessary, customize the article subscription email notification templates.

Configure knowledge subscription properties

These properties enable the knowledge subscription feature, identify the roles that can use the feature, and identify the article states that generate notifications.

Role required: knowledge_admin or admin

1. Navigate to **Knowledge > Administration > Properties**.
2. In the **KM Subscription Properties** section, configure the following properties.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable subscribe feature for KM (glide.knowman.enable_km_subscription)</td>
<td>Enables or disables the Knowledge Management knowledge subscriptions feature.</td>
</tr>
<tr>
<td>List of roles (comma-separated) who can have subscription feature</td>
<td>A comma-separated list of the roles that can use the knowledge subscriptions feature and subscribe to knowledge bases and articles.</td>
</tr>
<tr>
<td>(glide.knowman.enable_km_subscription.roles)</td>
<td></td>
</tr>
<tr>
<td>List of workflow states (comma-separated) that can have subscription</td>
<td>A comma-separated list of the article states for which the knowledge subscription feature is available. The default states include Draft, Review, and Published.</td>
</tr>
<tr>
<td>feature (glide.knowman.enable_km_subscription.workflow_state)</td>
<td></td>
</tr>
</tbody>
</table>

3. Click Save.

Knowledge subscription email notification templates

The knowledge subscription feature uses email notification templates to send subscription notifications to knowledge users.

<table>
<thead>
<tr>
<th>Email template</th>
<th>Subscription type</th>
</tr>
</thead>
<tbody>
<tr>
<td>KM Subscription: Article created</td>
<td>Knowledge base</td>
</tr>
<tr>
<td>KM Subscription: Article revised in KB</td>
<td>Knowledge base</td>
</tr>
<tr>
<td>KM Subscription: Article checked out</td>
<td>Knowledge article</td>
</tr>
<tr>
<td>KM Subscription: Article revised</td>
<td>Knowledge article</td>
</tr>
<tr>
<td>KM Subscription: Article commented</td>
<td>Knowledge article</td>
</tr>
</tbody>
</table>

Users with the admin or knowledge_admin role can customize these email notification templates. To locate the template, navigate to System Notifications > Email > Notifications. For more information about customizing a template, see Create an email notification.

Subscription notifications include a link at the bottom of the email to the user’s Notification Preferences page.

Subscribe to a knowledge base

Subscribe to a knowledge base and receive notifications when articles are added to that knowledge base.

Role required: knowledge

Users can subscribe to a knowledge base from either the Knowledge Management v3 user interface or the Knowledge Management Service Portal.

1. Navigate to Knowledge > Homepage.
2. Click the Subscribe link on the knowledge base tile.
   The link changes to Subscribed and includes a check mark.

Subscribe to a knowledge article

Subscribe to a knowledge article within a knowledge base.

Role required: knowledge
Users can subscribe to a knowledge article from either the Knowledge Management v3 user interface or the Knowledge Management Service Portal.

### Note:

Users who are already subscribed to a knowledge base are also subscribed to the articles within that knowledge base.

To subscribe to articles from the base service portal (https://<instance name>/sp?), you must navigate to the Knowledge Management Service Portal pages (for example: https://<instance name>/sp?id=kb_home) from the base service portal.

1. Navigate to **Knowledge > Homepage**.
2. Click **Subscribe** at the top of the knowledge article.

   The system displays an information message about the article subscription and the button toggles to **Subscribed**.

---

### Unsubscribe from a knowledge base

Unsubscribe from a knowledge base.

Role required: knowledge

Users can unsubscribe from a knowledge base from either the Knowledge Management v3 user interface or the Knowledge Management Service Portal.

### Note:

If you subscribe to an article and then subscribe to the knowledge base, unsubscribing from the knowledge base also unsubscribes you from the article.

1. Navigate to **Knowledge > Homepage**.
2. Point to and click the **Subscribed** link on the knowledge base tile, which toggles to **Unsubscribe**.

   After unsubscribing you from the knowledge base, the link toggles to **Subscribe**.

---

### Unsubscribe from a knowledge article

Unsubscribe from a knowledge article.

Role required: knowledge

Users can unsubscribe from a knowledge article from either the Knowledge Management v3 user interface or the Knowledge Management Service Portal.

### Note:

If you are subscribed to a knowledge base and you unsubscribe from an article in that knowledge base, you must also unsubscribe from the parent knowledge base.

1. Navigate to **Knowledge > Homepage**.
2. Point to and click **Subscribed**, which toggles to **Unsubscribe**.

   If you are subscribed to the knowledge article, this action results in an information message that the article subscription has been removed. If you are also subscribed to the parent knowledge base, proceed to the next step.

3. If you are subscribed to the parent knowledge base, click **Yes** on the Unsubscribe pop-up window.
This action results in an information message that the knowledge base subscription has been removed.

Set knowledge subscription notification preferences

Set notification preferences for knowledge bases and knowledge articles.

Role required: knowledge

Users can set notification preferences from the Knowledge menu or from the Knowledge Management Service Portal.

1. Navigate to the Notification Settings page.

<table>
<thead>
<tr>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From the Knowledge application</td>
<td>Click the Notification Settings module.</td>
</tr>
<tr>
<td>From the Knowledge Management Service Portal</td>
<td>Click the user name in the portal header and then click Notification Settings.</td>
</tr>
</tbody>
</table>

2. Click the Notification Preferences tab.
3. Click Knowledge Base and enable or disable the knowledge base notification options.
4. Click Knowledge Articles and enable or disable the knowledge article notification options.

Manage knowledge subscriptions

Manage knowledge base and knowledge article subscriptions from the Notification Settings page.

Role required: knowledge

Users can manage knowledge subscriptions from the Knowledge application or from the Knowledge Management Service Portal.

1. Navigate to the Notification Settings page.

<table>
<thead>
<tr>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From the Knowledge application</td>
<td>Click the Notification Settings module.</td>
</tr>
<tr>
<td>From the Knowledge Management Service Portal</td>
<td>Click the user name in the portal header and then click Notification Settings.</td>
</tr>
</tbody>
</table>

2. Click the Subscriptions tab.
3. Click Knowledge Base or Knowledge Articles to see a list of current subscriptions.
4. To unsubscribe from a knowledge base or knowledge article, click Subscribed. The link toggles to Unsubscribed.

Article quality index for knowledge management

Assess the quality of knowledge articles with the article quality index (AQI). The AQI helps maintain consistent quality of knowledge articles attached to a knowledge base where articles are written by various authors.

Using AQI feature, a knowledge administrator (a user with knowledge_admin role) creates a checklist and adds a set of true or false questions to the checklist to assess the quality of knowledge articles. For each question, the knowledge_administrator assigns a weight based on its importance to the quality measurement and then attaches the checklist to a knowledge base.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
A knowledge reviewer (a user with knowledge_coach and knowledge_domain_expert role) performs AQI review on published knowledge articles attached to the knowledge base by answering the true or false questions in the checklist. The article quality is then scored based on the cumulative weight of all answers set to true in the checklist.

**Activating article quality index**

The article quality index feature is activated with the Knowledge Management Advanced (com.snc.knowledge_advanced) plugin. For details see, [Activate the Knowledge Management Advanced plugin](#).

**Create an AQI checklist**

Create a checklist of questions that reviewers can use to evaluate the quality of knowledge articles.

Role required: knowledge_admin or admin

1. Navigate to Knowledge > Article Quality Index > AQI checklists, and click New.
2. Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Checklist</td>
<td>Name for the checklist.</td>
</tr>
<tr>
<td>Description</td>
<td>Description for the checklist.</td>
</tr>
</tbody>
</table>

3. Right-click the form header and click Save.
4. In the Checklist Questions related list, add questions to the checklist.

Add questions and adjust the weight of the questions until the combined weight of all questions is equal to 100. The weight defines the score that is added to the total AQI review score of the article when the answer for that question is set to true. The maximum score that can be applied to an article in an AQI review is 100.

**Note:** The default AQI pass score is 70. You can change the pass score in the Article Quality Index properties.

To add a question:

a) Click New.

b) Fill in the following fields:

**Checklist Question form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Question</td>
<td>Text for the question to evaluate articles.</td>
</tr>
<tr>
<td>Description</td>
<td>Short description for the question.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>Value for the display order of questions in the checklist. The lower the value in the Order field, the higher the question displays in the checklist. <strong>Note:</strong> Before you assign a value for the display order, think about how many questions you would create for the checklist. For example, if you have five questions in a checklist, you can assign the value in increments of 20. This ensures that you have enough values to assign if you add questions to the checklist later.</td>
</tr>
<tr>
<td>Weight</td>
<td>A value for the question to score the article quality. This value is added to the AQI score when the answer for the question is set to <code>true</code>. <strong>Note:</strong> - The combined weight of all questions cannot exceed 100. - The sum of weights of all questions in a checklist must be equal to 100 to be assigned to a knowledge base.</td>
</tr>
</tbody>
</table>

5. After you finish adding questions to the checklist, click **Update** on the AQI Checklist form.

After you create a checklist, assign it to a knowledge base.

**Assign an AQI checklist to a knowledge base**

Before a knowledge reviewer can start performing the AQI review, you must assign an AQI checklist to a knowledge base.

You can only assign a checklist to a knowledge base when the weight of all questions in the checklist is equal to 100. Each knowledge base can have one assigned checklist. However, a checklist can be assigned to more than one knowledge base.

Role required: knowledge_admin or admin

1. Navigate to **Knowledge > Administration > Knowledge Bases**.
2. Click a knowledge base to which you want to assign a checklist.
3. On the Knowledge Base form, click the search icon in the **Checklist** field and select the AQI checklist to apply.

4. Click **Update**.

After you assign an AQI checklist to a knowledge base, you can start performing AQI reviews.

**Remove an AQI checklist from a knowledge base**

Before you can edit a checklist that is assigned to a knowledge base, you must remove it from the knowledge base.

A checklist with pending AQI reviews cannot be removed from the knowledge base until all AQI reviews associated with the checklist are complete.

Role required: knowledge_admin or admin

1. Navigate to **Knowledge > Administration > Knowledge Bases**.
2. Click a knowledge base from which you want to remove a checklist.
3. On the Knowledge Base form, delete the name of the AQI checklist from the **Checklist** field.
4. Click **Update**.

**Delete questions from an AQI checklist**

Deleting a question in a checklist deletes the text in the question of previously performed AQI reviews that use the checklist. Deleting an AQI question from a checklist will not affect the score of the previously performed AQI reviews. However, the text of the question will not be displayed in the checklist.

You can delete questions from a checklist if the following conditions are met:

- The checklist is not attached to a knowledge base. For more information, see **Remove an AQI checklist from a knowledge base**.
- There are no AQI reviews using the checklist in progress.

Role required: admin

1. Navigate to **Knowledge > Article Quality Index > AQI checklists**.
2. Click the AQI checklist from which you want to delete one or more questions.
3. In the Checklist Questions related list, select the check box next to the questions that you want to delete.
4. From the **Actions on Selected Rows** choice list, select **Delete**.
5. In the Confirmation window, click **Delete**.

**Perform an AQI review**

Perform the AQI review to evaluate the quality of the article.

The knowledge base must have an assigned AQI checklist.

Role required: knowledge_domain_expert, knowledge_coach, knowledge_admin, or admin

You can only perform an AQI review on the latest published version of an article in a knowledge base. You can perform several AQI reviews for an article. If you perform several AQI reviews for the same version of the article, the latest AQI score appears in the **Latest AQI** field in the article.

1. Navigate to **Knowledge > Articles > Published**, and click on an article to perform the AQI review.
2. Perform one of the following actions:

<table>
<thead>
<tr>
<th>Option</th>
<th>Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>The AQI review is not yet started.</td>
<td>Click <strong>Perform AQI</strong> in the form header.</td>
</tr>
<tr>
<td>The AQI review was started and is pending.</td>
<td>Click <strong>Continue AQI</strong> in the form header.</td>
</tr>
</tbody>
</table>

An Article Checklist Summary form appears.

3. For each question, select whether the answer is true or false. To change the answer, double click the value in the **Answer** column, select the required value and click the green check mark.

   ![Article Checklist Answers](image)

   **Note:** The cumulative weighted score of all answers set to true is applied to the AQI score when you save or submit the review.

4. Perform one of the following actions:
<table>
<thead>
<tr>
<th>To</th>
<th>Do This</th>
</tr>
</thead>
</table>
| **Submit the completed AQI review.** | Click Submit.  
The form refreshes and the total score of the AQI review is displayed in the AQI score field.  
The system sends an email notification as follows:  
• If the AQI review was performed on the first version of the article, the system sends an email notification to the author of the article.  
• If the AQI review was performed on subsequent versions of the article, the system sends an email notification to the author and creator of the article versions.  

**Note:** The notification includes the AQI review score and AQI review result. You can customize the content and design of the notification emails. |
| **Save the pending review to complete later.** | Click Update and return to the Article Checklist Summaries list.  
The checklist with pending reviews is added to the My Pending AQI Checklists queue. When you want to complete the AQI reviews, navigate to Knowledge > My Pending AQI Checklists and complete the reviews. |

To view all the AQI reviews you completed, navigate to Knowledge > My Completed AQI Checklists.

**View all pending and completed AQI reviews**

View checklists of all users to monitor the pending and completed reviews.  
Role required: knowledge_admin or admin

1. Navigate to Knowledge > Article Quality Index  
2. Do one of the following:  
   • To view all completed AQI checklists, select All Completed AQI Checklists.  
   • To view all pending AQI checklists, select All Pending AQI Checklists.

**Delete AQI reviews**

Roles required:

• To delete an AQI in a submitted state: admin or knowledge_admin  
• To delete an AQI not in a submitted state: knowledge admin or the reviewer who initiated the AQI

1. Navigate to Knowledge > Articles > My Pending AQI Checklists.  
2. Select all checklist reviews you would like to delete.  
3. Click Delete.
Knowledge article templates

Article templates have pre-defined fields structured in a specific order. These templates help create a consistent structure for knowledge articles.

Using the Knowledge Article Templates feature, as a knowledge administrator (a user with knowledge_admin role), you can create new article templates, add or customize fields in a template, and activate or deactivate a template.

As a security administrator (a user with security_admin role), you can configure field-level security in any template to make it visible to specific users.

As an author, you can create articles using pre-defined article templates or any newly created article templates.

Pre-defined knowledge article templates

Use either the standard template or one of the pre-defined How To, What Is, FAQ or a KCS article templates.

Note:
When you upgrade Knowledge Management to Kingston or later releases, all existing articles from the earlier version automatically use the standard template of the upgraded version. For example, if you upgrade Knowledge Management from Jakarta to Kingston, all existing articles use the standard template available in the Kingston version.

All pre-defined templates are inactive by default. If you do not activate a template, the articles automatically use the standard template. As a knowledge admin, you can activate a template by navigating to Knowledge > Administration > Article Templates. Then in the article template list, set the Active field to true for one or more templates you would like to activate.

The table below lists the fields available in each template and the name of the template table.

<table>
<thead>
<tr>
<th>Template name</th>
<th>Template fields</th>
<th>Maps to table</th>
</tr>
</thead>
<tbody>
<tr>
<td>FAQ</td>
<td>• Question • Answer</td>
<td>FAQ (kb_template_faq)</td>
</tr>
<tr>
<td>How To</td>
<td>• Introduction • Instructions</td>
<td>How To (kb_template_how_to)</td>
</tr>
<tr>
<td>What Is</td>
<td>• Introduction • Explanation</td>
<td>What Is (kb_template_what_is)</td>
</tr>
<tr>
<td>KCS Article</td>
<td>• Issue • Environment • Cause • Resolution</td>
<td>KCS Article (kb_template_kcs_article)</td>
</tr>
<tr>
<td>Standard</td>
<td>Text</td>
<td>kb_knowledge</td>
</tr>
</tbody>
</table>
Activating knowledge article templates

The Knowledge Article Templates feature is activated with the Knowledge Management Advanced (com.snc.knowledge_advanced) plugin. For details, see Activate the Knowledge Management Advanced plugin.

Deactivating knowledge article templates

You cannot delete an article template because article templates have an associated child table. Deleting a template would also require deleting the child table. Due to the limitations on dropping tables, article templates and template columns are explicitly made non-deletable. Instead you can disable the Knowledge Article Templates feature by clearing the Active check box on the Article Template form.

Create an article template

Create new article templates in addition to the pre-defined templates. Add new fields based on how you want to customize and display your content.

Role required: knowledge_admin or admin

For each new article template, a child table of the Knowledge (kb_knowledge) table is created. When you add a new field to the template, a new column is added to that table.

1. Navigate to Knowledge > Administration > Article Templates, and click New.
2. Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the article template.</td>
</tr>
<tr>
<td>Description</td>
<td>Description for the article template.</td>
</tr>
</tbody>
</table>

The Active check box is selected by default making the template available for use.

3. Right-click the form header and click Save.
4. In the Article Templates Field related list, add fields to the template.
   
   To add a field:
   a) Click New.
   b) Fill in the following fields as required:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field Name</td>
<td>Title to display on the template form.</td>
</tr>
<tr>
<td>Field Type</td>
<td>Available field types:</td>
</tr>
<tr>
<td>Order</td>
<td>Position of the field in the article page view and the article edit view.</td>
</tr>
<tr>
<td>HTML</td>
<td></td>
</tr>
<tr>
<td>String</td>
<td></td>
</tr>
<tr>
<td>Integer</td>
<td></td>
</tr>
<tr>
<td>Date</td>
<td></td>
</tr>
<tr>
<td>Date and time</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Article Template</td>
<td>(Read-only) Name of the article template associated with this field.</td>
</tr>
<tr>
<td>Template Table</td>
<td>(Read-only) Name of the table for this template.</td>
</tr>
<tr>
<td>Template Field</td>
<td>(Read-only) Name of the template column associated with this field.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>If checked, this field is mandatory.</td>
</tr>
<tr>
<td>Active</td>
<td>If checked, this field displays in the template.</td>
</tr>
</tbody>
</table>

c) Click **Submit**.

The field is added to the template.

5. Configure the article template form to display the fields that you added to the template.

   **Note:** You must have the admin role to configure the form layout. If the field is not available in the form layout, use the **form designer** to configure the fields.

a) Navigate to **Knowledge > Articles > Create New**.
b) Select the template in which you want to display the fields.
c) Right-click the header and select **Configure > Form Layout**
d) Select and move the required fields from the **Available** to the **Selected** list.
e) Click **Save**.

   **Note:** Authors who started a session before a template was created or activated will see the newly added template upon their next login.

---

**Restrict access to fields in an article template**

Use encryption context to set field-level security in article templates and display the fields based on user permissions.

Activate the **Encryption Support plugin** to enable field-level security using encryption context.

Role required: security_admin

1. Navigate to **System Security > Field Encryption > Encryption Contexts** and click **New**.
2. In the **Name** field, enter a name for the encryption context and click **Submit**.
3. Set the **Type** field for a table to Encrypted Text.
   
   To set the **Type** field for a table to Encrypted text:
   a) Navigate to **System Definition > Dictionary**.
b) Select the table to set the **Type** field to Encrypted Text.
c) In the **Type** field, select **Encrypted Text**.
d) Click **Update**.

The field is configured for encryption context.
4. Configure roles that can view the fields configured for encryption context.
   
   To configure the roles that can view the fields:
   
   a) Navigate to User Administration > Roles and select the role you want to assign permissions to view this field.
   
   b) In the Encrypted context field, select the name of the encryption context to apply for this role.

   **Note:** If the Encrypted context field is not on the form, configure the form to add the field.

5. Click Update.
   
   The field is displayed if the user has permissions to view the configured encrypted text field.

---

**External content integration**

Use the external content integration feature to integrate content from various external sources and enable unified knowledge search results.

Users store and manage knowledge using various external sources and search each source separately for relevant results. External content integration enables acquiring and searching all WebDAV-compliant source content from a single location. This provides users with a seamless search experience across multiple knowledge sources and drives more usage to the platform.

Using this feature, knowledge administrators can define the external content to be imported into a knowledge base and periodically run a job to import the content. Knowledge users have a seamless user experience searching for relevant content across multiple knowledge sources.

**Activate the External Content Integration plugin**

The External Content Integration feature is activated with the Knowledge Management - External Content Integration plugin (com.snc.knowledge.external_integration).

Role required: admin

The Knowledge Management - External Content Integration plugin is not active by default.

The following plugins are automatically activated when the Knowledge Management - External Content Integration plugin is activated:

- Centralized Connection and Credentials plugin (com.snc.core.automation.connection_credential)
- Knowledge Management V3 plugin (com.snc.knowledge3)
- Knowledge Management Advanced Installer plugin (com.snc.knowledge_advanced.installer)

The Knowledge > Administration module displays the External Knowledge Sources and External Knowledge Jobs sub-modules when the Knowledge Management - External Content Integration plugin is activated.

1. Navigate to System Definition > Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.

   If the plugin depends on other plugins, these plugins are listed along with their activation status.
If the plugin has optional features that depend on other plugins, those plugins are listed under **Some files will not be loaded because these plugins are inactive.** The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).

4. Optional: If available, select the **Load demo data** check box.

Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.

You can also load demo data after the plugin is activated by clicking the **Load Demo Data Only** related link on the System Plugin form.

5. Click **Activate**.

**Define an external knowledge source**

Before you import content, create and configure the connection between the a Web Distributed Authoring and Versioning (WebDAV) - compliant external knowledge source and the ServiceNow knowledge base where you want to import content. Define import parameters for the external knowledge source.

Define **basic authentication credentials** and **create an HTTP connection** to the external source.

Caution: This feature expects that the external source endpoint is a publicly accessible endpoint. Mid-server configuration is not supported.

Role required: admin

1. Define the connection from the external source and the target knowledge base.
   a) Navigate to **Knowledge > Administration > External Knowledge Sources**.
   b) Click **New**.
   c) Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Instruction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter unique name for the external source.</td>
</tr>
<tr>
<td>Target Knowledge Base</td>
<td>Select the knowledge base in which you want to create articles for the external content.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Select the connection alias to connect to the external source.</td>
</tr>
</tbody>
</table>

   d) Right-click the form header and click **Save**.

2. Set import parameters for the external content.
   a) In the **Parameter** related list, click **New**.
   b) In the **Name** field, select the name of the parameter from the drop-down list.
   c) In the **Value** field, enter the desired value for the parameter.

   The table below lists the parameters and the corresponding values that can be set for the external source.
<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum size limit (in MB) for this source</td>
<td>Set maximum allowed content size for this source. Once this limit is reached, no further content is processed. Default value is 400 MB.</td>
</tr>
<tr>
<td>Maximum size limit (in KB) per file/content in this source</td>
<td>Set maximum allowed size limit for each file from this external source. If a file exceeds this limit, that file is not processed. Default value is 4000 KB.</td>
</tr>
<tr>
<td>Open search results in the original source system</td>
<td>Set value to true to open search results in the external source system. Set value to false to open search results in the target knowledge base. Default value is set to false.</td>
</tr>
<tr>
<td>Include folders with names that match these regex patterns</td>
<td>Enter a comma-separated list of regular expressions for folder names that need to be included from this external source.</td>
</tr>
<tr>
<td>Exclude folders with names that match these regex patterns</td>
<td>Enter a comma-separated list of regular expressions for folder names that need to be excluded from this external source.</td>
</tr>
<tr>
<td>Create articles when file names match these regex patterns</td>
<td>Enter a comma-separated list of regular expressions for file names that need to be included to create articles.</td>
</tr>
<tr>
<td>Do not create articles when file names match these regex patterns</td>
<td>Enter a comma-separated list of regular expressions for file names that need to be excluded to create articles.</td>
</tr>
<tr>
<td>Maximum retry limit</td>
<td>Maximum number of retries to send request to the external source.</td>
</tr>
</tbody>
</table>

d) Click Submit.

**Import content from an external knowledge source**

Run an import job manually or set up a schedule to process the integrated external content.

Role required: admin or knowledge_admin

Each external source is associated with two handlers: the **Acquire handler** and the **Process handler**, for running the import job. The acquire handler uses a WebDAV client to acquire external content to create articles. You can customize the process handler to assign categories to articles or populate additional metadata for the knowledge articles.

1. Navigate to Knowledge > Administration > External Knowledge Sources.
2. Select the external knowledge source from which you would like to import content.
3. In the **Handler** tab, set a schedule to run the acquire and process handlers.
4. In the Related Links section, click **Run Scheduled Job**.
5. To view all jobs scheduled to run to import content for the external source, click the **Jobs**.
   You can open the most recent job to monitor the status.
Open knowledge search results in source system

Configure the URL to the external source system to open articles from search results directly in the source system.

Make sure the **Open search results in the original source system** import parameter for the **external knowledge source** is set to **true**.

Role required: admin

1. Navigate to **System Definition > Script Includes**.
2. Open **KBWebDAVContentHandler**.
3. In the **Script** window, override the function **getFileURL** using script shown below.

   ```javascript
   getFileURL: function(fileObj) {
     //write your logic here
   },
   ```

4. Click **Update**.

Sample configuration for integrating external knowledge content

You can integrate content from multiple external sources so your users can acquire and search knowledge from a single location. Use this sample configuration to create a connection to your external account, configure external knowledge sources, and import content to enable search results for unified content.

Requirements for integrating external content

Make sure the Knowledge Management -- External Content Integration plugin (com.snc.knowledge.external_integration) is enabled and your external source is WebDAV-compliant.

Integrate external knowledge sources into the Knowledge Management application

Create authentication credentials and a connection alias to connect your external knowledge source to the ServiceNow Knowledge Management application. Define import parameters for your external source to import integrated content.

Role required: admin

1. Enable basic authentication on your external account.
2. Create the connection to your external account using the basic authentication credentials.
   a) Navigate to Connections and Credentials > Credentials.
   b) Click New.
   c) Click Basic Auth Credentials.
      Fill in the following fields:
      | Field        | Description                                      |
      |--------------|-------------------------------------------------|
      | Name         | Name for the credential. For example, Demo_Auth.|
      | User name    | The external account user name created for basic authentication.|
      | Password     | The external account password for the user name.|
   d) Click Submit.

3. Create an HTTP connection to your external account.
   a) Navigate to Connections & Credentials > Connection & Credential Aliases.
   b) Select New.
   c) In the Name field, enter the name of the connection alias. For example, Demo_Account.
   d) Right-click the form header and click Save.
   e) In the Connections related list, click New.
      Fill in the following fields:
      | Field        | Description                                                             |
      |--------------|-------------------------------------------------------------------------|
      | Name         | Name for the HTTP connection. For example, Demo_Connection.             |
      | Credential   | Credential created to connect to the external account. For example, Demo_Auth.|
      | Connection URL| WebDAV URL to your external account. This is the WebDAV end point of your external account. |
   f) Click Submit.

4. Configure the external knowledge source for importing content.
   a) Navigate to Knowledge > Administration > External Knowledge Sources.
   b) Click New and fill in the following fields:
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for the external source. For example, Demo_knowledge.</td>
</tr>
<tr>
<td>Target Knowledge Base</td>
<td>Knowledge base in which you want to create articles for the external content. For example, IT.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Connection alias to connect to the external source. For example, Demo_Account.</td>
</tr>
</tbody>
</table>

c) Right-click the form header and select **Save**.

d) In the Parameter related list, click **New**.

e) On the Parameter form, select the name of the import parameter that you want to configure for your external source and then set the value for the parameter.

The table below lists the parameters and the corresponding values that can be set for the external source.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum size limit (in MB) for this source</td>
<td>Maximum allowable content size to import from your external source. For example, 250 MB.</td>
</tr>
<tr>
<td>Maximum size limit (in KB) per file/content in this source</td>
<td>Maximum allowable size for each article, including attachments, that you can import from this external source. For example, 2000 KB.</td>
</tr>
<tr>
<td>Open search results in the original source system</td>
<td>Opens search results in the external source system if this value is set to <strong>true</strong>.</td>
</tr>
<tr>
<td>Include folders with names that match these regex patterns</td>
<td>Comma-separated list of regular expressions for folder names to include from this external source. For example, to include all folders names that start with the letters a and b, enter <code>[a.*,b.*]</code>.</td>
</tr>
<tr>
<td>Exclude folders with names that match these regex patterns</td>
<td>Comma-separated list of regular expressions for folder names to exclude from this external source. For example, to exclude all folders names that start with the letters a and b, enter <code>[a.*,b.*]</code>.</td>
</tr>
<tr>
<td>Create articles when file names match these regex patterns</td>
<td>Comma-separated list of regular expressions for file names that to include when creating articles. For example, to include all file names have <code>.docx</code> and <code>.pdf</code> extensions, enter <code>[.*\.docx,.*\.pdf]</code>.</td>
</tr>
<tr>
<td>Do not create articles when file names match these regex patterns</td>
<td>Comma-separated list of regular expressions for file names to exclude when creating articles. For example, to exclude file names have <code>.docx</code> and <code>.pdf</code> extensions, enter <code>[.*\.docx,.*\.pdf]</code>.</td>
</tr>
<tr>
<td>Parameter name</td>
<td>Value</td>
</tr>
<tr>
<td>---------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>Maximum retry limit</td>
<td>Maximum limit for the number of times a connection request can be sent to the external source. For example, 5.</td>
</tr>
</tbody>
</table>

Import content from an external knowledge source.

Managed Documents

Use the ServiceNow® Managed Documents application to control electronic documents within your instance.

After parameters have been set by the administrator and the Knowledge Document plugin installed, documents can move through the managed document cycle.

**Note:** Step through the process below on your test (or any non-production) instance.

Managed Document features

Managed Documents is a lightweight, ITIL-based solution for creating and managing electronic documents within your instance.

This application adds a layer of control around any document by providing workflow, storage, security, and categorization options. It can be used for a variety of internal documents, such as policies and procedures, compliance documentation, and knowledge articles. Because it is integrated within the instance, Managed Documents offers a seamless alternative to 3rd-party systems.

**Features**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Check-in/Check-out</td>
<td>Track revisions, approval history, and automated notifications for approvers and reviewers. Useful for compliance and risk authors, policy and procedure writers, and contract administrators.</td>
</tr>
<tr>
<td>Categorization</td>
<td>Classify documents for organization and search.</td>
</tr>
<tr>
<td>Access control</td>
<td>Share documents with selected users.</td>
</tr>
<tr>
<td>Revision control</td>
<td>Track changes to documents.</td>
</tr>
<tr>
<td>Digital signature for approval</td>
<td>Integration with the Approval with E-Signature plugin.</td>
</tr>
<tr>
<td>Workflow</td>
<td>Support consistent content review and approval.</td>
</tr>
<tr>
<td>Security</td>
<td>Use high security setting.</td>
</tr>
</tbody>
</table>

Managed Document concepts

The following concepts explain Managed Documents: Managed Document, Document Collection, Document Revisions, and Document Parameters.
# Concepts

<table>
<thead>
<tr>
<th>Concept</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Managed Document</td>
<td>The <strong>Document (dms_document)</strong> table contains the documents controlled through the managed documents process.</td>
</tr>
<tr>
<td>Document Collection</td>
<td>The <strong>Document Collection (dms_collection)</strong> table allows related documents to be grouped together.</td>
</tr>
<tr>
<td>Document Revisions</td>
<td>Because managed documents must have clear records of individual versions of a document, revisions (including the file) are attached to the master document record through a related list. Document revisions are controlled to keep a standard naming scheme and consistent version numbers. Once a document revision is ready, it can be submitted for review.</td>
</tr>
</tbody>
</table>
| Document Parameters   | **Attention:** Parameters do not control application or document security. Parameters only organize documents, they do not affect who can access documents. To grant access to the Managed Documents application, you can assign a role. To grant access to a specific document, set user and group permissions. Each document can be associated with predefined parameters. The parameters can help with grouping documents.  
  - Type: Defines the type of document being controlled. Documents of the same type use the same controls.  
  - Classification: Defines document restriction level, such as public, restricted, or confidential.  
  - Audience: Defines the groups with access to the document, such as internal or external.  
  - Name Formats: Defines the format of document names, ensuring that documents of the same type have the same name scheme assembled from name components.  
  - Name Components: Defines the document values used in the name formats.  
  - Approval Rules: Defines the approvals the document must have before it can be published. |

---

## Install the Managed Documents plugin

The Managed Documents plugin is available for activation by users with the admin role.

1. Navigate to **System Definition > Plugins**.
2. Right-click the plugin name on the list and select **Activate/Upgrade**.
   
   If the plugin depends on other plugins, these plugins and their activation status are listed.
3. (Optional) Select the **Load demo data** check box.
Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when first activating the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.

4. Click Activate.

Managed Documents plugin

This page describes the applications and modules, database table structure, scripts, and roles.

Database table structure

The following tables are added:

<table>
<thead>
<tr>
<th>Display Name (Table Name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Revision (dms_revision)</td>
<td>The document revisions.</td>
</tr>
<tr>
<td>Audience (dms_audience)</td>
<td>The intended document readers.</td>
</tr>
<tr>
<td>Classifications (classification)</td>
<td>The document restriction level, such as public or confidential. (Does not define access to the document. Document security is set in user and group permissions.)</td>
</tr>
<tr>
<td>Type (dms_type)</td>
<td>The document purpose.</td>
</tr>
<tr>
<td>Component (dms_component)</td>
<td>The components of name formats. The value field is a dot-walking expression that is evaluated. An exception is made for the revision because it does not exist when the revision name is generated.</td>
</tr>
<tr>
<td>Name format (dms_name_format)</td>
<td>The composition of components to generate revision names.</td>
</tr>
<tr>
<td>Approval sequence (approval_sequence)</td>
<td>The approval sequences that users need to follow.</td>
</tr>
<tr>
<td>Approval Rule (dms_approval_rule)</td>
<td>The criteria that records of the dms_document table must match. Used to automatically add approvers to a document.</td>
</tr>
<tr>
<td>Collection (dms_collection)</td>
<td>The document groups created by the user.</td>
</tr>
</tbody>
</table>

Scripts

Business rules that are added to sys_script

<table>
<thead>
<tr>
<th>Rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update Document</td>
<td>Changes the state of a document depending on its revisions.</td>
</tr>
</tbody>
</table>
**Rule** | **Description**
--- | ---
Add Approvers | Populates the list of approvers in the document.

**Script includes that will be added to sys_script_include**

| Script include | Description |
--- | ---
DocumentManagement | Contains the main logics for the Managed Documents plugin. |
DocumentManagementDB | Contains methods to perform CRUD operations on the database. |
DocumentManagementSecurity | Helps manage the security of the Managed Documents system. |
DocumentManagementAjax | Updates the details of the temporary revision that is created when opening the upload/check in revision form. |
DocumentAttachmentAjax | Renames an attachment file. |
DocumentRevisionWorkflowHelper | Helps perform basic workflow operations on a revision. |
DocumentManagementApprovalMatcher | Helps obtain the user and group approvers for a document that matches approval rules. |
DocumentApproverHelper | Contains logics to handle document approvers. |
DocumentManagementUtils | Useful methods. |
DocumentReferenceQualifiers | Static methods that return reference qualifiers. |

**Client script that is added to sys_script_client**

| Rule | Description |
--- | ---
Document type change | Updates the name format field in the revision settings section of the document. Each type has a default name format. |

**Roles**

This plugin introduces two new roles:

| Role | Description |
--- | ---
document_management_user | This role enables a user to access the Managed Documents plugin, create documents, and search for documents. Document reviewers and approvers need the document_management_user role to access the Managed Document plugin. (Please note that reviewers and approvers can also access a document revision from an approval record.) |
### ServiceNow | Kingston | Now Platform Capabilities

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>document_management_admin</td>
<td>This role enables a user to change administrative settings for the Managed Documents plugin.</td>
</tr>
</tbody>
</table>

**Note:** Each document has individual permissions, so even if a user is given the document_management_user role and has permissions to the application, the user can only view documents to which they have been given access.

### Create a new managed document record

Configure the properties and policies for a managed document.

1. Navigate to **Managed Documents > Create New**.
2. In the **Name** field, type **Policy**.
3. In the **Requested by** field, add your name.
4. In the **Owner** field, add your name.
5. In the **Reviewer** field, add your name.
6. In the **Type** field, select **Policy**.
7. In the **Classification** field, select **Confidential**.
8. In the **Audience** field, select **Internal**.
9. Under **Revision Settings**, select the **Auto increment revision** option.

![Revision Settings](image)

10. Click **Submit**.

### Check in a document after making changes

After making changes to a document, check the revised document into Managed Documents.

1. Open the document record.
2. Click the **Upload/Check in Revision** related link.
3. Click **Choose File**, select the revised file, and click **Open**.
4. Check that the **Name** and **Revision Number** contain the updated number.
5. Ensure that the **Check in** option is selected.
6. Click **OK**.
Check out a document to make changes

After a document is added to a managed document record, check the file out to make changes. Checking documents in and out keeps a record of document changes and ensures that only one person at a time is editing the document.

1. Open the document record.
2. Select the Check Out Document related link.
4. Click Check Out.
5. Open the file and make a small change.
6. Save the document with the same name, but a new revision number. For example, Policy_POL_02.txt.

Publish a document in Managed Documents

After the document is reviewed and approved, publish the document within Managed Documents.

1. Open the document record.
2. In the Document Revisions list, click the name of the revision that was approved and is listed in the Ready for Publishing stage.
3. In the header bar, click Publish Revision.
4. In the Publish revision dialog box, check that the name and revision number are correct and click Publish.
   In the Document Revisions list, the revision you just published is now in the Published stage.

**Send a document out for review and approval**

When a document is ready, send it out for review and approval. If a reviewer or approver is not identified in the document record, the document is moved directly to the publishing stage.

1. In the Document Revisions list, right-click the revised document and select Submit Revision.

   Because you identified yourself as the reviewer, you receive an approve request email message.

2. In the email message, click the link next to Click here to view Approval Request.
3. (Optional) View the document by clicking the attachment name under Document Revision.
4. Click Approve.
   The Approvals page displays and lists the document you just approved.

5. Open the document record.
6. In the Document Revisions list, the revision you approved is now in the Ready for Publishing stage.

**Upload a document as an attachment**

After creating a document record, add the document to the record as an attachment.

1. Open the document record.
2. Select the Upload/Check in Revision related link.
3. Click Choose File.
4. Select a simple document, such as a text file, and click Open.
5. Check that the name reads Policy_POL_0.1.
6. Click OK.

The document is listed under Document Revisions.

Defining Document Parameters

Before using the Managed Documents application, the user with the document_management_admin role needs to set the parameters that define the kinds of documents to be managed through the application. Managed Documents provides both base and custom parameter options.

Defining Document Parameters

The following document parameters should be defined:

- **Type**: identifies the purpose of the document. The type also determines the default document format and name format.
- **Classification**: indicates the security level assigned to the document and determines who can view or edit the document.
- **Audience**: specifies the intended readers of the document.
- **Name format**: specifies the name format to use when a document revision is added.
- **Name components**: are individual identifiers used inside a name format. Name components define a reference path (often by dot-walking) that holds the value specific to the document.
- **Approval rules**: determine which approvers are added to documents (in addition to the Reviewers specified on the document record).

Defining Types

To define a new type, navigate to Managed Documents > Administration > Type and click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the type.</td>
</tr>
<tr>
<td>Code</td>
<td>A short code for the type. Referenced as a name component for the name format.</td>
</tr>
<tr>
<td>Label</td>
<td>A label to display in the Type choice list.</td>
</tr>
<tr>
<td>Name Format</td>
<td>The name format that documents of this type will use.</td>
</tr>
</tbody>
</table>
The following types are available in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Code</th>
<th>Label</th>
<th>Name format</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>-- None --</td>
<td>null</td>
<td>-- None --</td>
<td>null</td>
<td>1</td>
</tr>
<tr>
<td>policy</td>
<td>POL</td>
<td>Policy</td>
<td>Default Policy</td>
<td>2</td>
</tr>
<tr>
<td>guideline</td>
<td>GUI</td>
<td>Guideline</td>
<td>Default</td>
<td>3</td>
</tr>
<tr>
<td>procedure</td>
<td>PROC</td>
<td>Procedure</td>
<td>Default</td>
<td>4</td>
</tr>
<tr>
<td>contract</td>
<td>CON</td>
<td>Contract</td>
<td>Default</td>
<td>5</td>
</tr>
</tbody>
</table>

**Note:** For documents with a Type of Contract, a Contracts related list appears on the document record, listing any contracts the document is associated with.

### Defining Approval Rules

To define a new approval rule, navigate to Managed Documents > Administration > Approval Rules and click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique identifier for the approval rule.</td>
</tr>
<tr>
<td>Active</td>
<td>A check box indicating whether this approval rule is used.</td>
</tr>
<tr>
<td>Condition</td>
<td>A condition builder that determines which documents use this approval rule.</td>
</tr>
<tr>
<td>Description</td>
<td>A short description of the approval rule.</td>
</tr>
</tbody>
</table>

Once the approval rule is saved, the Approvers related list defines which approvers are added if the conditions in the Condition field are met.

The following approval rules are available in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Internal policy</td>
<td>type=Policy ∧ audience=Internal</td>
</tr>
<tr>
<td>Development policy</td>
<td>type=Policy ∧ department=Development</td>
</tr>
</tbody>
</table>

### Defining Audiences

To define a new audience, navigate to Managed Documents > Administration > Audience and click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audience Name</td>
<td>A unique name for the audience.</td>
</tr>
</tbody>
</table>
### Defining Classifications

Define a new classification on the Classification form.

Navigate to **Managed Documents > Administration > Classification** and click **New**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the classification.</td>
</tr>
<tr>
<td>Code</td>
<td>A short code for the classification. Referenced as a name component for the name format.</td>
</tr>
<tr>
<td>Label</td>
<td>A label to display in the Classification choice list.</td>
</tr>
<tr>
<td>Order</td>
<td>A number indicating this classification's sequence in the choice list.</td>
</tr>
</tbody>
</table>

The following classifications are available in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Code</th>
<th>Label</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>public</td>
<td>P</td>
<td>Public</td>
<td>1</td>
</tr>
<tr>
<td>restricted</td>
<td>R</td>
<td>Restricted</td>
<td>2</td>
</tr>
<tr>
<td>confidential</td>
<td>C</td>
<td>Confidential</td>
<td>3</td>
</tr>
</tbody>
</table>

### Defining Name Components

Name components define the document values used in the name format.

For example, the name component `document.audience.code` dot-walks from the document record to the audience **Code**.

To define a new name component, navigate to **Managed Documents > Administration > Components** and click **New**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique identifier for the name component.</td>
</tr>
<tr>
<td>Short Description</td>
<td>A short description of the name component value.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Value</td>
<td>The path to the field holding the value used for the name format. Defined relative to a current revision record. For example:</td>
</tr>
<tr>
<td></td>
<td>• Enter revision to use the revision Number field on the revision record.</td>
</tr>
<tr>
<td></td>
<td>• Enter document.name to use the Name field on the revision's referenced document.</td>
</tr>
<tr>
<td></td>
<td>• Enter document.audience.code to use the Code field for the audience referenced by the document.</td>
</tr>
<tr>
<td></td>
<td>This dot-walking approach makes it possible to get any value related to the revision into the name format.</td>
</tr>
</tbody>
</table>

**Note:** The revision component is a special component replaced by the appropriate revision number (rather than querying a value related to the current record). The revision is either automatically incremented or uses the latest revision number, depending on the setting on the document form.

The following components are defined in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Short description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audience code</td>
<td>Displays the code assigned to the document audience.</td>
<td>document.audience.code</td>
</tr>
<tr>
<td>Classification code</td>
<td>Displays the classification code.</td>
<td>document.classification.code</td>
</tr>
<tr>
<td>Document name</td>
<td>Displays the document name.</td>
<td>document.name</td>
</tr>
<tr>
<td>Revision</td>
<td>Displays the document revision.</td>
<td>revision</td>
</tr>
<tr>
<td>Type code</td>
<td>Displays the code assigned to the document type.</td>
<td>document.type.code</td>
</tr>
</tbody>
</table>

### Defining Name Formats

The name format automatically generates a name for a document revision by arranging name components in a standard code to match naming conventions.

For example, a name format with the name components **Type Code**, **Document Name**, and **Revision Number** and the separator `-`, would be formatted as:

```
TYPECODE-Name-RevNumber.fileformat
```

In this example, a policy (code POL) named IT Off-Boarding Policy, with revision number 1.0, and uploaded as a `.docx` file would have the name:

```
POL-IT Off-Boarding Policy-1.0.docx
```

To define a new name format, navigate to **Managed Documents > Administration > Name Formats** and click **New**.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the name format.</td>
</tr>
<tr>
<td>Separator</td>
<td>A separator to put between each of the components. Hyphens (-) and underscores (_) are commonly used. Using alphanumeric characters can create a confusing name format.</td>
</tr>
<tr>
<td>Description</td>
<td>A description of the name format.</td>
</tr>
</tbody>
</table>

Use the related list to add name components. Use the **Order** field to set the sequence in which name components are used.

The following name formats are defined in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Separator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>_</td>
<td>The default format. Document name and revision separated by an underscore.</td>
</tr>
<tr>
<td>Default Policy</td>
<td>_</td>
<td>The format for the policy document type.</td>
</tr>
<tr>
<td>Development documentation</td>
<td>(no separator)</td>
<td>The format for the software documentation type.</td>
</tr>
<tr>
<td>Development Sources</td>
<td>(no separator)</td>
<td>The format for the development and code sources type.</td>
</tr>
<tr>
<td>Intranet Improvement</td>
<td>(no separator)</td>
<td>The format for documents that describe intranet use.</td>
</tr>
</tbody>
</table>

**Defining Document Workflow**

In the base system, all managed documents use the **Managed Documents** workflow after the **Active** check box is selected.
Document workflow

The document parameters defined in the workflow are often used as conditions to trigger more specific workflows, such as type-specific workflows or classification-specific workflows. If different
kinds of documents should follow different workflows, use the Graphical Workflow Editor to create new workflows.

**Knowledge document**

The Knowledge Document plugin extends the Managed Documents plugin by providing the functionality for managed documents to be published to the knowledge base.

**Installed with knowledge document**

These elements are installed with the knowledge document plugin.

**Dependencies**

The Knowledge Document plugin depends on the Managed Documents plugin. Activating Knowledge Document activates Managed Documents.

**Tables**

<table>
<thead>
<tr>
<th>Display Name (table_name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Records</td>
<td>A many-to-many table storing the relationship between a document and a knowledge article.</td>
</tr>
</tbody>
</table>

**UI Actions**

<table>
<thead>
<tr>
<th>UI action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link to Knowledge</td>
<td>Creates or updates a knowledge article related to the current document, depending on whether a knowledge article already exists.</td>
</tr>
</tbody>
</table>

**Scripts**

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KnowledgeDocument</td>
<td>Holds the main logic for the Knowledge Document plugin.</td>
</tr>
<tr>
<td>KnowledgeDocumentDB</td>
<td>Class that gets, inserts, and updates data for the Knowledge Document plugin.</td>
</tr>
</tbody>
</table>
Knowledge settings fields
These fields appear on the Managed Document form Knowledge Settings section.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Behavior</td>
<td>Defines the process performed when the Link to Knowledge related link is clicked. Select <strong>Always create record</strong> to create a new knowledge article with the latest published revision attached. The knowledge article is then linked to the document. Select <strong>Update existing record</strong> to update the existing knowledge article to the latest published revision. If no knowledge articles exist for the document, a new knowledge article is created. The <strong>Update existing record</strong> option is not available when many knowledge articles are linked to a document.</td>
</tr>
<tr>
<td>Type</td>
<td>Specifies the type of knowledge article. Use Knowledge or any option that extends the kb_knowledge table. For example, if you have the IT GRC plugin installed to create GRC policies, select the type Policies. Note that when a knowledge article is created, the <strong>Type</strong> field becomes read-only.</td>
</tr>
<tr>
<td>Topic</td>
<td>Defines the subject of the document. Adds the topic information to the same field in the knowledge article.</td>
</tr>
<tr>
<td>Published</td>
<td>Date that the article should be published. Adds publishing date information to the same field in the knowledge article.</td>
</tr>
<tr>
<td>Valid to</td>
<td>Date that the article expires. Adds valid to date information to the same field in the knowledge article.</td>
</tr>
<tr>
<td>Short description</td>
<td>A few words or short phrase describing the knowledge article. Adds the short description to the same field in the knowledge article.</td>
</tr>
</tbody>
</table>

View knowledge linked to a document
You can view the knowledge linked to a document from the document record.

1. Navigate to the document record.
2. Select the **Knowledge Records** related list.
3. Select the knowledge article to view.

Create a document

After Managed Documents parameters have been set by the administrator, documents can be created, requested, checked out, edited, checked in, copied, and, if necessary, rolled back to an earlier version.

Once documents have been added to the Managed Documents application, they can be grouped into document collections.

Approval process

During the approval process, the approver approves or rejects the document. A document goes through the approval process after the review process.

Approval workflow

After the document has been reviewed, submit the document for approval. If the document does not have an approver, the approval process is omitted.

When the document is Active, the workflow Document Management Default is used to manage approvals:
Document Management Default workflow
If the approver rejects the document, the author and owner are notified and the document review is cancelled. The author, owner, and approver should discuss what changes need to be made to the document. When the document is ready, a new review can be initiated.

If the final approver approves the document, the author and the owner are notified. Once final approval is successful, the document stage changes to Ready for Publishing in the Document Revisions list.

Process modification for multiple approvers

If there are multiple approvers, the approval process works in sequence and multiple approvers can be assigned to a single sequence. For example:

Sequence 1: approvers A and B
Sequence 2: approvers C and D
Sequence 3: approver E

Because the sequences take place in ascending chronological order, approvers A and B receive the approval request first (approvers C, D, and E are not part of the process yet). Similar to the review process, the first approver to act within a sequence dictates what happens to the document. If approver A acts first and rejects the document, the approval process stops and the state is set to Cancelled. Approver B’s status is changed to No Longer Required. If approver A acts first and approves the document, the process stops and approver B’s status is changed.
to No Longer Required. Then, the document moves to approval sequence 2. After at least one approver in each sequence approves the document, the author and the owner are notified that the document has been approved.

**Review process**

During the review process, the reviewer approves or rejects the document. Sometimes a document will have multiple reviewers.

If the reviewer rejects the document, the author and owner are notified and the review is cancelled. The author, owner, and reviewer should discuss what changes need to be made to the document. If the reviewer approves the document, the author and owner are notified that the review was successful and the document can move to the approval stage.

If multiple reviewers are assigned to a document, the first reviewer to act dictates what happens to the document. For example, there are two reviewers, A and B. If reviewer A acts first and rejects the document, the review process stops and the revision state is set to Cancelled. Reviewer B receives a notification email stating that the review was rejected and their status is changed to No Longer Required. If reviewer A acts first and approves the document, the review process stops and the document can move to the approval stage. Reviewer B’s status is changed to No Longer Required.

**Enable electronic signature for approval**

This topic explains how to enabling electronic signatures for approval. Electronic signatures are helpful if you must obtain a digital signature for compliance or auditing purposes.

You can activate the Approval with E-Signature plugin to require that users type in a user name and password when reviewing and approving documents.

The digital signature is not tracked or stored in the document record. Users must simply type in a user name and password after clicking the Approve or Reject button.

![ approver authentication dialog box](image)

Digital signature

After activating the Approval with E-Signature plugin, ensure that a row in the e-signature registry table is created for the dms_document_revision table.

1. Navigate to System Definition > e-Signature Registry.
2. Check if dms_document_revision is already listed and Enabled is set to true.
3. If not listed, click New.
4. In Table name, select Document Revision.
5. Select Enabled.
6. Click **Submit**.

### Publish an approved revision

This topic explains how to publish a document revision that has been approved.

Once a document has been created and edited, a specific revision can be submitted for draft review and final approval. After final approval, the document can be published.

Publish the approved revision from the Document Revisions list.

**Note:** Publishing documents to the Knowledge Base requires the Knowledge Document Plugin.

1. Navigate to the document record.
2. In the Document Revisions List, click the revision marked **Ready for Publishing**.
3. Click **Publish Revision** to display the **Publish** dialog box.

The revision number matches the latest revision number. If your standard is to change the revision number when the document is published, such as incrementing the version number to 1.1 or 1.0.1, the change can be made on this dialog box manually.

4. Click **Publish**.

The published revision is highlighted in green and the stage of previous revisions is automatically changed to Retired:
Submit a revision for draft review

This topic explains how to submit a document draft for review.

Once a document has been created and edited, a specific revision can be submitted for draft review and final approval. After final approval, the document can be published.

When a draft of the document is ready, submit the draft for review. If the document does not have reviewers identified in the Reviewers field of the document record, the review process is omitted.

1. Navigate to the document record.
2. Right-click the appropriate revision.
3. Select Submit Revision.

The revision stage is set to Awaiting Review.
The document name and parameters are changed to read-only. The document state is set to Active.

Create or request a new document

Once an administrator has set parameters for the Managed Documents application, you can create or request new documents.

1. Navigate to **Managed Documents > Create New**.
2. Complete the following fields:

   New document fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>An identifying number for the document. Automatically generated using number maintenance.</td>
</tr>
<tr>
<td>Field</td>
<td>Input value</td>
</tr>
<tr>
<td>---------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Name</td>
<td>A name for the document. Note that the name for the document is combined with other naming components (as defined by the name format) to create the names for each document revision.</td>
</tr>
<tr>
<td>Requested by</td>
<td>The person asking that the document be created or updated.</td>
</tr>
<tr>
<td>Owner</td>
<td>The approver of the document request. Also responsible for setting completion date with requesters and authors.</td>
</tr>
<tr>
<td>Reviewers</td>
<td>The user or users who review the document and provide feedback to owners and authors.</td>
</tr>
<tr>
<td>Department</td>
<td>The department responsible for the document.</td>
</tr>
<tr>
<td>Type</td>
<td>The document purpose. This is a choice list derived from the type parameters.</td>
</tr>
<tr>
<td>Classification</td>
<td>The document classification, based on security, audience, and confidentiality. This is a choice list derived from the classification parameters.</td>
</tr>
<tr>
<td>Audience</td>
<td>The document readers, such as external or internal. This is a choice list derived from the audience parameters.</td>
</tr>
<tr>
<td>State</td>
<td>The current status of the document in the editing and publication process.</td>
</tr>
<tr>
<td>Checked out by</td>
<td>The user who currently has the document checked out.</td>
</tr>
<tr>
<td>Description</td>
<td>A short description of the document.</td>
</tr>
<tr>
<td>Revision Settings</td>
<td></td>
</tr>
<tr>
<td>Name format</td>
<td>The format for the name of each individual revision of the document. For more information, see Defining Name Formats.</td>
</tr>
<tr>
<td>Revision format</td>
<td>A choice between the two digit (0.x) or the three digit (0.0.x) revision format.</td>
</tr>
<tr>
<td>Auto increment revision</td>
<td>If selected, the revision number automatically increments each time the document is revised.</td>
</tr>
</tbody>
</table>

The User Permissions related list determines which users have rights to view and contribute to the document:

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>A reference to a user who is entitled to read and contribute to the document.</td>
</tr>
</tbody>
</table>
The Group Permissions related list determines which groups have rights to view and contribute to the document:

**Group permissions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group</td>
<td>A reference to a group of users who are entitled to read and contribute to the document.</td>
</tr>
<tr>
<td>Type</td>
<td>A choice list describing how group members can interact with the document. Options are:</td>
</tr>
<tr>
<td></td>
<td>- Reader - Group members can read the document versions.</td>
</tr>
<tr>
<td></td>
<td>- Editor - Group members can upload new versions.</td>
</tr>
<tr>
<td></td>
<td>- Owner - Group members can edit the document.</td>
</tr>
</tbody>
</table>

### Specify an approver

You can specify approvers for a document record after you save it.

You can have one approver or multiple approvers. For example, set multiple approvers to have one person do a quality check of the document and a different individual to serve as a final approver. Approvers are assigned a number. The lowest number (usually number one) approver always goes first, then any other approvers in ascending chronological order. Multiple approvers can have the same sequence number. For example, two approvers can do a quality check and be assigned sequence number 1. Then, two individuals can be final approvers and be assigned sequence number 2.

1. Navigate to the document record.
2. Right-click in the document header bar and select Add Approver.
3. Add a user name.
4. Select a sequence number from the drop-down list. (Lower numbers approve before higher numbers. For example, approver number one approves before number two.)
5. Click Add User.
6. Repeat steps 2-5 to add more approvers.

### Check in a document

Check in the document after you revise it so other users can check out the document.

1. Navigate to the document record.
2. Select the **Upload/Check In Revision** related link.
3. Click **Browse** and navigate to the revised file.
4. Click **Open**.
5. Check the Name and Revision Number.
6. Click **OK**.

The Document Revisions related list updates to contain the most recent revision:

![Document Revisions](image)

**Document revisions**

**Copy a document**

A document can be duplicated at any time. This is useful if you have an existing document that you want to use as a base for a new document.

1. Navigate to the document record.
2. Right-click the header bar and select **Copy Document**.

An information message with a link to the new document displays:

3. Click **OK**.

The new document is renamed and includes the word "Copy."

**Note:** Only the latest revision is copied.

**Deactivate a document**

To change the document state to Inactive, deactivate the document. This is useful when changes to a document have been put on hold. An inactive document can be reopened at any time.

1. Navigate to the document record.
2. Right-click the header bar and select **Deactivate Document**.

**Note:** To activate a document, right-click on the header and click **Reopen Document**.
Reopen a deactivated document
A document that has been deactivated can be reopened.
1. Navigate to the document record.
2. Right-click the header bar and select Reopen Document.

Roll back a document
A document can be rolled back to an earlier revision at any time. Before rolling back to an earlier revision, ensure that the document is not checked out and that you have Editor or Owner permissions for the document.
1. Navigate to the document record.
2. In the Document Revisions list, click the revision to which you want to roll back.
3. Right-click the header bar and select Rollback. The Rollback to Revision dialog box displays. The name and revision number are new. The note specifies the revision to which you are rolling back.

4. Change any information on the Rollback to Revision dialog box as necessary.
5. Click OK. The latest revision is now the revision you selected for rollback.

Cancel a document
Change the document state to Cancelled when no more changes will be made to the document.
When canceling a document, there is no confirmation message, so ensure that you want to cancel the document.
1. Navigate to the document record.
2. Right-click the header bar and select Cancel Document.
   An info message confirms the cancellation:
   The State is set to Cancelled:
Check out a document

Documents in the Managed Documents application can only be revised by one user at a time. Check out the document to revise it.

1. Navigate to the document record.
2. Select the Check Out Document related link.
3. Select Download file to download the current version of the document when it is checked out.
4. Click Check Out.

After checking out a document, you can edit the document and make any necessary changes.

Create a document collection

A document collection is a set of individual documents. After documents have been uploaded into Managed Documents, organize the documents by grouping them into collections.

1. Navigate to Managed Documents > Document > My Collections.
2. Select New.
3. Type in a Name.
4. (Optional) Type in a Description.
5. Click Submit.
6. Click the name of the collection you created.
7. Click Edit.
8. On the left, double-click an available document or select a document and click **Add**.

9. Click **Save**. The Document Collection page displays and the individual documents in the collection are listed:

![Document Collection](Image)

![Documents](Image)

**Document collection**

**Upload a document**

Upload a document into a saved record. You can upload text files, spreadsheets, presentations, PDF files, and more.

1. Navigate to the document record.

2. Click the **Upload/Check In Revision** related link.

3. Click **Choose File** and navigate to the file.

4. Click **Open**.

5. Check the Name and Revision Number.

6. Click **OK**.

After the initial document is uploaded, subsequent revisions can be created by checking out the document.
Domain separation in Managed Documents

This is an overview of domain separation in Managed Documents. Domain separation allows you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

Support: Data only

Domain separation in this application is supported at the Data only level, meaning it supports the data security model of separating visibility of data from one domain to another. To learn more, see Application support for domain separation.

MetricBase application

Use the MetricBase application to collect, retain, analyze, and visualize time series data on the Now Platform.

Time series data is a collection of values for an item taken at specific time intervals. Time series data is stored in a separate database, called the MetricBase database. An example is collecting CPU usage values for a computer every hour. You can then use the time series data to evaluate system capacity issues.

The MetricBase application is integrated with the Now Platform making it easy to handle time series data for applications on the Now Platform. The MetricBase database saves values as floating-point numbers.

You can create a trigger that evaluates data and executes a script when the trigger criteria are met. See Create a MetricBase trigger for the steps to create a trigger.

MetricBase data can be accessed through the Performance Analytics and Reporting application. See the Create time series reports from MetricBase data topic to create advanced reports.

A demonstration plugin is available that contains a user created table with metric fields, triggers, a scheduled job to create data, and the Data Explorer that provides a place to experiment with transform APIs. See MetricBase demonstration application for more information.

The MetricBase product is available as a separate subscription. For more information, see Request the MetricBase product.

Request the MetricBase product

The MetricBase product requires a separate subscription and must be activated by ServiceNow personnel. A demonstration plugin with sample tables, metrics, triggers, and data is available. Be sure to request the MetricBase Demo plugin with the MetricBase product.

Role required: none

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization’s production and sub-production instances, generally within a few days.
View time series retention policies

The MetricBase application provides pre-defined retention policies that define the data collection interval for a metric.

Role required: clotho_admin

How often time series data is collected and how long the time series data is retained are important parameters for each metric. The MetricBase application provides pre-defined retention policies. You cannot create retention policies.

A retention policy is a series of time periods and collection rates. An example is 8d@1h, which means for eight days data is collected at one hour intervals. A retention policy is a series of these time periods with longer intervals for each subsequent time period. For example, 8d@1m, 31d@30m, 397d@1h.

Retention policies define the collection interval, which changes with the age of the data. Older data is compacted and stored with lower fidelity. You can see the available retention policies with the Retention Policies module. The 8d@1m, 31d@30m, 397d@1h retention policy means

- For the last eight days, data points are available at 1-minute intervals.
- Data points from 9 through 31 days are compressed to 30-minute intervals.
- Data points older than 32 days are compressed to 1-hour intervals.
- If data is ingested at 30-second intervals in the last eight days, one data point is lost. Data in the last eight days are always stored at 1-minute intervals.
- If data is ingested at 2-minute intervals in the last eight days, the missing data points are stored as NaN. Data in the last eight days are always stored at 1-minute intervals.

1. Navigate to MetricBase > Retention Policies.
2. Click a policy to view the collection interval specification.

Create a time series metric

Create a time series metric record for each item for which time series data is to be collected. You must define the table, metric field name, and the retention policy.

Role required: clotho_admin

2. Click New.
3. Complete the time series metric definition form then click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Name of the metric.</td>
</tr>
<tr>
<td>Table name</td>
<td>Name of the table to contain the metric. A table can have multiple metric columns. Required.</td>
</tr>
<tr>
<td>Metric field name</td>
<td>Required. Define the name of the column to add to the target table.</td>
</tr>
<tr>
<td>Retention policy</td>
<td>Required. Retention policy to use. Select one of the available retention policies.</td>
</tr>
<tr>
<td>Application</td>
<td>Application for which this metric is defined. (auto-filled)</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Display value aggregator</td>
<td>Aggregation to use for the metric field display value on the list view of the table.</td>
</tr>
<tr>
<td>Display value aggregate duration</td>
<td>Sample interval to use for the metric field display value on the list view of the table.</td>
</tr>
</tbody>
</table>

Adds a float field with the name specified in the **Metric field name** field to the target table.

Create a MetricBase trigger

Create a trigger to run a script. The trigger is based on static thresholds you create. Data is checked when added to the MetricBase database.

Role required: admin

To create a trigger, select the metric, create a filter to select the records to be evaluated against the trigger criteria, define the trigger criteria, and write the script to run when the trigger criteria are met.

**Note:** The script is not used to determine when the trigger is triggered.

After the trigger has been created, you can specify the trigger levels. Trigger levels define a value or range of values and are part of the trigger criteria. The trigger level whose criteria has been met is one of the parameters to the trigger script. You can define one or more trigger levels for a trigger.

You can use the condition builder to use any field in the table containing the metric to specify the records to be used by the trigger criteria.

A trigger script should have a short execution time. Do not write a script that performs significant amounts of processing. Instead, update a field or create an event and then exit.

1. Navigate to MetricBase > Trigger Definitions, and click **New**.
   The **MetricBase Trigger New Record** form is shown.
2. Fill in the fields as needed.

**MetricBase trigger form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the trigger.</td>
</tr>
<tr>
<td>Aggregator</td>
<td>Specify the aggregation to be done, or none.</td>
</tr>
<tr>
<td>Window</td>
<td>Specify the time period to use for the aggregation. This field appears when <strong>Min</strong>, <strong>Max</strong>, or <strong>Average</strong> is selected from the lane.</td>
</tr>
<tr>
<td>Table name</td>
<td>Specify the table that contains the metric. Only tables that have a metric field are shown in the list.</td>
</tr>
<tr>
<td>Metric</td>
<td>Specify the metric. When you select a metric, the <strong>Table name</strong> field is updated for the selected metric.</td>
</tr>
</tbody>
</table>
Create a MetricBase trigger level

Define levels or ranges for a trigger.

Role required: admin

The trigger must be defined before you can create a trigger level. Trigger bands must not overlap.

1. Navigate to MetricBase > Trigger Definitions, and click the trigger for which you want to add a trigger level.
   The MetricBase Trigger form is shown.
2. Scroll down to the MetricBase Trigger Levels list, and click New.
   The MetricBase Trigger Level New record form is shown.
3. Fill in the fields as needed.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trigger</td>
<td>This field is pre-filled with the trigger on which you were working. Use the lookup list to select a different trigger.</td>
</tr>
<tr>
<td>Level</td>
<td>Level number. Set to the next available number. You can change the number.</td>
</tr>
<tr>
<td>Function</td>
<td>Function to use on the value.</td>
</tr>
<tr>
<td>Band Function</td>
<td>To define a range, select the function to apply to the second value.</td>
</tr>
<tr>
<td>Value</td>
<td>Value to cause a trigger. If no band function is selected, the trigger is a fixed number.</td>
</tr>
<tr>
<td>Band Value</td>
<td>Second value to use to define a range. When a band function is selected, this value is required. This field appears when Greater than, Less than, Greater than or is, or Less than or is selected from the Band Function field.</td>
</tr>
<tr>
<td>Tolerance</td>
<td>Range, plus or minus, around a trigger value or band. After a trigger event has occurred, subsequent calculated values must be outside the value or band plus or minus the tolerance before a second event is triggered.</td>
</tr>
</tbody>
</table>
4. Click Submit.

**Store time series data**

Use JavaScript, REST, or scriptable REST APIs to add time series data to a metric field.

It is recommended that you use the REST APIs to store time series data.

For information on the MetricBase REST APIs see the REST API Explorer on an instance with the MetricBase application installed, or see the **Clotho Time Series API**.

For information on the MetricBase JavaScript APIs, see **Client**, **Data**, **DataBuilder**, **Transformer**, **TransformPart**, **TransformResult**.

In practice, for performance reasons, batch multiple series of multiple data points and store them at one time, do not insert each data point individually.

**Store time series data using REST APIs**

```bash
```

**Store time series data using JavaScript APIs**

```javascript
// get the subject GlideRecord with which we are going to put metric data
var gr = new GlideRecord('cmdb_ci_computer');
gr.get(<sys id of record containing metric to be stored>);

// build time series data for cpu_percentage metric. time is GlideDateTime
var dataBuilder = new sn_clotho.DataBuilder(gr, 'cpu_percentage').add(time, 0.75);

// use clotho client to insert data
new sn_clotho.Client().put(dataBuilder);
```

**Analyze time series data**

Use JavaScript or REST APIs to extract time series data from the MetricBase database, and to run transforms on the data.

For information on the MetricBase REST APIs see the REST API Explorer on an instance with the MetricBase application installed, or see the **Clotho Time Series API**.

© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
For information on the MetricBase JavaScript APIs, see Client, Data, DataBuilder, Transformer, TransformPart, TransformResult.

To use MetricBase time series data in report visualizations, see Create time series reports from MetricBase data.

**Analyze time series data with the JavaScript APIs**

This example is to get the average CPU percentage over the specified time for each XYZ computer.

```javascript
// Query the cmdb_ci_computer table for the records for
var gr = new GlideRecord('cmdb_ci_computer');
gr.addEncodedQuery('manufacturer=xyz');
gr.query();

// Create a DataSelector object and specify the metric
// (cpu_percentage),
// the transform (avg), and label (avg cpu)
var transform = new sn_clotho.Transformer(gr).addMetric('cpu_percentage').avg().label('avg-cpu-percentage');

// Run the transform between startTime and endTime. 
// startTime and endTime are GlideDateTime
var data = transform.execute(startTime, endTime);
var values = data['avg-cpu-percentage'].getValues();
```

**View time series data**

You can view time series data for a metric. A metric is defined for all records in a table, and you can view the time series data for all records.

Role required: admin

See the Create time series reports from MetricBase data topic to create advanced reports.

1. Navigate to the table containing the metric.
   In the Filter Navigator, type `<table name>.list`, and hit enter.
2. Click the menu icon above the metric column, and select Time Series Chart.
3. Change the Time Span and Transform fields to evaluate the data.
   When you select the Add, Multiply, or Divide transforms, the Value field and Submit button are shown. Enter a value and click Submit to view the adjusted data. The adjusted data is not saved to the MetricBase database.

**View MetricBase status**

You can view the status of the MetricBase database.

Role required: admin

1. Navigate to MetricBase > MetriBase Status.
   A list of MetricBase statistics is shown.
2. Set up the list to show the information that you want to check.
   a) Click the Update Personalized List icon.
b) Use the slushbucket to move the desired metric to the display, and click **OK**.

3. Click the metric value to view the time series data for that statistic.

**Debug MetricBase**

You can use session debug tools and statistics to debug issues.

Role required: admin

1. To use MetricBase session debug.
   a) Navigate to **System Diagnostics > Session Debug > Debug MetricBase**. Session debug tracking for MetricBase activities starts.
   b) Navigate to **MetricBase > MetricBase Status**, and scroll to the bottom of the list. Debug information is listed below the list.

2. To view MetricBase statistics
   a) Navigate to **System Diagnostics > Stats > Stats**
   b) Scroll down to find **MetricBase Statistics**

**MetricBase demonstration application**

Investigate an example application that uses MetricBase features. The demonstration application is in the **MetricBase Demo** plugin.

The demonstration application contains a table that has metric fields defined. Triggers have been created for evaluating data as it is added to the MetricBase database. A scheduled job that runs every five minutes adds data to the MetricBase database. You can use the **Data Explorer** module to experiment with transform APIs.

The **MetricBase Demo** application has these modules.

<table>
<thead>
<tr>
<th>MetricBase Demo modules</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Module</strong></td>
</tr>
<tr>
<td>Drones</td>
</tr>
<tr>
<td>Fleets</td>
</tr>
<tr>
<td>Data Generators</td>
</tr>
<tr>
<td>Metrics</td>
</tr>
<tr>
<td>Module</td>
</tr>
<tr>
<td>---------------------</td>
</tr>
<tr>
<td>Scheduled Jobs</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>Triggers</td>
</tr>
<tr>
<td>Anomaly Logs</td>
</tr>
<tr>
<td>Data Explorer</td>
</tr>
</tbody>
</table>

**MetricBase Data Explorer**

Experiment using MetricBase APIs on the data created by the demonstration application.

Role required: admin

The Data Explorer screen has three sections, the Data Explorer Script Result Display on top, the Data Explorer Script area in the middle, and the Server Output area on the bottom.

Note: You may need to scroll down the screen to see the bottom two sections. The buttons are located below the script field.

The **Data Explorer Script Result Display** is initially blank.

The **Data Explorer Script** section is initially contains a script that you can run. The results of the script are shown in the **Data Explorer Script Result Display**. Using the **Example Script** list you can select one of the provided scripts. You can modify the scripts provided or write your own scripts.

Note: If you want to keep a modified script or a script you create, you will need to save the script separately.

The **Server Output** section is initially empty. You can add `gs.info()` statements to a script to provide debug information that shows in the **Server Output** section.

1. Navigate to MetricBase Demo > Data Explorer.
2. To execute a script, click Run.
3. To change the script to be run.
   a) Select a script from the **Example Script** list.
   b) Click **Load Example**.
c) Click **Run**.

**Domain separation and MetricBase**

This is an overview of domain separation and the MetricBase application. Domain separation allows you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

**Overview**

**Support: Data only**

Domain separation in this application is supported at the **Data only** level, meaning it supports the data security model of separating visibility of data from one domain to another. To learn more, see [Application support for domain separation](#).

**MID Server**

The ServiceNow® MID Server application facilitates communication and movement of data between the platform and external applications, data sources, and services.

<table>

**Introducing the MID Server**

The Management, Instrumentation, and Discovery (MID) Server is a Java application that runs as a Windows service or UNIX daemon on a server in your local network.

The MID Server facilitates communication and the movement of data between a ServiceNow instance and external applications, data sources, and services.

This video gives you an overview of the MID Server:
Applications that use MID Servers

<table>
<thead>
<tr>

<td>• Service Assurance</td>
</tr>
</tbody>
</table>

Communicating with the MID Server

The MID Server initiates all communications with the ServiceNow® instance. The instance never initiates communications with the MID Server. This communication is recorded as records in the ECC queue, which is essentially the communication log between the instance and the MID Server. See The MID Server ECC Queue for more information.

MID Server selection

An application can select a MID Server in these ways.

• **Auto-selection**: The application can automatically find an appropriate MID Server that meets the necessary selection criteria. The criteria is different for each application.
• **Default selection**: The application defaults to a single MID Server that you can specify for each application.
• **Manual selection**: The application selects a single MID Server that you specify. Not every application allows for manual selection.

See MID Server selection for details.

Asynchronous Message Bus

The MID Server opens a persistent connection to the instance through the Asynchronous Message Bus (AMB) Client and listens on the /mid/server/<mid_sys_id> AMB channel. When an output record is inserted into the Queue (ecc_queue) table, an AMB message is sent to the MID Server’s channel. The MID Server receives this message and immediately polls the ecc_queue table for work.

The MID Server polls the ECC queue on the regular interval defined in the mid.poll.time configuration parameter, regardless of AMB message activity. The default polling interval is set to 40 seconds, but can be reconfigured. This polling of the ECC queue at a regular interval is done in case the AMB connection is dropped.
MID Server ECC queue polling process

Note: The AMB client on the MID Server does not work in all environments and might need to be disabled to avoid performance issues. To disable AMB in your environment, set the mid.disable_amb parameter to true. When you disable AMB, the MID Server reverts to a default polling interval of 5 seconds, unless the mid.poll.time parameter is set to a different value.
System clones and the MID server

See [KB0547597](https://service-now.com) for information on what to do with MID Servers when you are cloning your instance.

MID Server heartbeat

The Now Platform checks the MID Server for a response every 5 minutes, using a synthetic transaction monitoring system.

Checking for a heartbeat

ServiceNow instances send a synthetic transaction via the Heartbeat probe to every MID Server every 5 minutes. The Heartbeat probe functions exactly as a normal probe does and is sent by writing an output record to the ECC queue. A MID Server retrieves the record when it queries the ECC queue for work. The MID Server processes the probe just as it would any other probe and responds back to the instance. If the instance does not detect a response from a MID Server, the instance marks that MID Server as Down. If the MID Server responds, the instance considers the MID Server to not be Down and is communicating properly with the instance.

**Note:** Make sure that your MID Server can communicate on port 443. See [Configure MID Server connection prerequisites](https://service-now.com) and [MID Server system requirements](https://service-now.com) for more information.

System events

When a MID Server transitions from one state to another, one of these events is triggered:

- mid_server.up: The MID Server goes from a status of Down, Paused, or Upgrading to a status of Up.
- mid_server.down: The MID Server goes from a status of Up to a status of Down.
- mid_server.paused: The MID Server is paused.
- mid_server.upgrading: The MID Server is being automatically upgraded because the instance is being upgraded.

You can use these events to send notifications or trigger actions that you specify in scripts.

Scheduled job

To change the trigger interval for the Heartbeat probe, navigate to System Scheduler > Scheduled Jobs > Scheduled Jobs. Open the MID Server Monitor record and edit the interval.
MID Server heartbeat trigger interval

MID Server system requirements

Use these minimum system requirements to allocate resources for computers hosting MID Servers.
MID Server supported systems

The following systems support the MID Server.

  
  **Note**: .NET Framework version 3.5, 4.0, 4.5, 4.6, or 4.7 is required for Service Mapping support and for Windows pattern-based discovery.

- **Linux**: The MID Server was tested on Linux Red Hat 6, Ubuntu 12, and CentOS 6. Linux MID Servers support virtual machines and 64-bit systems. On 64-bit Linux systems, you must install the 32-bit GNU C library (glibc). The installation command for CentOS is: `yum install glibc.i686`.

Java version support

The MID Server installs with JRE version 1.8. If you upgrade with a MID Server using JRE 1.6, the system automatically upgrades that MID Server to use version 1.8. Both the 32 bit and 64 bit MID Servers use JRE 1.8.

Setting the JVM Memory size

The MID Server installs with 1 GB of JVM memory. If the suggested memory size for your product is greater than 1 GB, see [Set the MID Server JVM memory size](#) for the procedure to override the default setting.

Deployment types

System requirements for your instance are determined by the needs of the individual products you use that require a MID Server.

**Standard deployments**

The following products are considered "standard" because their MID Servers share the same minimum disk space and memory requirements:

- Discovery
- Event Management
- Integrations
- Orchestration
- Service Mapping

The minimum standard requirements pertain to both a single product and a combined product deployment. You can deploy a single MID Server for multiple standard products without significantly increasing the disk or memory requirements.

**High resource deployments**

Cloud Management Platform (CMP), alert aggregation and RCA, and Operational Intelligence are processing intensive and require more resources for each MID Server than the standard
products. Install MID Servers for these products on dedicated hosts that do not support MID Servers for other products.

**Recommended MID Server minimum requirements**

All configurations listed here require a quad core processor with a speed of 2 GHz or greater and were calculated for a Windows Server 2012 R2 host.

**Note:** The MID Server minimum system requirements for 25 concurrent threads includes resource overhead that is independent of the number of threads. As a result, the system requirements for 200 threads do not require a linear increase in resources.

### MID Server minimum system requirements for 25 concurrent threads (base system)

<table>
<thead>
<tr>
<th>Product</th>
<th>Disk space (GB)</th>
<th>Memory (GB)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>OS</td>
<td>MID Server + product</td>
</tr>
<tr>
<td>Alert aggregation and RCA</td>
<td>36 GB</td>
<td>10 GB</td>
</tr>
<tr>
<td>Cloud Management Platform (CMP)</td>
<td>36 GB</td>
<td>4 GB</td>
</tr>
<tr>
<td>Operational Intelligence</td>
<td>36 GB</td>
<td>16 GB</td>
</tr>
<tr>
<td>Standard</td>
<td>36 GB</td>
<td>4 GB</td>
</tr>
</tbody>
</table>

### MID Server minimum system requirements for 200 concurrent threads (customer configured)

<table>
<thead>
<tr>
<th>Product</th>
<th>Disk space (GB)</th>
<th>Memory (GB)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>OS</td>
<td>MID Server + product</td>
</tr>
<tr>
<td>Alert aggregation and RCA</td>
<td>36 GB</td>
<td>10 GB</td>
</tr>
<tr>
<td>Cloud Management Platform (CMP)</td>
<td>36 GB</td>
<td>4 GB</td>
</tr>
<tr>
<td>Operational Intelligence</td>
<td>36 GB</td>
<td>16 GB</td>
</tr>
<tr>
<td>Standard</td>
<td>36 GB</td>
<td>4 GB</td>
</tr>
</tbody>
</table>

**Use case 1: Single MID Server deployed for multiple standard products**

In this example, Service Mapping, Discovery, and Orchestration share a MID Server with 25 threads that is installed on a dedicated host. The disk space and memory requirements specified here satisfy the minimum recommended requirements for the combined product deployment.
### One MID Server for multiple standard products

<table>
<thead>
<tr>
<th>Product</th>
<th>Disk space (GB)</th>
<th>Memory (GB)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>OS</td>
<td>MID Server + product</td>
</tr>
<tr>
<td>Service Mapping + Discovery + Orchestration</td>
<td>36 GB</td>
<td>4 GB</td>
</tr>
</tbody>
</table>

### Use case 2: Multiple MID Servers deployed to a single host

In this example, three MID Servers for standard products are deployed to a single host, where each MID Server has 25 threads. The required resources are calculated as follows:

- **Total disk space required**: Add the recommended disk space for the operating system from the **OS** column to the sum of the values in the **MID Server + product** column for all products mapped.
- **Total memory required**: Add the recommended memory for the operating system from the **OS memory** column to the sum of the values in the **JVM memory** column for all products mapped.

### Calculating resources for multiple MID Servers on a single host

<table>
<thead>
<tr>
<th>Product</th>
<th>Disk space (GB)</th>
<th>Memory (GB)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>OS</td>
<td>MID Server + product</td>
</tr>
<tr>
<td>MID Server 1</td>
<td>36 GB</td>
<td>4 GB</td>
</tr>
<tr>
<td>MID Server 2</td>
<td>4 GB</td>
<td>1 GB</td>
</tr>
<tr>
<td>MID Server 3</td>
<td>4 GB</td>
<td>1 GB</td>
</tr>
<tr>
<td>Recommended minimum</td>
<td>36 GB</td>
<td>12 GB</td>
</tr>
</tbody>
</table>

### Monitoring performance

To ensure that the MID Server resource allocations are sufficient for your environment, monitor performance during peak periods of product execution from the **MID Server dashboard**.

### MID Server version compatibility

The version of the MID Server must be compatible with the version of the instance. Otherwise, the MID Server cannot process commands or communicate with the instance.

The instance determines which version of the MID Server is allowed. The MID Server version must at minimum belong to the same major release, such as Helsinki. If the MID Server version belongs to the same major release, it can, but does not have to, belong to the same minor version, such as Helsinki Patch 1. In this case, communication with the instance might still be possible, but it is always suggested that you upgrade to the latest version.

**Caution**: You can pin the MID Server to a specific version using the **mid.version.override** property, but you should be aware that the version might become out of date.
For more information on upgrades, see [MID Server upgrade](#).

**Version indicators**

If the version is not compatible, the MID Server status is not changed to **Down** in the MID Server dashboard. So it might still appear to be processing commands when it actually is not doing so. You must check the MID Server **Version** on the dashboard, which is available starting with the Istanbul release.

The icons in the **Version** column indicates the following:

- **Red**: Incompatible. The MID Server and instance do not belong to the same release. You must upgrade the MID Server and verify that it is not pinned to an older version with the `mid.version.override` property. The MID Server will not be upgraded until the parameter is cleared.
- **Yellow**: Compatible, but an upgrade is recommended. This indicates that the MID Server version belongs to the same family as the instance, but not the same version.
- **Green**: Compatible. No upgrade necessary.
- **Gray**: Incompatible. The instance cannot detect the version.

See [KB0597571](#) for additional MID Server troubleshooting information.

**MID Server connection prerequisites**

You must install a MID Server on a local network resource and configure it to communicate with the machines it probes.

**Network privileges**

The local network resource must have these network privileges:

- **Firewall access**: Configure any firewalls between the MID Server and the target devices to allow a connection. If your network uses a DMZ, and if your network security protocols limit port access from within the network to the DMZ, you might have to deploy a MID Server to a machine within the DMZ to probe the devices there.
- **Network access**: Configure target devices to allow the MID Server probe to connect. If network security prevents you from configuring new machines that can connect to the targets, install the MID Server on an existing machine with connection privileges.
- **Network account**: Install the MID Server with the proper account, either local or domain administrator.

Additionally, for the MID Server to access your ServiceNow instance, satisfy these prerequisites:

- **Network access to the ServiceNow instance**: Configure the network that the MID Server uses to allow traffic over TCP port 443.
- **A MID user**: Create a ServiceNow user record for the MID Server to use. This user record must have the mid_server and import_admin roles.

**Note**: Verify that the baseline public page **InstanceInfo** is active for the MID Server to connect to the instance.
Security considerations

Sometimes computers or devices have additional security measures configured, and these measures may interfere with the MID Server's ability to run commands or queries on those systems.

For example, a Linux server might be configured to allow only certain IP address to connect to it via SSH. Similarly, a network router might be configured to allow only certain IP address to query SNMP on it. To allow access in such cases, use one of the following methods:

- Update the configuration of those computers or devices to allow the desired MID Server to run commands or query them. For example, a network router may be configured to only allow the network management systems to query SNMP on it. In that case, add the MID Server as though it were another network management system.
- Install a MID Server on a computer that already has access to the computers or network devices with such restrictions. For example, to use Discovery within a DMZ (where communication from outside the DMZ will be severely restricted), install a MID Server on a computer that is already in the DMZ.

External connectivity requirements

These requirements are specifically for the use of MID Servers with the ServiceNow Discovery and Orchestration products.

The MID Server communicates securely on port 443 to the instance and requires no inbound connections. In some cases, it might be necessary to allow this communication through the firewall if the MID Server fails to register on the instance. To determine if the application or a network security restriction is to blame for connection failure, attempt to telnet to the instance on port 443 from the server that is hosting the MID Server application. If this connection fails, then the problem could be a web proxy (since 443 is a https connection) or a Firewall rule preventing external TCP connections from that host. Contact network security personnel for the proxy information to add to the config.xml file, or request that the firewall be configured to allow access using one of the following syntaxes:

- `<source IP> to <any>`
- `<source IP> to <ServiceNow> any established`
- `<source IP> to <instance_name.service-now.com> 443`

**Important:** Ensure that the MID Server can connect to install.service-now.com to download and install updates.

Internal connectivity requirements

These methods are used for discovering various devices on a network and are specifically for the use of MID Servers with the ServiceNow Discovery and Orchestration products.

- **SSH:** For UNIX-like machines, Discovery and Orchestration use SSH protocol, version 2 to access target machines. SSH is a network protocol that allows data to be exchanged using a secure channel between two networked devices. SSH communicates on port 22 within an encrypted datastream and requires a login to access the targets using two available methods of authentication: a user name and password combination and a user name and shared private key. Specify SSH authentication information and type in the Credentials module. If multiple credentials are entered, the platform tries one after the other until a successful connection
is established or all are ultimately denied. To provide for application relationships a limited number of SUDO commands must be available to be run.

- **WMI:** For Windows machines, Discovery uses the Windows Management Instrumentation (WMI) interface to query devices. Due to security restrictions for WMI, the MID Server application executing the WMI queries must run as a domain user with local (target) administrator privileges. When Discovery detects activity on port 135, it launches a WMI query. The response from the Windows device is sent over a Distributed Component Object Model (DCOM) port configured for WMI on Windows machines. This can be any port. Ensure that the MID Server application host machine has access to the targets on all ports due to the unique nature of the WMI requirements.

- **Windows PowerShell:** PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications. Orchestration uses PowerShell to run Workflow activities on Windows machines. PowerShell must be installed on any MID Server that executes these activities. MID Servers using PowerShell must be installed on a supported Windows operating system. ServiceNow supports PowerShell 2.0 and 3.0. Orchestration activities for PowerShell require a credentials Type of Windows.

- **SNMP - Network:** For network devices, Discovery uses an SNMP scan to get device specific MIBs and OIDs. SNMP is a common protocol used on most routers, switches, printers, load balancers and various other network enabled devices. Use a community string (password) for authentication when scanning a device via SNMP. Many devices have a default community string of public, which Discovery uses by default when querying a target. Define additional community strings in the SNMP credentials form which are tried in succession, along with public, until a successful query returns. In addition to the credentials, the platform also requires the ability to make SNMP requests on port 161 from the MID Server to the target. If Access Control Lists (ACLs) are in place to control the IP addresses that can make these queries, ensure that the IP address of the MID Server is in the ACL. ServiceNow Discovery supports SNMP versions 1, 2c, and 3.

- **WBEM:** Web-Based Enterprise Management (WBEM) defines a particular implementation of the Common Information Model (CIM), including protocols for discovering and accessing each CIM implementation. WBEM requires either of two ports, 5989 or 5988 and uses the HTTP transport protocol. WBEM supports SSL encryption and uses CIM user name/password credentials. ServiceNow Discovery launches a WBEM port probe to detect activity on the target ports and to append gathered data to a classification probe that explores CIM Servers.

### MID Server installation

The installation of the MID Server requires you to satisfy certain connection prerequisites and create a MID Server user before you download and install the MID Server service on a host machine.

You can perform the installation prerequisites and install the MID Server manually or use the MID Server Guided Setup utility, which streamlines the entire process and allows you to set up a basic MID Server quickly.

The manual process requires these setup tasks, performed in the order shown here:

1. **Configure communication between the MID Server and the instance on the appropriate port and enable required web services.** See [Configure MID Server connection prerequisites](#) for details.

2. **Create the MID Server user** and grant that user the mid_server role.

3. **Download the installer file** for the host machine.

4. **Install the MID Server on a Linux or Windows host.**

5. **Test the MID Server** connection to the instance.
6. **Validate the MID Server** to ensure that it is trusted to access credentials used by the instance for automations.

7. Configure **MID Server parameters**, which control several aspects of MID Server functionality, including proxy servers, debugging, and upgrade.

### Use MID Server guided setup

MID Server guided setup provides a sequence of tasks that help you install a MID Server with the proper user account, select SNMP credentials for that MID Server, and assign IP addresses automatically.

**Role required**: admin

You are guided through configuration activities that create, download, and validate a MID Server. A progress indicator on each screen allows you to monitor your progress for each task.

Each configuration activity provides the following resources to help you:

- Contextual embedded help.
- Links to comprehensive documentation on the ServiceNow product documentation site.

**Important**: You must complete MID Server configuration before you can launch any other IT Operations Management guided setup.

1. **Navigate to** Guided Setup > ITOM Guided Setup. The IT Operations Management Guided Setup welcome screen appears.
2. Click **Get Started**.
The IT Operations Management Guided Setup category screen appears, with controls for starting the MID Server tasks.

3. In the MID Server pane, click **Get Started**.
The MID Server task list appears with a description of each task.
MID Server

The MID Server runs as a Windows service or a UNIX daemon to facilitate communication and the movement of data between a ServiceNow instance and external applications, data sources, and services. Complete the activities in this category to create a user for the MID Server, download the installation package, and validate the MID Server after installation.

Create MID User
Not started yet

Create the user account that the MID Server needs to authenticate on the ServiceNow instance.

Download & Install MID
Add Notes

Unlock by completing Create MID User

Select and download the appropriate MID Server installer archive for the operating system.

Validate MID
Add Notes

Unlock by completing Download & Install MID

You must validate the network connection between the MID server and your instance before the MID server is permitted to access automation credentials or execute any outbound EOC probes.
4. Click **Configure** to create the MID Server user and follow the instructions in the help pane that appears on the right edge of the screen.

5. When you have provided the requested information for the MID Server user, click **Submit**, and then click **Mark as Complete** at the bottom of the help pane.

The view returns to the task list. Notice that the circular progress indicator for the category shows 20% of the MID Server configuration complete. The progress indicator on the left edge of the screen shows the completion percentage for all the IT Operations Management tasks. In the case of the MID Server, the completed task represents 3% of the MID Server setup's contribution to the whole.
6. Click **Configure** for the next task, **Download & Install MID**, and continue with the MID Server setup.

7. After you create and validate your MID Servers, configure any SNMP credentials you need and select the MID Servers to use for IP range auto-assignment.

When all the required MID Server tasks are completed, you can begin the guided setup tasks for the applications that require a MID Server.
Configure MID Server connection prerequisites

You must perform several prerequisite tasks to allow the MID Server to connect to the instance.

Role required: admin

1. Configure the network to allow MID Server network connectivity to the ServiceNow instance over TCP port 443.
2. Configure basic authentication for SOAP communications with the ServiceNow instance.
3. Navigate to System Web Services > Scripted Web Services > Scripted SOAP Services.
4. Confirm that the following web services are active:
   - GetMIDInfo
   - InstanceInfo
   - MIDAssignedPackages
   - MIDFieldForFileProvider
   - MIDFileSyncSnapshot
   - MIDServerCheck
   - MIDServerFileProvider
5. Type sys_public.list in the navigation search field and press Enter. The Public Pages record list appears.
6. Verify that the InstanceInfo public page is active, to allow the MID Server to validate its version.
7. Make sure that the MID Server computer can access install.service-now.com.

Create the MID Server user and grant the role

Create the MID Server user ID and grant this user the role it needs to communicate with the instance.

Role required: admin

The MID Server connects to an instance by using the SOAP web service. To allow authentication with the instance, create a separate user account for each MID Server or share the same account across multiple MID Servers. Grant each MID Server user the mid_server role, which is required for the MID Server user on any instance on which basic authentication is enabled. The mid_server role allows the MID Server to access protected tables when strict SOAP security is in place. The system adds the necessary SOAP roles automatically with this role.

Note: The strict SOAP security feature, enabled by default for any instance that uses basic authentication, protects all tables with Access Control Lists (ACL).

1. From the instance, navigate to User Administration > Users.
2. Click New.
3. Complete the fields in the form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>User name for the MID Server user. This name is specified in the mid.instance.username parameter of the configuration file that the MID Server installer creates. For details, see MID Server parameters.</td>
</tr>
<tr>
<td>First name</td>
<td>The user's first name.</td>
</tr>
</tbody>
</table>

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
### Field | Description
--- | ---
Last name | The user's last name.
Password | Password for the MID Server user. This password is specified in the `mid.instance.password` parameter of the configuration file that the MID Server installer creates.

4. Right-click the header and select **Save**.
5. Under the **Roles** related list, click **Edit**.
6. Select the **mid_server** role for this user.

   Each MID Server account must have this role to access protected tables.

   **Important:** The **mid_server** and **security_admin** roles are incompatible and cannot be assigned to the same user. For information on how the instance checks role assignments, see [MID Server role validation](#).

7. Click **Save**.
8. Confirm that the MID Server account was created successfully and the account has connectivity to the instance.
   a) On the host machine where you intend to install the MID Server, open a browser and navigate to the instance.
   b) Use your new MID Server user credentials to log in.
      
      If the login is successful, then any MID Servers you install on that host will be able to connect to the instance.

**MID Server role validation**

Real-time system validation of MID Server role assignments prevents incompatible settings.

To prevent MID Server validation failure and ensure that your MID Server is configured correctly, the system runs several business rules that monitor the roles and settings you select for your MID Server user. The instance displays a warning and blocks the change when you attempt to save an incompatible configuration.

**Elevated privileges not permitted**

The **mid_server** role cannot be configured for elevated privileges. The [Invalid MID Server settings](#) business rule runs on the Role (sys_user_role) table and prevents the `elevated_privileges` field from being set to true for the **mid_server** role.
Warning for elevated privileges on the mid_server role

Relationship table protection

The User Role (sys_user_has_role) table creates the relationship between the (sys_user) and the (sys_user_role) tables.

- Incompatible role
  The mid_server and security_admin roles are incompatible and cannot be assigned to the same user. The system determines the user's current role and runs the Security Admin incompatible with MID business rule on the User Role (sys_user_has_role) table. This rule prevents an administrator from adding the security_admin role for a user who currently has the mid_server role.
Warnings for incompatible security_admin role assignment

- Incompatible user role and user record settings
  The Incompatible MID Server user role business rule runs on the User Role (sys_user_has_role) table to protect its data from incompatible configurations. Validation for this related table ensures that an administrator cannot assign the mid_server role to a user who:
  - Already holds the security_admin role.
  - Has the web_service_access_only field set to true.
  - Has the internal_integration_user field set to true.
<table>
<thead>
<tr>
<th>Warning Message</th>

Incompatible user record settings

Certain settings in the user record are not permitted with the mid_server role. The **User settings incompatible with MID** business rule runs on the User (sys_user) table to monitor the settings of the **web_service_access_only** and **internal_integration_user** check boxes. If the user has the mid_server role, this rule prevents either of these fields from being set to true.

Incompatible MID Server settings

**Note:** If you upgrade from a previous release with incompatible MID Server roles and settings, the system displays the appropriate warning messages when any change is made to the tables monitored by these business rules. If the change is unrelated to any role and settings validation, the system permits the updates and simply warns you of the existing incompatibilities. If the changes violate any compatibility rules in the Jakarta release, the business rules enforce the restrictions appropriately.

Download the MID Server files

The MID Server application is downloadable from the ServiceNow service instance. The IP address of the MID Server download site (install.service-now.com) can change without notice. To ensure that you can download the MID Server installation package and receive automatic MID Server upgrades, allow local network access to these IP addresses:

149.96.5.98 and 149.96.6.98

You download the MID Server and then enable Discovery, Orchestration, or any integration that requires the use of the MID Server.

1. On the ServiceNow instance, navigate to **Mid Server > Downloads** on your instance.
2. Select and download the MID Server for the appropriate operating system.
   
   If the download does not begin immediately, try again later when the system is not as busy.
MID Server downloads

3. Save the download file to a temporary file on the local drive.
4. Move the file into the designated MID Server folder you create for your operating system and run the installer from that location.
   - Linux
   - Windows

Install a MID Server on Linux

This MID Server installer automates the installation of a MID Server on a Linux computer.

Role required: admin, mid_server

**Important:** Verify that the computer meets the MID Server system requirements.

You can install a MID Server on a 32-bit or 64-bit Linux computer. Click this link to view the installation video:

1. From the Linux command line, type `mkdir -p /servicenow/mid server name` to create the installation directory. You need to have read/write/execute permissions on this folder.
2. Extract the downloaded MID Server archive file, `mid.os.zip` into the `servicenow/mid server name/` directory. Use the MID Server name created in the instance or create a new name that you will use for this MID Server moving forward. The resulting directory structure is `servicenow/<mid server name>/agent`.
3. Change to the `servicenow/mid server name /agent` directory, and enter the following command to start the MID Server installer: `./installer.sh`.
   If you prefer to manually configure the MID Server instead, skip to this step.
4. Use the installer to enter the following information.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

</tr>
<tr>
<td>Proxy password</td>
<td>Enter the password for the user name.</td>
</tr>
</tbody>
</table>

5. Click **Test your connection** to validate the credentials and instance information. If you encounter any errors, verify the information that you input.

6. Click **Next**.

7. Configure the MID name parameters (see table).
Configure MID name parameters

Field | Description
--- | ---
MID Server name | Enter any MID Server name.
MID Service wrapper name | Modify this field if necessary. It is populated automatically by prefixing `snc_mid_` to the MID Server name. In most cases, you do not need to modify this.
MID Server wrapper display name | Modify this field if necessary. It is populated automatically by prefixing `ServiceNow MID Server_` to the MID Server name. In most cases, you do not need to modify this.

8. Click Next to view the summary.
9. Click Start MID Server.
The local host starts the MID Server.

10. Click Mid Servers List Page.
The installer opens the MID Server list from your instance.

11. Select the MID Server name from the list.

   Note: It may take a few seconds for the MID Server time to establish a connection with your instance.

   The system displays the MID Server record.

12. From Related Links, click Validate.
The MID Server Validated changes to Yes.
13. To configure the MID Server manually, change to the `servicenow/mid server name`/agent directory, and then edit the `config.xml` file as follows:
   
a) Find the element `<parameter name="url" value="https://YOUR_INSTANCE.service-now.com" />` and change the value to the URL of your instance.

b) Enter the MID user credentials in the `mid.instance.username` and `mid.instance.password` parameters.
   By default, the MID Server uses basic authentication for SOAP messages. The password value is also encrypted authentication.

c) Find the `<parameter name="name" value="YOUR_MIDSERVER_NAME_GOES_HERE" />` element and change the value for the MID Server name.

d) Optional: Enter connection information for the proxy server. Remove the appropriate comment tags from the proxy configuration information. For example, you can configure these parameters:
   - `mid.proxy.use_proxy`
   - `mid.proxy.host`
   - `mid.proxy.port`
   - `mid.proxy.username`
   - `mid.proxy.password`

14. If you configured the MID Server manually, finalize the configuration as follows:
   
a) Execute the shell script `start.sh`. The system starts the new MID Server.

b) Log into the instance.

c) Navigate to MID Servers > Servers. The system displays a list of MID Server records.

d) Select the record matching your new MID Server and verify that the Status is listed as Up.

15. To configure the MID Server to restart automatically when the host is restarted, run `${base_install_dir}/agent/bin/mid.sh install` as root.
This command installs the MID Server as a daemon service and adds the auto start scripts to the `init.d` directory.

   **Note:** You cannot install more than one MID Server service as a daemon on a Linux host. This is a limitation of the Tanuki wrapper service.

Configure **MID Server parameters**, which control several aspects of MID Server functionality, including proxy servers, debugging, and upgrade.

### Install a MID Server on Windows

This MID Server installer automates the installation of a MID Server on a Windows computer.

Role required: admin or mid_server

You can install one or more MID Servers on a supported Windows computer. For details on installing multiple MID servers, see **Install multiple MID Servers on a single system**. Click this link to view the installation video:

1. Log in to the Windows host machine where you want to install the MID Server.
2. Create a folder for the MID Server on the top level of the drive such as `ServiceNow\MID Server1`.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
3. Download the MID archive file into the new folder.
4. Right-click the archive and select **Extract All**.
5. Navigate to the `service-now\<mid server name>\agent` folder that was created when the file was extracted.
6. Run `installer.bat` to start the MID Server installer.
   To configure the MID Server manually, skip to this step.
7. Use the installer to enter the following information.
ServiceNow instance URL
Enter the full URL of your instance, for example:
https://mycompanyinstance.service-now.com

ServiceNow MID Server username
Enter the user name of the MID Server user that you already created. The MID Server user must have the mid_server role.

ServiceNow MID Server password
Enter the password for the user in the ServiceNow MID Server username.

Use proxy
Select this check box if your MID Server communicates through a proxy to connect to the instance.

Note: Your proxy server must use Basic Authentication for the MID server to connect to the instance.

Proxy host
Enter the proxy server host name or IP address. Do not include the protocol in the host name. For example, enter proxyserv-domain.com, not https://proxyserv-domain.com.

Proxy port
Enter the port through which the proxy server communicates. If you leave this field blank, it should use the proxy server’s default port number.

Proxy username
Enter the user name that has administrator rights to the proxy server.

Proxy password
Enter the password for the user name.

8. Click Test your connection to validate the credentials and instance information. If you encounter any errors, verify the information that you input.

9. Click Next.

10. Configure the MID name parameters (see table).
Configure MID name parameters

### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Server name</td>
<td>Enter any MID Server name.</td>
</tr>
<tr>
<td>MID Service wrapper name</td>
<td>Modify this field if necessary. It is populated automatically by prefixing <code>snc_mid_</code> to the MID Server name. In most cases, you do not need to modify this.</td>
</tr>
<tr>
<td>MID Service wrapper display name</td>
<td>Modify this field if necessary. It is populated automatically by prefixing <code>ServiceNow MID Server_</code> to the MID Server name. In most cases, you do not need to modify this.</td>
</tr>
</tbody>
</table>

11. Click **Next** to view the summary.
12. Click **Start MID Server**.
   The local host starts the MID Server.

13. Click **Mid Servers List Page**.
    The installer opens the MID Server list from your instance.

14. Select the MID Server name from the list.

    **Note**: It may take a few seconds for the MID Server time to establish a connection with your instance.

    The system displays the MID Server record.

15. From **Related Links**, click **Validate**.
    The MID Server **Validated** changes to **Yes**.
16. To configure the MID Server manually, edit the config.xml file with a text editor such as WordPad:
   a) Find the element `<parameter name="url" value="https://YOUR_INSTANCE.service-now.com" />` element and change the value to the URL of your instance.
   b) Enter the MID user credentials in the mid.instance.username and mid.instance.password parameters. By default, the MID Server uses basic authentication for SOAP messages. The password value is also encrypted authentication.
   c) Optional: Find the `<parameter name="name" value="YOUR_MIDSERVER_NAME_GOES_HERE" />` element and change the value for the MID Server name.
   d) Optional: Enter connection information for the proxy server. Remove the appropriate comment tags from the proxy configuration information. For example, you can configure these parameters:
      - mid.proxy.use_proxy
      - mid.proxy.host
      - mid.proxy.port
      - mid.proxy.username
      - mid.proxy.password

17. If you configured the MID Server manually, finalize the configuration as follows:
   a) Execute the batch file start.bat. The system starts the new MID Server.
   b) Log into the instance.
   c) Navigate to MID Servers > Servers. The system displays a list of MID Server records.
   d) Select the record matching your new MID Server and verify that the Status is listed as Up.

Configure MID Server parameters, which control several aspects of MID Server functionality, including proxy servers, debugging, and upgrade.

Manually install a MID Server as a Windows Service

If you did not start the MID server at the end of the installation procedure, you can manually install the MID Server to run as a Windows service.

Role required: admin

You can install a MID Server as a Windows service in these operating systems:
- Windows Server 2008
- Windows Server 2012
- Windows Server 2016

1. Open the agent directory in the directory you created for the MID Server installation files. For example, the path might be C:\ServiceNow\MID Server1\agent.
2. Right-click the start.bat file, and select Properties.
3. Select the option to Run as administrator.
4. Double-click the start.bat file to install the Windows service.
Test MID Server connectivity

Confirm network connectivity to the MID Server for automatic upgrades, and then ensure that the MID Server can communicate with the instance.

Role required: admin

The system that hosts the MID Server must be able to access one of these URLs to automatically upgrade:

- HTTPS: https://install.service-now.com on the default HTTPS port (443)
- HTTP: http://install.service-now.com on the default HTTPS port (80)

1. Use PING to test connectivity with the host on the network (ping<host IP>).
2. If no ping response is returned, use TRACEROUTE to see where traffic might be stopped (traceroute<host>).
3. Use TELNET to connect to any of the TCP ports (telnet<host> <port>).
4. Use an SNMP scanning tool to determine if a potential network device is responsive.
5. Resolve the most likely issues around network connectivity:
   - Routing: Confirm that the MID Server host has network access to the IP ranges you are attempting to discover.
   - Firewalls: Confirm access to the physical firewalls that protect a large environment such as the Data Center. Confirm access to any logical firewalls that protect an individual computer. MID Server communications are initiated inside the firewall and therefore do not require any special firewall rules or VPNs.
   - Access Control Lists (ACL): Confirm that ACLs contain the IP addresses based list on SNMP network devices that allows communication to a particular target.
   - Resolve all issues with your network teams to better understand your topology. Deploy additional MID Servers if necessary to help keep your network secure. Configure access from your existing MID Server host to networking components.

6. Verify that the MID Server service is running on the host:
   - Windows: In the Windows Services console, locate the ServiceNow (MID Server name) and confirm that each MID Server has the Started Status value.
   - Linux: Ensure that the agent0.log.0.lck appears in the /servicenow/ MID Server name]/agent folder.

7. After each MID Server restart, open the agent0.log.0 and address all error messages.
8. From the ServiceNow instance, navigate to MID Server > Servers.
9. Review and verify that all MID Servers that are connected to the instance are listed.
10. Verify that the Status is Up for the MID Servers.

Validate the MID Server

You must manually validate the MID Server after it is installed to enable it to execute automation tasks. You can invalidate a MID Server you suspect has been compromised to prevent it from accessing automation credentials in the instance or executing outbound ECC probes.

Role required: agent_admin, admin

Make sure that the MID Server version is compatible with the instance.

Validation restricts access to automation credentials to trusted MID servers only.

Starting in the Istanbul release, you can specify that the MID should be used for all capabilities, applications, and IP ranges when you validate a MID Server. You will be prompted to set the

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
initial selection criteria when you validate MID Servers that do not already have capabilities, applications, or IP ranges already configured. You do not have to set the initial selection criteria to actually validate the MID Server. See MID Server selection for more information on capabilities, applications, and IP ranges.

**Note:** When you upgrade to Geneva and later releases, MID Servers that are already configured in your instance are automatically validated. This prevents the interruption of automation tasks that MID Servers might be performing. See MID Server upgrade for more information.

1. Install the MID Server using the instructions in MID Server installation.
   This creates a record in the MID Server (ecc_agent) table.
2. Navigate to MID Server > Servers.
3. Open the new MID Server from the list of MID Servers.
4. Under Related Links click Validate.
   The Set Initial Selection Criteria window appears if there are no records in the Supported Applications, IP Ranges, or Capabilities related lists.
5. On the Set Initial Selection Criteria window, use the switches to enable or disable selection criteria for this MID Server:
   - **Allow ALL capabilities:** Allow all capabilities for Orchestration and Event Management use this MID Server.
     **Note:** Service Mapping and Event Management alert aggregation and RCA, which used capabilities in previous releases, rely on the application for MID Server selection starting with the Istanbul release.
   - **Allow ALL applications:** Allow all applications that use MID Servers use this MID Server.
   - **Allow ALL IP ranges:** Make all IP ranges valid for this MID Server, meaning that it can target any IP address.

6. Click OK.
   The Validated field on the dashboard is set to Validating, and then set to Yes after the validation completes.
7. To invalidate a MID Server, open the record for the MID Server you suspect has a security issue.
8. Under Related Links, click Invalidate.
Invalidating a MID Server forces it to clear its memory and restart. The MID Server generates a new keypair on restart.

Multiple MID Server deployments
Depending upon how you use the MID Server (for an external integration, Discovery, Service Mapping or Orchestration) and the load placed on it, you might find it necessary to deploy multiple MID Servers in your network.
Factors determining the number of MID Servers your network will require to support external applications that integrate with ServiceNow include the following:
- The security constraints in your network.
- Your network policies.
- The amount of traffic between ServiceNow and the integrations.
- The reliability of the MID Server machines.

Network policies and security
Security policies in your network (firewalls between network segments, for example) might make direct communication impossible between your instance and an integration’s data source (JDBC, LDAP, etc.). To retrieve data for the instance, you can install a MID Server that has access to both the data source and the instance.
These network policies can determine if you need to install multiple MID Servers in your environment:
- **Access control lists (ACL):** If your security policy controls access to network devices (e.g. switches and routers) with an ACL, it might be necessary to install one or more MID Servers on a machine in the network that is already on the ACL.
- **DMZ:** Your network policy might require you to install one or more MID Servers in your DMZ to probe the devices there. This is common in networks that tightly regulate the ports that are opened on the inside firewall.
- **Probe types:** If you are conducting probes of different operating systems, your network policy might require a separate MID Server for each type of probe (e.g., one MID server for Windows WMI probes and another for SSH probes on UNIX).

Load balancing
Deploy multiple MID Servers where capacity is an issue, as when Discovery has to gather information about thousands of configuration items quickly. In a high volume environment, it might be necessary to deploy multiple MID Servers as load balancers for certain transactions. For example, JDBC data transfers can tie up the resources of a MID Server, making it unable to respond to other requests. The following operations between an integration might require separate MID Servers in a busy network:
- File exports
- Running scripts
- JDBC data sources
- Reading files

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
High availability model

Avoid installing MID Servers for critical integrations on a machine that might experience any type of planned outage or an outage caused by overloaded processes. If necessary for reliability, consider deploying these types of MID Servers to dedicated machines for high reliability.

Note: Do not integrate with an external application on a MID Server provisioned for ServiceNow Discovery or Orchestration.

Wide area network (WAN)

When determining where to deploy MID Servers in a WAN, consider the bandwidth available between your local area networks. In most cases, install a MID Server on each LAN to probe devices locally, rather than deploying MID Servers that must probe devices across slow WAN connections. An alternative to this type of deployment is to install MID Servers that probe other LANs via VPN connections that take advantage of fast Internet connections. If the bandwidth of your WAN connections is comparable to that of your Internet connection, then there is no performance impact in running MID Server probes across WAN connections.

Domain separation

In deployments where domain separation is enabled and domains are configured to form a hierarchy, place the MID Servers at the lowest domain level.
Deploying MID Servers with domain separation

Install multiple MID Servers on a single system

You can install multiple MID Servers on the same host computer.

Role required: admin, mid_server

You can install multiple MID Servers on a Linux or Windows host or on a virtual machine. Installing multiple MID Servers may involve other setup steps depending on your network configuration.

**Important:** You cannot install more than one MID Server service as a daemon on a Linux host. This is a limitation of the Tanuki wrapper service.

1. Log in to the host system or virtual machine where you want to install multiple MID Servers.
2. Create a directory for each MID Server on the top level of the drive.

Make sure you create a unique and descriptive name for each MID Server, such as MIDSrvr_SMS_Int or MIDSrvr_Disc1.
3. Extract the downloaded MID Server archive file into each MID Server directory. When the extract completes, there should be a directory path that resembles the following for each MID Server. For example, ServiceNow<MID Server name>\agent.

4. For each MID Server, run the installer appropriate to the host's operating system.

**MID Server installers**

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Installer path</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows</td>
<td>/agent/installer.bat</td>
</tr>
<tr>
<td>Linux</td>
<td>/agent/installer.sh</td>
</tr>
</tbody>
</table>

5. Use the installer to enter the following information.
   - URL to your instance
   - User credentials to run the MID Server
   - Proxy server connection details
   - MID server name
   - MID server service wrapper name and display name (Windows systems only)

**Note:** The MID Server user must have the mid_server role.

6. From the installer, click **Start MID Server**.
ServiceNow MID Server Installer

The local host starts the MID Server.

7. Click **Mid Servers List Page**. The installer opens the MID Server list from your instance.
8. Select the MID Server name from the list.

**Note:** It may take a few seconds for the MID Server time to establish a connection with your instance.

The system displays the MID Server record.

9. From **Related Links**, click **Validate**. The MID Server **Validated** changes to **Yes**.

© 2020 ServiceNow, Inc. All rights reserved.

Uninstall a MID Server

The MID Server runs as a stand-alone service. You can remove a stand-alone MID Server service to accommodate such tasks as redeploying the MID Server to another host machine or changing the unique name of a MID Server when deploying multiple MID Servers.

Role required: admin

1. Do one of the following to stop the running MID Server service.
   - Windows command line: From the MID Server home directory, for example from the `agent` folder, type `stop.bat`.
   - Windows Services console: From the Windows Services console, right-click the ServiceNow MID Server name and then select `stop`.
   - Linux: From the MID Server home directory, for example the agent folder, type `stop.sh`.

2. From a command prompt, go to the `\agent\bin` directory in the MID Server installation directory.

3. Do one of the following:
   - Windows: Double-click the `UninstallMID-NT.bat` file.
   - Linux: Confirm that the MID Server is stopped by executing the `bin/mid.sh status` shell script. After the MID Server stops, delete the files in the `agent` directory.

4. On Windows machines, check in the Windows Services console for a service named ServiceNow WMI Collector. If it is running, open a command prompt, navigate to `agent\bin\sw_wmi\tools`, double-click `uninstall_wmi.bat`

Configure Windows MID Server service credentials

MID Server service credentials are required so the MID Server can communicate with devices on your network.

By default, the MID Server service runs as a Local System account. This account only grants access to the machine on which the MID Server is running, not to other systems on the network. Therefore, you must change the service credentials to one of the following types:

- A Domain User account. This account should have local admin rights to allow automatic MID Server upgrade.
- A specific user account that has local admin access to the MID Server machine as well as access to other systems on the network.

**Note:** Service credentials are not the same as the MID Server user credentials: the service credentials allow communication between the MID Server and your network, while the MID Server user credentials allow communication between the MID Server and the instance. You must configure both of these credentials separately. See [Create the MID Server user and grant the role](#) for instructions on MID Server user credentials.

1. Open the Windows Services console.
2. Double-click the ServiceNow <MID Server name> service for each MID Server.
3. Select the Log On tab.
4. Set Log on as privileges with the Domain User or another user account that has local admin access to the MID Server machine as well as access to other systems on the network.

Whatever account you choose, verify that it has local admin access and access to other systems on the network. For local admin access, you can use Windows Explorer to grant write permissions to the MID Server agent folder.
5. In the General tab, set **Startup type** to **Automatic**.
6. Click **OK**.
7. Restart the ServiceNow <MID Server name> service, and make sure that ServiceNow\<MID Server name>\agent\logs\agent0.log does not have error messages. If the MID Server does not start, see the ServiceNow knowledge article Review the agent log for MID Server errors (article KB0535148).
8. On the instance this MID Server is connected to, navigate to **MID Server > Servers**. If Discovery is installed, navigate to **Discovery > MID Servers**.
   All MID Servers connected to this instance are listed.
9. Make sure that the Status of the MID Server you just installed is **Up**.

**Post installation MID Server administration**

You can manually start, stop, restart, and monitor the MID Server after it is installed.

The status of each MID Server activity appears in the **MID Servers** page. Additional log information appears in the following places:

- The MID Server log is available on the instance.
- The corresponding agent0.log.0 and wrapper logs (wrapper.log) are available in the MID Server agent\logs folder.

**Start the MID Server**

Manually start the MID Server to initiate communication with the instance.

**Role required:** admin, mid_server

You can manually start the MID Server.

1. Do one of the following:
   - Windows command line: From the MID Server home directory, for example the agent folder, type `start.bat`.
   - Windows Services console: From the Windows Services console, right-click the **ServiceNow MID Server name** and then select Start.
   - Linux: From the MID Server home directory, for example the agent folder, type `start.sh`.

2. Monitor the MID Server to ensure that it is operating properly.

**Stop the MID Server**

Stop the MID Server to terminate communication with the instance.

**Role required:** admin

Consider **pausing the MID Server** instead. Pausing the MID Server from the instance still allows you to run certain commands on the MID server.

1. Do one of the following:
   - Windows command line: From the MID Server home directory, for example the agent folder, type `stop.bat`.
   - Windows Services console: From the Windows Services console, right-click the **ServiceNow MID Server name** and then select stop.
   - Linux: From the MID Server home directory, for example the agent folder, type `stop.sh`. 
2. **Restart the MID Server** when ready.

### Restart the MID Server

You can restart the MID Server if it has been stopped.

**Role required:** admin

You can manually restart the MID Server.

1. Do one of the following:
   - **MID Server instance:** Navigate to the MID Servers and click a Name. Under Related Links, click Restart MID.
   - **Windows command line:** From the MID Server home directory, for example the `agent` folder, type `Restart.bat`.
   - **Windows Services console:** From the Windows Services console, right-click the **ServiceNow MID Server name** and then select **Start**.
   - **Linux:** From the MID Server home directory, for example the `agent` folder, run the `restart-service.sh` script using one of these commands:
     - `./restart-service.sh`
     - `sh restart-service.sh`
     - `bash restart-service.sh`

2. Monitor the MID Server to ensure that it is operating properly.

### Monitor the MID Server

Monitoring MID Servers involves verifying entries in log files, confirming network connectivity, and checking MID server status.

**Role required:** agent_admin or admin

You can monitor MID Servers hosted by Windows or Linux MID servers.

1. **For Windows only**, navigate to the Windows Services console, locate the service name that matches the name that appears from the `wrapper-override.conf` file. If the MID Server process is the only Java process running on the host, monitor the memory used by `java.exe` and alert on less than the maximum configured memory defined in the `~\agent\conf\wrapper-override.conf` folder.

2. Ensure that the `agent0.log.0.lck` file appears in the `~\agent\logs` folder to confirm that the MID Server running and logging system activity in the `agent0.log.0` file.

3. Review the following logs for warning, critical, and severe errors:
   - `~\agent\logs\agent0.log.0`
   - `~\agent\logs\wrapper.txt`

   See [Manage ECC Queue content for a MID Server](#) to see how to open log entries from the instance.

4. **Confirm network connectivity.**

5. From the MID Server instance, navigate to the MID Servers page, and review the status of the MID Server. For additional information, click a Name.

6. Use Windows or Linux tools to monitor:
   - CPU
- Disk utilization
- Events
- Memory
- syslog

Set up email, SMS, and push notifications to alert you when issues occur with MID servers. The **MID Server Down** notification is enabled by default. See [Notifications](#) for details.

**MID Server upgrade**

MID Servers are automatically upgraded, but you can also manually upgrade each MID Server separately or ‘pin’ the MID Server to a specific version to disable auto-upgrades.

**Upgrade methods**

- **Automatic**: Allow the instance to automatically upgrade the MID Server. This functionality is available by default. Automatic upgrade occurs:
  
  - Every hour, when the MID Server checks with the instance to see if there is a different version available for upgrade. You cannot modify this time period.
  
  - When the instance is upgraded and the MID Server for that version is different than the version currently on the MID Server.
  
  - When the MID Server **pre-upgrade test** passes without an error. Any errors encountered during this automatic test prevent the upgrade from occurring until the issues are resolved. The pre-upgrade test is enabled by default, but can be disabled by adding and setting a system property.

- **Manual**: Manually start the upgrade by clicking a related link on the MID Server record. Use this method when you do not want to wait until the next hourly automatic update or if your upgrade failed and you want to force an upgrade. See [Upgrade the MID Server manually](#) for instructions.

**Pinning a MID Server to a specific version**

You can specify a different upgrade version if you do not want to use the default MID Server version that is determined by the instance. This is referred to as **pinning** and can be applied to all MID Servers in your environment or to specific MID Servers. See [MID Server version selection](#) for more information.

**The Upgrade state**

The instance initiates the upgrade by sending the **autoUpgrade** system command to the MID Server. Starting with MID Servers upgrading from an Istanbul version MID Server, the MID Server **Status** is changed to **Upgrading** while the upgrade is running. The **Upgrading** state is similar to the **Paused** state. This is done to avoid potential miscommunication between the new version of the instance and the previous version of the MID Server during upgrade. For the upgrade to run, MID servers must be in the **Up** state and must be **validated**.

While in the **Upgrading** state, you cannot resume or restart the MID Server. However, you can perform the same actions that you can when the MID Server is in the **Paused** state. After a
When the instance sends the autoUpgrade system command to the MID Server, if it is Down or Paused, or if it has not been validated, the command remains in the ECC Queue until the MID Server status changes to Up. Then the command is processed.

**Note:** If you are using an Istanbul instance but you are upgrading a pre-Istanbul MID Server to Istanbul, these upgrade states are not available. They are available only for MID Servers that are already on Istanbul.

### Failed upgrades

Failed upgrades are handled differently based on the version you are upgrading to:

- Upgrade to another major release: (such as Istanbul to the next full release): the status changes to **Upgrade Failed**.
- Upgrade from a minor version within a release (such as Helsinki patch 1 to patch 2): the MID Server continues using the version it is currently running. It does not perform the upgrade and the status eventually changes to **Up**, assuming the MID Server was already functioning properly.

### Upgrading MID Servers in the Down state

If a MID Server is in the Down state, it cannot process the upgrade command. When the MID Server changes to **Up**, it immediately checks to see if an upgrade is necessary. If it does need to upgrade, the upgrade process starts before the MID Server processes any other commands.

### Upgrade error messages

The MID Server can display the following upgrade error messages.

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unable to refresh packages</td>
<td>The MID Server displays this message as a generic error when the error is not handled by a defined error message.</td>
</tr>
<tr>
<td>Failed to query instance for MID Server buildstamp</td>
<td>Instance is unavailable or there is a major version mismatch between the MID Server and the instance.</td>
</tr>
<tr>
<td>Not a valid package buildstamp</td>
<td>InstanceInfo returned an assigned buildstamp that was not in the correct format, such as a version mismatch.</td>
</tr>
</tbody>
</table>

### MID Server pre-upgrade check

The instance automatically tests the MID Server's ability to upgrade on your system prior to the actual upgrade, to identify issues that could cause a MID Server outage or require reinstallation.

Each MID Server contains an AutoUpgrade monitor that compares the MID Server version with that of the instance to determine if the MID Server needs to upgrade. If the AutoUpgrade monitor
discovers that the MID Server version is out of date, the monitor runs pre-upgrade validation
tests for that MID Server. If an issue is detected, a message is logged to the MID Server Issue
(ecc_agent_issue) table, and the upgrade is blocked. The AutoUpgrade monitor continues to run
every hour, until the tests all pass. If there are no blocking issues, the MID Server downloads the
appropriate upgrade package and begins the upgrade process.

Failed tests leave the MID Server in one of these states:
- **Upgrade Failed**: For upgrades to a different release family, such as from Geneva to Jakarta.
- **Up**: For upgrades within the same release family, such as an upgrade to a patch.

Errors, such as insufficient disk space for the installer and lack of connectivity to install.service-
now.com, are written to both the MID Server agent log and to the MID Server Issue
(ecc_agent_issue) table. These errors are published before the actual MID Server upgrade occurs
and must be resolved before the upgrade can continue. You can view issues from the MID Server
Issue (ecc_agent_issue) table in any of these locations:
- **MID Server Issues** related list in a MID Server record.
- **MID Server > Server Issues** navigation module.
- **MID Server Issues** gauge on the MID Server dashboard.

**Pre-upgrade tests**

The pre-upgrade validation tests check these requirements:
- At least 1GB of free disk space.
- Access to the download site at install.service-now.com.
- Permission to execute these file operations:
  - Extract a ZIP archive to a temp folder.
  - Copy files from the temp folder to the agent folder.
  - Read a text file.
  - Delete the pre-upgrade contents.
- For Windows, ensure that the Log On As user for the Windows service is either LocalSystem or a
  user that is part of the local Administrator group. By default, domain administrators are added
to the local Administrator group when joining a computer to a domain. If the PowerShell script
that performs this test does not return the expected output, the system logs a warning to the
MID Server Issue (ecc_agent_issue) table, but the test passes.

**Data provided**

When the instance encounters issues during the pre-upgrade check, it populates these fields in
the MID Server Issue (ecc_agent_issue) table:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last detected</td>
<td>Date and time the issue was last detected.</td>
</tr>
<tr>
<td>Short description</td>
<td>Contents of the generated message that specifies a possible issue with available disk space, download server access, or file permissions.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>MID Server</td>
<td>Name of the MID Server affected by a pre-upgrade test failure.</td>
</tr>
<tr>
<td>Issue source</td>
<td>The process that identified the issue. For all issues with MID Server pre-upgrade testing, the source is UpgradeCheck.</td>
</tr>
<tr>
<td>State</td>
<td>The current state of the issue. Possible states are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>New</strong>: Starting state when the instance creates the issue.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Acknowledged</strong>: State set by the administrator when he or she first examines the issue.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Resolved</strong>: Ending state, set by the instance, indicating that the issue has been resolved. If the scheduled job does not encounter the issue when it runs again, the instance automatically sets the state to this value.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain for the MID Server. For all issues derived from MID Server pre-upgrade testing, the domain value is inherited from the domain of the MID Server user.</td>
</tr>
<tr>
<td>Count</td>
<td>Number of times an issue has been detected. Each time the pre-upgrade tests run and encounter the same issue, the AutoUpgrade monitor increments this field.</td>
</tr>
</tbody>
</table>

**Errors that block the upgrade**

These messages describe issues detected by the pre-upgrade test and published to the MID Server Issue (ecc_agent_issue) table. Failure of any of these tests blocks the upgrade.

- **Not enough free disk space. The system reports &lt; bytes free**: This message is displayed when less than 1GB of free disk space is detected on the MID Server host. This error is also written to the MID Server agent log.
- **Unable to download updates from install server**: This message indicates that either the MID Server host does not have permission to download the installation package from install.service-now.com or network problems prevent connection. This error is also written to the MID Server agent log.
- **Unable to extract contents of pre upgrade check zip**: This message indicates that the service account on the MID Server host does not have permission to extract the pre-upgrade ZIP archive to the temporary folder specified by the system property, java.io.tmpdir. On a UNIX host, the value for this property is typically /tmp or /var/tmp. On Microsoft Windows hosts, the path is c:\WINNT\TEMP.
- **Unable to create folder &lt;upgrade check file path&gt;**: This message indicates that the MID Server service account does not have permission to create the upgradeCheck folder for the pre-upgrade checking files in the agent/package path.
- **Unable to verify file permissions: &lt;message&gt;**: This message indicates an exception has occurred when checking file permissions, such as a file that does not exist or access failure.
- **MID Server Windows Service is not running as LocalSystem or a local Administrator**: This message warns that the Windows service is not running with the desired permissions.
Non-blocking warnings

These warnings are displayed in the MID Server Issue (ecc_agent_issue) table and do not prevent a Windows MID Server from upgrading:

- **WARN: Unable to parse $logOnAsUser**: This message warns that the Log On As User value for the Windows service is not in either of these expected formats:
  - user@domain.company.com
  - domain\user

- **WARN: Unable to look up Log On As user's groups**: When the instance attempts to look up the logged on user's group memberships, it executes the `net user <username>` command. The instance expects a certain output structure by the Windows service from this command and issues this warning if the expected output does not match the actual output.

These PowerShell warnings are written to the MID Server agent log only. Because PowerShell is not required to use a MID Server, these configuration issues do not prevent a Windows MID Server from upgrading. However, these warnings might indicate issues in your environment that require attention.

- **Skipping PowerShell upgrade checks since PowerShell is not usable**: PowerShell 2.0 (at a minimum) is not installed or `powershell.exe` is not available to the MID Server service user.
- **Continuing with upgrade, but the following issue was encountered during upgradeCheck**: `<exception message>`. This message indicates that there was an issue running the PowerShell portion of the pre-upgrade tests.

Disabling the pre-upgrade check

A MID Server configuration parameter called `mid.upgrade.run_precheck` is set to `true` by default, which allows the automatic pre-upgrade test to run. To disable these tests for a single MID Server, add this parameter to that MID Server's `config.xml` file and set it to `false`. To disable these tests for all MID Servers, add a new record to the MID Server Property (ecc_agent_property) table called `mid.upgrade.run_precheck`. Set the value of this property to `false` and leave the MID Server field blank.

MID Server version selection

You can pin all the MID Servers in your environment to a specific version by setting a system property, or you can configure specific versions for individual MID Servers.

**Note:** ServiceNow does not recommend pinning the MID Server to a specific version for a significant amount of time, especially if you upgrade the instance. Under most circumstances, you should let the instance determine which MID Server version to use.

Version control properties

These properties control the version for all MID Servers:

- **mid.buildstamp**: Identifies the MID Server version with an identifier based on the date of the build. This property uses a date and time format of yyyy-mm-dd-hhmm. The MID Server checks for version information hourly. If no override version is configured, the MID Server looks at the mid.buildstamp property for the version to use. This property resets itself to the default version.
(the version that matches your instance version) when the instance is restarted or upgraded, so any user changes are lost at that time.

- **mid.version.override**: Sets an override condition for the current version for all MID Servers in your environment. This action pins the MID Servers to a single version and disables the automatic upgrade feature. This property is not visible in the base system and must be added to the System Property (sys_properties) table when it is set. For details, see [Add a property using sys_properties.list](#).

  When the MID Servers check the version each hour, they look at the mid.version.override property first. If this property is empty, the MID Servers get their version information from the mid.buildstamp property. If an override version is configured, the MID Servers use this value and ignore the version information in the mid.buildstamp property. This override value remains when the instance is restarted and is passed to the MID Servers.

  **Attention**: The value in the **mid.version.override** property is cleared during an upgrade, which forces the MID Server to reset itself to the version in the mid.buildstamp property.

### Version control configuration parameter

To pin specific MID Servers on a desired version, set the **mid.pinned.version** parameter with the name of that version in the config.xml file of each MID Server. This setting overrides the property setting for the pinned MID Server version. For instructions, see [Add a MID Server parameter](#).

**Note**: The value set in this parameter is not affected by an upgrade.

### Upgrade the MID Server manually

You can manually upgrade MID Servers at any time if you do not want to wait for the automatic upgrade.

**Role required**: mid_server or admin

For the upgrade to run, MID servers must be in the Up state and must be validated.

The MID Server is upgraded to the version specified by build stamp on the instance, or by the upgrade property that you specify.

1. Navigate to Discovery > MID Servers or Orchestration > MID Server Configuration > MID Servers.
2. Open the record of the MID Server that you want to upgrade.
3. Click Upgrade MID under Related Links.
4. Confirm that you want to perform the upgrade.

### MID Server configuration

Administrators must configure a MID Server to ensure that it has access to sufficient system resources, probes the proper data sources, and communicates with the instance as expected.

You must complete all the steps in [MID Server Installation](#) before attempting any of the configuration steps explained here.

Restart a MID Server after any configuration change for the changes to take effect.
**Note:** All new MID Servers must be validated before use. Validation ensures that the MID Server is trusted to access credentials used by the instance for automations. For instructions, see [Validate and invalidate the MID Server](#).

### MID Server Records that cannot be altered

These records cannot be modified or deleted.

<table>
<thead>
<tr>

<td>- MIDServerFileProvider</td>
</tr>
</tbody>
</table>

### Using special characters in an XML file

The XML specification defines five predefined entities that represent special characters, and requires that all XML processors honor them. If these characters are used in a password, you will experience unexpected results.

The following characters represent the five pre-defined entities:

- `"`
- `&`
- `'`
- `<`
- `>`

If you use the pre-defined entity characters in an XML file, such as the MID Server configuration file, you need to encode them. To encode pre-defined entities into an XML document:

- replace " with `&quot;`
- replace & with `&amp;`
- replace ' with `&apos;`
- replace < with `&lt;`
- replace > with `&gt;`

For example, to specify the password as `test&` in the MID Server config.xml file:

```xml
<parameter encrypt="true" name="mid.instance.password" value="test&amp;"/>
```
The MID Server dashboard

The MID Server dashboard is a central place for MID Server users to monitor ongoing operations. The dashboard consists of reports and gauges that display information from the MID Server Status table.

The MID Server Dashboard is available from the MID Server > Dashboard module.

The MID Server status gauge

The MID Server Status gauge on the dashboard displays basic information about each MID Server. This information comes from the MID Server Status (ecc_agent_status) table.

<table>
<thead>
<tr>

<tr>
<td></td>
<td>- <strong>Red</strong>: Incompatible. The user does not have the <code>mid_server role</code> or the user does not match the value in the <code>mid.instance.username</code> parameter (in the config.xml configuration file). Reconfigure the MID Server user and verify that it works.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Green</strong>: Compatible. The user has the <code>mid_server role</code> and matches the user in the configuration file.</td>
</tr>
</tbody>
</table>

**Note:** The user can also have any of the SOAP roles that the `mid_server role` inherits.

**CPU and maximum memory usage**

This graph shows the average percentage of CPU usage on all the systems that host MID Servers in the last 30 days.
This graph shows the average percentage of maximum memory used by all the systems that host MID Servers in the last 30 days.
**MID Server selection**

You can configure applications to select MID Servers in a variety of ways.
**MID Server criteria**

MID Servers offer these types of criteria that help an application determine which MID Server to use:

- **Application:** The application that you specify on the MID Server. You can designate these applications for a specific MID Server:
  - Discovery
  - Orchestration
  - Service Mapping
  - Event Management
  - Operational Intelligence
  - Cloud Management
  
  An **ALL** application option is also available. By default, this option includes all applications except Event Management alert aggregation and RCA, which requires an exclusive MID Server. You can configure which applications are included in the **ALL** designation.

- **IP address or range:** The IP address or the IP ranges that the MID Server is allowed to work within. You can specify an IP address or IP range in the application, such as on a Discovery schedule or an Orchestration activity, and for the MID Server. If the IP configured in the application matches the IP address or falls within the allowable IP range configured on the MID Server, a match is possible, and that MID Server passes this criteria. To have the instance automatically assign IP ranges (subnets) to available MID Servers, see **MID Server IP range auto-assignment**.

- **Capabilities:** The **network capability** an application needs to use, such as the **PowerShell Orchestration activity**. Some applications, like Cloud Management and alert aggregation and RCA, require a specific capability.

**Note:** Discovery and Service Mapping can also use behaviors, which determine the type of port probes used during the port scan phase of Discovery. Both Discovery and Service Mapping use a behavior to discover **load balancers running on Linux**. Other applications do not use behaviors. Behaviors are not used for auto-selection, default MID Servers, or specific MID Servers as described below. See **Discovery behaviors** for more information.

**How an application selects a MID Server**

If you do not specify a specific MID Server for an application to use, the application tries to select one. Each application relies on different criteria to select an appropriate MID Server.

<table>
<thead>
<tr>
<th>Application</th>
<th>Supported Application on the MID Server</th>
<th>IP address range</th>
<th>Capability</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discovery</td>
<td>The Discovery or ALL application must be specified on the MID Server.</td>
<td>Discovery uses IP ranges that you configure on the Discovery Schedule form to see if they fall within the IP ranges that you configure on the MID Server, or the <strong>ALL</strong> IP ranges option must be selected on the MID Server.</td>
<td>N/A</td>
</tr>
</tbody>
</table>

**Note:** Any configured behaviors are ignored.
<table>
<thead>
<tr>
<th>Application</th>
<th>Supported Application on the MID Server</th>
<th>IP address range</th>

<td>The endpoint IP address must fall within the IP range that you configure on the MID Server, or the <strong>ALL</strong> option must be selected on the MID Server.</td>
<td>One of the supported Service Mapping capabilities (for new installs) must be configured on the MID Server, or the MID Server capability must be set to <strong>ALL</strong>.</td>
</tr>
<tr>
<td>Event Management</td>
<td>The <strong>Event Management</strong> or <strong>ALL</strong> application must be specified on the MID Server.</td>
<td>The IP configured in the event connector instances, such as <strong>HPOM</strong>, must fall within the IP range configured on the MID Server.</td>
<td></td>
</tr>
<tr>
<td>Cloud Management</td>
<td>N/A</td>
<td>N/A</td>
<td>The <strong>Cloud Management</strong> or <strong>ALL</strong> capability must be added.</td>
</tr>
</tbody>
</table>

**Using a specific MID Server**

Discovery and Event Management can use a specific MID Server that you specifically call out. 

**Note:** Selecting a specific MID Server is not the same as specifying the default MID Server for an application. A specific MID Server is always used. If it is **Down** or not validated, the application does not execute commands against the MID Server. A default MID Server is fallback that is used when the auto-selection of MID Servers does not find any eligible MID Server.

<td>N/A</td>
</tr>
<tr>
<td>Cloud Management</td>
<td>N/A</td>
<td>N/A</td>
</tr>
</tbody>
</table>

**Note:** You can also specify a **cluster of MID Servers**.

**Note:** If a MID Server manages resources within defined IP ranges for Orchestration, you must map the fully-qualified domain name (FQDN) of a server with its IP address to run certain activities, such as **Exchange activities**.

### Domain separation

If you are using domain separation, you can configure MID Servers to be in separate domains. The domain that the MID Server is in affects how the application selects the domain:

- **Discovery and Service Mapping:** On the Discovery schedule, the MID Servers and clusters that available for selection are limited to the same domain of the user who is configuring the schedule. This also applies to the auto-selection option: only MID Servers in the same domain as the user can be automatically selected.

- **Alert aggregation and RCA (Event Management):** The metrics for a business service is done on the MID Server that is in the same domain as the business service. Otherwise, a MID Server from the global domain is used.

### MID Server selection test

If Service Mapping is active, you can preview which MID Server that Service Mapping uses for a specific target device or computer. To do this, navigate to **Service Mapping > MID Servers** and click **MID Selection Test**. Enter the IP address and an optional application and capability, and then click **OK**. The name of the MID Server that Service Mapping will use appears in the window.

### Configure a default MID Server for each application

You can configure a default MID Server that an application can use if all other possible MID Servers are unavailable.

Role required: agent_admin or admin

Applications are only available when their respective plugins are activated.

The default MID Server is used when applications fail to find a suitable MID Server that matches **configured criteria during auto-select**. The default MID Server for the **ALL** application is used if the

© 2020 ServiceNow, Inc. All rights reserved.

default MID Server for the specific application is not available. Some applications also offer a property to set the default MID Server.

**Important:** If you configure a MID Server for **ALL IP ranges** (type **Include**) and also create an IP range of type: **Exclude** for the same MID Server, the system ignores the excluded IP range for that MID Server.

The default MID Server does not need to meet any criteria (application, IP range, behavior, or capability) to be used. Specifying a default MID Server is optional, and you can use a MID Server as the default for more than one application.

<table>
<thead>
<tr>

</tbody>
</table>

1. Navigate to **MID Server > Applications**. The list of installed applications that can use MID Servers appears.
2. Click the name of an installed application.
3. Select a MID Server from the list in the **Default MID Server** field.
4. To select additional MID Servers for this application, click **Edit** in the **MID Servers** related list and select alternate MID Servers that this application is allowed to use.
5. Click **Update**.

**Configure an IP address range for the MID Server**

Configure an IP address range for the MID Server to use.

Role required: agent_admin or admin

Applications, such as Discovery and Orchestration, can specify an IP range or a specific IP address of a target. When the application looks for a MID Server to use during auto-selection, it chooses a MID Server that has corresponding IP range that includes the application's IP range or specific IP address. Applications also use other criteria, such as the MID Server supported application and capabilities. See **MID Server selection** for more information.
These applications use IP ranges as follows:

- **Orchestration**: Use the IP address of the target machine (together with the capability) to select the correct MID Server for Orchestration activities. Refer to the procedure in this topic to configure the IP address.

- **Service Mapping**: Select the MID Server whose IP address range matches the IP in the discovery request. See MID Server configuration for Service Mapping for more information.

- **Discovery**: Can select an IP address range using the same criteria as Service Mapping. Discovery can also use a quick IP range that you specify in the Discovery schedule.

**Tip**: You can also use the ALL IP range, which allows the MID Server to be used with any range of IP addresses that an application specifies. This only allows the MID Server to access IP ranges, it does not mean that the MID Server can actually reach all of the IP ranges. To function with an application, the MID server must have access to the IP ranges that the application needs.

Valid IP address ranges can be as follows:

- An IP address in dotted decimal or hexadecimal format. The hexadecimal format can be explicitly prefixed with 0x, this is not mandatory. Here are examples:
  - 10.11.144.155
  - 0xA0B909B
  - 0xA0B909B

- An IP address range in dotted decimal or hexadecimal format. Here are examples:
  - 10.11.144.150-10.11.144.160
  - 0xA0B9096-0xA0B90A0
  - 10.11.144.150-0xA0B90A0

- An IP network address with the net mask specified after a slash (/) in regular notation (0-32 inclusive) or in IP address notation. Dotted decimal or hexadecimal format is not allowed. Here are examples:
  - 10.11.144.0/24 10.11.144.0/255.255.255.0
  - 10.11.144.0/0xFFFFFFFF
  - 0xA0B9000/24
  - 0xA0B9000/0xFFFFFFFF

1. Navigate to **MID Server > IP Ranges**.
2. Click **New**.
3. Complete the form, using the fields in the table.
### IP address ranges

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the type of range:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Include</strong>: Include the specified IP range.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Exclude</strong>: Exclude the IP address range.</td>
</tr>
<tr>
<td>Note:</td>
<td>If a MID Server is configured for <strong>ALL</strong> applications, any IP addresses configured for exclusion are ignored by the system. If your goal is to configure default MID Servers for separate applications in your system, see <a href="#">Configure a default MID Server for each application</a>.</td>
</tr>
<tr>
<td>Range</td>
<td>Enter the range in a valid format.</td>
</tr>
<tr>
<td>Related list</td>
<td>The MID Servers that can use this IP address range.</td>
</tr>
</tbody>
</table>

4. Click **Save**.

**Important**: IP ranges assigned manually prior to using the auto-assignment feature are affected as follows:

- Individual IP ranges are retained and appended to the ranges assigned automatically by the system for the designated MID Server.
Open the **ALL** IP range record and configure the MID Servers that you want to use with any set of IP addresses.

**Configure applications included in ALL Applications**

You can narrow down the list of applications that are included in the definition of **ALL**.

Role required: `agent_admin` or `admin`

You can specify the **ALL** application for a MID Server, which means that the MID Server is allowed to work with any of the applications that require MID Servers, such as Discovery, Event Management, Service Mapping, and so on. But you might not want all applications to be included in the definition of **ALL**. For example, you might want to exclude Service Mapping from all the **ALL** definition if you already have a dedicated MID Server to work with Service Mapping.

1. Navigate to **MID Server > Applications**.
   - The list of installed applications that can use MID Servers appear.
2. If you do not see the **Included in application ALL** column, you can personalize the list and add it.
3. For each application, double-click the value in the **Included in application ALL** column.
4. Change the value to **true** (to include) or **false** (to exclude).

**MID Server IP range auto-assignment**

IP ranges that represent a subnet can be automatically assigned to MID Servers.

To be automatically assigned to a subnet, a MID Server must be:

- In a running (**Up**) state.
- Successfully validated.
- Able to access one or more subnets in your network.

You can select MID Servers for auto assignment using either of these methods:

- **Guided Setup**: The ITOM Guided Setup module leads you through the process of installing and configuring a MID Server and automatically assigning that MID Server to a subnet range. When
you use the Guided Setup to assign MID Servers to subnets, the instance runs Discovery to
identify the available subnets and then makes the assignments for the MID Servers you select.
To get started with Guided Setup, navigate to **Guided Setup > ITOM Guided Setup**.

- **Auto-Assign IP Ranges**: The MID Server > Auto-Assign IP Ranges module displays the MID
  Server auto assignment list. When you select one or more MID Servers for auto-assignment, the
  instance runs Discovery to identify the subnets in your network and completes the MID Server IP
  range assignments.

The subnet assignments that the instance makes for the MID Servers you select are stored in the
Automation Status Set (automation_status_set) table.

**Required SNMP OIDs for MID Server IP range auto-assignment**

Customers who use network service providers must request specific SNMP access to use MID
Server IP range auto-assignment.

IP range auto-assignment requires SNMP credentials for read-only access to all routers that
Discovery uses to identify subnets. In addition, your service provider must grant the following
SNMPWALK access:

- iso.org.dod.internet.mgmt.mib-2.ip.ipRouteTable (1.3.6.1.2.1.4.21)
  - ipRouteDest (1.3.6.1.2.1.4.21.1.1)
  - ipRouteNextHop (1.3.6.1.2.1.4.21.1.7)
  - ipRouteType (1.3.6.1.2.1.4.21.1.8)
  - ipRouteMask (1.3.6.1.2.1.4.21.1.11)

- iso.org.dod.internet.mgmt.mib-2.ip.ipForward.ipCidrRouteTable (1.3.6.1.2.1.4.24.4)
  - ipCidrRouteDest (1.3.6.1.2.1.4.24.4.1.1)
  - ipCidrRouteMask (1.3.6.1.2.1.4.24.4.1.2)
  - ipCidrRouteNextHop (1.3.6.1.2.1.4.24.4.1.4)
  - ipCidrRouteType (1.3.6.1.2.1.4.24.4.1.6)

**Select MID Servers for auto-assignment**

Select the MID Servers you want the instance to automatically assign to discovered subnets.

Role required: admin

You can auto-assign MID Servers in ITOM Guided Setup or use this procedure to select MID Servers
for subnet assignments from the instance navigator.

1. Navigate to **MID Server > Auto-Assign IP Ranges**.
   The MID Server range auto-assignment lists appear. Only validated, running MID Servers are
   available for selection.
1. Drag and drop MID Servers selected for assignment from the Available list to the Selected list, or use the arrow buttons to move them.

2. Click OK when you are done.
The instance runs a subnet Discovery and automatically assigns the MID Servers you have selected to the subnets that Discovery finds.

**View automation status sets and IP range assignments**

The Automation Status Set form shows summary details of a subnet Discovery and the subsequent IP range assignments for MID Servers selected for automatic subnet assignment.

Role required: admin

1. Navigate to **MID Server > Automation Status Sets**.
2. Select a status record for a subnet Discovery you want to view.

The form contains read-only status information about the selected Discovery, the subnets found, and the range assignment process for the MID Servers you selected for auto assignment.

**Important:** IP ranges assigned manually prior to using the auto-assignment feature are affected as follows:

- Individual IP ranges are retained and appended to the ranges assigned automatically by the system for the designated MID Server.
- If the MID Server was configured with the **ALL** ranges selection, the auto-assignment feature overwrites that designation with the ranges it finds.
The Automation Status Set shows the IP range assignments for the MID Servers selected for discovery. This form includes summary details of the Discovery that identified the available subnets.

![Subnets Discovered](image)

4. Select the **IP Range Assignments** related list to view the IP ranges that were assigned to a MID Server.

**Caution:** IP ranges identified by Discovery are stored in the IP collection (ip_address_collection) table, which is only used for MID Server IP range auto-assignment in the Jakarta release. This table is intended for future development and should not be used in any customizations, including column additions, business rules, or scripting actions.
MID Server properties

Properties control the behavior of all MID Servers or a particular MID Server.

The MID Server properties are in the MID Server Property (ecc_agent_property) table and can be accessed by navigating to MID Server > Properties. You must add these properties if they are not already present.

MID Server properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>com.glide.closure_max_rows_per_table</td>
<td>Sets the maximum number of rows allowed in a table. This property is not visible by default and must be added. See the instructions for creating properties below.</td>
</tr>
<tr>

</tbody>
</table>
| mid.property.jms.command.allowed_factory_names | Comma delimited list of Java Messaging Service (JMS) connection factories that the MID Server requires for a custom JMS activity or action. This property requires the Orchestration plugin.  
- **Type**: string  
- **Default value**: connectionFactory, queueConnectionFactory, topicConnectionFactory |
| mid.property.powershell.command.script.parameter_passing | **Type**: true | false  
- **Default value**: false |
| mid.property.ssh.use_snc | Enables the use of the SNCSSH client for Discovery and Orchestration. Change this property to **false** to use J2SSH. This property applies to all MID Servers connected to the instance.  
- **Important**: If you upgrade from Dublin or earlier and want to use the SNCSSH client, you must add this property to the MID Server Properties (ecc_agent_property) table and set it to **true**. If you do not set this property, all the MID Servers in the upgraded system will use J2SSH.  
- **Type**: true | false  
- **Default value**: true |
| mid.servicewatch.max_concurrent_connections | Defines the maximum number of concurrent tasks sent to an individual host by a single MID Server.  
- **Type**: integer  
- **Default value**: 7 |
| glide.stored_proc.data_type.validation | Stops validation of data types in stored procedure parameters. Use this property if you use Orchestration to run a stored procedure on MySQL, Oracle DB, and MS-SQL databases and you want to avoid performing data type validation. Restart the MID Server service if after you change the value of this property.  
- **Type**: true | false  
- **Default value**: false |

**Create a MID Server property**

Use a MID Server property to control either the behavior of all MID Servers or a particular MID Server.

**Role required**: admin

You set MID Server properties to override MID Server parameters. Configure MID Server properties in the MID Server plugin. Do not configure MID Server properties in the `glide.properties` file that is
located in the properties folder of the agent. The glide.properties file gets overwritten during the upgrade process.

1. Navigate to MID Server > Properties.
2. Click New.
3. Fill in the fields, as appropriate (see table).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the property name.</td>
</tr>
<tr>
<td>Value</td>
<td>You can enter the value you want the property to have. Note: If you are amending JDBC operations through the mid.property.jdbc_operations properties, you can enter verbs like BEGIN, END, IF, or common PL/SQL block statements. This will assist in being able to run CREATE or ALTER statements. You might have to restart the MID server before running some of the statements.</td>
</tr>
<tr>
<td>MID Server</td>
<td>Leave this field blank to set a MID Server property that affects all MID Servers. To set a MID Server property for a particular MID Server, select the MID Server.</td>
</tr>
</tbody>
</table>

After setting any MID Server properties, restart the MID Server to ensure the properties sync with the instance.

**MID Server parameters**

Parameters control the behavior of a particular MID Server and have lower precedence than MID Server properties.

**Important:** Changes to parameters only take effect when the MID Server is started (or restarted).

**Required parameters**

**Note:** Using special characters in an XML configuration file requires you to encode them.
<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance URL</td>
<td>url</td>
<td>Specifies the URL to the associated instance. Normally the URL is similar to <a href="https://instance.service-now.com">https://instance.service-now.com</a>, where you replace instance with the instance name. If you host your own instance, use the URL set by your organization.</td>
</tr>
<tr>
<td>MID Server ID</td>
<td>mid_sys_id</td>
<td>Records the MID Server record’s unique identifier. This parameter should be empty when you initially configure a MID Server. Do not change the value.</td>
</tr>
<tr>
<td>MID Server name</td>
<td>name</td>
<td>Use this parameter to supply a name that is meaningful for you. If you do not supply this parameter, the MID Server uses the default value. A set of business rules synchronizes the name in the configuration file with the name in the MID Server record. The business rules ensure that changing the name in one location also changes the name in the other location.</td>
</tr>
<tr>
<td>Instance user name</td>
<td>mid.instance.username</td>
<td>If the ServiceNow instance has authentication enabled, as it is by default, set this parameter to define the user name the MID Server should use to log in to the instance. This user should have the mid_server role on the ServiceNow instance in order to access necessary tables and fields. You can use this parameter to define user names with special characters.</td>
</tr>
<tr>
<td>Instance password</td>
<td>mid.instance.password</td>
<td>If your ServiceNow instance has authentication enabled, as it is by default, set this parameter to define the password the MID Server should use to log in to the instance.</td>
</tr>

### Connection parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asynchronous Message Bus Client disable</td>
<td>mid.disable_amb</td>
<td>Disables the Asynchronous Message Bus (AMB) Client. When AMB is enabled, the MID Server uses a default polling interval of 40 seconds. When the AMB client is disabled, the default polling interval switches to 5 seconds. If you set a polling interval with the <code>mid.poll.time</code> parameter, the MID Server uses that value whether or not the AMB client is enabled.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default value: false</td>
</tr>
<tr>
<td>Instance date format</td>
<td>instance.date.format</td>
<td>Specifies the format the instance uses for dates and times. The primary impact of setting this parameter is to allow the MID Server to correctly refresh its start and stop times on the MID Server record in ServiceNow. The format of this date/time string is identical to that used by the Java SimpleDateFormat class.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Type: string (Date format)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default value: yyyy-MM-dd HH:mm:ss</td>
</tr>
<tr>
<td>MID Server immediate response enable</td>
<td>glide.mid.fast.responses</td>
<td>Instructs the MID Server to try sending messages to the instance as soon as they are ready. Normally the MID Servers ends message to the ServiceNow instance serially (that is, one message at a time). Since many probes can be run in parallel, there can be multiple messages simultaneously transmitted to the instance. Setting this parameter to <code>true</code> may decrease the time between a probe’s completion and its response arriving at the instance. However, the multiple simultaneous messages consume resources, decreasing the overall instance responsiveness. If there are communication problems, this parameter’s value can also cause a logjam on the MID Server, as threads normally used running probes may become consumed for sending messages. Generally, leave this parameter out of your configuration. Setting it to <code>true</code> is meaningful only under very special circumstances.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default value: false</td>
</tr>
<tr>
<td>Label</td>
<td>Names</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| MID Server JMX enable | mid.jmx.enabled | Enables a JMX server on the MID Server, which exposes some management information to JMX consoles. Implementing JMX requires additional configuration of the Java runtime environment. Setting this parameter to `true` is only recommended for those with detailed knowledge of the Java security architecture and a specific need for JMX.  
- Type: true | false  
- Default value: false |
| MID Server max transmission queue size | glide.mid.max.sender.queue.size | Places an upper limit on how large the queue is allowed to get. The MID Server starts deleting queue messages if this limit is exceeded. When the MID Server generates messages to the ServiceNow instance faster than it can send them, it queues them temporarily on the file system of the MID Server's host. This queue is normally quite small, and is completely emptied as soon as the MID Server processing slows for a short period. However, this queue can grow in size when there are communication problems between the MID Server and the instance, and especially if there is an integration running on the MID Server.  
The parameter is of the form `{number}{multiplier}`, where `{number}` is any positive decimal number including non-integers, and the optional multiplier is any spelling of bytes, kilobytes, megabytes, gigabytes, or terabytes (only the first character is tested, and the test is case-insensitive). The default multiplier is bytes. White space is liberally tolerated. The following strings all represent valid parameters: "1000000000", "0.5m", "5 gig", "7.67gigas", "145.69392 meg", and "1.1 terra".  
- Type: string  
- Default value: 0.5 GB |
| Maximum amount of expedited messages to queue in memory for processing | threads.expedited.max | Sets the maximum amount of expedited messages to queue in memory for processing. These requests are higher priority than background tasks, but do not receive an immediate response. This value is calculated based on the `{threads.max}` value; Do not change.  
- Type: integer (threads)  
- Default value: 4 (threads) |
| Maximum amount of interactive messages to queue in memory for processing | threads.interactive.max | Sets the maximum amount of interactive messages to queue in memory for processing. These requests require an immediate response. This value is calculated based on the `{threads.max}` value; Do not change.  
- Type: integer (threads)  
- Default value: 4 |
<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| MID Server maximum number of probe threads | threads.max | Controls the number of execution threads (simultaneous work) that probes may use. This parameter provides direct control over what CPU resources the MID Server consumes on the computer that hosts it. To decrease the MID Server's CPU consumption, lower the number of threads. To make the MID Server work faster, increase the number of threads. This value directly affects both the (threads.expedited.max) and (threads.interactive.max) values. See Set MID Server Thread Use.  
  
  - Type: integer (threads)  
  - Default value: 25 |
| Maximum amount of expedited messages to queue in memory for processing. | threads.expedited.max | Sets the maximum amount of expedited messages to queue in memory for processing.  
  
  - Type: integer (threads)  
  - Default value: 4 (threads) |
| MID Server poll time in seconds when MID server is not busy. | mid.poll.time | Sets the default MID Server polling interval (in seconds). The polling interval is the amount of time the MID Server waits before checking the ECC queue for work when the ECC queue is not busy. The MID Server polls the ECC queue using this interval if the AMB client connection is dropped.  
  
  Note: The default polling interval resets to 5 seconds when the AMB client is disabled. If you configure the mid.poll.time parameter, the MID Server uses this polling interval whether or not the AMB client is connected.  
  
  - Type: integer (seconds)  
  - Default value: 40 |

### Credentials parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Credentials provider. | mid.credentials.provider | Specifies the Java class name of the credentials provider.  
  
  - Type: string  
  - Default value: com.service_now.mid.creds.standard.StandardCredentialsProvider |
| Class that the MID server uses to generate secure key pairs. | mid.secure_credentials.key_pairs.provider | Class that the MID server uses to generate secure key pairs.  
  
  - Type: String  
  - Default value: com.service_now.mid.keypairs.provider.standard.StandardKeyPairsProvider |
## Debug parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Debug logging enable. | debug.logging | (Deprecated) Specifies whether to enable logging of MID Server events and messages (both sent and received). Normally this parameter is only used by developers, but it is occasionally useful when troubleshooting a problem. Be aware that setting this parameter to true causes intensive logging on the MID Server, potentially using considerable disk space.  
• Type: True | False  
• Default value: false  
This parameter has been replaced by the mid.log.level parameter. |
| Debug mode enable. | debug | (Deprecated) Specifies whether to enable debug logging on the MID Server. Normally this parameter is only used by developers, but it is occasionally useful when troubleshooting a problem. Be aware that setting this parameter to true causes intensive logging on the MID Server, potentially using considerable disk space.  
• Type: True | False  
• Default value: false  
This parameter has been replaced by the mid.log.level parameter. |
| Debug file probe templates. | file.probe.template.debug | Specifies whether to debug file probe templates.  
• Type: True | False  
• Default: false |
| Enables debug logging for CIM / WBEM / SLP / SMI-S. | mid.cim.debug | Specifies whether to enable debug logging for CIM, WBEM, SLP, or SMI-S.  
• Type: True | False  
• Default value: false |
<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Enable debug logging for ServiceNow SSH Client. | mid.ssh.debug | Enables SSH debug information in the log file. The parameter usage depends on whether the ServiceNow SSH client is enabled. When the ServiceNow SSH client is enabled, the parameter functions as follows:  
- Type: String  
- Default value: false  
  The following string values are valid for the ServiceNow SSH client:  
- true: Enables SSH debug information in the log file.  
- false: Disables SSH debug information in the log file.  
- <IP Addresses>: Specify which IP ranges to enable SSH debug information in the log file. You can enter IP addresses in the following formats:  
  - An IP range defined by a slash and the number of bits in the subnetwork. For example, the string 10.10.10.0/24 scans 24 bits of IP addresses from 10.10.10.0 to 10.10.10.254.  
  - An IP range defined by a dash. For example, the string 10.10.11.0-10.10.11.165 scans the IP addresses from 10.10.11.0 to 10.10.11.165.  
  - A comma-separated list of specific IP addresses. For example the string 10.10.11.200,10.10.11.235 scans the IP addresses 10.10.11.200 and 10.10.11.235.  
  - deferred: Logs SSH debug information in memory unless an error or warning occurs. If an error or warning occurs, the platform publishes the debug information to the log file. This ensures that only the part of the log file pertaining to the error or warning is recorded. If no error or warning is detected, the platform deletes the unused data from memory when the session closes. Each session stores up to 1000 log messages. If the session exceeds 1000 log messages, the deferred log discards the oldest log message to make room for the newest log message. When the ServiceNow SSH client is disabled, the parameter enables or disables SSH debug information in the log file:  
  - Type: True | False  
  - Default value: false |

### Remote logging disable

**Label:** Remote logging disable  
**Names:** disable.remote.logging  
**Description:** Prevents the MID Server from logging any information to the MID Server log on the instance. Relatively little information is logged on the instance in any case, but setting this parameter to true eliminates all logging to the instance.
- **Type:** True | False
- **Default value:** false

### Status sending disable

**Label:** Status sending disable  
**Names:** disable.status  
**Description:** Prevents the MID Server from sending a status report to the instance every 10 minutes.
- **Type:** True | False
- **Default value:** false

### Proxy server parameters

#### Instance proxy enable

**Label:** Instance proxy enable  
**Names:** mid.instance.use_proxy or mid.proxy.use_proxy  
**Description:** If your MID Server must go through a web proxy to access the ServiceNow instance, set this parameter to true to instruct the MID Server to use the proxy. You must also set the proxy server's host and port, and perhaps the user name and password as well.
- **Type:** True | False
- **Default value:** false

#### Instance proxy host

**Label:** Instance proxy host  
**Names:** mid.proxy.host  
**Description:** If your MID Server must go through a web proxy to access the ServiceNow instance, set this parameter to define the proxy's host.
- **Type:** String
- **Default value:** none

#### Instance proxy password

**Label:** Instance proxy password  
**Names:** mid.proxy.password  
**Description:** If your MID Server must go through a web proxy to access the ServiceNow instance, and your proxy requires a password, set this parameter to define the password.
- **Type:** String
- **Default value:** none

#### Instance proxy port

**Label:** Instance proxy port  
**Names:** mid.proxy.port  
**Description:** If your MID Server must go through a web proxy to access the ServiceNow instance, set this parameter to define the proxy's port.
- **Type:** Integer (0-65535)
- **Default value:** 80
### ServiceNow: Kingston | Now Platform Capabilities

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Instance proxy user name     | mid.proxy.username     | If the MID Server must go through a web proxy to access the ServiceNow instance, and the proxy requires a user name, set this parameter to define the user name.  
  - Type: String  
  - Default value: none |

### Shazzam parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Port probe packet interval   | mid.shazzam.regulator.interval_ms | Sets the interval, in milliseconds, in which Shazzam can launch packets. This parameter works with the mid.shazzam_regulator.packets_per_interval parameter to set the number of packets allowed in this interval.  
  By default, Shazzam launches one packet each millisecond.  
  - Type: Integer  
  - Default value: 1 |
| Port probe packets launched  | mid.shazzam.regulator.packets_per_interval | per regulator interval Sets the number of packets that Shazzam can launch in the configured time interval. This parameter works with the mid.shazzam_regulator.interval_ms parameter, which sets that interval. By default, Shazzam launches one packet each millisecond.  
  - Type: Integer  
  - Default value: 1 |
| Shazzam chunk size           | mid.shazzam.chunk_size | Specifies the maximum number of IP addresses that Shazzam scans in parallel. This parameter primarily controls outbound port consumption.  
  - Type: Integer  
  - Default value: 100 |

### SSH Discovery parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| MID Server connection cache  | mid.connection_cache   | Specifies whether to cache connections. Set to false to disable connection caching. This parameter applies to SSH connections only.  
  - Type: true | false  
  - Default value: true |
<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>

</tbody>
</table>
| Timeout in ms for SSH channel activity     | mid.ssh.channel_timeout     | Specifies the amount of time that the MID Server waits for activity on the SSH socket before closing the connection. If there has been no activity on the SSH socket for the specified timeout value, the MID Server closes the connection. Some devices, such as systems with embedded controllers like UPSs and PDUs, that have SSH enabled may require more time to respond to an authentication request.  
   - Type: integer (milliseconds)  
   - Default value: 120000 (2 minutes) |
| Timeout in ms for SSH socket read          | mid.ssh.session_timeout     | Specifies the amount of time that a cached session remains in memory after last use. Excessively small values tend to decrease performance. This parameter applies to the ServiceNow SSH client only.  
   - Type: integer (milliseconds)  
   - Default value: 300000 (5 minutes) |
| Timeout for SSH command execution (ms)     | mid.ssh.command_timeout_ms   | The timeout duration, in milliseconds, for the execution of an SSH command.  
   - Type: integer (milliseconds)  
   - Default value: 300000 (5 minutes) |
| Use keyboard interactive authentication for SSH | mid.ssh.use_keyboard_interactively | Uses the keyboard interactive authentication mode in SSH daemons on which it is activated.  
   - Type: true | false  
   - Default value: false |
| Min size of DH group in bits               | mid.ssh.dh_group_length_min | Specifies the minimum group length in bits used for generating a ‘shared secret’ key in Diffie-Hillman key exchange. The larger the key the more secure the SSH connection is but at the cost of performance.  
   - Type: integer (bits)  
   - Default value: 1024 |
| Max size of DH group in bits               | mid.ssh.dh_group_length_max | Specifies the maximum group length in bits used for generating a ‘shared secret’ key in Diffie-Hillman key exchange. The larger the key the more secure the SSH connection is but at the cost of performance.  
   - Type: integer (bits)  
   - Default value: 2048 |
<table>

| List of bourne-compatible shells | mid.ssh.shells_supported | Defines the bourne-compatible shells supported by the MID Server. This value is a comma-separated list of supported shells, such as ksh, dsh, bash and sh.  
- Type: string  
- Default value: ksh,bash,sh |
| Discard long running command error output, emulating legacy behavior. | mid.ssh.discard_lrc_error | Discard long running command error output, emulating legacy behavior.  
- Type: String  
- Default value: j2ssh - true, snccsh - false |
| Ratio of ssh session pool capacity to mid thread number in percentage. | mid.ssh.pool_thread_ratio | The ratio of SSH session pool capacity to the MID Server thread number, in percentage. The pool capacity is at least 25%.  
- Type: Integer  
- Default value: 75 |
| Disable the privilege check for SSHCommand. | mid.ssh.disable_privilege_check | This parameter has no effect if the target is using a privileged command other than “sudo.” For more information, see Privileged commands for the MID Server.  
The remainder of this section only applies to targets which run sudo. When this parameter is set to true, the MID Server assumes that the user configured in the credential has the privilege to run the given command using sudo. The MID Server assumes the target user can run any command string following sudo on the target. When this parameter is set to false, the MID Server runs “sudo -l” on the target to verify the command which follows sudo has permission to run on the target. Regardless of this parameter’s value, the MID Server always validates that “sudo” by itself can be run on the target.  
Some releases do not show this parameter in the MID Configuration Parameters pull down list. In this case, you may optionally add this parameter in MID Properties.  
- Type: true | false  
- Default value: false |

By default, the MID Server is configured to search for SSH commands in the following paths and the logged-on user’s default paths:
- /usr/sbin
- /usr/bin
- /bin
- /sbin
## Upgrade parameters

## Windows Discovery parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Enable or disable Powershell parameter passing via the command line. | mid.powershell.command.parameter_passing | Enable this parameter to allow passing Powershell parameters from the command line.  
- Type: True | False  
- Default value: false |
| Enable or disable the Powershell script parameter passing via the command line. | mid.powershell.command.script.parameter_passing | Enable this parameter to allow passing Powershell scripts from the command line.  
- Type: True | False  
- Default value: true |
| Enable or disable the enforcement of UTF-8 for command output. | mid.powershell.enforce_utf8 | Enable this parameter to force commands on a target Windows system to return UTF-8 encoded output. Disabling it allows the target system to use its default encoding. This parameter is only valid when PowerShell is enabled. Setting this value to false may result in incorrect values in the CMDB when non-ASCII characters are returned by a probe.  
- Type: True | False  
- Default value: true |
| Enable PowerShell for Discovery. | mid.use_powershell | Specifies whether to enable PowerShell for Discovery. The MID Server requires PowerShell version 2 to operate. If the MID Server cannot find the correct version of PowerShell, it uses WMIRunner instead.  
- Type: True | False  
- Default value: true |
| Enable/Disable automatically falling back to the MID Server service user credential if all other credentials fail. | mid.powershell.local_mid_service_credential_fallback | Specifies the login credentials the MID Server uses if all other credentials fail.  
- Type: True | False  
- Default value: false |
| Timeout for Windows probes. | mid.windows.probe_timeout | Specifies the timeout value for the Windows probe, in seconds. The default value is 5 minutes.  
- Type: Integer  
- Default value: 300 seconds |
| Powershell use credentials table. | mid.powershell.use_credentials | Specifies whether PowerShell Discovery should use the Windows credentials from the credentials table. To use PowerShell Discovery on a single domain, set this parameter to false, and then restart the MID Server. In this case, the MID Server runs the probes with the credentials of the user for the MID Server process.  
- Type: True | False  
- Default value: true |
<table>
<thead>
<tr>
<th>Label</th>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Path to Powershell executable.</td>
<td>mid.powershell.path</td>
<td>Enables an administrator to point to a specific PowerShell on a MID Server in cases where more than one PowerShell is installed. Supply the path to the directory containing the PowerShell executable for example, C:\mypowershell or C:\mypowershell.. ServiceNow automatically appends the string powershell.exe to the path. This parameter might be necessary when both 32-bit and 64-bit PowerShells are active on the same MID Server, and it becomes necessary to launch the correct PowerShell for the context. Note that 64-bit Windows employs file system redirection and the MID Server runs as a 32-bit application. If the path is in %WinDir%\System32, Windows automatically redirects to %WinDir%\SysWOW64. To avoid redirection, specify the path as %WinDir%\Sysnative. An example would be to specify C:\WINDOWS\sysnative\WindowsPowerShell\v1.0\ instead of C:\WINDOWS\system32\WindowsPowerShell\v1.0.</td>
</tr>
<tr>

| Maximum number of sessions allowed in the session pool. | mid.powershell_api.session_pool.max_size | Specifies the maximum number of sessions allowed in the session pool.  

> **Note:** Setting or changing this parameter requires restarting the MID Server.  

- Type: Integer  
- Default value: 25
| Idle Powershell session timeout (seconds). | mid.powershell_api.idle_session_timeout | Specifies the timeout value of idle Powershell sessions in seconds.  

> **Note:** Setting or changing this parameter requires restarting the MID Server.  

- Type: Integer  
- Default value: 60
| Timeout for all Windows probes on a MID Server. | mid.windows.probe_timeout | Sets the timeout interval for all Windows probes on a specific MID Server. This value is overridden by the values configured for individual probes with the wmi_timeout probe parameter.  

- Type: Integer  
- Default value: 300

**SNMP configuration parameters**

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Enable automatic inclusion of SNMP public community string. | mid.snmp.enable_auto_public | Specifies whether to use the **SNMP public community string** automatically if no other SNMP credentials were successful.  

- Type: True | False  
- Default value: true
| Maximum time to wait for a response for the first OID request. | mid.snmp.request.timeout | Specifies the timeout value for the first OID request, in milliseconds. For subsequent requests (for example, table OIDs), the **mid.snmp.session.timeout** configuration parameter (see below) takes effect.  

> **Note:** You can override this parameter with the timeout SNMP probe parameter.  

- Type: Integer  
- Default value: 1500
<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Maximum time to wait for responses to OID requests once a session has been established. | mid.snmp.session.timeout | Specifies the timeout value for subsequent OID requests in milliseconds. SNMP communication is stateless and does not have a session or connection in the normal sense. The system regards a positive response from the first OID request as a sign that it should expect prompt responses to subsequent requests. While the default is short, it may be useful to increase this parameter value to the same value as that used for mid.snmp.request.timeout. **Note:** You can override this parameter with the establish_session_timeout SNMP probe parameter.  
- Type: Integer  
- Default value: 500 |
| Use the Snmp4j library for SNMP communication. | mid.snmp.use_snmp4j | Use the Snmp4j library for SNMP communication. This is a strict requirement for SNMPv3. This parameter should only be set to false based on advice from ServiceNow Technical Support.  
- Type: True | False  
- Default value: true |
| Use SNMP v1 and v2c for probes. | mid.snmp.use_snmp_v1_v2c | Attempt communication using these SNMP protocol versions. Requires configuration of SNMP community string credentials or the mid.snmp.enable_auto_public parameter set to true, as applicable for targeted devices.  
- Type: True | False  
- Default value: true |
| Use SNMP v3 for probes. | mid.snmp.use_snmp_v3 | Attempt communication using the SNMPv3 protocol version. Requires configuration of SNMPv3 credentials.  
- Type: True | False  
- Default value: true |

### Event Management parameters

- metrics  
- metrics:<filter>  
- events:<filter>  
- Type: String  
- Default value: none |
| Number of seconds of delay when collecting metrics | mid.em.metric_connector_latest_arrivals_delay | Specifies the number of seconds to delay when collecting metrics.  
- Type: Integer  
- Default value: 30 |

**Add a MID Server parameter**

Use a MID Server parameter to control the behavior of a particular MID Server.

Role required: admin

1. Navigate to **MID Server > Servers**.
2. From the list of MID Servers, select a MID Server to configure.
3. Select the **Configuration Parameters** related list.

   This related list shows all the parameters currently in the MID Server’s configuration file. If there are any passwords, they are displayed in asterisks for security reasons.
### Defining MID Server configuration parameters

4. To add parameters, click **New**, and then complete the form.

After the form is submitted, the configuration file for that MID Server is modified to include the new parameter. Changes to existing parameters are reflected in the MID Server configuration file as well. Changes made to the MID Server configuration file do not take place immediately, but rather the next time the MID Server is restarted. The MID Server form has a related link for restarting the MID Server.
Note: ServiceNow prevents you from saving changes, such as modifying or deleting parameters, that would cause the MID Server to lose communications with the instance. For example, you cannot change the url parameter. Any changes to these protected properties must be made directly in the config.xml file for that MID Server.

Setting Parameters from the config.xml File

MID Server configuration is controlled by an XML file called config.xml. This file is located in the \agent directory, immediately under the directory where the MID Server is installed. Edit this file directly to make any configuration changes to protected parameters. Many configuration changes, such as those that do not disrupt communication between the MID Server and the ServiceNow instance, may also be made from the instance.

The structure of the config.xml file is simply an outer parameters tag and a series of inner parameter tags. Each parameter tag has name and value attributes.

- To change the value of a parameter, edit the value attribute.
- To add a parameter, add another parameter tag with its name and value.
- To delete a parameter, delete the entire parameter tag.

The order of the parameters within the file is not important. Notice the green comment sections in the sample. Use these elements to add useful comments to the configuration file.

Note: When configuring the MID Server for use with a proxy server, be sure to remove the comment tags around the proxy sections that you configure.
The MID server can be put into a **Paused** state to temporarily prevent it from polling the ECC Queue for work or sending Discovery results back to the instance.

You might want to pause the MID Server when your network infrastructure is undergoing changes. This prevents applications like Discovery from throwing errors during a particular maintenance window.
A paused MID Server continues processing commands that it had already retrieved before it was paused. When you resume the MID Server, the MID Server starts retrieving new commands to process.

**Note:** Discovery continues to assign jobs to MID Servers that are **Paused**. MID Servers that are **Down** are not assigned jobs.

Unlike stopping the MID Server from the Windows or Linux server command line on the MID Server machine, pausing the MID server is something that you can do from the instance. The MID Server pause feature is available starting with the Istanbul release.

**Note:** You can only pause **validated MID Servers**.

You can still perform these actions when the MID Server is paused:

- Access the MID Server logs and delete log entries.
- View MID server statistics. While the MID Server is in the **Paused** state it stops generating statistics. But you can still view the statistics generated before you paused the MID Server.
- Retrieve the MID Server thread dump.
- Make and save **configuration changes** and property changes to the server. The changes take effect after the MID Server is resumed.
- Clear the ECC queue.

The **MID server heartbeat** continues to function while the MID Server is in the **Paused** state. If the MID Server is upgraded while it is in the **Paused** state, the MID Server state automatically changes to **Up** after successful upgrade. It does not return to the **Paused** state.

During **MID Server selection**, paused MID Server can still be selected but are prioritized below MID Servers that are not paused.

**Events that occur during MID Server pause**

The **vCenter** and **SNMP** event collectors, continue to run and process events when you pause the MID Server. These events are not part of the normal synchronous communication that the MID Server has with the instance that you see in the ECC queue. Events are still relayed to the instance and can even trigger actions on records in the instance, such as a CI update. For example, if vCenter detects that a virtual machine goes down or is deleted, a vCenter event makes a change to the status of the corresponding CI record for that virtual machine.

To prevent these events from being processed, stop the extensions from running. See:

- Configure and run the vCenter event collector extension
- Configure the SNMP Trap Collector Extension

**Pause the MID Server**

Pause the MID Server to temporarily prevent it from polling the ECC Queue for work or sending Discovery results back to the instance.

Role required: agent_admin

You can only pause **validated MID Servers**.

1. Open the MID server record.
2. Select a running MID Server that has been validated.
3. On the MID Server form, select **Pause MID** under **Related Links**.
   The state of the MID Server changes to **Paused**.
4. To resume MID Server processing, select Resume MID under Related Links.

**MID Server domain separation**

MID Servers can be configured in separate domains.

The records that can be read, updated, or created by a MID Server are determined by the credentials configured for that MID Server in the config.xml file. These are the user credentials that a MID Server uses to access the instance and specify which domain’s records that MID Server can access.

You can create versions of these specific MID Server policy records that only a MID Server from the same domain can use. This process separation is supported for records in tables that extend MID Server Synchronized Files (ecc_agent_sync_file):

- MID Server MIB File (ecc_agent_mib)
- MID Server JAR File (ecc_agent_jar)
- MID Server Script File (ecc_agent_script_files)

See [Set up domain separation for MID Servers](#) for instructions on setting up domain separation through the MID server.

**Note:** Attachments on MIB or JAR file records might not appear as they did in a non-domain separated environment. The attachments do not appear because the Attachments (sys_attachment) table is data separated. When data is separated between domains, a record in a child domain cannot access records in a parent domain.

**Set up domain separation for MID servers**

Set up domain separation through the MID server user role and the MID Server configuration file.

Role required: admin, agent_admin

1. Configure a MID Server user within a specified domain with the proper mid_server role.
2. Specify this user within the MID Server config.xml file. When you set the MID Server user credentials in the config.xml file, make sure they are in the proper domain.

If you must change the MID Server domain:

1. Stop the MID Server and delete the ecc_agent record.
2. Update the MID Server config.xml with the new user in the new domain and restart the MID Server service.

If you need to create versions of specific MID Server files that only MID Servers in your domain can use:
1. Open or create a record in one of these MID Server modules:
   - SNMP MIBs
   - JAR Files
   - Script Files

2. Update an existing domain policy or submit a new record.

   **Note:** Attachments on MIB or JAR file records might not appear as they did in a non-domain separated environment. The attachments do not appear because the Attachments (sys_attachment) table is data separated. When data is separated between domains, a record in a child domain cannot access records in a parent domain.

### Configure a multi-domain MID Server

You can create a MID Server in the global domain that can explore targets in other domains.

**Before configuring a multi-domain MID Server:**

- Activate the Domain Support - Domain Extensions Installer (com.glide.domain.msp_extensions.installer) plugin.
- Ensure that your instance is **domain separated**.

**Role required:** admin

1. Type `sys_properties.list` in the navigation filter and press **Enter**.
2. Locate the `glide.ecc.enable_multidomain_mid` property.
3. Set the value of the property to **true**.

   **Note:** Enabling this property has no effect on existing MID Servers. MID Servers in a domain prior to setting this property, remain in that domain.

4. Create a MID Server in the global domain.
   
   A MID Server created in the global domain after this property is set to **true** can explore any domain for which it has the credentials. However, this MID Server is restricted to trying only the credentials for the target domains requested by ECC Queue inputs.

   **Caution:** If you reset the `glide.ecc.enable_multidomain_mid` property to **false** after creating a multi-domain MID Server in the global domain, that MID Server writes all the data it receives to the global domain and not to the correct domains.

### Privileged commands for the MID Server

To discover certain information on a host server, the MID Server must run SSH commands with higher privileges. The platform provides default privileged commands for the MID Server to use and the ability to add additional commands to the system.

An example of information that requires elevated privileges is information about storage disks on a host server, retrieved with the `fdisk -l` command. If your system cannot use sudo commands, you must configure the hosts in your network to use one of the other privileged commands. You can have different privileged commands set up for different hosts. However, Discovery supports only one privileged command per host.
Important: You can edit supported privileged commands, but do not delete them.

For a list of possible SSH commands requiring root privileges, see SSH credentials.

SSH privileged escalation command requirements

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| sudo    | - Host must support the `sudo -S -p <password>` command and return the correct list of allowed SSH commands.  
- Credentials provided for Discovery must be able to run the command `sudo -S -p <password> <commands>`. |
| pbrun   | - Host must support the `pbrun -v` command and return the correct version of PowerBroker.  
- Credentials provided for Discovery must be able to run `pbrun <commands>`.  
- Discovery does not support any other `pbrun` options, such as a password prompt.  
- The instance must be able to reach the target host via SSH. |
| pfexec  | - Host must support the `pfexec id -a` command and return the correct ID.  
- Credentials provided for Discovery must be able to run `pfexec <commands>`.  
- Discovery does not support any other `pfexec` options, such as a password prompt. |
| dzdo    | - Host must support the command `dzdo` command and return the path to dzdo in standard output.  
- Credentials provided for Discovery must be able to run `dzdo <commands>`.  
- Discovery does not support any other `dzdo` options, but Discovery supports password authentication for dzdo. |

Long-running commands with sudo

Configure J2SSH and ServiceNow SSH to prevent long running commands using sudo from failing when the MID Server disconnects.

ServiceNow SSH allows probes to run sudo against individual commands or an entire, long-running script. This is also supported for the `pbrun` and `pfexec` privileged commands.

Sudo for individual commands

You can run sudo against individual commands within a probe, but only if all the following sudoer configurations are performed on the target:
- The `!requiretty` option is required.
• Allow individual commands to be run by the user in the provided credential with `NOPASSWD` configured.
• The target specifies an individual sudo call in the command or referenced scripts. For example, set sudo as "sudo fdisk -I" or "${sudo:fdisk -I}" rather than "must_sudo" for the entire script.

**Note:** Running sudo against individual commands with ServiceNow SSH produces detailed and useful entries in the sudo logs on the target computer.

Running sudo on an entire script

If any of the required sudoer configuration requirements for individual commands is not in place, Discovery applies sudo to the initial and complete probes, and does not execute sudo remotely inside the command. This condition can be forced by setting `must_sudo` on the probe and eliminating any sudo commands within the probe.

This approach prevents long running commands from failing when the probe disconnects, but cannot specify individual commands in the sudoers configuration.

Logging

The logs from ServiceNow SSH sudo activity run against an entire script show cryptic entries, such as `/tmp/.run.aef13123fe124123`, which prevent administrators from controlling permissible commands and knowing the exact command that was run. Sudo run against individual commands produces more detailed log entries, such as `/sbin/fdisk -l`.

Add a new privileged command for use by the MID Server

Add a new privileged command to the Privileged Command (privileged_command) table that is available to your MID Servers.

Role required: admin

**Important:** Do not delete any of the supported commands.

1. Navigate to **MID Server > Privileged Command** and click **New**.
2. Complete these fields:
   - **Command**: The name of the privileged command.
   - **Password Prompt**: The password prompt displayed to the user for this privileged command, or a regular expression that matches this password prompt. If this field is empty, no password is required for this privileged command, and no prompt is displayed. SUDO commands do not require a password prompt.
3. Click **Submit**.

Configure the MID Server to use specific privileged commands

You can configure the MID Server to use specific commands in a defined order.

Role required: admin

1. Navigate to the list of MID Servers using one of the following paths:
   - **MID Server > Servers**
   - **Discovery > MID Servers**
- **Orchestration > MID Servers**

2. Select the MID Server you want to configure.
3. Click the menu icon in the header bar and select View > Advanced from the context menu.

4. In the Privileged Command related list, click Edit.
5. Select the command you want this MID Server to use and click Save.

The default order of privileged commands is 100, but you can change the order as necessary. The privileged command with the smallest order number is tried first.
Create a pbrun profile privileged command

You can create a special configuration for the pbrun privileged command that allows it to run as a profile.

Role required: discovery_admin, admin

Of all the privileged commands, only the pbrun command can be configured to run as a profile, and only one of these special pbrun configurations can function on a MID Server.

Important: Edit the existing pbrun record for this purpose. The system ignores any additional commands you create for pbrun.

1. Navigate to MID Server > Privileged Command.
2. Select pbrun from the list.
3. In the Privileged Command record, edit the value in the Command field to use the format pbrun -u <profile>.
   For example, you can set pbrun -u admin as a command to run with an admin profile.
4. Click Update.

Map an IP address to a DNS name

If the MID Server manages resources within defined IP ranges, all host servers must have their DNS names mapped to an IP address.

Role required: admin
The association of an IP address to a DNS name ensures that the appropriate MID Server is selected based on the IP Address range configuration. If this is not done, Orchestration reverts to the default MID Server.

If Discovery cannot discover the server and resolve the DNS name to an IP address, you must creating the mapping manually, using this procedure.

1. Enter `cmdb_ci_dns_name.list` in the navigation filter.
   
   A list of DNS names appears.
2. Check the list for your host server.
   
   If the server does not appear in the list, continue with this procedure.
3. Click New.
4. Enter the fully-qualified domain name (FQDN) of the host server in the Name field.
5. Right-click in the form header and select Save from the context menu.
6. In the IP Address related list, click New.
7. In the IP Address field, enter the IP address of your host server.
8. In the Nic field, select `eth0` or your preferred network interface controller.
9. Leave the Netmask field blank.
10. Click Submit.

MID Server security and encryption

Several options are available for you to enhance security on MID Servers, including credential and encryption security, the authorization of SOAP requests, and the establishment of secure socket layer (SSL) connections.

How MID Server encryption works

The MID Server login credentials appear in the `config.xml` file in clear text by default, but you can encrypt them. While the `username` and `password` are initially set in a `config.xml` configuration file on the MID server, once the MID server retrieves the credentials, it can replace the clear-text password with an encrypted password. For the encryption of the local MID server service account, the password is encrypted using an AES128 encryption algorithm. The MID server also maintains an encryption key that is generated each time it starts and remains in memory and not on the hard disk. When credentials need to be sent from the instance to the MID server, the following process takes place:

1. The instance retrieves the encrypted password and the unencrypted `username` from the instance database table.
2. The instance decrypts the encrypted password, and then re-encrypts it using the MID server encryption key.
3. The `username` and re-encrypted password are sent to the MID Server through the encrypted TLS session was already established between the MID server and the instance.
4. The MID server receives the credentials and decrypts the password in memory before using the credentials for remote operations. At no point is the credential password stored on the disk in an unencrypted format.

To enable this encryption, see Encrypt MID Server login credentials.
MID Server encryption keypairs

Automation credentials are secured by encrypting them in the instance with the MID Server’s trusted public key prior to transmission. When the MID Server is created, it generates a keypair, consisting of a public and private key. After the MID Server is validated, it can use the private key to decrypt automation credentials. You should occasionally rekey the MID Server to meet your organization’s security requirements. See Rekey a MID Server for instructions.

SSL certificates

You can add certificates to the MID Server if you want communication to occur over SSL. You can add these certificates to the cacerts keystore file:

- Signing Certificate Authority (CA) certificate
- MID Server certificate

See Add SSL certificates for the MID Server for instructions.

Basic authentication credentials and SOAP requests

You can enforce basic authentication on each request. The MID Server is not able to communicate through a proxy server if the proxy server supports only NTLM authentication. You can use basic authentication with a proxy server or create an exception for the MID server host.

Supplying basic authentication information, regardless of whether it is required, has an added advantage. The web service invocation creates or updates data using the supplied credentials. For example, when you create an incident record, the journal fields have the user id of the basic authenticated user instead of the default Guest user. This behavior allows you to identify data added by a specific MID Server.

You can set basic authentication credentials for SOAP requests. See Require basic authorization for incoming SOAP requests for instructions. Each SOAP request contains an Authorization header as specified in the Basic Authentication protocol.

Note: The setting for enforcing strict security controls how the instance uses the credentials you provide for the MID Server. When the setting is enabled, you must provide a user ID with access to the tables the MID Server is trying to access. When the setting is disabled, any valid user ID allows the MID Server to access to all tables.

Encrypt MID Server login credentials

Encrypt the MID Server login credentials for added security.

Role required: admin

Any field in the config.xml file can be encrypted, but once encrypted, a field can be managed only from within the instance. You should encrypt password fields only for the MID Server and any proxy server specified.

Note: An encryption interface is available that enables you to move encryption out of the config.xml file entirely and into an external system. For information about this interface and the methods provided, see MID Server configuration file security.

1. Navigate to the agent directory that was created when the MID Server was installed and open the config.xml file using a text editor such as WordPad.
The instance credentials section of the `config.xml` file looks like this:

```
<!-- If your instance has authentication enabled (the normal case), set these parameters to define the user name and password the MID Server will use to log into the instance. -->

<parameter name="mid.instance.username" value="midsrvadmin"/>
<parameter name="mid.instance.password" value="securepassw0rd"/>
```

2. Add the `secure="true"` attribute to the password tag.

```
<parameter name="mid.instance.username" value="midsrvadmin"/>
<parameter name="mid.instance.password" secure="true" value="securepassw0rd"/>
```

3. Save the `config.xml` file, and then restart the MID Server service.

4. Open the `config.xml` file and view the encrypted password.

```
<parameter name="mid.instance.username" value="midsrvadmin"/>
<parameter name="mid.instance.password" secure="true" value="encrypted:hrfUNYRzZAI8/BkTtZmNA=="/>
```

The password cannot be decrypted, which means displaying it in clear text again, by changing the encryption attribute to false or by deleting the attribute. If the password is changed in the `config.xml` file and the MID Server restarted, the new password is encrypted.

---

**ECC queue data encryption with the automation API**

The automation API encrypts sensitive probe data that is sent from an instance to the MID Server through the ECC Queue.

You can use the automation API to encrypt data that you send from a custom application to the ECC queue and prevent that data from appearing in clear text. For example, you can encrypt a password used by a MID Server to authenticate on a REST endpoint.

**Methods**

The API provides these methods:

- `encrypt()`
- `isEncrypted()`

The following example shows how you might call these methods:

```javascript
var automation_api = new sn_automation.AutomationAPI();
var password = 'xyz';
var encrypted_password;
if (automation_api.isEncrypted(password))
    encrypted_password = password;
else
    encrypted_password = automation_api.encrypt(password);
```

The `encrypted_password` value can then be passed safely to the ECC Queue and on to the desired MID Server.
MID Server configuration file security

Sensitive MID Server configuration data can be protected using several different schemes, including internal and external data encryption and external data storage.

The MID Server provides the following built-in security options for content in the config.xml file:

- **Default security provider**: Secures the data in the config.xml file by encryption. When the MID Server is restarted, any unencrypted data is encrypted and written to the config.xml file. The default security provider offers these encryption options:
  - **Default encryptor**: Default process for encrypting data in the MID Server config.xml file. See Encrypt MID Server login credentials for details.
  - **Windows Data Protection API (DPAPI)**: The operating system performs the data encryption, rather than the MID Server. DPAPI encryption is based on the logged in user's account. When this scheme is used, the data can only be decrypted by the same user account. If the account changes, the data must be re-encrypted.
  - **Custom encryption**: Implement the IMidServerEncrypter interface to create your own custom encryption scheme to manage sensitive config.xml data.

- **CyberArk**: Data security is provided by CyberArk's Privileged Account Security system, which moves sensitive data from the config.xml file to a secure CyberArk vault. This solution does not encrypt the data.

- **Custom external storage**: Implement the ISecuredConfigProvider interface to create your own custom external storage system to manage sensitive config.xml data.
Secured content and encryption schemes

Encrypt MID Server configuration data with DPAPI
Windows Data Protection API (DPAPI) encrypts sensitive data from the config.xml file, based on the MID Server user account.

Role required: admin

DPAPI encryption provides another level of security for data such as credentials, IP addresses, and URLs in the MID Server config.xml file. The operating system performs the data encryption, rather than the MID Server. DPAPI encryption is based on the logged in user’s account. When this scheme is used, the data can only be decrypted by the same user account. If the account changes, the data must be re-encrypted.

1. Open the config.xml file in a text editor.
   This file is located in the /agent folder in your MID Server installation path.

2. Enable this parameter and value:
   `<parameter name="mid.secure_encrypter" value="com.service_now.mid.services.config.WindowsDPAPIEncrypter"/>

3. Save the configuration file.
4. Restart the MID Server.
   Any values in clear text in the `config.xml` file are encrypted by the operating system.

5. Follow this procedure if you need to change the MID Server user account that is used for encryption.
   a) Stop the MID Server service.
   b) Open the `config.xml` file in a text editor.
      This file is located in the `/agent` folder in your MID Server installation path.
   c) Re-enter all the encrypted values in clear text.
   d) Make the changes to the MID Server user account in the ServiceNow® instance.
   e) Restart the MID Server service.
      The data is re-encrypted by the operating system, based the new MID Server user account.

Use CyberArk as a secure configuration provider
You can use a CyberArk vault to secure any sensitive data from the MID Server `config.xml` file.

Role required: admin
CyberArk is commonly used to secure credentials in its external vault. However, a MID Server parameter in the `config.xml` file enables you to store other types of data in CyberArk.

1. Open the `config.xml` file in a text editor.
   This file is located in the `/agent` folder in your MID Server installation path.

2. Enable this parameter and value:

   `<parameter name="mid.secure_config.provider" value="com.service_now.mid.services.config.CyberArkSecuredConfigProvider" />

3. Configure specific data to secure in the CyberArk vault, as shown in these examples.
   a) Secure the MID Server credentials by setting this parameter to match the ID and Type for that data in your CyberArk configuration.

   ```xml
   <parameter name="mid.instance.username" secure="true" value="cyberark: id=<CyberArk ID>, type=<CyberArk type>"/>
   <parameter name="mid.instance.password" secure="true" value="cyberark: id=<CyberArk ID>, type=<CyberArk type>"/>
   ```

   b) Secure the URL of the instance by setting this parameter to match the ID and Type for that data in your CyberArk configuration.

   ```xml
   <parameter name="url" secure="true" value="cyberark: id=<CyberArk ID>, type=<CyberArk type>"/>
   ```

4. Save the configuration file.
5. Restart the MID Server.

Change MID Server configuration file security schemes
The MID Server provides several schemes for securing sensitive data in the `config.xml` file and allows you to switch between these options to suit your security requirements.

Role required: admin
To switch between configuration security schemes:

1. Stop the MID Server service.
2. Open the `config.xml` file in a text editor.
   This file is located in the `/agent` folder in your MID Server installation path.
3. Re-enter all the encrypted values in clear text.
4. Disable the previous security scheme and configure the MID Server to use the new provider.
5. Restart the MID Server service.
   The data is re-secured or encrypted, based on the security scheme you have selected.

**MID Server ISecuredConfigProvider interface**

Use the methods in this interface to create custom providers that manage secured parameter values in the MID Server `config.xml` file.

*Note: These methods are contained in the `snc-automation-api.jar` file, located in the MID Server installation folder.*

### initialize

This method initializes the provider with additional configuration parameters and does not return a value.

**Example**

```java
void initialize(java.util.Properties properties, 
IMidServerEncrypter encrypter) 
throws java.lang.Exception
```

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>properties</td>
<td>Initialization properties.</td>
</tr>
<tr>
<td>encrypter</td>
<td>Encrypter to use if the provider is encryption based.</td>
</tr>
</tbody>
</table>

**Exception**

`java.lang.Exception`

### isParameterValueSecured

This method checks to see if the parameter value has been secured or not. This method returns a `boolean` type value.

**Example**

```java
boolean isParameterValueSecured(java.lang.String paramValue)
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>paramValue</td>
<td>The parameter value.</td>
</tr>
</tbody>
</table>

Returns

The parameter returns true if the parameter value is secured.

secureParameterValue

This method secures the parameter value if it has not been secured. This method returns a string type value.

Example

```java
java.lang.String secureParameterValue(java.lang.String unsecuredParameterValue) throws java.lang.Exception
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unsecuredParameterValue</td>
<td>The unsecured parameter value.</td>
</tr>
</tbody>
</table>

Returns

This method returns the unsecured parameter value.

Exception

```java
java.lang.Exception
```

unsecuredParameterValue

This method returns the unsecured value of the parameter. This method returns a string type value.

Example

```java
java.lang.String unsecuredParameterValue(java.lang.String parameterName) throws java.lang.Exception
```

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameterName</td>
<td>The parameter name.</td>
</tr>
</tbody>
</table>

**Returns**

This parameter returns the unsecured value.

**Exception**

`java.lang.Exception`

---

**MID Server IMidServerEncrypter interface**

Use the methods in this interface to create a custom external encrypter for the MID Server `config.xml` file.

**initialize**

This method initializes the encrypter with additional configuration parameters and does not return a value.

**Example**

```java
void initialize(java.util.Properties properties)
    throws java.lang.Exception
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>properties</td>
<td>Initialization properties.</td>
</tr>
</tbody>
</table>

**Exception**

`java.lang.Exception`

**encrypt**

This method encrypts the unencrypted data and returns a `byte()` type value.
Example

```java
byte[] encrypt(byte[] unencryptedData)
    throws java.lang.Exception
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unencryptedData</td>
<td>The data unencrypted.</td>
</tr>
</tbody>
</table>

Returns

- Encrypted data

Exception

- java.lang.Exception

```java
decrypt
```

This method decrypts encrypted data and returns a \texttt{byte()} type value.

Example

```java
byte[] decrypt(byte[] encryptedData)
    throws java.lang.Exception
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>encryptedData</td>
<td>The data decrypted.</td>
</tr>
</tbody>
</table>

Returns

- Decrypted data.

Exception

- java.lang.Exception

Rekey a MID Server

Rekeying a MID Server forces it to restart and generate a new private key. Typically, this is only necessary if the MID Server keystore is compromised.

Role required: admin
When the MID Server comes back online, the system automatically validates the new key, and the MID Server resumes processing automation tasks.

1. Navigate to **MID Server > Servers**.
2. Open the MID Server whose keypairs you want to rotate.
3. Under **Related Links**, click **Rekey**.

### Add SSL certificates for the MID Server

Configure the MID Server to connect to a source over SSL.

Role required: admin

**Note:** The MID Server does not support SSL when importing data from an integration, such as an LDAP server.

1. Open a command prompt and navigate to the folder containing the JRE `keytool`. An example path might be: `C:\Program Files (x86)\ServiceNow\<MidServer(s)>\agent\jre\bin`
2. Enter the following `keytool` command to import a certificate into the MID Server's cacerts keystore:
   ```
   keytool -import -alias <certificate alias> -file "<path to certificate>" -keystore "<path to MID Server(s)>\agent\jre\lib\security\cacerts"
   ```
   For example, you might enter:
   ```
   keytool -import -alias MyCA -file "C:\myca.cer" -keystore "C:\Program Files (x86)\ServiceNow\MIDserver\agent\jre\lib\security\cacerts"
   ```

   **Note:** Keytool prompts for a certificate password. If the certificate is for a CA, keytool also asks whether to trust the certificate authority. To add a certificate to an instance, see **Upload a certificate to an instance**.

### Require basic authorization for incoming SOAP requests

For added security, you can enforce basic authentication on each incoming SOAP request to the MID Server.

Role required: admin

1. Navigate to **System Properties > Web Services**.
2. Select the check box for **Require basic authorization for incoming SOAP requests**.
3. Click **Save**.
4. To provide basic authentication credentials for a MID Server, navigate to `C:\Program Files \ServiceNow\<MID Server name>\agent` and edit the `config.xml` file, as follows:
   a) Find the element `<parameter name="mid.instance.username" value=""/>` and enter the instance administrator user name as the value. For example, you might enter `<parameter name="mid.instance.username" value="admin"/>`.
   b) Find the element `<parameter name="mid.instance.password" value=""/>` and enter the configured password for this instance as the value. For example, you might enter `<parameter name="mid.instance.password" value="abc123"/>`.
Advanced MID Server configuration

There are several advanced options available for you to customize and configure the MID Server.

Install and uninstall Nmap on a MID Server

If you decide to use credential-less Discovery in your network, install Nmap on each Windows MID Server that you want to use for this purpose. Self-hosted customers whose network security does not permit downloads from install.service-now.com must use a specific manual process to install and configure Nmap.

- Assign MID Server IP ranges to all deployed MID Servers. The quickest and most reliable way to do this is with the MID Server IP range auto-assignment feature available in the ITOM Guided Setup. This method ensures that the set of MID Servers configured to access an IP address range is comprehensive.
- Identify the IP ranges you want to explore with credential-less Discovery. Ensure that these ranges can only be accessed by MID Servers with Nmap installed, running on supported Windows hosts.
- Use the All option for selecting IP ranges and observe these requirements:
  - Restrict the use of this feature to Windows MID Servers only.
  - Ensure that Nmap is installed on each of these MID Servers.
  - Ensure that the MID Servers can access the entire customer network.
- When you create a Discovery schedule with Nmap enabled, observe these requirements for the MID Server selection options:
  - Specific MID Cluster: Verify that Nmap is installed on all MID Servers in the cluster, where each MID in the cluster is configured to access the same set of MID Server IP ranges.
  - Auto-Select Mid Server: When running horizontal Discovery, verify that Nmap is installed on at least one of the MID Servers that can access the Discovery schedule’s configured MID Server IP ranges.
  - Specific MID Server: Verify that Nmap is installed on each MID Server that can access the schedule’s configured MID Server IP Ranges.

Note: To use credential-less Discovery for Service Mapping, install Nmap on all MID Servers that can access the Discovery schedule’s configured MID Server IP ranges.

Role required: agent_admin

Note: Self-hosted customers whose network security does not permit downloads from install.service-now.com must install and configure Nmap manually on their system. Refer to the procedure here for installing Nmap on a self-hosted system.

The Discovery - IP Based (com.snc.discovery.ip_based) plugin provides the installer for Nmap and the programming elements that allow a Windows MID Server to run approved scripts on target CIs for credential-less Discovery. MID Servers on which Nmap is installed can execute an Nmap command configured to perform reverse DNS name resolution, discover MAC addresses, or gather OS information on target CIs without using credentials. The Discovery - IP Based plugin is activated automatically when the Discovery (com.snc.discovery) or Event Management and Service Mapping Core (com.snc.service-watch) plugins are activated.

Important: Service Mapping does not check for the presence of the Nmap capability and selects the MID Server based on the IP address only. To ensure that Service Mapping
does not select a MID Server without the **Nmap** capability, install Nmap on all MID Servers assigned to the IP address ranges on which you want credential-less Discovery to be available. If Service Mapping selects a MID Server for credential-less Discovery that does not have Nmap capabilities, this error message appears in the map, at the site of the CI being discovered: Nmap is not installed on MID Server. Verify all MIDs configured to handle selected IP Address have Nmap Capability. Nmap root directory path does not exist: `<path>`.

Nmap is supported on all editions of these operating systems, including virtual machines and 64 bit systems:

- Windows 2008
- Windows 2012
- Windows 2016

Nmap can be installed on MID Servers that meet these requirements:

- Status is **Up**.
- MID Server is validated.
- MID Server does not already have the **Nmap** capability.

**Important:** Running Nmap scans to or from any resource within the Amazon Web Service AWS environment is tightly regulated and requires the permission of AWS through the **AWS Vulnerability/Penetration Testing Request** form. AWS only permits testing of EC2 and RDS instances that you own. Tests against any other AWS services or AWS-owned resources are prohibited. In addition, any Nmap scan of a permitted instance must be performed within an approved time window. For these reasons, credential-less Discovery within an AWS environment is not appropriate, and if a violation of their policy occurs, could result in expulsion from the service.

1. Navigate to **MID Server > Servers**.
2. Open the desired MID Server record.
3. Under **Related Links**, select **Enable Credential-less Discovery**.
   A confirmation dialog box appears.

4. Click **Yes** to continue with the installation.
   The instance runs the Nmap installer from [https://install.service-now.com](https://install.service-now.com), a site within a ServiceNow datacenter that contains installers for the platform. This progress notice appears during installation:
The Logs tab in the MID Server record shows the message: Running system command: installNmap.

5. Click OK if you want to hide the dialog box while the installer continues to run in the background.

Installing Nmap also installs Npcap on the host, if it is not already installed. Npcap is Nmap’s packet capture library for Windows that allows Nmap to perform port scans quickly and to identify the family of the operating system running on the target. Npcap is installed once on the host and can be used by any other application that requires it, such as Wireshark.

Note: If a more recent version of Npcap is already installed on the Windows MID Server host, Nmap is installed without Npcap. If an older version of Npcap is installed on the host, the Nmap installer upgrades it to the newer version.

The installation process has either of these outcomes:

- **Success**: These conditions indicate a successful installation:
  - The version of Nmap that is installed appears in the Nmap version field in the MID Server record
  - The Related Link changes to Disable Credential-less Discovery.
  - The Nmap capability is assigned to the MID Server and appears in the Capabilities tab of the MID Server record.

- **Failure**: If the installation fails, an error message is logged to the MID Server Issue (ecc_agent_issue) table. If you run the installer again with success, the issue is marked as Resolved.

6. To uninstall Nmap for a selected MID Server, select Disable Credential-less Discovery under Related Links in the MID Server record.

   This dialog appears during the uninstallation process:
The **Logs** tab in the MID Server record shows the message: Running system command: uninstallNmap.

**Note:** Uninstalling Nmap does not uninstall Npcap. This must be done manually.

**Install Nmap in a self-hosted environment**

Use this procedure to install Nmap on MID Server host machines in a self-hosted environment that does not allow network access to the ServiceNow install.service-now.com download site.

Role required: admin, maint

You must install Nmap manually on each MID Server host, and then configure the instance to execute credential-less Discovery.

**Note:** This procedure does not apply to self-hosted customers whose instance can access install.service-now.com from within their network.

1. Navigate to **MID Server > Properties** (MID Server Property (ecc_agent_property) table) and open the record for the **mid.nmap.version** property.
   
   This property contains the version of Nmap that you must install. Record the version number.

2. Download the correct installer executable from one of these URLs:
   
   - [https://nmap.org/dist/](https://nmap.org/dist/): If the Nmap version in the property is 7.50, the executable you need is [https://nmap.org/dist/nmap-7.50-setup.exe](https://nmap.org/dist/nmap-7.50-setup.exe).
   

3. Create a folder called `nmap` in the MID Server agent folder of every MID Server you want to use for credential-less Discovery.
4. Copy the Nmap installer file that you downloaded to the `nmap` folder and rename it to `nmapInstaller.exe`.

5. Run the `agent\scripts\PowerShell\NmapInstallation.ps1` script and pass it the following parameters in the order in which they appear. This script runs the `nmapInstaller.exe` file.

   1. `$operation`: Task that `NmapInstallations.ps1` will process. To install Nmap, the task is `install`.
   2. `$nmap_root_path`: Complete path for the `nmap` folder that you create in step 4.
3. **$nmap_self_installer**: Complete path for nmapInstaller.exe file that you copied in step 5.

4. **$nmap_command**: Complete path for the Nmap install command. The NmapInstallations.ps1 script installs Nmap in the nmap folder created in step 4. This parameter is **$nmap_root_path\nmap.exe**.

5. **$nmap_uninstall_command**: Complete path for the Nmap uninstall command. This command is **$nmap_root_path\Uninstall.exe**.

6. **$nmap_npcap_version**: The Npcap version installed with Nmap. This value must be the same as the value of the mid.nmap.npcap.version property in the MID Server Property (ecc_agent_property) table.

7. **$nmap_safe_scripts**: List of safe scripts that Nmap uses. You can retrieve this list from the mid.nmap.safe.scripts property in the MID Server Property (ecc_agent_property) table.

6. Set up the parameters in the NmapInstallations.ps1 script in this order:

   ./NmapInstallations.ps1 $operation $nmap_root_path $nmap_self_installer $nmap_command $nmap_uninstall_command $nmap_npcap_version $nmap_safe_scripts

   For example, the script might look like this:

   ```powershell
   PS C:\MidServers\mid1\agent\scripts\PowerShell> .\NmapInstallations.ps1
   "install"
   "C:\MidServers\mid1\agent\nmap"
   "C:\MidServers\mid1\agent\nmapInstaller.exe"
   "C:\MidServers\mid1\agent\nmap\nmap.exe"
   "C:\MidServers\mid1\agent\nmap\Uninstall.exe"
   "0.91"
   ```

7. After installation is complete, add the **Nmap** capability to each MID Server you want to use for credential-less Discovery.

   **Attention**: Only a **maint** user can add the **Nmap** capability to a MID Server. Contact ServiceNow Technical Support to request temporary **maint** access to your instance.

   a) On the instance, open the MID Server record.
   b) Select the **Capabilities** related list.
   c) Click **Edit**.
   d) Select **Nmap** from the list of available capabilities and click **Save**.
Uninstall Nmap in a self-hosted environment

Use this procedure to uninstall Nmap in a self-hosted environment that does not allow network access to the ServiceNow install.service-now.com download site.

Role required: admin, maint

Nmap must be manually uninstalled from each MID Server host machine and then disabled on the ServiceNow instance.

1. Run `Uninstall.exe` in the `nmap` folder on each MID Server host configured for credential-less Discovery.
2. After uninstallation is complete, delete the `nmap` folder from the `agent` folder.
3. Remove the Nmap capability from each MID Server record.

**Attention:** Only a maint user can remove the Nmap capability from a MID Server. Contact ServiceNow Technical Support to request temporary maint access to your instance.

a) On the instance, open the MID Server record.
b) Select the Capabilities related list.
c) Click Edit.
d) Remove Nmap from the active capabilities list and click Save.

Enable script file synchronization for Windows enhanced security

Windows Internet Explorer enhanced security blocks downloaded files that it determines are potentially dangerous.

Enhanced security in Windows browsers, such as Internet Explorer, blocks downloaded files that it determines are potentially dangerous. This would block files downloaded for use by the MID Server. You would need to unblock each file manually through the browser.

To get around this issue, use file synchronization. File synchronization requires you to proactively take script files from your instance and save them on the MID Server. The files on the instance and the MID server stay synchronized, but there is no longer any need for the MID Server to download the whole file. File synchronization also protects any updates you make in those script files from being overwritten during the upgrade of an instance.
Script files synchronized with the MID Server are stored on the instance in the MID Server Script File \[ecc_agent_script_file\] table, which you can access in the MID Server > Script Files module.

When the MID Server first connects to the instance, the instance creates a directory called \scripts in the MID Server root. The instance then creates a parent directory in the path \scripts\<parent_name> using definitions from the ecc_agent_script_file table. Finally, the instance creates the script files themselves inside the parent directory using the records from the ecc_agent_script_file table.

The record for the parent directory looks like this:

The instance creates each script file in the parent directory on the MID Server using the record Name from the ecc_agent_script_file table as the file name and the Script field payload as the file contents. A script file record looks like this:
The synchronization of the script file continues to work as if the script was manually added to the form.

See [Attach a script file to a MID Server](#) for instructions on how to attach a script file.

**Note:** The MID Server Script File (ecc_agent_script_file) table is domain separated. You can create versions of these policies that only a MID Server from the same domain can use. For instructions, see [Set up domain separation for MID servers](#).

### Attach a script file to a MID Server

You can attach a script file to synchronize to a connected MID Server, to enable using the script file attachment.

**Role required:** `admin`

You can attach multiple files, but the last attached file gets synchronized to the MID Server. If you delete the attachment, the script file becomes inactive, and the synchronized file is deleted from MID Server.

1. Navigate to **MID Server > Script Files**.
2. Open the file to which you would like to attach the script file, or click **New** to create a new file.
3. Select **Use attachment**, and then click the paperclip icon to add the attachment.

**Note:** When **Use attachment** is checked, an attached script file overrides the script contained in the **Script** field. If this check box is cleared, the script in the **Script** field is used instead of the attachment.

The script file attachment name must match the MID Server script file name, since the record can contain other attachments.

4. Click **Update** to initiate the synchronization process. Ensure that the file name matches the script name.

**Note:** If you receive the error message: *File type not permitted or mime type does not match the file content*, request that your administrator turn off mime type validation on attachments. The system property glide.security.file.mime_type.validation controls this setting.

### Configure a MID Server for RCA for business services

To enable the Event Management root cause analysis (RCA) for business services capability, configure at least one dedicated MID Server with the ServiceAnalytics as a supported application, and with the RCA capability. To ensure uninterrupted services, you can configure a failover MID Server cluster for RCA.

If the Domain Support - Domain Extensions Installer plugin is activated, then you can configure a dedicated MID Server with the RCA for business services capability per domain. In this case, RCA for a business service is done on the MID Server that is in the same domain as the business service. Otherwise, a MID Server from the global domain is used.

#### Hardware requirements

<table>
<thead>
<tr>
<th>Component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Memory</td>
<td>• <strong>Minimum:</strong> 4 GB</td>
</tr>
<tr>
<td></td>
<td>• <strong>Recommended:</strong> 8 GB</td>
</tr>
<tr>
<td>Processor</td>
<td>• <strong>Minimum:</strong> Either of the following:</td>
</tr>
<tr>
<td></td>
<td>• Core 2+</td>
</tr>
<tr>
<td></td>
<td>• Xeon processor with a speed over 2 GHz</td>
</tr>
<tr>
<td></td>
<td>• <strong>Recommended:</strong> Quad-core</td>
</tr>
<tr>
<td>Disk space (for 100 discovered services)</td>
<td>• <strong>Minimum:</strong> 8 GB</td>
</tr>
<tr>
<td></td>
<td>• <strong>Recommended:</strong> 10 GB</td>
</tr>
</tbody>
</table>
Software requirements

<table>
<thead>
<tr>
<th>OS</th>
<th>Supported OS versions</th>
<th>Additional requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows</td>
<td>32-bit and 64-bit versions:</td>
<td>For either version of the OS:</td>
</tr>
<tr>
<td></td>
<td>- Windows 2008 R2</td>
<td>- 32-bit version of the MID Server</td>
</tr>
<tr>
<td></td>
<td>- Windows Server 2016</td>
<td></td>
</tr>
<tr>
<td>Linux</td>
<td>- Red Hat Enterprise Edition Linux 6.6 or later</td>
<td>32-bit or 64-bit version of the MID Server</td>
</tr>

</tbody>
</table>

Role required: admin

The RCA for business services MID Server supports the Event Management RCA for business services process by hosting the RCA Learner and the real-time RCA query handler. On the RCA for business services MID Server, the system builds models that support responses to root cause queries. The learner data on the RCA for business services MID Server persists by default for a maximum of 90 days.

By default, the MID Server is set up as a dedicated MID Server for Event Management RCA for business services, and an attempt to add additional supported applications to the same MID Server is prevented. You should implement Operational Intelligence with its own dedicated Operational Intelligence MID Server. This ensures a high level of performance. However, if needed, you can modify this default behavior and configure the RCA for business services MID Server or the Operational Intelligence MID Server with additional supported applications. For information about modifying the behavior of the ALL option when selecting supported applications, see Configure applications included in ALL Applications.

1. Ensure that the MID Server is validated.
   For more information, see Validate the MID Server.
2. Navigate to MID Server > Servers.
3. Double-click the MID Server that you want to configure as an RCA for business services MID Server.
4. Add the ServiceAnalytics application:
   a) At the center of the MID Server form, click Supported Applications.
   b) In the Supported Applications section click Edit.
   c) In the slushbucket select ServiceAnalytics and click the > add button.
   d) Click Save.

If the MID Server needs to support ServiceAnalytics as well as one or more other applications, you can modify the definition of the ALL option to include these applications, and then select ALL in the slushbucket. ALL is the only option to which it is valid to add the ServiceAnalytics option. Performance might be compromised with these settings.

5. Add the RCA capability:
   a) At the center of the MID Server form, click Capabilities.
b) In the **Capabilities** section click **Edit**.

c) In the slushbucket select **RCA** and click the ‘>’ add button.

d) click **Save**.

6. **Click Update.**

The RCA for business services MID Server is automatically configured with a Discovery IP range set to 0.0.0.0-0.0.0.0.

Create a failover cluster for RCA. In this cluster, add the MID Servers that were configured for RCA. For more information, see [Configure a MID Server cluster](#).

### MIDSystem methods

MIDSystem variables (referred to by the variable name ms.) provide a variety of methods to get information about the MID Server.

<table>
<thead>
<tr>
<th>Method summary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>log(String message)</code></td>
<td>Logs the given message with a standard prefix to indicate that the message was generated by JavaScript.</td>
</tr>
<tr>
<td><code>getConfigParameter(String parameter name)</code></td>
<td>Returns the value of the named configuration parameter.</td>
</tr>
<tr>
<td><code>include(String script include)</code></td>
<td>Include the MID Server script include with the given name into the current context.</td>
</tr>
<tr>
<td><code>getName()</code></td>
<td>Returns the name of the MID Server.</td>
</tr>
<tr>
<td><code>getSysID()</code></td>
<td>Returns the sys_id of the MID Server.</td>
</tr>
<tr>
<td><code>toJavaScript(Object)</code></td>
<td>Converts the given Java object into the equivalent JavaScript object.</td>
</tr>
</tbody>
</table>

This example writes a message to the log:

```java
ms.log('Attempting to log in with user: ' +
       this.getParameter('user'));
```

### Synchronize a JAR file to MID Servers

You can upload a JAR file to an instance and synchronize it to all MID Servers, or write custom probes that use the synchronized JAR file.

Role required: admin, agent_admin

The MID Server JAR File (ecc_agent.jar) table is domain separated. You can create versions of these policies that only a MID Server from the same domain can use. For instructions, see [Set up domain separation for MID servers](#).

**Caution:** Synchronizing a JAR file with this procedure causes all MID Servers connected to the instance to restart automatically.

1. **Navigate to** **MID Server > JAR Files.**
2. **Click New.**
3. Complete the following fields:
   - **Name**: A unique and descriptive name for identifying the file in the instance.
   - **Version**: A version number for the file, if one is available.
   - **Source**: Location of the JAR file for reference purposes. Source information is not used by the system.
   - **Description**: Short description of the JAR file and its purpose in the instance.

4. Click the paper clip icon in the banner.

5. In the Attachments dialog box, click **Browse** and select the file you want to attach.

   The platform attaches the JAR file to the record and restarts the MID Servers to synchronize the file. It is not necessary to update the record to attach the file.

### Set the MID Server JVM memory size

The MID Server starts with a default JVM memory allocation, but you can modify this setting in the configuration file.

**Role required**: admin

In the base ServiceNow system, the MID Server JVM memory is set to 1024MB, which is configured in the `\agent\conf\wrapper-override.conf` file in the MID Server installation directory. This setting might not be appropriate for the way your organization uses the MID Server. If you want the MID Server to work harder, allocate more resources to it. If the MID Server is located in a small branch office and runs in an environment where memory allocation is shared between a print server, mail server, or web proxy server, the allocation might have to be reduced.

**Note**: For a complete list of minimum MID Server requirements, see [MID Server system requirements](#).

1. Open the `\ServiceNow\<MID Server name>\agent\conf\wrapper-override.conf` file in a text editor.

   For more information about this file, see [Installing Multiple MID Servers on a Single System](#).

2. Locate the following lines in the file:

   ```
   # OPTIONAL: Maximum Java Heap Size (in MB)# wrapper.java.maxmemory=1024
   ```

3. Edit the memory allocation.

4. Remove the comment tag (#) from the memory allocation parameter.

5. Save the file.
6. Restart the MID Server service.

**Set MID Server thread use**

If the MID Server is running on a host containing many other programs that must compete for CPU time, fewer threads than the default of 25 might be necessary.

**Role required:** admin

You can set the MID Server to use as few as 5 threads without issues. If the MID Server needs more speed, and the host is powerful enough or lightly loaded with other programs, raise the thread setting. The thread limit depends on the hardware and the operating system of the host. You might have to experiment to find the optimal value for your situation. The following general observations may be useful:

- Most MID Server tasks require file handles to do their job.
  - Windows: On the Windows operating system, file handles are available in a fixed quantity. If you configure too many MID Server threads on a Windows host, the MID Server can consume all the file handles before approaching maximum CPU usage. This situation appears as an Out of file handles error in the MID Server log and indicates that the MID Server is trying to use too many threads.
  - UNIX and Linux: UNIX and Linux hosts have a much different scheme for allocating file handles. Generally, you can increase MID Server thread use on these operating systems until the CPU of the host is overloaded. See your OS documentation for monitoring CPU usage.

- Each thread on the MID Server requires some memory. Exactly how much memory varies considerably from task to task and depends on the equipment being discovered. To increase the number of threads, you might have to increase the amount of memory that Java uses. If you configure insufficient memory, an Out of memory error appears in the MID Server log.

Follow the steps below to change the `config.xml` file. Alternatively, use the `threads.max` connection parameter.

1. Open the `\agent\config.xml` file using any text editor.
2. Locate the following lines:
   ```xml
   <!-- MID Server Threads -->
   <parameter name="threads.max" value="25"/>
   ```
3. Edit the value. Keep in mind the cautions described above.
4. Save the record.
5. Restart the MID Server service.

**ECC queue retry policy**

Define retry policies for outbound Web Services that are executed via the ECC Queue table.

Retry policies specify a matching error condition for ECC Queue input records that are a result or response of an output queue record, the interval for retry, and the maximum number of retries. Because it matches on the input queue record, the retry policies only work when an input ECC Queue record is expected, and therefore requires that the outbound messages are queued on the ECC Queue table as well. Advanced matching criteria may be specified using script.

**Retry activity**

The retry activity records document each attempt to retry the output queue record.
When the current policy is being retried, the **Status** of the activity will indicate Retrying. When all retries are exhausted, e.g. the maximum number of retries have occurred and the output queue still failed, the **Status** field will indicate a Failed state. Otherwise, at anytime during the retry, if the request then becomes successful, it indicates Succeeded.

**Queue Retry Activity**

You may also display the current list of retry activities and their states by selecting the **Queue Retry Activity** module.
### Queue Retry Activities

</tr>
</tbody>
</table>
Retry policy example

This retry policy defines the matching criteria when an UnknownHostException response is received during a SOAPClient (outbound SOAP message invocation) call.

<table>
<thead>
<tr>
<th>Name:</th>
<th>SOAPClient java.net.Unkn</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agent:</td>
<td>SOAPClient</td>
</tr>
<tr>
<td>Topic:</td>
<td></td>
</tr>
<tr>
<td>ECC Name:</td>
<td></td>
</tr>
<tr>
<td>Source:</td>
<td></td>
</tr>
<tr>
<td>Action:</td>
<td></td>
</tr>
<tr>
<td>Description:</td>
<td></td>
</tr>
<tr>
<td>Max retry:</td>
<td>3</td>
</tr>
<tr>
<td>Retry interval:</td>
<td>Days 0 Hours 00:00:15</td>
</tr>
</tbody>
</table>

Condition:

- State: is error

Condition script:

```java
answer = current.error_string.toString().startsWith('java.net.UnknownHostException');
```

Default Queue Retry Policy

The policy will only match if the Agent, Topic, ECC Name (matches the Name field), and Source fields match that of an input ECC queue record. Additionally, the Condition and Condition script criteria will also have to match "State == error" and the error_string field contains the text java.net.UnknownHostException.

When these conditions are met, and an input record is matched, it will retry the originating output queue record after 15 seconds, and for a maximum of 3 times.

The MID Server ECC Queue

The External Communication Channel (ECC) Queue is a connection point between an instance and the MID Server. Jobs that the MID Server needs to perform are saved in this queue until the MID Server is ready to handle them.

The MID Server subscribes to messages published by the Asynchronous Message Bus (AMB), which notifies the MID Server that it has pending tasks in the ECC Queue. If a job exists in the ECC Queue...
for that MID Server, the MID Server sets the status to "I'm working on it." When finished working on a requested job, the MID Server reports back to the ECC queue with the results.

You can access the ECC Queue by navigating any of these paths:

- **Discovery > Output and Artifacts > ECC Queue**
- **Discovery > Discovery Schedules > (schedule name) > (Discovery status record)**
- **ECC > Queue**
- **(Discovery Status record) > ECC Queue**

## ECC Queue fields

An ECC Queue provides the following information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agent</td>
<td>The name of the external system that this messages is either from or to. If the message is from or to a MID Server, the agent name is in the form <code>mid.server.xxx</code>, where <code>xxx</code> is the name of a particular MID Server.</td>
</tr>
<tr>
<td>Topic</td>
<td>The name of the probe the MID server ran. If you are using a pattern for discovery, the Horizontal Pattern probe appears.</td>
</tr>
<tr>
<td>Name</td>
<td>The actual command the probe ran. For example, if Topic is SSHCommand, then the Name field contains the actual shell command to run. If you are using a pattern for discovery, the following appears: Pattern Launcher: followed by the name of the pattern and the multipage number.</td>
</tr>
<tr>
<td>Source</td>
<td>The IP address that the discovery is to run against. A few probes run against multiple IP addresses; in those cases, this field contains a human-readable description.</td>
</tr>
<tr>
<td>Response to</td>
<td>This optional field contains a reference (sys_id) to the ECC Queue message that this message is in response to. Discovery makes extensive use of this field to track the hierarchy of messages that result from a given scheduled Discovery. Click the record icon for the value in this field to open the ECC Queue record for the activity that spawned the current probe or sensor record.</td>
</tr>
<tr>
<td>Queue</td>
<td>An indicator of whether this message was an input message or an output message.</td>
</tr>
<tr>
<td>State</td>
<td>The state of the current ECC queue record. States update automatically.</td>
</tr>
<tr>
<td>Processed</td>
<td>The time when this message was processed.</td>
</tr>
<tr>
<td>Created</td>
<td>The time when this message was created.</td>
</tr>
<tr>
<td>Sequence</td>
<td>The unique sequence number for this message. This value is automatically generated when an ECC Queue record is inserted. Its use is deprecated.</td>
</tr>
<tr>
<td>Field</td>
<td>Input value</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Error string</td>
<td>An error message, if an error occurred during processing. This field is hidden on the standard form unless there was an error.</td>
</tr>
<tr>
<td>Payload</td>
<td>The body of the message in XML format. The returned XML has a root tag of <code>&lt;results&gt;</code> containing one or more <code>&lt;result&gt;</code> tags and a single <code>&lt;parameters&gt;</code> tag. The parameters are simply an echo of those sent to the MID server in the probe; they vary from probe to probe, but in general they tell the probe the details of what it is to do and how it should behave. The result tags are the most interesting ones: they contain the actual data generated by the probe.</td>
</tr>
</tbody>
</table>

### ECC queue controls

The ECC Queue form contains these related links:

<table>
<thead>
<tr>
<th>Related link</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run again</td>
<td>Runs the probe again. You can re-run probes when you encounter a failed discovery or other unexpected results.</td>
</tr>
<tr>
<td>Go to CMDB item</td>
<td>Open the CI record for the CI that was updated during the discovery.</td>
</tr>
<tr>
<td>Go to Sensor</td>
<td>Open the record for the associated sensor.</td>
</tr>
</tbody>
</table>

### Manage ECC Queue content for a MID Server

The ECC Queue allows you to create ECC Queue messages, access MID Server log entries, and retrieve statistics from an individual MID Server record.

Role required: admin, mid_server

1. Send remote commands through a MID Server to a hosting device directly from the ECC Queue without running Discovery.
   a) Navigate to the ECC Queue and click **New**.
   b) Create a message with these settings:
      - **Agent**: The name of the MID Server that executes the command.
      - **Topic**: Command
      - **Name**: The actual command that you want to process. For Windows, this is expressed in a DOS command line structure. For Linux, the structure could be a bash command line entry.
      - **Queue**: Output
      - **Payload**: With proper XML tags, you can specify the command here instead of in the **Name** field. The advantage to this is that the command is not restricted by the **Name** field length of 120 characters. Use the following XML format for the command:

```xml
<parameters>
  <parameter name="name" value="ACTUAL_COMMAND_LINE"/>
</parameters>
```
2. Access entries in the ECC Queue that show **agent0.log.0** logs and **wrapper.log** logs for an individual MID Server.
   a) Open a MID Server record.
   b) Under **Related Links**, click **Grab MID Logs**.
      ECC queue records appear in the list using the following filter:
      - (Topic) (is) (SystemCommand)
      - (Source) (is) (grabLog)
      - (Agent) (is) (your MID Server)
      Only **agent0.log.0** and **wrapper.log** entries appear. These logs are also accessible in the ~ \agent\logs\ file path.
   c) To open a log entry, click the link under the **Created** column.

3. Access the **queue.stats** topic for useful information about individual MID Servers, such as memory and CPU usage data.
   a) Open a MID Server record.
   b) Under **Related Links**, click **MID Statistics**.
      ECC queue records appear in the list using the following filter:
      - (Topic) (is) (queue.stats)
      - (Agent) (is) (your MID Server)

**MID Server cluster configuration**

MID Server clusters enable multiple MID Servers with the appropriate capabilities to be grouped together for load balancing and fail-over protection.

**External data sources**

For performance and reliability reasons, these data sources should not be used with MID Server clusters:
- LDAP
- Export sets
- JDBC data sources

These external data sources should only be used with dedicated MID Servers.

**Note:** If a MID Server in a cluster fails, the fail-over MID Server starts over at the beginning of the ECC queue task even if much of the information from the JDBC data source was already returned. This can result in duplicate data.
How clusters work

MID Servers in clusters must be able to connect to the instance and to all the devices with which they are expected to communicate. If all MID Servers in a cluster are down, the discovery is canceled. Make sure all the MID Servers are added to any Access Control List (ACL) in use. MID Server clusters are managed by a business rule called MID Server Cluster Management, which checks to see if the MID Server assigned to a job in the ECC Queue belongs to a cluster.

Load balancing

If the cluster business rule determines that a MID Server is part of a load balancing cluster, the application using the MID Server automatically balances the work between the MID Servers in that cluster. It is good practice to put MID Servers with the same capabilities in a load balancing cluster.

Fail-over protection

MID Servers in a fail-over cluster each have a configured order that the platform uses to determine which MID Server to use next in case of failure. MID Servers in a fail-over cluster work independently and do not load balance with other MID Servers in that cluster (although they might also be members of load balancing clusters). When a MID Server fails, the MID Server Cluster Management business rule selects the highest available MID Server in the order to take over the work. The selected MID Server checks the ECC Queue and starts with jobs that are either Processing or Ready.

Note: MID Server clustering does not support the ECC queue topics Command or SystemCommand. If these commands are received, the clustered MID Servers do not redirect the ECC queue to another MID Server. The ECC queue records stay on the ECC queue without being processed.

Configure a fail-over MID Server with at least the same capabilities as the MID Server it is intended to relieve.

Note: If a MID Server fails while the Shazzam probe is running and auto-selection is configured, failover is not available. The Shazzam discovery stops. Discovery does not automatically choose another MID Server.

MID Server cluster event

The following event is triggered when the platform cannot find a MID Server with the appropriate capabilities to replace a MID Server in a fail-over cluster. Use this event to create an email to notify appropriate users that the cluster has failed.

<table>
<thead>
<tr>
<th>Event</th>
<th>Table</th>
<th>Description</th>
<th>Business Rule</th>
</tr>
</thead>
<tbody>
<tr>
<td>mid_server.cluster.down</td>
<td>MID Server Cluster</td>
<td>A MID Server cluster has failed</td>
<td>MID Server Cluster Management</td>
</tr>
</tbody>
</table>

Combining clusters

A MID Server can be added to both types of clusters at the same time. This diagram shows a scenario in which a MID Server from a load balancing cluster (MID Server D) is also present in a
fail-over cluster. If MID Server D fails, MID Server E in the failover cluster is available to the load balancing cluster to perform the tasks previously assigned to MID Server D.

![MID Server failover example](image)

**Specify a specific MID Server cluster**

You can specify a specific MID Server cluster for a Discovery schedule. The discovery process uses that cluster only. You cannot chain clusters or specify a single MID Server that belongs to multiple clusters.

**Configure a MID Server cluster**

Configure a cluster of MID Servers for either failover or load balancing.

Role required: admin

You can select a MID Server cluster from the Discovery Schedule form.

1. Navigate to **MID Server > Clusters**.
2. Click **New**.
3. Name the cluster and select the cluster type: **Failover** or **Load Balance**.
4. Right click in the header bar and select **Save** from the context menu.
5. Click **Edit** in the **Includes MID Servers** Related List.
6. Select appropriate MID Servers for this cluster from the slushbucket.

**Note:** All MID Servers in a cluster should have capabilities defined. Ensure that each MID Server has the appropriate capabilities for the job. A MID Server in a fail-over cluster must have the same capabilities (or expanded capabilities) as the MID Server it is expected to replace.

**MID Server capabilities**

MID Server capabilities define the specific functions of a MID Server within an IP address range.

Several applications, such as Discovery, Service Mapping, Cloud Management, and Orchestration can use capabilities, IP ranges, and **MID Server selection** to narrow the pool of MID Servers the applications need.
Note: At least one capability is required for each MID Server used by Orchestration. See MID Servers for Orchestration for more information.

The following capabilities are available by default with Discovery:

- All
- Cloud Management
- Nmap
- PowerShell
- Resolve DNS
- REST
- SNMP
- SOAP
- SSH
- VMware
- WMI

Nmap capability

The Nmap capability is only assigned to MID Servers for which the Network Mapper (Nmap) scanner has been installed for credential-less Discovery. This capability cannot be added to or removed from any MID Server manually. For instructions on installing or uninstalling Nmap, see Install and uninstall Nmap on a MID Server.

MID Server capability values

Capabilities provided in the base system do not have a defined value string. A MID Server configured to use a capability that has no value can locate any device using that capability’s protocol. If a capability has a defined value, the MID Server using that capability finds only those devices using that protocol that match the value string exactly. The exception to this is the Resolve DNS capability, which is configured to resolve any DNS name into an IP address using a partial string match.

Starting with the Kingston release, the (capability name):(value) combination appears in the slushbucket when you add a capability to a MID Server. This combination allows you to see all the capabilities that have different values, even if the capability name is the same. For example, if you are using the Cloud Management capability, and you use the value field to specify the us-west logical datacenter on one of the capability records, you can see the combination in the Collection list.
Scripted MID Server capability value matching

You can use value tests to create capabilities that find devices using values without requiring exact string matching. Action on these values is controlled by a user-defined script.

The Resolve DNS capability is provided in the base system and is configured to resolve DNS names into IP addresses for devices whose names end with a specified domain name. The capability Value entered is automatically prefaced with a dot during processing to match domain syntax. This value can contain one or more sub-domains, but must include the end of the domain string. Matching devices must end with the identical syntax. The script for the Resolve DNS capability determines if a device name matches the criteria defined by Value. If a match exists, the platform performs the address resolution automatically. For example, if the value for the Resolve DNS capability is service-now.com, the MID Server with this capability finds lnxlab01.sandiego.service-now.com and dbsrv101.sanjose.service-now.com. If the value is changed to sandiego.service-now.com, then the MID Server finds only lnxlab01.

**Note:** If Value in the Resolve DNS capability is blank, then all domains match.

To view the script for evaluating this capability, navigate to MID Server > Capability Value Tests and select Resolve DNS from the list.
Configure MID Server capabilities

A capability is required for each MID Server to work with Orchestration, Cloud Management, Service Mapping, and alert aggregation and RCA.

Role required: admin or sm_admin

1. Navigate to MID Server > Capabilities.
2. Select an existing capability. You can also select **ALL** to include all capabilities.

   **Note:** Ensure that each IP address range has MID Servers with the necessary capabilities to complete the Orchestration activities on that network segment.

3. Create a new capability:
   a) Click **New**.
   b) Configure the value for a custom capability.
      An example is a capability for **DOMAIN**, with a value of **service-now**.
   c) Click **Submit**.

4. Click **Edit** in the MID Servers related list to add MID Servers to the capability.
5. Select one or more MID Servers for this capability from the slushbucket.
6. Click **Save**.
   The capability defined here also appears in the primary record for this MID Server.

**MID Server troubleshooting**

The Knowledge Base on Hi contains several articles to help you troubleshoot MID Server issues.

<table>
<thead>
<tr>
<th>The MID Server Troubleshooting Guide</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>KB0597571</strong></td>
</tr>
<tr>
<td>Start here if you are experiencing symptoms such as the MID Server going down or not responding, or CIs being duplicated during discovery.</td>
</tr>
</tbody>
</table>

You can also see the following video on NOWsupport YouTube channel:

- **How to set up a MID Server**

**MID Server active issues**

The ServiceNow® instance has a dedicated table that publishes active issues with MID Servers and alerts administrators when a MID Server is in danger of exceeding its resources.

The MID Server issue (ecc_agent_issue) table displays a number of common issues that a MID Server can experience, as they occur. Error checking processes attempt to pinpoint the most likely cause of the issue. Informative error messages name the affected MID Server and explain the possible cause of the issue. The ecc_agent_issue table retains its records for 30 days.

To access records in this table, navigate to **MID Server > Server Issues**.

Supported MID Server active issues:

- Bad user credentials after instance cloning.
- Approaching resource thresholds for CPU usage and JVM memory.
- Errors detected during **pre-upgrade testing**.
- User authentication and authorization failures.
- Network connectivity interruptions and role configuration errors.
Active MID Server post-cloning credential issues

The system provides automatic processes to detect and notify you of possible MID Server credential issues after instance cloning.

During an instance clone, the MID Server (ecc_agent) table is not copied from the source instance, but the User (sys_user) table is copied. As a result, the source MID Server user credentials copied into the target instance might not match those used by the existing set of MID Servers used by the target. Bad credentials can cause those MID Servers to be down for the target instance. Processes on the instance notify you if a MID Server is down from suspected bad credentials following an instance clone.

Table for post-cloning credential issues

The MID Server Issue (ecc_agent_issue) table stores active MID Server issues after an instance clone. Records in this table show a MID Server’s current state, evaluation times, and the issue.
source. For cases in which a MID Server for a cloned instance is down because of possible bad credentials, the Issue source is InstanceClone. Data from the MID Server Issue (ecc_agent_issue) table are displayed in a related list on a MID Server record. Records in this table are removed after 10 days, regardless of their state. Ongoing issues reappear as they occur.

Post-cloning cleanup script and scheduled jobs

A cleanup script called Bad MID Server credentials after clone runs on the target instance after cloning and calls a script include called BadMIDCredentialAfterClone. This script includes schedules the execution of the following jobs on the Schedule Item (sys_trigger) table:

- BadMIDCredentialAfterClone-1: Runs 15 minutes after clone execution.
- BadMIDCredentialAfterClone-2: Runs 75 minutes after clone execution.

These jobs log to the MID Server Issue (ecc_agent_issue) table any MID Servers that existed on the target instance prior to the clone that are in the Down state. These MID Servers are not ready for normal processing and might be down due to invalid credentials resulting from the cloning process. The state of MID Servers added to the target instance after the clone is not evaluated.

Note: The MID Server log shows that the MID Server user associated with the target instance could not be authenticated or was missing the proper role.

Business rule that checks for bad credentials

The Check for bad MID credential after clone business rule monitors the MID Server (ecc_agent) table for MID Servers that are transitioning from Down to Up. If the business rule finds a MID Server making that transition, the rule attempts to find a matching MID Server in the MID Server Issue (ecc_agent_issue) table that has an issue source of InstanceClone and a state other than Resolved. If a match is found, the business rule updates the state of the MID Server in the (ecc_agent_issue) table to Resolved.

Resolving MID Server issues

The error message in the MID Server Issue (ecc_agent_issue) table names the affected MID Server user. This message appears each time the business rule runs and finds a MID Server that is down from suspected bad credentials:

MID Server not operational (status: Down), possibly due to recent clone.
Verify credentials for logged in User 'local-midserver'.

Attempt to resolve the issue first by comparing the user's credentials with the credentials that the affected MID Server is expecting. If the credentials are incorrect, fix the problem and check the MID Server status again. If the credentials are correct, but the MID Server remains down, check the Knowledge Base for other possible causes.

MID Server resource threshold alerts

The instance displays warnings when a MID Server breaches its resource thresholds for CPU and JVM memory usage, enabling users to create email notifications or custom scripts when a breach occurs.

The MID Server Issue (ecc_agent_issue) table warns users when a MID Server exceeds configured thresholds of its allocated CPU and memory resources. These warnings are published before the MID Server experiences performance degradation or an out-of-memory error, enabling the administrator to increase resources and avoid downtime. Administrators can use a registered...
event to send email notification to selected recipients, advising them of any threshold breaches, or to create a custom script to do some other type of work. The instance continues to update the MID Server Issue (ecc_agent_issue) table to keep unresolved issues current.

By default, CPU and memory threshold alerts are disabled and no alerts are published to the MID Server Issue (ecc_agent_issue) table. To enable both types of alerting, add these properties to the System Property (sys_properties) table, and then set their values to true:

- mid.threshold.resource.breach.enable.cpu.alerts
- mid.threshold.resource.breach.enable.memory.alerts

For details on adding system properties to the platform, see Add a property using sys_properties.list.

Evaluation process

This processing occurs whether or not alerting is enabled:

1. Every 10 minutes, each MID Server transmits its CPU and memory consumption metrics to the instance. The instance inserts CPU metrics into the Mean CPU used % field of the ECC Agent Scalar Metrics (ecc_agent_scalar_metric) table and memory metrics into the Max memory used % field of the ECC Agent Memory Metrics (ecc_agent_memory_metric) table.

2. After a successful insert, the following business rules run on each table, invoking a script include that calls an appropriate function. Each function takes an average of the metric sets inserted into the tables, based on the configured sampling intervals.

   - **Update cpu mean on MID Server Status**: Calls the MIDResourceThresholdBreach.checkCpuUsage() script include.
   - **Update max memory on MID Server Status**: Calls the MIDResourceThresholdBreach.checkMemoryUsage script include.

Each function takes an average of the metric sets inserted into the tables, based on the configured thresholds and sampling intervals. The instance first looks at each MID Server for configuration parameters that set custom threshold values or sampling intervals for that MID Server. If no configuration parameters for these attributes are found, the instance looks in the System Properties (sys_properties) table for custom values to use. If no properties are found, the instance uses the default threshold and interval values from the code.

**Note:** Both the threshold percentages and the sampling intervals are configurable. See Configuring thresholds and sampling intervals for details.

Alerting process

When alerting for CPU or memory thresholds is enabled, this processing occurs:

1. If the aggregated average metric value equals or exceeds the configured percent threshold, the instance triggers the mid.threshold.resource.breach event. Administrators can use this event to create email notifications for threshold breach alerts or to create a custom script.

2. The instance inserts a record of the breach into the MID Server Issue (ecc_agent_issue) table with a State value of New and a Count of 1, and then publishes a message containing all the pertinent details of the breach. An example of this message is Mean CPU used % has exceeded threshold (96>=91) for a 40 minute interval span, occurring after start date 2017-01-11 14:25:19. This message appears in the Short description field of
the MID Server issue form and in the event. You can copy any part of the message into your email notifications.

**MID Server issue states**

When the administrator first examines an issue in the MID Server Issue (ecc_agent_issue) table, the administrator can change the **State** of the issue to **Acknowledged** to indicate that the issue is being addressed. Each time the instance detects a breach, it attempts to match the breach with an existing issue. If a MID Server already has an issue record for that breach in a **State** of **New** or **Acknowledged**, the instance updates the **Last Detected** field with the current date/time and increments the **Count** field in the existing record. This prevents the creation of duplicate records in the MID Server Issue (ecc_agent_issue) table and records the number of times after the initial incident that the breach reoccurred. The administrator can increase MID Server resources gradually and watch the effect on the **Count** field. When the counter stops incrementing, the administrator knows that the MID Server has adequate resources. When the MID Server resource have been adjusted appropriately, the administrator sets the **State** to **Resolved**. If a new threshold breach is logged that matches a MID Server issue with a **State** of **Resolved**, the instance creates a new issue record.

**Note:** Any record in the MID Server Issue (ecc_agent_issue) table that has not been updated in 30 days is deleted, regardless of its state.

**Recommendations for resolving resource issues**

Administrators have the opportunity to resolve any resource issues with a MID Server when they receive notification of the event. Follow these recommendations for reducing the strain on MID Server resources:

- **JVM memory**:
  - Allocate more max memory to the MID Server. For more information, see *Set the MID Server JVM memory size*.
  - Add additional MID Servers to share the workload. For more information, see *MID Server cluster configuration*.
  - Reduce the amount of concurrent processing for the MID Server. This includes segmenting IP Address ranges into smaller segments for a Discovery schedule or loading smaller segments of data within an import job.

- **CPU**: Reduce the activity on the host or migrate the MID Server to a new host with more available resources.
Tables used for resource threshold evaluation

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Server Issue (ecc_agent_issue)</td>
<td>Stores data on various types of MID Server issues, including breaches of configured CPU and memory thresholds. Fields used for resource threshold breaches are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>count</strong>: Number of times a previously reported threshold breach occurs, if the event is not marked <strong>Resolved</strong>.</td>
</tr>
<tr>
<td></td>
<td>• <strong>last_detected</strong>: Current date and time a threshold breach is detected. This field is updated each time a previously detected breach is found, if it is not marked <strong>Resolved</strong>.</td>
</tr>
<tr>
<td></td>
<td>• <strong>message</strong>: Descriptive message summarizing the conditions that triggered the threshold breach event. This message includes the actual percentage of CPU and memory calculated and the configured thresholds that were breached.</td>
</tr>
<tr>
<td></td>
<td>• <strong>mid_server</strong>: Name of the MID Server experiencing the resource threshold breach.</td>
</tr>
<tr>
<td></td>
<td>• <strong>source</strong>: The issue source for the breach. These are the possible sources:</td>
</tr>
<tr>
<td></td>
<td>• <strong>CpuMIDResourceThresholdBreach</strong>: CPU threshold issue sources.</td>
</tr>
<tr>
<td></td>
<td>• <strong>MemoryMIDResourceThresholdBreach</strong>: Memory threshold issue sources.</td>
</tr>
<tr>
<td>MID Server Status (ecc_agent_status)</td>
<td>Stores the percentages used for the CPU and memory resources, averaged over configurable intervals for each resource. The fields used are:</td>
</tr>
<tr>
<td></td>
<td>• Mean CPU used %</td>
</tr>
<tr>
<td></td>
<td>• Max Memory used %</td>
</tr>
<tr>
<td>ECC Agent Scalar Metric (ecc_agent_scalar_metric)</td>
<td>Stores the CPU usage data inserted by each MID Server every 10 minutes. The table field used by resource threshold alerting is <strong>mean</strong>.</td>
</tr>
<tr>
<td>ECC Agent Memory Metric (ecc_agent_memory_metric)</td>
<td>Stores the memory usage data inserted by each MID Server every 10 minutes. The table field used by resource threshold alerting is <strong>max_used_pct</strong>.</td>
</tr>
</tbody>
</table>
Business rules that check for threshold breaches

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update cpu mean on MID Server Status</td>
<td>Runs after the MID Server inserts a record into the ECC Agent Scalar Metric (ecc_agent_scalar_metric) table. This business rule triggers the MIDResourceThresholdBreach script include function that evaluates threshold settings to determine if the MID Server has breached its configured CPU resource thresholds.</td>
</tr>
<tr>
<td>Update max memory on MID Server Status</td>
<td>Runs after the MID Server inserts a record into the ECC Agent Memory Metric (ecc_agent_memory_metric) table. This business rule triggers the MIDResourceThresholdBreach script include function that evaluates threshold settings to determine if the MID Server has breached its configured memory resource thresholds.</td>
</tr>
</tbody>
</table>

Configuring thresholds and sampling intervals

You can use the default threshold percentages and sampling intervals or configure custom values using either of these methods:

- **Add system properties** to the instance and change the default values for all MID Servers.
- **Add configuration parameters** to change the default resource values for individual MID Servers.

The system properties and the configuration parameters use the same names.

<table>
<thead>
<tr>
<th>Property/configuration parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mid.threshold.mean_cpu.aggregate_interval_span</td>
<td>Number of 10 minute units in the interval for sampling CPU usage data. The default interval is 30 minutes (3 x 10 min.)</td>
</tr>
<tr>
<td><strong>Default</strong>: 3</td>
<td></td>
</tr>
<tr>
<td>mid.threshold.mean_cpu.percent</td>
<td>Usage percentage of the total CPU resources that initiates a threshold breach alert.</td>
</tr>
<tr>
<td><strong>Default</strong>: 95</td>
<td></td>
</tr>
<tr>
<td>mid.threshold.mean_max_memory.aggregate_interval_span</td>
<td>Number of 10 minute units in the interval for sampling memory usage data. The default interval is 30 minutes (3 x 10 min.)</td>
</tr>
<tr>
<td><strong>Default</strong>: 3</td>
<td></td>
</tr>
<tr>
<td>mid.threshold.mean_max_memory.percent</td>
<td>Usage percentage of the total memory resources that initiates a threshold breach alert.</td>
</tr>
<tr>
<td><strong>Default</strong>: 95</td>
<td></td>
</tr>
</tbody>
</table>
MID Server resource reporting

The MID Server dashboard contains two reports that give you views into the consumption of CPU and JVM memory resources. These reports show usage over the previous 30 days.

- **Avg Percentage of CPU Used**: Trending the daily average on CPU usage helps illustrate the amount of CPU processing that the MID Server host consumes. MID Servers deployed on the same host will report the same CPU usage.

- **Avg Percentage of Max Memory Used**: The maximum used percentage (max_used_pct) is a useful metric for determining if the MID Server has enough memory resources. This metric is a percentage of the max used memory over the total available memory. Trending this over time provides a visualization of how much memory is needed by the MID Server.

MID Server user connectivity issues

The instance writes issues involving MID Server user logins and network connectivity to the MID Server Issue (ecc_agent_issue) table and creates events you can use in custom scripts or to send email notifications.

Records in the MID Server Issue (ecc_agent_issue) table can provide insight into why your MID Server user cannot log in or why a MID Server cannot connect to the instance. The system displays records for connectivity problems in this table that include informative error messages suggesting possible causes. By default, a scheduled job called MIDUserConnectivity runs every four hours and launches the MIDUserConnectivity script included to evaluate MID Server connection activity. Records in the MID Server Issue (ecc_agent_issue) table reflect the status of MID Server login attempts and connectivity at the time the scheduled job runs.

From the perspective of the instance, the MID Server is **Down** when:

- User authentication fails
- User authorization fails.
- Network issues prevent MID Server from establishing a TCP/IP connection.

**Note**: To associate a user with a MID Server, navigate to the `servicenow/<mid_server_name>/agent/config.xml` file and enter the user credentials in the `mid.instance.username` and `mid.instance.password` parameters. Make sure to restart the MID Server to activate your changes.

How issues are logged

User authentication failures and authorization issues are logged automatically to the MID Server `agent log file`. The message for both is the same: **User cannot be authenticated or is missing the proper roles**. If the issue is related to authorization, the `agent.log` file shows the list of missing roles.

When debugging is enabled, MID Server issues are logged to the system log (syslog) and are available for display in either a summary or a detailed format. You can also change the sampling interval from the default 4 hours to something shorter for tracking your remediation efforts.

For instructions on enabling and configuring debugging for MID Server user issues, see **Test remediation efforts for MID Server user connectivity issues**.

Data provided

When the instance encounters user connectivity issues, it opens a record in the MID Server Issue (ecc_agent_issue) table.
Example user authentication error message

The MID Server Issue table contains these fields:

**MID Server issue fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last detected</td>
<td>Date and time the issue was last detected.</td>
</tr>
<tr>
<td>Short description</td>
<td>Contents of the generated message that specifies a possible issue with the named user or the MID Server.</td>
</tr>
<tr>
<td>MID Server</td>
<td>Empty in the Jakarta release.</td>
</tr>
<tr>
<td>Issue source</td>
<td>The process that identified the issue. For all issues with MID Server user connectivity, the source is MIDUserConnectivity.</td>
</tr>
</tbody>
</table>
### State

The current state of the issue. Possible states are:

- **New**: Starting state when the instance creates the issue.
- **Acknowledged**: State set when the administrator first examines the issue.
- **Resolved**: Ending state, set by the instance, indicating that the issue has been resolved. If the scheduled job does not encounter the issue when it runs again, the instance automatically sets this value.

### Domain

Domain associated with the MID Server user account.

### Count

Number of times an issue has been detected. Each time the scheduled job runs and encounters the same issue, it increments this field.

---

#### User authentication failure

The credentials that the instance uses to authenticate a MID Server user are configured in the MID Server Configuration Parameters (ecc_agent_config) table. If the MID Server user attempts to log into the instance with invalid credentials, the instance rejects the connection, and writes the `login.failed` event to the Events (sysevents) table for the user. Administrators can use this event in a custom script or in email notifications for authentication failure.

**Note:** If user authentication fails, user authorization is not attempted.

#### User accounts associated with a MID Server

Either of the following messages in the MID Server Issue (ecc_agent_issue) table indicate authentication failure for user accounts that are associated with a MID Server:

- **Login authentication failure for User `<user name>` associated with 1 down MID Server. Check password on MID server.**
- **Login authentication failure for User `<user name>` associated with `<n>` down MID Servers. Check password on MID servers.**

The necessary conditions for these messages to appear are:

- The **Status** field in the MID Servers (ecc_agent) table that is associated with the MID Server indicates that the MID Server is **Down**.
- The user identified in the MID Server Configuration Parameters (ecc_agent_config) table is the user that one or more MID Servers is configured to use for authentication and authorization when connecting to the instance. The record in the (ecc_agent_config) table must have these values:
  - Parameter name (param_name) field set to `mid.instance.username`.
  - Value (value) field set to the user’s name, corresponding to the User ID (user_name) field in Users (sys_user) table.

- The Events (sysevent) table contains posts showing that the last login attempt associated with the user failed during the scheduled time period. The record created in the (sysevent) table contains these field values:
- Event Name (name) field is set to `login.failed`.
- Parm1 (parm1) field is set to the user’s name.

**Note:** The MID Server (mid_server) field in the MID Server Issues (ecc_agent_issue) table is empty (=NULL).

**User accounts with the mid-server role not associated with a MID Server**

The following message appears when a user with the mid_server role who is not associated with a MID Server fails to authenticate: Login authentication failure for User `<user name>` with mid_server role not associated with a MID Server.

The necessary conditions for this message to appear are:

- The User Roles (sys_user_has_role) table contains a record linking the sys_id associated with the user record stored in the (sys_user) table, with the sys_id associated with the mid_server role record stored in the (sys_user_role) table.
- The user is not identified in the MID Server Configuration Parameters (ecc_agent_config) table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- The Events (sysevent) table contains posts showing that the last login attempt associated with the user failed during the scheduled time period.
- The (sysevent) table contains a record with the Event Name (name) field set to `login.failed`.
- The Parm1 (parm1) field is set to the user’s name, corresponding to the User ID (user_name) field in Users (sys_user) table.

**Note:** The MID Server (mid_server) field in the MID Server Issues (ecc_agent_issue) table is empty (=NULL).

**User authorization failure**

The user authorization check occurs after the MID Server has successfully authenticated on the instance. In this step, the system ensures that the user account associated with a MID Server is granted the minimum roles required. A SOAP web service called MIDServerCheck performs the role checking on the instance. If the MID Server user has the proper roles, the connection is allowed and a `login` event is written to the Events (sysevents) table. If the user does not have the proper roles, the instance writes a `login.authorization.failed` event to the Events (sysevents) table. This event provides a comma separated list of the user’s missing roles. Administrators can use this event in custom scripts or in email notifications for authorization failure.

Authorization can fail if a user is missing the mid_server role or any of the important SOAP roles, as in these cases:

- If the user has the soap_script role, the MIDServerCheck SOAP web service runs to check for the appropriate MID Server roles. If the user lacks the mid_server role or any of the other SOAP roles, authorization fails, and the `login.authorization.failed` event is created.
- If the user is missing the soap_script role, that user is not authorized to launch the MIDServerCheck SOAP web service, which checks for all required MID Server roles. Authorization fails, but the `login.authorization.failed` event is not created. When this occurs, the instance displays this message: Connectivity of MID Server user `<user name>` cannot be detected by the instance.
Users associated with one or more down MID Servers

Either of the following messages in the MID Server Issue (ecc_agent_issue) table indicate authorization failure for user accounts that are associated with a MID Server that is Down:

- Login authorization failure for User <user name> associated with 1 down MID Server. Re-assign mid_server role to grant all required roles.
- Login authorization failure for User <user name> associated with <n> down MID Servers. Re-assign mid_server role to grant all required roles.

The MIDUserConnectivity script includes identifies active users associated with one or more down MID Servers whose last login attempt within the reporting period failed user authorization. This message is generated when user authorization failures are detected and reported by the MIDServerCheck scripted web service. However, user authorization failures for users who are not assigned the soap_script role should this occur, problems with the user are reported by the network connectivity message.

This message appears in the MID Server Issue (ecc_agent_issue) table when:

- The user may or may not have the mid_server role.
- The user is identified in the MID Server Configuration Parameters (ecc_agent_config) table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- The Events (sysevent) table contains posts showing that the last login attempt associated with the user failed during the scheduled time period. The (sysevent) table contains a record with these settings:
  - Event Name (name) field set to login.authorization.failed.
  - Parm1 (parm1) field set to the user’s name, corresponding to the User ID (user_name) field in Users (sys_user) table.

Note: The MID Server (mid_server) field in the MID Server Issues (ecc_agent_issue) table is empty (=NULL).

Users with the proper role not associated with a MID Server

The following message appears when a user with the mid_server role who is not associated with a MID Server fails authorization: Login authorization failure for User <user name> with mid_server role not associated with a MID Server.

This message is generated when user authorization failures are detected in which the user account, with the mid_server role, is not identified as a configured MID Server user in the (ecc_agent_config) table. It is possible that the user account was associated with a MID Server at the time of the failure.

This message appears in the MID Server Issue (ecc_agent_issue) table when:

- The user has the mid_server role. The User Roles (sys_user_has_role) table has a record linking the sys_id associated with the user record stored in the (sys_user) table, with the sys_id associated with the mid_server role record stored in the (sys_user_role) table.
- The user is not identified in the MID Server Configuration Parameters (ecc_agent_config) table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- The Events (sysevent) table contains posts showing that the last login attempt associated with the user failed during the scheduled time period. The (sysevent) table contains a record with these settings:
  - Event Name (name) field set to login.authorization.failed.
- Parm1 (parm1) field set to the user’s name, corresponding to the User ID (user_name) field in Users (sys_user) table.

**Note:** The MID Server (mid_server) field in the MID Server Issues (ecc_agent_issue) table is empty (=NULL).

### Network issues

A network issue can prevent the MID Server from connecting to the instance’s TCP/IP server to begin a session. In this case, the instance marks the MID Server as Down, because the instance failed to receive the MID Server heartbeat within the prescribed 5 minute interval.

#### Users associated with down MID Servers who have not attempted to log in

Either of the following messages in the MID Server Issue (ecc_agent_issue) table name users associated with MID Servers who have not attempted to log in during the reporting period:

- **User <user name> is associated with 1 down MID Server. No login attempts within reporting period.**
- **User <user name> is associated with <n> down MID Servers. No login attempts within reporting period.**

The MIDUserConnectivity script include reports active users associated with down MID Servers where network connectivity cannot be detected by the instance.

This message appears in the MID Server Issue (ecc_agent_issue) table when:

- The user may or may not have the mid_server role.
- The user is identified in the MID Server Configuration Parameters (ecc_agent_config) table as the user which one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- There are no login attempts, either failed or successful, recorded in the Events (sysevent) table for the user during the scheduled reporting period.

**Note:** The MID Server (mid_server) field in the MID Server Issues (ecc_agent_issue) table is empty (=NULL).

#### Users not associated with MID Servers who have not attempted to log in

The following message appears when a user with the mid_server role who is not associated with a MID Server has not attempted to login during the configured reporting interval: **User <user name> with mid_server role is not associated with a MID Server. No login attempts within reporting period.**

The MIDUserConnectivity script include reports active users with the mid_server role not associated with a MID Server, where connectivity cannot be detected by the instance.

This message appears in the MID Server Issue (ecc_agent_issue) table when:

- The user has the mid_server role. The User Roles (sys_user_has_role) table has a record linking the sys_id associated with the user record stored in the (sys_user) table, with the sys_id associated with the mid_server role record stored in the (sys_user_role) table.
- The user is not identified in the MID Server Configuration Parameters (ecc_agent_config) table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
There are no login attempts, either failed or successful, recorded in the Events (sysevent) table for the user during the scheduled reporting period.

**Note:** The MID Server (mid_server) field in the MID Server Issues (ecc_agent_issue) table is empty (=NULL).

### Configuration issues

Any of the following messages, discussed above, can indicate a configuration issue:

- **Login authentication failure for User** `<user name>` **with mid_server role not associated with a MID Server.**
- **Login authorization failure for User** `<user name>` **with mid_server role not associated with a MID Server.**
- **User** `<user name>` **with mid_server role is not associated with a MID Server. No login attempts within reporting period.**

These are some common configuration errors:

- An administrator neglected to associate the user record with the MID Server record as shown in the MID Server Configuration Parameters (ecc_agent_config) table. This table is read-only and cannot be updated directly. To associate a user with a MID Server, configure the user name and password in the MID Server's `config.xml` file and restart the MID Server.
- During the process of reconfiguring a MID Server to use a different account for TCP/IP connection, the administrator has not yet removed the mid_server role from the account or deleted the account.
- A multipurpose user account was created and granted a large number of roles, including the mid_server role, although this account was never intended to be used as a MID Server account.

### User who successfully authenticates and authorizes but might not need mid_server role

The following message appears when a user with the mid_server role who is not associated with a MID Server successfully logs in: **User** `<user name>` **with mid_server role successfully connected but not associated with a MID Server. The mid_server role should be reserved for MID Server use only.**

The MIDUserConnectivity script include reports active users with the mid_server role who are not identified as a configured MID Server user, and whose last login attempt was successful during the scheduled time period. This message suggests that the user’s credentials are being used by a system administrator or a process that is not running on a MID Server. The assumption here is that the mid_server role should only be used for applications deployed to a MID Server. The presence of this message reminds the system administrator to remove extraneous mid_server roles from user accounts that do not require them.

This message appears in the MID Server Issue (ecc_agent_issue) table when:

- The user has the mid_server role.
- The user is not identified in the MID Server Configuration Parameters (ecc_agent_config) table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- The Events (sysevent) table contains posts showing that the last login attempt associated with the user succeeded during the scheduled time period. The (sysevent) table contains a record with these settings:
  - Event Name (name) field set to login.
Parm1 (parm1) field set to the user’s name, corresponding to the User ID (user_name) field in Users (sys_user) table.

Note: The MID Server (mid_server) field in the MID Server Issues (ecc_agent_issue) table is empty (=NULL).

Test remediation efforts for MID Server user connectivity issues
After attempting to resolve a user connectivity issue that appears in the MID Server Issue (ecc_agent_issue) table, you can test your remediation efforts without having to wait until the next scheduled reporting period by shortening the sampling interval.

Role required: admin

Reconfigure the sampling interval using this procedure and then examine the results in the MID Server Issue (ecc_agent_issue) table. You can set any time span for the sample, but you should define a window of not less than 5 minutes, since this is the default interval of the MID Server heartbeat that reports its status. The recommended method for configuring a shorter sampling interval is to copy and modify the code from the MIDUserConnectivity scheduled job, and then run it manually in the background script utility.

Caution: Avoid editing the script in the MIDUserConnectivity schedule record. If you make any change to this record, it will not be updated when you upgrade the instance.

1. Navigate to System Definition > Scheduled Jobs.
2. Open the MIDUserConnectivity scheduled job.
3. Copy this line from the Run this script field:

   MIDUserConnectivity(0).checkConnectivity(4 * (60 * 60 * 1000));

   This code sets the 4 hour sampling interval in milliseconds and turns debugging off with the MIDUserConnectivity(0) value.
4. Navigate to System Definition > Scripts - Background.
5. Paste the code from the scheduled job into the Run script field.
6. Set the sampling interval to 5 minutes by changing the time calculation to (5 * 60 * 1000).

   The modified command looks like this: MIDUserConnectivity(0).checkConnectivity (5 * 60 * 1000);
7. Click Run script.
8. Open the record of the MID Server that had the issue and select the MID Server Issues related list.

   The issue is updated as follows:
   - If the issue persists, the Count column is incremented, and the Last detected column shows the current date and time.
   - If the issue no longer exists, the system changes the State to Resolved.
9. Optionally, you can enable debugging by selecting a level, and then run the script again to see the breakdown for each condition evaluated.

   Use these settings to select a debugging level:
   - For a summary view, enter MIDUserConnectivity(1).
   - For a detailed view, enter MIDUserConnectivity(2).

   For details about the type of debugging information provided, see Interpreting MID Server user debugging output.
Interpreting MID Server user debugging output

Debugging output from the system log is available in either a summary or detailed view for MID Server user issues, but must be enabled manually.

To enable debugging and display all connectivity issues in either of the available formats, you must run a method manually on your instance. For instructions on enabling debugging, see Test remediation efforts for MID Server user connectivity issues. For information about each error condition and how records are created in the MID Server issue (ecc_agent_issue) table, see MID Server user connectivity issues.

Available formats

You can configure the instance to generate a simple summary of the issue or a detailed output that identifies users and MID Servers. Summaries provide a quick look at the issue conditions, by count, while the detailed view allows you to examine roles, MID Server associations, and login activity by named users.

In this summary example of an authorization issue, the instance evaluates each condition and indicates how many users met that condition. You can see that a MID Server is down and that one of two users configured for a MID Server failed authorization. Because this is a summary, neither the MID Server nor the users are named.

Sample summary debug output

```
[0:00:00.014] Script completed in scope global: script

*** Script: Log Object: MIDUserConnectivity: jobSchedulerDateTime
Java Object: com.glide.glideobject.GlideDateTime = 2017-02-21 17:35:08
Java Object: java.lang.String = 2017-02-21 19:35:08
*** Script: MIDUserConnectivity: found (1) user(s) with the mid_server role defined
*** Script: MIDUserConnectivity: found (1) down MID Servers with a configured 'mid.instance.username' parameter
*** Script: MIDUserConnectivity: found (2) configured MID Server UserIds
*** Script: MIDUserConnectivity: found (0) user(s) with the MID Server role NOT associated with a configured MID Server user
*** Script: MIDUserConnectivity: found (5) user(s) whose most recent login attempt during the reporting period failed
*** Script: MIDUserConnectivity: found (1) user(s) whose most recent login attempt during the reporting period failed due to user authorization
*** Script: MIDUserConnectivity: found (5) user(s) whose most recent login attempt during the reporting period succeeded
*** Script: MIDUserConnectivity: found (0) configured MID Server users where connectivity to the MID by the instance can not be detected
*** Script: MIDUserConnectivity: found (1) new message(s) skipped by the auto-resolver
*** Script: MIDUserConnectivity: processing completed
```

Authentication failure

When a MID Server user cannot authenticate on the instance, the system displays these error messages in the detailed output:

- Login authentication failure for User <user name> associated with 1 down MID Server. Check password on MID server.
- Login authentication failure for User <user name> associated with <n> down MID Servers. Check password on MID servers.
- Login authentication failure for User <user name> with mid_server role not associated with a MID Server.

In this example, three users with the mid_server role, midserver2, local-midserver, and ardis.maison, failed to authenticate. Two of these users were configured for MID Servers that were Down, and the other user was not configured for any MID Servers. Each of these users has an authentication failure and is named in the appropriate error message.

[1]: string = Login authentication failure for User local-midserver associated with 1 down MID Server. Check password on MID server.

*** Script: MIDUserConnectivity; processing completed
MID Server ID map

The debugging output lists all MID Servers that are marked as **Down** and maps them to their user accounts by the MID Server **sys_id**. This map includes all user accounts that have the mid_server role, whether or not they are associated with a MID Server. If there are no **Down** MID Servers, the map is not displayed in the debugging output.

The map is presented in three sections:

- User accounts not associated with any MID Servers.
- User accounts associated with **Down** MID Servers, identified by their **sys_id**.
- The **sys_id** of each **Down** MID Server, identified by name.

**Authorization failure**

If a user is missing any of the required roles, the instance generates these authorization failure messages:

- **Login authorization failure for User <user name> associated with 1 down MID Server. Re-assign mid_server role to grant all required roles.**
- **Login authorization failure for User <user name> associated with <n> down MID Servers. Re-assign mid_server role to grant all required roles.**
- **Login authorization failure for User <user name> with mid_server role not associated with a MID Server.**

In this example, three users with the mid_server role, **midserver2**, **local-midserver**, and **ardis.maison** have failed authorization. One user is not associated with any MID Server, but the other two users are. The system has logged an authorization failure, indicating that the user is missing at least one critical role. To see what roles are missing, look at the comma separated list in...
the **Parm2** field in the `login.authorization.failed` event record. This record is the most recent login attempt in the Event (sysevent) table for the user account within the reporting period.
Network issues

Network issues may exist for these users who are associated with MID Servers, but who have not attempted to log in during the reporting period:

- **User <user name>** is associated with 1 down MID Server. No login attempts within reporting period.
- **User <user name>** is associated with <n> down MID Servers. No login attempts within reporting period.

Network issues may also exist for these users who are NOT associated with MID Servers, and who have not attempted to log in during the reporting period: **User <user name> with mid_server role** is not associated with a MID Server. No login attempts within reporting period.

In this example, no login attempts have been detected for midserver2, local-midserver, and ardis.maison, all of whom have the mid_server role. Two of those users are associated with MID Servers that are marked Down. The other user is not associated with any MID Server. None of these users has attempted to log in to the system within the configured reporting interval. The system assumes that these users would make an attempt to log in unless network issues prevented them from doing so.

**Note:** By default, the sampling period is 4 hours. However, during debugging or remediation, the sampling period can be reset to a value that matches the MID Server heartbeat interval of 5 minutes, or greater.
Configuration issues

Any of the following messages can indicate a user configuration issue:

- Login authentication failure for User <user name> with mid_server role not associated with a MID Server.
- Login authorization failure for User <user name> with mid_server role not associated with a MID Server.
- User <user name> with mid_server role successfully connected but not associated with a MID Server. The mid-server role should be reserved for MID Server use only.
- User <user name> with mid_server role is not associated with a MID Server. No login attempts within reporting period.

In this example, a user with the mid_server role has logged in successfully within the configured sampling interval. However, this user is not configured for a MID Server and might have the role in error.

```plaintext

Detailed debugging log for MID Server user account login
Orchestration

ServiceNow® Orchestration extends the workflow engine to manage processes and to automate things outside of a ServiceNow instance.

Orchestration is available as a separate subscription from the rest of the ServiceNow platform. See Activate Orchestration for details.

Introduction to Orchestration

Orchestration automates simple or complex multi-system tasks on remote services, servers, applications, and hardware.

An Orchestration process can cross all management disciplines and interact with hosted services and all types of infrastructure elements. These capabilities provide a powerful system for managing IT and Business processes quickly and reliably.

Orchestrated solutions aide collaboration among teams by providing reusable data and versioning for both the workflows and the activities within them. Subject matter experts can create activities that are reusable to numerous workflow developers. When an activity requires a change, developers can see the downstream implication of the change immediately by knowing which workflows use the activity. Well-designed orchestrations never fail and apply human tasks to address errors as they arise.

Orchestration tools

Orchestration can make calls outside of a ServiceNow instance, directly to web services or through a MID Server to systems within corporate firewall. Orchestration also enables the creation reusable activities that wrapper Java Script functions for manipulating things inside the platform. Orchestration extends the Workflow editor by providing these features:

- Activity packs containing ready-to-use activities.
- Activity Designer, which enables developers to create custom activities without an over dependence to create scripts to orchestrate to third-party systems.
- Ability to create activity packs using Scoped Applications.
• A **Databus** for following the flow of data across orchestration activities.

Orchestration Core provides entitlements to use specific applications:

**Client Software Distribution**
An application that automates software delivery from the Service Catalog. Provides OOB support for SCCM. Partner solutions support Macs using JAMF. Other third-party solutions provide support through the extension framework.

**Password Reset**
An application for users to reset their password in Active Directory. It can expand to communicate with other third-party systems.

**Orchestration ROI**
Enables users to evaluate estimated costs and actual costs for tasks, automate these tasks, and track the ROI of these tasks.

**Systems that Orchestration can automate**

Orchestration can automate tasks such as employee onboarding, user access rights, server management, managed file transfers, and **Security Operations Orchestration activities**. For example, you might use the Active Directory and Exchange activities provided in the base Orchestration system to set up network accounts and mailboxes for new employees.

If Orchestration does not provide the activities you need for an integration, create the necessary activities using the templates in the **Orchestration Activity Designer**. The external systems that Orchestration can automate for:

• Any system exposing web services (**SOAP**, **REST**)
• Any system accessible from the command line (such as a UNIX system accessible through **SSH**, a Windows system enabled for **PowerShell** remoting or **WMI**)
• Numerous proprietary services: Windows **Active Directory**, Microsoft **Exchange** mail servers, **InfoBlox**, and **F5 Networks**.

**Note:** For a full list of Activity Pack service offerings, see **Orchestration Core Activity Packs**.

• Any filesystem accessible by **SFTP**
• Any database with a compliant **JDBC** driver
• Additional Activity Packs are also available with other ServiceNow products, such as Security Operations.
Orchestration capabilities

Orchestration workflow

When an Orchestration activity starts within a workflow, Orchestration launches a probe and writes a probe record to the ECC Queue. The workflow pauses as the MID Server picks up the
request and executes the probe. When the probe reports back, the workflow resumes as the results are analyzed. The workflow can exit or continue at this point.

Orchestration workflow

Orchestration video tutorial

Watch the introductory video for Orchestration.

Domain separation in Orchestration

This is an overview of domain separation and Orchestration. Domain separation allows you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

Support: Data only

Domain separation in this application is supported at the Data only level, meaning it supports the data security model of separating visibility of data from one domain to another. To learn more, see Application support for domain separation.

Activate Orchestration

The Orchestration (com.snc.runbook_automation) plugin is available as a separate subscription from the rest of the ServiceNow platform.

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and sub-production instances, generally within a few days.

If you do not have an account manager, decide to delay activation after purchase, or want to evaluate the product on a sub-production instance without charge, follow these steps.

Role required: none

1. In the HI Service Portal, click Service Requests > Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
</tbody>
</table>
Specify the date and time you would like this plugin to be enabled | Date and time must be at least 2 business days from the current time.

**Note:** Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.

| Reason/Comments | Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows. |

3. Click **Submit**.

**List of Orchestration plugins**

This table lists all plugins available for Orchestration and their dependencies.

These Orchestration plugins are available for purchase or can be requested as part of your Orchestration subscription. Contact your account representative for details.

<table>
<thead>
<tr>

**Orchestration Runtime plugin**

The Orchestration – Runtime plugin enables other applications on the ServiceNow® platform to automate tasks, without requiring an Orchestration subscription.

The Orchestration – Runtime plugin can be activated as part of another plugin or application. It is used by strategic technology partners and ServiceNow applications to distribute activity packs to customers who may not own Orchestration. For example, the Security Incident Response Management (SIRM) application provides orchestration content, which includes activities that are available from the Packs tab in the Workflow Editor. Customers who purchase SIRM can consume and modify the activities that SIRM ships without having to purchase an Orchestration license.

**Included with the plugin**

The Orchestration – Runtime plugin provides access to the Packs and Data tabs in the Workflow Editor. This plugin gives users access to custom activities for their applications and enables them to reuse data from the Databus. This plugin does not provide access to custom Orchestration activity packs or to the activity designer. The Custom tab in the Workflow Editor is not available without an Orchestration subscription.
Orchestration plugin relationships

Dependencies

The Orchestration – Runtime plugin activates these application plugins:

- Security Incident Response Orchestration
- Service Release Automation

Access to activities

Custom activities shipped with ServiceNow® applications are available in the Packs tab of the Workflow Editor for use in workflows. To edit these activities, navigate to Orchestration > Activity Designer Activities and select the activity you want to modify. For information about the provider templates used to create these activities, see Orchestration custom activity templates.

List of Orchestration activities

Orchestration provides the following activities for use in workflows:
Several Orchestration activities have been rewritten as scoped activities using the activity designer and grouped into activity packs. Other non-scoped activities are deprecated and may or may not appear in the Workflow Editor. However, all deprecated activities still function in existing workflows that use them.

Global activities

These activities run in the global scope only. Any activities you create in the global scope are organized in the Global category in the Packs and Custom tabs in the Workflow Editor.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Test Server Alive</td>
<td>Runs a command (including shell scripts) on a Linux or UNIX computer via SSH to validate whether the target system is alive.</td>
</tr>
</tbody>
</table>

Active Directory (AD) activities

All AD Orchestration activities were rewritten in the Geneva release as scoped activities and are available in the Active Directory activity pack. All previous version AD activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create AD Object</td>
<td>Creates a user account in Windows Active Directory when a user account is created in a ServiceNow instance.</td>
</tr>
<tr>
<td>Disable AD User Account</td>
<td>Marks a Windows Active Directory user account disabled, making it inactive.</td>
</tr>
<tr>
<td>Enable AD User Account</td>
<td>Enables a Windows Active Directory user account, making it active.</td>
</tr>
<tr>
<td>Query AD</td>
<td>Retrieves entries from the Windows Active Directory based on a search filter.</td>
</tr>
<tr>
<td>Remove AD Object</td>
<td>Deletes a user account from Windows Active Directory.</td>
</tr>
<tr>
<td>Reset AD User Password</td>
<td>Resets the password of a user account in Windows Active Directory.</td>
</tr>
<tr>
<td>Change AD User Password</td>
<td>Changes the password of a user account in Windows Active Directory.</td>
</tr>
<tr>
<td>Update AD Object</td>
<td>Updates a user account in Windows Active Directory.</td>
</tr>
<tr>
<td>Is AD Account Locked</td>
<td>Determines if an Active Directory user account is locked.</td>
</tr>
<tr>
<td>Unlock AD Account</td>
<td>Unlocks a locked Active Directory user account.</td>
</tr>
</tbody>
</table>

Azure AD

All these activities are scoped and part of the Azure AD activity pack. They do not have legacy versions.
### ServiceNow

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add User to Group</td>
<td>Adds a user to an existing security group in Azure Active Directory.</td>
</tr>
<tr>
<td>Assign User License</td>
<td>Assigns an extra Office 365 software license to the named user.</td>
</tr>
<tr>
<td>Create User</td>
<td>Creates a user for the Azure Active Directory tenant.</td>
</tr>
<tr>
<td>Delete User</td>
<td>Deletes the named user's account from the Azure Active Directory tenant.</td>
</tr>
<tr>
<td>Get User Info</td>
<td>Returns the named user's information from the Azure Active Directory.</td>
</tr>
<tr>
<td>Remove User from Group</td>
<td>Removes an existing user from a security group in Azure Active Directory.</td>
</tr>
<tr>
<td>Remove User License</td>
<td>Revokes the specified Office 365 software license for the named user.</td>
</tr>
<tr>
<td>Reset User Password</td>
<td>Changes the named user's Azure Active Directory password.</td>
</tr>
</tbody>
</table>

### F5 Network Management activities

All these activities are scoped and part of the F5 Network Management activity pack. They do not have legacy versions.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add F5 Pool</td>
<td>Creates the load balancer pool.</td>
</tr>
<tr>
<td>Check F5 Pool</td>
<td>Checks the status of a pool to validate whether it is available to accept traffic.</td>
</tr>
<tr>
<td>Delete F5 Pool</td>
<td>Deletes an F5 pool.</td>
</tr>
<tr>
<td>Add F5 Pool Member</td>
<td>Adds a member to an F5 pool.</td>
</tr>
<tr>
<td>Get F5 Pool Member</td>
<td>Returns the pool members and verifies the pool status.</td>
</tr>
<tr>
<td>Delete F5 Pool Member</td>
<td>Deletes an F5 pool member.</td>
</tr>
<tr>
<td>Add F5 Virtual Server</td>
<td>Adds a virtual server.</td>
</tr>
<tr>
<td>Modify F5 Virtual Server</td>
<td>Configures a virtual server assigned to an F5 pool with irules and a vlan.</td>
</tr>
<tr>
<td>Delete F5 Virtual Server</td>
<td>Deletes a virtual server from an F5 pool.</td>
</tr>
<tr>
<td>Add F5 Profile to Virtual Server</td>
<td>Adds a profile to a virtual server assigned to an F5 pool.</td>
</tr>
</tbody>
</table>

### Infoblox activities

All these activities are scoped and part of the Infoblox DDI activity pack. They do not have legacy versions.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DHCP Reserve IP v4 Address Range</td>
<td>Reserves an IP address range for DHCP use.</td>
</tr>
<tr>
<td>Activity</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DHCP Delete IP Reservation</td>
<td>Deletes IP reservations in DHCP using either an IPv4 or IPv6 address range.</td>
</tr>
<tr>
<td>DHCP List IP Reservations</td>
<td>Generates a list of all the DHCP range reservations on a specific Infoblox server.</td>
</tr>
<tr>
<td>List DNS C-records</td>
<td>Retrieves all canonical (CNAME) records from a specified Infoblox server.</td>
</tr>
<tr>
<td>Register DNS A-record</td>
<td>Creates a DNS A record on a specified Infoblox server.</td>
</tr>
<tr>
<td>Register DNS C-Record</td>
<td>Creates a DNS canonical (CNAME) record on a specified Infoblox server.</td>
</tr>
<tr>
<td>List DNS Record</td>
<td>Generates a list of all the DNS entries on a specific Infoblox server.</td>
</tr>
<tr>
<td>DNS Delete</td>
<td>Deletes DNS records of any type from in Infoblox server, such as C and A records.</td>
</tr>
<tr>
<td>IPAM Register IP Address</td>
<td>Registers an IP address in a network using Infoblox IPAM.</td>
</tr>
<tr>
<td>IPAM Reserve IP Address</td>
<td>Reserves an IP address in a network using Infoblox IPAM.</td>
</tr>
<tr>
<td>IPAM List IP Reservations</td>
<td>Returns an array of all IP Address within the named Infoblox Server.</td>
</tr>
<tr>
<td>IPAM Delete</td>
<td>Deletes an IP Address within a named Infoblox server.</td>
</tr>
<tr>
<td>Create Network</td>
<td>Creates networks on a specified Infoblox server.</td>
</tr>
<tr>
<td>Get Network Details</td>
<td>Retrieves the information about a specific network on an Infoblox server.</td>
</tr>
<tr>
<td>Delete Network</td>
<td>Deletes a network from an Infoblox server.</td>
</tr>
<tr>
<td>List Registered Networks</td>
<td>Retrieves all the networks associated with an Infoblox server.</td>
</tr>
</tbody>
</table>

**Microsoft Exchange activities**

All Exchange Orchestration activities were rewritten in the Geneva release as scoped activities and are available in the Exchange activity pack. All previous version Exchange activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Address List</td>
<td>Creates an address list that acts as an alias for emailing all users in the group. This alias cannot be used to manage user permissions.</td>
</tr>
<tr>
<td>Delete Address List</td>
<td>Removes an existing address list from an Exchange server.</td>
</tr>
<tr>
<td>Get Address List</td>
<td>Retrieves all attributes from the specified Exchange address list.</td>
</tr>
<tr>
<td>Move Address List</td>
<td>Moves an Exchange address list to another location in the address hierarchy.</td>
</tr>
<tr>
<td>Activity</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Set Address List</td>
<td>Modifies an Exchange address list.</td>
</tr>
<tr>
<td>Update Address List</td>
<td>Adds or removes users from the specified address list and immediately applies any cached address list changes to the server.</td>
</tr>
<tr>
<td>Create Mailbox</td>
<td>If a user does not exist, creates a new Active Directory user and associated Exchange mailbox.</td>
</tr>
<tr>
<td>Delete Mailbox</td>
<td>Deletes the Exchange mailbox of an Active Directory user.</td>
</tr>
<tr>
<td>Disable Mailbox</td>
<td>Disables the mailbox associated with a specified Active Directory account.</td>
</tr>
<tr>
<td>Enable Mailbox</td>
<td>Creates a mailbox for an existing Active Directory user.</td>
</tr>
<tr>
<td>Get Mailbox</td>
<td>Gets the mailbox for the specified user or all mailboxes on an Exchange server.</td>
</tr>
<tr>
<td>Set Mailbox</td>
<td>Modifies the settings of an existing Exchange mailbox.</td>
</tr>
</tbody>
</table>

### PowerShell activities

These PowerShell activities were rewritten as scoped activities and are available in the PowerShell activity pack. All previous version PowerShell activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Install Windows App</td>
<td>Installs an application on a Windows target machine.</td>
</tr>
<tr>
<td>Join Domain</td>
<td>Joins a Windows machine to a domain.</td>
</tr>
<tr>
<td>Uninstall Windows App</td>
<td>Uninstalls an application from a Windows target machine.</td>
</tr>
<tr>
<td>Change Service State</td>
<td>Starts or stops a Windows service on a remote system.</td>
</tr>
</tbody>
</table>

### Probe activities

These probe activities were rewritten as scoped activities and are available in the Probe activity pack. All previous versions of these activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Resolve DNS Name</td>
<td>Resolves an IP address or a fully qualified domain name (FQDN) into one or more IP addresses.</td>
</tr>
<tr>
<td>SNMP Query</td>
<td>Queries an SNMP device.</td>
</tr>
</tbody>
</table>
SCCM activities

All these activities are scoped and part of the SCCM activity pack. They do not have legacy versions.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add to Device Collection</td>
<td>Adds a device to a Microsoft System Center Configuration Manager (SCCM) device collection.</td>
</tr>
<tr>
<td>Add to User Collection</td>
<td>Adds a user to a Microsoft System Center Configuration Manager (SCCM) user collection.</td>
</tr>
<tr>
<td>Get Applications</td>
<td>Returns a list of all the applications available on a Microsoft System Center Configuration Manager (SCCM) server.</td>
</tr>
<tr>
<td>Get Deployments</td>
<td>Returns the list of deployments performed by Orchestration using a Microsoft System Center Configuration Manager (SCCM) server.</td>
</tr>
<tr>
<td>Get Device Collections</td>
<td>Returns the list of available device collections on a Microsoft System Center Configuration Manager (SCCM) host.</td>
</tr>
<tr>
<td>Get User Collections</td>
<td>Returns the list of available user collections on a Microsoft System Center Configuration Manager (SCCM) host.</td>
</tr>
<tr>
<td>Remove from Device Collection</td>
<td>Removes a device from a Microsoft System Center Configuration Manager (SCCM) device collection.</td>
</tr>
<tr>
<td>Remove from User Collection</td>
<td>Removes a user from a Microsoft System Center Configuration Manager (SCCM) user collection.</td>
</tr>
</tbody>
</table>

SSH activities

These SSH activities were rewritten as scoped activities and are available in the SSH activity pack. The SSH activities not converted to scoped activities were moved to the Orchestration - Deprecated category, but are still available for all workflows.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Copy</td>
<td>Copies a file on a Linux or Unix computer, via SSH.</td>
</tr>
<tr>
<td>File Read</td>
<td>Reads a file on a Linux or Unix computer, via SSH.</td>
</tr>
<tr>
<td>File Write</td>
<td>Writes a file on a Linux or Unix computer.</td>
</tr>
<tr>
<td>File Replace String</td>
<td>Finds and replaces a string in a file on a Linux or UNIX computer.</td>
</tr>
<tr>
<td>Files Compare</td>
<td>Compares two files on a Linux or Unix computer, via SSH.</td>
</tr>
</tbody>
</table>
### Activity

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Reset Linux User Password</strong></td>
<td>Resets the password for a given user on a Linux computer.</td>
</tr>
<tr>
<td><strong>Secure Copy</strong></td>
<td>Copies a file from one host to another, without storing the copied file on the MID Server.</td>
</tr>
</tbody>
</table>

#### SFTP activities

All these activities are scoped and part of the SFTP File Transfer activity pack. They do not have legacy versions.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Copy File</strong></td>
<td>Copies a file from an SFTP server (source host) to another SFTP server (target host).</td>
</tr>
<tr>
<td><strong>Create Directory</strong></td>
<td>Creates a directory on an SFTP server.</td>
</tr>
<tr>
<td><strong>Get File List</strong></td>
<td>Returns a list of files from a given directory and its subdirectories on an SFTP server (source host).</td>
</tr>
<tr>
<td><strong>Remove File or Directory</strong></td>
<td>Removes a file or a directory on an SFTP server, including subdirectories, when configured.</td>
</tr>
<tr>
<td><strong>Rename File or Directory</strong></td>
<td>Renames a file or directory to a new name on an SFTP server.</td>
</tr>
<tr>
<td><strong>Set File Attributes</strong></td>
<td>Sets common file attributes, such as timestamps, size, permissions, and UID/GID, for a file or directory on an SFTP server.</td>
</tr>
</tbody>
</table>

#### Deprecated activities

These activities have been removed from the Workflow Editor and are not available for new workflows, but continue to work normally in existing workflows. You can reactivate the deprecated activity or duplicate the functionality of a deprecated activity as a scoped activity by recreating it using the activity designer.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Run Probe</strong></td>
<td>Launches a MID Server probe on behalf of a document.</td>
</tr>
<tr>
<td><strong>SOAP Request</strong></td>
<td>Executes a SOAP request on a target server. The SOAP Message activity replaces this activity.</td>
</tr>
<tr>
<td><strong>Run Command</strong></td>
<td>Runs a command (including shell scripts) on a Linux or UNIX computer.</td>
</tr>
<tr>
<td><strong>Run SCP</strong></td>
<td>Uses Secure Copy Protocol (SCP) to copy a file from one computer to another, including the directory in which the file resides. The Secure Copy activity replaces the Run SCP activity.</td>
</tr>
<tr>
<td><strong>Run Powershell</strong></td>
<td>Executes Windows PowerShell commands on a MID Server.</td>
</tr>
</tbody>
</table>
Available activity packs
Activity packs are available with your subscription to Orchestration.

Role required: admin

The following activity packs are available and active with your Orchestration subscription:

- **Orchestration - Active Directory** (com.snc.orchestration.ad)
- **Orchestration - Azure Active Directory** (com.snc.orchestration.azure.ad)
- **Orchestration - Exchange** (com.snc.orchestration.exchange)
- **Orchestration - SFTP** (com.snc.orchestration.sftp)
- **Orchestration - Infoblox DDI Activity Pack** (com.snc.orchestration.infoblox)
- **F5 Network Management activity pack** (com.snc.orchestration.f5)
- **Orchestration - SSH** (com.snc.orchestration.ssh)
- **Orchestration - PowerShell** (com.snc.orchestration.powershell)
- **Orchestration - System Center Configuration Manager** (com.snc.orchestration.sccm_mgnt)

1. In the HI Service Portal, click **Service Requests > Activate Plugin**.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
</tbody>
</table>

Specify the date and time you would like this plugin to be enabled

- **Date and time must be at least 2 business days from the current time.**

- **Note:** Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.

| Reason/Comments | Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows. |

3. Click **Submit**.

Deprecated Orchestration activities
These Orchestration activities have been deprecated.

Run Probe
The Run Probe activity launches a MID Server probe on behalf of a document. All Orchestration activities that launch a probe on a target machine are based on the Run Probe activity. Your ServiceNow instance must have access to a MID Server configured to use SSH to run this activity.
Attention: This activity is deprecated and is unavailable for new workflows. To replace the functionality of this probe, use the Probe activity template to create a custom activity. Workflows from a previous release that use the Run Probe activity can continue to do so.

### Run Probe input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Probe</td>
<td>Select a MID Server probe from the list. This is the name of the probe as it appears in the discovery_probes table.</td>
</tr>
<tr>
<td>Source for probe</td>
<td>Enter the IP address of the host system against which the probe runs (the probe’s target).</td>
</tr>
<tr>
<td>Sensor script</td>
<td>The script to run using the results of the probe. The output from the probe is contained in a variable called output. Any error from the probe is contained in a variable called error.</td>
</tr>
</tbody>
</table>

### SOAP Request

The SOAP Request activity executes a SOAP request on a target server.

Attention: This activity is deprecated and is replaced by the SOAP Message workflow activity activity. Workflows from a previous release that use the SOAP Request activity can continue to do so. However, this activity is not available for new workflows.

### SOAP Request input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAP URL</td>
<td>The SOAP endpoint.</td>
</tr>
<tr>
<td>Username</td>
<td>User name for basic authentication credentials.</td>
</tr>
<tr>
<td>Password</td>
<td>Password for basic authentication credentials.</td>
</tr>
<tr>
<td>Envelope Script</td>
<td>Script for setting up parameters for the web service.</td>
</tr>
<tr>
<td>Sensor Script</td>
<td>The script to execute after the request has been made and a response has been received.</td>
</tr>
</tbody>
</table>

### Reactivate a deprecated activity

Orchestration activities that were converted to activity packs are deprecated for upgraded and new instances but can be reactivated for use in new workflows.

Role required: workflow_admin, admin

Note: Reactivation of deprecated activities for use in new workflows is discouraged. Legacy activities cannot use the unique features of the scoped applications, such as reuse of data from the databus and input variable testing.

1. Navigate to Workflow > Administration > Activity Definitions.
2. In the list of activities, clear the condition Category != deprecated from the filter.
3. Open the definition record for the activity you want to reactivate.

4. Select the **What to Display** tab.

5. In the **Category** field, replace the value **deprecated** with another category. This can be an arbitrary string.

6. Click **Update**.

The system creates a new category using the value provided and reactivates the activity, which becomes available in the **Core** tab of the Workflow Editor.

### SOAP Message workflow activity

The **SOAP Message** activity uses SOAP messages defined in the System Web Services plugin and can call the messages using a MID Server.

Your instance must have access to a MID Server configured to use SOAP.

**Input variables**

**SOAP Message activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAP Message</td>
<td>soap_message</td>
<td>The SOAP Message defined under the System Web Services plugin's Outbound SOAP Message (sys_soap_message) table. (<a href="#">System Web Services &gt; Outbound &gt; SOAP Message</a>)</td>
</tr>
<tr>
<td>SOAP Message Function</td>
<td>soap_message_function</td>
<td>The function to call that is defined in the SOAP Message. Functions are listed in the <strong>SOAP Message Functions</strong> related list in each SOAP Message record.</td>
</tr>
<tr>
<td>SOAP Endpoint</td>
<td>soap_endpoint</td>
<td>Endpoint to use instead of the <strong>SOAP endpoint</strong> value in the SOAP Message Function record. Leave this field blank to use the defined endpoint in the SOAP Message Function record.</td>
</tr>
<tr>
<td>Field</td>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Variables</td>
<td>variables</td>
<td>Variables to substitute into the SOAP Envelope defined in the SOAP Message Function record. Use this format for the string: name1=value1, name2=value2, ... If either the name or value contains a comma or equal sign, escape these characters with a backslash.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>use_midserver</td>
<td>Check box for using a MID Server to send the SOAP message. A MID Server might be necessary to reach an endpoint within a firewall or a sub-network that is not visible from the instance. If this check box is selected (true), but no MID Server is defined in the MID Server field, workflow automatically attempts to find a MID Server.</td>
</tr>
<tr>
<td>MID Server</td>
<td>midserver</td>
<td>Name of the MID Server to use. This field appears when you select the Use MID Server check box. The workflow ignores this parameter if the use_midserver parameter is disabled.</td>
</tr>
<tr>
<td>Sensor Script</td>
<td>sensor_script</td>
<td>The script to execute after the request has been made and a response has been received. You can access the full XML response body from the activity.output object.</td>
</tr>
</tbody>
</table>

**Probes used by Orchestration**

Certain probes, controlled by MID Servers, perform Orchestration tasks on remote computers, such as restarting a server or creating virtual machines from templates.
How Orchestration probes work

When a Workflow executes an Orchestration activity, that activity launches a probe, which writes an output record to the ECC Queue. The MID Server selected for the activity checks the ECC Queue for assignments, and then executes the appropriate probe to do the work on the target machine. The information about the activity (machine restarted, files copied, etc.) that is returned from the target machine by the probe is written to the ECC Queue as an input record. This information is then sent from the ECC Queue to a sensor that is built into the Workflow activity. The Workflow is updated, and the next activity is executed.

Note: The probe parameters are set by the activities that launch the probe.

How Orchestration uses probes

Probe List

The base system includes the following Orchestration probes (Orchestration > Definition > Probes).

<table>
<thead>
<tr>
<th>Probe Name</th>
<th>ECC Queue Topic</th>
<th>ECC Queue Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>Command</td>
<td></td>
<td>A probe that runs a local command on the MID server.</td>
</tr>
<tr>
<td>DNS Name Resolver</td>
<td>DNSNameResolver</td>
<td></td>
<td>A probe that resolves a fully qualified domain name (FQDN) into an IP address.</td>
</tr>
<tr>
<td>SCPCommand</td>
<td>SCPCommand</td>
<td></td>
<td>A probe that copies files securely from one machine to another. The copy function is performed using the MID Server as a tunnel.</td>
</tr>
<tr>
<td>Shazzam</td>
<td>Shazzam</td>
<td></td>
<td>A probe that identifies active devices.</td>
</tr>
<tr>
<td>Probe Name</td>
<td>ECC Queue Topic</td>
<td>ECC Queue Name</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------------</td>
<td>----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SNMPProbe</td>
<td>SNMP</td>
<td>SNMP Query</td>
<td>This is a generic SNMP probe.</td>
</tr>
<tr>
<td>SOAPProbe</td>
<td>SOAPProbe</td>
<td></td>
<td>A probe that sends a SOAP request to target machine.</td>
</tr>
<tr>
<td>SSHCommand</td>
<td>SSHCommand</td>
<td></td>
<td>A probe that executes shell scripts from a command line after logging in to a target machine via SSH.</td>
</tr>
<tr>
<td>SSHCommandLong</td>
<td>SSHCommandLong</td>
<td></td>
<td>A probe that executes long running shell scripts from a command line after logging in to a target machine via SSH.</td>
</tr>
<tr>
<td>VMWare</td>
<td>VMWareProbe</td>
<td></td>
<td>A generic VMware probe that executes the MID Server script include in the ECC queue name that is set by a VMware Orchestration activity. This probe can run any MID Server script include.</td>
</tr>
</tbody>
</table>
| Windows - PowerShell | PowerShell        | Windows - PowerShell | A probe that runs a Windows PowerShell script on the MID Server. The PowerShell script is provided as the value of a parameter with name ending in `.ps1`. Two variables are available to the script:  
- `$computer`: The computer pointed to as the source for this probe  
- `$cred`: A PowerShell credential, using a user name and password from the Credentials table, that logs into `$computer` successfully. |

**PowerShell activities**

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications.

PowerShell must be installed on any MID Server that uses these activities. MID Servers using PowerShell must be installed on a supported Windows operating system. ServiceNow supports PowerShell 2.0 and above. PowerShell 3.0 does not support Windows 2003 Server.
The ServiceNow Orchestration plugin adds these basic PowerShell activities to workflows. For instructions on using activities from the PowerShell activity pack, see PowerShell activity pack.

Legacy Run PowerShell activity
The Run PowerShell activity executes Windows PowerShell commands on a MID Server.

Attention: This activity is deprecated and is unavailable for new workflows. To replace the functionality of this activity, use the Powershell activity template to create a custom, scoped activity. Workflows from a previous release that use the Run PowerShell activity can continue to do so.

Result Values
The workflow designer can assign a result value using activity.result from within a script field of the activity. By default, the success or failure of the PowerShell commands used determines the result value of the Run PowerShell activity. Possible result values are:

- Success
- Failure

Scratchpad Entries
Information written to stdout by the executing script is captured and returned to the activity in the activity.output variable. This information can be parsed, processed, or saved (to a scratchpad variable, for example) for future processing in the activity’s sensor script.

An example would be to run the get-date command to get the MID Server’s current time. This sensor script saves the full output received, but we can process it to return and save only the time.

```
// Save full output for a later processing in scratchpad variable 'currendatetime'
workflow.scratchpad.currendatetime = activity.output;

// Process the output and fetch the time and store it in a scratchpad variable 'time'
var time = /* (result_data)[0][PM]/.exec(output);*/
workflow.scratchpad.time = time ? time[1] : "No time found";
```
Note: This is an over-simplified example. In most cases, the script operates against some remote Windows computer. However, the principal is the same – whatever is written to stdout is returned in activity.output and available to process.

Input Variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>IP address of the target Windows machine. This value is mapped to the $computer variable for use in commands (see the example in the Command field). A PowerShell credential variable called $cred that is based on information in the ServiceNow Credentials table will authenticate on the computer pointed to by Hostname.</td>
</tr>
<tr>
<td>Command</td>
<td>Enter the PowerShell command to run. For example, to execute a simple WMI query against a remote machine pointed to by the hostname variable, the command is:</td>
</tr>
<tr>
<td></td>
<td>get-wmiobject &lt;class&gt; -computer $computer -credential $cred</td>
</tr>
<tr>
<td></td>
<td>If no credentials authenticate on the computer, the command runs in the context of the MID Server user.</td>
</tr>
<tr>
<td></td>
<td>You cannot run both a command and a script file. Specifying a command hides the Script file variable.</td>
</tr>
<tr>
<td>Sensor script</td>
<td>The script to run using the results of the probe. The output from the probe is contained in a variable called output. Any error from the probe is contained in a variable called error.</td>
</tr>
<tr>
<td>Script file</td>
<td>The MID Server script file to run. You cannot run both a script file and a command. Selecting a script file hides the Command variable.</td>
</tr>
<tr>
<td>PowerShell script variables</td>
<td>Additional parameters, in JSON format, used by the specified script file.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the onExecute function of the activity.</td>
</tr>
<tr>
<td>State</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>---------------------------------------------------------------</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was cancelled.</td>
</tr>
</tbody>
</table>

Add workflow variables for the command line using the normal workflow variable syntax. In the example above, if the `<class>` was in a workflow input variable called `myclass`, the command would look like:

```powershell
get-wmiobject $ {workflow. inputs. myclass } -computer $computer -credential $cred
```

Similarly, if the variable is a scratchpad variable named `myclass`, the command would look like:

```powershell
get-wmiobject $ {workflow. scratchpad. myclass } -computer $computer -credential $cred
```

**HResult codes**

When a PowerShell script encounters an error, the Windows machine may return an HResult code as part of the error message.

PowerShell activities can read and interpret this code. Not all PowerShell errors include an HResult code. In the event of a failed PowerShell script, you can use the HResult code to move the workflow through a specific condition.

For example, when resetting an Active Directory password to a password that does not meet policy requirements, such as minimum length or complexity, the PowerShell script returns the HResult code `-2146022651`. To use this code, create an activity condition with the **Condition** value of `activity.hresult = -2146022651`. If the PowerShell script returns this code when the activity runs, the workflow transitions through this new condition.

**SSH activities**

SSH activities allow workflows to perform operations on Linux and Unix computers.

Your ServiceNow instance must have access to a MID Server configured to use SSH to run these Orchestration activities.

**Run Command activity**

The Run Command activity runs a command (including shell scripts) on a Linux or UNIX computer.

**Attention:** The Run Command activity is deprecated in this release. If you have a workflow created in a previous version that uses this activity, your workflow will continue to work normally after upgrading to Helsinki. However, to use this functionality in a new workflow, you must create a custom activity using the [SSH activity template](https://www.snowflake.com) in the ServiceNow activity designer.
Input variables

Run command input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Long running</td>
<td>Select this check box to disable the SSH connection timeout if you think the command will take longer to run than the default 60 seconds. Orchestration periodically checks the running process to determine its status until it is finished.</td>
</tr>
<tr>
<td>Hostname</td>
<td>Hostname or IP address of destination server for SSH activity.</td>
</tr>
<tr>
<td>Directory</td>
<td>Name of the working directory.</td>
</tr>
<tr>
<td>Command</td>
<td>The command to run from this activity.</td>
</tr>
<tr>
<td>Sudo</td>
<td>Select this check box to use <code>sudo</code> to run the command on the host machine.</td>
</tr>
<tr>
<td>Sensor script</td>
<td>The script to run using the results of the probe. The output from the probe is contained in a variable called <code>output</code>. Any error from the probe is contained in a variable called <code>error</code>.</td>
</tr>
</tbody>
</table>

Run SCP activity
The Run SCP activity uses Secure Copy Protocol (SCP) to copy a file from one computer to another, including the directory in which the file resides.

Note: This activity is deprecated in the Geneva release and is not available for use in new workflows. If you have a workflow created in a previous version that uses this activity, your workflow will continue to work normally after upgrading. The custom `Secure Copy activity` replaces the Run SCP activity in the Geneva release.

Input variables

Run SCP input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Host</td>
<td>Hostname or IP address of the source computer.</td>
</tr>
<tr>
<td>From File</td>
<td>Absolute path to the file to copy. This value can be a directory.</td>
</tr>
<tr>
<td>To Host</td>
<td>Hostname or IP address of the target computer.</td>
</tr>
<tr>
<td>To File</td>
<td>Path to the target file. This path can be absolute or relative to the logged in user's home directory. The specified directory must already exist on the target computer.</td>
</tr>
<tr>
<td>Copy Directory</td>
<td>Check box to copy a directory defined in the <code>From File</code> variable and all files contained in that directory.</td>
</tr>
</tbody>
</table>
Orchestration applications

Orchestration provides several applications with your subscription.

Orchestration ROI

The Orchestration ROI application allows you to estimate and compute cost savings for tasks in your system that could be automated with Orchestration.

After you automate the tasks, you can track cost savings by associating Orchestration workflows with corresponding task areas. Configuration in the application allows you to select the hourly rate for performing the task manually, the rules the system uses to select tasks for evaluation, and the time period of the evaluation. Orchestration ROI estimates your savings by multiplying the cost of performing repetitive tasks manually by the estimated number of times the system performs those tasks automatically during a specific date/time range. The system also calculates the actual savings of your automations. Orchestration ROI is included with the base Orchestration subscription.

Orchestration ROI reports offer a number of views of the comparative data and allow you to access the associated records directly from the reports. The standard reports included with the Orchestration - ROI plugin provide summaries, estimated costs, and calculated costs for automated processes. The ROI premium dashboard uses Performance Analytics to provide detailed reports on calculated savings over time. Performance Analytics requires a different plugin and subscription.

Note: When Orchestration ROI is activated as a dependent plugin of Orchestration, demo data is not installed. If you want to use demo data as a template for your own ROI evaluation, submit a request to ServiceNow® technical support for an Orchestration ROI plugin upgrade with demo data selected.

To set up Orchestration ROI, complete the configuration tasks in the order shown here.

Create Orchestration ROI labor rate cards

Before calculating your Orchestration ROI, you must create labor rate cards for the manual work that would be required to complete the tasks correlated to the ROI calculations.

Role required: orchestration_manager

The hourly rates defined in the rate cards are used to determine the savings from your orchestrated tasks.

1. Navigate to Orchestration > ROI > Labor Rate Cards.
2. Complete the fields in the form using the descriptions in Manage a labor rate card.
3. Click Submit.
4. Create additional rate cards as needed.

Create an Orchestration ROI automation entry record

The ROI automation entry record couples the cost of performing a task with the specific workflow that automates the task, for the purpose of calculating the resulting savings.

Role required: orchestration_manager

Before starting this procedure, verify that the appropriate labor rate cards were created.

Use this record to apply a manual hourly rate to a task that is performed automatically by your instance. To determine the savings realized from orchestrating a task, the system can evaluate whether those savings were estimated or calculated.
- **Estimated savings**: Uses the labor rate, the time estimates for completion of the task, and the number of automations that have been run to determine savings.
- **Calculated savings**: Uses the labor rate, the time calculated for completion of the task, based on the configured evaluation period, and the number of automations that have been run to determine savings.

1. Navigate to **Orchestration > ROI > Automation Entry Form**.
2. Fill in the fields on the form, as appropriate.

### Automation Entry Form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Category**                    | Category of the selected workflow automation. The following categories are provided in the base Orchestration - ROI system:  
  - Access & Identity Management  
  - Datacenter Automation  
  - IT Service Management  
  - Other  |
| **Item**                        | Unique name for the specific task within the category. This value represents the work to which the labor rate card applies, such as *Password Reset*. |
| **Resource**                    | Labor rate card to apply to this automation entry. You must have IT Cost Management active on the instance for this field to appear. |
| **Associated Workflows**        | Workflow automations created to automate this manual task. The system uses this field to identify the number of automations that have been run. |
| **Estimated Duration (min) per Task** | Estimated time to perform this task manually. |
| **Estimated Volume per Month**  | Estimated number of times needed to perform this task manually per month. |
| **Start time**                  | Start time for the evaluation period. Configure this value in the Time Range for Calculated Averages module. |
| **End time**                    | End time of the evaluation period. Configure this value in the Time Range for Calculated Averages module. |
| **Calculated average duration per task (min)** | Actual time required to perform this task manually. |
3. Select one of these submission options:
   - **Submit**: Saves the record to the table without running any calculations.
   - **Submit and process now**: Saves the record and calculates the savings based on the hourly rate and the number of workflow contexts for this automation entry.

### Create an Orchestration ROI correlated task rule

The correlated task rule applies configurable conditions to fields in a selected table that tell the instance which manual tasks correspond to an automation entry record.

Role required: orchestration_manager

Before starting this procedure, make sure you have created **labor rate cards** and the appropriate **automation entry records** for the automated tasks you want to evaluate.

Create conditions that the system can use to correlate manual tasks to the automation entry. For example, a rule on the Incident (incident) table uses these conditions to correlate the employee on-boarding task to values configured in the Employee OnBoarding automation entry record:

- **(Subcategory) (is) (Employee OnBoarding)**
- **(Sort description) (contains) (new employee)**

When a new employee opens an incident to request services or assets which are typically handled manually, Orchestration applies the usual labor rate for the manual work to the potential automated solution, and then computes the actual savings.

1. Navigate to **Orchestration > ROI Task Correlation > Correlated Tasks Rules**.
2. Click **New**.
3. Fill in the fields on the form, as appropriate.

### Automation entry form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automation entry</td>
<td>Automation entry record that correlates to the manual task defined by these conditions. The entry record names the workflow used to automate the task and defines the labor rate used to calculate the cost of the task.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to filter, using these conditions. The rule selects records from this table that match the conditions. Information from these records is used to calculate the actual time to perform a manual task and the actual volume for that manual task.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition builder to use to filter records for this table. Use these conditions to identify all manual tasks correlated to this automation entry.</td>
</tr>
</tbody>
</table>

Read-only fields
### ServiceNow Kingston Now Platform Capabilities

#### Field  | Description
--- | ---
Processed on | Date and time that the system performs the matching records lookup. The system automatically searches for new manual tasks matching these conditions.

4. Select one of these submission options:
   - **Submit**: Saves the record to the table without running any calculations.
   - **Submit and process now**: Saves the record, looks up all matching tasks, and saves matching record information to the Correlated Tasks (manual_mapping_records) table.

5. To view a rule, select the link in the **Table** column of the **Correlated Tasks Rules** related list for the automation entry you want to see.

6. To view the list of tasks that match all correlated rules in the system, navigate to **Orchestration > ROI Task Correlation > Correlated Tasks**.

7. To view the list of tasks that match this rule in the system, click **Correlated Tasks** under **Related Links** in this form.

### Configure the time range for Orchestration ROI calculations

Select a date range to calculate the average number of tasks and the duration per month for the correlated tasks.

Role required: orchestration_manager

By default, the system creates a range ending at the current date and time and extending back over the previous month. You can change this range at any time and recalculate the ROI instantly.

1. Navigate to **Orchestration > ROI Task Correlation > Time Range for Calculated Averages**.
2. Enter a new start or end date and time or click the icon to select a date using the calendar.
3. Click **Calculate** to recalculate the ROI based on the new time range and to save your settings.

### Installed with Orchestration ROI

Several types of components are installed with the Orchestration - ROI plugin (com.snc.runbook_automation.roi).

*Tables installed with Orchestration ROI*

Orchestration - ROI adds the following tables.

**Tables for Orchestration - ROI**

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expense and Savings</td>
<td>Contains the data for the reports in Orchestration &gt; ROI Reports &gt; Predicted Savings.</td>
</tr>
</tbody>
</table>

| run_rate_predicted_savings    |                                                                                   |

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
</table>
| Savings Report  
(savings_report) | Contains the number of automations that have been run before the date specified in the **Processed On** column, based on:  
- Each automation entry’s associated workflows  
- Estimated savings based on the estimated duration per task.  
- Calculated savings based on calculated duration. |
| Detailed Savings Report  
(detailed_savings_report) | Contains a detailed list for the Savings Report  
(savings_report) table. This list contains each automation’s run date and savings for that automation. |
| Automation Entries  
(automation_entry_form) | Contains automation entries that couple labor resources to specific manual tasks. You can specify the estimated duration to perform a task manually and the estimated number of times that a task is performed per month. If this automation entry already has workflow automations implemented, you can specify the associated workflows. The system calculates the savings, based on the labor rate card and the number of workflow automations that have been performed. |
| Roadmap Planning  
(roadmap_planning) | Contains roadmap planning for each automation entry to be implemented. You can provide estimated hours to implement a workflow automation, the automation percentage anticipated by the end of the year, and the starting month to implement the workflow. |
| Correlated Tasks  
(manual_mapping_records) | Contains all matching manual tasks for each automation entry. Each task’s information is stored in this table for the system to use to calculate the actual duration and volume for each manual task. |
| Correlated Tasks Rules  
(manual_mapping_conditions) | Contains the correlated task rules the system uses to look up manual tasks corresponding to each automation entry. |

**Plugins installed with Orchestration ROI**

These plugins are installed with the Orchestration - ROI plugin, if they are not already active.

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
</table>
| Cost Management  
(com.snc.cost_management) | Provides the labor rate cards Orchestration ROI uses to determine the savings for each automated task. See **Cost Management** for more information. |

**User roles installed with Orchestration ROI**

These roles are installed with the Orchestration - ROI plugin.
Orchestration - ROI adds the following roles.

**Roles for Orchestration - ROI**

<table>
<thead>
<tr>
<th>Role title (name)</th>
<th>Description</th>
<th>Contains Roles</th>
</tr>
</thead>
</table>
| Orchestration manager (orchestration_manager) | Manages all activities in the Orchestration ROI module. | • pa_admin  
• report_admin |

**UI actions installed with Orchestration ROI**

Orchestration - ROI adds the following UI actions.

**UI actions for Orchestration - ROI**

<table>
<thead>
<tr>
<th>UI action</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Savings Report</td>
<td>Automation Entry Form (automation_entry_form)</td>
<td>Displays the savings report specific to this automation entry, if the associated workflows are not empty.</td>
</tr>
<tr>
<td>Estimated and Projected Savings</td>
<td>Automation Entry Form (automation_entry_form)</td>
<td>Displays the estimated savings, based on the estimated duration of the task, and calculated savings, based on the calculated duration of the task.</td>
</tr>
<tr>
<td>Show Workflow Context</td>
<td>Detailed Savings Report (detailed_savings_report)</td>
<td>Shows the related workflow context.</td>
</tr>
<tr>
<td>Submit AND process now</td>
<td>Automation Entry Form (automation_entry_form)</td>
<td>Processes this new entry</td>
</tr>
<tr>
<td>Correlated Tasks</td>
<td>Correlated Tasks Rules (manual_mapping_conditions)</td>
<td>Displays all matching tasks from the Correlated Tasks (manual_mapping_records) table.</td>
</tr>
<tr>
<td>Detailed Savings Report</td>
<td>Automation Entry Form (automation_entry_form)</td>
<td>Displays the list of automations that have been run, based on associated workflows.</td>
</tr>
<tr>
<td>Task</td>
<td>Correlated Tasks (manual_mapping_records)</td>
<td>Displays the task record.</td>
</tr>
<tr>
<td>Submit AND process now</td>
<td>Correlated Tasks Rules (manual_mapping_conditions)</td>
<td>Processes a correlated task rule. This action performs matching on the specified table and the filter conditions.</td>
</tr>
</tbody>
</table>

**Script includes installed with Orchestration ROI**

Orchestration - ROI adds the following script includes.
Script includes for Orchestration ROI

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OrchestrationROIAjax</td>
<td>Script that calculates the actual duration and volume of a task.</td>
</tr>
<tr>
<td>OrchestrationROI</td>
<td>Script that calculates the number of workflow contexts, looks up all matching tasks, calculates savings, and other functions used in the UI actions.</td>
</tr>
<tr>
<td>ROIDemoDataUtil</td>
<td>Script that updates demo data timestamps.</td>
</tr>
</tbody>
</table>

Client scripts installed with Orchestration ROI

Orchestration ROI adds the following client scripts.

<table>
<thead>
<tr>
<th>Client script</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display info for processing rules</td>
<td>Correlated Tasks Rules (manual_mapping_conditions)</td>
<td>Displays annotation on the Correlated Task Rule form advising that new task rules are not evaluated until the time specified in the ROI schedule.</td>
</tr>
</tbody>
</table>

Business rules installed with Orchestration ROI

Orchestration ROI adds the following business rules.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete corresponding records</td>
<td>Automation Entry Form (automation_entry_form)</td>
<td>When a record is deleted from the Automation Entry Form (automation_entry_form) table, this business rule deletes all records in other ROI tables that reference this entry.</td>
</tr>
<tr>
<td>Insert into Run Rate &amp; Savings</td>
<td>Automation Entry Form (automation_entry_form)</td>
<td>When a new automation entry is provided, this business rule calculates the estimated savings, based on the estimated duration of a task and its associated labor rate card.</td>
</tr>
<tr>
<td>Insert into Savings Reports</td>
<td>Automation Entry Form (automation_entry_form)</td>
<td>When a new automation entry is provided, this business rule inserts a new record into the Savings Report (savings_report) table with the automations_run field set to 0.</td>
</tr>
</tbody>
</table>

Orchestration ROI reports

Orchestration ROI provides a collection of standard and premium reports to help you calculate savings from automating services in your organization.
The ROI standard reports are included with Orchestration ROI. The premium reports provide enhanced views generated with Performance Analytics and require the Orchestration - ROI Premium plugin.

**Orchestration ROI standard reports**
The dashboard of standard ROI reports provides summaries, estimated costs, and calculated costs for automated processes.

To access the ROI standard dashboard, navigate to Orchestration > ROI Reports > Dashboard. The Summary tab contains four reports on automation categories.

### Report Description

| Report                                                                 | Description                                                                                   |
|                                                                      | Total projected hours spent annually on all manual tasks by category, using the calculated duration of each task and the calculated volume of each task per month. |
|                                                                      | · **Type**: Bar chart                                                                          |
|                                                                      | · **Table**: Expense and Savings (run_rate_predicted_savings)                                      |

| Report                                                                 | Description                                                                                   |
|                                                                      | Total projected annual expense for all manual tasks by category using the calculated duration of each task, the calculated volume of each task per month, and the cost from the labor rate card. |
|                                                                      | · **Type**: Bar chart                                                                          |
|                                                                      | · **Table**: Expense and Savings (run_rate_predicted_savings)                                      |

**Note**: This report uses negative numbers to express an expense.

## Schedule Orchestration ROI calculations for standard reports

The scheduled job that calculates Orchestration ROI standard reports is active by default and controlled by system properties.

**Role required**: orchestration_manager, admin

The system provides a default scheduled job called Processing ROI Schedule that allows you to configure when Orchestration calculates the ROI for standard reports. This schedule allows scripting for advanced conditions. To modify the schedule or write a script to run, open Processing ROI Schedule from **System Scheduler > Scheduled Jobs > Scheduled Jobs** and click **Configure Job Definition**. To execute the schedule directly from the job definition, click **Execute Now**

To control the running of the schedule job with the Orchestration properties.

1. Navigate to **Orchestration ROI > Properties**.
2. Configure the following properties:

### ROI schedule properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>roi.processing.active</td>
<td>Activate scheduled job for ROI processing. This property activates the Processing ROI Schedule scheduled job.</td>
</tr>
<tr>

<td>· <strong>Type</strong>: true</td>
</tr>
<tr>
<td></td>
<td>· <strong>Default</strong>: true</td>
</tr>
<tr>
<td>roi.processing.interval</td>
<td>Scheduled ROI processing interval (hours). This property sets the repeat interval for the scheduled job that processes savings reports and correlated tasks.</td>
</tr>
<tr>
<td></td>
<td>· <strong>Type</strong>: integer</td>
</tr>
<tr>
<td></td>
<td>· <strong>Default</strong>: 24</td>
</tr>
</tbody>
</table>
3. Click **Save** to save your changes.

**Orchestration ROI premium reports**
The premium dashboard provides detailed reports on calculated savings over time.

The ROI premium reports require the Orchestration - ROI Premium plugin and are built using **Performance Analytics concepts**. The Orchestration - ROI Premium plugin is dependent on the **Performance Analytics - Premium** plugin which requires a separate subscription.

**Important:** You must activate the Performance Analytics **scheduled collection job** before Orchestration ROI premium can display data.

To access the ROI premium dashboard, navigate to **Orchestration > ROI Reports > Premium Dashboard**.

**ROI By Category tab**

The ROI By Category tab contains three reports showing the calculated savings over time by category.

![Calculated savings monthly by category](image-url)

</table>

### Activate Orchestration ROI premium reports

To view the Orchestration ROI premium reports, you must activate the Orchestration - ROI Premium (com.snc.runbook_automation.roi_premium) plugin.

The Orchestration - ROI Premium plugin requires the Performance Analytics - Premium plugin, which must be purchased separately.

Role required: admin

The Orchestration - ROI Premium plugin is included with an Orchestration subscription, but must be activated by request.

1. In the HI Service Portal, click **Service Requests > Activate Plugin.**
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.

| Reason/Comments | Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows. |

3. Click **Submit**.

Schedule Orchestration ROI calculations for premium reports

Orchestration ROI premium reports use a Performance Analytics job that must be activated before premium reports can be generated.

Role required: orchestration_manager, admin

The scheduled job required to calculate premium ROI reports is called (PA ROI) Historic Data Collection and is installed with the Orchestration - ROI Premium (com.snc.runbook_automation.roi_premium) plugin. This job is not active by default.

1. Navigate to **Performance Analytics > Data Collector > Jobs**.
2. Search for the (PA ROI) Historic Data Collection job.
3. Select the **Active** check box.
4. The scheduling options appear for the value selected in the **Run** field.
   
   For instructions on creating a schedule, see [Create or schedule a data collection job](#).
5. To execute the schedule directly from the job definition, click **Execute Now**.
6. Click **Update**.

**Client Software Distribution**

The Client Software Distribution (CSD) application allows administrators to distribute software from the service catalog using third-party management systems.

CSD allows an administrator to create all the records necessary to deploy software from service catalog requests, including software models and catalog items. You can use the CSD application to automate the deployment and revocation of software from an SCCM host using the custom **SCCM activity pack**. You can define lease periods for software distributed from the Service Catalog and allow lease extensions in some cases, pending approvals. Deployment is accomplished using Orchestration activities and workflows.

CSD also integrates with **Software Asset Management** to manage license counts for deployed software.
CSD process flow using SCCM

Activate client software distribution

Client software distribution requires the Orchestration - Client Software Distribution plugin (com.snc.orchestration.client_sf_distribution), which is available by request with a subscription to Orchestration.
The Orchestration - Client Software Distribution plugin activates the *Orchestration - System Center Configuration Manager* plugin that contains the custom SCCM activities used to deploy or revoke software using an SCCM server. For additional plugin dependencies, see *Plugins installed with client software distribution*.

**Note:** The Orchestration - Client Software Distribution plugin runs in its own application scope.

1. In the HI Service Portal, click **Service Requests > Activate Plugin**.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

**Installed with client software distribution**

Several types of components are installed with client software distribution (CSD). *Tables installed with client software distribution*

These tables are installed with the Orchestration - Client Software Distribution plugin (com.snc.orchestration.client_sf_distribution).

**Client software distribution tables**

<table>
<thead>
<tr>

Properties installed with client software distribution

Properties for client software distribution (CSD) manage the installation status of requested software deployments and configure scheduled Discoveries.

To access CSD properties, navigate to Client Software Distribution > Properties. The following properties are available:
### Client software distribution properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Status check expiration interval (days)** | sn_client_sf_dist.softwareInstallExpDays | Controls how many days the system waits before ignoring the software installation status. The default time limit for installing software is 30 days before the system stops checking the installation status of a deployment. Installation statuses are:  
- **Not installed**: User has not installed requested software prior to the expiration of the configured time limit.  
- **Installed**: Software was installed within the configured time limit.  
- **Status check expired**: Time limit has expired for the user to install the requested software. The system no longer checks the status of this deployment.  
- **Revoked**: Software was revoked by the administrator.  
- **Type**: integer  
- **Default value**: 30 |
| **Reconcile software installation status interval (hours)** | sn_client_sf_dist.softwareInstallIntervalHour | Determines when the scheduled job runs that determines the installation status. By default, the system checks the installation status every hour.  
- **Type**: integer  
- **Default value**: 24 |
| **Set scheduled application Discovery interval (days)** | sn_client_sf_dist.discoveryExeDay | Sets the repeat interval for the scheduled job that runs application Discovery. By default, Discovery runs at midnight on the day set with this value.  
- **Type**: integer  
- **Default value**: 5 |
| **Set lease execution schedule job interval (minutes)** | sn_client_sf_dist.lease_execution_interval | Interval in which the CSD Lease Schedule scheduled job checks for requested software leases to start, stop, or extend.  
- **Type**: integer  
- **Default value**: 1 |
### Now Platform Capabilities

<th>Description</th>
</tr>
</thead>
</table>
| Set time prior to lease end to notify requester (days)                  | sn_client_sf_dist.lease_end_notification  | Determines how many days prior to the end of a software lease to notify the requester. If lease extensions are allowed, ensure that this period provides enough time for the approval process to complete before the lease expires.  
  - **Type**: integer  
  - **Default value**: 5                                               |

#### Workflows installed with client software distribution

These workflows are installed with the Orchestration - Client Software Distribution plugin

**Workflows installed with client software distribution**

<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discover SCCM</td>
<td>Retrieves lists of applications, collections, and deployments from SCCM servers using custom CSD orchestration activities. An administrator runs this workflow from a UI action in a <strong>SCCM Server Instance record</strong>.</td>
</tr>
<tr>
<td>Order Client Software</td>
<td>Runs automatically when a user orders software from the service catalog.</td>
</tr>
<tr>
<td>Deploy SCCM Application</td>
<td>Triggered by the Order Client Software workflow to deploy software through SCCM server. This workflow adds either the user or the device into the SCCM collection.</td>
</tr>
<tr>
<td>Revoke Client Software</td>
<td>Begins the software revocation process for software deployed by an external provider. Administrators run this workflow from a UI action on the Requested Software record and the Installed Software Not Entitled record. This workflow triggers the appropriate provider workflow that performs the actual revocation. For example, this workflow triggers the Revoke SCCM Application workflow for applications in SCCM uninstall collections.</td>
</tr>
<tr>
<td>Revoke SCCM Application</td>
<td>Revokes SCCM applications that are members of an uninstall collection. The Revoke Client Software workflow triggers this workflow to revoke software deployed by an SCCM server. This workflow moves either the user or the device from the SCCM collection into the appropriate uninstall collection.</td>
</tr>
</tbody>
</table>
You can create software licenses and counters in Software Asset Management for software items deployed from the service catalog by CSD. CSD depends on the software counter result to determine if the license is available for the requested software. If the license Valuation is greater than 0, and the license type is Not allocated, CSD assumes that the license is available for the software.

1. Navigate to Software Asset > Software Licenses.
2. Add a new software license for the software model you used in CSD.
3. Navigate to Software Asset > Reconciliation > Software Counters.
4. Create a software counter for the software model you created.
5. Run the counter to retrieve the software license information.

Client software distribution ordering process
Software deployed by Client Software Distribution (CSD) can be ordered from the service catalog by individual users or by approved users on behalf of others.

Client Software Distribution catalog items have different options, depending on how ordering is configured.

Lease start and end dates

All software deployed by CSD requires users to specify the beginning date for the lease. This is enforced by the Orchestration - Asset Lease Management plugin that is activated automatically with CSD. The system prepopulates the Lease start field with the current date and time.

If the catalog item is configured for revocation (uninstall), the form displays the Lease end field, which allows the requester to define an end date and time for the lease. The system validates user input in these fields to ensure that the dates selected define a future window. The Lease end field is not mandatory and can be left blank to order software with no end date.

Note: For systems deploying software from Microsoft System Center Configuration Management (SCCM), the Lease end field is only available if the SCCM configuration specifies an uninstall collection.

Software offered only to the logged in user

If the software catalog item is configured with the Order on behalf of check box cleared, the User field does not appear on the order form. The logged in user selects the device on which to deploy the software from the Device to install this software on field. Only those devices assigned to the logged in user appear in the list.

In this example, a user has logged into the service catalog to order Firefox for a computer that is assigned to her. She selects the machine from a list of devices she owns and selects the date and time the lease should begin. This software is deployed through Microsoft System Center Configuration Management (SCCM), but does not have an uninstall collection configured and cannot be revoked automatically by the system. As a result, the Lease end field is not available.
If the software catalog item is configured with the **Order on behalf of** check box selected, the **User** field appears on the form. The logged in user can select any user from this field. The **Device to install this software on** field only lists the devices assigned to the user selected in the **User** field. If an approval is required for software ordered on behalf of another user, the system automatically sends an approval request to the manager of the user receiving the software. The approval is skipped if the requester is the named user’s manager.

In this example, a manager is ordering Google Chrome for a contractor. The manager selects the contractor from the **User** field and then chooses a computer from the list of devices assigned to the contractor. This software has an SCCM uninstall collection configured, which allows the manager to select an end date for the lease that coincides with the end of the user’s contract. When the lease expires, SCCM automatically uninstalls the software from the device.
Defining software lease window

Extend a software lease

Users of software deployed by Client Software Distribution (CSD) can request the extension of a lease window, if the software is revocable by a software distribution system.

Role required: Any system user

If your software has a lease end date defined, and the software status is Installed, you can request an extension of the lease, pending any approvals your organization requires.

1. Navigate to Service Catalog > My Requested Software.
   The list shows only the software you have requested from the service catalog.

2. Select the record for the installed software whose lease you want to extend.

3. Under Related Links click Extend Lease.
4. In the dialog box that appears, select a new lease end date in the calendar and click **OK**. You must select a date later than the current date.

If the lease extension is subject to manager approval, you are notified of the decision. If the request is approved, a notification shows the new lease end date. If the new end date is within 5 days (the default notification period) of the date when you made the request, CSD sends an immediate end-of-lease notification.

**Important:** If lease extensions in your organization require approval, make sure the approver is available and has enough time to process your extension request. If the extension cannot be approved before the original end date expires, the software is revoked.
**Client software distribution from SCCM**

You can use Client Software Distribution (CSD) to deploy and revoke software deployments from Microsoft System Center Configuration Management (SCCM) and manage distributions on SCCM hosts.

The **SCCM activity pack** contains Orchestration activities that CSD uses to deploy software from a service catalog request and manage user and device collections on SCCM servers. In addition, CSD can manage license counts for deployed software using ServiceNow Software Asset Management, revoke software deployed by SCCM without user interaction, and manage lease periods.

**Configuring SCCM**

Follow the SCCM configuration procedures in the order shown.

Configure the Application Administrator role on the SCCM server

To deploy software using ServiceNow® Client Software Distribution (CSD), ensure that an SCCM administrative user has the correct permissions to deploy software and that PowerShell is properly configured.

SCCM role required: Application Administrator

These instructions are for Microsoft 2012 R2 Server.

1. In the System Center Configuration Manager console, navigate to **Administration > Security > Administrative Users**.
2. Right-click the user to whom you want to grant the Application Administrator role.
3. Select **Properties** from the drop-down menu.
4. In the Properties dialog box, select the **Security Roles** tab.
5. Ensure that the user has the Application Administrator role.
6. If the user does not already have this role, click **Add**, select this role from the list, and click **OK**.
Granting the Application Administrator role on the SCCM server
7. Log into SCCM as the user with the Application Administrator role.
8. Open the menu from the upper left corner of the console and select **Connect via Windows PowerShell**.

9. Ensure that the user can access the CM console. This action establishes the environment path to PowerShell for the logged in Application Administrator user.

**Update the SCCM cmdlet libraries**

Ensure that the System Center Configuration Manager SCCM Cmdlet Library is up-to-date.

SCCM role required: Either current user or system administrator, depending on settings.

The System Center Configuration Manager SCCM Cmdlet Library installs and updates the Windows PowerShell module for SCCM. SCCM checks for library updates on a daily basis. Out-of-date libraries can cause Discovery of the SCCM server to fail, because the system cannot parse the SCCM activity output. This warning message appears in the ECC queue input records for the SCCM GET activities:

```
WARNING: An update to the System Center 2012 Configuration Manager Cmdlet Library is available. Please go to 'http://go.microsoft.com/fwlink/?LinkId=528947' to download the latest version.
```

If you elect to use an earlier version library, use this procedure to disable the CM update check, which allows Discovery to proceed without issues.

1. Log into the SCCM console as an administrator.
2. Open the menu from the upper left corner of the console.
3. Select **Connect via Windows PowerShell**.
4. Run one of these commands to disable the update check:
   - **Per-user**: `Set-CMCmdletUpdateCheck -CurrentUser -IsUpdateCheckEnabled 0`
   - **Per-system**: `Set-CMCmdletUpdateCheck -System -IsUpdateCheckEnabled 0`

   **Important:** The per-system cmdlet must run in an elevated Windows PowerShell session.

5. Run the `Get-CMCmdletUpdateCheck` command to refresh the console and check the settings.
6. Ensure that the value of the `IsEnabled` configuration variable has changed to `False`. This indicates that the warning for an out of date cmdlet library is disabled for the users specified.
7. To re-enable the update check, run the `-IsUpdateCheckEnabled 1` command for either the current user or for the system.

Configure the MID Server for SCCM activities

To use a MID Server with Microsoft System Center Configuration Management (SCCM) activities, configure it to communicate with the SCCM server.

**Role required:** admin

1. In the navigation filter, enter `cmdb_ci_dns_name.list`.
2. Click **New**.
3. Enter the fully-qualified domain name (FQDN) of the SCCM server in the **Name** field.
4. Right-click in the form header and select **Save**.
5. In the **IP Address** related list, click **New**.
6. In the **IP Address** field, enter the IP address of the SCCM server.
7. In the **Nic** field, select **eth0** or your preferred network interface controller.
8. Leave the **Netmask** field blank.
9. Click **Submit**.

Create Windows credentials for SCCM deployments

Microsoft System Center Configuration Manager (SCCM) requires the appropriate credentials to deploy applications using the Client Software Distribution application.

**Role required:** sn_client_sf_dist.csd_admin or admin

Client software distribution requires Windows credentials that have administrative rights on the SCCM server.

1. Navigate to **Orchestrator > Credentials**.
2. Click **New**.
3. In the list of credential types, select **Windows Credentials**.
4. Provide a user name and password with administrative rights on the SCCM server.
Important: Ensure the following:
- This user must have the Application Administrator role on the SCCM server.
- Use the credentials to log into the SCCM Server and connect via Windows PowerShell from the System Center Configuration Manager console at least once to set the path variable for that credential.

5. Fill in the other fields on the form, as appropriate.
   For details, see Windows credentials.

6. Click Submit.

Retrieve SCCM data for client software distribution

Retrieve the collections and the list of applications available for deployment from your SCCM servers.

Role required: sn_client_sf_dist.csd_admin or admin

Before starting this procedure:
- Set up your Microsoft System Center Configuration Manager (SCCM) server, create the applications and collections, and configure the deployments you need. For information, see your SCCM documentation.
- Configure a user with the Application Deployment Manager role on the SCCM server.
- Set up the MID Server to communicate with the SCCM server.
- Add Powershell credentials to the ServiceNow Credentials (discovery_credentials) table for the SCCM user who has the Application Deployment Manager role.

To populate the Client Software Distribution application with SCCM data:

1. Navigate to Client Software Distribution > SCCM > SCCM Server Instance.
2. Click New.
3. In the SCCM Server Instance form, identify the server by name and provide the fully qualified domain name.
4. Click Submit.
   The new SCCM server appears in the list.
5. Open the new SCCM record and click Discover now under Related links.
   The system runs the Discover SCCM workflow that retrieves the application, collection, and deployment data from the SCCM server.
Retrieving SCCM data with Discovery

SCCM server Discovery for client software distribution

A Discovery workflow populates ServiceNow tables with collection, application, and deployment data retrieved from SCCM servers.

Users run the Discover SCCM workflow from an SCCM Server Instance record to populate the following ServiceNow tables:

<table>
<thead>
<tr>
<th>Table data populated in ServiceNow tables</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Table</strong></td>
</tr>
</tbody>
</table>
| SCCM Application (sn_client_sf_dist_sccm_application) | • name  
• publisher  
• version  
• model  
• sccm_server |
| SCCM Collection (sn_client_sf_dist_sccm_collection) | • name  
• type  
• sccm_server |
| SCCM Deployment (sn_client_sf_dist_sccm_deployment) | • application  
• collection  
• type |
Set up a software model for an SCCM application

Using the applications discovered on the SCCM server, set up a software model used by the Software Asset Management application to manage licenses.

Role required: sn_client_sf_dist.csd_admin or admin

Before creating software models, you must discover the applications available for deployment on the SCCM server. See Retrieve SCCM data for client software distribution for details.

You can link an SCCM application to an existing software model or create a new model.

1. Navigate to Client Software Distribution > SCCM > SCCM Applications.
   A list of applications discovered on the SCCM server appears.
2. Open an SCCM application record.
3. To link to an existing model, click the magnifying glass icon in the Model field and select a model from the list. <info>

   ![](SCCM Application Record.png)

   **SCCM Application Record**

   - **Name**: Dropbox
   - **Publisher**: Dropbox
   - **Version**: 9.0

   **Related Links**

   - **Create Software Model**

4. To create a model, click Create Software Model under Related Links.
   a) Complete the software model fields.
      See for details.
   b) Click Submit.
      The view returns to the SCCM Applications form.

Define an SCCM configuration
To create catalog items for SCCM software deployment or to configure your instance to revoke software through SCCM, you must first associate that software with a collection through an SCCM configuration.

Before you create an SCCM configuration record, make sure you have discovered the SCCM applications, collections, and deployments and set up the necessary software models.

Role required: sn_client_sf_dist.csd_admin or admin

The SCCM configuration process associates software with SCCM collections. To deploy software from an SCCM server, the user or device must be a member of an SCCM collection associated with an install deployment. Client Software Distribution (CSD) allows you to revoke unentitled software using an SCCM server when that software can be removed using an uninstall collection. Users requesting revokable software from the Service Catalog also have the ability to define lease start and stop dates and request lease extensions.
SCCM table references

1. Navigate to Client Software Distribution > SCCM > SCCM Applications.
2. Open an application that has a configured software model.
3. Under Related Links, click Create Software Configuration.
4. Complete the form, using the fields in the table.
SCCM configuration form

SCCM configuration fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Recognizable name for this SCCM software configuration.</td>
</tr>
<tr>
<td>SCCM application</td>
<td>Name of an application hosted on the SCCM server.</td>
</tr>
<tr>
<td>SCCM collection</td>
<td>Name of the collection associated with the <em>install</em> deployment for the selected application on the SCCM server. Only those collections associated with the application are available for selection.</td>
</tr>
</tbody>
</table>
| SCCM uninstall collection| Name of the collection associated with the *uninstall* deployment for the selected application on the SCCM server. You must specify an uninstall collection to:  
- Define a lease end date for deployed software.  
- Allow lease extensions.  
- Revoke software from a user's machine. |

Create a catalog item for an SCCM application

Using the applications discovered on the SCCM server, create a catalog item for an application you want to offer for distribution from the service catalog.

Role required: sn_client_sf_dist.csd_admin or admin

Before creating a catalog item, you must link the application to a software model and create at least one software configuration.

1. Navigate to **Client Software Distribution > SCCM > SCCM Applications**.  
   A list of applications discovered on the SCCM server appears.
2. Open a record for an SCCM application.
3. Under **Related Links**, click **Create Catalog Item**.  
   A new SCCM Application Catalog Item record appears with preconfigured information. For information about common service catalog fields, see .

<table>
<thead>
<tr>
<th>Name</th>
<th>Dropbox - 0.1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Short description</td>
<td>Mobile file backup &amp; sharing</td>
</tr>
</tbody>
</table>

Dropbox is a service that keeps your files safe, synced, and easy to share. Bring your photos, docs, and videos anywhere and never lose a file again.
4. Add price information and complete the following fields added to the Client Software Distribution Catalog Item (sn_client_sf_dist_cat_item) table by the Orchestration - Client Software Distribution plugin:

### SCCM fields in the catalog item form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Skip approval (skip_approval)</td>
<td>Check box that allows skipping approval for this item by the requester’s manager when a user orders it from the service catalog. Use this field in conjunction with the <strong>Order on behalf of</strong> field to ensure that software ordered by a logged in user on behalf of another user is subject to approval. By default, this check box is cleared, requiring manager approval for all new catalog items.</td>
</tr>
<tr>
<td>Check license compliance (check_license_compliance)</td>
<td>Check box that forces the system to determine if deploying this item is allowed under the current license.</td>
</tr>
</tbody>
</table>

**Note:** There are two levels of approval possible. By default, all category items require group approval for items in excess of $1000. If that approval is given or skipped, the system evaluates the `Skip approval` check box to determine if the software item requires approval by the requester’s manager.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Order on behalf of        | Check box that allows the logged-in user to order this software from the service catalog for another user. This permits service desk personnel to order SCCM deployments for other users in the system. By default, this feature is enabled. To prevent unauthorized users from ordering software, ensure that approvals are required for this type of deployment by clearing the Skip approval check box. If an approval is required for software ordered on behalf of a user, the system automatically sends an approval request to the manager of the user receiving the software. The approval is skipped if the requestor is the named user's manager. Software items requested from the service catalog on behalf of a different user require the following information:  
  - **User**: User selected for deployment. This field is automatically populated with the name of the logged in user. You can select another user from the list.  
  - **Device to install this software on**: Device belonging to the selected user on which to deploy the software. Only devices belonging to that user appear in the choice list.  
  - **Lease start**: Date and time to deploy the software. This is the start time for the lease. A lease can be open-ended or have a lease end time. |
| SCCM configuration        | Name of the SCCM configuration record for this application. This record defines the collection and uninstall collection for this application. This configuration is required for all deployments, revocations, and leases performed by the SCCM server. |

5. If the catalog item requires approval because of cost, be sure to configure an approval group in the **Approved By Group** related list.

   By default, the Service Catalog Request workflow runs when an item costing more than $1000 is ordered and looks for an appropriate approval group. If no approval group is configured for the item, this workflow skips approval altogether and ends. The system then runs the Order Client Software workflow, which evaluates the Skip approval check box to determine if approval by the requester's manager is required.

6. **Click Update**.

   The view returns to the SCCM Applications list.

7. To see all client software distribution (CSD) catalog items, navigate to **Client Software Distribution > Maintain Items > Software Items**.

**Workflow process for SCCM deployment**

Ordering an SCCM application from a client software distribution (CSD) catalog item in the service catalog triggers the Order Client Software workflow.
This process deploys an SCCM application to a user or device through a service catalog order:

1. If the **Skip approval** check box is cleared in the software catalog item, the Order Client Software workflow sends the catalog request to the requesting user's manager for approval.

2. If the **Check license compliance** check box is selected in the software catalog item, the workflow performs a software license check. If there is no license available, the workflow creates a catalog task to procure more licenses and assigns the task to the Client Software Distribution Administrators group.

3. The Order Client Software workflow triggers the Deploy SCCM Application workflow as a subflow. This workflow adds either the user or the device to the SCCM collection using the **Add to User Collection** or **Add to Device Collection** SCCM activity.

4. If the software configuration specifies **SCCM uninstall collection** in the software catalog item, the Deploy SCCM Application workflow checks if the user or device exists in the uninstall collection. The workflow uses the **Is Device in Collection** or **Is User in Collection** SCCM activity. If the user or device exists in the uninstall collection, the workflow removes the device or user. The workflow uses the **Remove from Device Collection** or **Remove from User Collection** SCCM activity before adding it to the **SCCM install collection**.

**Client software distribution validation process**

After SCCM deploys software to a target computer, client software distribution (CSD) detects the installation and validates its status.

Client software distribution uses the following methods for detecting software installed on the target machine:

- **Discovery**: CSD is configured to leverage Discovery to detect software installations. You can run Discovery manually at any time, or by a scheduled job.

- **Microsoft SCCM Integration**: You can import SCCM data into the CMDB using the features in the Integration - Microsoft SCCM plugin if Discovery is not active on the instance.

The instance uses the data gathered by Discovery or the SCCM integration plugin to populate the Software Installation (cmdb_sam_sw_install) table. To validate installations using this data, CSD runs a scheduled job called Reconcile Requested Software that uses CSD property settings. This process reconciles the software installation data accumulated in the CMDB and makes these status updates:

- **Not installed** to **Installed**: The user has installed the requested software within the time limit configured in the sn_client_sf_dist.softwareInstallExpDays property.

- **Not installed** to **Status check expired**: The time limit has expired for the user to install the requested software. The system stops checking for installation when the time limit expires.

**SCCM software revocation**

An administrator can revoke software without any user interaction using Microsoft System Center Configuration Manager (SCCM) if the software configuration specifies an SCCM uninstall collection, even if the software was installed by some other process or user.

**Revoke software deployed through the service catalog**

Software deployed by SCCM can be revoked, but only when the software's status is **Installed** and the application associated with the software configuration has an uninstall collection configured.

- Create an **SCCM configuration record** for the application that names an appropriate uninstall collection.

- Associate the **CSD catalog item** for the application with the SCCM configuration that specifies the uninstall collection.

Role required: sn_client_sf_dist.csd_admin or admin
A workflow called Revoke SCCM Application moves either the user or the device from its respective collection and adds it to the appropriate uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.

1. Navigate to Client Software Distribution > Reports > Requested Software. 
2. Open the record for the SCCM software package you want to revoke. The package must have a Status of Installed to be revocable. 
3. Under Related Links, click Revoke software. 

This action runs the Revoke Client Software workflow, which triggers the Revoke SCCM Application subflow that moves the user or device from the install collection to the uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.

Revoke unentitled software
An administrator can revoke software using Microsoft System Center Configuration Manager (SCCM) that a user is not entitled to use even if the software was installed by some other process or user.

To revoke software using SCCM, you must create an SCCM configuration record for the application, in which the appropriate software Discovery model is defined. See Software discovery models.

Role required: sn_client_sf_dist.csd_admin or admin

Client Software Distribution (CSD) uses Software Asset Management (SAM) to identify unentitled software installations. Discovery detects the software on the user's machine, and SAM determines if the user or device is entitled to use that software. This might include software that was not installed through a catalog request or software that the user installed without approval. If the software installation's Discovery model is associated with an SCCM software configuration that has an uninstall collection defined, then an administrator can use CSD to revoke that software from the user's machine without involving the user.

1. Navigate to Client Software Distribution > Reports > Installed Software Not Entitled. 
2. Select the record for the installation that has unentitled users. 
3. Under Related Links, click Revoke software. 

This action runs the Revoke Client Software workflow, which triggers the Revoke SCCM Application subflow that moves the user or device from the install collection to the uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.
Revoking a software installation

SCCM software revocation workflow

The Revoke SCCM Application workflow moves a user or device from an install collection to an uninstall collection to revoke software installed from Microsoft System Center Configuration Manager (SCCM).
For the revocation workflow to run, the software package must have a status of **Installed** and must be pre-configured for an appropriate uninstall collection. See [Revoke software deployed through the service catalog](#) for configuration instructions. When an administrator initiates the revocation process, the system launches the Revoke SCCM Application workflow to move the user or device collection associated with installation to the appropriate SCCM uninstall collection. When the SCCM server performs a policy check, it finds the additions to the user or device uninstall collection and revokes the software package associated with that collection.

The workflow employs two custom activities, **Remove from User Collection** and **Remove from Device Collection**, to remove either the user or the device from its original collection. The workflow then adds the user or device to the appropriate uninstall collection on the SCCM server with the **Add to User Collection** or **Add to Device Collection** activity.

**Note:** This workflow is triggered by the Revoke Client Software workflow as a subflow.

### Client software distribution dashboard

The CSD dashboard provides a collection of visual reports for the Client Software Distribution application.

To access the CSD dashboard, navigate to **Client Software Distribution > Requested Software > Dashboard**.

![Sample report from CSD dashboard](image)

**Client software distribution extension framework**

Client software distribution (CSD) provides built-in extension points for integrating a ServiceNow instance with client software distribution providers, such as Casper, Altiris, or LANDesk.
**Caution:** The use of CSD extension points is an advanced procedure intended for use by experienced Now Platform developers only. Instructions for customizing your instance to deploy and revoke software from a software distribution provider can be found in the CSD Extension Implementation Guide.

**Configure client software distribution providers**
Identify the provider and specify the workflows and extension points for a customized software distribution process.

Perform the development tasks described in the CSD Extension Implementation Guide before attempting this procedure.

Role required: sn_client_sf_dist.csd_admin, admin

1. Navigate to **Client Software Distribution > Extensions > Providers**.
2. Click **New**.
3. Complete the form using the fields in the table.

### Provider information for Casper integration

### Client software distribution provider fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name of the provider.</td>
</tr>
<tr>
<td>Provider server</td>
<td>Table name of the provider server. You must create this table as an extension of the Configuration Item (cmdb_ci) table. For example, you might call your table Casper Server Instance (cmdb_ci_casper_server_instance).</td>
</tr>
<tr>
<td>Discovery workflow</td>
<td>Workflow that discovers the provider server and returns the data from that server back to the instance. This is the workflow you create with custom activities that query the provider server.</td>
</tr>
</tbody>
</table>
### Field |
<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Software configuration</td>
</tr>
<tr>
<td>Deployment extension key</td>
</tr>
<tr>
<td>Deployment workflow</td>
</tr>
<tr>
<td>Revocation extension key</td>
</tr>
<tr>
<td>Revocation workflow</td>
</tr>
</tbody>
</table>

**Client software distribution extension keys**

Client software distribution (CSD) extension keys allow you to customize the deployment and revocation of software from distribution providers.

These pre-defined keys allow you to generate input variables for workflows that deploy and revoke software from external distribution providers:

- **SetDeploymentData**: Sets the software order information and generates the input variables for the deployment workflow.
- **SetRevocationData**: Generates the input variables for the revocation workflow.
- **CheckRevocable**: Specifies the conditions that determine if an installation can be revoked. If the software configuration associated with the installed software allows uninstallation, the installed software can be revoked.

**Client software distribution extension points**

The client software distribution (CSD) extension points create the customization code for the specific provider and the extension keys.

The purpose of the extension points is to associate extension keys with a specific provider, and then create a script that sets input variables for your custom deployment and revocation workflows. Another extension point script tells CSD if the provider has the capability to revoke software. If this is the case, CSD enables the UI action that triggers revocation from the provider.

**SetDeploymentData**

The script associated with this extension key must set the csdExtensionResult object with these attributes:

- **deploymentWorkflowInputs**: Object that specifies the deployment workflow input variables.
• **softwareModel**: Software model sys_id.
• **deploymentType**: An integer. Use 1 for deployment to a user and 2 for deployment to a device.
• **softwareApplication**: Software application sys_id.

**CheckRevocable**

The script associated with this extension key gets the input parameter `csdExtensionInputs.softwareConfiguration`, which is a Client Software Distribution record in the Software Configuration (sn_client_sf_dist_software_config) table. All providers' software configurations are extended from this table, but may have different attributes.

This script must set the `csdExtensionResult` object to **true** or **false**, depending on whether the software configuration specifies uninstallation.

**SetRevocationData**

The script associated with this extension key gets the input parameter `csdExtensionInputs.softwareConfiguration`, which is a Client Software Distribution record in the Software Configuration (sn_client_sf_dist_software_config) table. All providers' software configurations are extended from this table, but may have different attributes.

The script must set the `csdExtensionResult` object with these attributes:

- **revocationWorkflowInput**: Object that specifies the revocation workflow input variables.
- **softwareModel**: Software model sys_id.
- **deploymentType**: An integer. Use 1 for deployment to a user and 2 for deployment to a device.

**Orchestration examples**

These examples demonstrate how Orchestration can be used to automate common tasks.

**Active Directory automation example**

A set of six Orchestration Active Directory activities enables organizations to automate their on-boarding/off-boarding processes with auditable, self-documenting workflows that save time and eliminate mistakes.

The activities in the [Active Directory activity pack](#) are designed to manage user accounts and reset user passwords. The following activities cover the most common use cases administrators encounter when managing Active Directory user accounts:

- Create AD User Account
- Update AD User Account
- Remove AD User Account
- Disable AD User Account
- Query AD
- Reset AD User Password.

These activities share a common design, have complementary functionality, and share a common set of parameters. They can be used singly or together to create consistent workflows for provisioning and de-provisioning user accounts.
Update Active Directory with Orchestration

An organization plans to make their ServiceNow instance the single system of record for user account data and wants to update Active Directory with the latest changes.

The solution is to create an Orchestration workflow that pushes changes from the ServiceNow user record down to the Active Directory to create a new user record or update an existing record. This is accomplished by creating an Orchestration workflow that can create and update records in Active Directory based on the data in the ServiceNow User (sys_user) table.

Note: This example workflow assumes that ServiceNow is configured for LDAP and an LDAP server is configured to accept the new user accounts. The Active Directory user management activities are not dependent on LDAP, but the presence of LDAP makes this example workflow much easier. You must provide the domain controller's IP address to the workflow, either by hardcoding it, adding another workflow input, or using a script to look it up from the CMDB.

1. Navigate to Workflow > Workflow Editor.
2. In the Workflow tab, click the + icon to create a new workflow using these variables:
   - Name: Sync AD User
   - Table: Global (global)
3. Click Submit.
   A basic workflow with a Begin and End point appears on the canvas.
4. Click the menu icon in the upper left corner of the canvas and select Edit Inputs from the context menu.
5. In the Workflow Inputs form, click **New** in the **Variables** record list, and create a new variable, using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Reference</td>
</tr>
<tr>
<td>Label</td>
<td>User</td>
</tr>
<tr>
<td>Column name</td>
<td>u_user</td>
</tr>
<tr>
<td>Reference Specification &gt; Reference</td>
<td>User (sys_user)</td>
</tr>
</tbody>
</table>

6. Click **Submit**.
7. In the **Custom** tab, expand **Custom Activities > Active Directory**.
8. Drag and drop the Update AD Object activity onto the transition line between the Begin and End points of the new workflow. This action automatically links the activity with the end point and opens the Workflow Activity property form.

9. Complete the form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as <strong>Update user data.</strong></td>
</tr>
<tr>
<td>Domain controller</td>
<td>The ServiceNow LDAP integration adds a reference to the LDAP server to which the user's account is linked. To identify the LDAP server, enter the following statement: <code>${workflow.inputs.u_user.ldap_server.server_url}</code></td>
</tr>
<tr>
<td>Type</td>
<td>Type of AD object. In this case, the type is <strong>User</strong>, which is the default.</td>
</tr>
<tr>
<td>Object name</td>
<td>This example assumes that the ServiceNow user name matches the Active Directory sAMAccountName. Enter the following: <code>${workflow.inputs.u_user.user_name}</code></td>
</tr>
<tr>
<td>Object data</td>
<td>Updates the user's account in Active Directory, if the user exists. In this example, the user's title is updated: <code>{&quot;title&quot; : &quot;QA&quot;}</code></td>
</tr>
</tbody>
</table>

10. Click **Submit**.

The workflow looks like this:

![Workflow diagram](image)

**Updating an AD user**

11. Attach both activity outcomes (Success and Failure) to the end point.

At this point, the workflow takes a ServiceNow user record as input and updates the First Name, Last Name, and Title of the corresponding Active Directory account. If the account does not exist in Active Directory, the workflow fails.
**Note:** In a normal workflow, some type of alternate action is desirable upon failure. For example, you might send an [email notification](#) if the workflow failed to update the record.

12. To prevent the workflow from failing, add a Create AD Object activity to the transition lines between Begin and the Update AD Object activity.

13. Complete the Workflow Activity property form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as <strong>Create user data.</strong></td>
</tr>
<tr>
<td>Domain controller</td>
<td>Same as for the update activity, ${workflow.inputs.u_user.ldap_server.server_url}</td>
</tr>
<tr>
<td>Ou</td>
<td>The organizational unit to which this object belongs. For the purpose of this example, you can enter <strong>OU=HQ,OU=Managed Objects</strong></td>
</tr>
<tr>
<td>Object name</td>
<td>Same as for the update activity, ${workflow.inputs.u_user.user_name}</td>
</tr>
<tr>
<td>Object data</td>
<td>Creates an account with only the user name in it. For the purpose of this example, you can enter <code>{&quot;givenName&quot;: &quot;${workflow.inputs.u_user.first_name}&quot;, &quot;SN&quot;: &quot;${workflow.inputs.u_user.last_name}&quot;}</code></td>
</tr>
</tbody>
</table>

14. Click **Submit**.

15. Connect the Failure outcome of the Create AD Object activity to End.

   For this example, we are ignoring errors. The workflow now looks like this:

![Workflow diagram](#)

This procedure builds a simple workflow that creates a bare-bones Active Directory account consisting of a user name only. The workflow then updates that account with additional information provided by the ServiceNow User (sys_user) table. However, we do not want to
execute the Create AD Object activity if the user account already exists. The workflow needs to query Active Directory for matching user records and then branch the workflow based on the results of the query. If an account already exists, then the workflow should update the account. If the account does not exist, then the workflow should create the account in Active Directory.

16. Drag and drop the Query AD activity onto the transition between Begin and Create AD Object.

17. Complete the Workflow Activity property form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as Search for existing account.</td>
</tr>
<tr>
<td>Domain controller</td>
<td><code>${workflow.inputs.u_user.ldap_server.server_url}</code></td>
</tr>
<tr>
<td>Properties</td>
<td>A comma-separated list of Active Directory properties to return. For example, givenName, SN, title. If the parameter field is blank, then all properties are returned. In this workflow, we leave the field blank.</td>
</tr>
<tr>
<td>Search filter</td>
<td>An LDAP filter string that defines the search parameters. Use any valid LDAP filtering criteria. To find user accounts matching the input record, we use: <code>{samaccountname=${workflow.inputs.u_user.user_name}}</code></td>
</tr>
</tbody>
</table>

18. Click Submit.

19. Connect the Failure outcome for the query activity to the End point.
   Remember that we are ignoring errors in this workflow.

20. Connect the Success outcome of the query activity to the Update AD Object activity.
    The workflow now looks like this:
Querying AD for user accounts

The Query AD activity returns its results as a JSON string in the workflow data bus. This JSON string is always an array of objects. Each object corresponds to an Active Directory entry that matched the query. Our workflow should branch, whether that array is empty or not.

21. Drag a standard If activity from the Conditions folder in the Core tab and drop it onto the transition between Query AD and Update AD Object.

22. Complete the Workflow Activity properties form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as Account exists.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to open the Script field.</td>
</tr>
<tr>
<td>Script</td>
<td>For the If activity to work correctly, we must return a yes or no in the answer variable (var) which corresponds to the Yes and No outcomes of the query activity. Line 1 converts the Query AD results from a JSON string into a Javascript array called queryResults. Line 2 checks the length of that array. If the array is more than 0, a match to the account was found, and we set our answer to yes. Otherwise, the answer is no.</td>
</tr>
</tbody>
</table>

```javascript
var queryResults=new JSON().decode(data.get(5).output);
answer = ( queryResults.length>0 ? 'yes' : 'no' );
```
Note: The expression `data.get(5)` in this script identifies the Query AD output in the Databus by order number, since it was the fifth activity added to the workflow.

23. Click Submit.
24. In the canvas, create a transition from the Yes outcome of the If activity to the Update AD Object activity.
25. Create a transition from the No outcome of the If activity to the Create AD Object activity.
This is the final step. This workflow will query Active Directory to determine if an account already exists. If an account exists, the workflow updates that account. If an account does not exist, the workflow creates the account and then updates the Active Directory with the configured user data set.

**Creating the conditional paths**

**Orchestration activity packs**

The base Orchestration system includes packs of custom activities you can use to automate typical IT and business processes in your network.

Activity packs allow you to automate several common business processes, such as managing Active Directory accounts and Exchange server mailboxes. Activity packs can also automate IT functions such as starting and stopping Windows servers, joining domains, assigning IP addresses, and configuring load balancers.

**Use an activity pack**

The Packs tab of the Workflow Editor contains any activity packs downloaded from the ServiceNow Store and any activity packs that you create.

**Roles required:** admin, activity_admin, activity_creator

You can organize custom activities into packs and upload them to the ServiceNow Store. Your custom packs do not appear in the tree until at least one activity in the pack is published. Activities added to an existing pack are not displayed until they are published. Activity packs from any application scope can appear in the Packs tab, regardless of the current scope setting for the instance.

1. In the Workflow Editor palette, select the Packs tab.
2. Click the download icon.
The hierarchy in the tab organizes packs by vendor, scope, category, and activity.

Active Directory activity pack

The Active Directory (AD) activity pack enables an administrator to create, delete, and manage objects in Windows Active Directory, such as users, groups, and computers, using a ServiceNow Orchestration workflow.

Activities in this pack can reset a password automatically from a user request or manage any user account in Active Directory, whether or not it was created by a Orchestration workflow.

Domain controllers are identified by the IP address of the host machine. To use the hostname of the domain controller, add the Resolve DNS Name activity to resolve the hostname into an IP, and then pass the IP into the Active Directory activity.

Your instance must have access to a MID Server configured to use PowerShell to run these activities.

Note: All Active Directory activities pass through error messages returned from Active Directory. To view these error messages, point to the failed activity in the workflow canvas or select the Workflow Log tab in a Workflow Context record.
Custom Active Directory activities

Orchestration provides custom Active Directory activities that were created with the Orchestration Create a PowerShell activity, starting with the Geneva release. These activities perform the same functions as AD activities by the same name from previous releases and replace those activities for all new workflows. Existing workflows from earlier versions that were created with legacy AD activities continue to function normally after an upgrade to Istanbul. However, all new workflows must use these custom AD activities. The Powershell activity template gives workflow administrators the ability to store input and output variables from the Query AD activity in the Databus.

Note: To use the Active Directory custom activities, you must request activation of the Orchestration - Active Directory plugin.

Active Directory credentials with LDAP

If you are using an LDAP Server with MID Servers, note that Orchestration and Active Directory activities do not use the user name and password configured on LDAP Servers. You must create a Windows type orchestration credential record. The username and password in the credentials record is used for LDAP queries that Orchestration and workflow activities perform.

Connection port used by AD Orchestration activities

All Active Directory activities use port 389 for LDAP access. If you are using AD activities with Oracle Virtual Directory (OVD) as a proxy, set up pass-through on port 389 only.

Add User to Group AD activity

The Add User to Group activity adds a user to a group in Windows Active Directory.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

Input variables

Add User to Group input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>
</tr>
<tr>
<td>UserName</td>
<td>Name of the user to add to the group.</td>
</tr>
<tr>
<td>GroupName</td>
<td>Name of the group to which this user is added.</td>
</tr>
</tbody>
</table>

Output variables

Add User to Group output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>Either success or failure.</td>
</tr>
</tbody>
</table>
### Conditions

**Add User to Group conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>User was successfully added to group.</td>
</tr>
<tr>
<td>Failure</td>
<td>An error occurred while attempting to add the user to the group. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>

### Change AD User Password activity

The Change AD User Password activity changes the password for an Active Directory user account.

This activity requires the user's current password to run, unlike the *Reset AD User Password* activity. If the new password violates any Active Directory password requirements, such as length or character combinations, the activity fails and returns the appropriate error message. This error message appears in the ECC queue and in hint text when a user points to the activity in the Workflow Editor.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Active Directory**.

**Note:** This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the *PowerShell activity designer*.

### Input variables

**Change AD User Password input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>
</tr>
<tr>
<td>User</td>
<td>The sAMAccountName of the Active Directory user account.</td>
</tr>
<tr>
<td>New_password</td>
<td>The new password to assign this user.</td>
</tr>
<tr>
<td>Old_password</td>
<td>The user's current password.</td>
</tr>
</tbody>
</table>
Output variables

Change AD User Password output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>One of the following outcomes:</td>
</tr>
<tr>
<td></td>
<td>· failure</td>
</tr>
<tr>
<td></td>
<td>· success</td>
</tr>
<tr>
<td></td>
<td>· Policy Failure</td>
</tr>
<tr>
<td></td>
<td>· Incorrect old password</td>
</tr>
<tr>
<td>errorMessage</td>
<td>The <code>executionResult.errorMessages</code> from the Activity designer parsing sources.</td>
</tr>
<tr>
<td>hresult</td>
<td>Powershell command result.</td>
</tr>
</tbody>
</table>

Conditions

The activity provides the following conditions:

Change AD User Password conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Password successfully reset.</td>
</tr>
<tr>
<td>Policy Failure</td>
<td>Password does not comply with the organization's Active Directory requirements.</td>
</tr>
<tr>
<td>Incorrect old password</td>
<td>Password being changed was not entered correctly.</td>
</tr>
<tr>
<td>Failure</td>
<td>An error occurred while attempting to change the password. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>

Active Directory credentials with LDAP

If you are using an LDAP Server with MID Servers, note that Orchestration and Active Directory activities do not use the user name and password configured on LDAP Servers. You must create a Windows type orchestration credential record. The username and password in the credentials record is used for LDAP queries that Orchestration and workflow activities perform.

Create AD Object activity

The Create AD Object activity creates an object in Windows Active Directory.

This activity fails if it finds an existing object with matching input variables.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

Note: This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work...
normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the *PowerShell activity designer*.

**Input variables**

*Create AD Object input variables*

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>
</tr>
<tr>
<td>Type</td>
<td>The object type to create: user, group, or computer.</td>
</tr>
<tr>
<td>OU</td>
<td>The organizational unit to which this object belongs.</td>
</tr>
<tr>
<td>ObjectName</td>
<td>The sAMAccountName of the Active Directory object. <strong>Object name</strong> is also used for the name attribute in Active Directory. This behavior is available in <em>ActiveDirectory.psm1</em>. Whatever is passed as the <strong>Object name</strong> becomes both the <strong>samAccountName</strong> and the <strong>name</strong> of the new user in Active Directory.</td>
</tr>
<tr>
<td>ObjectData</td>
<td>A JSON object containing Active Directory property names and their corresponding values. For example:</td>
</tr>
</tbody>
</table>

```json
{
    "givenName" : "John",
    "SN" : "Doe",
    "title" : "Sr. Account Specialist",
    "allowLogin" : true
}
```

This example sets the first name (givenName), last name (SN), and title on the Active Directory user account and allows that user to log in (allowLogin). This field allows expression evaluation via the ${()} variable substitution syntax.

**Output variables**

*Create AD Object output variables*

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>Either <strong>success</strong> or <strong>failure</strong>.</td>
</tr>
<tr>
<td>errorMessage</td>
<td>The <code>executionResult.errorMessages</code> from the Activity designer parsing sources.</td>
</tr>
</tbody>
</table>
Conditions

Create AD Object conditions

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>Success</td>
<td>A Windows Active Directory object was created successfully.</td>
</tr>
<tr>
<td>Failure</td>
<td>An error occurred while attempting to create the AD object. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>

Disable AD User Account activity

The Disable AD User Account activity disables a Windows Active Directory user account, making it inactive.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

Note: This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Input variables

Disable AD User Account input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>
</tr>

<td>An error occurred while attempting to enable the AD user account. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>

Is AD Account Locked activity

The Is AD Account Locked activity determines whether an Active Directory user account is locked. An account may be locked automatically if a user enters an incorrect password more times than allowed by the Active Directory security policy. You can unlock an account using the Unlock AD User Account activity.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

Note: This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Input variables

<td>An error occurred while processing the query. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>

Query AD activity

The Query AD activity retrieves entries from the Windows Active Directory based on an LDAP search filter and stores the results as a JSON string that can be used in the data bus.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory > .

Note: This activity replaces an AD activity by the same name available in releases prior to Geneva. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul and will continue to save query results to the scratchpad. However, all new workflows must use the custom version of this activity. This activity was built with the Create a PowerShell activity, which stores input and output variables in the databus instead of the scratchpad.

Input variables

Query AD input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>
</tr>
<tr>
<td>Properties</td>
<td>A comma-separated list of Active Directory properties to return. For example, givenName,SN,title. If this field is blank, then all properties are returned.</td>
</tr>
<tr>
<td>SearchFilter</td>
<td>An LDAP filter string that defines the search parameters. Use any valid LDAP filtering criteria. For example, to find user accounts matching the ServiceNow input record, use: (samaccountname=${workflow.inputs.u_user.user_name})</td>
</tr>
</tbody>
</table>
Output variables

</tr>
</tbody>
</table>

Reset AD User Password activity

The Reset AD User Password activity resets the password of a user account in Windows Active Directory.

If the new password violates any Active Directory password requirements, such as length or character combinations, the reset activity fails and returns the appropriate error message. This error appears in the ECC Queue and when you point to the activity in the Workflow Editor.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

Note: This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

## Unlock AD Account activity

The Unlock AD Account activity unlocks a locked Active Directory user account.

You can use the `Is AD Account Locked activity` activity to determine if an account is locked.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Active Directory**.

**Note:** This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity, which was built with the **PowerShell activity designer**.

## Input variables

### Unlock AD Account input variables

### Update AD Object activity

The Update AD Object activity updates an object in Windows Active Directory.

This activity only replaces existing values with new values. It cannot add new values to AD records such as adding a new group member to an AD group. For complex AD operations, use the Run PowerShell activity instead. The activity fails if it cannot find an existing account with matching object name and data.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

**Note:** This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

### Input variables

**Update AD Object input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>
</tr>
<tr>

#### Update AD Object conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>AD object was successfully updated.</td>
</tr>
<tr>
<td>Failure</td>
<td>An error occurred while attempting to update an AD object. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>

### Azure AD activity pack

The Azure AD activity pack enables an administrator to automate employee onboarding and offboarding functions on Azure AD and manage Office 365 licensing.

Use the Azure AD activities to add and remove users to Azure Active Directory, manage security group membership, and assign or remove Office 365 licenses for individual users.

The Azure AD activities were created with the Orchestration REST Web Service activity template.

### Add User to Group Azure AD activity

The Add User to Group activity adds a user to an existing security group in Azure Active Directory.
To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Azure AD**. This activity was built with the **REST web service activity template**.

**Important:** The REST message used for this activity must be configured to use **OAuth2 authentication**.

### Input variables

**Add User to Group input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user_id</td>
<td>Object ID (GUID) of the member to be added.</td>
</tr>
<tr>
<td>group_id</td>
<td>Object ID (GUID) of the target group.</td>
</tr>
</tbody>
</table>

### Output variables

**Add User to Group output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error</td>
<td>Returns the error string from the REST message. If there are no errors, this variable returns a null value.</td>
</tr>
<tr>
<td>body</td>
<td>Contains a string value representing the output from the REST message.</td>
</tr>
<tr>
<td>status_code</td>
<td>Contains the status code returned from the Web service.</td>
</tr>
</tbody>
</table>

### Conditions

**Add User to Group conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully added the object ID to the security group.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to update the group's membership, or the activity failed to connect to Azure AD.</td>
</tr>
</tbody>
</table>

**Assign User License Azure AD activity**

The **Assign User License Azure AD** activity assigns an additional Office 365 software license to the named user.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Azure AD**. This activity was built with the **REST web service activity template**.
Important: The REST message used for this activity must be configured to use OAuth2 authentication.

Input variables

Assign User License input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user_id</td>
<td>The object ID (GUID) or the user principal name of the target user. An example of a user principal name is <a href="mailto:someuser@ca830edad9050849NDA1.onmicrosoft.com">someuser@ca830edad9050849NDA1.onmicrosoft.com</a>.</td>
</tr>
<tr>
<td>sku_id</td>
<td>Subscription SKU ID associated with the tenant's enterprise agreement.</td>
</tr>
</tbody>
</table>

Output variables

Assign User License output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error</td>
<td>Returns the error string from the REST message. If there are no errors, this variable returns a null value.</td>
</tr>
<tr>
<td>body</td>
<td>Contains a string value representing the output from the REST message.</td>
</tr>
<tr>
<td>status_code</td>
<td>Contains the status code returned from the Web service.</td>
</tr>
</tbody>
</table>

Conditions

Assign User License conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully assigned an Office 365 license to a user.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to assigned an Office 365 license to a user, or the activity failed to connect to Azure AD.</td>
</tr>
</tbody>
</table>

Create User Azure AD activity

The Create User activity creates a user for the Azure Active Directory tenant.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Azure AD. This activity was built with the REST web service activity template.
Important: The REST message used for this activity must be configured to use OAuth2 authentication.

Input variables

Create User input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>display_name</td>
<td>Name of the Azure AD user in the accepted display format, such as jacinto.gawron.</td>
</tr>
<tr>
<td>user_principal_name</td>
<td>User principal name (UPN) in an email format. For example, you might enter <a href="mailto:jacinto.gawron@khitomer.com">jacinto.gawron@khitomer.com</a>.</td>
</tr>
<tr>
<td>mail_nickname</td>
<td>User's email alias that redirects to the user's full address.</td>
</tr>
<tr>
<td>password</td>
<td>User's Azure AD password. This password must be passed as a workflow input with a type of Password (2 Way Encrypted) and must meet the password policy set in Azure AD.</td>
</tr>
<tr>
<td>change_password</td>
<td>Control that requires the user to change his or her password at the next login, if set to true.</td>
</tr>
<tr>
<td>account_enabled</td>
<td>Control that sets the user's account is enabled, if set to true.</td>
</tr>
<tr>
<td>given_name</td>
<td>First name of the user.</td>
</tr>
<tr>
<td>surname</td>
<td>Last name of the user.</td>
</tr>
<tr>
<td>other_mails</td>
<td>List of additional email addresses for the user. For example, you might enter [&quot;<a href="mailto:jac@home.com">jac@home.com</a>&quot;, &quot;<a href="mailto:jgawron@fabrikam.com">jgawron@fabrikam.com</a>&quot;].</td>
</tr>
<tr>
<td>country</td>
<td>The country or region in which the user is located. For example, you might enter US or UK. The default value is set to US.</td>
</tr>
<tr>
<td>city</td>
<td>City in which the user is located.</td>
</tr>
<tr>
<td>department</td>
<td>Name of the department in which the user works.</td>
</tr>
<tr>
<td>mobile</td>
<td>User's primary cell phone number.</td>
</tr>
<tr>
<td>job_title</td>
<td>User's job title.</td>
</tr>
<tr>
<td>physical_delivery_office_name</td>
<td>Office location in the user place of business.</td>
</tr>
<tr>
<td>postal_code</td>
<td>Postal code of the user's address.</td>
</tr>
<tr>
<td>preferred_language</td>
<td>Language in which the user prefers to communicate. This value must follow the ISO 639-1 Code. For example, you might enter en-US. The default value is set to en-US.</td>
</tr>
<tr>
<td>state</td>
<td>State or province for the user's address.</td>
</tr>
<tr>
<td>street_address</td>
<td>Street address of the user's place of business.</td>
</tr>
<tr>
<td>telephone_number</td>
<td>Primary telephone number of the user's place of business.</td>
</tr>
<tr>
<td>Variable</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>usage_location</td>
<td>Two letter country code that is required for users who are assigned Office 365 licenses. The default value is <strong>US</strong>.</td>
</tr>
</tbody>
</table>

**Output variables**

**Create User output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error</td>
<td>Returns the error string from the REST message. If there are no errors, this variable returns a null value.</td>
</tr>
<tr>
<td>status_code</td>
<td>Contains the status code returned from the Web service.</td>
</tr>
<tr>
<td>user_exists</td>
<td>Output variable mapped to the JSON message that contains the <strong>User already exists</strong> error.</td>
</tr>
<tr>
<td>user_info</td>
<td>The <strong>user_info</strong> array contains attributes that can be leveraged by other activities as inputs. For example, the user <strong>objectId</strong> output (GUID) can be passed to the Add User to Group activity as the <strong>user_id</strong> input.</td>
</tr>
<tr>
<td></td>
<td>- <strong>objectId</strong>: User's Azure AD identifier.</td>
</tr>
<tr>
<td></td>
<td>- <strong>accountEnabled</strong>: Boolean variable indicating whether the user's account is active or inactive.</td>
</tr>
<tr>
<td></td>
<td>- <strong>displayName</strong>: Users display name, such as <strong>jacinto.gawron</strong>.</td>
</tr>
<tr>
<td></td>
<td>- <strong>userPrincipalName</strong>: User’s name in email format, such as <strong><a href="mailto:jacinto.gawron@wammo.com">jacinto.gawron@wammo.com</a></strong>.</td>
</tr>
<tr>
<td></td>
<td>- <strong>mailNickname</strong>: User's email alias.</td>

<td>Activity failed to connect to Azure AD.</td>
</tr>
</tbody>
</table>

Get User Info Azure AD activity

The Get User Info activity returns the named user's information from the Azure Active Directory. To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Azure AD. This activity was built with the REST web service activity template.

Important: The REST message used for this activity must be configured to use OAuth2 authentication.
### Input variables

#### Check If User Exists input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user_id</td>
<td>The object ID (GUID) or the user principal name of the target user. An example of a user principal name is <a href="mailto:someuser@a830edad9050849NDA1.onmicrosoft.com">someuser@a830edad9050849NDA1.onmicrosoft.com</a></td>
</tr>
</tbody>
</table>

**Note:** Version 2 of this activity enforces input validation. If empty, the following message appears: "Mandatory input 'user_id' is empty".

### Output variables

<td>Activity failed to reset the named user’s password, or the activity failed to connect to Azure AD.</td>
</tr>
</tbody>
</table>

**Exchange activity pack**

The Exchange activity pack allows workflows to manage Microsoft Exchange mail systems.

The use of Orchestration Exchange activities requires the following:

- Microsoft Exchange 2010 or 2013.
- A MID Server configured to run Powershell 2.0
- A target Exchange server in the same Active Directory domain as the instance.
- Powershell Remoting enabled on the target Exchange server.

**Note:** These activities cannot be used to interact with Microsoft Exchange Online.

Orchestration provides custom Exchange activities that were created with the Orchestration activity designer template. These activities perform the same functions as Exchange activities by the same name from previous releases and replace those activities for all new workflows. The custom Exchange activities were built with a PowerShell activity template, which gives workflow administrators the ability to store input and output variables in the databus.

**Note:** Existing workflows from earlier versions that were created with legacy Exchange activities continue to function normally after an upgrade to Geneva. However, all new workflows must use these custom Exchange activities.

To use the Microsoft Exchange custom activities, you must request activation of the Orchestration - Exchange plugin. The custom Exchange activities are available in the Workflow Editor on the Custom tab. Expand the Custom Activities tree and select the Exchange category for the activity you want to use.
Accessing custom Exchange activities

**Configure MID Server for Exchange**

Configure a MID Server with defined IP ranges to use Exchange.
If the MID Server manages resources within defined IP ranges, instead of all computers on your network, you must perform additional configuration steps to run Exchange activities. You do not need to perform these steps if your MID Server uses the default configuration.

1. In the navigation filter, enter `cmdb_ci_dns_name.list`.
2. Click New.
3. Enter the fully-qualified domain name (FQDN) of your Exchange server in the Name field.
4. Right-click the form header and select Save.
5. In the IP Address related list, click New.
6. In the IP Address field, enter the IP address of your Exchange server.
7. In the Nic field, select eth0 or your preferred network interface controller.
8. Leave the Netmask field blank.
9. Click Submit.

### Pass multivalued properties with an Exchange activity

To set a multivalued property using an Exchange activity, you must use a specific parameter format.

The Optional parameters shared input variable allows you to set multivalued properties.

- To set a multivalued property, replacing any existing values, use this format:
  
  "PropertyName": "(value1, value2, value3)"

- To add values, use this format: "PropertyName": "+(value1, value2, value3);"

- To remove values, use this format: "PropertyName": "-(value1, value2, value3);"

- To both add and remove values, use this format: "PropertyName": "-(value1, value2, value3); +(value1, value2, value3);"

### Create Address List activity

The Create Address List activity creates a new address list that acts as an alias for emailing all users in the group.

This alias cannot be used to manage user permissions. This activity implements the Microsoft Exchange `New-AddressList` command.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Exchange > Address List.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

### Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.</td>
</tr>
</tbody>
</table>
## ServiceNow Kingston Now Platform Capabilities

### Create Address List

**Variable**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>domain</td>
<td>The name of the Exchange server's assigned domain.</td>
</tr>
<tr>
<td>name</td>
<td>Name of the new address list to create.</td>
</tr>
<tr>
<td>parameters</td>
<td>Optional parameters to pass to the Exchange server written in JavaScript Object Notation (JSON). Exchange activities cannot pass parameters that reference an object, such as a PSCredential object. Plain text is automatically converted to SecureString objects for parameters that require that data type. Attempting to save an activity that specifies duplicate parameters, including parameters from activity variables, or incorrectly formatted JSON causes a warning message to appear.</td>
</tr>
</tbody>
</table>

**Note:** When passing a switch parameter, such as ForceUpgrade, you must use the format `"parameter":"true"`.  

### Output variables

<td>The activity failed to create a new address list.</td>
</tr>
</tbody>
</table>

## Delete Address List activity

The **Delete Address List** activity removes an existing address list from an Exchange server. This activity implements the Microsoft Exchange **Remove-AddressList** command.  

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Exchange > Address List**.
**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Get Address List activity

The Get AddressList activity retrieves all attributes from the specified Exchange address list.

This activity implements the Microsoft Exchange Get-AddressList command.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Exchange > Address List.

Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

### Move Address List activity

The Move Address List activity moves a Microsoft Exchange address list to another location in the address hierarchy.

This activity implements the Microsoft Exchange `Move-AddressList` command.

The Exchange server caches the changes from this activity but does not immediately apply them. Use the `Update Address List` activity after this activity to apply the changes or wait for the Exchange server to automatically apply cached changes.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Exchange > Address List.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.
Input variables

**Move Address List input variables**

<table>
<thead>
<tr>

Set Address List activity

The Set Address List activity modifies a Microsoft Exchange address list.
Use the Optional parameters variable to pass specific values to the Microsoft Exchange server. This activity implements the Microsoft Exchange Set-AddressList command.

The Exchange server caches the changes from this activity but does not immediately apply them. Use the Update Address List after this activity to apply the changes or wait for the Exchange server to automatically apply cached changes.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Exchange > Address List.

Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

</tr>
</tbody>
</table>

### Update Address List activity

The Update Address List activity adds or removes users from the specified address list and immediately applies any cached address list changes to the server.

Use the optional parameters variable to specify which users to add or remove. This activity implements the Microsoft Exchange $Update-AddressList$ command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Exchange > Address List**.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the **PowerShell activity designer**, which gives workflow administrators the ability to store input and output variables in the **databus**.

</tbody>
</table>

### Create Mailbox activity

The Create Mailbox activity creates a new Active Directory user, if that user does not already exist, and a Microsoft Exchange mailbox for that user.

This activity implements the Microsoft Exchange `New-Mailbox` command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Exchange > Mailbox**.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the **PowerShell activity designer**, which gives workflow administrators the ability to store input and output variables in the **databus**.
## Input variables

### Create Mailbox input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.</td>
</tr>
<tr>
<td>domain</td>
<td>The name of the Exchange server's assigned domain. In the same domain as the Exchange server.</td>
</tr>
<tr>
<td>first_name</td>
<td>First name of the user.</td>
</tr>
<tr>
<td>middle_initial</td>
<td>Middle initial of the user.</td>
</tr>
<tr>
<td>last_name</td>
<td>Last name of the user.</td>
</tr>
<tr>
<td>alias</td>
<td>The display name for the mailbox address, the part of the email address to the left of the @ symbol. If no alias is specified, the activity uses First name.Last name as the alias. The alias is also used as the user's principal name (UPN) if none is specified in the optional parameters.</td>
</tr>
<tr>
<td>password</td>
<td>Password to use for the new mailbox. The password is encrypted when it is sent to the target host.</td>
</tr>
<tr>
<td>parameters</td>
<td>Optional parameters to pass to the Exchange server written in JavaScript Object Notation (JSON). Exchange activities cannot pass parameters that reference an object, such as a PSCredential object. Plain text is automatically converted to SecureString objects for parameters that require that data type. Attempting to save an activity that specifies duplicate parameters, including parameters from activity variables, or incorrectly formatted JSON causes a warning message to appear.</td>
</tr>
</tbody>
</table>

**Important:** The MID Server must be in the same domain as the Exchange server.

---

### Output variables

#### Create Mailbox output variables

<table>

</tr>
<tr>
<td>Failure</td>
<td>The activity failed to create a new mailbox or an Active Directory account for the specified user.</td>
</tr>
</tbody>
</table>

**Delete Mailbox activity**

The Delete Mailbox activity deletes the Microsoft Exchange mailbox of an Active Directory user. Optional parameters determine how the Exchange server handles the mailbox after deleting the user. This activity implements the Microsoft Exchange Remove-Mailbox command.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Exchange > Mailbox.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

</tr>
</tbody>
</table>

### Disable Mailbox activity

The Disable Mailbox activity disables the mailbox associated with a specified Active Directory account.

This activity implements the Microsoft Exchange Disable-Mailbox command.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Exchange > Mailbox.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity...
was built with the **PowerShell activity designer**, which gives workflow administrators the ability to store input and output variables in the **databus**.

Enable Mailbox activity

The Enable Mailbox activity creates a new mailbox for an existing Active Directory user. This activity implements the Microsoft Exchange `Enable-Mailbox` command.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Exchange > Mailbox.

Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

</tr>
</tbody>
</table>

### Get Mailbox activity

The Get Mailbox activity gets the mailbox for the specified user or all mailboxes on a Microsoft Exchange server.

This activity implements the Microsoft Exchange `Get-Mailbox` command.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Exchange > Mailbox.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity...
was built with the *PowerShell activity designer*, which gives workflow administrators the ability to store input and output variables in the *databus*.

F5 Network Management activity pack

Orchestration provides custom activities for configuring elements of an F5 load balancer, including pools, pool members, and the virtual servers contained in the pool.

All F5 custom activities are in the F5 Network Management Application scope and are activated by the Orchestration - F5 network management plugin, which must be activated by request.

ServiceNow provides custom F5 activities, built from the REST web service activity template, that you can use to perform the following tasks:

- Add, delete, or verify pools.
- Add, delete, or identify pool members.
- Add or delete virtual servers.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
- Add a profile to a virtual server.
- Configure the virtual server for vlans, irules, pool, and persistence.

Add F5 Pool Member activity

The Add F5 Pool Member activity adds a member to an F5 load balancer pool.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

REST settings

- **REST message**: F5 POOL Membership Management
- **REST function**: post

Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PoolName</td>
<td>Name of this pool, such as testPool.</td>
</tr>
<tr>
<td>F5IPAddress</td>
<td>IP address of the F5 console.</td>
</tr>
<tr>
<td>MemberName</td>
<td>Pool member IP address and port, such as 192.168.2.19:80.</td>
</tr>
</tbody>
</table>

Output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>Success or failure.</td>
</tr>
<tr>
<td>status_code</td>
<td>The HTTP status code.</td>
</tr>
<tr>
<td>error</td>
<td>The REST error.</td>
</tr>
<tr>
<td>output</td>
<td>The REST output.</td>
</tr>
</tbody>
</table>

Conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully added an F5 load balancer pool member.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to add an F5 load balancer pool member.</td>
</tr>
</tbody>
</table>
Get F5 Pool Member activity

The Get F5 Pool Member activity returns the pool members and verifies the pool's status. Use this activity to verify that a pool member was created properly.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

REST settings

- REST message: F5 POOL Membership Management
- REST function: get

Input variables

Get F5 Pool Member input variables

<table>

Add F5 Profile to Virtual Server activity

The Add F5 Profile to Virtual Server activity adds a profile to a virtual server assigned to an F5 load balancer pool.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.
Rest settings

- **Rest message**: F5 VIP Profile Management
- **Rest function**: post

Input variables

Add F5 Profile to Virtual Server input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The virtual server's name, such as testVIP</td>
</tr>
<tr>
<td>F5IPAddress</td>
<td>IP address of the F5 console.</td>
</tr>
<tr>
<td>VirtualServerName</td>
<td>Name of the virtual server, such as testVIP.</td>
</tr>
</tbody>
</table>

Output variables

Add F5 Profile to Virtual Server output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>Success or failure.</td>
</tr>
<tr>
<td>output</td>
<td>The REST output.</td>
</tr>
<tr>
<td>status_code</td>
<td>The HTTP status code.</td>
</tr>
</tbody>
</table>

Conditions

Add F5 Profile to Virtual Server conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully added the F5 load balancer profile to the virtual server.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to add the F5 load balancer profile to the virtual server.</td>
</tr>
</tbody>
</table>

Modify F5 Virtual Server activity

The Modify F5 Virtual Server activity configures a virtual server assigned to an F5 load balancer pool with irules and a vlan.

This activity was built using the **REST web service activity template**. To access the activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Active Directory**.

Rest settings

- **Rest message**: F5 VIP Management
• **REST function**: `put`

### Input variables

**Modify F5 Virtual Server input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The virtual server's name, such as <code>testVIP</code>.</td>
</tr>
<tr>
<td>F5IPAddress</td>
<td>IP address of the F5 console.</td>
</tr>
<tr>
<td>irules</td>
<td>The irules for the virtual server, such as <code>_sys_https_redirect</code>.</td>
</tr>
<tr>
<td></td>
<td>• <strong>pool</strong>: Name of the pool for the virtual server, such as <code>testPool</code>.</td>
</tr>
</tbody>
</table>
|            | • **persistent**: Persistent profile for the virtual server, such as `cookie`.
| vlans      | Vlans for the virtual server, such as `internal`.                           |

### Output variables

**Modify F5 Virtual Server output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>Success or failure.</td>

</table>

**Infoblox DDI activity pack**

This activity pack supports Infoblox DDI management through ServiceNow Orchestration.

The Infoblox DDI activity pack manages the IP addresses used in a network by integrating DNS and DHCP. Custom Orchestration activities use Infoblox Web API (WAPI) REST web services to access the Infoblox GRID server.

**Important:** Managing IP addresses through the Infoblox server requires a fully functional MID Server.
Starting with the Jakarta release, the Infoblox activity pack updates to version 2. This update supports Infoblox network views, which can restrict the visibility of network data. The view parameter can be passed as a query parameter or payload content, to do operations in a specific view. Version 2 also supports specifying the version of WAPI to use in integration endpoints.

Supported for Infoblox:
- WAPI version 2.0 for REST messages
- NIOS appliance version 7.0

**Note:** To use the Infoblox DDI activities and workflow, you must request activation of the Orchestration - Infoblox DDI Activity Pack plugin.

### Create a REST credential for Infoblox activities

All Infoblox activities require a REST credential to manage IP addresses from the Infoblox DDI server.

Before starting this procedure, make sure you have the following:
- A properly configured and running Infoblox DDI Grid Server.
- REST credentials defined on the Infoblox DDI server.

Role required: admin

You must create a REST credential record on the ServiceNow instance that each Infoblox activity can use to access management features on the Infoblox server.

1. Navigate to Orchestration > Credentials and click New.
2. In the list of credential types, select Basic Auth Credentials.
3. Create the credential record with a logical name, such as InfobloxCred.
4. Right-click in the header bar of your new credential record and select Copy sys_id from the context menu. Follow browser instructions to copy the sys_id if browser security measures restrict this function.
5. Paste the sys_id into the restCredentials input field of each activity you use.

### Infoblox workflows

The Infoblox DDI activity pack includes two default workflows, one that reserves and registers IP addresses and another that releases IP addresses.

To access these workflows, navigate to Workflow > Workflow Editor and select the Workflows tab. Click on a workflow to open it, and then click the information icon in the workflow header to display the properties dialog box.

### Infoblox Reserve/Register IP in IPAM

Use this workflow to register IPv4 addresses or request the next available IP address on IPAM. Optionally, you can use it to register IP addresses on DNS. The custom Infoblox activities used in this workflow are:
- IPAM Register IP Address
- IPAM Reserve IP Address
- Register DNS A-Record
- Get Network Details
Infoblox Reserve/Register IP input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Infoblox Server</td>
<td>IP address of the Infoblox DDI server.</td>
</tr>
<tr>
<td>Network</td>
<td>Network containing the target IP address.</td>
</tr>
<tr>
<td>Zone</td>
<td>The DNS zone for the IP address being registered.</td>
</tr>
<tr>
<td>Rest Credentials</td>
<td>The sys_id of the REST credentials from the ServiceNow instance.</td>
</tr>
<tr>
<td>DNS Host Name</td>
<td>Name of the DNS server machine on which the IP address is being registered.</td>
</tr>
<tr>
<td>IPv4 Address</td>
<td>IP address being reserved or registered.</td>
</tr>
</tbody>
</table>

Infoblox Release IPAM Reservations

Use this workflow to release (delete) all the IPAM reservations associated with an IPv4 address. The custom Infoblox activities used in this workflow are:

- IPAM List IP Reservations
- List DNS Record
- DNS Delete
- IPAM Delete

Infoblox Release IPAM Reservations input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rest Credentials</td>
<td>The sys_id of the REST credentials from the ServiceNow instance.</td>
</tr>
<tr>
<td>IP to Delete</td>
<td>IP address to release.</td>
</tr>
<tr>
<td>Infoblox Server</td>
<td>IP address of the Infoblox DDI server.</td>
</tr>
</tbody>
</table>

Infoblox roles and permissions

Define the roles and permissions that the Infoblox activities need to access the various resources on the Infoblox server.

Admin groups

There are three types of admin groups on an Infoblox server:

- Superuser
- Default
- Limited Access

To perform specific operations on the Infoblox server, the Limited Access user must have a minimum set of privileges for the desired resources, using either the user interface or an API. These privileges are based on read and read/write access. For more information, refer to the “About Admin Groups” section in the Infoblox NIOS Administrator Guide.
Permission hierarchy

1. **User:** A user can be part of multiple groups.
2. **Group:** A group can have many roles.
3. **Role:** Each role consists of specific resource permissions.

Required permissions

The ServiceNow Infoblox activity pack requires appropriate read and read/write privileges for these resources:

- Network
- DHCP
- DNS
- IPAM

This example shows a default DHCP admin role, its resources, and the related permissions for each.

Infoblox DHCP activities

The Infoblox DHCP activities manage the IP addresses reserved for DHCP in your network. Use these activities to reserve, list, or delete IP addresses that are used for DHCP assignment in your network.

**DHCP Reserve IP v4 Address Range activity**
The DHCP Reserve IP v4 Address Range activity reserves an IP address range for DHCP use.

The DHCP activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > DHCP.

**Input variables**

**DHCP Reserve IP v4 Address Range input variables**

</tbody>
</table>

DHCP Delete IP Reservation activity

The DHCP Delete IP Reservation activity deletes IP reservations in DHCP using either an IPv4 or IPv6 address range.

An automation can obtain an Infoblox DHCP object to delete from either of these activities:
- DHCP List IP Reservations
- DHCP Reserve IPv4 Address Range

The DHCP activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > DHCP.

Input variables

DHCP List IP Reservations activity

The DHCP List IP Reservations activity generates a list of all the DHCP range reservations on a specific InfoBlox server.

The DHCP activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > DHCP.

### Infoblox DNS activities

The Infoblox DNS activities manage DNS records in your network using an Infoblox DDI Grid Server. Use these activities to register, list, or delete DNS records managed on an Infoblox server.

**List DNS C-records activity**

The List DNS C-records activity retrieves all canonical (CNAME) records from a specified Infoblox server.

The DNS activities use the [REST web service activity template](#) to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Infoblox DDI > DNS**.
## Input variables

<td>Activity failed to create the cannonical DNS record.</td>
</tr>
</tbody>
</table>

### List DNS Record activity

The List DNS Record activity generates a list of all the DNS entries on a specific InfoBlox server.

The DNS activities use the [REST web service activity](https://service-now.com/developer/docs/infoblox-activities.html) template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > DNS.
### Input variables

**List DNS Record input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>InfobloxServer</td>
<td>Name of the Infoblox DDI Grid Server.</td>
</tr>
<tr>
<td>restCredentials</td>
<td>The sys_id of the REST credentials from the ServiceNow instance.</td>
</tr>
<tr>
<td>api_version</td>
<td>Defines the version of WAPI to use for the integration endpoints. The default value is 2.0.</td>
</tr>
<tr>
<td>view</td>
<td>Name of the Infoblox network view. The default value is <strong>default</strong>.</td>
</tr>
</tbody>
</table>

*Note:* This field is mandatory. If field is empty, the orchestration activity will fail.

*Note:* If the field is empty, the operation is treated as happening with no view and returns the values with data from all views.

### Output variables

**List DNS Record output variables**

<table>
<thead>
<tr>

DNS Delete activity

The DNS Delete activity deletes DNS records of any type from in Infoblox server, such as C and A records.

The DNS activities use the REST web service activity template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > DNS.

Note: It is faster to create a new record than recover one that has been deleted.

### Infoblox IPAM activities

The Infoblox IPAM activities manage IP addresses in your network using an Infoblox DDI Grid Server. Use these activities to register, reserve, list, or delete IP addresses.

**IPAM Register IP Address activity**

The IPAM Register IP Address activity registers an IP address in a network using Infoblox IPAM. The output of this activity produces an InfoBlox IP address record that can be used for other IPAM functions in the format `fixedaddress/<encrypted key>:<reserved ip address>/<view>`. The IPAM activities use the [REST web service activity template](#) to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Infoblox DDI > IPAM**.

### Input variables

### IPAM Reserve IP Address activity

The IPAM Reserve IP Address activity reserves an IP address in a network using Infoblox IPAM. The output of this activity produces an InfoBlox IP address record that can be used for other IPAM functions in the format `fixedaddress/<encrypted key>:<reserved ip address>/<view>`.

The IPAM activities use the [REST web service activity template](#) to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Infoblox DDI > IPAM**.

### Infoblox network activities

The Infoblox network activities manage networks using an Infoblox DDI Grid Server.

Use these activities to create, list, or delete networks on an Infoblox server.

**Create Network activity**

The Create Network activity creates new networks on a specified Infoblox server.

The network activities use the [REST web service activity template](#) to manage network addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > Network.

### Input variables

#### Create Network input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>

</tr>
</tbody>
</table>

**Get Network Details activity**

The Get Network Details activity retrieves the information about a specific network on an Infoblox server.

The network activities use the [REST web service activity template](#) to manage network addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > Network.

### Input variables

**Get Network Details input variables**

</table>
PowerShell activity pack

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications.

Orchestration provides custom PowerShell activities that were created with the PowerShell activity designer template. These activities perform the same functions as PowerShell activities by the same name from previous releases and replace those activities for all new workflows. These custom activities give workflow administrators the ability to store input and output variables in the databus.

**Note:** Existing workflows from earlier versions that were created with legacy PowerShell activities continue to function normally after an upgrade to Geneva. However, all new workflows must use these custom PowerShell activities.

Starting with the Kingston release, there are the following updates to the PowerShell activity pack:

- A new PowerShell probe (V2), which takes advantage of IntegrationHub functionality
- The ability to insert debug statements in the PowerShell scripts and produce the resulting messages at runtime

To use the PowerShell custom activities, you must request activation of the Orchestration - PowerShell plugin. These activities are available in the Workflow Editor on the Custom tab. Expand the Custom Activities tree and select the PowerShell category for the activity you want to use.

ServiceNow supports PowerShell 2.0 and above. PowerShell 3.0 does not support Windows 2003 Server.

PowerShell activity designer

PowerShell activities are configured to return data to a workflow from a host using Microsoft PowerShell.

You must purchase Orchestration to use this template. For specific information about using the tools in the activity designer, refer to these resources:

- Orchestration activity designer
- Create input variables
- Create a parsing rule

ServiceNow supports PowerShell 2.0 and above. PowerShell 3.0 does not support Windows 2003 Server.

PowerShell protocols and troubleshooting

PowerShell uses the Windows Management Instrumentation (WMI) and Windows Remote Management (WinRM) protocols to enable Orchestration activities to run commands on remote Windows hosts.

Windows Management Instrumentation (WMI)

WMI provides a uniform interface for any local or remote applications or scripts that obtain management data from a computer system, a network, or an enterprise. WMI contains these components:

- Managed objects and WMI providers: A WMI provider is a COM object that monitors one or more managed objects for WMI. A managed object is a logical or physical enterprise...
component, such as a hard disk drive, network adapter, database system, operating system, process, or service.

- **WMI infrastructure**: The WMI infrastructure is a Microsoft Windows operating system component known as the WMI service (winmgmt). The WMI infrastructure is composed of the WMI Core and the WMI repository. The WMI repository is organized by WMI namespaces. The WMI service creates namespaces, such as `root\default`, `root\cimv2`, and `root\subscription`, at system startup and preinstalls a default set of class definitions, including the Win32 Classes, the WMI System Classes, and others. The remaining namespaces found on your system are created by providers for other parts of the operating system or products.

- **WMI consumers**: A WMI consumer is a management application or script that interacts with the WMI infrastructure. A management application can query, enumerate data, run provider methods, or subscribe to events by calling either the COM API or the Scripting API for WMI.

**WMI installation and configuration**

For the MID Server to successfully make a remote connection to the target host, TCP port 135 must be open. The Windows firewall automatically creates an inbound rule for WMI connectivity called Windows Management Instrumentation (DCOM-In).

**Windows Remote Management (WinRM)**

WinRM is the Microsoft implementation of WS-Management Protocol, a standard Simple Object Access Protocol (SOAP) protocol that allows hardware and operating systems from different vendors to interoperate.

WinRM contains these components:

- **WinRM Scripting API**: This scripting API enables Orchestration to obtain data from remote computers, using scripts that perform WS-Management protocol operations.
- **WMI Service**: The WMI service continues to run side-by-side with WinRM and provides requested data or control through the WMI plug-in. You can continue to obtain data from standard WMI classes, such as `Win32_Process`.

**WinRM configuration**

WinRM is automatically installed on Windows 2008 R2 and above operating systems, but must be configured before use.

1. In a command prompt, enter `winrm quickconfig`. This command is not case sensitive.
2. When the console displays **Make these changes (y/n)?**, enter `y`.

The `winrm quickconfig` command performs the following operations:

- Starts the WinRM service, and sets the service startup type to `auto start`.
- Configures a listener for the ports that send and receive WS-Management protocol, using either HTTP or HTTPS on any IP address.
- Creates a firewall exception for the current user profile.

**MID Server PowerShell files**

PowerShell functions are stored in script files (`*.ps1`) that use a PowerShell Script module (`*.psm1`) file name extension.

The PowerShell functions are used by the PowerShell MID Server script files included in these activity packs:

- Active Directory
- Exchange
- SCCM
- PowerShell

**PSScript.ps1**

This script performs a few tasks, such as credential testing, password encryption, and the execution of scripts configured in the Orchestration Activity Designer or in MID Script Files. However, this document focuses on how PSScript.ps1 uses the `credential.psm1` module for testing access to remote hosts.

The PowerShell variables are generally used directly in the *PowerShell execution command* or as arguments in the MID Server script file you specify. There are special variables that are passed to PSScript.ps1, such as `credType`. 
Drag variable from the left to template fields below to create associations to the template inputs below.

**Target host:** ${activityInput.sccmServer}

**Script type:** MID Server script file

**MID Server script file:** AddToDeviceCollection.ps1

### PowerShell variables

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>collection</td>
<td>${activityInput.collection}</td>
<td>Plain</td>
</tr>
<tr>
<td>device</td>
<td>${activityInput.device}</td>
<td>Plain</td>
</tr>
<tr>
<td>credType</td>
<td>SCCM</td>
<td>Plain</td>
</tr>
</tbody>
</table>

**Credential tag:**

Required MID Server capabilities

PowerShell credTypes

The PowerShell credential types:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WMI</td>
<td>testCredentialWMI</td>
</tr>
<tr>
<td>Exchange</td>
<td>testCredentialExchange</td>
</tr>
<tr>
<td>AD</td>
<td>testCredentialAD</td>
</tr>
<tr>
<td>SCCM</td>
<td>testCredentialSCCM</td>
</tr>
</tbody>
</table>

If no credential type is passed to the PSScrip.ps1 script, the MID Server defaults to the WMI test function to test access to the target host. If there is a credential type used, the MID Server runs the corresponding test function for that credential type.

Exit codes

These exit codes are returned from the PSScript.ps1 script and logged in the MID Server log file.

PSScript.ps1 exit codes

<table>
<thead>
<tr>
<th>Type</th>
<th>Test function</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>PowerShell command/script ran successfully.</td>
</tr>
<tr>
<td>1</td>
<td>Test finished successfully, but the command/script failed to execute.</td>
</tr>
<tr>
<td>2</td>
<td>Incorrect syntax passed to script.</td>
</tr>
<tr>
<td>3</td>
<td>All credentials including MID Server service account failed to execute the command/script.</td>
</tr>
<tr>
<td>4</td>
<td>Passed test and executed the activity, but an error was returned. Example user cannot be found.</td>
</tr>
</tbody>
</table>

DiagnosticsUtil.psm1

The MID Server uses this module file to perform PowerShell logging that assists debugging any Orchestration activity using PowerShell scripting. You can also add debugging statements directly to custom scripts.

PowerShell diagnostic utilities

<table>
<thead>
<tr>
<th>Utility</th>
<th>Description</th>
</tr>
</thead>
</table>
| SNCLog-DebugInfo | Log a debug message for a PowerShell script or PowerShell Orchestration activity. Examples:  
  - SNCLog-DebugInfo -message "My debug message..."  
  - SNCLog-DebugInfo "My debug message" |
<table>
<thead>
<tr>
<th>Utility</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SNCLog-ParameterInfo</td>
<td>Log a function parameter value. For &quot;function getHostName( param( [String] $target ) )&quot;, the first value to the PowerShell hashtable is a string to indicate which function executes, and the values for each of the function parameters. Examples:</td>
</tr>
<tr>
<td></td>
<td>• Function with single parameter: SNCLog-ParameterInfo @(&quot;Running getHostName&quot;, $target)</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The debug message shows: Running getHostName $target:[actual value of $target]:</td>
</tr>
<tr>
<td></td>
<td>• Function with multiple parameters: SNCLog-ParameterInfo @(&quot;Running functionName&quot;, $param1, $param2, $param3)</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The debug message shows: Running getHostName $target:[actual value of $target]:</td>
</tr>
<tr>
<td>SNCObfuscate-Value</td>
<td>Use this utility to encrypt values for security purposes. The function displays &quot;$variableName&quot;:***, where *** is the obfuscated value. Example:</td>
</tr>
<tr>
<td></td>
<td>• SNCObfuscate-Value $password</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The debug message reads: &quot;$password : ***&quot;.</td>
</tr>
</tbody>
</table>

**Credentials.psm1**

The MID Server uses this module file to test access to a target host. The MID Server loops through all Windows credentials stored in its credentials table using the following access type functions, unless the PowerShell activity has a credential type (credType) defined. All ServiceNow® authored PowerShell activities are hardcoded to use a specific credential type. As a result, the MID Server only tests credential access against the designated function.

**PowerShell test functions**

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>testCredentialWMI</td>
<td>Tests the given user and password on the target host using the Get-WMI object.</td>
</tr>
<tr>
<td>testCredentialAD</td>
<td>Tests the given user and password on the target host using the built-in DirectoryEntry object.</td>
</tr>
<tr>
<td>testCredentialExchange</td>
<td>Tests the given user and password to create a session on an Exchange host. This test uses the built-in PowerShell remoting feature on a remote host. WinRM is configured on Exchange servers by default.</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>testCredentialSCCM</td>
<td>Tests the given user and password to create a session on an SCCM server. This test uses the built-in PowerShell remoting feature on a remote host. This test requires WinRM to be configured.</td>
</tr>
<tr>
<td>testNoCredentialAccessWMI</td>
<td>Tests the given user and password on the target host, using the <code>Get-WMI</code> object. This test is used when no <code>credType</code> is used.</td>
</tr>
</tbody>
</table>

**Note:** If the test passes using one of these functions, that credential is used to run the PowerShell script/command. If the tests fail to access the target host using these functions, the MID Server runs the PowerShell script/command under the account of the MID Server service.

This diagram illustrates the dependency of the credential selection behavior on the host being targeted by the PowerShell activity. If the target host is the IP address or host name of the MID Server, the MID Server bypasses all credentials in the Credentials table and uses the account of the MID Server service. If the target host is not the MID Server, then all Windows credentials are used first. If all credentials in the Credentials table are unsuccessful in running the PowerShell activity, then the MID Server uses the MID Server service account.
PowerShell credential selection criteria
**ActiveDirectory.psm1**

This module file stores the functions used by the PowerShell scripts shipped with the Active
Directory activity pack.

**Exchange.psm1**

This module file stores the functions used by the PowerShell scripts shipped with the Exchange activity pack.

**SCCM.psm1**

This module file stores the functions used by the PowerShell scripts shipped with the SCCM activity pack.

*Set up credential tags for a PowerShell activity*

Credential tagging gives an administrator more control over the credentials used in a PowerShell activity.

*Role required: admin, activity_creator or workflow_admin*

Tagging is useful when the activity requires specific credentials to perform a task. By populating the Credential tag field you are telling the activity to use a credential that has a specific tag set for it. Additionally, credential tagging allows you to use a different underlying credential in development, testing, and production systems without having to change the activity for a given target system. For example, you can use the SCCMCred tag and have it point to both a development and test instance.

1. Navigate to Orchestration > Credentials.
2. Select the credential you want to tag.
3. Enter a unique name in the Tag field that is descriptive of the credentials purpose.
Credential tag definition

4. Click **Update**.
5. Open the Workflow Editor and select the PowerShell activity you want to tag.
6. In the activity's Execution Command, add the name of the tag you created to the **Credential tag** field.
Adding a credential tag to an activity

You are editing a record in the Active Directory application (cancel)

Target host: $(activityInput.DominController)
Script type: MID Server script file
MID Server script file: UpdateADObject.ps1

PowerShell variables:
- **objectName**: Value: $(activityInput.User), Type: Plain
- **type**: Value: User, Type: Plain
- **credType**: Value: AD, Type: Plain

Credential tag: AD User Admin
Required MID Server capabilities: PowerShell

Continue
PowerShell troubleshooting
Authentication and access denied errors can prevent PowerShell activities from running a command on a target host.

Use these procedures for troubleshooting authentication failures with Orchestration PowerShell activities and when the Remote Procedure Call (RPC) server is unavailable or when access is denied. The authentication failure error displays when all credentials, including those of the local MID Server service account, do not have the correct permissions to run the Powershell script/command. The same error displays when the target host is unreachable.

**Response**

![Authentication failure with the local MID server service credential.]

**Authentication error message**

Authentication failure in an Active Directory activity
This example uses the Create AD Object activity to illustrate troubleshooting authentication failure in PowerShell.

Role required: Permissions to access and create accounts on Active Directory

Validate that the account you are using has the proper permissions to run the activity.

1. Log on to the target machine using the account under which you want to run the activity. Active Directory tools must be installed on this machine.
2. Launch the Active Directory Users and Computers application.
3. Navigate to the OU under which you want to create the Active Directory object.
4. Attempt to create the object.

If this procedure is successful under the specified user, the following might be the cause of the authentication failure:

- User name is invalid.
- Password entered incorrectly.
- Domain controller is unreachable.

**Note:** The majority of the return codes listed in the MID Server log for this error are 1s and 3s. This is because the Active Directory activities use the ADSI provider and not WMI or WinRM. An error code of 1 means the account was able to connect with the test account, but running the script failed.
An error code of 3 means that the MID Server attempted to run the PowerShell activity under the MID Server service account but failed.

```
Attempting to use credential with username 'service-now\joe1
Running command:-> C:\windows\system32\windowsPowerShell\v1.0\PowerShell\PSScript.ps1' -computer '10.11.144.230' -script 'C:\Windows\PowerShell\Profiles\test.psl'; usecred $true -isDiscovery $false -debug $true; exit $LASTEXITCODE
Thread name is Powershell is executing...
The exit value from waitFor() is 1
The status code returned from running the command is 1
```

Authentication failure in an Exchange activity

This example uses the Create Mailbox activity to illustrate troubleshooting authentication failure in PowerShell.

**Role required:** Permissions to access and create mailboxes on the Exchange server

1. Validate that the account you are using has the proper permissions to run the PowerShell activity.
2. Log on to a machine that has the Exchange Management Shell (EMS) installed.
3. Create a user using the `New-mailbox` Exchange commandlet.
Creating a new user in Exchange

If this procedure is successful under the specified credential, the following is the likely cause of the failure:

- User name is invalid.
- Password entered incorrectly.
- Exchange server is unreachable.

4. If the Exchange server is unreachable, examine the MID Server logs. Because the Exchange activities use WinRM to access the Exchange server, the logs can provide more troubleshooting information.

Note: Ensure that the error is NOT WinRM cannot process the request.

Remote Procedure Call (RPC) server unavailable or access denied
Typically, this error is logged when running a PowerShell script/command that uses WinRM or WMI.

Possible causes of error

The target host might have one of these issues:

- WinRM isn’t configured.
- Firewall is blocking access to the host over TCP port 135 (WMI) or HTTP/HTTPs and TCP port 5985 (WinRM).
- Kerberos issue, caused by hopping to multiple hosts using WMI.
Example WinRM error

The Create Mailbox activity from the Exchange activity pack has generated an error in the ECC queue involving authentication using the MID Server service credential. This occurred because the MID Server credential is the last to be used if the targeted host is not the MID Server.

Response

Authentication failure error message

The MID Server log shows that the MID Server tried to run the activity under specific credentials, but wasn’t successful and received an exit code of 1.

MID Server error code
Join Domain activity

The Join Domain activity joins a Windows computer to a domain.

If the computer is already a member of a domain, this activity completes without modifying the computer. Joining a domain requires a username and password. This user must have domain administration privileges or privileges to join a computer to the domain.

Note: This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

### Install Windows App activity

The Install Windows App activity installs an application from an MSI package on a Windows target machine.

**Note:** This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the [PowerShell activity designer](https://docs.servicenow.com), which gives workflow administrators the ability to store input and output variables in the databus.

### Input variables

**Install Windows App input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>Hostname or IP address of the target Windows machine on which the service is installed. Use the Resolve DNS MID Server capability to resolve hostnames into IP addresses.</td>
</tr>
<tr>
<td>installerpath</td>
<td>Path to the installer. The installer can be on any machine that is visible to both the MID Server and the target machine (local drive, UNC path, mapped drive, etc.).</td>
</tr>
<tr>
<td>installer</td>
<td>Name of the installer file, such as winzip150.msi. The installer must be an MSI package.</td>
</tr>
<tr>
<td>arguments</td>
<td>The parameter that contains the command line arguments to the MSI package. These are name=value pairs, separated by a space. For example, the argument might appear as: INSTALLDIR=c:\myinstallfolder ADDDESKTOPICON=0. These arguments are dependent on the what the actual MSI being installed defines. If there are no arguments, leave the field empty.</td>
</tr>
</tbody>
</table>

### Output variables

**Install Windows App output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>Either <strong>success</strong> or <strong>failure</strong>.</td>
</tr>
</tbody>
</table>
### Variable Description

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>errorMessage</td>
<td>The <code>executionResult.errorMessages</code> from the <code>Activity designer parsing sources</code></td>
</tr>
</tbody>
</table>

### Conditions

The activity state tells the workflow engine what to do with the activity.

**Install Windows App conditions**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The Windows application was successfully installed on the target machine.</td>
</tr>
<tr>
<td>Failure</td>
<td>The Windows application failed to install on the target machine.</td>
</tr>
</tbody>
</table>

**Enable WMI Windows Installer provider**

To install software on Windows machines using the Install Windows App activity, enable WMI Windows Installer provider on all target machines.

- It is recommended that the MID Server, the target machine, and the installer source machine be on the same Active Directory domain. However, if these computers are on separate domains, those domains must have a trust relationship established between them.
- If the installer path is a UNC file sharing machine, the Active Directory account of the target computer must be trusted for delegation. For instructions on this configuration, see the posting on the community for installing and uninstalling Windows applications.

**Note:** See [WMI Providers](#) for a list of Windows operating systems that provide this tool by default.

1. Open the Control Panel.
2. Go to **Add or Remove Programs**.
3. Select **Add/Remove Windows Components**.
4. Double-click **Management and Monitoring Tools**.
   
   This action opens a secondary window displaying additional selections.
5. Select **WMI Windows Installer Provider** check box.
6. Click **OK** to return to the Windows Components Wizard window.
7. Click **Next**.
   
   You might be asked for the Windows installation CD to complete this process.

### Change Service State activity

The Change Service State activity starts or stops a Windows service on a remote system.

This activity replaces a Powershell activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the [Powershell activity template](#), which gives workflow administrators the ability to store input and output variables in the databus.
## Input Variables

### Change Service State input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>Hostname or IP address of the target Windows machine on which the service is installed. Use the Resolve DNS activity to resolve hostnames into IP addresses.</td>
</tr>
<tr>
<td>service</td>
<td>Name of the Windows service to start or stop. The <code>service</code> parameter is the service name, not the display name of the service affected.</td>
</tr>
<tr>
<td>state</td>
<td>There are two actions to select for a service state change: <code>StartService</code> or <code>StopService</code>.</td>
</tr>
</tbody>
</table>

## Output variables

### Change Service State output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td>Success</td>
<td>The target service was successfully started or stopped.</td>
</tr>
<tr>
<td>Failure</td>
<td>The update to the target service was unsuccessful, or the service was not found on the target system.</td>
</tr>
</tbody>
</table>

## Restart Windows Server activity

The Restart Windows Server activity stops and then restarts a Windows server using Powershell.

Note: This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the Powershell activity template, which gives workflow administrators the ability to store input and output variables in the databus.
Input variables

**Restart Windows Server input variables**

<table>

Probe activity pack

Orchestration provides an activity pack customized using the ServiceNow activity designer that runs probes on target hosts to return specific information.

These custom activities were built with the Create a probe activity, which gives workflow administrators the ability to store input and output variables in the databus.

To use the custom probe activities, you must request activation of the Orchestration - Probe plugin.

Resolve DNS Name activity

The Resolve DNS Name activity takes an IP address or a fully qualified domain name (FQDN), which it resolves into one or more IP addresses.

The domain name is sent through the MID Server to the domain name system (DNS) to resolve the name. If a single IP address is returned, it is stored in two variables: resolved_ip and resolved_ips.
If multiple IP addresses are returned, the first IP address is stored in the `resolved_ip` variable, and all the addresses are stored in the `resolved_ips` variable. If an IP address is provided instead of an FQDN, this address is output directly to both variables. Your ServiceNow instance must have access to a MID Server configured to use Resolve DNS to run this activity.

This activity replaces an activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the `Probe activity template`, which gives workflow administrators the ability to store input and output variables in the `databus`.

### Input variables

**Resolve DNS Name input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FQDN</td>
<td>The fully qualified domain name to resolve or an IP address.</td>
</tr>
</tbody>
</table>

### Output variables

<tr>
<td>Failure</td>
<td>Activity failed to resolve the DNS name.</td>
</tr>
</tbody>
</table>

### SNMP Query activity

The SNMP Query activity queries an SNMP device.

Your ServiceNow instance must have access to a MID Server configured to use SNMP to run this activity.
This activity replaces an activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the Probe activity template, which gives workflow administrators the ability to store input and output variables in the databus.

### Input variables

**SNMP Query input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>Hostname or IP address of the SNMP device being queried.</td>
</tr>
<tr>
<td>oids</td>
<td>A list of unique object identifiers used to identify SNMP devices.</td>
</tr>
</tbody>
</table>

### Output variables

<td>Description of the SNMP object.</td>
</tr>
<tr>
<td>timeout</td>
<td>Boolean value indicating whether or not the query timed out.</td>
</tr>
<tr>
<td>error</td>
<td>Indicates any error that occurred. If no error occurred, this value is null.</td>
</tr>
<tr>
<td>oid_data</td>
<td>An array of data objects for all unique object identifiers.</td>
</tr>
</tbody>
</table>

### Conditions

**SNMP Query conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully ran the query on the target device.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to run the query on the target device. Failure could be caused by invalid credentials or a device that is not accessible.</td>
</tr>
</tbody>
</table>

### SCCM activity pack

The Microsoft System Center Configuration Management (SCCM) activity pack provides Orchestration activities you can use to manage software deployments and collections on an SCCM server.

"© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated."
You can use SCCM Orchestration activities to deploy and revoke software from an SCCM server or manage user and device collections. The system manages software on an SCCM server using Orchestration activities and workflows.

Client software distribution requires:
- SCCM 2012 R2.
- Powershell 3.x.
- Powershell Remoting enabled.
- The Windows PowerShell x86 execution policy must be set to unrestricted mode.
- Latest version of the SCCM cmdlet library installed on the SCCM server.
- Use the credentials to log onto the SCCM Server and connect via Windows PowerShell from the System Center Configuration Manager console at least once to set the path variable for that credential.

**Activate SCCM activities**

The Orchestration - System Center Configuration Manager plugin installs the SCCM activity pack that deploys software from an SCCM host and manages user and device collections.

The SCCM plugin is activated automatically when the Orchestration - Client Software Distribution (com.snc.orchestration.sccm_mgnt) plugin is activated, but can be activated separately.

**Note:** The activities in the SCCM plugin run in the System Center Configuration Manager scope.

1. In the HI Service Portal, click **Service Requests > Activate Plugin.**
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.

3. Click **Submit**.

**Configure the MID Server for SCCM activities**

To use a MID Server with Microsoft System Center Configuration Management (SCCM) activities, configure it to communicate with the SCCM server.
Role required: admin

1. In the navigation filter, enter `cmdb_ci_dns_name.list`.
2. Click **New**.
3. Enter the fully-qualified domain name (FQDN) of the SCCM server in the **Name** field.
4. Right-click in the form header and select **Save**.
5. In the **IP Address** related list, click **New**.
6. In the **IP Address** field, enter the IP address of the SCCM server.
7. In the **Nic** field, select `eth0` or your preferred network interface controller.
8. Leave the **Netmask** field blank.
9. Click **Submit**.

### Add to Device Collection activity

The Add to Device Collection activity adds the specified device into a Microsoft System Center Configuration Manager (SCCM) device collection.

The Add to Device Collection activity uses the **Powershell activity template** to add a specified device to an SCCM device collection. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called `AddToDeviceCollection.ps1` to edit the collection.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > System Center Configuration Manager (SCCM)**.

**Note:** The Add to Device Collection activity does not use pre-processing or post processing scripts.

</tr>
</tbody>
</table>

### Add to User Collection activity

The Add to User Collection activity adds a user to a Microsoft System Center Configuration Manager (SCCM) user collection.

The Add to User Collection activity uses the [Powershell activity template](#) to access the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called `AddToUserCollection.ps1` to edit the collection.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > System Center Configuration Manager (SCCM)**.

**Note:** The Add to User Collection activity does not use pre-processing or post processing scripts.

### Input variables

**Add to User Collection input variables**

Get Applications activity

The Get Applications activity returns a list of all the applications available on a Microsoft System Center Configuration Manager (SCCM) server.

The Get Applications activity uses the Powershell activity template to access the applications on the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called GetApplications.ps1. This script filters the results of the GET, so that only specific attributes are returned for the applications on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable application data. The list of available applications is returned as an array in a JSON object.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > System Center Configuration Manager (SCCM).

Note: The Get Applications activity does not use a pre-processing script.

Input variables

Get Applications input variables

<table>
<thead>
<tr>
<th>Variable</th>

<td>Activity failed to retrieve the list of applications available on the SCCM host.</td>
</tr>
</tbody>
</table>

Get Deployments activity

The Get Deployments activity returns the list of deployments performed by Orchestration using a Microsoft System Center Configuration Manager (SCCM) server.

The Get Deployments activity uses the Powershell activity template to access the deployments on the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called `GetDeployments.ps1` that returns the deployments on the host. This script filters the results of the GET, so that only specific attributes are returned for the deployments on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable deployment data. The list of available deployments is returned as an array in a JSON object.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > System Center Configuration Manager (SCCM).

Get Device Collections activity

The Get Device Collections activity returns the list of available device collections on a Microsoft System Center Configuration Manager (SCCM) host.

The Get Device Collections activity uses the **Powershell activity template** to access the collections on the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called `GetDeviceCollections.ps1` that returns the device collections on the server. This script filters the results of the GET, so that only specific attributes are returned for the device collections on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable device collection data. The list of available collections is returned as an array in a JSON object.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > System Center Configuration Manager (SCCM)**.

**Note:** The Get Device Collections activity does not use pre-processing scripts.

Get User Collections activity

The Get User Collections activity returns the list of available user collections on a Microsoft System Center Configuration Manager (SCCM) server.

The Get User Collections activity uses the Powershell activity template to access the user collections on the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called `GetUserCollections.ps1` that returns the user collections on the host. This script filters the results of the GET, so that only specific attributes are returned for the user collections on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable user collection data. The list of available collections is returned as an array in a JSON object.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > System Center Configuration Manager (SCCM).

Note: The Get User Collections activity does not use pre-processing scripts.

Is Device in Collection activity

This activity verifies if a device exists in an SCCM device collection.

The Is Device in Collection activity uses the PowerShell activity template to verify if a specific device exists in an SCCM device collection. The activity is configured to use a MID Server with PowerShell capabilities and to run a MID Server script called IsDeviceInCollection.ps1 to perform the test.
To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > System Center Configuration Manager (SCCM).

Remove from Device Collection activity

The Remove from Device Collection activity removes a device from a Microsoft System Center Configuration Manager (SCCM) device collection.

The Remove from Device Collection activity uses the PowerShell activity template to remove a device from a device collection on a Microsoft SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called RemoveFromUserCollection.ps1 to edit the collection.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > System Center Configuration Manager (SCCM).

SFTP File Transfer activity pack

Use the SFTP File Transfer activities to manage files and directories on an SFTP server and to move files from one SFTP server to another.

The SFTP activity pack includes scoped activities for common file transfer tasks and a ready-to-use workflow that includes these activities. Use the SFTP workflow to control which files are going to be moved, what conditions the files need to meet, the order in which the files are moved, and which overwrite options are executed.

Note: To use the SFTP File Transfer activities and workflow, you must request activation of the Orchestration - SFTP plugin.

SFTP File Transfer workflow

The SFTP File Transfer activity pack includes a scoped workflow that uses multiple activities to manage files on SFTP servers.
The maximum activity count for the SFTP File Transfer workflow is set to 10,000. This allows the workflow to move up to 1000 files from one server to another.

**Accessing the workflow**

- Navigate to **Workflow > Workflow Editor** and select the **Workflows** tab.
- Click on the SFTP File Transfer workflow to open it.
- Click the information icon in the workflow header to display the properties dialog box.

**Input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source host</td>
<td>Name or IP address of the server containing the files you want to move.</td>
<td></td>
</tr>
<tr>
<td>Source port</td>
<td>Port number to use to communicate with the source server.</td>
<td>22</td>
</tr>
<tr>
<td>Source directory</td>
<td>Full path to the directory where the source files are located.</td>
<td></td>
</tr>
<tr>
<td>Source files</td>
<td>Names of specific source files to move. Separate the file names in this list with semi-colons. This field supports the use of wild cards. For information about how the values in this field are affected by options in other fields, see the section below the table.</td>
<td></td>
</tr>
<tr>
<td>Excluded files</td>
<td>Names of specific source files to exclude from the move. The system moves all other files found in the source directory or subfolders. Separate the file names in this list with semi-colons. This field supports the use of wild cards. For information about how the values in this field are affected by options in other fields, see the section below the table.</td>
<td></td>
</tr>
<tr>
<td>Target host</td>
<td>Name or IP address of the server to which the files are being moved.</td>
<td></td>
</tr>
<tr>
<td>Target port</td>
<td>Port number to use to communicate with the target host.</td>
<td>22</td>
</tr>
<tr>
<td>Variable</td>
<td>Description</td>
<td>Default value</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------------</td>
</tr>
<tr>
<td>Datetime format</td>
<td>Timestamp format to apply when the $[DateTime]$ variable is used in the <strong>Target directory</strong> or <strong>Target files</strong> field. The system uses the current time from the instance to create timestamp values.</td>
<td>yyyy-MM-dd</td>
</tr>
<tr>
<td>Target directory</td>
<td>Path to the directory in the target host where the files are being moved. You can specify a target directory whose name includes the timestamp by adding the $[DateTime]$ variable to the directory name. For example, you might enter this path to a target directory: /user/jacinto.gawron/documents/projects_$[DateTime]. This produces the projects_20150505 directory. When the timestamp variable is used, the system uses the format specified in the <strong>Datetime format</strong> field.</td>
<td></td>
</tr>
</tbody>
</table>
| Target file     | Format to use for target file names when a timestamp is added. You can configure the system to add the timestamp as a prefix to the file name or insert the timestamp into the name, using these variables:  

- $[DateTime]$: Current timestamp, using the format defined in the **Datetime format** field.  
- $[SourceFile]$: Complete file name.  
- $[SourceFile:Base]$: Base file name without the extension.  
- $[SourceFile:Ext]$: File extension only. 

A target file name with the timestamp added as a prefix is expressed as: $[DateTime]$_$[SourceFile]$. This produces a file name that looks like this: 20150505_file1.txt  

A target file name with the timestamp inserted into the name is expressed as: $[SourceFile:Base]$_$[DateTime]$_$[SourceFile:Ext]$. This produces a file name that looks like this: file1_20150505.txt |               |

<tr>
<td>Upon failure, keep moved files on target</td>
<td>Check box to keep any files on the target that were moved successfully, even if the entire file transfer operation ended in failure. If this check box is cleared, the system removes all successfully transferred files from the target when general failure occurs.</td>
<td>true</td>
</tr>
<tr>
<td>Credential tag for source</td>
<td>Specific credential tag this activity must use to run SSH commands on the source host.</td>
<td></td>
</tr>
<tr>
<td>Credential tag for target</td>
<td>Specific credential tag this activity must use to run SSH commands on the target host.</td>
<td></td>
</tr>
</tbody>
</table>

**File selection logic**

When selecting the files to move from the source host, the system uses this logic:

- If the **Source files** and **Excluded files** fields are empty, the system moves all the files in the source directory.
- When the **Include subfolders** check box is selected, the following dependencies exist:
  - If no files are specified in the **Source files** and **Exclude files** fields, the system moves all files in the source directory and all files in all subfolders of the source directory.
  - If the **Source files** field contains file names, the system moves those files from their location on either the source directory or any of its subfolders.
  - If the **Exclude files** field contains file names, the system moves all the files from the source directory and its subfolders except those excluded files.
- When the **Include subfolders** check box is cleared, the system looks only in the source directory for files to move or exclude.

**Copy File activity**

The Copy File activity copies a file from an SFTP server (source host) to another SFTP server (target host).

**Input variables**

**Copy File input variables**

| Variable     | Description                                                                                                                                                                                  |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---|
| sourceHost   | Name or IP address of the server containing the files you want to transfer.                                                                                                                                 |
| sourcePort   | Port number to use to communicate with the source server. The default port number is 22.                                                                                                |
| sourceFilePath | Full path to the file to copy from the source host.                                                                                                                                                             |
**Variable** | **Description**
---|---
targetHost | Name or IP address of the server to which you want to move the files.
targetPort | Port number to use to communicate with the target server. The default port number is 22.
targetFilePath | Full path to the copied file on the target host.
tempFileSuffix | Temporary suffix to use when moving a file. If this field contains a value, the activity deletes the duplicate target file, if it exists, and then copies the source file to a temporary file using `targetFilePath + tempFileSuffix` as the name. Upon completion, the activity renames the file to the actual target file name. If this field is blank, the activity copies the source file directly to the target file and overwrites it, if it already exists.
sourceCredentialTag | Specific credential tag this activity must use to run SSH commands on the source host.
targetCredentialTag | Specific credential tag this activity must use to run SSH commands on the target host.

**Output variables**

**Copy File output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
</table>
temporaryConnectionString | The `executionResult.errorMessages` from the Activity designer parsing sources. If this variable is not null, the operation has failed. |
result | Text message advising that the command was executed successfully. |

**Conditions**

**Copy File conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
</table>
Success | The activity succeeded in copying the file. |
Failure | The activity failed to copy the file. |

**Create Directory activity**

The Create Directory activity creates a new directory on an SFTP server.
Input variables

Create Directory input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sourceHost</td>
<td>Name or IP address of the server containing the files you want to move.</td>

<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>errorMessage</td>
<td>The executionResult.errorMessages from the Activity designer parsing sources. If this variable is not null, the operation has failed. An activity can examine the error message to customize a condition. For example, if the error message contains NO_SUCH_FILE, the activity can be considered successful, depending on circumstances.</td>
</tr>
<tr>
<td>result</td>
<td>List of requested files, returned as a JSON string.</td>
</tr>
</tbody>
</table>

Conditions

Get File List conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The activity succeeded in listing the requested files.</td>
</tr>
<tr>
<td>Failure</td>
<td>The activity failed to list the requested files.</td>
</tr>
</tbody>
</table>

Remove File or Directory activity

The Remove File or Directory activity removes a file or a directory on an SFTP server, including subdirectories, when configured.
### Input variables

**Remove File or Directory input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sourceHost</td>
<td>Name or IP address of the server containing the files you want to remove.</td>
</tr>
<tr>
<td>sourcePort</td>
<td>Port number to use to communicate with the target server. The default port number is 22.</td>
</tr>
<tr>
<td>sourceFilePath</td>
<td>Full path to the file or directory to remove. To remove multiple files or directories using a single activity, enter a semicolon-separated list of paths in this field.</td>
</tr>
<tr>
<td>isDirectory</td>
<td>True/false variable that determines if the specified file path is a directory. The default value for this variable is false.</td>
</tr>
<tr>
<td>includeSubfolders</td>
<td>True/false variable that determines if the given directory and all of its subfolders should be removed. The default value for this variable is false. If the value for this field is false, then the activity can only remove an empty directory. This field appears when the isDirectory checkbox is selected.</td>
</tr>
<tr>
<td>sourceCredentialTag</td>
<td>Specific credential tag this activity must use to run SSH commands on the host.</td>
</tr>
</tbody>
</table>

### Output variables

**Remove File or Directory output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>errorMessage</td>
<td>The executionResult.errorMessages from the Activity designer parsing sources. If this variable is not null, the operation has failed.</td>
</tr>
<tr>
<td>result</td>
<td>Either success or failure.</td>
</tr>
<tr>
<td>deletionResults</td>
<td>The deletionResults array contains these attributes:</td>
</tr>
<tr>
<td></td>
<td>- fullPath: Full path to the file or directory targeted.</td>
</tr>
<tr>
<td></td>
<td>- status: Either succeeded or failed.</td>
</tr>
<tr>
<td></td>
<td>- reason: Text message describing the cause of a failure.</td>

</thead>
<tbody>
<tr>
<td>Success</td>
<td>The activity succeeded in removing the file or directory specified.</td>
</tr>
<tr>
<td>Failure</td>
<td>The activity failed to remove the file or directory specified.</td>
</tr>
</tbody>
</table>

Rename File or Directory activity

The Rename File or Directory activity renames a file or directory to a new name on an SFTP server.

Input variables

Rename File or Directory input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sourceHost</td>
<td>Name or IP address of the server containing the file or directory you want to rename.</td>
</tr>
<tr>
<td>sourcePort</td>
<td>Port number to use to communicate with the target server. The default port number is 22.</td>
</tr>
<tr>
<td>sourceFilePath</td>
<td>Full path to the file or directory to rename.</td>
</tr>
<tr>
<td>targetFilePath</td>
<td>Full path to the renamed file or directory.</td>
</tr>
<tr>
<td>sourceCredentialTag</td>
<td>Specific credential tag this activity must use to run SSH commands on the host.</td>
</tr>
</tbody>
</table>

Output variables

Rename File or Directory output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>errorMessages</td>
<td>The executionResult.errorMessages from the Activity designer parsing sources. If this variable is not null, the operation has failed.</td>
</tr>
<tr>
<td>result</td>
<td>A message saying that the operation has been successful. For example, you might see: Rename /tmp/sftp_test/subdir1 to /tmp/sftp_test/subdir2 complete.</td>
</tr>
</tbody>
</table>
Conditions

Rename File or Directory conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The activity succeeded in renaming the file or directory.</td>
</tr>
<tr>
<td>Failure</td>
<td>The activity failed to rename the file or directory.</td>
</tr>
</tbody>
</table>

Set File Attributes activity

The Set File Attributes activity sets common file attributes, such as timestamps, size, permissions, and UID/GID, for a file or directory on an SFTP server.

A good practice is to use the Get File List activity to return a list of files and their attributes first. Then, when you moved a file from a source host to a target host, use the Set File Attributes activity to set the source file attributes on the target file. This is demonstrated in the SFTP File Transfer workflow.

Input variables

Set File Attributes input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sourceHost</td>
<td>Name or IP address of the server containing the file or directory whose attributes you want to change.</td>
</tr>
<tr>
<td>sourcePort</td>
<td>Port number to use to communicate with the target server. The default port number is 22.</td>
</tr>
<tr>
<td>sourceFilePath</td>
<td>Full path to the file or directory whose attributes you want to change.</td>
</tr>
<tr>
<td>userID</td>
<td>User ID attribute to apply to the file or directory. The UID and GUID variables must be set together as a pair.</td>
</tr>
<tr>
<td>groupID</td>
<td>Group ID attribute to apply to the file or directory. The UID and GUID variables must be set together as a pair.</td>
</tr>
<tr>
<td>permissions</td>
<td>File or directory permissions to set for the user and group specified. This value must be expressed as an integer, such as 16877, which defines these permissions: <code>rwxr-xr-x</code>.</td>
</tr>
<tr>
<td>accessTimestamp</td>
<td>Override the timestamp when the file or directory was last accessed. The access and modification timestamps must be set together as a pair.</td>
</tr>
</tbody>
</table>

Note: The permissions number is an internal value returned by the Get File List activity.

</tr>
<tr>
<td>Failure</td>
<td>The activity failed to change the attributes of the specified file or directory.</td>
</tr>
</tbody>
</table>

### SSH activity pack

Orchestration provides an activity pack of SSH activities that were customized using the ServiceNow activity designer.

These activities perform the same functions as SSH activities by the same name from previous releases and replace those activities for all new workflows. The custom SSH activities were built with the Create an SSH activity, which gives workflow administrators the ability to store input and output variables in the databus.

**Note:** Existing workflows from earlier versions that were created with legacy SSH activities continue to function normally after an upgrade to Geneva. However, all new workflows must use these custom SSH activities.

To use the SSH custom activities, you must request activation of the Orchestration - SSH plugin.
Secure Copy activity

The Secure Copy activity copies a file from one host to another, without storing the copied file on the MID Server.

This activity replaces an SSH activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity designer template, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Secure Copy input variables

<table>
<thead>
<tr>
<th>Input variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>from_host</td>
<td>Host name or IP address of the source machine.</td>
</tr>
<tr>
<td>from_scp_file</td>
<td>Name of the file to copy, including the absolute path.</td>
</tr>
<tr>
<td>to_host</td>
<td>Host name or IP address of the target machine.</td>
</tr>
<tr>
<td>to_scp_file</td>
<td>Path to the target file. This path can be absolute or relative to the logged in user's home directory.</td>
</tr>
<tr>
<td>debug_mid</td>
<td>Check box that enables debug logging when selected.</td>
</tr>
<tr>
<td>debug_ssh</td>
<td>Check box that enables J2SSH debug logging when selected.</td>
</tr>
</tbody>
</table>

Output variables

</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully copied the file from one host to another.</td>
</tr>
</tbody>
</table>
Files Compare activity

The Files Compare activity compares two files on a Linux or UNIX computer.

This activity replaces an SSH activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity designer template, which gives workflow administrators the ability to store input and output variables in the databus.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Global > Orchestration - SSH.

Input variables

Files Compare input variables

<table>

</tbody>
</table>

File Write activity

The File Write activity writes a file on a Linux or UNIX computer.

The source file can be an absolute or relative path from the Directory. If an absolute path is used, then no value is required in the Directory field.

This activity replaces an SSH activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Reset Linux User Password activity

The Reset Linux User Password activity resets the password for a given user on a Linux computer. This activity requires that the user executing the command be able to run the `chpasswd` command and, if expiring the password immediately, to run `chage` with `sudo privileges`. This activity replaces an SSH activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully changed specified user's password</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to change specified user's password.</td>
</tr>
</tbody>
</table>

Global activities

Global activities are Orchestration activities created in the global scope.

Any activities you create in the global scope are listed in the Global category in the Packs and Custom tabs of the Workflow Editor.
The Test Server Alive activity determines if a target system is alive by its response to a particular protocol.

This activity replaces an activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will
continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the Probe activity template, which gives workflow administrators the ability to store input and output variables in the databus.

**Input variables**

**Test Server Alive input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>port_probes</td>
<td>A comma separated list of protocols to use to check for signs of activity on the target machine (example: wmi,wins,https,ssh,http,https,snmp,dns)</td>
</tr>
<tr>
<td>hostname</td>
<td>Hostname or IP address of the target system to check.</td>
</tr>
</tbody>
</table>

**Output variables**

**Test Server Alive output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alive</td>
<td>Code that indicates whether or not the server is alive. If any value but '1' is returned, the server is not alive.</td>
</tr>
</tbody>
</table>

**Conditions**

**Test Server Alive conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity determined that the device is running.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to determine if the target device is running. Failure could be caused by a missing protocol or a device that is not accessible.</td>
</tr>
</tbody>
</table>

**Orchestration activity designer**

The Orchestration activity designer enables a user with either the workflow_admin or activity_creator and workflow_creator roles to construct reusable activities that suit an organization's business needs.

Activities created by the activity designer offer the following advantages over core activities offered in previous releases:

- Reuse custom activities in multiple workflows.
- Upload and download custom activities from the ServiceNow Store.
- Parse data from standard input formats.
- Test input variables against a target host or endpoint and inspect the payload.
- Automatically map values from a test payload to an activity's output variables.
- Share data between activities.
- View previous versions of an activity.

Access to the activity designer requires activation of ServiceNow Orchestration. For instructions about managing transitions and conditions for all activities, see Workflow activities.

Orchestration provides numerous pre-defined activities, which are reusable components that can be used in numerous workflows without having to understand the complexities of the underlying system. These activities are grouped into activity packs, which address specific business needs, such as: Active Directory, Azure AD, Exchange, Infoblox DDI, and PowerShell. There are other ServiceNow applications which provide and maintain their own separate activity packs, such as Security Incident Response, Cloud Management, or Release Automation.

Customers can also build their own activities and activity packs. You can construct custom activities with a specified template through the Orchestration Activity Designer. Custom-built activities built with the Activity Designer are referred to as activity elements. Activity elements provide optimal operations, enable code reuse, and minimize the need to write code. They also enable you to follow the flow of data within a given workflow across orchestration activities.

Incorporating activity elements limits the dependency on the scratchpad which reduces problems in complex workflows. Limit the use of core activities, like ‘Run Script’, unless you need direct access the scratchpad, for example, for a counter. Activity elements do not have direct access to the scratchpad. You can, however, pass scratchpad variables as inputs into your activities.

Orchestration activities created by the activity designer:
- Can be uploaded and shared in the ServiceNow App Store
- Use the databus, which allows the activity to have well-defined inputs and outputs
- Share data across activities within a workflow
- Use versioning
- Provide a consistent approach for activity development regardless protocol

Note: Prior to the Fujirelease, activities were built with Activity Definitions. In Fuji, a new architecture was introduced using the Activity Designer. Orchestration Core activities, built originally as Activity Definitions, have been converted to use the new template format (Activity Elements) and the databus offered with the activity designer. Workflows in upgraded instances that use legacy activities continue to work normally.

For instructions on using activities to construct a workflow, see Add an activity to a workflow.

Introduction to credentials, connections, and aliases for Orchestration

All application integrations in Orchestration require connection information, credentials, and connection and credential aliases to their respective applications to access resources.

Before you can execute an application integration in Orchestration, you must create and configure the corresponding connection information and credentials. The Connections pertains to an integration with a system, such as an IP address or endpoint with protocols. It contains specific details, such as database particulars, when integrating with a database. The associated Credentials are the authentication data required to make the connection.

Connection information and credentials can vary between QA/Development/Production environments for the same integration. The tight coupling between this data and application metadata, such as workflow or job scheduling, make application metadata obsolete when you change environments. To alleviate this problem, the concept of an alias is introduced, for connections and credentials, to decouple this data from application metadata. These aliases

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
allow customers to design their application metadata to couple to an alias, which during runtime resolves to connection and credential data.

There are two types of aliases, a connection and credential alias and a credential alias. There are business rules that enforce certain constraints on these aliases. Names should contain alphabets, numbers, and underscores but cannot have special characters. The alias must be unique in a scope. If you choose to have multiple active connections, you can have more than one active connection in the same domain. If you do not choose this option, you can have only one active connection in per domain.

**Note:** If you enable multiple active connections, when the connection records resolve, your application picks one connection based on an established order. The order of the connections depends on the API you use to retrieve connection data.

You can add additional connection attributes to an alias, which are available in connection data during run time. Variables overridden by connection administration during run time should not affect the alias.

The credential alias resolves only credential data. Along with alias data model, you can use a scriptable API which can get connection and credential data during runtime.

**Using Connection and Credential Alias with Orchestration**

Define an alias to label a credential or connection record.

The Credential and Connection Alias defines an alias that labels a credential or connection record. It is extended from the sys_metadata table. It requires the admin role. The credential_admin and connection_admin have read access to sys_alias. A connection alias contains:

- **Name**
  Name of the alias.

- **ID**
  This field is based on the format ‘scope name.alias name’ Unique index on ID to ensure unique record based on scope name + name. If the scope is global, the ID is the alias name.

- **Type**
  You can select either 'Credential' or 'Connection and Credential'. The default is Connection and Credential.

- **Connection type**
  This field is applicable when the alias type is set to Connection and Credential. There are three connection types: HTTP, JDBC, JMS. The default is HTTP.

  If you create a workday alias in global scope, the ID is set to workday
  If you create a workday alias in hr app scope, the ID is set to x_hr_app.workday
  - Name can only contain alphabets, numbers and underscore.
  - During the upgrade, the tag in credential record will be migrated to connection alias. If the tag in previous release’s credential record contains special characters other than alphabets, numbers and underscore, the tag data will be preserved during the upgrade. The user still can use these connection alias, but the user cannot update these alias, unless he removes these special characters when do the update.
Using credentials with Orchestration

Orchestration requires credentials to access resources.

Credential table

The credential table (discovery_credential) defines credentials that can be used for integration. In the previous release, the Credential table contains a string-type tag field, which labels a credential and the tag is used in orchestration activities. In the Kingston release, we rename tag to credential alias, and change the type from string to GlideList, which is a reference to connection alias table.

Credential types

The following credential types are provided:

<table>
<thead>
<tr>
<th>Credential type</th>
<th>Description</th>
<th>Supports Test Credential option</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applicative credentials</td>
<td>The credentials to explore the applications on a device or computer. Discovery patterns used by Discovery and Service Mapping often need applicative credentials.</td>
<td>No</td>
</tr>
<tr>
<td>AWS credentials</td>
<td>The Amazon Web Services (AWS) master account, access key ID, and secret access key.</td>
<td>No</td>
</tr>
<tr>
<td>Azure credentials</td>
<td>The Azure service principals required for an Azure subscription.</td>
<td>No</td>
</tr>
<tr>
<td>Basic authentication credentials</td>
<td>A user name and password.</td>
<td>No</td>
</tr>
<tr>
<td>CIM credentials</td>
<td>The user name and password required to access a CIMOM - Common Information Model Object Manager (CIM) server, which obtains information about VMware ESX servers.</td>
<td>No</td>
</tr>
<tr>
<td>Cloud credentials</td>
<td>Credentials that Orchestration uses to access cloud resources.</td>
<td>No</td>
</tr>
<tr>
<td>JDBC credentials</td>
<td>A user name and password to access a Java Database Connectivity (JDBC) connection.</td>
<td>Yes</td>
</tr>
<tr>
<td>JMS credentials</td>
<td>A user name and password to access to a Java Message Service (JMS).</td>
<td>Yes</td>
</tr>
<tr>
<td>OAuth 2.0 credentials</td>
<td>OAuth 2.0 credentials enable ServiceNow to obtain access to user accounts on an HTTP service.</td>
<td></td>
</tr>
<tr>
<td>SNMP community credentials</td>
<td>The community string to access devices via SNMP.</td>
<td>Yes</td>
</tr>
<tr>
<td>SNMPv3 credentials</td>
<td>The user name and keys required to access devices on your SNMP v3 network.</td>
<td>Yes</td>
</tr>
<tr>
<td>SSH credentials</td>
<td>The user name and password to access Linux and Unix devices.</td>
<td>Yes</td>
</tr>
<tr>
<td>Credential type</td>
<td>Description</td>
<td>Supports Test Credential option</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------------------------------</td>
</tr>
<tr>
<td><strong>SSH private key</strong></td>
<td>The private key credentials to access Linux and Unix devices.                                                                ---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>Yes</td>
</tr>
<tr>
<td><strong>credentials</strong></td>
<td>SSH private key credentials are recommended over SSH password credentials for security reasons.</td>
<td></td>
</tr>
<tr>
<td><strong>VMware</strong> credentials</td>
<td>Credentials to access vCenter resources. These credentials are required for any work that is performed on vCenter, such as cloning a virtual machine.</td>
<td>Yes</td>
</tr>
<tr>
<td><strong>Windows</strong> credentials</td>
<td>The user name and password required to access Windows computers. Several <strong>requirements</strong> must be satisfied to use Windows credentials.</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**How MID Servers use credentials**

By default, Windows MID Servers use the login credentials of the MID Server service on the host machine to discover Windows devices in the network. You should **configure these service credentials** so that they have domain or local administrator privileges. For Linux and UNIX machines and network devices, the MID Server uses the SSH and SNMP credentials configured in the instance in **Discovery > Credentials**.

MID Servers that Orchestration uses must have access to the necessary credentials to execute commands on computers in the network as specified by the **Workflow activities**. Orchestration can use the same SSH and SNMP credentials as Discovery, but has two additional credentials designed for specific Workflow activities: Windows (for **PowerShell**) and VMware.

**Encryption and decryption**

The platform stores credentials in an encrypted field on the Credentials (discovery_credentials) table. Once they are entered, they cannot be viewed.

When credentials are requested by the MID Server, the platform decrypts the credentials using the following process:

1. The credentials are decrypted on the instance with the password2 fixed key.
2. The credentials are re-encrypted on the instance with the MID Server's public key.
3. The credentials are encrypted on the load balancer with SSL.
4. The credentials are decrypted on the MID Server with SSL.
5. The credentials are decrypted on the MID Server with the MID Server's private key.

**Note:** The platform does not have separate encryption keys for multi-tenant instances.

**Credential order**

Credentials can be assigned an order value in the **Credentials Form**, which forces the application to try all the credentials at their disposal in a certain sequence. If you do not specify an order value, the application tries the credentials in the Credentials (discovery_credentials) table.
randomly, until it finds one that works, such as when Orchestration attempts to run a command on an SSH server (such as a Linux or UNIX machine), or when Discovery attempts to query an SNMP device (such as a printer, router, or UPS).

After identifying the credentials for a device, Discovery and Orchestration create an affinity between the credentials and the device using the Credential Affinity [dscy_credentials_affinity] table. All subsequent discoveries or Orchestration activities attempt to match the credentials in this table with a device for which an affinity exists. If credentials for a device change, Discovery and Orchestration try all available credentials again until they create a new affinity.

**Note:** If Orchestration and Discovery are installed, and credential alias is enabled, multiple affinities can exist. In this case, the platform looks up credentials for each affinity and inserts the credential for the affinity with the lowest order into the probe.

Ordering credentials is useful in the following situations:

- The credentials table contains many credentials, with some used more frequently than others. For example, if the table contains 150 SSH credentials, and 5 of those are used to log into 90% of the devices, it is good practice to configure those five with low order numbers, which places them at the top of the execution list. Discovery and Orchestration will work faster if they try these common credentials first. After the first successful connection, the system knows which credentials to use the next time for each device.
- The system has aggressive login security. For example, if the Solaris database servers in the network only allow three failed login attempts before they lock out the MID Server, configure the database credentials with a low order value.

**Credential alias**

Credential alias allows flow and workflow creators to:

- Assign individual credentials to any activity in an Orchestration workflow
- Assign individual credentials to any action in Flow Designer
- Assign different credentials to each occurrence of the same activity type in an Orchestration workflow.
- Assign different credentials to each occurrence of the same action in designer flow.

Credential alias also works with credential affinities.

**External credential stores**

If you do not want credentials stored in your instance, you can use external credential repositories. External credential stores save the credentials in an external site that your instance can access. Only CyberArk is supported.

**Connections with Orchestration**

Use the connections table to setup a JMS, JDBC, or HTTP(s) connection to a target host.

**Connection Table**

The Connection table (sys_connection) is the base table for all connection tables. You can setup connections for the following protocols:
- JDBC
- JMS
- HTTP(s)

The connection table references the connection alias table, which couples the connection alias to connection information. Every connection records the following information:

**Base connection properties**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the connection. This field must be unique on the table.</td>
</tr>
<tr>
<td>Credential</td>
<td>Specify the credential to use with this connection. This is optional.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>The connection alias resolves your connection and credentials at run time. Only one connection is active per Connection alias at any one time.</td>
</tr>
<tr>
<td>Active</td>
<td>Check to make the current connection active.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain to which the connection belongs.</td>
</tr>
</tbody>
</table>

Credential is unique across active connections, if not empty

**Upgrading connection information**

The JDBC connection (jdbc_connection) and JMS connection (orch_jms_ds) tables are existing Orchestration connection tables. In Kingston, we re-parent them to extend from Connection (sys_connection) table. They move from Orchestration run time plugins to Credentials & Connections plugins. They are originally extended from sys_metadata. The sys_metadata related data will be removed. JDBC field name changes:

- JDBC server is renamed to host
- Database port is renamed to port

**Create custom activities using custom activity designer templates**

You can create and update different types of custom activities in the Workflow Editor using a custom template.

Roles required: workflow_admin or activity_creator

The Activity Designer contains common steps which are applicable to all the activities that you create. This procedure guides you through the common steps and the order they should be set up. You specify an activity template before you create a custom activity.

1. Navigate to Orchestration > Workflow Editor.
   The Welcome tab of the Workflow Editor opens.
2. On the Custom tab in the palette, click + to create a new activity select the appropriate template from the list.
The Activity Designer form appears, with a stage indicator at the top. All new activities start at the **General** stage. The current stage shows with a blue underscore.

3. **Add the general properties.**
   This information is standard for each custom activity, include a name, description, and other related information.

4. **Create the template Create input variables for the template.**
   Create the variables to pass into the activity in the Inputs form of the activity designer.

5. **Optional: Add a pre-processing script.**
   For input validation or transforming input data, you might need a pre-processing script.

   **Note:** This step is not included in the Run Script activity.
6. Click Continue to open the Execution Command form, then fill out the Execution Command step based on the corresponding execution templates:
   - Create a SOAP web service activity
   - Create a JDBC activity
   - Create a JavaScript Probe activity
   - Create a PowerShell activity
   - Create a REST web service activity
   - Create a Probe activity
   - Create an SFTP activity
   - Create a Run Script activity
   - Create an SSH activity
   - Create a JMS activity

7. Optional: Test your inputs.

8. Optional: In the Outputs form, define local and/or output variables. Local variables can be used for temporary storage when cascading parsing rules. For example, you might extract an XML payload from within a JSON payload. A local variable can access the XML document and use that as a source for another parsing rule. The graphic shows a Local1 variable source to parse data for Output2.

9. Use one of the options to assign values to Outputs:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parsing rule</td>
<td>You can create a parsing rule and map them to the output fields by dragging and dropping the variables into the parsing rules structure. The REST, SOAP, and JDBC templates provide auto-mapping to create the parsing rules automatically. If available from the test inputs form, auto-mapping should be used when possible.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Post-processing</td>
<td>Post-processing scripts allow you to code your own output data validation, output parsing code, and related tasks. Post-processing executes after the execution command results have been returned and before the parsing rules and conditions are run. Click Go to Post-Processing (Advanced) to create a post-processing script. Note: If you create a script, this step reflects as a stage in the indicator.</td>
</tr>
</tbody>
</table>

10. Click **Continue** to open the **Conditions** form to create exit condition rules for your activity and then click **Save**.

**General properties for activity designer templates**

The following General Property fields are common to all activity designer templates.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Descriptive name of the activity. Select a unique name that makes the activity easily identifiable in the palette. If you do not name the activity, it is identified in the Data tab of the Workflow Editor with an index number when it is added to a workflow. This index reflects the order in which the custom activity was added to the workflow. Only custom activities and their output variables appear in the Data tab.</td>
</tr>
<tr>
<td><strong>Short description</strong></td>
<td>Brief description of what the activity does.</td>
</tr>
<tr>
<td><strong>Image</strong></td>
<td>Icon that identifies an activity of this type in the workflow palette.</td>
</tr>
<tr>
<td><strong>Execution template</strong></td>
<td>Predefined template selected for this activity.</td>
</tr>
<tr>
<td><strong>Application</strong></td>
<td>Current scope set on the instance. To view the scope, click the gear icon on the right side of the title bar in any record or list and look at the value in the Application field. The activity runs in this scope within a workflow. You cannot view or change the scope for the instance in the Workflow Editor.</td>
</tr>
<tr>
<td><strong>Accessible from</strong></td>
<td>Accessibility setting for this activity, by scope. The following options are available:</td>
</tr>
<tr>
<td></td>
<td>- All application scopes: This activity is available to all application scopes.</td>
</tr>
<tr>
<td></td>
<td>- This application scope only: Use of this activity is restricted to the scope named in the Application field.</td>
</tr>
<tr>
<td><strong>Category</strong></td>
<td>Category for this activity in the Custom and Packs tabs. All categories are listed under their scope in the collapsible hierarchy.</td>
</tr>
</tbody>
</table>
Create input variables

Create the variables to pass into the activity in the **Inputs** form of the activity designer.

You must name your activity in the **General** form before you can advance to the **Inputs** stage.

Roles required: workflow_admin or activity_creator

**Note:** Variable strings in the **Inputs** form have a 255 character limit.

1. Click the + icon to create a new input variable.

   The designer creates a default variable called **Input1**.

2. Type your new variable name in the field.

3. To change the name of a variable or any of its attributes, double-click the value and then select or enter a new value in the field that appears.

4. Configure your variable using these fields:
Variable configuration

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Data type for this variable. Double-click on the field to display the choice list. In addition to the usual data types, you can create input arrays and encrypt individual variables that contain sensitive data. Encrypted variables are passed to the ECC Queue and then decrypted by the MID Server when they run on the target host. Sensitive data returned from running these variables on the host can then be passed to another activity through encrypted output variables.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Marks an input variable as mandatory. Variables marked as mandatory are required fields in the properties form for the activity in the workflow. The input testing feature allows you to filter on mandatory variables.</td>
</tr>
<tr>
<td>Default</td>
<td>Default value for this input variable. Default values are prepopulated for variables in the properties form for the activity in the workflow. You can override this value when you test the variables.</td>
</tr>
</tbody>
</table>

5. To reorder the variable list, select a row and then drag the row to its new location.
   When you select a row to move it, the pointer icon changes to an up/down arrow icon.

6. To delete a variable, click the delete icon in the row.

7. Click **Continue** to advance to the **Execution Command** stage or click **Go to Pre-Processing (Advanced)** to create a script that runs before the activity executes.

**Map an input variable**
After you create the input variables, map them to the fields in the Execution Command form.

Role required: activity_admin, activity_creator

These fields contain values required by the target host or endpoint to authenticate and query for data. Included in this example are fields for a command to run on the target and the MID Server to use, if one is required.

- To map a variable, drag it into the appropriate field.
- The designer automatically expresses the variable in the syntax the system requires.
Configure the PowerShell execution command
Use the input variables you created to configure the command that Orchestration executes on the Windows target machine.

Create the input variables you need in the **Inputs** form before you can advance to the **Execution Command** stage.

Role required: activity_creator, admin

**Note:** You can test the PowerShell connection between the MID Server and the target computer without having to run the activity in a workflow context. For details, see [test template outputs](#).

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
PowerShell execution command

2. Complete the fields shown in the table.

**Powershell command fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. Create variables to map to available fields.</td>
</tr>
<tr>
<td>Target host</td>
<td>Host name or IP address of the target server for this PowerShell activity.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
Script type | Type of script to run on the PowerShell host. Available options are:
- Custom Powershell command
- MID Server script file

MID Server script file | MID Server script file to run. This field is available when the **Script type** selected is MID Server script file.

Command | Command that this activity runs on the target host. This field is available when the **Script type** selected is Custom Powershell command. You can drag and drop input variables from the variable builder into this field to create your command.

Powershell variables | Name-value pairs to pass to the host with Powershell. You can create these variables manually, or drag input variables into the Value field. Encrypted input variables retain their encryption, regardless of the data type settings in this field. If you type in a value and select the **Encrypted** data type, your value appears in plain text in this field and is only encrypted when it passes to the ECC Queue.

Use MID service account | Forces this activity to authenticate on the target host using the credentials of the MID Server service account only, without trying any other credentials. When this check box is selected, the **Credential tag** field is not available.

Credential tag | Specific **credential tag** this activity must use to run Powershell commands on the host. If this field is left blank, the MID Server tries all the available credentials until it finds a valid one, ending with the MID Server service account. If a credential tag is defined, the MID Server tries the credentials for that tag only and does not try the MID Server service account. This field is not available when the **Use MID service account** check box is selected.

Required MID Server capabilities | MID Server to use for querying Powershell, by capabilities. By default, the system selects a Powershell MID Server.

3. Click **Save**.
4. Click **Continue** to advance to the **Outputs** stage.

**Test activity template inputs**
You can test the input parameters of a custom activity during its development without having to run the activity in a workflow context.

Create input variables and map them to fields in the **Execution Command** form or provide actual values for these fields.

Role required: web_service_admin, activity_admin, activity_creator
An input test executes only the input parameters against an endpoint and not the pre-processing or post-processing scripts. You need to use a workflow to test a pre-processing or post-processing script. You do not need to check out the activity to test it, and you can test input variables from any stage in the activity designer, if your activity is properly configured. Typically, the **Execution Command** stage is the point at which your inputs are ready for testing.

**Note:** If you intend to use auto-mapping, you must test your input variables.

1. Click **Test Inputs**.

   The list of input source variables appears. If you added default values for these variables, those values appear in the **Substitute Value** column. Mandatory variables are marked with a red star. In this example, a SOAP endpoint returns a value for a stock quote variable.

2. Filter the variable list with these controls:
   - **All Inputs**: Displays all input variables. This is the default view.
   - **Mandatory Inputs**: Displays only mandatory input variables.
   - **Inputs Without Defaults**: Shows input variables that do not have assigned default values.

3. Reset values as needed.
   - **Reset default values**: Replaces any test values set in this form with the default values, if they are present.
   - **Clear values**: Clears all values in the input variable list, even if default values exist.

4. When your test values are configured correctly, click **OK**.

   The system runs the values for all the inputs configured against the specified target and returns the resulting payload. The buttons in the Response form display different views of the payload. The entire payload appears in the **Raw Output** window.
5. To map appropriate parameter values in the payload to variables in the Outputs stage automatically, select an **auto-mapping option**.

6. Alternately, you can click **Save for parsing rules** to copy the entire payload to the parsing rules.
This allows you to manually select values for the output variables directly from the payload. This action completely overwrites any previous payload that existed in the parsing rules.

7. Click the X in the upper right corner of the window to close it.

**Data encryption for activity variables**

You can protect sensitive data passed from Orchestration activities by encrypting input and output variables.

The system never stores encrypted variables as clear text. If the MID Server is used to fulfill the activity, the corresponding ECC Queue’s input payload is encrypted if an **encrypted output variable** is defined in the template. Output variables passed to a downstream activity as input variables maintain their encryption throughout processing.

Inputs that require data encryption come from one of these sources:

- **Workflows**: These inputs are provided through the Workflow Editor and must be in the password2 format for two-way encryption.
- **Service catalog requests**: These input values are provided to an activity as encrypted variables from a service catalog item.
- **GlideRecord**: These are variables attached to any ServiceNow table. The source column in the table must be a password2 type variable.
- **Activity outputs**: These are variables passed as outputs from one activity to a downstream activity as inputs, through the data bus.
- **Empty string**: The system allows you to define encrypted input variables but never pass a value into the variable.

**Activity designer template pre-processing fields**

Use the Pre Processing form of the activity designer to define a script to run before the activity executes..

**Pre-processing fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input process script</td>
<td>Script to run before the activity executes.</td>
</tr>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the input process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution parameters and input variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the pre-processing script with this syntax: activityInput.variable. Before the activity executes and makes a call to the service or host, you can override the effective execution value of this variable by assigning values to the executionParam.variable_name execution parameter. Refer to the specific execution parameters for your template.</td>
</tr>
</tbody>
</table>
Logging

Activity designers can add logging to the pre-processing using the `ActivityLogger` API, which works for scoped or global applications. Logged data from the script appears in the **Workflow Log** related list in the context records for any workflow that uses the activity. The **Source** for these messages in the workflow log is **ACTIVITY**.

![Important: To display the debug messages in the workflow log, set the glide.workflow.log.debug property to true.]

The supported messages are:

- `ActivityLogger.debug("Pre Processing Log Message");`
- `ActivityLogger.info("Pre Processing Log Message");`
- `ActivityLogger.warn("Pre Processing Log Message");`
- `ActivityLogger.error("Pre Processing Log Message");`

**ActivityLogger API**

**Template post-processing fields**

From the **Post Processing** form in the activity designer you can define a script to run after the activity executes.

**Post-processing fields**

To use the results returned by the activity, append the `executionResult.` prefix to these parameters.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output process script</td>
<td>Script to run after the activity executes.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the output process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution results and the variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the post-processing script with this syntax: <code>activityInput.variable</code>. For parameter descriptions, refer to the table in the post-processing parameters topic for this activity.</td>
</tr>
</tbody>
</table>

### Logging

Activity designers can add logging to the post-processing script using the `ActivityLogger` API, which works for scoped or global applications. Logged data from the script appears in the Workflow Log related list in the context records for any workflow that uses the activity. The Source for these messages in the workflow log is `ACTIVITY`.

**Important:** To display the debug messages in the workflow log, set the `glide.workflow.log.debug` property to `true`.

The supported messages are:

- `ActivityLogger.debug("Post Processing Log Message");`
- `ActivityLogger.info ("Post Processing Log Message");`
- `ActivityLogger.warn ("Post Processing Log Message");`
- `ActivityLogger.error("Post Processing Log Message");`
Auto-map activity output variables

You can map parameter values in a test payload to variables in the Outputs tab automatically.

Role required: admin

1. From the Execution Command in the template, select the Inputs tab.
2. Click Test Inputs to test the input parameters.
   - If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.
3. Provide test values, if requested, and click OK to display the payload.
   - The entire payload appears in the Raw Output tab of the Response form.

4. Select an auto-mapping option:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Auto-Map to Local</td>
<td>Translates the entire payload into a JSON object and places it in the data bus. This allows for post-processing manipulation in JavaScript. This selection causes the entire data field on the right to disappear and the inputs structure to be auto-populated with these default variables: output, totalRows, errorMessage, eccSysId</td>
</tr>
<tr>
<td>Auto-Map to Output</td>
<td>Automatically populates the output variables in the activity with the same default variables used as inputs for the local variable.</td>
</tr>
</tbody>
</table>

Note: No parsing rules are available with auto-mapping selections.

Create an output variable

The Outputs form in the designer contains a variable builder for creating data structures of objects and arrays.

Roles required: activity_admin, activity_creator
Elements in this structure are mapped with Create a parsing rule to specific data contained in payloads returned from an endpoint or host. These variables and their values are then made available locally or for reuse in other activities.

1. Click the + icon in the Outputs column to create a local or output variable.

   Local variables are only available within an activity and are not visible in the data structures displayed in the Custom tab. Output variables are available for reuse in other activities, either individually or as an entire data structure. When you create a new variable of either type, the designer provides a default name of Local1 or Output1.

2. Type your new variable name in the field and select a data type.

   Variable names must be unique within an array or an object. You can assign a data type of Encrypted to output variables that contain sensitive data. Data protected by encryption is passed to other activities or processes encrypted and is never displayed in plain text.

3. To change the name of a variable or any of its attributes, double-click the value, type a new value in the editing field, and then press Enter.

   The icon to the left of the name reflects the data type of the variable.

4. To reorder the variable list, select a row and then drag the row to its new location.

   When you select a row to move it, the pointer icon changes to an up/down arrow icon.

5. Drag and drop the row into another location.

6. To reuse a variable from another activity, drag it from the Custom tab in the palette and drop it onto the Local or Output heading at the top of the variable list. To copy an entire data structure, drag the parent object or array into the variable list header.

   The designer duplicates the copied data structure in the outputs variable builder.
Reuse of data structures

7. To delete a variable, click the delete icon (−) in the row.

Activity designer template outputs
Output variables contain messages returned from a destination that are available to other activities in a workflow or internally to the activity.

Activity designer output fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable name</td>
<td>Name of a variable, either Local or Output, that this activity passes.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Local</td>
<td>Variable that contains a value used within an activity. For example, use a local variable to identify metadata that is processed within an activity before the final value is exported to an output variable.</td>
</tr>
<tr>
<td>Output</td>
<td>Variable that contains a value that is passed to other activities in the workflow.</td>
</tr>
</tbody>
</table>

**Map an output field**

Mapping is configured with parsing rules that allow you to build expressions in the appropriate data format for the selected payload.

Role required: activity_admin, activity_creator

When you are finished creating the output data structure, map each variable to the specific data you want to extract from the target host.

To map a variable, drag it from the Outputs variable builder and drop it into an empty **Variable name** field in the Parsing rules section.

See [create a parsing rule](#) for instructions on configuring parsing for output variables.
Create a parsing rule

Populate output variables defined in a custom activity with payload data returned from an inputs test on an external host or endpoint.

Roles required: activity_admin, activity_creator

1. Navigate to Workflow > Workflow Editor.
2. From the Custom tab in the palette, open a custom activity.
3. In the Activity Designer form, advance to the Output stage.
4. Drag an output variable from the data structure builder into the Variable name field in the Parsing rules builder.
Mapping variables to parsing rules

The parsing rules form appears for the selected variable. By default, the parsing type is set to **Direct**, which populates the variable with all the data from the selected payload, without parsing the contents. Each template has a specific default parsing source.

5. Complete the form using the fields in the table.

In this example, the parsing type selected is **XML**, which allows you to select specific parameters from the payload to parse.
# Parsing rules fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parsing source</td>
<td>Source of the data returned from the target host or endpoint. Each template opens to a specific, default payload. Available choices depend on the execution template selected for the activity. You can also use local variables as a parsing source if a parsing rule has previously been defined for them. For a list of the available payloads for each template, see <a href="#">Activity designer parsing sources</a>.</td>
</tr>
<tr>
<td>Expression</td>
<td>Expression used to extract specific data from the selected parsing source. This expression is created from clickable data in the sample payload and appears in the format selected in the Parsing type field. When testing, the expression can return multiple results. Discern which choice gives reliable or predictable results before choosing your expression.</td>
</tr>
<tr>
<td>Variable name</td>
<td>Revised variable name as it is used in the final output expression. The system adds the <code>activityOutput</code> or <code>activityLocal</code> prefix to the variable you specify.</td>
</tr>
</tbody>
</table>
| Parsing type           | The language to use for querying the target host’s payload. The selections are:  
  - Direct: Maps to the entire content of the payload selected in the Parsing source field, without any parsing. This is the default parsing type.  
  - XML: XPath query used for selecting nodes from an XML payload.  
  - JSON: JSONPath query for selecting parts of a JSON payload.  
  - RegEx: Parsing method that uses a regular expression to extract data from a payload. The RegEx parsing type does not support multi-line parsing and is not case sensitive.  |
| Short description      | Brief description of this parsing rule.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Sample payload data    | Sample data from the source containing the data requested. This field is not available for Direct parsing types. After you click Parse sample data, the data in this field cannot be edited, but becomes clickable for the purpose of creating expressions. Click Edit sample data to make the field editable again.                                                                                               |
6. To retest the inputs, click **Get sample payload from test**. This action reopens the test form, allowing you to substitute different test values and create a different payload.

7. Click **Save** to have the parsing rules overwrite the previous payload with the one you just created.

8. To create an expression for the parsing rule, click the specific parameter you want to see in the sample payload. The value for that parameter appears in the **Parsing result** field, and the system creates the appropriate expression in the **Expression** field.

9. Click **Submit** to save the parsing rule for that variable.

**Activity designer parsing sources**

This table lists the parsing sources available with each execution template.

<table>
<thead>
<tr>
<th>Template</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAP Web Service</td>
<td>• executionResult.body (Default)</td>
</tr>
<tr>
<td></td>
<td>• executionResult.status_code</td>
</tr>
<tr>
<td></td>
<td>• executionResult.header</td>
</tr>
<tr>
<td></td>
<td>• executionResult.error</td>
</tr>
<tr>
<td>JDBC</td>
<td>• executionResult.output (Default)</td>
</tr>
<tr>
<td></td>
<td>• executionResult.errorMessages</td>
</tr>
<tr>
<td></td>
<td>• executionResult.probeCompletedEccId</td>
</tr>
<tr>
<td></td>
<td>• executionResult.totalRows</td>
</tr>
<tr>
<td>JavaScript Probe</td>
<td>• executionResult.payload (Default)</td>
</tr>
<tr>
<td></td>
<td>• executionResult.output</td>
</tr>
<tr>
<td></td>
<td>• executionResult.eccSysId</td>
</tr>
<tr>
<td></td>
<td>• executionResult.errorMessages</td>

<td>• executionResult.tags</td>
</tr>
<tr>
<td></td>
<td>• executionResult.hresult</td>
</tr>
<tr>
<td></td>
<td>• executionResult.eccSysId</td>
</tr>
<tr>
<td></td>
<td>• executionResult.errorMessages</td>
</tr>
<tr>
<td>REST Web Service</td>
<td>• executionResult.body (Default)</td>
</tr>
<tr>
<td></td>
<td>• executionResult.status_code</td>
</tr>
<tr>
<td></td>
<td>• executionResult.header</td>
</tr>
<tr>
<td></td>
<td>• executionResult.error</td>
</tr>
</tbody>
</table>
Activity designer parsing rule example

In this example, the parsing rule is configured to populate the activityOutput.ipv4 variable with the value for the IP address from a domain server, using PowerShell.

Role required: activity_creator, activity_admin

To generate the sample data, the administrator must actually run the command on the host and then paste the data returned into the Sample payload data field when creating the parsing rule.

The administrator can then create an expression that returns IP addresses from that sample in two formats: ipv4 and ipv6. In this example, the system produces two expressions to use for the parsing rule.

1. Navigate to Workflow > Workflow Editor and open the activity that runs on the host.
2. Click the Inputs tab, and note the Command.
### Parsing rule PowerShell inputs command

3. In a PowerShell console, run the **Command** on the host to extract the XML sample that contains the values you need.

4. Copy the data that is returned to the clipboard.

5. In the activity designer, click the **Outputs** tab and paste the returned data into the **Sample payload data** field.
   
   In this example, the data includes IP addresses in two different formats and the domain name.

6. Select the parsing type for the source. In this example, select **XML**.
7. Click **Parse sample data**.

The system displays the XML in the proper format, and it becomes clickable. In this view, the system can translate clicked data from the sample into an expression.
8. To create the expression, click the elements in the data sample you want to map to the variable.

Based on the sample data you clicked, the system creates two expressions.
9. Select an expression from the list.

The desired result is the IP address that has a **type** attribute of **ipv4**. The system populates the **Expression** field with this choice.
10. **Click Test expression.**

The system parses the payload using the selected expression and returns the requested data in the **Parsing result** field.
11. Click **Submit**.

The view returns to the Outputs tab of the activity designer. The new parsing rule is listed, and a blank row is available for another rule.
Activity conditions

Create the exit conditions for your activity in the **Condition** column and set the order for each.

The system evaluates the condition with the lowest order number first and stops when it finds the first true condition. The system delays evaluation of conditions with an **Else** value set to **true** until all conditions with an **Else** value set to **false** are evaluated. If the system does not find a true condition, it looks for a default condition in which the value for **Else** is **true** and takes this exit. You must have at least one default exit condition, or the activity hangs when the workflow runs.

The following are possible conditions you might create for an activity:

### Sample activity conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Evaluation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Tests for a success condition. <strong>Else</strong> is set to <strong>false</strong> and the <strong>Order</strong> is set to <strong>100</strong>. If this condition is true, the activity takes the <strong>Success</strong> exit. If this condition is false, the system evaluates the next condition in order.</td>
</tr>
<tr>
<td>Retry</td>
<td>Tests for a condition that runs the activity again. <strong>Else</strong> is set to <strong>false</strong>. If this condition is true, the activity runs again. If this condition is false, the system takes the default <strong>Failure</strong> exit.</td>
</tr>
<tr>
<td>Failure</td>
<td>Default condition that allows the workflow to continue if the other conditions in the activity are false. <strong>Else</strong> is set to <strong>true</strong>.</td>
</tr>
</tbody>
</table>
Orchestration custom activity templates

Orchestration provides customizable activity templates to create and manage custom activities in the Workflow Editor.

You create and update different types of Orchestration activities with the Activity Designer using activity templates for SSH, PowerShell, REST, SOAP, JMS, SFTP, JDBC, JavaScript Probes, and Probes. Hundreds of workflows can share these activities simultaneously. Before you change an activity, you should check the workflows that they are part of by clicking the form menu icon (��) and selecting Used In. Any central change to a versioned activity automatically updates across workflows unless you have pinned that activity.

All the Orchestration Core activities are built using the Activity Designer in scoped applications. Custom activities can be developed in the global scope or their own application scope even if that scope is different from the scope of the workflow. Use Activity scoping when build your own activity packs.

Create a JDBC activity

Create a custom JDBC activity to automate SQL commands and stored procedure calls to relational databases from workflow.

Role required: activity_admin, activity_creator

The JDBC activity template allows you to execute ANSI SQL statements or stored procedures on a target database. Support for stored procedures with IN, OUT, and INOUT parameters are available in Kingston. To learn how to set up these parameters, see JDBC stored procedure parameters.

Note: If you are transferring bulk data into a ServiceNow instance from an external data source, use Import sets. The JDBC activities allow you to transfer data between external
data sources and ServiceNow within a workflow. It is not intended to replace the bulk import features of data sources.

1. Create or verify your **JDBC credential**.
   Your JDBC credentials must have permission for the target database and proper configuration for the corresponding JDBC connection. Credentials must be set up before you can create a JDBC activity.

2. Create or verify your **JDBC connection**.
   Your JDBC connection must be configured with valid JDBC credentials set up before you can create a JDBC activity.

3. Create a **custom activity**.
   This action creates a custom activity using a template.

4. After setting up **general properties** and **creating input variables**, configure the JDBC Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>JDBC Connection</strong></td>
<td>Configure or reference the appropriate JDBC Connection for the database. The connection selected provides the activity with the following information:</td>
</tr>
<tr>
<td></td>
<td>• Target database information (server and database names)</td>
</tr>
<tr>
<td></td>
<td>• Connection URL</td>
</tr>
<tr>
<td></td>
<td>• Target database port (if different from standard port number)</td>
</tr>
<tr>
<td></td>
<td>• Database instance name</td>
</tr>
<tr>
<td><strong>Credential</strong></td>
<td>JDBC credential to use for your JDBC connection.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SQL statement</td>
<td>Input the ANSI SQL to execute on the JDBC target database.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is hidden when the Stored Procedure check box is selected.</td>
</tr>
<tr>
<td></td>
<td>You can map the input variables you created to configure the SQL statements. By default, you can run the following SQL statements.</td>
</tr>
<tr>
<td></td>
<td>· select</td>
</tr>
<tr>
<td></td>
<td>· insert</td>
</tr>
<tr>
<td></td>
<td>· update</td>
</tr>
<tr>
<td></td>
<td>· delete</td>
</tr>
<tr>
<td></td>
<td>· show</td>
</tr>
<tr>
<td></td>
<td>· create</td>
</tr>
<tr>
<td></td>
<td>· describe</td>
</tr>
<tr>
<td>Maximum rows</td>
<td>Maximum number of records to retrieve from database. The default is 1000.</td>
</tr>
<tr>
<td>Maximum payload size (KB)</td>
<td>You can set a limit on the maximum payload size of data retrieved from the database. The default is 64 kilobytes.</td>
</tr>
<tr>
<td>Connection timeout</td>
<td>How long the activity waits to make the connection. This field is populated automatically from the data source, but can be changed for this activity.</td>
</tr>
<tr>
<td>Query timeout</td>
<td>Elapsed time to wait after running the query until the data is returned. This field is populated automatically from the data source, but can be changed for this activity.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server to use for querying JDBC, by capabilities. By default, the system selects a MID Server that has JDBC capability.</td>
</tr>
<tr>
<td>Use stored procedure</td>
<td>If checked, you can run a stored procedure on MySQL, Oracle, or SQL Server databases by entering the procedure name and parameters. See JDBC stored procedure parameters.</td>
</tr>
</tbody>
</table>
You can map parameter values in a test payload to variables in the Outputs tab automatically. See automap output variables.

- Test JDBC activity inputs
- Use auto-mapping to generate outputs and parsing rules (recommended for JDBC)
- If you do not use auto-mapping, you can manually create output variables and create parsing rules.

Create a JDBC connection for an Orchestration activity

The JDBC Connection (jdbc_connection) table provides the information custom JDBC Orchestration activities use to connect to various target databases.

You must have an appropriate JAR file, whether it is supplied with the instance or a custom JAR file.

Note: The ServiceNow instance supplies mysql-connector-java-5.1.21.jar, sqlserver-jdbc-4.0.jar, and ojdbc6.jar files as part of the current release, which supports MySQL, SQLServer, and Oracle databases. Other databases, such as Sybase or DB2 Universal, must use a custom JAR file that must be uploaded to the instance before setting the JDBC connection.

Role required: activity_admin, activity_creator

JDBC credentials are retrieved separately by the activity designer template and support external credential storage, such as CyberArk.

1. Navigate to Orchestration > Credentials & Connections > JDBC Connections and click New.
2. Complete the form using the fields in the table.

The database selection in the Format field determines which fields are available.

<table>
<thead>
<tr>
<th>Field</th>
<th>Database Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>All</td>
<td>Unique name of this JDBC connection. For example, you might enter JDBC MySQLProd.</td>
</tr>
<tr>
<td>Query timeout</td>
<td>All</td>
<td>Maximum elapsed time the JDBC query is allowed to run without a response.</td>
</tr>
<tr>
<td>Connection timeout</td>
<td>All</td>
<td>Maximum elapsed time for the JDBC activity to wait while attempting to connect to the target database.</td>
</tr>
<tr>
<td>Application</td>
<td>All</td>
<td>Scope for this table. By default, the JDBC Connection (jdbc_connection) table runs in the Global scope.</td>
</tr>
<tr>
<td>Domain</td>
<td>All</td>
<td>Domain for this table. By default, the JDBC Connection (jdbc_connection) table runs in the global domain.</td>
</tr>
<tr>
<td>Field</td>
<td>Database Format</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Format           | All             | Database type for this connection. The default choices are:  
|                  |                 |   · MySQL  
|                  |                 |   · Oracle  
|                  |                 |   · SQLServer  
|                  |                 |   · None  
|                  |                 |   You can add **Sybase** or **DB2 Universal** to the choice list by uploading the appropriate JDBC driver JAR file to the instance. Orchestration automatically recognizes these drivers when they are loaded into the system and adds them to this list. |
| Server           | Oracle, MySQL, SQLServer | Host name or IP address of the database server. |
| Oracle sid       | Oracle          | The Oracle database site identifier. The default value is **orcl**. |
| Oracle port      | Oracle          | Port that the Oracle database is using. The default value is **1521**. |
| Database name    | MySQL, SQLServer | Name of the database. |
| Database port    | MySQL, SQLServer | Port that the selected database is using. |
| Instance name    | SQLServer       | Instance name for the selected SQLServer |
| Connection URL   | All             | URL that the MID Server uses to connect to the specified database. The URL is created automatically when you save the form, and is read-only for the default databases. |
|                  |                 |   **Note:** If the format selected is not one of the default databases, you must create the connection URL manually so that the MID Server knows how to create the connection. |
| JDBC driver      | None, DB2 Universal, Sybase | The JDBC driver to use for this connection when it is not a default database. |
|                  |                 |   **Note:** If you add a Sybase or DB2 Universal database, you must enter the driver name in this field and upload the driver JAR file to the instance. |
3. Click **Submit**.

**Auto-map JDBC activity output variables**
The ServiceNow activity designer allows you to map parameter values in a JDBC test payload to variables in the **Outputs** tab automatically.

Role required: **admin**

1. In the JDBC provider template form, select the **Inputs** tab.
2. Click **Test Activity** to test the input parameters.
   If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.
3. Provide test values, if requested, and click **OK** to display the payload.
   The entire payload appears in the **Raw Output** tab of the Response form.
4. Select one of these auto-mapping options.
   - **Auto-Map to Local**: Directly maps values to a local variable for use within the activity.
   - **Auto-Map to Output**: Directly maps values to the output variable to pass to other activities in the workflow. Auto-mapping to an output variable creates an array of objects, each of which contains the column names from the query result.

**JDBC stored procedure parameters**
You can use Orchestration to run a stored procedure on MySQL, Oracle DB, and MS-SQL databases.

There is support of multiple data types, with the following limitations:
- Only one result-set is returned.
- The order of input and output data types in the stored procedure parameters must match the activity definition.
- Binary, Blob, Varbinary, and LongBinary should be base64 encoded.
- Date, Time, and Timestamp have a specific format:
  - **Date format**: `yyyy-mm-dd`
    - `yyyy-mm-dd` is the supported format.
  - **Time format**: `hh:mm:ss[.sss]`
    - `hh:mm:ss[.sss]` is the supported format. Precision is in milliseconds only, microseconds or nanoseconds cannot be handled.

  **Note:** `10:30:59` and `10:30:59.999000` are correct but `10:30:59.` is incorrect.

  - **Timestamp format**: `yyyy-mm-dd hh:mm:ss[.ffffff]`
    - `yyyy-mm-dd hh:mm:ss[.ffffff]` is the supported format. Precision is to microseconds.

- ResultSet is the first result set coming back from database server.
- MS-SQL does not support INOUT parameters. If you use INOUT parameters, the Activity Template transparently maps them to OUT parameters.

  **Note:** If you do not want to do a validation of data types in stored procedure parameters, like the legacy behavior, you set the glide.stored_proc.data_type.validation as false. See **MID Server properties** for more information.
### Stored procedure parameters

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

<tr>
<td></td>
<td>• VARCHAR</td>
</tr>
<tr>
<td>Name/Value</td>
<td>Name-value pairs to pass to the host. You can create these parameters manually, or drag and drop input variables into the parameter fields and assign a value.</td>
</tr>
</tbody>
</table>

**Note:** Not all database providers support the entire realm of JDBC data types. Reference your database reference manual to understand the supported datatypes for your installation.
Test JDBC activity template inputs
You can test the input parameters of a custom JDBC activity during its development without having to run the activity in a workflow context.

Create input variables and map them to fields in the Execution Command form or provide actual values for these fields. Role required: web_service_admin, activity_admin, activity_creator

This test executes only the input parameters against an endpoint and not the pre-processing or post-processing scripts. It is not necessary to check out the activity to test it.

**Note:** If you provide enough information for Orchestration to contact the endpoint or host and return data, you can test the input variables. You can test from any stage in the activity designer. Typically, the Execution Command stage is the point at which your inputs are ready for testing.

1. From the JDBC Execution Command, click **Test Inputs**.
   The list of input source variables appears. If you added default values for these variables, those values appear in the **Substitute Value** column. Mandatory variables are marked with a red star.

   **Note:** The test fails if the MID Server cannot be found or if it cannot connect to the target.
2. Filter the variable list with these controls:
   - **All Inputs**: Displays all input variables. This control is the default view.
   - **Mandatory Inputs**: Displays only mandatory variables.
   - **Inputs Without Defaults**: Shows input variables that do not have assigned default values.

3. Reset values as needed.
   - **Reset default values**: If values are present, this control replaces any test values set in this form with the default values.
   - **Clear values**: Clears all values in the input variable list, even if default values exist.

4. When your test values are configured correctly, click **OK**.
   The system runs the values for all the inputs configured against the specified target and returns the resulting payload. The buttons in the Response form display different views of the payload. The entire payload appears in the **Raw Output** window.
To map appropriate parameter values in the payload to variables in the **Outputs** stage automatically, select an **auto-mapping option.**
7. Click the X in the upper right corner of the window to close it.

Create a SOAP web service activity

Use this template to create a custom SOAP activity.

Role required: web_service_admin, activity_admin, activity_creator

For instructions on using the activity template process flow, see create custom activities.

1. Create a custom activity.
   This action creates a custom activity using a template.

2. After setting up general properties and creating input variables, configure the SOAP web service Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Map the input variables</td>
<td>Use the variables you created to configure the command that Orchestration executes on the SOAP web service.</td>
</tr>
<tr>
<td>Web service message</td>
<td>Specify the SOAP web service message to use for this activity. If you need information on SOAP web services messages, see SOAP message.</td>
</tr>
<tr>
<td>Web service message function</td>
<td>Specify the SOAP message function available in conjunction with the SOAP web service.</td>
</tr>
<tr>
<td>Endpoint</td>
<td>If you enter an endpoint in this field, it overrides the endpoint URL configured in the SOAP message web service. Click the lock icon to open the input field and add the endpoint.</td>
</tr>
<tr>
<td>SOAP message parameters</td>
<td>Name-value pairs to pass to the SOAP endpoint. You can create these parameters manually, or drag input variables into the parameter fields and then assign a value. Parameters defined in the SOAP message that use ${ } can be assigned data from this activity template. Use the Additional attribute column to configure the system to not escape the text. By default, text sent to the SOAP message is escaped. The Name column is auto-populated if the users have provided variables using variable substitution in the SOAP message.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>Check box that determines if a MID Server must be used to invoke the SOAP web service. If the SOAP web service message function defines a MID Server, that MID Server is used instead of the one selected here.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server with the appropriate capabilities for connecting to the SOAP endpoint. By default, the system selects a MID Server with SOAP capabilities. This field is available when the Use MID Server check box is selected.</td>
</tr>
<tr>
<td>Timeout</td>
<td>Allowed duration of the SOAP web service request before it times out, in seconds. The default is 10.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Authentication</td>
<td>Determines what type of authentication is required for the endpoint. The options are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Use existing credentials in SOAP message</strong>: Uses credential definitions from the SOAP message definition.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Override with Basic Authentication credentials</strong>: Uses basic authentication credentials. Overrides the credentials in the SOAP message definition. Basic authentication credentials must be provisioned before they are available for selection.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Override with Certificate Authentication credentials</strong>: Overrides the credentials in the SOAP message definition with certificate authentication credentials.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Override with Both Basic and Certificate Authentication credentials</strong>: Overrides the credentials in the SOAP message definition with both basic authentication or certificate authentication credentials.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Override with WS-Security Username profile</strong>: Overrides the credentials in the SOAP message definition with credentials defined a WS Security Profile.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Credentials</td>
<td>Required REST endpoint basic authentication credentials. This field is available when <strong>Override with Basic Authentication credentials</strong> is selected in the <strong>Authentication</strong> field. Only basic authentication credentials appear in the selection list, which includes credentials stored on the instance and credential IDs from an external storage system. If you are using credentials stored in a CyberArk safe, you can override the <strong>default safe</strong> defined in the MID Server configuration file by adding the name of a different safe as a prefix to the credential ID, separated by a colon. For example, newsafe:orch-test-f5.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Protocol Profile</td>
<td><strong>Protocol profile</strong> to use for authentication. This field is available when the authentication type is either <strong>Override with Certificate Authentication credentials</strong> or <strong>Override with Both Basic and Certificate Authentication credentials</strong>.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Note:</td>
<td>You can map parameter values in a test payload to variables in the Outputs tab automatically. See <a href="#">automap output variables</a>.</td>
</tr>
</tbody>
</table>

- Use **auto-mapping** to generate outputs and parsing rules (recommended for JDBC)
- If you do not use auto-mapping, you can manually [create output variables](#) and [create parsing rules](#)

**Auto-map SOAP activity output variables**
The ServiceNow activity designer allows you to map parameter values in a SOAP test payload to variables in the Outputs stage automatically.
Role required: web_service_admin, activity_admin, activity_creator

Note: You can test input variables from any stage in the activity designer if you have provided enough information for Orchestration to contact the endpoint and return data. Typically, the Execution Command stage is the point at which your inputs are ready for testing.

1. In the activity designer, proceed to the Execution Command stage.
2. Define an appropriate MID Server, if requested.
   The test fails if the MID Server cannot be found or if it cannot connect to the target.
3. Click Test Activity to test the input parameters.
   If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.
4. Provide test values, if requested, and click OK to display the payload.
   The entire payload appears in the Raw Output tab of the Response form.

5. Select one of these auto-mapping options.
   - Auto-Map to Local: Directly maps values to a local variable for use within the activity.
   - Auto-Map to Output: Directly maps values to the output variable to pass to other activities in the workflow. Auto-mapping to an output variable creates an array of objects, each of which contains the column names from the query result.

Provide credentials to access a SOAP message WSDL
If the SOAP WSDL you are requesting in a test payload requires authentication, you must provide basic auth credentials in either the SOAP message or the SOAP activity.

Role required: web_service_admin, activity_admin, activity_creator

The ServiceNow instance only supports basic auth credentials for accessing a WSDL. If the SOAP function or the SOAP message does not provide these credentials, you must configure them in the SOAP activity template. Orchestration uses these priorities for deciding which basic authentication credentials to use:

- SOAP message: Credentials for a SOAP message are used if no other credentials are defined.
- SOAP function: Credentials for a SOAP function override the credentials configured for the SOAP message.
- SOAP activity template: Credentials for a SOAP activity template override both the SOAP function and SOAP message credentials.

1. Navigate to System Web Services > Outbound > SOAP Message.
2. Select the SOAP message you want the activity to use.
3. In the SOAP Message record, select the Download WSDL check box.
4. In the Authentication type field, select Basic.
   The Basic auth profile field appears.
5. Select the basic auth profile to use with this SOAP message.
Basic authentication for a SOAP message

6. Alternately, you can configure basic authentication credentials in *Configure the SOAP execution command.*
   a) In the **Authentication** field, select **Override with Basic Authentication credentials**.
The **Credentials** field appears.

b) Select the basic auth credentials to use to access the WSDL. This setting overrides any credentials configured in the SOAP message.

Configure the SOAP execution command

Use the input variables you created to configure the command that Orchestration executes on the SOAP endpoint.

Create the input variables you need in the **Inputs** form before you can advance to the **Execution Command** stage.
Role required: web_service_admin, activity_admin, activity_creator

**Note:** You can test the SOAP connection between the MID Server and the endpoint without having to run the activity in a workflow context. For details, see [test template outputs](#).

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
2. Complete the fields shown in the table.
### SOAP template execution command fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. <a href="https://service.objectivity.org/SP/924/962/962/index.html">Create input variables</a> to map to available fields.</td>
</tr>
<tr>
<td>Web service message</td>
<td><a href="https://service.objectivity.org/SP/924/962/962/index.html">SOAP message</a> to use for this activity. Users must have the web_service_admin role to configure this field.</td>
</tr>
<tr>
<td>Web service message function</td>
<td>SOAP message <a href="https://service.objectivity.org/SP/924/962/962/index.html">function</a> to use for this activity. Users must have the web_service_admin role to configure this field.</td>
</tr>
<tr>
<td>Endpoint</td>
<td>Endpoint URL for the SOAP web service this activity uses. Enter an endpoint in this field to override the endpoint configured in the SOAP message. Click the lock icon to open the input field.</td>
</tr>
<tr>
<td>SOAP message parameters</td>
<td>Name-value pairs to pass to the SOAP endpoint. You can create these parameters manually, or drag input variables into the parameter fields and then assign a value. Parameters defined in the SOAP message that use <code>${ }</code> can be assigned data from this activity template. Use the <a href="https://service.objectivity.org/SP/924/962/962/index.html">Additional attribute</a> column to configure the system to not escape the text. By default, text sent to the SOAP message is escaped. The Name column is auto-populated if the users have provided variables using <a href="https://service.objectivity.org/SP/924/962/962/index.html">variable substitution</a> in the SOAP message.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>Check box that determines if a MID Server must be used to invoke the SOAP web service.</td>
</tr>
<tr>
<td>Note:</td>
<td>If the SOAP web service message function defines a MID Server, that MID Server is used instead of the one selected here.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server with the appropriate <a href="https://service.objectivity.org/SP/924/962/962/index.html">capabilities</a> for connecting to the SOAP endpoint. By default, the system selects a MID Server with SOAP capabilities. This field is available when the <a href="https://service.objectivity.org/SP/924/962/962/index.html">Use MID Server</a> check box is selected.</td>
</tr>
<tr>
<td>Timeout</td>
<td>Allowed duration of the SOAP web service request before it times out, in seconds. The default is <strong>10</strong>.</td>
</tr>
</tbody>
</table>

Create a JavaScript array in a SOAP template

These are instructions for creating JavaScript arrays using SOAP execution parameters.

Role required: web_service_admin, activity_admin, activity_creator

To add more name-value pairs to the parameter's array, append the values to the existing array.

1. Create a JavaScript object with the following syntax, and add it to the executionParam.parameter array:

   ```javascript
   var newParameter = {
                         "name": "parameterName",
                         "value": "parameterValue",
                         "additional_attribute": "none"
                       };
   executionParam.parameters.push(newParameter);
   ```

   By adding the new parameter JavaScript object to the array, you ensure that any elements already available in the array are not impacted.

2. Make sure to set the value in the Additional attribute column in the SOAP message parameters input field to Do not escape text.

   In this case, the system does not escape the value specified for the value attribute. An example of this is:

   ```javascript
   var newParameter = {
                         "name": "parameterName",
                         "value": "parameterValue",
                         "additional_attribute": "do_not_escape_text"
                       };
   executionParam.parameters.push(newParameter);
   ```

   **Note:** If the value for the additional_attribute field is None, then the system escapes the value specified by the value attribute. In the first example, parameterValue is escaped.

SOAP template post-processing parameters

Use these parameters to create a post-processing script.

**Activity designer post-processing parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status code</td>
<td>status_code</td>
<td>Integer</td>
<td>Contains the status code returned from the web service.</td>
</tr>
<tr>
<td>Name</td>
<td>Variable</td>
<td>Type</td>
<td>Usage</td>
</tr>
<tr>
<td>--------</td>
<td>----------</td>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Header</td>
<td>header</td>
<td>Hashmap of JavaScript object</td>
<td>Contains the key value paired hashmap associated with the header values passed into the web service. You can access each value with executionResult.header[keyName].</td>
</tr>
<tr>
<td>Body</td>
<td>body</td>
<td>String</td>
<td>Contains a string value representing the output from the SOAP message</td>
</tr>
<tr>
<td>Error</td>
<td>error</td>
<td>String</td>
<td>Returns the error string from the SOAP web service, unless there are no errors, in which case it returns null.</td>
</tr>
</tbody>
</table>

### Create a JavaScript Probe activity

Create a JavaScript Probe activity to instruct a MID server to execute server-side javascript.

Role required: activity_creator or workflow_admin

The JavascriptProbe activity has the same functionality as making ‘Packages’ calls into standard Java libraries. It allows you to have more control over the Java libraries on the MID Server. You can load your own JAR files on the MID Server and have the JavascriptProbe make Package calls into those java files.

1. **Create a custom activity.**
   - This action creates a custom activity using a template.
2. **After setting up general properties and creating input variables**, configure the JavaScript probe activity Execution Command:

#### Option | Description
---|---
**Map the input variables** | Use the variables you created to configure the command that Orchestration executes on the MID server.

**Script type**
- Select the type of script to include. Available options are:
  - Custom JavaScript
  - MID Server script include

**Script**
- Custom JavaScript to run with this probe.

**MID Server script include**
- Script for the MID Server to run with this probe.

**Select MID Server by host**
- MID Server on which the probe runs.

**Required MID Server capabilities**
- MID Server to use, by capabilities.
### Parameters

Name-value pairs to pass to the host with this probe. You can create these parameters manually, or drag input variables into the Parameters fields and assign a value.

**Note:** You can map parameter values in a test payload to variables in the Outputs tab automatically. See [automap output variables](#).

Finish creating your JavaScript probe activity by creating output variables, creating a parsing rule, or creating template conditions. Refer to the create custom activities topic to know your template options.

**JavaScript probe template execution parameters**

You use execution parameters to create the input process script in the Preprocessing form of the activity designer.

For descriptions of the JavaScript Probe command fields, see the table in Configure the JavaScript Probe execution command.

**Note:** You must use the `executionParam.` prefix with all variables in this table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Script Type</td>
<td>script_type</td>
<td>Enumerated</td>
<td>Type of script to run. The possible types are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• custom_javascript_type</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• mid_script_include_type</td>
</tr>
<tr>
<td>Script</td>
<td>script</td>
<td>String</td>
<td>Script that runs custom JavaScript when the script_type is</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>custom_javascript_type</td>
</tr>
<tr>
<td>Mid script include</td>
<td>mid_script_include</td>
<td>Reference</td>
<td>The sys_id reference associated with the MID Server script</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>include to call, when the script_type is mid_script_include_type</td>
</tr>
<tr>
<td>Source</td>
<td>source</td>
<td>String</td>
<td>Target host on which to run the script.</td>
</tr>
<tr>
<td>MidCapabilities</td>
<td>midCapabilities</td>
<td>String (comma separated)</td>
<td>List of required MID Server capabilities.</td>
</tr>
<tr>
<td>Name</td>
<td>Variable</td>
<td>Type</td>
<td>Usage</td>
</tr>
<tr>
<td>--------------</td>
<td>------------</td>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Parameters   | parameters | Array of JavaScript object | Array of JavaScript objects, expressed with the executionParam. prefix. To add more name-value pairs to the parameters array, append them to the existing array. Create a JavaScript object with the following syntax, and add it to the executionParam.parameters array. This assigns additional parameters to the message:  
  var newParameter = {
    "name": "parameterName", "value": "parameterValue"
  }
  executionParam.parameters.push(newParameter); |
| ValueCapabilities | valueCapabilities | Array of hashmap | Capability values used to select the MID Server. For more information, see MID Server capabilities. If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection:  
  var valueCapability = {
    "NEW_MID_CAPABILITY": "NEW_MID_CAPABILITY_VALUE"
  }
  executionParam.valueCapabilities.push(valueCapability); |

**JavaScript probe template post-processing parameters**

Use these parameters to create a post-processing script.

**JavaScript probe post-processing parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Payload</td>
<td>payload</td>
<td>String</td>
<td>Contains raw payload returned from the JavaScript Probe.</td>
</tr>
<tr>
<td>Output</td>
<td>output</td>
<td>String</td>
<td>Contains output data returned from the JavaScript Probe.</td>
</tr>
<tr>
<td>Name</td>
<td>Variable</td>
<td>Type</td>
<td>Usage</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------</td>
<td>--------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>EccSysId</td>
<td>eccSysId</td>
<td>String</td>
<td>Contains the reference ID associated with the ECC Queue input message.</td>
</tr>
<tr>
<td>Error Messages</td>
<td>errorMessages</td>
<td>String</td>
<td>Contains the error messages returned from the JavaScript probe. If no error messages are returned, this value is null.</td>
</tr>
</tbody>
</table>

**Configure the JavaScript Probe execution command**

Use the input variables you created to configure the command that Orchestration executes on the JavaScript Probe target host.

Create the input variables you need in the **Inputs** form before you can advance to the **Execution Command** stage.

Role required: activity_creator, admin

**Note:** You can test the JavaScript Probe connection between the MID Server and the target without having to run the activity in a workflow context. For details, see [test template outputs](#).

1. Drag variables from the list of inputs and drop them into command fields.
   The system formats the variable in the proper syntax for the command.
2. Complete the fields shown in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. <a href="#">Create input variables</a> to <a href="#">map</a> to available fields.</td>
</tr>
<tr>
<td>Script type</td>
<td>Select the type of script to include. Available options are:</td>
</tr>
<tr>
<td></td>
<td>- Custom JavaScript</td>
</tr>
<tr>
<td></td>
<td>- MID Server script include</td>
</tr>
<tr>
<td>Script</td>
<td>Custom JavaScript to run with this probe. This field is available when the Script type selected is Custom JavaScript.</td>

<tr>
<td>MID Server script include</td>
<td>Script for the MID Server to run with this probe. This field is available when the Script type selected is MID Server script include.</td>
</tr>
<tr>
<td>Select MID Server by host</td>
<td>MID Server on which the probe runs.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server to use, by capabilities.</td>
</tr>
<tr>
<td>Parameters</td>
<td>Name-value pairs to pass to the host with this probe. You can create these parameters manually, or drag input variables into the Parameters fields and assign a value.</td>
</tr>
</tbody>
</table>

3. Click Save.

4. Click Continue to advance to the Outputs stage.

Create a PowerShell activity

Create a custom PowerShell activity return data to a workflow from a host using Microsoft PowerShell.

Role required: activity_creator or workflow_admin

ServiceNow supports PowerShell 2.0 and above. PowerShell 3.0 does not support Windows 2003 Server.

1. Create a [custom activity](#).
   This action creates a custom activity using a template.

2. After setting up [general properties](#) and [creating input variables](#), configure the PowerShell Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Map the input variables</td>
<td>Use the variables you created to configure the command that Orchestration executes on the MID Server.</td>
</tr>
<tr>
<td>Target host</td>
<td>Host name or IP address of the target server for this PowerShell activity.</td>
</tr>
<tr>
<td>Script type</td>
<td>Type of PowerShell script to run on the PowerShell host. Available options are:</td>
</tr>
<tr>
<td></td>
<td>- Custom PowerShell command</td>
</tr>
<tr>
<td></td>
<td>- MID Server script file</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>

**Powershell post-processing parameters and payload parsing**

Use these parameters to create a post-processing script, payload parsing, and tagging.
<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tags</td>
<td>tags</td>
<td>Hashmap</td>
<td>Contains the tags used to extract output using the PowerShell commands. The tag output is delimited by double percentage signs, as in %tagname %% ... %% Set up the command using the format in this example:</td>
</tr>
</tbody>
</table>
|             |          | of tag   | Write-Host % tagname1%% output1 line 1 output1 line 2 ...
|             |          | values   | Write-Host%%
|             |          | to return | Write-Host % tagname2%% output2 line 1 output2 line 2 ...
|             |          | from the  | Write-Host%%
|             |          | PowerShell | The tags returned are JavaScript hashmap objects in which each key is prefixed with tag appended with the tagname. |
|             |          |          | {
|             |          |   "__text__":  "",
|             |          |   "tagtagname1":"output1
|             |          |     line1
|             |          |     output1
|             |          |     line2\n",
|             |          |   "tagtagname2":"output2
|             |          |     line1
|             |          |     output2
|             |          |     line2\n"}
| Hresult     | hresult  | String   | Contains any hresult returned from the PowerShell command. If no hresult is returned, this parameter is null. |
| Output      | output   | String   | Contains the raw output from the PowerShell command. |
| EccSysID    | eccSysID | String   | Contains the reference ID associated with the ECC Queue input message returned by the activity. |
Create a REST web service activity

Use this procedure to create a custom REST web service Orchestration activity.

Role required: web_service_admin, activity_admin, activity_creator

To create and use a REST web service workflow activity:

- Create a REST message if an appropriate one is not already configured.
- Assign the web_service_admin role to any user who must create or edit a custom REST activity.
- Determine an application, or scope, for this activity.
- Determine the REST endpoint to use for the activity. Use this value to override the endpoint configured in the REST message.
- Optionally, create basic authentication credentials. Use this value to override the credentials configured in the SOAP message.

1. Create a custom activity.
   This action creates a custom activity using a template.

2. After setting up general properties and creating input variables, configure the REST web service Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Map the input variables</td>
<td>Use the variables you created to configure the command that Orchestration executes.</td>
</tr>
<tr>
<td>REST message</td>
<td>Name of an existing REST message to use in this activity.</td>
</tr>
<tr>
<td>REST message function</td>
<td>REST message function to use for this activity.</td>
</tr>
<tr>
<td>Endpoint</td>
<td>Endpoint URL for the REST web service this activity uses. Enter an endpoint in this field to override the endpoint configured in the REST message. Click the lock to open the input field.</td>
</tr>
<tr>
<td>Variable substitutions</td>
<td>Name-value pairs to pass to the REST endpoint. You can create these parameters manually, or drag input variables into the parameter fields, and then assign a value. Parameters defined in the REST message that use ${} can be assigned data from this activity template. Use the Additional attribute column to configure the system to not escape the text. By default the text sent to the REST message is escaped. If the users have provided variables using variable substitution in the REST message, then the Name column is automatically populated.</td>
</tr>
<tr>
<td>Additional Headers</td>
<td>Additional HTTP header parameters for the REST message selected. You can also use these values to override parameters inherited from the REST message.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Additional Query Parameters</td>
<td>Additional query parameters for the REST message selected. You can also use these values to override parameters inherited from the REST message.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>Check box that determines if a MID Server should be used to invoke the REST web service.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>If the REST web service message function defines a MID Server, that MID Server is used instead of the one selected here.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server with the appropriate capabilities for connecting to the REST endpoint. By default, the system selects a MID Server with REST capabilities. This field is available when the Use MID Server check box is selected.</td>
</tr>
<tr>
<td>Timeout</td>
<td>Allowed duration of the REST web service request before it times out, in seconds. The default is 10.</td>
</tr>
<tr>
<td>Authentication</td>
<td>Determines what type of authentication is required for the endpoint. The options are:</td>
</tr>
<tr>
<td><strong>Use existing credentials in REST message:</strong></td>
<td>Uses credential definitions from the REST message definition.</td>
</tr>
<tr>
<td><strong>Override with Basic Authentication credentials:</strong></td>
<td>Uses basic authentication credentials to override the credentials in the REST message definition. Basic authentication credentials must be provisioned before they are available for selection.</td>
</tr>
<tr>
<td><strong>Override with Certificate Authentication credentials:</strong></td>
<td>Uses a certificate, such as a private key, to override the credentials in the REST message definition.</td>
</tr>
<tr>
<td><strong>Override with Both Basic and Certificate Authentication credentials:</strong></td>
<td>Uses both basic authentication and certificate authentication to override the credentials in the REST message definition.</td>
</tr>
<tr>
<td><strong>Override with OAuth Authentication credentials:</strong></td>
<td>Uses OAuth 2.0 credentials to override the credentials in the REST message definition. The REST message selected for this activity must have its Authentication type set to OAuth 2.0 and its OAuth profile configured appropriately.</td>
</tr>
</tbody>
</table>
Finish creating your Rest web service activity by creating output variables, creating a parsing rule, or creating template conditions. Refer to the create custom activities topic to know your template options.

Auto-map REST activity output variables
The ServiceNow activity designer allows you to map parameter values in a REST test payload to variables in the Outputs stage automatically.

Role required: web_service_admin, activity_admin, activity_creator

Note: You can map parameter values in a test payload to variables in the Outputs tab automatically. See automap output variables.

1. In the activity designer, proceed to the Execution Command stage.
2. Define an appropriate MID Server, if requested.
   The test fails if the MID Server cannot be found or if it cannot connect to the target.
3. Click Test Activity to test the input parameters.
   If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.
4. Provide test values, if requested, and click OK to display the payload.
   The entire payload appears in the Raw Output tab of the Response form.
5. Select one of these auto-mapping options.
   - **Auto-Map to Local**: Directly maps values to a local variable for use within the activity.
   - **Auto-Map to Output**: Directly maps values to the output variable to pass to other activities in the workflow. Auto-mapping to an output variable creates an array of objects, each of which contains the column names from the query result.

**REST template execution parameters**

You use execution parameters to create the input process script in the Pre Processing form of the activity designer.

For descriptions of the REST web service command fields, see Configure the REST execution command.

**Note**: You must use the `executionParam` prefix with all variables in this table.

### REST template execution parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web service message</td>
<td><code>web_service_message</code></td>
<td>Reference</td>
<td>The sys_id of the corresponding web service message.</td>
</tr>
<tr>
<td>Web service message function</td>
<td><code>web_service_message_function</code></td>
<td>Reference</td>
<td>The sys_id of the REST message function.</td>
</tr>
<tr>
<td>Web service endpoint</td>
<td><code>web_service_endpoint</code></td>
<td>String</td>
<td>URL of the REST endpoint.</td>
</tr>
<tr>
<td>Parameters</td>
<td><code>parameters</code></td>
<td>Array of JavaScript objects</td>
<td>Array of JavaScript objects, expressed with the <code>executionParam</code> prefix. For instructions on creating arrays using this parameter see Create a JavaScript array in a REST template.</td>
</tr>
<tr>
<td>Use mid server</td>
<td><code>use_mid_server</code></td>
<td>Boolean</td>
<td>Selects whether or not to use the MID Server. A value of <code>true</code> uses the MID Server, and a value of <code>false</code> does not use the MID Server.</td>
</tr>
<tr>
<td>Name</td>
<td>Variable</td>
<td>Type</td>
<td>Usage</td>
</tr>
<tr>
<td>--------------------</td>
<td>----------------</td>
<td>------------------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>MidCapabilities</td>
<td>midCapabilities</td>
<td>String (comma separated)</td>
<td>List of references to required MID Server capabilities.</td>
</tr>
<tr>
<td>Time out</td>
<td>time-out</td>
<td>String</td>
<td>Allowable time out duration, expressed in seconds.</td>
</tr>
<tr>
<td>ValueCapabilities</td>
<td>valueCapabilities</td>
<td>Array of hashmap</td>
<td>Capability values used to select the MID Server. For more information, see MID Server capabilities. Use this example to customize the MID Server selection if there are additional capabilities that are assigned by value: var valueCapability = {'NEW_MID_CABABILITY': 'NEW_MID_CABABILITY_VALUE'}; executionParam.valueCapabilities.push(valueCapability);</td>
</tr>
<tr>
<td>Auth Type</td>
<td>auth-type</td>
<td>Boolean</td>
<td>Type of credentials to use. The choices are: basic_auth_pick_credentials, use_existing_credentials</td>
</tr>
<tr>
<td>Credentials</td>
<td>credentials</td>
<td>Reference</td>
<td>Contains the credentials to use for this REST message when the auth_type selected is basic_auth_pick_credentials.</td>
</tr>
</tbody>
</table>

*Create a JavaScript array in a REST template*

These are instructions for creating JavaScript arrays using REST execution parameters.

Role required: web_service_admin, activity_admin, activity_creator

To add more name-value pairs to the parameter's array, append the values to the existing array.

1. Create a JavaScript object with the following syntax, and add it to the executionParam.parameter array:

   ```javascript
   var newParameter = {
     "name": "parameterName", "value": "parameterValue", "additional_attribute": "none";
   }
   executionParam.parameters.push(newParameter);
   ```

   By adding the new parameter JavaScript object to the array, you ensure that any elements already available in the array are not impacted.

2. Make sure to set the value in the Additional attribute column in the REST message parameters input field to Do not escape text.
In this case, the system does not escape the value specified for the value attribute. An example of this is:

```javascript
var newParameter = {
  "name": "parameterName",
  "value": "parameterValue",
  "additional_attribute": "do_not_escape_text"
};
executionParam.parameters.push(newParameter);
```

**Note:** If the value for the additional_attribute field is None, then the system escapes the value specified by the value attribute. In the first example, parameterValue is escaped.

REST template post-processing parameters
Use these parameters to create a post-processing script.

Activity designer post-processing parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status code</td>
<td>status_code</td>
<td>Integer</td>
<td>Contains the status code returned from the REST web service.</td>
</tr>
<tr>
<td>Header</td>
<td>header</td>
<td>Hashmap of JavaScript object</td>
<td>Hashmap of key value pairs associated with the header values passed into the web service. You can access each value with executionResult.header[keyName].</td>
</tr>
<tr>
<td>Body</td>
<td>body</td>
<td>String</td>
<td>Contains a string value representing the output from the REST message</td>
</tr>
<tr>
<td>Error</td>
<td>error</td>
<td>String</td>
<td>Returns the error string from the REST web service, unless there are no errors, in which case it returns null.</td>
</tr>
</tbody>
</table>

Configure the REST execution command
Use the input variables you created to configure the command that Orchestration executes on the REST endpoint.

Create the input variables you need in the Inputs form before you can advance to the Execution Command stage.

Role required: web_service_admin, activity_admin, activity_creator

**Note:** You can test the REST connection between the MID Server and the endpoint without having to run the activity in a workflow context. For details, see test template outputs.

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
2. Complete the fields shown in the table.

### REST execution command fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. <a href="#">Create input variables</a> to map to available fields.</td>
</tr>
<tr>
<td>REST message</td>
<td>Name of an existing REST message to use in this activity. Users must have the web_service_admin role to configure this field.</td>
</tr>
<tr>
<td>REST message function</td>
<td>REST message function to use for this activity. Users must have the web_service_admin role to configure this field.</td>
</tr>
<tr>
<td>Endpoint</td>
<td>Endpoint URL for the REST web service this activity uses. Enter an endpoint in this field to override the endpoint configured in the REST message. Click the lock to open the input field.</td>
</tr>
<tr>
<td>Variable substitutions</td>
<td>Name-value pairs to pass to the REST endpoint. You can create these parameters manually, or drag and drop input variables into the parameter fields, and then assign a value. Parameters defined in the REST message that use ${} can be assigned data from this activity template. Use the Additional attribute column to configure the system to not escape the text. By default the text sent to the REST message is escaped. The Name column is automatically populated if the users have provided variables using variable substitution in the REST message.</td>
</tr>
<tr>
<td>Additional Headers</td>
<td>Additional HTTP header parameters for the REST message selected. You can also use these values to override parameters inherited from the REST message.</td>
</tr>
<tr>
<td>Additional Query Parameters</td>
<td>Additional query parameters for the REST message selected. You can also use these values to override parameters inherited from the REST message.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>Check box that determines if a MID Server should be used to invoke the REST web service.</td>
</tr>
</tbody>
</table>

**Note:** If the REST web service message function defines a MID Server, that MID Server is used instead of the one selected here.

<p>| Required MID Server capabilities | MID Server with the appropriate capabilities for connecting to the REST endpoint. By default, the system selects a MID Server with REST capabilities. This field is available when the Use MID Server check box is selected. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timeout</td>
<td>Allowed duration of the REST web service request before it times out, in seconds. The default is <strong>10</strong>.</td>
</tr>
<tr>
<td>Authentication</td>
<td>Determines what type of authentication is required for the endpoint. The options are:</td>
</tr>
<tr>
<td></td>
<td>· <strong>Use existing credentials in REST message</strong>: Uses credential definitions from the REST message definition.</td>
</tr>
<tr>
<td></td>
<td>· <strong>Override with Basic Authentication credentials</strong>: Uses basic authentication credentials to override the credentials in the REST message definition. Basic authentication credentials must be provisioned before they are available for selection.</td>
</tr>
<tr>
<td></td>
<td>· <strong>Override with Certificate Authentication credentials</strong>: Uses a certificate, such as a private key, to override the credentials in the REST message definition.</td>
</tr>
<tr>
<td></td>
<td>· <strong>Override with Both Basic and Certificate Authentication credentials</strong>: Uses both basic authentication and certificate authentication to override the credentials in the REST message definition.</td>
</tr>
<tr>
<td></td>
<td>· <strong>Override with OAuth Authentication credentials</strong>: Uses OAuth 2.0 credentials to override the credentials in the REST message definition. The REST message selected for this activity must have its <strong>Authentication type</strong> set to <strong>OAuth 2.0</strong> and its <strong>OAuth profile</strong> configured appropriately.</td>
</tr>
<tr>
<td>Credentials</td>
<td>Required REST endpoint basic authentication credentials. This field is available when <strong>Override with Basic Authentication credentials</strong> is selected in the <strong>Authentication</strong> field. Only basic authentication credentials appear in the selection list, which includes credentials stored on the instance and credential IDs from an external storage system. If you are using credentials stored in a CyberArk safe, you can override the default <strong>safe</strong> defined in the MID Server configuration file by adding the name of a different safe as a prefix to the credential ID, separated by a colon. For example, <strong>newsafe:orch-test-f5</strong>.</td>
</tr>
<tr>
<td>Protocol Profile</td>
<td>Certificate authentication to use. This field is available when the selections in the <strong>Authentication</strong> field is either <strong>Override with Certificate Authentication credentials</strong> or <strong>Override with Both Basic and Certificate Authentication credentials</strong>.</td>
</tr>
<tr>
<td>OAuth profile</td>
<td>Profile for the OAuth provider for this REST message. See <strong>Specify an OAuth profile</strong> for more information.</td>
</tr>
</tbody>
</table>
3. Click Save.
4. Click Continue to advance to the Outputs stage.

Create an SFTP activity

Create an activity that executes basic SFTP commands on a remote server.

Roles required: activity_creator or workflow_admin

You can create a custom activity that manages files and directories on a target host or copies a file from one SFTP server to another. The file content is streamed through a MID Server, which avoids having to store the data on the hard drive of the MID Server host machine.

**Note:** This activity requires the credentials of a user who can execute SFTP commands on the source host. The Copy File activity, provided in the activity pack, requires separate credentials to access the target host.

1. Create a custom activity.
   This action creates a custom activity using a template.

2. After setting up general properties and creating input variables, configure the SFTP Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>Type of activity to create. The choices are:</td>
</tr>
<tr>
<td></td>
<td>- Copy file</td>
</tr>
<tr>
<td></td>
<td>- Create directory</td>
</tr>
<tr>
<td></td>
<td>- Get file list</td>
</tr>
<tr>
<td></td>
<td>- Remove file or directory</td>
</tr>
<tr>
<td></td>
<td>- Rename file or directory</td>
</tr>
<tr>
<td></td>
<td>- Set file attributes</td>
</tr>
</tbody>
</table>

**Note:** The fields that display on the form depend on the command you select.

<table>
<thead>
<tr>
<th>Source host</th>
<th>Name or IP address of the server containing the files targeted by the activity.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Source port</th>
<th>Port number to use to communicate with the source server. The default port number is 22.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Source file path</th>
<th>Full path to a file (/temp/test_data_file.txt) or directory (/temp/test_dir) on a source host depending on the selected command. Field available on following commands:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- Copy file</td>
</tr>
<tr>
<td></td>
<td>- Remove file or directory</td>
</tr>
<tr>
<td></td>
<td>- Set file attributes</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Source directory</th>
<th>Path to the directory where the source files are located. Field available on following commands:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- Create directory</td>
</tr>
<tr>
<td></td>
<td>- Get file list</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| **Source files**       | Names of specific source files to include in the file transfer. Separate the file names with semi-colons. This field supports a semi-colon separated list of wild-card patterns. For example: *.txt; a?cd.pdf. If this field is blank, all files are included. Field available on following command:  
  - Get file list  
  
  **Note:** For information about how the values in this field affect options in other fields, see the logic explanation which follows. |
| **Is a directory**     | If checked, specifies the file path is a directory. Field available on following command:  
  - Remove file or directory                                                                                                           |
| **Credential tag for source** | Specific credential tag this activity must use to run SFTP commands on the source host.                                                    |
| **Credential tag for target** | Specific credential tag this activity must use to run SFTP commands on the target host. Field available on following command:  
  - Copy file                                                                                                                            |
| **Excluded files**     | Names of specific source files to exclude from the file transfer. The activity acts on all other files found in the source directory or subfolders. Separate the file names with commas. This field supports comma-separated list of wild-card patterns. For example: *.txt, a?cd.pdf.. Field available on following command:  
  - Get file list  
  
  **Note:** For information about how the values in this field affect options in other fields, see the logic explanation which follows. |
| **Include subfolders** | If checked, includes the files from subfolders in the source directory. Field available on following command:  
  - Get file list  
  
  **Note:** For information about how your selection affects other fields in the form, see the logic explanation which follows. |
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Target host</strong></td>
<td>Name or IP address of the server to which the files are being transferred. Field available on following command:</td>
</tr>
<tr>
<td></td>
<td>• Copy file</td>
</tr>
<tr>
<td><strong>Target port</strong></td>
<td>Port number to use to communicate with the target host. The default port number is <strong>22</strong>. Field available on following command:</td>
</tr>
<tr>
<td></td>
<td>• Copy file</td>
</tr>
<tr>
<td><strong>Target file path</strong></td>
<td>Full path to a file on a target host. Field available on following commands:</td>
</tr>
<tr>
<td></td>

<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Permissions</td>
<td>File or directory permissions to set for the user and group specified. This value must be expressed as an integer, such as 16877, which defines these permissions: rwxr-xr-x. The permissions numbers are internal values returned by the Get File List activity. Typically, you first use the Get File List activity to return a list of files and their attributes. Then you can move a file from a source host to a target host and set the source file attributes on the target file. This flow is demonstrated in the SFTP File Transfer workflow. Field available on following command: <strong>Set file attributes</strong></td>
</tr>
<tr>
<td>Access timestamp</td>
<td>Override the timestamp when the file or directory was last accessed. The access and modification timestamps must be set together as a pair. Field available on following command: <strong>Set file attributes</strong></td>
</tr>
<tr>
<td>Modification timestamp</td>
<td>Override the timestamp when the file or directory was last modified. The access and modification timestamps must be set together as a pair. Field available on following command: <strong>Set file attributes</strong></td>
</tr>
<tr>
<td>Size in bytes</td>
<td>Size of a file, expressed in bytes. Field available on following command: <strong>Set file attributes</strong></td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server with the appropriate capabilities for connecting to the source and target servers.</td>
</tr>
</tbody>
</table>

The system uses this logic to determine which files to move from the source host:

- If the Source files field is empty, the system selects all the files in the source directory. Otherwise, it only selects those files whose names match one of the file name patterns given in the field.
- If the Excluded files field is empty, the system excludes nothing. Otherwise, it excludes those files whose names match one of the file name patterns given in the field.
- The exclude rule has a higher preference than the include rule. If a file name matches one of the file name patterns in the Excluded files field, it does not get into the selection regardless of the include rule.
- When the Include subfolders check box is cleared, the system looks only in the source directory for files to include or exclude. Otherwise, it looks in the source directory and any of its subfolders for files to include or exclude.

**Note:** You can map parameter values in a test payload to variables in the Outputs tab automatically. See automap output variables.

- Use **auto-mapping** to generate outputs and parsing rules (recommended for JDBC)
If you do not use auto-mapping, you can manually create output variables and create parsing rules.

**SFTP template execution parameters**

You use execution parameters to create the input process script in the **Preprocessing** form.

For descriptions of the command fields, see [Configure the SFTP execution command](#).

**Note:** You must use the `executionParam.` prefix with all variables in this table.

| Tags | tags     | Hashmap of tag values returned from the SSH command | Contains the tags used to extract output using the SSH commands. The tag output is delimited by double percentage signs, as in `%%%tagname%%% ... %`. Set up the command using the following format:  
```
%%tagname1%%  
output1 line 1  
output1 line 2  
...  
%%
```
```
%%tagname2%%  
output2 line 1  
output2 line 2  
...  
%%
```

The tags returned are JavaScript hashmap objects in which each key is prefixed with `tag` appended with the tagname.

```
{"__text__": 
"",
"tagtagname1":"output1

line1

output1

line2\n",
"tagtagname2":"output2

line1

output2

line2\n"}
```

**Configure the SFTP execution command**

Use the input variables you created to configure the command that Orchestration executes on the SFTP target.

Create the input variables you need in the **Inputs** form before you can advance to the **Execution Command** stage.

Role required: activity_creator, admin

**Note:** You can test the JDBC connection between the MID Server and the target without having to run the activity in a workflow context. For details, see [test template outputs](#).

1. Drag variables from the list of inputs and drop them into command fields.  
The system formats the variable in the proper syntax for the command.
2. Complete the fields shown in the table.
### SFTP command fields

<table>

</tr>
<tr>
<td>GID</td>
<td>Group ID attribute to apply to a file or directory. The UID and GID values must be set together as a pair or they are ignored.</td>
<td>Set file attributes</td>
</tr>
<tr>
<td>Permissions</td>
<td>File or directory permissions to set for the user and group specified. This value must be expressed as an integer, such as 16877, which defines these permissions: rwxr-xr-x. The permissions number is an internal value returned by the Get File List activity. Typically, you first use the Get File List activity to return a list of files and their attributes. Then you can move a file from a source host to a target host and set the source file attributes on the target file. This is demonstrated in the SFTP File Transfer workflow.</td>
<td>Set file attributes</td>
</tr>
<tr>
<td>Access timestamp</td>
<td>Override the timestamp when the file or directory was last accessed. The access and modification timestamps must be set together as a pair.</td>
<td>Set file attributes</td>
</tr>
<tr>
<td>Modification timestamp</td>
<td>Override the timestamp when the file or directory was last modified. The access and modification timestamps must be set together as a pair.</td>
<td>Set file attributes</td>
</tr>
<tr>
<td>Size in bytes</td>
<td>Size of a file, expressed in bytes.</td>
<td>Set file attributes</td>
</tr>
<tr>
<td>Required MID Server</td>
<td>MID Server with the appropriate capabilities for connecting to the source and target servers. By default, the system selects an SSH MID Server.</td>
<td>All</td>
</tr>
</tbody>
</table>

The system uses this logic to determine which files to move from the source host:

- If the **Source files** field is empty, the system select all the files in the source directory. Otherwise, it only selects those files whose names match one of the file name patterns given in the field.
• If the **Excluded files** field is empty, the system excludes nothing. Otherwise, it excludes those files whose names match one of the file name patterns given in the field.
• The exclude rule has a higher preference than the include rule. A file whose name matches one of the file name patterns in the **Excluded files** field does not get into the selection, even though it would be selected by the include rule.
• When the **Include subfolders** check box is cleared, the system looks only in the source directory for files to include or exclude. Otherwise, it looks in the source directory and any of its subfolders for files to include or exclude.

3. Click **Save**.
4. Click **Continue** to advance to the **Outputs** stage.

### Create a probe activity

Create an activity that runs a probe on the target host that is configured to return specific information.

Role required: activity_creator or workflow_admin

For instructions on using the activity template process flow, see [create custom activities](#).

1. **Create a custom activity.**
   This action creates a custom activity using a template.

2. **After setting up general properties and creating input variables, configure the Probe Execution Command:**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Map the input variables</strong></td>
<td>Use the variables you created to configure the command that Orchestration executes.</td>
</tr>
<tr>
<td><strong>Probe</strong></td>
<td>Probe to run with this activity, from the list of probes in the system</td>
</tr>
<tr>
<td><strong>Target host</strong></td>
<td>Host name or IP address of the target server for this activity.</td>
</tr>
<tr>
<td><strong>Parameters</strong></td>
<td>MID Server to use, by capabilities.</td>
</tr>
<tr>
<td><strong>Required MID Server capabilities</strong></td>
<td>Name-value pairs to pass to the host with this probe. You can create these parameters manually, or drag and drop input variables into the parameter fields and assign a value.</td>
</tr>
</tbody>
</table>

**Note:** You can map parameter values in a test payload to variables in the **Outputs** tab automatically. See [automap output variables](#).

- Use **auto-mapping** to generate outputs and parsing rules
- If you do not use auto-mapping, you can manually [create output variables](#) and [create parsing rules](#)

### Probe template execution parameters

You use execution parameters to create the input process script in the **Pre Processing** form.

For descriptions of the command fields, see [Configure the Probe execution command](#).

**Note:** You must use the `executionParam` prefix with all variables in this table.
## Probe activity execution parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Probe</td>
<td>probe</td>
<td>Reference</td>
<td>The sys_id of the MID Server probe.</td>
</tr>
<tr>
<td>Source</td>
<td>source</td>
<td>String</td>
<td>Intended target host</td>
</tr>
<tr>
<td>Parameters</td>
<td>parameters</td>
<td>Array of JS object</td>
<td>Array of JavaScript objects, expressed with the executionParam.prefix. To add more name-value pairs to the parameters array, append them to the existing array. Create a JavaScript object with the following syntax, and add it to the executionParam.parameter array. This assigns additional parameters to the message:</td>
</tr>
<tr>
<td>MidCapabilities</td>
<td>midCapabilities</td>
<td>String (comma separated)</td>
<td>List of required MID server capabilities.</td>
</tr>
<tr>
<td>ValueCapabilities</td>
<td>valueCapabilities</td>
<td>Array of hashmap</td>
<td>Capability values used to select the MID Server. For more information, see MID Server capabilities. If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection:</td>
</tr>
</tbody>
</table>

### Probe template post-processing parameters

Use these parameters to create a post-processing script.
Probe post-processing parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Payload</td>
<td>payload</td>
<td>String</td>
<td>Contains raw payload returned from the probe.</td>
</tr>
<tr>
<td>Output</td>
<td>output</td>
<td>String</td>
<td>Contains output data returned from the probe.</td>
</tr>
<tr>
<td>EccSysId</td>
<td>eccSysId</td>
<td>String</td>
<td>Contains the reference ID associated with the ECC Queue input message.</td>
</tr>
</tbody>
</table>

Configure the Probe execution command
Use the input variables you created to configure the command that Orchestration executes on the target.

Create the input variables you need in the Inputs form before you can advance to the Execution Command stage.

Role required: activity_creator, admin

Note: You can test the activity connection between the MID Server and the target without having to run the activity in a workflow context. For details, see test template outputs.

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
2. Complete the fields shown in the table.
Probe execution command fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. <a href="#">Create input variables to map to available fields.</a></td>
</tr>
<tr>
<td>Probe</td>
<td>Probe to run with this activity, from the list of probes in the system.</td>
</tr>
<tr>
<td>Target host</td>
<td>Host name or IP address of the target server for this activity.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server to use, by capabilities.</td>
</tr>
<tr>
<td>Parameters</td>
<td>Name-value pairs to pass to the host with this probe. You can create these parameters manually, or drag and drop input variables into the parameter fields and assign a value.</td>
</tr>
</tbody>
</table>

3. Click **Save**.
4. Click **Continue** to advance to the **Outputs** stage.

**Create an SSH activity**

Create an activity that extracts data from a target host that uses the SSH network protocol.

Role required: activity_creator or workflow_admin

For instructions on using the activity template process flow, see [create custom activities](#).

1. Create a [custom activity](#).
   This action creates a custom activity using a template.

2. After setting up [general properties](#) and [creating input variables](#), configure the SSH Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Map the input variables</td>
<td>Use the variables you created to configure the command that Orchestration executes.</td>
</tr>
<tr>
<td>Target host</td>
<td>Host name or IP address of the target server for this activity.</td>
</tr>
<tr>
<td>Command</td>
<td>Command this activity runs on the target host. You can invoke a MID Server script from this field using any script type that the SSH command line supports. For more information, see <a href="#">Advanced SSH script options</a> below the table.</td>
</tr>
<tr>
<td>Directory</td>
<td>Directory on the target host where the command is run.</td>
</tr>
<tr>
<td>Credential tag</td>
<td>The Orchestration credential tag to use when running the command.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server with the appropriate capabilities for connecting to the host. By default, the system selects a MID Server with SSH capabilities.</td>
</tr>
<tr>
<td>Long running</td>
<td>If checked, disables the SSH connection timeout for commands that might take longer to run than the default 60 seconds. Orchestration periodically checks the running process to determine its status until it is finished.</td>
</tr>
</tbody>
</table>
### ServiceNow Kingston Now Platform Capabilities

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Must Sudo</td>
<td>If checked, enables the use of <code>sudo</code> to run commands.</td>
</tr>
</tbody>
</table>

**Note:** You can map parameter values in a test payload to variables in the Outputs tab automatically. See [automap output variables](#).

### Advanced SSH script options

To run a MID Server script on the target host, specify the script type and pass the name of the script into the `$syncFile()` parameter. The system uses this parameter to locate the named script in the MID Server Script File (ecc_agent_script_file) table and run it on the target host. For example, a bash script can be expressed as:

```bash
bash ${syncFile("<MID script name>")} argument1 argument2 argument3
```

A base script (`main_script.bash`) can reference another script (`my_include.bash`) as well as a separate file (`.my_profile`) located on the target host. Both scripts and the file referenced must be synced to the MID Server, using the `$syncFile()` parameter, to execute properly.

```bash
source ${syncFile(".my_profile")}
cp ${syncFile("my_include.bash")} /usr/ssmith/my_include.bash
bash ${syncFile("main_script.bash")} one two three four five six
rm /usr/ssmith/my_include.bash
```

A Python example with inline comments might look like this:

```python
set $LIB_DIR=/usr/bin;
# Sync a file that is referenced inside myF5CreateLBPool.py
cp ${syncFile("specialFunctions.py")} ~/specialFunctions.py
# set up environment variables
source ${syncFile(".python_profile")}
# call script that sets up dependencies on the box from remote package repos
python ${syncFile("setupPythonDependencies.py")} pycontrol
# call a script that requires functions from the package as well as a function from myIncludedFile
python ${syncFile("myF5CreateLBPool.py")} snow_pool myActualValue
# user is responsible for their own cleanup
rm ~/specialFunctions.py
```

- Use **auto-mapping** to generate outputs and parsing rules
- If you do not use auto-mapping, you can manually create output variables and parsing rules

### SSH template execution parameters

Use execution parameters to create the input process script in the Pre Processing form of the activity designer.

For descriptions of the command fields, see [Configure the SSH execution command](#).
**Note:** You must use the `executionParam` prefix with all variables in this table.

### SSH execution parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source</td>
<td>source</td>
<td>String</td>
<td>Intended target or host.</td>

<td>Tags</td>
<td>tags</td>
<td>Hashmap of tag values returned from the SSH command</td>
<td>Contains the tags used to extract output using the SSH commands. The tag output is delimited by double percentage signs, as in <code>%%tagname</code> ... <code>%%</code>. Set up the command using the following format: <code>%%tagname1%% output1 line 1 output1 line 2 ...</code> <code>%%</code> <code>%%tagname2%% output2 line 1 output2 line 2 ...</code> <code>%%</code> The tags returned are JavaScript hashmap objects in which each key is prefixed with <code>tag</code> appended with the <code>tagname</code>.</td>
</tr>
</tbody>
</table>

```json
{"__/text__/": "", "tagtagname1": "output1 line1
output1 line2
", "tagtagname2": "output2 line1
output2 line2
"}
```
Configure the SSH execution command
Use the input variables you created to configure the command that Orchestration executes on the host target.

Create the input variables you need in the Inputs form before you advance to the Execution Command stage.

Role required: activity_creator, admin

Note: You can test the SSH connection between the MID Server and the target without having to run the activity in a workflow context. For details, see test template outputs.

1. Drag variables from the list of inputs and drop them into command fields.
   The system formats the variable in the proper syntax for the command.
SSH execution command

2. Complete the fields shown in the table.
SSH activity inputs

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. <a href="#">Create input variables</a> to map to available fields.</td>
</tr>
<tr>
<td>Target host</td>
<td>Host name or IP address of the target server for this activity.</td>
</tr>
<tr>

</tbody>
</table>

3. Click **Save**.
4. Click **Continue** to advance to the **Outputs** stage.

Create a run script activity

Create an activity that runs any script.

Role required: activity_creator or workflow_admin

1. Create a [custom activity](#).
   This action creates a custom activity using a template.

2. After setting up [general properties](#) and [creating input variables](#), configure the Run Script Execution Command:
   Create a script for this activity to execute.

   **Note:** You can map parameter values in a test payload to variables in the Outputs tab automatically. See [automap output variables](#).

   - Use [auto-mapping](#) to generate outputs and parsing rules.
• If you do not use auto-mapping, you can manually create output variables and create parsing rules.

**Run Script template processing script**

Use the Run Script custom template Script form to enter a script to call and use with other activities.

**Run Script processing script**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Processing script</td>
<td>Script that the activity runs.</td>
</tr>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the input process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays input variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the processing script with this syntax: activityInput.variable.</td>
</tr>
</tbody>
</table>

**Create a JMS activity**

Create a custom JMS activity to retrieve or send messages to external systems using the Java Messaging Service.

Role required: activity_creator or workflow_admin

The JMS activity supports third party JMS providers whose JMS client application is written with a typical Java EE pattern and can support these operations:

• Using JNDI to find a ConnectionFactory object.
• Using JNDI to find one or more destination objects.
• Using the ConnectionFactory to create a JMS connection object.
• Using the JMS connection to create one or more JMS session objects.
• Using a JMS session and the destinations to create the MessageProducer and MessageConsumer objects.
• Starting the JMS connection to enable delivery or consumption of messages.

**Note:** The JMS activity designer has been tested with the JMS providers ActiveMQ and Tibco EMS. When connecting to a JMS provider, refer to your third party user documentation.

1. Create or verify your **JMS credential**.
   Your JMS credentials must have permission for the target database and proper configuration for the corresponding JMS connection. Credentials must be set up before you can create a JMS activity.

2. Create or verify your **JMS connection**.
   Your JMS connection must be configured with valid JMS credentials set up before you can create a JMS activity.

3. Create a **custom activity**.
   This action creates a custom activity using a template.
After setting up **general properties** and **creating input variables**, configure the JMS Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Configure your credential</strong></td>
<td>Fill in the fields necessary for your database connection.</td>
</tr>
<tr>
<td><strong>Connection Factory</strong></td>
<td>Name of the JMS Connection Factory. You should create or verify your JMS connection. This configuration links the name of the Initial Context Factory with the URL of the JMS provider.</td>
</tr>
<tr>
<td><strong>Destination Type</strong></td>
<td>Type of destination used for this message:</td>
</tr>
<tr>
<td></td>
<td>· <strong>Queue</strong>: Message is queued for point-to-point communications.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: The GET operation is only supported for the Queue destination type.</td>
</tr>
<tr>
<td></td>
<td>· <strong>Topic</strong>: Message is used for publish and subscribe communication.</td>
</tr>
<tr>
<td><strong>Destination Name</strong></td>
<td>Name of the queue or topic destination that is configured on the JMS provider.</td>
</tr>
<tr>
<td><strong>Message Type</strong></td>
<td>The JMS message type value. Only the <strong>Text Message</strong> type is supported. The queue or topic destination must be configured to receive or send only Text Message. Other message types are dropped, since the JMS Activity cannot process them.</td>
</tr>
<tr>
<td><strong>Operation</strong></td>
<td>The programmatic operation to perform on the destination. The choices are <strong>PUT</strong> or <strong>GET</strong>.</td>
</tr>
<tr>
<td><strong>Timeout (Secs)</strong></td>
<td>Allowed time to wait for a message in the message queue before it times out, in seconds. The default is <strong>30</strong>.</td>
</tr>
<tr>
<td><strong>Custom message headers</strong></td>
<td>The custom header values in a name/value pair format, that is available on the JMS destination.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This is only supported for a PUT operation.</td>
</tr>
<tr>
<td><strong>Message payload</strong></td>
<td>Actual message content or payload that is sent to the JMS destination.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This is only supported for a PUT operation.</td>
</tr>
<tr>
<td><strong>Credential tag</strong></td>
<td>A tag for an individual credential for a JMS activity in an Orchestration workflow.</td>
</tr>
<tr>
<td><strong>Required MID Server capabilities</strong></td>
<td>MID Server to use, by capabilities.</td>
</tr>
</tbody>
</table>

- Use **auto-mapping** to generate outputs and parsing rules
- If you do not use auto-mapping, you can manually **create output variables** and **create parsing rules**
Create a JMS connection for an Orchestration activity

Configure your system to use Java Messaging Service (JMS) with a custom Orchestration JMS activity.

Role required: admin

The MID Server must have the correct JMS connection factories for your organization. Configure those values in the `mid.property.jms.command.allowed_factory_names` property, found in MID Server > Properties. The default values for this property can be changed to any value or comma-separated list of values that the third-party JMS provider advertises.

1. Navigate to MID Server > JAR Files.
2. Click New and add:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique and descriptive name for identifying the file in the instance.</td>
</tr>
<tr>
<td>Version</td>
<td>A version number for the file, if one is available.</td>
</tr>
<tr>
<td>Source</td>
<td>Location of the JAR file for reference purposes.</td>
</tr>
<tr>
<td>Description</td>
<td>Short description of the JAR file and its purpose in the instance.</td>
</tr>
</tbody>
</table>

3. Click the paper clip icon in the banner and attach the JMS driver jar file.

The JMS driver jar file should be available as part of JMS provider installation. Few JMS vendors make them available as a separate product. Refer to the JMS provider documentation to determine which JMS client driver jar files require the client applications to connect to the JMS provider. For example, if you are trying to connect to ActiveMQ V5.10 (JMS provider), you need the `activemq-all-5.10.1.jar` file.

5. Click New, add the following, and click Submit:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of this connection factory</td>
</tr>
<tr>
<td>Initial Context Factory</td>
<td>Name of the JNDI class that is used to create the InitialContext.</td>
</tr>
</tbody>
</table>

**Note:** For example, to connect to ActiveMQ V5.10 (JMS Provider), the value is `org.apache.activemq.jndi.ActiveMQInitialContextFactory`.

<table>
<thead>
<tr>
<th>Provider URL</th>
<th>Location of the running JMS provider installation.</th>
</tr>
</thead>
</table>

**Note:** For example, to connect to ActiveMQ V5.1:tcp://ipAddresOrHostName:61616.

6. Navigate to Orchestration > Credentials.
7. Click New, select JMS Credentials, and provide the user name and password the MID should use to communicate with the JMS provider.

For more information, see JMS credentials.

8. Click Submit.

You are ready to create a custom JMS activity.
JMS template execution parameters
You use execution parameters to create the input process script in the **Preprocessing** form.
You must use the `executionParam` prefix with all variables in this table.

**JDBC execution parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Jms ds</td>
<td>jms_ds</td>
<td>Reference</td>
<td>Selected JMS data source.</td>
</tr>
<tr>
<td>Destination type</td>
<td>destination_type</td>
<td>Enumerated</td>
<td></td>
</tr>
<tr>
<td>Destination name</td>
<td>destination_name</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>Message type</td>
<td>message_type</td>
<td>Enumerated</td>
<td></td>
</tr>
<tr>
<td>Operation</td>
<td>operation</td>
<td>Enumerated</td>
<td></td>
</tr>
<tr>
<td>Time out</td>
<td>time_out</td>
<td>Integer</td>
<td>Length of time to wait for the query to return results.</td>
</tr>
<tr>
<td>Custom headers</td>
<td>custom_headers</td>
<td>Array of JavaScript objects</td>
<td></td>
</tr>
<tr>
<td>Message payload</td>
<td>message_payload</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>Credential tag</td>
<td>credential_tag</td>
<td>String</td>
<td>List of required MID Server capabilities.</td>
</tr>
<tr>
<td>MidCapabilities</td>
<td>midCapabilities</td>
<td>String (comma separated)</td>
<td></td>
</tr>
</tbody>
</table>
| ValueCapabilities  | valueCapabilities | Array of hashmap | Capability values used to select the MID Server. For more information, see [MID Server capabilities](#). If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection:  
```javascript
var valueCapability = {'NEW_MID_CAPABILITY': 'NEW_MID_CAPABILITY_VALUE'};
executionParam.valueCapabilities.push(valueCapability);
``` |

JMS template post-processing parameters
Use these parameters to create a post-processing script.

**JMS post-processing parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>status</td>
<td>String</td>
<td>Status of the operation (Put or Get) on the JMS destination.</td>
</tr>
<tr>
<td>Name</td>
<td>Variable</td>
<td>Type</td>
<td>Usage</td>
</tr>
<tr>
<td>-------------------</td>
<td>--------------</td>
<td>------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>StandardHeaders</td>
<td>standardHeaders</td>
<td>String</td>
<td>All the standard headers, as specified by JMS, that are obtained as part of the JMS message during a Get operation. This field is applicable only for Get operations.</td>
</tr>
<tr>
<td>CustomHeaders</td>
<td>customHeaders</td>
<td>String</td>
<td>All custom headers added by a producer or publisher application that are obtained as part of the JMS message during a Get operation. This field is applicable only for Get operations.</td>
</tr>
<tr>
<td>MessagePayload</td>
<td>messagePayload</td>
<td>String</td>
<td>Message payload that is obtained as part of the JMS message during a Get operation. This field is applicable only for Get operations.</td>
</tr>
<tr>
<td>EccSysID</td>
<td>eccSysID</td>
<td>String</td>
<td>Contains the reference ID associated with the ECC Queue input message returned by the activity.</td>
</tr>
<tr>
<td>ErrorMessages</td>
<td>errorMessages</td>
<td>String</td>
<td>Contains any error messages retrieved from the JMS command. This value is null if there are no error messages.</td>
</tr>
</tbody>
</table>

**Activity scoping**

Custom activities run in their own scope, even if it is different from that of the workflow.

Any script that runs inside a custom activity with a scope can only access outside artifacts that are within the scope of that activity or artifacts that are configured to run in any scope. Conversely, an outside artifact can only access the script inside that private activity if the outside artifact is running in the same scope. Activities with public scopes can interact with outside artifacts in any application scope.

You can use private activities as part of a workflow that has a public application scope. These activities are protected from reaching outside of the workflow or from being reached from outside the workflow. For details about setting application scoping for custom activities, see the field description table for the appropriate activity template.

**Note:** Custom activities uploaded to the ServiceNow Store must be configured as accessible to all application scopes.
Publish a custom activity

When a user creates a custom activity and saves or submits it, that activity appears in the Custom and Packs tabs of the designer palette, but is visible only to the user who created it.

Roles required: admin, activity_admin, activity_creator

1. When you finish configuring the activity, click Publish.
   This makes the activity accessible to other users on the instance with the workflow_admin or activity_creator role. Published activities are available for upload to the ServiceNow Store, can be added to workflows, and can be edited by any user with the proper roles.

2. To edit a published activity, click Checkout.
   When an activity is checked out by a user, only that user can modify it. The fields of a checked out activity are read-only for all other users.

3. When you are finished editing the checked out activity, publish it again.
   The system adds a new version of this activity to the Custom tab in the Workflow Editor palette.

   **Note:** Activities you create and publish are visible in the Packs tab only if they were created in the current application scope.

Return a locked activity to a published state

Problems can arise if an activity version is checked out by a user and not checked back in. An activity in this state cannot be checked out for update.

**Role required:** admin, activity_admin, activity_creator

An administrator can return a locked activity to a published state.

1. Open the Workflow Editor.

2. From the Custom tab, open the activity that is locked.

3. Click the menu icon in the title bar and select **Versions** from the context menu.
   A list of all the versions of that activity appears. The locked version displays the user who checked it out.
4. Select the checked out version.
   The system opens the record in the activity designer.
5. Click the menu icon again and select **Force Checkout** from the context menu.
   The activity fields become editable.
6. Click **Publish**.
   The activity becomes available to users with the appropriate roles.

**Copy a custom activity**

You can copy activities for reuse from the **Custom** tab in the global scope.

Role required: admin, activity_admin, activity_creator

- **Note:** You cannot copy an activity in a private scope.

1. To reuse an activity in the global scope, expand the parent category to display the activities.
2. Right-click the activity you want to copy and select one of these options:
   - Copy into global scope as new activity: Copies the activity with the new name you provide, uses the same version number as the original activity, and moves it to the global scope in the **Custom** tab.
Naming an activity copy

- Copy into global scope as new version: Copies the activity using the same name, increments the version number, and moves it to the global scope in the Custom tab. The system automatically adds the parent category to the Custom tab if it does not already exist. This action will overwrite another activity with the same name and version number.

Creating a new activity version

**Note:** If the activity is in any other scope but global, the system displays this message: Cannot copy privately scoped activity.

Orchestration databus

The databus allows workflow designers to track the flow of data through an Orchestration workflow and provides access to output data that can be consumed by other custom activities. Data is made available in a workflow when you use activities created with the Orchestration activity designer. The activity designer provides the ability to specify well-defined inputs and outputs for your activities. When you use those activities on the workflow canvas, the outputs appear in the Data tab and are available for use as inputs in subsequent activities.

**Note:** Orchestration does not filter the data you are given for reuse in the Data tab. You must make sure an activity in the workflow canvas has executed before you consume its output data.

When you drop a custom activity onto the workflow canvas, the system assigns it an index. If you delete an activity from the canvas and add a new one, the indexes are not reused. This ensures that you don’t accidentally start subscribing to data you did not intend to use. If you update an activity in the activity designer, the system automatically updates the activity on the canvas to ensure the data you are subscribing to downstream is not affected.
Reuse data in the activity designer

The Data tab in the Workflow Editor lists all custom activities used in the current workflow that produce data and displays that data for reuse in other custom activities.

Roles required: workflow_creator

Activities are categorized by application in this tab and are available for use as data sources for other activities. The Data tab is a graphical representation of the workflow Databus, which manages all the temporary data used by the current workflow.

1. Drag output variables from an activity in this tab into the inputs of another activity on the workflow canvas to link the activities together.

   You can use any of the outputs in the structure, regardless of the the application to which they belong. An index number in parenthesis after the activity name provides a unique identifier for the parameters that you use as input data in other activities. If you do not name a custom activity, the only identifier for that activity in the Data tab is the index number. Index numbers indicate the sequence in which custom activities were added to the workflow and are not reused. When you drag a custom activity onto the workflow canvas, the system adds that activity and its output data to the structure. Conversely, if you remove a custom activity from the canvas, that activity and its outputs disappear from the data list.

2. Point to an activity to display information about it in a pop-up window.

   Any output data reused by the activity is listed in the Databus Output field of the the pop-up window.
MID Servers for Orchestration

Orchestration automatically selects an appropriate MID Server based on the capabilities that you configure in activities, the IP addresses of target devices, and the application that the MID Server is allowed to use.

To allow a MID Server to work with Orchestration, it must have the Orchestration application or the ALL application assigned to it. See Configure a default MID Server for each application for instructions.

You can have MID Servers focus on different capabilities and separate sections of your network. See:

- MID Server capabilities
- Map an IP address to a DNS name

You can also specify a default MID Server to use if no MID Servers meet the capability and IP range criteria for an activity. See Select the default MID Server for Orchestration.

MID Server capabilities

MID Server capabilities define the specific functions of a MID Server within an IP address range.

Several applications, such as Discovery, Service Mapping, Cloud Management, and Orchestration can use capabilities, IP ranges, and MID Server selection to narrow the pool of MID Servers the applications need.

Note: At least one capability is required for each MID Server used by Orchestration. See MID Servers for Orchestration for more information.
The following capabilities are available by default with Discovery:

- All
- Cloud Management
- Nmap
- PowerShell
- Resolve DNS
- REST
- SNMP
- SOAP
- SSH
- VMware
- WMI

**Nmap capability**

The Nmap capability is only assigned to MID Servers for which the Network Mapper (Nmap) scanner has been installed for credential-less Discovery. This capability cannot be added to or removed from any MID Server manually. For instructions on installing or uninstalling Nmap, see Install and uninstall Nmap on a MID Server

**MID Server capability values**

Capabilities provided in the base system do not have a defined value string. A MID Server configured to use a capability that has no value can locate any device using that capability's protocol. If a capability has a defined value, the MID Server using that capability finds only those devices using that protocol that match the value string exactly. The exception to this is the Resolve DNS capability, which is configured to resolve any DNS name into an IP address using a partial string match.

Starting with the Kingston release, the (capability name):(value) combination appears in the slushbucket when you add a capability to a MID Server. This combination allows you to see all the capabilities that have different values, even if the capability name is the same. For example, if you are using the Cloud Management capability, and you use the value field to specify the us-west logical datacenter on one of the capability records, you can see the combination in the Collection list.
Scripted MID Server capability value matching

You can use value tests to create capabilities that find devices using values without requiring exact string matching. Action on these values is controlled by a user-defined script.

The Resolve DNS capability is provided in the base system and is configured to resolve DNS names into IP addresses for devices whose names end with a specified domain name. The capability Value entered is automatically prefaced with a dot during processing to match domain syntax. This value can contain one or more sub-domains, but must include the end of the domain string. Matching devices must end with the identical syntax. The script for the Resolve DNS capability determines if a device name matches the criteria defined by Value. If a match exists, the platform performs the address resolution automatically. For example, if the value for the Resolve DNS capability is service-now.com, the MID Server with this capability finds lnxlab01.sandiego.service-now.com and dbsrv101.sanjose.service-now.com. If the value is changed to sandiego.service-now.com, then the MID Server finds only lnxlab01.

Note: If Value in the Resolve DNS capability is blank, then all domains match.

To view the script for evaluating this capability, navigate to MID Server > Capability Value Tests and select Resolve DNS from the list.
Configure MID Server capabilities

A capability is required for each MID Server to work with Orchestration, Cloud Management, Service Mapping, and alert aggregation and RCA.

Role required: admin or sm_admin

1. Navigate to MID Server > Capabilities.
2. Select an existing capability. You can also select ALL to include all capabilities.
ServiceNow Kingston Now Platform Capabilities

3. Create a new capability:
   a) Click New.
   b) Configure the value for a custom capability.
      An example is a capability for DOMAIN, with a value of service-now.
   c) Click Submit.

4. Click Edit in the MID Servers related list to add MID Servers to the capability.
5. Select one or more MID Servers for this capability from the slushbucket.
6. Click Save.
   The capability defined here also appears in the primary record for this MID Server.

Select the default MID Server for Orchestration

Orchestration uses the default MID Server if it cannot find a MID Server with the correct IP range and capability.

Specify the default MID Server in either of these locations:

- The Default MID Server field on the Orchestration application record. See Configure a default MID Server for each application for instructions.
- The Default MID Server to use for Orchestration Activities property. Navigate to Orchestration > MID Server Properties to set this value.

These two values are automatically kept in synch. You can change the default MID Server in either location.

PowerShell probe version 2 system property

View detailed PowerShell credential information and view extended logging information.

Starting with the Kingston release, there is a new system property for the PowerShell probe which enables the version 2 of the probe. This new version enables you to view detailed credential information on why PowerShell credentials fail or succeed. You can also view logging information for an ECC Queue payload and Workflow Context log.

mid.server.rba_powershell_v2

Enables the PowerShell probe version 2 for use with all PowerShell activities. The default value is true. If you choose false, the legacy PowerShell probe is used. Unless there are issues, use version 2, as the legacy version is going to be deprecated.

Note: This property only applies to Orchestration activities. Discovery probes are not affected.

You can access the property by selecting the MID Server Properties link in the navigation pane:
PowerShell log property

Enable debug messages to display from PowerShell.

This property enables control of when and where to display debug messages generated by debug statements embedded in the PowerShell scripts.

**mid.property.powershell.log_info**

The new MID Server PowerShell log property:

- Displays logging information.

  ![Note: Once logging is enabled, OOB PowerShell scripts log information.]

- Adds logging information to your developed PowerShell scripts and PowerShell activities.

  ![Note: Logging information is only available when property is enabled.]

- Logging is not enabled by default.

If the property is set to true, debug messages display from the workflow context or from the Response popup after you test inputs. The ecc_queue entry payload for each of the PowerShell activities is going to show all the debug messages that were logged.

Enable the PowerShell log property for each MID Server. If the MID Server field is empty, the property applies to all MID Servers. There are separate credential debug messages that always come back regardless of this setting. The credential debug messages show which credentials have been used and other related information.

![Note: All the debug messages that come back to the instance are also saved to the MID Server log file. The log file might have additional debug messages generated from Java code, which might help the debug process.]
Use the Orchestration Usage dashboard

This dashboard shows an overview of Orchestration usage metrics to show customers how their organization uses Orchestration and to support license compliance.

Role required: orchestration_manager

1. To view the dashboard, navigate to **Orchestration > Operations & Troubleshooting > Orchestration Usage Dashboard**.

   The Orchestration Usage dashboard displays. The tabs on the dashboard include Licensable Usage and Orchestration Usage. Reports on these tabs include:

   **Orchestration Usage Metrics**

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transaction Summary Last 12 months</td>
<td>A running transaction count of all Orchestration transactions over the last 12 months. Includes:</td>
</tr>
<tr>
<td>Transaction Summary Last 12 months</td>
<td>- The count of orchestration transactions associated with the HR Application</td>
</tr>
<tr>
<td>Transaction Summary Last 12 months</td>
<td>- The count of Orchestration transactions associated with the Security Operations Application</td>
</tr>
<tr>
<td>Transaction Summary YTD</td>
<td>Cumulative count of all transactions since the time the Orchestration plugin was activated or the customer upgraded to Geneva.</td>
</tr>
<tr>
<td>365 day Running Average of Server</td>

<td></td>
</tr>
</tbody>
</table>

2. Optional: You can add more widgets to the dashboard by clicking the **Add Content** icon in the upper right corner of the dashboard.

**Note:** You should not modify the first tab in this Dashboard. If you want a different dashboard experience, add a tab and customize that with your usage reports.

**Password Reset application**

The ServiceNow® Password Reset application enables an end user to use a self-service process to reset or change the password. Alternatively, your organization can implement a process that requires a service desk agent to reset passwords for end users.

**Explore**
- Password Reset release notes
- Upgrade to Kingston

**Set up**
- Password Reset setup guide

**Administer**
- Plan your Password Reset processes
- Configure your Password Reset process
- Password Reset and Password Change reports and logs

**Use**
- Service desk: Reset a password or unlock a user account
- Service desk: Unblock a Password Reset user

**Develop**
- Developer training
- Developer documentation

**Integrate**
- Integrate Password Reset with a CMS integration
• **Users:** Reset your password on Windows systems

**Troubleshoot and get help**

• **Ask or answer questions in the Change Management forum**
• **Search the HI Knowledge Base for known error articles**
• **Contact ServiceNow Technical Support**

**Password Reset setup guide**

A simple version of the Password Reset application is active by default. You can install a plugin to extend functionality.

**Requirements**

Role required: admin

**Note:** The Password Reset application is not available during upgrade.

**What is installed**

- Password Reset is active by default and includes example verifications. The base system enables connections only to the Local ServiceNow Instance credential store type. For details, see [Credential stores for Password Reset](#).
- To enable connections to Active Directory (AD) and Remote (SOAP) ServiceNow Instance credential store types, you must activate the Password Reset - Orchestration Add-on plugin. The plugin also activates the Password Reset Windows Application (com.glideapp.password_reset_desktop). No other components are installed. Orchestration is available as a separate subscription. See [Activate the Password Reset - Orchestration Add-on plugin](#).

**Next steps**

Plan and configure the Password Reset processes for your organization. See the Password Reset **admin guide**.

**Activate the Password Reset - Orchestration Add-on plugin**

The Password Reset - Orchestration Add-on plugin activates the Password Reset Windows Application (com.glideapp.password_reset_desktop) and enables connections to the Active Directory (AD) and ‘Remote (SOAP) ServiceNow instance’ credential store types. No other components are installed.

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization’s production and sub-production instances, generally within a few days.
If you do not have an account manager, decide to delay activation after purchase, or want to evaluate the product on a sub-production instance without charge, follow these steps.

Role required: none

1. In the HI Service Portal, click **Service Requests > Activate Plugin**.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
</tbody>
</table>

   **Note:** Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.

   | Reason/Comments | Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows. |

3. Click **Submit**.

**Installed with Password Reset**

Tables, roles, business rules, scripts, and workflows are installed with the Password Reset application.

**Password Reset tables**

<table>

<tr>
<td>$pwd_process_flow</td>
<td>UI for indicating current stage.</td>
</tr>
<tr>
<td>$pwd_process_footer</td>
<td>JavaScript code to get the footer macro name.</td>
</tr>
</tbody>
</table>
### UI scripts installed with Password Reset

You can create a UI script and reference the script from a UI macro or UI page by using a `<g:include_script>` Jelly tag. The following example shows how the `$pwd_enroll_questions_ui` UI macro can reference the `$pwd_enroll_questions_ui` script. In the example, `[UI Script Name]+".jsdbx"` is the name of the script:

```
<g:include_script src="$pwd_enroll_questions_ui.jsdbx" />
```

By referencing an external script, you can maintain separation between client JavaScript code and Jelly code, which simplifies maintenance. You can use the following installed scripts with Password Reset UI macros:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>$pwd_csrf_common_ui_script</code></td>
<td>Common UI script for handling a Cross-site Request Forgery (CSRF).</td>
</tr>
<tr>
<td><code>$pwd_enroll_email_ui</code></td>
<td>JavaScript code for the <code>$pwd_enroll_questions_ui</code> UI macro.</td>
</tr>
<tr>
<td><code>$pwd_enroll_google_auth_ui</code></td>
<td>JavaScript code for the <code>$pwd_enroll_google_auth_ui</code> UI macro.</td>
</tr>
<tr>
<td><code>$pwd_enroll_questions_ui</code></td>
<td>JavaScript code for the <code>$pwd_enroll_questions_ui</code> UI macro.</td>
</tr>
<tr>
<td><code>$pwd_enroll_sample_ui</code></td>
<td>Included sample client JavaScript for the <code>$pwd_enroll_sample_ui</code> UI macro.</td>
</tr>
<tr>
<td><code>$pwd_enroll_sms_ui</code></td>
<td>SMS enrollment UI script.</td>
</tr>
<tr>
<td><code>$pwd_enrollment_submit_event</code></td>
<td>UI script for an enrollment submission event.</td>
</tr>
<tr>
<td><code>$pwd_util</code></td>
<td>Utilities for password reset UI pages and UI macros.</td>
</tr>
<tr>
<td><code>$pwdWfManager</code></td>
<td>Helper class to handle workflow activities and post-processing.</td>
</tr>
</tbody>
</table>

### Password Reset workflows

The Password Reset plugin adds workflows that you can use as examples to create custom workflows for Password Reset processes.

#### Workflows that connect to a credential stores

<table>
<thead>
<tr>

</tbody>
</table>

### Domain separation in the Password Reset application

A password reset process that you define in any domain is isolated from a process that you create in any other domain. Domain separation allows you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

### Domain separation is supported

Support: Level 2
Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

Each password reset process follows these steps:

1. The end user asks to reset the password.
2. The user provides identifying information (typically username or email address).
3. The user verifies the identity — proves that they are who they say they are (typically by answering questions or submitting a code number that was delivered securely).
4. The instance connects to the credential store to confirm the user credentials.
5. The instance generates the new password and displays it to the user.

How domain separation works in Password Reset

Domain separation for Password Reset is applied at the process level. The admin configures the following elements to define a password reset process: A connection to a credential store, user groups that can use the process, method of identification, and verifications to use during the process.

- A connection to the credential store where user credentials (like username/password) are securely stored. Each connection inherits the domain setting from a template called a connection type. Each connection type is tied to a domain (the connection type record has a domain field). There are uniqueness constraints on connection names within a domain.
- One or more user groups on the ServiceNow instance that can use the password reset process. User accounts are members of one or more domains — they use the standard ServiceNow domain separation. When a user enrolls to use one of the password reset processes that is configured for the organization, the user is allowed to choose only from the processes in the user’s domain.
- The identification — the method that the end user employs to claim identity for the public password reset or password change process. Each identification inherits the domain setting from a template called an identification type. Each identification type is tied to a domain (the identification type record has a domain field). There are uniqueness constraints on identification names within a domain.
- One or more verifications — methods to verify the identity of the person who is attempting to reset the password. Each verification inherits the domain setting from a template called a verification type. Each verification type is tied to a domain (the verification type record has a domain field). There are uniqueness constraints on verification names within a domain.
- All Password Reset tables have a domain column.
- Password Reset process tables include a sys-overrides column on business rules, UI actions, and so on.
- The Password Reset application is built using Orchestration. Orchestration supports 'Data only' domain separation — the data security model of separating visibility of data from one domain to another.
Self-service and Service desk-assisted processes

In addition to configuring the connections, user groups, identifications, and verifications that are used in each process, the admin specifies one of the following operational methods for the organization:

- Self-service process: End users reset passwords over the Internet using a browser on any supported interface, including mobile devices. The end user can select from any configured process in the end user’s domain (or child domain of an end user’s domain).
- Service desk-assisted process: End users do not reset passwords. An end user requests the assistance of a service desk agent, over the phone or in person. The agent processes the request. Each service desk agent has the Password Reset Admin service desk role. The “reset request” form that the agent works in presents a **User** field and a **Process** field. On the form, the agent can view all processes in the end user’s domain, even if the agent is not a member of one or more of the domains.

Password Change process

The Password Change application extends the Password Reset application by letting admins define how users change their passwords. A service desk-assisted process is not supported. An admin must publish the URL for the self-service password change form.

The Password Change application enables an end user to change a password over the Internet using a browser on any supported interface, including mobile devices. The end user can select from any configured process in the end user’s domain (or child domain of an end user’s domain).

A password change process uses the same elements as a password reset process (connections, user groups, identifications, and verifications), with the same domain-separation features.

Password Reset Windows Application

The Password Reset Windows Application enables a user who forgets the password or is locked out of a Windows computer to reset the password directly from the Windows login screen.

Installer and documentation

Download the installer and installation instructions from **KB0542328** in the ServiceNow Knowledge Base. The installer uninstalls any earlier version of the Password Reset Windows Application.

How the Password Reset Windows Application works

Administrators download and run an EXE or MSI file to install or distribute the application to user computers. The application installs a link on the Windows login screen. The user clicks the link (**Forgot Password?** in the examples on various Windows versions) and is then guided through the process of resetting the password.
By default, when a user requests a reset, the instance sends the user a URL with a user-specific token. After the user opens the URL, the instance prompts the user to enter and confirm the new password. The instance does not send a temporary password.

**Restrictions on the Password Reset Windows Application**

- The Password Reset Windows Application does not support custom verifications.
- The Password Reset Windows Application uses the base-system CAPTCHA service even if the Password Reset application is configured to use Google reCAPTCHA with the web interface. See the section titled "Settings on the Details tab" in [Configure your Password Reset process](#).
- The Password strength indicator is not supported. See [Configure and test the Password Reset connection to a credential store](#).
- For some verification types, you can use only one verification. Custom verifications are not supported. See [Password Reset verifications](#) for details.
- Custom UI macros configured on the Process > Advanced page are not supported (for example, entry, success, or failure macros). The system displays only the default success and failure messages.
- The Password Reset Windows Application supports newline characters in the Password rule hint text. Other formatting is not supported (bold, underline, hyperlink, and so on). See [Configure and test the Password Reset connection to a credential store](#).

**Password Reset Windows Application installation requirements**

You must activate the Password Reset Orchestration Add-on plugin to use the Password Reset Windows Application.

• Windows 10 Pro |

| Supported processor architecture | • X86  
• X64 |

| Supported network architecture | • Password Reset Windows Application clients must have direct access to both the Internet and the ServiceNow instance where the Password Reset Windows Application is configured  
• To reset an AD password, the client must be on the corporate network. |

**Password Reset admin guide**

The Password Reset application enables an end user to reset or change a password using a self-service process. Alternatively, your organization can implement a process that requires a service desk agent to reset passwords for end users.

Watch the video: [Introducing Password Reset (Video)](Video)

**Password Reset processes**

Users with the password_reset_admin role configure how the process of resetting a password works for an end user.

- **Self-service process:** Users reset passwords over the Internet using a browser on any supported interface, including mobile devices.
- **Service desk-assisted process:** A user requests the assistance of a service desk agent, over the phone or in person. Users do not reset passwords.

**End-user experience of the self-service process**

The following example is typical:

1. On the login page, the user clicks the **Forgot Password?** link to start the process.
2. The Identify page opens and the user enters their identifying information (typically username or email address). The example includes the default CAPTCHA security feature:

3. On the Verify page, the user verifies their identity by providing information that proves that they are who they say they are. You, the admin, configure the method of verification and you can require multiple verifications. In the example, the admin has configured the Security Question verification. The user must answer a question to prove identity. (The user had earlier
selected the question and provided a secure private answer while enrolling for the password reset process.) Other possible verifications require the user to enter a code number that was sent to a mobile device by SMS text, through the Google Authenticator app, or by email.

4. The system checks the credential store to verify identity and then displays the new password on the Reset page.
Elements of a password reset process

You configure the following elements of the process for your organization:

- A connection to the credential store for your organization where user credentials (like username/password) are securely stored.
- One or more user groups on the ServiceNow instance that can use the password reset process.
- The type of identification that users must enter to identify themselves (typically username or email address).
- One or more verifications — methods to verify the identity of the user. Examples:
  - Answer a question that only the user knows how to answer — the QA Verification (based on the Security Question verification type).
  - Enter a code number that was emailed to the user — the Email verification.
  - Enter a code number that was texted to a mobile device — the SMS verification.
  - Enter a code number that appears on the Google Authenticator app on a mobile device — the Google Authenticator verification.
How you implement a password reset process

1. Plan your implementation: Ensure that all applicable organizational guidelines, security policies, and areas of the organization are considered.

2. Set up the elements of the password reset and password change processes according to the plan:
   - Connection to the credential store.
   - User groups that will use the password reset process.
   - Identification type to use.
   - Verifications to use.

3. In the service desk-assisted model, assign service desk agents to monitor and reset passwords as needed.

4. Monitor password reset activity to identify security threats and to ensure compliance with the password policy requirements of your organization.

Password Reset Windows Application

If a user forgets the password or gets locked out of a Windows computer, the user can reset the password directly from the Windows login screen. The user clicks the Forgot Password? link and is then guided through the process of resetting the password. To learn more, see Password Reset Windows Application.

Password Change application

The Password Change application extends the Password Reset application by letting admins define how users change their passwords. Only a self-service process is supported and an admin must publish the URL to the password change form.

1. The user logs in to the instance and then selects the Change Password module or link from the user profile record.

2. On the Change Password page, the user selects the credential store where the password resides.

3. The user enters the old password and then enters and confirms a new password.

4. Workflows validate the old password and then implement the new password.

5. The system notifies the user that the password was changed.

What to do next

Plan your Password Reset processes

Plan your Password Reset processes

To ensure security and efficiency, take the time to plan your Password Reset implementation.

Role required: password_reset_admin or admin

1. Decide on the password reset process:
- **Self-service process:** Users reset their password over the Internet using a browser on any supported interface, including mobile devices. To make the Password Reset application with Orchestration available to all users publicly, create a new Password Reset process only for this purpose and make it accessible to all users by setting the Public access property.

- **Service desk-assisted process:** Users reset passwords by requesting the assistance of a service desk agent, over the phone or in person. Only service desk agents with the password_reset_service_desk role can reset user passwords. Watch the videos: Resetting User Passwords (Video) and How to Set Up a Service Desk-Assisted Password Reset Process (Video).

2. Understand how groups and roles differ in their access and security needs. Analyze and assess how members of each group in your organization access the system. For example, if members of the sales group primarily access the system remotely, consider using a stronger method or multiple methods to verify the identity of each user.

Identify user roles that have access to critical information and resources. For example, stronger verifications might be required for roles that have access to employee data, accounting information, or network configurations.

Based on your analysis of groups and roles, determine the number and variety of verifications needed for the different Password Reset processes.

3. Consider how to manage credentials.

Determine whether single sign-on is enabled with the type of directory service or other credential store used. If the directory service is configured for single sign-on, consider increasing the level of security by using multiple methods to verify identity of a user. A compromised user name and password can easily allow access to associated systems in a single sign-on environment.

4. Consider how to implement enrollment in the Password Reset program.

For example, will enrollment be optional or required? Will users be auto-enrolled? How will users be notified to enroll in the program? The answers to these questions will help you determine the appropriate verification types to use.

5. Consider which Password Reset options to offer to users.

- If your organization uses single sign-on, how will users reset their password if they are unable to log on?
- What options are available to users working off-site?

**Example: The default self-service Password Reset process**

The default self-service Password Reset process enables a user to reset the password without assistance from service desk agents.

**The default self-service password reset flow**

1. If a user does not remember the password, the user can click the **Forgot Password?** link on the login screen.
2. The Password Reset application starts. On the Identity page, the user identifies himself or herself by entering a **Username**.

3. On the Verify page, the user proves that they are the person who is associated with the username. In this example, the user enters the email address that is associated with the user profile. The admin can configure a different verification method or can require additional verifications, for example, a personal question that only the user can answer.

4. The Reset page tells the user to check email for instructions.

5. The user opens the email and clicks the **here** link to reset the password. The link is valid for a period that you specify (use the `password_reset.request.expiry` property).
6. The **Reset Password** page guides the user to reset the password.

The default self-service Password Reset process (com.glideapp.password_reset) defines:

- The URI that specifies where users are redirected when they click **Forgot Password**. By default this value is `/pwd_reset.do?sysparm_url=ss_default`, which is the same value used in the `glide.security.password_reset.uri` property. In previous releases, this value was set to `/reset_password.do`.
- The **Enable Password Reset URL** option, which specifies that the user should receive an email with a link to reset their password after they click **Forgot Password**.
- The **Personal Data - Enter Email Address** verification flow that specifies the three-step password reset flow.

See [Configure your Password Reset process](#) for instructions on accessing this form and configuring the fields.

**Note:**
- This feature works for locally authenticated users who enter the username and password specified in their user record. Users logging in to the instance via an SSO solution or an LDAP integration cannot reset passwords with self-service Password Reset.
Domain separation in the Password Reset application

A password reset process that you define in any domain is isolated from a process that you create in any other domain. Domain separation allows you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Domain separation is supported

Support: Level 2

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

Each password reset process follows these steps:

1. The end user asks to reset the password.
2. The user provides identifying information (typically username or email address).
3. The user verifies the identity — proves that they are who they say they are (typically by answering questions or submitting a code number that was delivered securely).
4. The instance connects to the credential store to confirm the user credentials.
5. The instance generates the new password and displays it to the user.

How domain separation works in Password Reset

Domain separation for Password Reset is applied at the process level. The admin configures the following elements to define a password reset process: A connection to a credential store, user groups that can use the process, method of identification, and verifications to use during the process.

- A connection to the credential store where user credentials (like username/password) are securely stored. Each connection inherits the domain setting from a template called a connection type. Each connection type is tied to a domain (the connection type record has a domain field). There are uniqueness constraints on connection names within a domain.
- One or more user groups on the ServiceNow instance that can use the password reset process. User accounts are members of one or more domains — they use the standard ServiceNow domain separation. When a user enrolls to use one of the password reset processes that is configured for the organization, the user is allowed to choose only from the processes in the user’s domain.
- The identification — the method that the end user employs to claim identity for the public password reset or password change process. Each identification inherits the domain setting from a template called an identification type. Each identification type is tied to a domain (the identification type record has a domain field). There are uniqueness constraints on identification names within a domain.
- One or more verifications — methods to verify the identity of the person who is attempting to reset the password. Each verification inherits the domain setting from a template called a
verification type. Each verification type is tied to a domain (the verification type record has a
domain field). There are uniqueness constraints on verification names within a domain.
- All Password Reset tables have a domain column.
- Password Reset process tables include a **sys-overrides** column on business rules, UI actions, and
  so on.
- The Password Reset application is built using Orchestration. Orchestration supports ‘Data only’
domain separation — the data security model of separating visibility of data from one domain
to another.

**Self-service and Service desk-assisted processes**

In addition to configuring the connections, user groups, identifications, and verifications that
are used in each process, the admin specifies one of the following operational methods for the
organization:
- **Self-service process**: End users reset passwords over the Internet using a browser on any
  supported interface, including mobile devices. The end user can select from any configured
  process in the end user’s domain (or child domain of an end user’s domain).
- **Service desk-assisted process**: End users do not reset passwords. An end user requests the
  assistance of a service desk agent, over the phone or in person. The agent processes the
  request. Each service desk agent has the Password Reset Admin service desk role. The “reset
  request” form that the agent works in presents a **User** field and a **Process** field. On the form, the
  agent can view all processes in the end user’s domain, even if the agent is not a member of
  one or more of the domains.

**Password Change process**

The Password Change application extends the Password Reset application by letting admins
define how users change their passwords. A service desk-assisted process is not supported. An
admin must publish the URL for the self-service password change form.

The Password Change application enables an end user to change a password over the Internet
using a browser on any supported interface, including mobile devices. The end user can select
from any configured process in the end user’s domain (or child domain of an end user’s domain).

A password change process uses the same elements as a password reset process (connections,
user groups, identifications, and verifications), with the same domain-separation features.

**Configure your Password Reset process**

To implement the process, you configure credentials, verifications, and users.

Role required: password_reset_admin or admin

1. Be sure to **Plan your Password Reset processes**.
2. Create the credential store record for usernames and passwords that are managed.

**Note**: For LDAP integrations: If the Active Directory settings require users to reset the
password when logging in, the results depend on the password reset plugin that is
installed.

- The Password Reset plugin cannot change an AD password. End users will not be
  able to log in to the instance.
3. Configure Password Reset to auto-enroll users or to enable users to enroll for the program. See Configure your Password Reset process to auto-enroll users and Enable users to enroll for Password Reset.

4. Define the verifications that the process will use.

A Password Reset process consists of the following elements:
- The credential store that contains user login credentials.
- Optionally, the user groups that are authorized to use the Password Reset process.
- The verifications (extension script includes) that verify the identity of the requesting user and that enable the service desk agents to authorize reset of the password.

1. Navigate to Password Reset > Processes.
2. Click New and then specify a meaningful Name and Description for the process.
3. Select the Credential store that contains the user credentials that the process applies to.
4. Specify the process that you are defining: Select the Password Reset check box and/or the Password change check box.
5. Specify the Apply to all users setting.

<table>
<thead>
<tr>
<th>Apply to all users setting</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Selected</td>
<td>All users use the process that you are defining. This setting is useful only if all users have access to the authentication methods that are defined in this process.</td>
</tr>
<tr>
<td>Not selected</td>
<td>Only the users in the groups that you specify use the process. You specify the groups in the Groups related list.</td>
</tr>
</tbody>
</table>

6. If you selected Password Reset, fill in the Password Reset Details tab and, optionally, the Advanced tab. See Settings on the Password Reset Details tab and Settings on the Password Reset Advanced tab.
7. Save the form. The form refreshes and additional related lists appear.
8. From the Password Reset Process Verifications related list, select one or more verifications. See Password Reset verifications.
9. Optional: From the Password Reset Process Groups related list, select the user groups that will use the process that you are defining.
   The Password Reset Process Groups related list appears only if the Apply to all users check box is not selected.
10. Select the Active check box to enable the Password Reset process that you configured. The check box is available only after the record has been saved.
11. Click Update.
12. Navigate to Password Reset > Properties to set the properties that configure the Password Reset experience for end users.
Credential stores for Password Reset

Credential stores hold user information such as user names and passwords that can be used as login credentials. Examples include the User (sys_user) table or an Active Directory server. Users with the password_reset_admin or password_reset_credential_manager role can create and modify connections to credential stores.

Credential store types installed with the base system

A credential store type is a set of workflows that specify how to connect to a credential store. Navigate to **Password Reset > Credential Stores** to view the list of example credential stores that are based on the base-system types. The base system includes the following credential store types:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local ServiceNow Instance</td>
<td>Represents the current (local) ServiceNow instance.</td>
</tr>
<tr>
<td>AD Credential Store</td>
<td>Represents an Active Directory credential store. Installed with the Orchestration Add-on plugin.</td>
</tr>
<tr>
<td>Remote (SOAP) ServiceNow instance</td>
<td>Represents a remote ServiceNow instance. Installed with the Orchestration Add-on plugin.</td>
</tr>
</tbody>
</table>

Remote credential stores

A remote credential store refers to any credential store other than the local ServiceNow instance. Remote credential stores, such as Active Directory, manage user names and passwords outside of the local instance. A remote credential store can also be a remote ServiceNow instance, a UNIX or Linux server, or any other directory-like service that relies on the SOAP protocol. The Password Reset Orchestration Add-on plugin is required to connect to remote credential stores. Review the information in the section on credential store types before you create, test, or delete credential stores.

Connection workflows for credential store types

A credential store type requires a subflow that defines how to connect to the store, and can include an optional subflow that defines how to test the connection. Use the **Pwd reset - AD** and **Pwd Reset - Local** subflows as models for your custom connection workflows.
Pwd Reset Local sub workflow
Configure and test the Password Reset connection to a credential store

You specify a credential store to access during the Password Reset or Password Change process and configure other settings that control the process.

Role required: password_reset_admin or password_reset_credential_manager

1. Navigate to Password Reset > Credential Stores.
2. Click New, enter a unique and meaningful Name and Description, and then fill in the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>You can use credential store types (templates that provide a desired set of capabilities). Credential stores inherit the functionality of the credential store type.</td>
</tr>
<tr>
<td></td>
<td><em>Note:</em> The Password Reset Windows Application supports only Active Directory (AD) credential stores.</td>
</tr>
<tr>
<td></td>
<td>Installed credential store types:</td>
</tr>
<tr>
<td></td>
<td>• Local ServiceNow Instance installed with Password Reset.</td>
</tr>
<tr>
<td></td>
<td>• AD Credential Store installed with the Orchestration Add-on.</td>
</tr>
<tr>
<td></td>
<td>• Remote (SOAP) ServiceNow installed with the Orchestration Add-on.</td>
</tr>
<tr>
<td>Auto-generate password</td>
<td>Script include that generates a temporary password for use during the reset process.</td>
</tr>
<tr>
<td></td>
<td><em>Note:</em> If you select the Enforce history policy check box, then you must specify a value for Auto-generate password.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Enforce history policy</td>
<td>To enforce the history policy that is configured for the credential store:</td>
</tr>
<tr>
<td></td>
<td>1. Select the <strong>Enforce history policy</strong> check box.</td>
</tr>
<tr>
<td></td>
<td>2. Follow the procedure that appears after this table.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Active Directory domains can be configured to include a history policy that ensures that users do not reuse passwords. For example, the history policy might be configured to not allow the user to reuse any of the previous three passwords when resetting a password.</td>
</tr>
<tr>
<td>Hostname</td>
<td>URL or IP address of the credential store that contains the user credentials (for example, usernames and passwords).</td>
</tr>
<tr>
<td>User account lookup</td>
<td>Script include that maps the user ServiceNow platform ID to the user credential store ID. A default script, PwdDefaultUserAccountLookup, returns the user ServiceNow platform user name.</td>
</tr>
<tr>
<td>Password rule hint</td>
<td>Text that appears on the password reset page to help the user to create a password that meets all requirements. The <strong>Password rule</strong> script enforces the requirements.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The Password Reset Windows Application supports newline characters in the hint. Other formatting is not supported (bold, underline, hyperlink, and so on).</td>
</tr>
<tr>
<td>Password rule</td>
<td>Client script that validates the password that the user enters. The script is invoked when the user enters a new password and clicks <strong>Password Reset</strong>. You can use the script to enforce password strength/complexity requirements.</td>
</tr>
<tr>
<td>Enable Password Strength</td>
<td>Select the check box to:</td>
</tr>
<tr>
<td></td>
<td>· Display the text box for the <strong>Strength rule</strong> script so you can update the script.</td>
</tr>
<tr>
<td></td>
<td>· Display the graphical <strong>Password Strength</strong> bar to the user while the user changes or resets the password.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The Password Reset Windows Application does not support Password Strength.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Strength rule</td>
<td>This text box appears only if you select <strong>Enable Password Strength</strong>. Client script that calculates the strength/complexity of the password that the user enters. The script is invoked when the user begins to enter a new password during the reset process.</td>
</tr>
<tr>
<td></td>
<td>Default settings:</td>
</tr>
<tr>
<td></td>
<td>• Selected for local ServiceNow credential stores</td>
</tr>
<tr>
<td></td>
<td>• Not selected for other credential stores</td>
</tr>
</tbody>
</table>

**Note:**
To guide the user during the reset process, the system displays a graphical bar labeled **Password Strength** under the **New password** field.

**Note:** The Password Reset Windows Application does not support **Password Strength**.

3. Click **Submit**.
   The connection is created. You should test the connection to a credential store after you configure a new credential store or when users experience problems that might involve the connection.

4. Navigate to **Password Reset > Credential Stores** and then open the credential store.

5. In the header bar, click **Save and Test Connection**.
   A progress page displays the result of the test.

If you selected the **Enforce history policy** check box, then follow these steps:

1. Open the associated Password Reset process definition: **Password Reset > Processes**.

2. On the Details tab of the Password Reset Process form, clear the **Auto-generate password** check box and then save the process definition.

3. On the domain controller, set **Password Aging** (**MIN_PASSWORD_AGE**) to zero.

4. On the domain controller, set the history policy to twice the desired number of passwords. For example, to enforce that the last three passwords are not repeated, set the history policy to six.

   **Note:** To enforce the history policy that is configured for the credential store, the system auto-generates a new temporary password for each reset cycle. The system auto-generates the temporary password even though you have cleared the **Auto-generate password** check box on the Password Reset Process form. Because the user...
Set up SOAP credentials for Password Reset

When the Orchestration Add-on plugin is activated, the ServiceNow platform can use the SOAP protocol to interact with remote credential stores such as a remote ServiceNow instance.

Role required: admin or web_service_admin

1. Navigate to System Web Services > Outbound > SOAP Message.
2. Click Password Reset Request.
3. From the Soap Message Functions related list, configure both the password_reset and sys_user_get_record functions by completing the following steps.
   a) In Basic auth user ID, enter the user ID for the remote system user who has privileges to update records on the User [sys_user] table.
   b) In Basic auth user password, enter the password for the remote system user who has privileges to update records on the User [sys_user] table.
   c) Select Use basic auth.
   d) Click Update.

You do not need to enter a value in the SOAP endpoint field. The field shows the name of the ServiceNow instance used for Password Reset.

Configure Password Reset for Active Directory

When the Orchestration Add-on plugin is activated, the Password Reset application can change passwords on an Active Directory credential store. The application changes passwords by referencing an Active Directory user role with the appropriate password change privileges.

Role required: admin

Active Directory must have a user role with the following privileges:

Descendent User objects:
- Reset password
- Read/Write pwdlastset
- Read/Write UserAccountcontrol
- Write Account Restrictions
- Read/Write lockouttime
- Read MemberOf

Descendent Group objects:
- Read Members
- Read MemberOf

1. Install MID Server on a Windows computer that can connect to Active Directory.
2. Configure the MID Server.
3. In the ServiceNow instance, navigate to Orchestration > Credentials.
4. Click New and then complete the form with the following values for the credential.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select Windows.</td>
</tr>
</tbody>
</table>
5. Click Submit.

6. Create a credential store for Active Directory.

Delete a connection to a credential store for Password Reset
Important: Before you delete the connection to a credential store, check all Password Reset processes to ensure that the credential store is not in use. If the credential store is being used by a process, update the process before deleting the credential store.

Role required: password_reset_admin or password_reset_credential_manager

1. Navigate to Password Reset > Credential Stores and then select the check box for the credential store.
2. In the Actions choice list, select Delete.

Create a credential store type for Password Reset
You can create a custom credential store type if the base-system types do not meet your needs.

Role required: password_reset_admin or password_reset_credential_manager

1. Navigate to Password Reset > Extensions > Credential Store Types.
2. Click New, enter a unique and meaningful Name and Description, and then fill in the form.

Note: You may need to configure the form to see the Get user lock state workflow and the Unlock user workflow.

New credential store fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password Reset workflow</td>
<td>Subflow that defines the credential store processing. Password Reset workflows are available to use as a model. Provide scripts for each of the activities defined for the subflow. For more information about how to create a workflow, see Create a workflow. For installed workflows, see Installed with Password Reset.</td>
</tr>
<tr>
<td>Connection test workflow</td>
<td>Subflow that defines how to test the connection. Connection test workflows are available to use as a model. If you create a connection test subflow, provide scripts for each of the activities defined for the subflow. For installed workflows, see Installed with Password Reset.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Get user lock state workflow</td>
<td>Subflow that defines how to get the user lock state. Get user lock state workflows are available to use as a model. Provide scripts for each of the activities defined for the subflow. For more on how to create a workflow, see Create a workflow. For installed workflows, see Installed with Password Reset.</td>
</tr>
<tr>
<td>Unlock user workflow</td>
<td>Subflow that defines how to unlock a user. Unlock user workflows are available to use as a model. If you create a connection test subflow, provide scripts for each of the activities defined for the subflow. For installed workflows, see Installed with Password Reset.</td>
</tr>
</tbody>
</table>

3. Click Submit.

Password Reset verifications

Each verification specifies the method and process for verifying the identity of the user that is requesting password reset.

Verifications included with Password Reset

The Password Reset application includes the following verifications in the base system. You can create a verification based on either a base-system verification or a verification type (a template).

Note: The Password Reset Windows Application does not support custom verifications.

Password Reset verifications

<table>
<thead>
<tr>
<th>QA verification</th>
<th>Implements a self-service Password Reset model with questions that are included with the base system or custom questions that the admin defines. While enrolling for the process, the user decides which questions to provide answers for. This verification is based on the Security Questions verification type. When a user requests password reset, the system poses a specified number of questions. The user must answer correctly to verify user identity. For information on the user enrollment experience, see Users: Enroll in the Password Reset program using questions and answers.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email verification</td>
<td>This verification relies on auto-generated code numbers. Based on the Email Code verification type. You typically implement Email verification as a self-service Password Reset model. When a user requests password reset, the system sends a verification code to an email address that the user authorized during enrollment. To verify identity, the user then submits the code on the Password Reset Verify page. For information on the user enrollment experience, see Users: Enroll in the Password Reset program using emailed codes. The Password Reset Windows Application supports Email verification.</td>
</tr>
</tbody>
</table>
| **SMS verification** | Implements a self-service or service desk-assisted Password Reset model that relies on auto-generated code numbers. This verification is based on the **SMS Code** verification type.  
When a user requests password reset, the system sends a code to an SMS-capable device that the user has authorized. To verify identity, the user then submits the code on the Password Reset Verify page.  
You can use the ServiceNow Notify feature to send the codes.  
For information on the user enrollment experience, see [Users: Enroll in the Password Reset program using SMS codes](#). |
| **Google Authenticator verification** | Password Reset model that relies on auto-generated code numbers. This verification is based on the **Google Authenticator** verification type. You typically implement Google Authenticator verification as a self-service Password Reset model.  
While requesting password reset, the user reads a code from the Google Authenticator app on a device that the user has paired. To verify identity, the user then submits the code on the Password Reset Verify page.  
For information on the user enrollment experience, see [Users: Enroll in the Password Reset program using Google Authenticator](#).  
The Password Reset Windows Application supports Google Authenticator verification. |
| **Personal Data — Confirm Email Address** | Implements a self-service Password Reset model that relies on user information that is available in the user profile on the instance. This verification is based on the **Personal Data Confirmation** verification type. |
| **Personal Data — Enter User Name** | Implements a self-service Password Reset model that relies on user information that is available in the user profile on the instance. This verification is based on the **Personal Data** verification type. |

**Verifications included with the demo data**

The following demo data is based on the Mock verification type:
- Sample Mock verification #1
- #2

*Personal data identification types and confirmation type verifications*

Personal data verifications allow users to verify their identity by providing answers to questions that are generated from personal information stored in the User table `[sys_user]`.  

**User experience**

For an example of how a user might enroll for Personal data verification, see [Users: Enroll in the Password Reset program using questions and answers](#).
### Personal data identification types

The Password Reset application provides the email and username identification types. You can use either type as provided or as a model to create a custom identification type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Identification</td>
<td>Identifies users by their email addresses.</td>
</tr>
<tr>
<td>Username Identification</td>
<td>Identifies users by their user names.</td>
</tr>
</tbody>
</table>

### Personal data confirmation verifications

- **Personal data verification**: If users are associated with a Password Reset process that uses a personal data verification, the users are typically not required to enroll for Password Reset.
- **Personal data confirmation verifications** allow employees with the `password_reset_service_desk` role to access personal data from the `sys_user` table when assisting a user with a password reset request.

To configure personal data and personal data confirmation verifications, you specify parameters as name/value pairs that correspond to a particular piece of user information. For example, to verify users by their email address:

1. Set the `label` parameter (the text that the end user should see) to Email (that is, `label=Email`).
2. Set the `column` parameter (the column in the table that holds the verification data) to `email` (that is, `column=email`).

**Note:** You can use only one set of name/value pair parameters per verification. Additional parameters are ignored.

To use multiple pieces of personal information for user verification, create more personal data or personal data confirmation verifications and add the verifications to the related Password Reset process.

### Personal data and personal data confirmation type verifications

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>Text to display as a label for the field that the user fills in during the password reset request. Data Type: string Default Value: n/a</td>
</tr>
<tr>
<td>column</td>
<td>Column of the <code>sys_user</code> table that provides the data that is used to verify the identity of the user. Data Type: string Default Value: n/a</td>
</tr>
</tbody>
</table>

Create a custom identification type for Password Reset
A custom identification type enables the user to enter alternative verification information such as an employee ID while resetting the password.

Role required: password_reset_admin or admin

1. Navigate to **Password Reset > Extensions > Identification Types**.
2. Click **New**, enter a unique and meaningful **Name** and **Description**, and then fill in the form.

<table>
<thead>
<tr>
<th>Identification field label</th>
<th>Text to display as a label for the Identification field.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identification processor</td>
<td>Identification processor script. Choose an existing script or create your own using the Identification form processor category (extension script).</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

**SMS Code Verification type for Password Reset**

Using the Simple Message Service (SMS) Code Verification type, a user can verify identity with the help of any SMS-enabled device, like a cell phone that accepts text messages. When a user requests password reset, the system sends a numerical code to the device and the user then enters the code on the Password Reset Verification page.

You can change the default behavior of an SMS code verification using either of the following methods:

- Set parameter values, as shown in the table.
- Update property settings for the Password Reset application.

**Note:** The system allows only one instance of each SMS code parameter.

**SMS Code Verification type parameters**

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Description</th>
</tr>
</thead>
</table>
| expiry         | Number of minutes the verification code is valid.  
Data Type: integer (any positive integer)  
Default Value: 5 |
| complexity     | Number of digits in the numerical verification code.  
Data Type: integer (any positive integer)  
Default Value: 4 |
| pause_window   | Number of minutes before the user can request another SMS code for verification.  
Data Type: integer (any positive integer)  
Default Value: 2 |
| max_per_day    | Maximum number of codes sent for verification in one day.  
Data Type: integer (any positive integer)  
Default Value: 10 |
User experience

For information on how users enroll for SMS verification, see [Users: Enroll in the Password Reset program using SMS codes](#).

Use NotifyNow to send SMS codes for enrollment and verification

You can configure the Password Reset application to send SMS codes for enrollment and verification using the ServiceNow NotifyNow application (via the Twilio SMS Messaging system). NotifyNow is tightly integrated with the workflow engine and business rules and delivers a highly configurable and trusted way to deliver SMS messages.

Role required: admin

NotifyNow requires a separate contract with Twilio.

1. Enroll for a Twilio account and telephone number at [https://www.twilio.com/](https://www.twilio.com/)
2. Activate the Notify plugin.
3. Associate the Twilio account with Notify.

No other configuration is required. Users who request password change or reset receive SMS codes through NotifyNow.

Configure your Password Reset process to auto-enroll users

To simplify management, many organizations auto-enroll users in the Password Reset program. Every base-system verification type enables you to specify automatic enrollment for your process.

Role required: password_reset_admin or admin

To enable automatic enrollment, you configure settings for the verification type that your Password Reset process is based on.

1. Navigate to **Password Reset > Extensions > Verification Types**.
2. Click the verification type for the verification that your Password Reset process uses. The verification type for each base-system verification is identified in [Password Reset verifications](#).
3. On the **Verification Types** page, specify the following settings:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enrollment check</td>
<td>Script that determines whether a user is enrolled for verification.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> For automatic enrollment to work, the Enrollment check script must return true. This may require additional setup by the admin to ensure that the preconditions are met. For example, for the SMS Code verification type, records must be populated in particular tables. If no script is specified when Automatic Enrollment is selected, a default script is provided.</td>
</tr>
<tr>
<td>Automatic enrollment</td>
<td>Select the check box to auto-enroll users.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If Automatic enrollment is not selected, then you must provide an enrollment UI macro and enrollment processor script as described in <a href="#">Create a custom Password Reset verification type</a>.</td>
</tr>
</tbody>
</table>
4. Repeat the procedure for all verifications that your Password Reset process uses.

Enable users to enroll for Password Reset

To enable users to enroll for the Password Reset program, you specify a UI macro that takes the user through the enrollment process and a script that processes the enrollment data that the user entered. The base system includes a functioning macro and script.

Role required: password_reset_admin or admin

To enable users to enroll, you configure settings for the verification type that your Password Reset process is based on.

1. Navigate to **Password Reset > Extensions > Verification Types.**
2. Click the verification type for the verification that your Password Reset process uses. The verification type for each base-system verification is identified in **Password Reset verifications.**
3. On the **Verification Types** page, specify the following settings:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automatic enrollment</td>
<td>Clear the check box to disable automatic enrollment.</td>
</tr>
<tr>
<td>Enrollment UI</td>
<td>Enrollment UI macro that takes the user through the enrollment process.</td>
</tr>
<tr>
<td>Enrollment processor</td>
<td>Enrollment processor script that processes enrollment data.</td>
</tr>
</tbody>
</table>

4. Repeat the procedure for all verifications that your Password Reset process uses.

Enabling user enrollment

This example verification type uses the **pwd_enroll_sms_ui** enrollment UI macro and the **PwdEnrollSMSProcessor** enrollment processor script.
A verification type must also define a verification UI macro and a corresponding verification processor script. The example uses the `{pwd_verify_sms_ui}` verification UI macro and the `{PwdVerifySMSProcessor}` verification processor script.
Verification UI macro

```xml
<xml version="1.0" encoding="utf-8" ?
	<!DOCTYPE jelly SYSTEM "jelly:core"
	<script language="javascript">
	addLoadEvent(getVerificationInfo);

text: getVerificationInfo() {
	var ga = new GlideAjax('PwAajaxPublicEnrollSMS');

gl.addParam('sysparam_name', 'getENSServerLocationInfo');

gl.addParam('sysparam_user_id', 'findUserBySysUser_10');

// add CSRF token for AJAX handling

gl.addParam('sysparam_pws.csrf_token', findCERFElement().value);

gl.getXML(handleGetVerificationInfoResponse, null);
}

text: handleGetVerificationInfoResponse(response, args) {
```

Configure the required strength for passwords

The password that a user defines must meet certain requirements — for example, it must contain at least eight characters, it must include a numeral, and so on. You can configure the requirements as needed for your organization.
Role required: password_reset_admin

The base system includes example credential stores with various password requirements. You can modify password requirements and provide users with hints for creating a password. The default requirements are:

- At least eight characters
- At least one uppercase and one lower case letter
- At least one numeral

**Note:** In addition to configuring password strength requirements, you can configure several other settings for the credential store, as described in Configure and test the Password Reset connection to a credential store.

1. Navigate to **Password Reset > Credential Stores**.
2. Select the credential store in the list and then configure the following settings:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password rule hint</td>
<td>Text that appears on the password reset page to help the user to create a password that meets all requirements. The Password rule script enforces the requirements. <strong>Note:</strong> The Password Reset Windows Application supports newline characters in the hint. Other formatting is not supported (bold, underline, hyperlink, and so on).</td>
</tr>
<tr>
<td>Password rule</td>
<td>Client script that validates the password that the user enters. The script is invoked when the user enters a new password and clicks Password Reset. You can use the script to enforce password strength/complexity requirements.</td>
</tr>
</tbody>
</table>
| Enable Password Strength| Select the check box to:  
  - Display the text box for the Strength rule script so you can update the script.  
  - Display the graphical Password Strength bar to the user while the user changes or resets the password.  
  **Note:** The Password Reset Windows Application does not support Password Strength. |
### Field | Description
--- | ---
Strength rule | This text box appears only if you select **Enable Password Strength**. Client script that calculates the strength/complexity of the password that the user enters. The script is invoked when the user begins to enter a new password during the reset process. Default settings:
- Selected for local ServiceNow credential stores
- Not selected for other credential stores

#### Note:
To guide the user during the reset process, the system displays a graphical bar labeled **Password Strength** under the **New password** field.

#### Note:
The Password Reset Windows Application does not support Password Strength.

3. Click **Submit**. You should test the connection to a credential store after you configure a new credential store or when users experience problems that might involve the connection.

4. Navigate to **Password Reset > Credential Stores** and then open the credential store.

5. In the header bar, click **Save and Test Connection**. A progress page displays the result of the test.

### Settings on the Password Reset Details tab

The settings on the **Details** tab define the user experience when resetting or changing a password. The Password Reset **Details** tab appears when you are configuring a Password Reset process (**Password Reset > Processes**).
### Settings on the Details tab

<table>

Configure Google reCAPTCHA for the password reset process

To use the Google reCAPTCHA service, instances that are running on a domain other than service-now.com require an API key pair from Google.

Role required: admin

- The procedure described in this topic is optional for instances that are running on the service-now.com domain.
- Because on-premises instances do not have access to the Internet, they cannot use the Google reCAPTCHA service. Do not follow the procedure described in this topic. Instead, set the password_reset.captcha.google.enabled system property to false. This setting enables the CAPTCHA service that is provided with the base system.
- The Password Reset Windows Application uses the base-system CAPTCHA service even if the Password Reset application is configured to use Google reCAPTCHA.

1. Request an API key pair (a site key and a secret) from Google at https://www.google.com/recaptcha.
2. Set the following system properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>password_reset.captcha.google.enabled</td>
<td>Set to true. Type: string Default: true</td>
</tr>
<tr>
<td>google.captcha.site_key</td>
<td>Set to the site key that Google provided. Type: string Default: A site key that Google provided to ServiceNow</td>
</tr>
<tr>
<td>google.captcha.secret</td>
<td>Set to the secret that Google provided. Type: password2 Default: An encrypted secret that Google provided to ServiceNow</td>
</tr>
</tbody>
</table>

Settings on the Password Reset Advanced tab

UI macros and script includes can extend the basic functionality of a Password Reset process. The Advanced tab appears when you are configuring a Password Reset process (Password Reset > Processes).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Entry UI macro</td>
<td>UI macro that displays a customized message to users when they access the initial Password Reset screen.</td>
</tr>
<tr>
<td>Success UI macro</td>
<td>UI macro that displays a customized message to users on the final Password Reset screen when their password is successfully reset.</td>
</tr>
<tr>
<td>Failure UI macro</td>
<td>UI macro that displays a customized message to users on the final Password Reset screen when their password reset fails.</td>
</tr>
</tbody>
</table>
Configure Password Reset properties

You can specify properties that configure the Password Reset experience for end users.

Role required: password_reset_admin

While there are no range limits for the values you can enter for properties, consider using only positive integer values starting at 1. When you determine the limit for the upper range of a property, consider the task that the user is performing.

For example, you would not want to allow 100 attempts for users to verify their identity. A more common value is three attempts. Similarly, you may not want to force users who are completing the enrollment process to spend time selecting and answering 30 security questions. The more commonly used number of security questions is between five and seven.

1. Navigate to Password Reset > Properties.
2. Update settings as needed and then click Save.

<table>
<thead>
<tr>
<th>Password Reset properties</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label on the Password Reset Properties page</td>
</tr>
<tr>
<td>Password Reset Global properties</td>
</tr>
<tr>
<td>Workflow polling frequency</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>Workflow expiration</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>Label on the Password Reset Properties page</td>
</tr>
<tr>
<td>-------------------------------------------</td>
</tr>
</tbody>
</table>
| Disable CAPTCHA validation functionality | password_reset.captcha.ignore | Enables or disables CAPTCHA functionality.  
  - Type: true | false  
  - Default value: false  
  The Password Reset application uses Google re-CAPTCHA as the default CAPTCHA service. To use the base system CAPTCHA, change the password_reset.captcha.google.enabled system property to false.  
  See Configure Google reCAPTCHA |

### Password Reset Request properties

| Number of unsuccessful attempts allowed to reset/change password | password_reset.request.max_attempt | Number of password reset attempts a user has before they are locked out for a period determined by the value in max_attempt_window.  
  - Type: integer  
  - Default value: 3 (attempts) |

| Number of minutes a user must wait to reset/change password after exceeding the maximum allowed unsuccessful attempts | password_reset.request.max_attempt_window | Time period that users are blocked or prevented from changing their passwords after trying the maximum number of times.  
  - Type: integer  
  - Default value: 1440 (minutes) |

| Number of minutes a user must wait to reset/change password after the last successful reset/change | password_reset.request.success_window | Time period that a user must wait after successfully resetting the password to reset the password again.  
  - Type: integer  
  - Default value: 1440 (minutes) |

| Number of minutes a user must wait to start a reset request after the last successful unlock account | password_reset.request.unlock_window | Time period that a user must wait after a successful unlock operation before starting a new request.  
  - Type: integer  
  - Default value: 1440 (minutes) |
<table>
<thead>
<tr>
<th>Label on the Password Reset Properties page</th>
<th>Property name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Number of minutes before a password reset request expires | password_reset.request.expiry | Time period that a user is allowed to perform the Password Reset process.  
- Type: integer  
- Default value: 10 (minutes) |

**Password Reset Security Question properties**

| Minimum number of characters in any answer | password_reset.qa.ans_min_len | Minimum number of alphanumeric characters that the user must enter in the answer text box for any security question.  
Default value: 3 characters |
| Number of security questions required during the password reset request | password_reset.qa.num_reset | Number of questions that a user must answer to verify identity during the Password Reset process.  
- Type: integer  
- Default value: 3 (questions)  
- Possible values: Integers that are less than the number specified for the num_enroll property. |

**Note:** You can override this security question property by adding the num_reset parameter in the security question verification.
<table>
<thead>
<tr>
<th>Label on the Password Reset Properties page</th>
<th>Property name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Number of security questions required during enrollment | password_reset.qa.num_enroll | During the enrollment process, the number of questions that a user must answer to be enrolled in the Password Reset program.  
  - Type: integer  
  - Default value: 5 (questions)  
  
  **Note:** You can override this security question property by adding the `num_enroll` parameter in the security question verification. |

<table>
<thead>
<tr>
<th>Password Reset SMS Code properties</th>
<th>Property name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Maximum number of SMS codes sent for verification per day | password_reset.sms.max_per_day | Maximum number of SMS codes that are sent to a user within one 24-hour period. The 24-hour period begins when a user clicks **Send Code**.  
  - Type: integer  
  - Default value: 10 (per day)  
  
  **Note:** You can override this SMS code property by adding the `max_per_day` parameter in the SMS code verification. |

| Number of minutes before the user can attempt to send another SMS code for verification | password_reset.sms.pause_window | Time that must pass before another SMS code can be sent to a user.  
  - Type: integer  
  - Default value: 2 (minutes)  
  
  **Note:** You can override this SMS code property by adding the `pause_window` parameter in the SMS code verification. |
<table>
<thead>
<tr>
<th>Label on the Password Reset Properties page</th>
<th>Property name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Number of digits in the SMS code sent to the user | password_reset.sms.default_complexity | Number of characters required for a user to reset their password.  
- Type: integer  
- Default value: 4 (digits)  
You can override this SMS code property by adding the complexity parameter in the SMS code verification. |
| Number of minutes before the SMS code expires | password_reset.sms.expiry | Time, in minutes, until the SMS code sent to the user expires.  
- Type: integer  
- Default value: 5 (minutes)  |

**Password Reset Monitoring and Reporting properties**

| Time interval, in minutes, for counting blocked users | password_reset.activity_monitor.incident_window | Time window to count the number of blocked users.  
- Type: integer  
- Default value: 60 (minutes)  |
| Number of blocked users, in the defined time interval, that triggers a system log event | password_reset.activity_monitor.incident_threshold | Number of blocked (or locked) users, within the specified time window, that triggers a system log event.  
- Type: integer  
- Default value: 10 (blocked users)  |

**Note:** Several components in the Self Service Password Reset (com.snc.password_reset) plugin and the Password Reset (com.glideapp.password_reset) plugin control the password reset flow. The following properties affect Password Reset, but do not appear on the Password Reset > Properties page:
- You can add the glide.pwd_reset.onetime.token.validity property to the System Properties (sys_properties) table to specify the number of hours that the Password Reset token should be valid. Default: 12.
Properties accessible from the System Properties (sys_properties) table:

- For Password Reset on mobile devices, you can specify the URL that the user is taken to when user taps the **Forgot password?** button. See the `glide.security.password_reset.uri` property in *High Security Settings*. Default: `/pwd_reset.do?sysparm_url=ss_default`
- If `glide.security.forgot_password.display.link` is set to *true*, displays the **Forgot Password?** link on the login page.

**Specify lockout for failed login attempts**

The system provides inactive script actions that enable you to specify the number of failed login attempts before a user account is locked and to reset the count after a successful login.

Role required: admin

Navigate to **System Policy > Script Actions** to view or activate the scripts.

**Note:** Starting with the Kingston release, following a zBoot, the script actions **SNC User Lockout Check with Auto Unlock** and **SNC User Clear** are activated.

<table>
<thead>
<tr>
<th>Script action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SNC User Lockout Check with Auto Unlock</td>
<td>- Uses the value of the <code>glide.user.max_unlock_attempts</code> property to set the limit for failed login attempts.</td>
</tr>
<tr>
<td></td>
<td>- Unlocks the user account after the time period that is specified for the <code>glide.user.unlock_timeout_in_mins</code> property. If no value is specified, then the system unlocks the user account after the default period of 15 minutes.</td>
</tr>
<tr>
<td>SNC User Lockout Check</td>
<td>Tracks the number of failed login attempts and locks the user account after a specified number of failed login attempts (default: 5).</td>
</tr>
<tr>
<td>SNC User Clear</td>
<td>Updates the user record after a successful login: Resets the number of failed login attempts and updates the date of the last login.</td>
</tr>
</tbody>
</table>

Each time a user attempts to log in, the action is recorded in an event log. You can view a log of failed login attempts.

1. Navigate to **System Policy > Event Logs**.
2. Filter for `login.failed` in the Name field. You can view the attempted login name, date, and IP address logged for the attempt.

**Integrate Password Reset with a CMS integration**

You can configure a site in the ServiceNow content management (CMS) application to define a single-site access point that includes the Password Reset service. For example, you can create an employee self-service site that provides Password Reset service.

Role required: content_admin
Each Password Reset process requires a separate CMS page.

1. Navigate to **Content Management > Specialty Content > iFrames** and create an iFrame record.
2. Go to **Content Management > Sites** and create a site that has no login page.

3. Go to **Content Management > Pages** and create a password reset page.
4. Enter the name of the site that you created in the **Content site** field (*Password Reset self-service* in the example).
5. Right-click the form header and click **Save**.
6. Click the **Edit Page** related link and then click **Add content**.
7. In the **Content Blocks** section, select the iFrame that you created. Add more content as needed.
8. Click **Update**.
Customizing Password Reset processes

Password Reset scripts enable you to customize Password Reset by creating your own credential store, verification, and identification types, and extend them by defining extension scripts. You can also create a custom credential store type, custom verification type, or verification.

Password Reset scripting is available to users with the password_reset_admin role. The easiest way to customize Password Reset is:

1. Create custom types and scripts as described in [Password Reset extension script categories](#).
   Extension scripts enable you to extend functionality in a password reset process. The extension script category refers to the specific types of behavior for an extension script (for example, credential store, verification, identification type, or as a post-processor).

2. Follow the configuration steps described in [Configure your Password Reset process](#).

3. Select the new types that you created. You can customize the following components:
   - Credential store types: Define new types for how to connect to your credential stores by creating custom workflows for connection and testing. See [Create a credential store type for Password Reset](#).
   - Verification types: Define new types for how users are verified. See [Create a custom Password Reset verification type](#).
   - Identification types: Define new types for how users can identify themselves. See [Create a custom identification type for Password Reset](#).

Add a custom question to the Security Questions verification

To enroll for the 'Security Questions' verification, the user selects several questions and supplies answers that only the user knows. You can add a custom question to the set of questions that are included with the base system.

Role required: password_reset_admin or admin

The default language is English, and you can create a custom question in a non-English language. If you create the appropriate non-English language questions, then the questions appear in the language that the user requested during login.

**Note:** Do not change the Language value for the default questions that come with the base system.

1. Navigate to Password Reset > Security Questions and then click New.
2. Enter the English language question in the Security question field and then click Submit.
3. To add the same question in another language, complete the following steps.
   a) Click the English language question to translate.
   b) On the Password Reset Question page, in the Translations related list, click New.
   c) Select the language in the Language field.
   d) Enter the non-English text in the Security question field.
   e) Click Submit.

   The question appears in the Translations related list on the Password Reset Question page. If a user selects the language while logging in, then the verification question appears in that language.
Configure the number of questions for a 'Security Questions' verification

When designing a Security Questions verification for Password Reset, you can specify the number of questions to display when users enroll and the number to display when a user requests password reset.

Role required: password_reset_admin or admin

1. Navigate to **Password Reset > Verifications** and then open a verification that uses the **Security Questions Verification Type**.
2. Configure the parameters in the **Password Reset Verification Parameters** related list.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>num_enroll</td>
<td>Number of security questions that are displayed while a user is enrolling for Password Reset. <strong>Data Type:</strong> Positive integer that does not exceed the number of questions in the security questions list (Password Reset &gt; Security Questions). <strong>Default Value:</strong> 5</td>
</tr>
<tr>
<td>num_reset</td>
<td>Number of security questions that are displayed while a user is attempting to reset the password. The questions are selected at random and are presented in random order. <strong>Data Type:</strong> Positive integer that does not exceed the value of the num_enroll parameter <strong>Default Value:</strong> 3</td>
</tr>
</tbody>
</table>

3. Click **Update**.

Create a custom Password Reset verification type

Each verification in Password Reset is based on the settings for a verification type. If the verification types in the base system do not meet your needs, you can create a custom verification type.

Role required: password_reset_admin or admin

Review the verification types that are provided in the base system to determine whether to create a custom verification type. Then review the verification type components to develop.

1. Navigate to **Password Reset > Extensions > Verification Types**.
2. Click **New**, enter a unique and meaningful **Name** and **Description**, and then fill in the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enrollment check</td>
<td>Script that determines whether a user is enrolled for verification. Automatic enrollment requires an enrollment check. If no script is specified when Automatic Enrollment is selected, a default script is provided.</td>
</tr>
<tr>
<td>Automatic enrollment</td>
<td>Select the check box to auto-enroll users. If Automatic enrollment is not selected, then you must provide an enrollment UI macro and enrollment processor script.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Enrollment UI</td>
<td>Enrollment UI macro that provides the UI for the enrollment.</td>
</tr>
<tr>
<td>Enrollment processor</td>
<td>Enrollment processor script that processes the enrollment.</td>
</tr>
<tr>
<td>Verification UI</td>
<td>Verification UI macro that provides the UI for the verification.</td>
</tr>
<tr>
<td>Verification processor</td>
<td>Verification processor script (extension scripts) that processes the verification.</td>
</tr>
</tbody>
</table>

3. Click Submit.

Create a Password Reset verification from an existing verification

The Password Reset application includes several example verifications that you can use as they are or as the basis for a custom verification. If the verification types in the base system do not meet your needs, you can create a custom verification type.

Role required: password_reset_admin

Note: The Password Reset Windows Application does not support custom verifications.

1. Navigate to Password Reset > Verifications and select a verification.
2. If needed, modify the parameters on the Password Reset Verification Parameters tab. The parameters are described in the instructions for the type of verification that you are working on.
3. Click Submit.
4. Each verification type has properties that control the user experience. Review the property settings and update as needed.

Create a custom Password Reset verification

Use a verification type in the base system as a template to design a custom verification. The Password Reset Windows Application does not support custom verifications.

Role required: password_reset_admin

<table>
<thead>
<tr>
<th>Verification type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Personal Data Confirmation</td>
<td>Verifies user identity using data from the User (sys_user) table. The user data is displayed to a service desk agent. The agent verifies the data. Enrollment is not required for this type. Recommended for service desk-assisted processes.</td>
</tr>
</tbody>
</table>

Note: The Password Reset Windows Application does not support the Personal Data Confirmation Verification type.

See Personal data identification types and confirmation type verifications.
<table>
<thead>
<tr>
<th>Verification type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Personal Data</td>
<td>Verifies user identity using data from the User (sys_user) table. The user is required to answer questions. Enrollment is not required for this type.</td>

</tbody>
</table>
## ServiceNow Kingston Now Platform Capabilities

### Verification type Description

<table>
<thead>
<tr>
<th>Verification type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mock</td>
<td>Not a functional identity verification. Demonstrates how to add a verification type in a Password Reset process.</td>
</tr>
</tbody>
</table>

**Note:** The Password Reset Windows Application does not support the Mock verification type.

- The enrollment UI macro for this verification gets the user input and returns the entered value in the enrollment processor.
- The Password Reset UI macro for this verification gets input from the user and returns the entered value through the verification processor.

1. Navigate to **Password Reset > Extensions > Verification Types**.
2. Click **New**, enter a unique and meaningful **Name** and **Description**, and then fill in the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Create verifications based on one of the verification types in the base system. Password Reset supports the following types. You can create multiple instances of any type.</td>
</tr>
<tr>
<td></td>
<td>- Personal Data Confirmation Verification</td>
</tr>
<tr>

</tr>
<tr>
<td></td>
<td>- SMS Code Verification. You can create only a single instance.</td>
</tr>
</tbody>
</table>

| Order                  | Position of the verification as it appears on the Enrollment form and Password Reset form. |
| Password Reset         | Parameters used by a verification to configure specific behaviors, like number of questions required to enroll, request expiration time, and columns used. Set parameters for any behavior that should be different from the value that is specified in the Password Reset properties. |
| Verification Parameters| The available parameters are described separately for each verification type. |

3. Click **Submit**.
4. Each verification type has properties that control the user experience. Review the property settings and update as needed.

**Password Reset script includes**

The Password Reset plugin adds several Password Reset script includes. Use the base-system script includes as they are or call custom extension scripts at the provided extension points.

Extension scripts enable you to extend functionality in a password reset process. The extension script category refers to the specific types of behavior for an extension script (for example, credential store, verification, identification type, or as a post-processor).
'Enrollment check' script includes

All enrollment check script includes take the following parameters and return a boolean indicating whether the user is enrolled for Password Reset.

- `params.userId`: The sys_id of the user being checked (table: [sys_user]).
- `params.verificationId`: The sys_id of the verification being checked (table: [pwd_verification]).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdAlwaysEnrolled</td>
<td>Provides a default check that always returns true.</td>
</tr>
<tr>
<td>PwdMockIsEnrolled</td>
<td>Provides an example check that always returns true.</td>
</tr>
<tr>
<td>PwdQuestionsEnrollmentCheck</td>
<td>Determines whether a user has enrolled for Password Reset using security question verification.</td>
</tr>
<tr>
<td>PwdSMSEnrollmentCheck</td>
<td>Determines whether a user has enrolled for Password Reset using SMS verification.</td>
</tr>
</tbody>
</table>

'Identification form processor' script includes

Identification form processor script includes provide functionality for extending identification processing.

All identification form processor script includes take the following parameters, and return the sys_id of the user that corresponds to the requested input. If the user was not identified, it returns null.

- `params.processId`: The sys_id of the calling Password Reset process (table: [pwd_process]).
- `params.request`: The form request object. Fields in the form can be accessed with `request.getParameter('<element-id>').` The supported request parameter is `sysparm_user_id`, the user identifier value entered in the form.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdIdentifyViaEmail</td>
<td>Verifies a user's identity by checking the email address.</td>
</tr>
<tr>
<td>PwdIdentifyViaUsername</td>
<td>Verifies a user's identity by checking the user name.</td>
</tr>
</tbody>
</table>

'Enrollment form processor' script includes

Enrollment form processor script includes provide functionality for extending enrollment form processing.

All enrollment form processor script includes take the following parameters, and return a boolean indicating whether the user was successfully enrolled.

- `params.userId`: The sys_id of the user trying to enroll (table: [sys_user]).
- `params.verificationId`: The sys_id of the verification used to enroll (table: [pwd_verification]).
- `params.enrollmentId`: The sys_id of this enrollment process.
• request: The form request object. Fields in the form can be accessed with request.getParameter('element-id')

You should add the following information to the state of the enrollment process:

• gs.getSession().putProperty("result.status", status): Whether the user was successfully enrolled.
• gs.getSession().putProperty("result.message", message): An associated message to be returned to the UI, such as a detailed error message.
• gs.getSession().putProperty("result.value", value): A custom value associated with the enrollment.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdEnrollQuestionsProcessor</td>
<td>Handles questions and answers for verification.</td>
</tr>
<tr>
<td>PwdEnrollSampleProcessor</td>
<td>Provides an enrollment processor for sample verification.</td>
</tr>
<tr>
<td>PwdEnrollSMSProcessor</td>
<td>Provides an enrollment processor for SMS verification.</td>
</tr>
</tbody>
</table>

'User account lookup' script includes

User account lookup script includes return the credential store account_id for a given user.

The following parameter returns the credential store account_id for a given user.

• params.userId: The sys_id of the user being checked (table: [sys_user]).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdDefaultUserAccountLookup</td>
<td>Provides a default script for user account lookup from a user_id to the account in a credential store. The default mapping is to use the user name as the account name.</td>
</tr>
</tbody>
</table>

'Password generator' script includes

Password generator script includes take the following parameter, and return an auto-generated string password.

• params.credentialStoreId: The sys_id of the calling Password Reset process (table: [pwd_process]).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdDefaultAutoGenPassword</td>
<td>Generates a password from a random word and 4 digits.</td>
</tr>
</tbody>
</table>

'Verification processor' script includes

If the user identity is verified, the verification processor script includes return true.
Verification processor script includes take the following parameters:

- **params.resetRequestId**: The sys_id of the current Password Reset request (table: (pwd_reset_request)).
- **params.userId**: The sys_id of the user to be verified (table: (sys_user)).
- **params.verificationId**: The sys_id of the verification (table: (pwd_verification)).
- **request**: The form request object. Access the fields in the form with request.getParameter('<element-id>').

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdVerifyPersonalDataConfirmationProcess</td>
<td>Verifies that the user accepts the answer.</td>
</tr>
<tr>
<td>PwdVerifyPersonalDataProcessor</td>
<td>Verifies that the user’s answers match the expected data in the system.</td>
</tr>
<tr>
<td>PwdVerifyQuestionsProcessor</td>
<td>Provides question and answer verification of user input on the second page of the verification form.</td>
</tr>
<tr>
<td>PwdVerifySimpleProcessor</td>
<td>Provides simple verification of user input on the second page of the verification form.</td>
</tr>
<tr>
<td>PwdVerifySMSProcessor</td>
<td>Provides SMS verification of user input on the second page of the verification form.</td>
</tr>
</tbody>
</table>

‘Post processor’ script includes

Post processor script includes execute custom actions after the Password Reset process has completed.

All post processor script includes take the following parameters.

- **params.resetRequestId**: The sys_id of the current Password Reset request (table: (pwd_reset_request)).
- **params.wfSuccess**: A flag indicating whether the workflow completed successfully: True if, and only if, successful.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdPostProcessor</td>
<td>Executes actions after the process completes for success, failure, or both conditions.</td>
</tr>
</tbody>
</table>

Example custom scripts for Password Reset

The example scripts perform a user account lookup and processes an identification form, define a credential store, and create an identification type.

Perform a user account lookup and process an identification form

The main script calls two extension scripts, one to perform the user account lookup, and the other to process the identification form.

```javascript
// User account lookup
var lookupExtensionSysId = getExtensionScriptSysId('SampleUserAccountLookupExtension', 'user_account_lookup');
var lookupExtension = new SNC.PwdExtensionPoint(lookupExtensionSysId);
```
// Setup parameters required for this extension type - userId
var params = new SNC.PwdExtensionPointParameter();
params.userId = 'joe.employee';

// Invoke the extension
var answer = lookupExtension.process(params);
gs.print('user: ' + answer);

// Form processor sample - Identification form processor
var identExtensionSysId =
    getExtensionScriptSysId('SampleIdentificationProcessorExtension',
    'identification_form_processor');
var identificationExtension = new
    SNC.PwdExtensionPoint(identExtensionSysId);

// Setup parameters required for this extension type - processId
var params = new SNC.PwdExtensionPointParameter();
params.processId = 'pwdreq1234';

// Simulate the posted form parameter for the identification processor
var request = new SNC.PwdExtensionPointParameter(); // A real life case
    will inject it's own request object
request.setParameter('sysparm_user_id', 'joe.employee');

var userIdentity = identificationExtension.processForm(params, request);
gs.print('identity: ' + userIdentity);

// Simple helper to return the sys-id for a given extension script
function getExtensionScriptSysId(scriptName, category) {
    var result;
    var gr = new GlideRecord('sys_script_include');
gr.addQuery('name', scriptName);
gr.addQuery('script', 'CONTAINS', 'category: \"password_reset.extension.' + category + '\\"');
gr.query();
    if (gr.next()) {
        result = gr.getValue('sys_id');
    }
    return result;
}

Define a credential store

The following is an example of an extended process function in the User Account Lookup
category used to define a credential store. To create this extension script, go to Password Reset >
Extensions > New extension script and create a new script as described in Create an Extension
Script. To configure the User Lookup in a Password Reset process, see Credential Stores.

<?xml version="1.0" encoding="UTF-8"?>
<record_update table="sys_script_include">
    <sys_script_include action="INSERT_OR_UPDATE">
        <active>true</active>
        <client_callable>false</client_callable>
        <description>Simple account lookup that returns the supplied user id</description>
        <name>SampleUserAccountLookupExtension</name>
        <script><![CDATA[
            var SampleUserAccountLookupExtension = Class.create();
            SampleUserAccountLookupExtension.prototype = {
            }]]></script>
</sys_script_include>
</record_update>
Create an identification type

The following is an example of an extended processForm function in the Identification Form Processor category that can be used to create an identification type. To create this extension script, go to Password Reset > Extensions > New extension script and create a new script as described in Create an Extension Script.

```xml
<?xml version='1.0' encoding='UTF-8'?>
<record_update table="sys_script_include">
</record_update>
```
<sys_script_include action="INSERT_OR_UPDATE">
  <active>true</active>
  <client_callable>false</client_callable>
  <description>Script that processes an identification form.
  Returns the sys-id of the user that corresponds to the requested input; if no user was found, null should be returned.</description>
  <name>SampleIdentificationProcessorExtension</name>
  <script><![CDATA[
var SampleIdentificationProcessorExtension = Class.create();
SampleIdentificationProcessorExtension.prototype = {
    category: 'password_reset.extension.identification_form_processor', // DO NOT REMOVE THIS LINE!
    processForm: function(params, request) {
      return request.getParameter('sysparm_user_id') + '_' + params.processId;
    },
    type: 'SampleIdentificationProcessorExtension'
};]]>
</script>
</sys_script_include>
Use the `process` and `processForm` extensions

This example shows a script that uses two sample extensions, one `process` extension and one `processForm` extension.

```plaintext
// User account lookup
var lookupExtensionSysId =
    getExtensionScriptSysId('SampleUserAccountLookupExtension', 'user_account_lookup');
var lookupExtension =
    new SNC.PwdExtensionPoint(lookupExtensionSysId);

// Setup parameters required for this extension type - userId
var params =
    new SNC.PwdExtensionPointParameter();
params.userId = 'joe.employee';

// Invoke the extension
var answer = lookupExtension.process(params);
gs.print('user: ' + answer);

// Form processor sample - Identification form processor
var identExtensionSysId =
    getExtensionScriptSysId('SampleIdentificationProcessorExtension', 'identification_form_processor');
var identificationExtension =
    new SNC.PwdExtensionPoint(identExtensionSysId);

// Setup parameters required for this extension type - processId
var params =
    new SNC.PwdExtensionPointParameter();
params.processId = 'pwdreq1234';

// Simulate the posted form parameter for the indentification processor
var request =
    new SNC.PwdExtensionPointParameter();
request.setParameter('sysparm_user_id', 'joe.employee');

var userIdentity =
    identificationExtension.processForm(params, request);
gs.print('identity: ' + userIdentity);

// Simple helper to return the sys-id for a given extension script
function getExtensionScriptSysId(scriptName, category){
    var result;
    var gr =
        new GlideRecord('sys_script_include');
    gr.addQuery('name', scriptName);
    gr.addQuery('script', 'CONTAINS', 'category: \"password_reset.extension.' + category + '\"');
    gr.query();
    if(gr.next()){
        result = gr.getValue('sys_id');
        return result;
    }
}
```

process function:

```xml
<?xml version="1.0" encoding="UTF-8"?><record_update
    table="sys_script_include" action="INSERT_OR_UPDATE"><active>true</active><client_callable>false</client_callable><description>Simple account lookup that returns the supplied user id</description><name>SampleUserAccountLookupExtension</name><script>![CDATA[var SampleUserAccountLookupExtension =Class.create(); SampleUserAccountLookupExtension.prototype={
    category:'password_reset.extension.user_account_lookup',// DO NOT REMOVE THIS LINE!```
returns the credential-store account id for a given user

* @param params.userId  The sys-id of the user being checked (table: sys_user)
* @return               The credential-store account-id (string) for a given user

**********

process: function (params) { return params.userId; },

*****SampleUserAccountLookupExtension*****

processForm function:

```xml
<record_update
  table="sys_script_include" action="INSERT_OR_UPDATE" type="SampleUserAccountLookupExtension">

Password Reset extension script categories
You can use a custom extension script to extend Password Reset functionality for credential store, verification, or identification types.

Note: To use a script include as an extension script, you must set it to Active status.

### Password Reset extension script categories

Extension scripts must specify a category that indicates which script include is being extended, for example, `category: 'password_reset.extension.enrollment_check'`. The ServiceNow platform installs several scripts in each category. A script in the Enrollment check category can perform the enrollment check for a verification. Detailed information on each extension script appears in Password Reset extension scripts.

<table>
<thead>
<tr>
<th>Extension script category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enrollment check</td>
<td>Defines how to check that a user is enrolled in the Password Reset process. Scripts of this category are available in the Enrollment check field when you define a verification type (Password Reset Verification Type form).</td>
</tr>
<tr>
<td>Enrollment form processor</td>
<td>Defines how an enrollment form is processed (if automatic enrollment is not configured). Scripts of this category are available in the Enrollment form processor field when you define a verification type (Password Reset Verification Type form).</td>
</tr>
<tr>
<td>Extension script category</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Identification form processor</td>
<td>Defines how a user identification is processed. Scripts of this category are available in the Identification processor field when you define a verification type (Password Reset Identification Type form).</td>
</tr>
<tr>
<td>Password generator</td>
<td>Defines how to generate a password. Scripts of this category are available in the Auto generate password field when you configure a credential store (Password Reset Credential Store Type form).</td>
</tr>
<tr>
<td>Post reset script</td>
<td>Executes at the end of a Password Reset process. Scripts of this category are available in the Post reset script field when you configure a process (Password Reset Process form).</td>
</tr>
<tr>
<td>User account lookup</td>
<td>Defines how to look up a user account. Scripts of this category are available in the User account lookup field when you configure a credential store (Password Reset Credential Store form).</td>
</tr>
<tr>
<td>Verification form processor</td>
<td>Defines how a verification form is processed. Scripts of this category are available in the Verification processor field when you define a verification type (Password Reset Verification Type form).</td>
</tr>
</tbody>
</table>

**Password Reset extension scripts**

Extension scripts allow you to extend Password Reset functionality in credential store, verification, or identification types.

**Password Reset extension script includes**

Each script include is associated with a specific category, which is available in the appropriate field of a Password Reset form.

![Note](https://via.placeholder.com/150)

*Note: Create extension scripts only from the Password Reset Extension Script form (Password Reset > Extensions > New extension script). Extension scripts are special purpose script includes that are not created in the System Definition > Script Includes interface. To use a script include as an extension script, you must set it to Active status.*
### Enrollment Check script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
</table>
| Enrollment Check        | Checks whether a user is enrolled for a given verification. | process(params) | Parameters:  
- params.userId - The sys_id of the user to check (table: sys_user).  
- params.verificationId - The sys_id of the verification to check (table: pwd_verification). | Returns: (boolean) true, if the user is enrolled in the specified verification; otherwise, false. |

This Enrollment Check example signals that the user is enrolled if both expected parameters are supplied. The code would be contained in the **Script** field of an extension script named SampleEnrollmentCheck:

```javascript
var SampleEnrollmentCheck = Class.create();
SampleEnrollmentCheck.prototype = {
    category : 'password_reset.extension.enrollment_check', // DO NOT REMOVE THIS LINE!

    process : function (params) {
        return (params.userId && params.verificationId) ? true : false;
    },

    type : 'SampleEnrollmentCheck'
};
```

### 'Enrollment Form Processor' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
</table>
| Enrollment Form Processor | Checks whether all necessary information has been collected from the user. Stores the information so it can be used for verification when the user resets their password. | process(params) | Parameters:  
- `params.resetRequestId` - The sys_id of the current Password Reset request (table: pwd_reset_request).  
- `params.userId` - The sys_id of the user to be verified (table: sys_user).  
- `params.verificationId` - The sys_id of the verification to be processed (table: pwd_verification).  
- `request` - The form request object. Fields in the form can be accessed with `request.getParameter('<element-id>')`. | Returns: (boolean) true, if the user is enrolled in the specified verification; otherwise, false. |

The following information should be added to the state of the enrollment process:

- `gs.getSession().setProperty('result.status',status)` - Whether the user was successfully enrolled.
- `gs.getSession().setProperty('result.message',message)` - An associated message to be returned to the UI, such as a detailed error message.
- `gs.getSession().setProperty('result.value',value)` - A custom value associated with the enrollment.
This example processes an enrollment form submission successfully if the user-submitted response was success. The code would be contained in the `Script` field of an extension script named `SampleEnrollmentProcessor`:

```javascript
var SampleEnrollmentProcessor = Class.create();
SampleEnrollmentProcessor.prototype = {
    category: 'password_reset.extension.enrollment_form_processor', // DO NOT REMOVE THIS LINE!

    processForm: function (params, request) {
        var verificationId = params.verificationId;
        var sampleInput = request.getParameter('sample_input');

        if (gs.nil(verificationId) || (sampleInput != 'success')) {
            return false;
        }

        var gr = new GlideRecord('sys_user');
        gr.get(params.userId);
        gs.print('User: ' + gr.getValue('user_name') + ' successfully enrolled');
        return true;
    }
};
```
### Identification Form Processor script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identification Form Processor</td>
<td>Processes an identification form request.</td>
<td>processForm(params, request)</td>
<td>Parameters:</td>
<td>Returns: the sys_id of the user that corresponds to the requested input. Returns null, if no user was found.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- params.processId - The sys_id of the calling Password Reset process (table: pwd_process).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- request - The form request object. Fields in the form can be accessed with request.getParameter('&lt;element-id&gt;'). Use request.getParameter('sysparm_user_id') to get the user ID that was entered into the form.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- request.getParameter('sysparm_user_id')</td>
<td></td>
</tr>
</tbody>
</table>

This example attempts to identify the user within the sys_user table given a user name submitted from the identification form. The code would be contained in the `Script` field of an extension script named `PwdIdentifyViaUsername`:

```javascript
var PwdIdentifyViaUsername = Class.create();
PwdIdentifyViaUsername.prototype = {
    category: 'password_reset.extension.identification_form_processor', // DO NOT REMOVE THIS LINE!
    initialize: function () {},

    // Process the identification form request, and returns the user's sys_id.
    // If user was not identified return null.
    processForm: function (params, request) {
        var processId = params.processId;
        var sysparm_user_id = request.getParameter('sysparm_user_id');

        var gr = new GlideRecord('sys_user');
        gr.addQuery('user_name', sysparm_user_id);
        gr.query();

        if (!gr.next()) {
            return null;
        }
        return gr.sys_id;
    }
};
```

'Password Generator' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password Generator</td>
<td>Returns an auto-generated password.</td>
<td>process(params)</td>
<td>Parameters: • params.processId - The sys_id of the calling Password Reset process (table: pwd_process).</td>
<td>Returns: (String) an auto-generated password.</td>
</tr>
</tbody>
</table>

This example randomly generates a password from a base word and numbers. The base word is selected depending on the credential store. The code would be contained in the Script field of an extension script named SamplePasswordGenerator:

```javascript
var SamplePasswordGenerator = Class. create();
SamplePasswordGenerator.prototype = {
    category : 'password_reset.extension.password_generator', // DO NOT REMOVE THIS LINE!

    process : function (params) {
        var basePassword;
        var gr = new GlideRecord('pwd_cred_store');
        gr.addQuery('name', 'Local ServiceNow Instance');
        gr.query();
        if (gr.next()) {
            if (params.credentialStoreId == gr.getValue('sys_id')) {
                basePassword = "Password";
            } else {
                basePassword = "Dorwssap";
            }
        }
        return this.generateSimple(basePassword);
    },

    generateSimple : function (base) {
        var pwd = base;
        var numbers = '0123456789';
        var length = 4;
        for (var i = 0, n = numbers.length; i < length; i++) {
            pwd += numbers.charAt(Math.floor(Math.random() * n) + 1);}
        return pwd;
    },

    type : 'SamplePasswordGenerator'
};
```
'Post Reset' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Post Reset</td>
<td>Performs additional operations after the completion of the Password Reset process.</td>
<td>process(params)</td>
<td>Parameters:</td>
<td>Returns: void</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>· params.resetRequestId - The sys_id of the calling Password Reset process (table: pwd_process).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>· params.wfSuccess - A flag indicating whether the workflow completed successfully. True if, and only if, successful.</td>
<td></td>
</tr>
</tbody>
</table>

This example adds failed reset requests to the system log. The code would be contained in the Script field for an extension script named PwdPostProcessor:

```javascript
var PwdPostProcessor = Class.create();

PwdPostProcessor.prototype = {
    category: 'password_reset.extension.post_reset_script', // DO NOT REMOVE THIS LINE!
    initialize: function() {},

    //**********
    // Execute custom actions after the Password Reset process has completed.
    // * @param params.resetRequestId The sys_id of the current Password Reset request (table: pwd_reset_request)
    // * @param params.wfSuccess A flag indicating if the workflow completed successfully.
    // * @return no return value
    //**********/
    process: function(params) {
        if (!params.wfSuccess) {
            gs.log('[PwdPostProcessor.process] failure post processing for request [' + params.resetRequestId + ']');
        }

        // We could place actions here that we always want executed
        return;
    },

type: 'PwdPostProcessor'
};
```
'User Account Lookup' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Account Lookup</td>
<td>Gets the credential store account ID for a given user.</td>
<td>process(params)</td>
<td>Parameters:</td>
<td>Returns: (String) the credential store account ID for the given user.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- params.userId - The sys_id of the user being checked (table: sys_user).</td>
<td></td>
</tr>
</tbody>
</table>

This example gets the credential store account for a user. This code would be contained in the Script field of an extension script named SampleUserAccountLookupExtension:

```javascript
var SampleUserAccountLookupExtension = Class. create () ;
SampleUserAccountLookupExtension.prototype = {
    category : 'password_reset.extension.user_account_lookup' , // DO NOT REMOVE THIS LINE!

    /**
     * Returns the credential store account id for a given user.
     * This sample echoes the user_id supplied as the credential store account id for that user.
     *
     * @param params.userId  The sys_id of the user being checked (table: sys_user)
     * @return               The credential store account id (string) for a given user
     ***/
    process : function (params ) { return params. userId ; },
    type : 'SampleUserAccountLookupExtension' }
```
### 'Verification Form Processor' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Verification Form Processor</td>
<td>Processes a verification form request and indicates whether the user was verified or not.</td>
<td><code>processForm(params, request)</code></td>
<td>Parameters:</td>
<td>Returns: (boolean)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- <code>params.resetRequestId</code> - The sys_id of the current Password Reset request (table: pwd_reset_request).</td>
<td>true, if the user is verified; otherwise, false.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- <code>params.userId</code> - The sys_id of the user to be verified (table: sys_user).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- <code>params.verificationId</code> - The sys_id of the verification to be processed (table: pwd_verification).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- <code>request</code> - The form request object. Fields in the form can be accessed with <code>request.getParameter('&lt;element-id&gt;')</code>.</td>
<td></td>
</tr>
</tbody>
</table>

This example shows a verification processor that returns true only if the user sent `ok` in the input field; otherwise, it returns false. The code would be contained in the `Script` field of an extension script named `SampleVerificationFormProcessor`:

```javascript
var SampleVerificationFormProcessor  = Class. create ( ) ;
SampleVerificationFormProcessor. prototype = {
  category : 'password_reset.extension.verification_form_processor' , // DO NOT REMOVE THIS LINE!

  processForm: function ( params, request ) { // ...
    /* Process the verification form request, and return whether the user was successfully verified. 
    * This is a sample verification processor returns true only if the user sent "ok" in the input field; 
    * otherwise, it returns false. 
    * 
    * @param params.resetRequestId The sys_id of the current Password Reset request (table: pwd_reset_request) 
    * @param params.userId The sys_id of the user trying to be verified (table: sys_user) 
    * @param params.verificationId The sys_id of the verification to be processed (table: pwd_verification) 
    * @param request The form request object. Fields in the form can be accessed with `request.getParameter('<element-id>')
    */

```
* @return Boolean indicating whether the user is successfully verified
**********/
processForm : function (params , request ) { if (request.getParameter ( "sysparm_simple_input" ) == "ok" ) return true ; else return false ; } ,
type : 'SampleVerificationFormProcessor' } ;

Create a Password Reset extension script
Create extension scripts only from the Password Reset Extension Script form. Do not create extension scripts in the System Definition > Script Includes interface.

Role required: password_reset_admin or admin

Note: To use a script include as an extension script, you must set it to Active status.

1. Navigate to Password Reset > Extensions > New extension script.
2. Enter a name in the Extension script name field.
   Use CamelCase to construct a name without spaces, for example, PwdEnrollmentCustom.
3. Select an Extension script category.
   - Enrollment check
   - Enrollment form processor
   - Identification form processor
   - Password generator
   - User account lookup
   - Verification form processor
4. Click Submit.
   A new instance of the script include for the selected category opens.
5. Edit the script by providing an implementation in the body of the process or processForm function, depending on the script category. You can add additional functions as long as the process or processForm function accepts the defined parameters and returns the expected results.

Note: Do not edit or delete the Category declaration.
6. Click **Update**.

**Service desk: Reset a password or unlock a user account**

In a service desk-assisted Password Reset process, service desk agents with the password_reset_service_desk role reset user passwords. Users do not reset passwords. Watch a video example of service desk agents resetting passwords: *Resetting User Passwords (Video)*.

Role required: password_reset_admin or password_reset_service_desk

> **Note:** You must set the **Public access** property to enable the service desk-assisted process. See *Settings on the Password Reset Details tab.*

1. Navigate to **Password Reset > Service Desk**.
2. Select a user and the Password Reset process to use.
3. Click **Verify Identity**.
4. On the Verify Identity form, enter the answers that the user provides and then click **Continue**. If the user identity is verified, the Reset Password form displays identity verification and status of the account lock.
5. Perform one of the following actions.
   - If the user is not locked, the form displays the **Reset password** button. Enter the new password and click **Reset password**.
• If the user is locked, the form displays the **Reset password** and **Unlock account** buttons. You can enter a new password and click **Reset password** to reset the password and unlock the account. If the **Enable account unlock** check box is selected for the password process, you can unlock the account without resetting the password by clicking **Unlock account**.

6. To reset the password for a different user, you must first navigate out of the **Service Desk** and then navigate to **Password Reset > Service Desk**.

**Service desk: View user requests for password reset**

The **Reset Requests** module displays the status of each password reset request from the Password Reset Request table (pwd_reset_request).

Role required: password_reset_admin or password_reset_service_desk

Navigate to **Password Reset > Reset Requests**.

<table>
<thead>
<tr>

</tbody>
</table>
### ServiceNow: Kingston | Now Platform Capabilities

#### Field | Description
--- | ---
Status | Result of the Password Reset request:
- **Completed With Failure**: User completed all steps in the Password Reset process, but the password was not reset in the credential store.
- **Completed With Success**: User completed all steps in the Password Reset process and the password was reset in the credential store.
- **Expired**: User did not complete all steps in the Password Reset process in the time allowed.
- **In Progress**: User is working through the steps to reset the password.
- **Max Number of Attempts**: User failed to answer the security questions correctly during the identity verification step and has exceeded the maximum number of attempts allowed.
- **Verified**: User has completed the identity verification step and is verified. The user can move to the Password Reset step.

Active | Whether the request is open or closed.
Retry | Total number of times the user has attempted to complete a password reset request.

**Service desk: Unblock a Password Reset user**

If a user is manually banned or is flagged as exceeding max attempts, the user can be blocked (not allowed to use the Password Reset application). You can unblock a blocked user.

Role required: password_reset_admin or password_reset_service_desk

Blocking events include:
- The user exceeded the limit for the number of failed password attempts.
- The most recent password reset occurred before the wait time required until the next reset.
- The user failed to provide the correct information while attempting to reset the password.

If the number of blocked or locked users exceeds the limit within a defined time interval, it triggers a system log event. You can configure the number of blocked or locked users and the time interval required to generate the log event by setting the `password_reset.activity_monitor.incident_threshold` and `password_reset.activity_monitor.incident_window` properties.

1. To view the list of blocked users, navigate to **Password Reset > Blocked Users**.
2. To unblock a self-service user:
   a) Navigate to **Password Reset > Blocked Users**.
   b) Select a user from the list.
   c) Select **Delete** on the **Actions on selected rows** list.

3. To unblock a user whose password was reset by a service desk agent:
If a user is manually banned or flagged as exceeding max attempts, the user can be blocked (not allowed to use the Password Reset application). When the password reset request is made through self-service, the user is unblocked when the password is successfully reset.

In contrast, service desk agents are allowed any number of retries. The max_attempt_reached limit does not apply and the Blocked status for the user is not reset after the password is reset. As a result, after you successfully reset a user password, you must unblock the user manually.

If the user is not unblocked manually, then the system resets the blocked state only when the max_attempt_window time period elapses and the user tries to reset the password using self-service.

a) After you successfully reset a user password, navigate to Password Reset > Blocked Users.

b) Change the Blocked setting for the user from true to false.

**Password Reset and Password Change reports and logs**

The Password Reset application provides several tools for monitoring and troubleshooting password reset activities.

Users with the password_reset_credential_manager or password_reset_admin role can view the status of password reset activities, identify potential security threats, and monitor for compliance with password security policies.

The Reset Requests, Activity Log, and Blocked Users modules are useful for monitoring password reset activities and for troubleshooting password reset issues. They also provide access to more detailed information than is provided on the Overview module.

To make room for new data, the system periodically purges the data that is used for password reset monitoring and reporting.

**Password Reset Overview module**

The Password Reset > Overview module displays reports on password reset and password change activities. Users with the password_reset_admin role can customize the layout of the reports that appear in the Overview module.

**Password Reset reports**

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password Requests (last 7 days)</td>
<td>Number of password reset requests by type during the last 7 days.</td>
</tr>
<tr>
<td>Blocked Users (last 7 days)</td>
<td>Number of users blocked over the last 7 days.</td>
</tr>
<tr>
<td>Password Reset Request Status (last 7 days)</td>
<td>Status of all password reset requests by process.</td>
</tr>
<tr>
<td>Password Reset Request by Action (last 30 days)</td>
<td>Number of password reset requests by action type: Reset Password, Unlock Account, or Reset and Unlock.</td>
</tr>
<tr>
<td>Password Reset Top Users (last 30 days)</td>
<td>Number of password reset requests per user. Many password reset requests from a single user could indicate a security issue.</td>
</tr>
<tr>
<td>Title</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Password Reset Failed Verifications (last 7 days)</td>
<td>Number of failed verification attempts, by verification instance. A failed verification occurs when a user attempts to reset the password, but fails for one reason or another, during the identity verification step. Many failed verification attempts for a specific type of verification could indicate that the process is too complicated or unclear.</td>
</tr>
<tr>
<td>Password Reset Enrollment By Verification</td>
<td>Number of users by verification type who have and have not enrolled in the password reset program. A large number for users who have not enrolled could indicate a compliance or communication issue within the organization.</td>
</tr>
<tr>
<td>Password Change Top Users (last 30 days)</td>
<td>Number of password change requests per user. Many password change requests from a single user could indicate a security issue.</td>
</tr>
</tbody>
</table>

**Password Reset activity log**

The activity log ([Password Reset > Activity Log](#)) provides detailed information that you can use to troubleshoot and to generate reports on password reset metrics. Information contained in the activity log is stored in the Password Reset activity log (pwd_reset_activity) table.

You must have the password_reset_credential_manager or password_reset_admin role to view the log.

**Password Reset event log**

The event log is a valuable resource for troubleshooting. On the Start menu, click Programs (or All Programs) > Administrative Tools > Event Viewer.

If the log does not appear, then, on the Windows Logs menu, click Applications > Service Logs.

You must have the admin role to view the log.

**To write to the Password Reset event log**

Edit the `DebugFlag` registry key entry at: Computer > HKEY_LOCAL_MACHINE > SOFTWARE > Microsoft > Windows > CurrentVersion > Authentication > Credential Providers > `{B6EFF27D-C1C4-4B1F-881B-F3547C47D58A}`

By default, the key is set to 0. Set the key to 1 to write log entries to the `ServiceNowPwdReset` event log.

You must have the password_reset_credential_manager or password_reset_admin role to write to the log.

**Password Reset blocked user notification**

You can receive email notifications when the number of users that are blocked or locked exceeds the password blocked threshold. Notifications can alert you to suspicious activities. The default threshold is 10.
To subscribe: Add an email notification device or modify an existing device and then subscribe to the **Password Reset-Activity Monitor Lockout** notification.

You must have the **password_reset_credential_manager** or **password_reset_admin** role to subscribe.

**Schedule for purging Password Reset data**

To make room for new data, the system periodically purges the data that is used for password reset monitoring and reporting. Information contained in reports and monitoring tools could change dramatically immediately after a data purge. Contact ServiceNow Technical Support to modify purge intervals.

Users with the **password_reset_credential_manager** or **password_reset_admin** role can follow this procedure to modify the purge interval:

1. On a non-production instance: Navigate to **Automated Test Framework > Administration > Table Cleanup**.
2. Modify the designated tables.
3. Test all changes on the non-production instance.
4. Modify the tables on your production instance and test.

Alternatively, contact ServiceNow Technical Support to modify the purge interval.

</table>
Users: Enroll in the Password Reset program

Some organizations auto-enroll users in a Password Reset program. Your organization could offer you the option to enroll for one or more methods of verifying your identity when you reset your password.

You might enroll for any combination of the following methods:

**Verify your identity using security questions (QA verification)**

To enroll, you choose multiple questions that only you can answer (like the name of your first pet) and then supply answers. The system stores your answers securely. Later, when you want to reset your password, the system presents one or more of the questions. You answer the questions to verify your identity.

**Verify your identity using an SMS code (SMS verification)**

To enroll, you authorize a device like a cellular phone for SMS verification. Later, when you want to reset your password, you get a code number on the device and enter the code on the web page to verify your identity.

**Verify your identity using an Emailed code**

To enroll, you authorize one or more email addresses. Later, when you want to reset your password, the system sends a code number to the email address. You then enter the code on the web page to verify your identity.

**Verify your identity using the Google Authenticator app**

To enroll, you load the Google Authenticator app on one or more devices and then authorize the devices for Google Authenticator verification. Later, when you want to reset your password, read the Google Authenticator code on your device and then enter the code on the web page to verify your identity.

Users: Enroll in the Password Reset program using questions and answers

Your organization might ask you to select the questions to use when resetting your password. You select the questions and provide answers that only you know. At another time, when you reset your password, your answers verify your identity.

Role required: none

1. Navigate to **Password Reset > Enroll** and then click the **QA Verification** tab.
   
   If you are required to enroll for the QA verification method, then the tab is marked with an asterisk (*).

2. For each **Question** field, select a question from the list and then enter the answer in the **Answer** field. Repeat the process until the required number of **Question** and **Answer** fields are filled in.

3. Click **Submit**.

4. Optional: Enroll for an extra identity verification using any of the other methods that your organization offers. See:
   - **Users: Enroll in the Password Reset program using SMS codes**
   - **Users: Enroll in the Password Reset program using Google Authenticator**
   - **Users: Enroll in the Password Reset program using emailed codes**
**Users: Enroll in the Password Reset program using SMS codes**

To prove that you are who you say you are (verify your identity) while resetting your password, you can use a code number (the SMS code) that was delivered to your mobile phone or device.

Role required: none

1. Navigate to **Password Reset > Enroll** and then click the **SMS Verification** tab.
   If your organization requires you to enroll for the SMS verification method, then the tab is marked with an asterisk (*).
2. If you had previously added an SMS-enabled device to your Password Reset profile, the device is listed. To add and verify a device, click **Add Device** and then follow the instructions. Provide a meaningful **Name** for each device. Repeat the process for as many devices as you need.
3. After you have verified each device, select the **Authorized** check box for each device that you expect to use to change or reset your password.

   **Note:** You can deauthorize a device at any time by clearing the **Authorized** check box.

4. Click **Submit**.
5. Optional: Enroll for an additional identity verification using any of the other methods that your organization offers. See:
   - **Users: Enroll in the Password Reset program using questions and answers**
   - **Users: Enroll in the Password Reset program using Google Authenticator**
   - **Users: Enroll in the Password Reset program using emailed codes**

**Users: Enroll in the Password Reset program using emailed codes**

To prove that you are who you say you are (verify your identity) while resetting your password, you enter a code that was sent to your email address.

Role required: none

During this enrollment process, you add the email address, the system sends you a code so you can verify the address, and then you authorize the address to be used for the Password Reset process. By default, the system sends the code to the email address that is associated with your ServiceNow profile. You can send the code to additional email addresses.

1. Navigate to **Password Reset > Enroll** and then click the **Email Verification** tab.
   If your organization requires you to enroll for the Email verification method, then the tab is marked with an asterisk (*). Email addresses that were added previously are listed on the tab.
2. Click **Add Email**, enter the **Email address** and a meaningful **Email name** to associate with the address and then click **Add Email**. Repeat the process for as many email addresses as you need.
3. On the **Email Verification** tab, for each email that should receive Password Reset codes, click **Verify**.
   The system sends an email message with a code and then displays the **Verify the Email Address** pop-up.
4. On the **Verify the Email Address** pop-up, enter the code and click **Verify**. If this fails, click **Send a New Code** to send a different code and try again.
5. After you have verified each email address, select the **Authorized** check box for each address that you expect to use to change or reset your password.
Note: To deauthorize an email address so that it does not receive Password Reset codes, clear the Authorized check box.

6. Click Submit.

7. Optional: Enroll for an additional identity verification using any of the other methods that your organization offers. See:
   - Users: Enroll in the Password Reset program using questions and answers
   - Users: Enroll in the Password Reset program using SMS codes
   - Users: Enroll in the Password Reset program using Google Authenticator

Users: Enroll in the Password Reset program using Google Authenticator

To prove that you are who you say you are (verify your identity) while resetting your password, you get a code number from Google Authenticator on your cell phone or mobile device and then enter the code on the Password Reset web page. If you have already paired a device (for example, to log in to the ServiceNow instance), you can skip this enrollment process.

Role required: none

1. Navigate to Password Reset > Enroll and then click the Google Authenticator Verification tab.

   Note: If your organization requires you to enroll for the Google Authenticator verification method, then the tab is marked with an asterisk (*).

2. Download the Google Authenticator app to your device.
3. Open the app and then use the device to scan the QR code on the tab.
4. When the device generates a code, enter the code in the text box and then click Pair Device.
5. Click Submit.
6. Optional: If the system displays a success message, click Submit. If the system displays a failure message, enter the code again, click Pair Device, and then click Submit. When you submit the enrollment, the tab displays the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generate New QR Code</td>
<td>Enables you to pair a device with a new code. This option is useful if you have a new device. Existing multi-factor authentication data is replaced with the new data.</td>
</tr>
<tr>
<td>Disable Multi-factor Authentication</td>
<td>Deletes existing multi-factor authentication data. The Google Authenticator verification is no longer available.</td>
</tr>
</tbody>
</table>

7. Optional: Enroll for an additional identity verification using any of the other methods that your organization offers. See:
   - Users: Enroll in the Password Reset program using questions and answers
   - Users: Enroll in the Password Reset program using SMS codes
   - Users: Enroll in the Password Reset program using emailed codes
Users: Reset your password on Windows systems

If your organization uses the Password Reset Windows Application, you can reset your password directly from your Windows login screen.

Role required: none

1. Start your computer or press Ctrl+Alt+Delete to go to the Windows login screen.
2. Click the **Forgot Password?** link. (Your administrator may have configured different text for the link.)

3. On the **Identify** page, enter the requested information and then click **Next**.

4. On the **Verify** page, enter the requested information, and then click **Next**.

   **Note:** You might be given the option to choose the method used to verify your identity.

   If your identity is verified, the **Reset** page displays whether you were successfully verified and the state of your account (either locked or unlocked).

5. Based on your locked/unlocked state, perform one of the following actions:
   - If your account is not locked, the page displays the **Reset Password** button. Enter and reenter the new password and then click **Reset Password**.
   - If your account is locked, the page displays the **Reset Password** and **Unlock Account** buttons.
     - You can enter a new password and click **Reset password** to reset the password and unlock the account.
     - If your administrator has selected **Enable account unlock** for the password process, you can unlock the account without resetting the password by clicking **Unlock account**.

**Service administration**

Configure settings for services that support business applications or the platform.

**Assessments**

Use assessments to evaluate, score, and rank records from any table in the system.

You can assess projects that executives want to evaluate for effective management, or rate and compare a vendor's goods and services. Use assessments to send custom questionnaires to selected users or write scripts that query the database directly. You can then compare assessment results for the records using unique graphical views designed to highlight key
performance information. Share an assessment between ServiceNow instances by using update sets, which is the recommended way to move assessment data from one instance to another. The Assessments plugin is enabled by default.

**Installed with Assessments**

Assessments are installed with components such as tables and properties.

- Demo data is available for assessments and surveys.
- Vendor Performance offers an additional set of vendor assessment demo data.

**Tables**

**Administrator tasks**

Before you create assessments, assign the assessment_admin role to the appropriate users in your organization and determine your objectives for the assessment.

Decide which sets of records in the system to assess, which themes you are interested in, and which traits to measure. Consider your organization's options for obtaining the data to compare. If you intend to use assessment questionnaires, consider which people can answer the questions.

**Assessment terminology**

Assessment admins use several terms when working with assessments.

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metric type</td>
<td>A metric type defines a set of records to evaluate, such as vendors, projects, or employees.</td>
</tr>
<tr>
<td>Assessable record</td>
<td>An assessable record links a record to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees. You define sets of assessable records when you create metric types.</td>
</tr>
<tr>
<td>Metric category</td>
<td>A metric category represents a theme for evaluating assessable records. Categories contain one or more individual metrics, which define specific traits or values that comprise the theme. Examples of categories include overall vendor performance or quality of delivery services. You can also set filter conditions that control which assessable records to evaluate for the metrics in a category.</td>
</tr>
<tr>
<td>Term</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>Metric</td>
<td>A metric is a trait or value used to evaluate assessable records. A metric can measure subjective values in an assessment questionnaire, or gather objective values in a database query run by a script. Examples of metrics include perceived courtesy of sales representatives or number of incidents per vendor.</td>
</tr>
<tr>
<td>Category user</td>
<td>A category user is a person who knows about a specific category. One person can be a category user for multiple categories. Examples of category users include a vendor manager who oversees all purchasing operations or a supervisor of a sales team.</td>
</tr>
<tr>
<td>Stakeholder</td>
<td>A stakeholder is a category user who knows about a specific assessable record. Examples of stakeholders include a vendor manager who coordinates purchases from Amazon or a supervisor of a sales team who manages a specific employee.</td>
</tr>
</tbody>
</table>
| Assessment instance | An assessment instance represents one assessment questionnaire assigned to one user. The system generates a new assessment instance for each assigned user when:  
- The assessment generation scheduled job runs.  
- An assessment administrator creates an on-demand assessment. |
| Scorecard | A scorecard provides a visual illustration of an assessable record’s performance, based on assessment results. Use scorecards to view a variety of data summaries for one assessable record and to compare the ratings with other assessable records. |
| Decision matrix | A decision matrix is a graph with two axes that plots the assessment results for multiple assessable records. Use decision matrices to determine the relative standing of assessable records in selected categories. |
| Bubble chart | A bubble chart is a graph with three axes that plots the assessment results for multiple assessable records. Use bubble charts to determine the relative standing of assessable records in selected categories, with an emphasis on one category. |

**Assessment roles**

The Assessments application requires certain roles to perform assessment tasks. No role is required to take assessment questionnaires that are assigned to you.
<table>
<thead>
<tr>
<th>Role Title</th>
<th>Role Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment administrator</td>
<td>assessment_admin</td>
<td>Assessment administrators set up assessments. They know which records to evaluate, the criteria on which to evaluate the records, and who to assign assessments to.</td>
</tr>
<tr>
<td>Note: By default, users with the assessment_admin role have limited system rights and might not have access to all source records to assess. When planning assessments, grant additional roles to assessment administrators as needed. For example, to create and manage vendor assessments, the assessment administrator must also have the vendor_manager role, which grants access to the Company table and other relevant tables.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>ITIL user</td>
<td>itil</td>
<td>ITIL users perform basic technician operations in the system. In the Assessments application, they have read access to the Assessable Record table.</td>
</tr>
<tr>
<td>Administrator</td>
<td>admin</td>
<td>Administrators have access to all aspects of the assessment process. Only administrators can set up assessment schedules.</td>
</tr>
</tbody>
</table>

**Assessment methods**

The available methods are **Assessment**, for non-scripted metrics, and **Script**, for scripted metrics. Each method serves a different function and can be used with certain data types.

Use the **Method** field to specify how to use the metric.

**Assessment method**

Metrics with the Method set to Assessment are called non-scripted metrics. Use each non-scripted metric to define a question for assessment questionnaires. Non-scripted metrics are useful if you want to obtain subjective data like personal opinions.

You can use the Assessment method with these **Data type** values:
Script method

Metrics with the Method set to Script are called scripted metrics. Use each scripted metric to define a custom script for database queries. Scripted metrics are useful if your system contains reliable data for the traits you want to evaluate.

You can use the Script method with these **Data type** values:

- Duration
- Number
- Percentage

Use the Script field to write JavaScript code. By default, the field contains information about available variables and an example, which you can use as the basis of your script or replace entirely:

![Script field example](image)

**Metric form script field**

You must use the following variables in your script:

- `primary`: Input variable used to access the sys_id of the record being assessed.
- `actual_result`: Output variable that contains the actual value for this metric. The system uses this variable to populate the Actual value field on the Metric Result form. For each `actual_result`, you must specify a corresponding `scaled_result` value.
- `scaled_result`: Output variable that contains a numerical scaled value to represent an actual value. The system uses this variable to populate the Scaled value field on the Metric Result form. Ensure the scaled values you specify are between or equal to the `Min` and `Max` values for...
the metric. The **Scale definition** field determines how the system uses the scaled value. A scale definition of **Low** means smaller numbers are better, such as for a metric that measures the number of incidents for a vendor. **High** means larger numbers are better, such as for a metric that measures user satisfaction on a scale of one to five.

**Script example**

The metric Number of active devices uses the script pictured below. The *primary* variable is used to find CIs that are associated to the vendor record being assessed. The script retrieves the `actual_result`, the number of CIs associated to the vendor, then calculates the correct `scaled_result`. The script uses a series of scaled values, from the **Min** to the **Max** value, to represent actual values. Because the **Scale definition** is set to **High**, the greatest scaled values are best, meaning a vendor associated to the most CIs scores highest. The system stores the actual and scaled values in a metric result record for the vendor.

---

**Scripted metric example**

**Data types for assessments**

Metric data types have functions that depend on the method that you select.
### Assessment data types

<td>Assessment</td>
<td>On questionnaires, users select Yes or No from a list. Set the <strong>Scale definition</strong> field to <strong>High</strong> if selecting Yes equates to a better score.</td>
</tr>
</tbody>
</table>

### Assessment generation

In the Assessments application, administrators or assessment administrators can trigger the system to generate scheduled assessments or on-demand assessments when all the prerequisite steps are completed.

An assessment administrator must publish the metric type to enable assessment generation.

The system performs these tasks when it generates assessments:

- Creates assessment questionnaires from non-scripted metrics and assigns the questionnaires to users. When users complete their assigned questionnaires, the system uses their responses to calculate assessment results.
- Runs scripted metrics from each category to query the database and calculate assessment results.

Each time the system generates assessments, it creates some or all of the following components. Consider having an administrator set a schedule for recurring data cleanup, as the system can potentially generate a considerable amount of assessment data.

- **Assessment group**
- **Assessment instances**
- **Assessment results**

### Assessment groups

An assessment group is a container for assessment instances and assessment results generated in a single occurrence.
The system generates an assessment group every time the scheduled job runs or the API is called, when there is at least one assessable record associated to a category in the type. You can find assessment group records in **Assessments > Assessment Groups**.

The Assessment Group form displays the group **Number**, the associated **Metric type**, and these related lists:

- **Assessment Instances**: Lists all assessment instances within this group. There may be no records in this related list. The system does not generate assessment instances if there are only scripted metrics for the type.
- **Metric Results**: Lists all **metric results** for this group. There may be no records in this related list initially. The system generates metric results immediately for scripted metrics, but not for non-scripted metrics, which appear as questions on assessments and require user response. The system dynamically updates the records in this list as users complete assessment questionnaires.
- **Assessment Category Results**: Lists all **category results** for this group. There may be no records in this related list initially. The system generates category results immediately if there are only scripted metrics in a category. Otherwise, the system does not calculate category results until a user completes an assessment questionnaire that contains questions from the category.

**Note:** To prevent the loss of important assessment data, you cannot delete an assessment group if it contains any assessment instances, metric results, or category results.

**Create an assessment category**

Assessment categories are used with assessment metric types and assessment metrics to generate bubble charts.

Role required: it_pps_admin

The Demand Management application comes with the Demand assessment metric type, five assessment metric categories, and assessment metrics. From the Assessment Categories section of the application menu, you can modify existing assessment categories and create ones.

1. Navigate to **Project Administration > Settings > Assessments Metric Categories**.
2. Click **New** to create a new record.
3. Fill in the fields and click **Submit**.

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Size</td>
<td>Assesses demand size relative to the size of other demands.</td>
</tr>
<tr>
<td>Strategic Alignment</td>
<td>Assesses how closely the demand aligns with strategic goals of the organization compared to other demands.</td>
</tr>
<tr>
<td>Risk</td>
<td>Assesses demand risks compared to other demands.</td>
</tr>
<tr>
<td>ROI</td>
<td>Assesses demand return on investment compared to other demands.</td>
</tr>
<tr>
<td>Cost</td>
<td>Assesses demand cost compared to other demands.</td>
</tr>
</tbody>
</table>

Assessment metric categories

In the Assessments application, a metric category represents a theme for evaluating assessable records in a given metric type.

Each category has a numeric weight value to indicate its importance relative to other categories. Within a category, records called metrics are the traits or values used to evaluate assessable records. For example, there are many categories within the Vendor metric type, including Support Rating, which contains metrics that measure the quality of vendors’ customer support services. Assessable records must be associated to categories to be eligible for evaluation. Assessment administrators create categories and manage which assessable records each category is associated to.

Weight categories and metrics

When you create a metric category or metric, you must specify a weight, a numeric value that indicates the importance of the category or metric relative to other categories and metrics.

The greater the weight value, the more important the item is. The system uses weight values in assessment result calculations. Consider these recommendations when choosing weight values.

- Determine a weighting scale and use it consistently. In general, use a scale with a small numeric range. A standard 1-10 scale is usually appropriate, where 1 is least and 10 most important. Understand that increasing the maximum value of a weighting scale impacts all related result calculations.
- Use the same weighting scale for metric categories and metrics. Though there is no limitation, consider using the same or very similar weighting scales for both categories and metrics to make it easier to remember which values to use. A scale of 1-10 is an effective and simple weighting system, but may not be suitable for all organizations.

Note: If you do not want to use weighting, set the same weight value for all categories and metrics. The default weight value is 10.

Create a category for assessable records

After you create a metric type and generate assessable records, create categories for the themes you are interested in using to evaluate the assessable records.

Role required: none

1. Navigate to Assessments > Metric Definition > Categories.
2. Click New to create a new metric category and then complete the Metric Category form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the metric category. The name appears on assessment questionnaires.</td>
</tr>
<tr>
<td>Type</td>
<td>(Required) Metric type this category is used for. Metrics in this category can be used to evaluate assessable records for the type you select. This field becomes read-only after you save the record.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Create stakeholders</td>
<td>Check box that enables (selected) or disables (cleared) automatic stakeholder creation for this category. When the check box is selected, the system makes all associated category users stakeholders for each assessable record associated to this category. This saves the time required to manually create stakeholders. For more information, see Create Stakeholders Automatically. Existing stakeholders are not impacted if you clear the check box.</td>
</tr>
<tr>
<td>Table</td>
<td>(Read-Only) Table that contains the records to evaluate with metrics in this category. The system automatically populates this field with the same table as the metric type selected. The table does not appear in the field until you save the form. This field is visible depending on whether a Type is selected.</td>
</tr>
<tr>
<td>Weight</td>
<td>(Required) Numerical value that represents the importance of this category relative to other categories. A greater value indicates greater importance. For more information, see Assessment metrics. The default value is 10.</td>
</tr>
</tbody>
</table>
| Scoring type                 | Scoring method for an attestation category. This field appears only when the metric type is an attestation with a Scoring type of Percent. Use this field to configure different scoring types for specific attestation categories. Possible selections are:  
  - **Percent**: Attestation score as a weighted percentage of correct answers for scored questions.  
  - **All or nothing**: All answers for attestation type questions must be correct or the score is zero for the entire category. |
<p>| Total metrics                | (Read-Only) Number of metrics associated to this category. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Filter                | Filter conditions that assessable records must meet to be evaluated using metrics in this category.  
The filter operates on fields on the selected table.  
If you specify a filter condition, the system automatically associates matching assessable records to the category when you save the record. If you change the filter conditions, the system removes and creates assessable record associations as needed. The system also deletes stakeholders for assessable records it disassociates. The system does not remove assessable record associations created by users, even if the assessable records do not match the filter conditions.  
This field is visible only when a **Type** is selected. |
<p>| Description           | Descriptive information about the category that appears on assessment questionnaires.                                                                                                                                                                                                                                                                                                                                                                                        |
| Roles                 | Only those users with the specified roles can perform the assessment for this category. If no role is specified, then users with any role can perform the assessment for this category.                                                                                                                                                                                                                                                                                                           |
|                       | <strong>Note:</strong> If the <strong>Roles</strong> property does not appear on the form, ask your admin to add the property.                                                                                                                                                                                                                                                                                                                                                                                  |
| Details               | Text field containing an HTML editor. Use this field to present important details about this category to assessment recipients. Details can include formatted lists, images, videos, or links to external websites. You may need to configure the form to see this field.                                                                                                                                                                                                                                                      |
| Related Lists         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Assessment Metrics    | All metrics associated to this category. There must be at least one metric associated to the category to use any assessments with the category.                                                                                                                                                                                                                                                                                                                   |
| Assessable records    | All assessable records associated to this category. There must be at least one assessable record associated to the <strong>category</strong> to use any assessments with the category. This related list is hidden if the <strong>Evaluation method</strong> is <strong>Attestation</strong>. |</p>
<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**Assessable record associations**

Only the assessable records associated to a category can be evaluated using metrics in that category. Manage which assessable records you evaluate for each category by creating and removing the associations.

Only the assessable records associated to a category can be evaluated using metrics in that category. Manage which assessable records you evaluate for each category by creating and removing the associations.

**Note:** You can also manage which categories an assessable record is associated to using the *Assessable Record* form.

**Manage an assessable record automatically**

You must define at least one filter condition in the Metric Category form to automatically associate assessable records with the category.

Role required: assessment_admin or admin

1. Navigate to *Assessments > Metric Definition > Categories*.
2. Open a category.
3. In the *Filter* field, create a condition statement that defines the records you want to associate to this category. The available fields are from the table defined for the metric type.

For example, for a category in the *Vendor* type, you might create the condition *(Country) (is) (Germany).* Metrics in the category will be used only to evaluate vendors that meet this condition.

4. Save the record.

The system associates this category to all assessable records that match the filter condition. As the system generates new assessable records that match the condition, it associates them to this category. If you change the filter condition, the system removes and creates assessable record associations, as appropriate. Note the following:

- The system does not remove assessable record associations created manually, even if the assessable records do not match the filter conditions.
- The system deletes any related stakeholders, if applicable, when it disassociates assessable records from a category.
- The system does not create or remove assessable record associations if the related source records change. For example, consider the previous example in which all assessable records for vendors based in Germany were associated to a particular category. Assume that a user changes the *Country* of one of the vendor records from Germany to Canada. The system does not disassociate the related assessable record from the category, even though it no longer matches the filter condition.

**Note:** To configure the system to automatically associate all assessable records from a metric type to a category, use the same category condition as the metric type.
condition. For example, if the Vendor metric type has the condition \((\text{Vendor}) \ (\text{is}) \ (\text{true})\), create the same condition for the category. If the metric type does not have a condition specified, you can use the category condition \((\text{Sys ID}) \ (\text{is not empty})\), which includes all records from any table.

Manage an assessable record manually
You can manually create and remove assessable record associations for a category using a related list on the Metric Category form.

Role required: assessment_admin or admin

Keep in mind that when you disassociate an assessable record from a category, the system deletes any related stakeholders, if applicable, and you can no longer evaluate the assessable record using metrics in that category.

1. Navigate to Assessments > Metric Definition > Categories.
2. Open a category.
3. In the Assessable records related list, click Edit and use the slushbucket to add or remove one or more assessable records.

Only assessable records associated to this category's metric type are available for selection.

Delete a category
When you delete a category, the system also deletes the associated category users and stakeholders.

Role required: assessment_admin or admin

1. Navigate to Assessments > Metric Definition > Categories.
2. Alternatively, navigate to a record that contains a related list for categories.
3. Open a record from the list.
4. On the Metric Category form, click Delete.
5. Click OK when asked to confirm the action.

The system displays messages at the top of the form describing the actions taken.

Assessment metrics
In the Assessments application, a metric is a trait or value used to evaluate assessable records.

Depending on the metric method, a metric can be used as either of the following:

- A question on assessment questionnaires, to obtain a subjective value such as how much people enjoy using each cell phone offered in the service catalog.
- A script that queries the database, to obtain an objective value such as the number of incidents related to each cell phone.

Each metric is associated to one metric category and can be used to evaluate assessable records for that category only. For example, the Support Rating category contains metrics that measure the quality of vendors' customer support services. One metric addresses the quality of product documentation. Others address the strength of the user community, self-service options, online training, and other support services. Each metric has a numeric weight value to indicate its importance relative to other metrics in the same category.

Assessment administrators can create and administer metrics and metric templates, which define reusable sets of answer options for metrics used as assessment questions. If you decide to use metric templates, you may want to create them before you create metrics.
Create a metric for a category
After you create a category, create metrics you can use to evaluate the assessable records for that category.

Role required: assessment_admin or admin

When you create metrics, consider the focus of the category and what characteristics you want to measure for the items you will assess. If you plan to use metrics for assessment questionnaires, you may want to review tips for writing good questions.

1. Navigate in one of the following ways:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessments &gt; Metric Definition &gt; Categories</td>
<td>Open a category, and locate the Assessment Metrics related list. This is the suggested navigation path, as the system links metrics to the category from which they are created.</td>
</tr>
<tr>
<td>Assessments &gt; Metric Definition &gt; Metrics</td>
<td></td>
</tr>
</tbody>
</table>

2. **Click New.**

3. **Fill in the fields, as appropriate.**

**Assessment Metric form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the metric.</td>
</tr>
<tr>
<td>Category</td>
<td>Metric category that the metric belongs to. The system automatically populates this category if you create a new metric from the Metric Category form.</td>
</tr>
</tbody>
</table>

**Note:** You cannot change the category if the Depends on field is set or if another metric depends on this metric.
### Field

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Determines how to use the metric.</td>
</tr>
</tbody>
</table>

- **Assessment**: Non-scripted metric. Make the metric available as a question on an assessment questionnaire. The Assessment method is compatible with all data types except Duration.
- **Script**: Scripted metric. Obtain values by writing a custom script. The Script method is compatible with the Duration, Number, and Percentage data types.
- **Default answer from field**: This option appears only if you have selected an Assessment Metric Type that contains a table. The General tab adds two fields:
  - **Default answer**: Select the default answer for the question. The list comes from the selected table.
  - **Ask question**: Specifies when to ask the question: always or only if the default answer is empty.
- **Default answer from script**: The General tab adds a field:
  - **Ask question**: Specifies when to ask the question: always or only if the script does not contain a default answer. The script is defined on the Field Type tab.

**Note:** If you select a Data type that is incompatible with the selected Method, the system automatically changes the Method to the correct value.

### Weight

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Numeric value that represents the importance of this metric relative to other metrics in the same category. By default, the weight is 10. For weighting suggestions, see Assessment metrics.</td>
</tr>
</tbody>
</table>

This field is visible and required unless the Data type is Date, Date/Time, or String. These data types are not included in results calculations.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>Numeric value that determines the order of the metric question on assessment questionnaires, relative to other metric questions in the same category. The metric with the smallest order value appears as the first question in the category section. By default, the order is 100. For more information about questionnaire layout, see <a href="#">Complete Assessment Questionnaires</a>.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> It does not matter which order value you use for metrics with the Script method, as they do not appear on questionnaires.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this metric is used to gather assessment results. If a non-scripted metric (Assessment method) is inactive, the question does not appear on assessment questionnaires generated after the metric becomes inactive. If a scripted metric (Script method) is inactive, the script does not run.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box that makes the metric question mandatory (selected) or optional (cleared) on assessment questionnaires. Users cannot submit questionnaires until they provide valid responses to all mandatory questions, which display a red field status indicator.</td>
</tr>
<tr>
<td></td>
<td>This field is visible only if the Method is Assessment, the Depends on field is empty, and the data type is not Checkbox.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box that determines whether to include a <strong>Not Applicable</strong> answer option for this metric question on assessment questionnaires. Users can select <strong>Not Applicable</strong> if they do not have sufficient information to respond to a question or if a question does not apply to a particular assessable record. User responses of <strong>Not Applicable</strong> are excluded from results calculations. This field is visible only if the <strong>Method</strong> is <strong>Assessment</strong> and certain data types are selected.</td>
</tr>
</tbody>
</table>

**Additional fields you can add by customizing the form**

| Details               | Text field containing an HTML editor. Use this field to present important details about this metric to assessment recipients. Details can include formatted lists, images, videos, or links to external websites. |

**General Section**
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Question</td>
<td>Text to use as the question on assessment questionnaires. Enter a clear, straightforward question that is easy to answer, such as How likely are you to recommend this vendor for the purchase of office supplies?</td>
</tr>
<tr>
<td>Description</td>
<td>Information about the metric and what it evaluates. If the Method is Assessment, include details that help users understand how to answer the question. This text appears as a hint when a user points to the question text on the questionnaire.</td>
</tr>
<tr>
<td>Depends on</td>
<td>Setting used to make this metric a conditional question. Select an existing metric question from the list, which displays Checkbox, Choice, Likert Scale, Template, and Yes/No metrics of the same category as this metric. Then, use the Displayed when field to set the conditions that display this metric question on questionnaires. The system prevents the creation of recursive dependencies between metrics. For example, if Metric A depends on Metric B, Metric B cannot depend on Metric A. This field is visible only if the Method is Assessment.</td>
</tr>
<tr>
<td>Displayed when</td>
<td>Answer options for the selected Depends on metric question that, when chosen on questionnaires, display this metric question. This field is visible and required only if the Depends on field is set.</td>
</tr>
</tbody>
</table>

<tr>
<td>Dependent plugin</td>
<td>Plugin that contains the tables queried in the script. The system executes the metric script only if the plugin is active. The default available values are Asset Management, CMDB, Core, Cost Management, Procurement, and Software Asset Management. If the Method is Script, select a plugin. This field is visible only if the Method is Script. Note: An administrator may need to add more choices of plugins to the field.</td>
</tr>
<tr>
<td>Scale definition</td>
<td>Setting that determines whether lesser or greater numerical values equate to a good score in assessment result calculations. Select Low if lesser numerical values are better, such as for a metric that measures the number of incidents for a vendor. Select High if greater numerical values are better, such as for a metric that measures user satisfaction on a scale of one to five. The default value is High. This field is visible and required unless the Data type is Date, Date/Time, or String. The results for these data types are not included in results calculations. Note: For information about how to set the scale definition for data types that do not require you to set a numerical value, see Data Types.</td>
</tr>
<tr>
<td>Min</td>
<td>Lowest numerical value to be used as an answer option on assessments or as a scaled value in a scripted metric. This field is visible and required only if certain data types are selected. If the data type is Choice or Likert Scale, this field is read-only and is set automatically based on the smallest metric definition Value.</td>
</tr>
<tr>
<td>Max</td>
<td>Highest numerical value to be used as an answer option or scaled value. This field is visible and required only if certain data types are selected. If the data type is Choice or Likert Scale, this field is read-only and is set automatically based on the largest metric definition Value.</td>
</tr>
<tr>
<td>Script</td>
<td>Script that obtains the desired system information. This field is visible and required only if the Method is Script. Script methods</td>
</tr>
</tbody>
</table>
Create a metric definition
Metrics with Choice or Likert Scale data types must have metric definitions defined to represent answer options on questionnaires.

Role required: assessment_admin or admin

Each metric definition appears as one answer option for a question on an assessment questionnaire. For example, a metric for the question "How satisfied are you with the quality of this vendor?" has three metric definitions to create these answer options: Very satisfied, Somewhat satisfied, and Not at all satisfied.

1. Open the metric record you want to edit.
2. In the Assessment Metric Definitions related list, click New to create a new metric definition.
3. Fill in the fields:
   - Display: Enter the text you want to appear as the answer option.
   - Value: Enter the numeric value, greater than or equal to zero, to which the answer option equates. Values are used to calculate metric results. When you view assessment questions, metric definitions appear in order from least to greatest value.
     - The system sets the minimum and maximum values according to the metric definition values.
     - To prevent reporting confusion, no two metric definitions for a given metric should have the same Value.

4. Click Submit.

Change the order of an answer
By default, the order of answer options is established when a question is created with a data type of Choice or Likert Scale.

Role required: assessment_admin or admin

The system creates an Order value for each choice based on where it appears in the original list when you submit it. This order corresponds to the Value setting you give the answer. The choice with the lowest order number appears first, and the choice with the highest order number appears last. If you want to reconfigure the order of the answer options, you must do so by editing the Order field and not the Value field.
The **Order** column is hidden in the base system.

To edit these records, configure the **Assessment Metric Definitions** related list in the question record to show the **Order** column, and then edit the order number in the list. The **Value** setting remain the same for each answer option after reorganization.

### Metric types and assessable records

In the Assessments application, assessment administrators create and administer metric types and assessable records.

A metric type defines a set of records an organization wants to evaluate, such as vendors, projects, or employees. For each type, the system generates unique assessable records that link the type to records that need to be evaluated, such as the individual records for the vendors Amazon and Intel. There may be multiple assessable records for the same source record if the source record meets the criteria for more than one type. For example, you might want to evaluate a record on the Company table, such as Intel, as a vendor and as a manufacturer, with different **categories** and **metrics**.

For configuration suggestions, see **Administrator tasks**.

### Assessable records

An assessable record links a source record you want to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees.

You use assessments to evaluate the assessable record. The system generates assessable records from the source records that match the table and conditions set on the Assessment Metric Type form. You evaluate the assessable records with metric categories and metrics, which define traits and values to assess. For metric types with the **On demand** schedule type, you can **Define a new smartphone table title** from the Assessable Record form. This method of assessment generation makes it easy to create and preview short questionnaires or to quickly obtain assessment results for specific assessable records.

### Create metric types and generate assessable records

Each metric type sets a table and filter conditions that define a set of records to evaluate.

Role required: assessment_admin or admin

For example, the Vendor Performance application provides the **Vendor** metric type, which defines an assessable record for each source record in the Company (core_company) table that has the **Vendor** field selected. Create a metric type for each set of records you want to evaluate, such as vendors, users within an organization, or projects.
In addition to defining assessable records, metric types also determine how to filter decision matrix data and set the schedule type, which determines whether assessments are on-demand or scheduled.

1. Navigate to Assessments > Metric Definition > Types.
2. Click New.
3. Fill in the fields, as appropriate (see table).
4. When you are satisfied with the type settings, click Generate Assessable Records to save the record and create assessable records. The page redirects to the list of assessable records created.

You must click Generate Assessable Records to create the initial set of assessable records based on the table and conditions specified on the type record. After that, the system creates an assessable record each time a new matching record is created. Generate Assessable Records is located under Related Links.

**Note:** Clicking Generate Assessable Records can trigger the deletion of existing assessable records under certain circumstances. For more information, see Enforce a condition to delete an assessable record.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>(Required) Name of the type. It may be practical to give the type a name that indicates which records it defines.</td>
</tr>
<tr>
<td>Assessment duration</td>
<td>Amount of time assessors have to complete their assigned questionnaires, starting from the time the assessment is generated. The assessment duration sets the Due date that appears on assessment instances. Changes made to the duration of an attestation in the GRC Control Test Definition form are updated dynamically in this field. The default duration is 14 days.</td>
</tr>
<tr>
<td>Live feed</td>
<td>Check box that determines whether to enable (selected) or disable (cleared) the Live Feed view in scorecards for all assessable records created from this type.</td>
</tr>
<tr>

</tr>
<tr>
<td>Default</td>
<td>Category</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field appears only when Service Portal is installed.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Roles</td>
<td>Additional user roles that can view the results and access records associated with this type. Users with the specified roles have read access to this type record as well as to associated categories, metrics, assessable records and scorecards, category users, stakeholders, and decision matrixes.</td>
</tr>
<tr>
<td>Note:</td>
<td>Users with these roles do not have access to Assessments modules unless they are also assessment administrators. Users with these roles can navigate to the records by other means, such as from reference fields on assessment instances. This field provides the option to easily grant certain users access to specific assessment data in special cases. For example, the Vendor metric type provides access to users with the vendor_manager role so they can view results and compare assessable records when they open scorecards or decision matrixes in the Vendor Performance application.</td>
</tr>
<tr>
<td>Signature</td>
<td>(Optional) Acknowledgement by a survey recipient of requirements, admonitions, or expectations related to an assessment. For more information, see Create an assessment signature.</td>
</tr>
<tr>
<td>Return URL</td>
<td>Destination address of a web page that is presented to users after they submit an assessment for this metric type. When a return URL is configured, the end note content does not appear.</td>
</tr>
<tr>
<td>State</td>
<td>(Read-Only) Status of the assessment: Draft or Published.</td>
</tr>
<tr>
<td>Business rule</td>
<td>(Admin only) Business rule the system creates to monitor the specified table. When a new record is added to the table that meets the metric type conditions, the business rule generates a corresponding assessable record. If someone changes the table or conditions of the metric type, the system updates the business rule to reflect the changes. Existing assessable records associated with the metric type are not affected.</td>
</tr>
<tr>
<td>Schedule type</td>
<td>Setting that determines which assessment process to use. Select On demand or Scheduled.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Scheduled job       | *(Admin only)* Scheduled job the system creates to generate assessments for this metric type. This field is populated the first time you save the record. The scheduled job name follows the format `<type name>-Assessment Creation`. Administrators can configure a recurring assessment generation schedule for the metric type.
|                     | This field is visible only when the schedule type is **Scheduled**. **Note:** If you change the schedule type from **Scheduled** to **On demand**, the system deletes the scheduled job. If you change the schedule type back to **Scheduled**, the system creates a new scheduled job. The previous assessment generation schedule is not saved, but can be reconfigured if desired. |
| Evaluation method   | *(Admin only)* Indicates the evaluation method for this metric type. The system sets this field based on how the metric type is created. The possible evaluation methods are:
|                     | - **Assessment**: Default filter value for metric types. Only this evaluation method uses **assessable records**, conditions, and **stakeholders**.
|                     | - **Attestation**: For details, see Survey definitions.
<p>|                     | - <strong>Survey</strong>: For details, see Survey definitions.                                                                                                    |
| Scale factor        | <em>(Required)</em> Number to represent the best possible score for assessment results. All results for assessments of this type are scaled to this number. <strong>10</strong> is generally a good scale factor. <strong>Note:</strong> This field becomes read-only when it contains a value and you save the metric type. Choose a scale factor that you are satisfied with before you save the metric type. |
| Allow retake        | Check box that allows users to modify their answers to a completed assessment, quiz, survey, or attestation. After the due date, the system removes the assessment from the user's My Assessments and Surveys page. |
| Active              | Check box that determines whether the metric type is active. When the metric type is inactive (cleared), assessment generation is disabled and users cannot take existing assessments. |</p>

**Related Lists**

<table>
<thead>
<tr>
<th>Metric Categories</th>
<th>All metric categories associated with the type.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessable Records</td>
<td>All assessable records associated with the type. This related list is hidden in the Attestation view of this form.</td>
</tr>
</tbody>
</table>

**Note:** The **Generate Assessments** button is visible to administrators in certain cases for scheduled assessments. Do not click the button until after completing the prerequisite tasks.

**Delete a metric type**

Deleting a metric type entails deleting many related records.

**Role required:** assessment_admin or admin

You must delete some of these records manually before deleting the type, while the system deletes others automatically with the type.

1. Delete the records associated with the type to delete:
   - **Assessment results** (metric and category results)
   - **Assessment instance** (questions and assessment instances, in that order)
   - **Assessment groups**

2. Delete the type.
   
   A confirmation dialog box appears and alerts you that certain records associated with the type will also be deleted.

3. Click **OK** to delete the type and these related records.
Export an assessment

You can share assessments between ServiceNow instances by exporting an assessment and then importing the assessment on another instance.

Role required: assessment_admin or admin

**Note:** Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see System update sets.

**Note:** The system exports a single XML file that does not contain result data.

The XML file contains a metric type [asmt_metric_type] and the following records that are associated with the type:

- Assessable records [asmt_assessable_record]
- Metric categories [asmt_metric_category]
- Metrics [asmt_metric]
- Metric definitions [asmt_metric_definition]
- Category users [asmt_m2m_category_user]
- Stakeholders [asmt_m2m_stakeholder]
- Decision matrixes [asmt_decision_matrix], [asmt_m2m_xcategory_matrix], and [asmt_m2m_ycategory_matrix]

1. Navigate to Assessments > Metric Definition > Types.
2. Right-click the record and select Export Assessment.
3. Save the XML file.

Import an assessment

Share assessments between ServiceNow instances by importing a previously exported assessment.

Role required: admin

**Note:** Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see System update sets.

1. Ensure that the target instance has assessments enabled.
2. Follow the procedure detailed in Import a Record as XML Data.

Use update sets for surveys and assessments

Use an update set to capture changes to surveys and assessments.

Role required: admin or survey_admin
When developing surveys and assessments, you can use an update set to capture the changes and move them from a development instance to a production instance. Once an update set is created and marked current, all of the updates to the following tables are recorded in the update set.

The following tables are now update set enabled and also extend the application file:
- Assessment Metric Templates (asmt_template)
- Assessment Template Definitions (asmt_template_definition)
- Assessment Metric Definitions (asmt_metric_definition): survey question answer options
- Schedule (sys_trigger): scheduled jobs associated with the survey
- Assessment Metric Categories (asmt_metric_category): survey categories
- Assessment Metrics (asmt_metric): survey questions
- Assessment Category Users (asmt_m2m_category_user): survey users
- Trigger Conditions (asmt_condition)

Create an assessment signature
A signature on an assessment questionnaire contains assertions that can communicate directions, a legal statement, or any text that you want the recipient to consider.

Role required: assessment_admin or admin

You can require the recipient to select a check box or provide a full signature to acknowledge acceptance of the assertion before submitting the form. You can display assertions without requiring a signature. An assessment property called **Require authentication for user signature** allows you to require users to provide their user name and password when an assessment asks for a full name signature.

1. Navigate to **Assessments > Metric Definition > Signatures**.
   All signatures in the system appear in this list.
2. Click **New**.
3. Complete and submit the form using the fields in the table.

### Assessment signature fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name for this signature</td>
</tr>
<tr>
<td>Signature type</td>
<td>Type of signature required. The selections are <strong>Checkbox</strong>, <strong>Full name</strong>, or <strong>Assertion only</strong>. If <strong>Assertion only</strong> is selected, no signature is required to submit the questionnaire. By default, the system requires user authentication for a full name entry.</td>
</tr>
<tr>
<td>Assertion</td>
<td>Text to present to recipients that requires acknowledgement.</td>
</tr>
</tbody>
</table>

Assessable records
An assessable record links a source record you want to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees.

You use assessments to evaluate the assessable record. The system generates assessable records from the source records that match the table and conditions set on the Assessment Metric Type form. You evaluate the assessable records with metric categories and metrics, which define traits and values to assess. For metric types with the **On demand** schedule type, you can generate on-
demand assessments from the Assessable Record form. This method of assessment generation makes it easy to create and preview short questionnaires or to quickly obtain assessment results for specific assessable records.

You can set up an assessment description that includes information from multiple fields on an assessable record and is displayed on multiple lines. This provides the user who is taking the assessment with a more detailed and understandable description of the information being requested on the assessment questionnaire. Create a multi-line description using table titles, which can be defined to use one or more fields from the selected table. See Define a new smartphone table title for more information.

View an assessable record

View the Assessable Record form to edit preferences and perform various actions.

Role required: assessment_admin or admin

1. Navigate to Assessments > Assessable Records.
2. Open a record from the list.
   By default, the list displays only assessable records with Active metric types.
3. On the Assessable Record form, edit fields and perform other actions as necessary (see table).

Viewing Assessable Records

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>(Read-Only) Assessable record name based on the display value of the source record. The name appears on assessment questionnaires.</td>
</tr>
<tr>
<td>Source</td>
<td>(Read-Only) Source record the assessable record is linked to. The Source reflects the table name and source record display value. For example, if the Name field is the display value for the Company table, the assessable record for a company record named Amazon has the Source value Company: Amazon.</td>
</tr>
<tr>
<td>Live feed</td>
<td>Check box that, when selected, creates a live feed group for the assessable record, which appears on the scorecard. If you clear the check box after a live feed group has been created, the system deletes the live feed group and all its messages.</td>
</tr>
<tr>
<td>Type</td>
<td>(Read-Only) Metric type from which the assessable record was generated.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Decision matrix</td>
<td>Check box that, when selected, enables this assessable record's results data to appear on decision matrices of the same metric type. Decision matrices are graphs that plot the assessment results for multiple assessable records. If you clear the check box, the assessable record still appears on the default decision matrices if you click the View Matrix related link on the assessable record's scorecard.</td>
</tr>
<tr>
<td>Live feed group</td>
<td>(Read-Only) Live feed group for this assessable record. When you select the Live feed check box and save the record, the system populates this field.</td>
</tr>
<tr>
<td>Related Links</td>
<td></td>
</tr>
<tr>
<td>View Scorecard</td>
<td>Opens the scorecard for the assessable record.</td>
</tr>
<tr>
<td>Related Lists</td>
<td></td>
</tr>
<tr>
<td>Category</td>
<td>All metric categories associated with the assessable record. An assessable record must be associated to a category to be evaluated. Click Edit to add or remove category associations. Note that it is often more efficient to associate assessable records to categories using the Metric Category form.</td>
</tr>
<tr>
<td>Category users</td>
<td>All stakeholders who can take assessment questionnaires about this assessable record. Click Edit to create and delete stakeholders. For more information about this and other methods of creating stakeholders, see Stakeholders. This related list is available only when the associated metric type has the Scheduled schedule type.</td>
</tr>
</tbody>
</table>

Enforce a condition to delete an assessable record

By default, the system does not delete assessable records, even if you change the table or conditions for the type and the existing assessable records no longer match.

Role required: assessment_admin or admin

The system can be configured so you can trigger the deletion of assessable records that do not match the type table and conditions.

1. On the Assessment Metric Type form, select the **Enforce condition** check box to enable deletion of existing assessable records of this type that do not match the table or conditions specified.

   When the check box is cleared, the system retains existing assessable records of this type, even if they do not match the table and conditions specified.

2. Click **Generate Assessable Records** to delete all assessable records associated with the type that do not match the current table and conditions.
The system does not automatically delete assessable records, even if the Enforce condition check box is selected. You must click Generate Assessable Records with the check box selected every time you want the system to delete non-matching assessable records.

Delete an assessable record
When you delete an assessable record, the system deletes any stakeholders for the record.
Role required: assessment_admin or admin

Note: If a source record is deleted, the system deletes the associated assessable record. To delete the source record, you must first delete all associated metric results and category results.

Delete the assessable record:
- To delete a single record, open the record and click Delete.
- To delete multiple records, use the Assessable Records list.

Copy an assessment
Create a copy of an assessment with at least one category to reduce the effort of creating another assessment with similar data.
Role required: assessment_admin or admin
All associated questions (type), configurations, categories, metrics, domain separation rules, and role-based categories are copied. Assigned users, category users, instances, and trigger conditions are not copied.
1. Navigate to Assessments > Metric Definition > Types.
2. Select an assessment metric type.
3. In the title bar, click Copy, or click the menu icon, and select Copy.

Create a metric template
Create a metric template to define reusable rating scales for evaluating non-scripted metrics.
Role required: assessment_admin or admin
1. Navigate to Assessments > Metric Definition > Templates.
2. Click New.
3. Fill in the Name field on the Assessment Metric Template form.
4. To use images for template choices, such as for image scale questions, select Allow Image.
5. Click Submit.
6. Under the Assessment Template Definitions related list, click New.

Create a template definition for each answer option you want to appear on an assessment question.
7. Fill in the following fields:
   - Display: Enter the text to appear as the answer option.
   - Value: Enter a numeric value, equal to or greater than zero, that you want the answer option to equate to. Values are used in results calculations.
   - Selected Image: Click to add the image to use for selected state.
   - Unselected Image: Click to add the image to use for unselected state.
When you view assessment questions that use templates, answer options appear in order from least to greatest Value.

Tip: To prevent reporting confusion, no two template definitions for a given template should have the same Value.

8. Click Update.

**Metric templates**

Metric templates define reusable rating scales for evaluating non-scripted metrics.

Each answer option on the scale is defined as a template definition, much like a metric definition. For example, the metric template named Satisfaction contains the template definitions: **Very Satisfied, Satisfied, Neutral, Dissatisfied, and Very Dissatisfied**.

Metric templates are available for metrics that have Template as the Data type. The following metric templates are available by default.

<table>
<thead>
<tr>
<th>Default metric templates</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>Likert 5</td>
</tr>
<tr>
<td>Satisfaction</td>
</tr>
<tr>
<td>Frequency</td>
</tr>
<tr>
<td>Amount</td>
</tr>
<tr>
<td>Size</td>
</tr>
<tr>
<td>Quality</td>
</tr>
<tr>
<td>Complexity</td>
</tr>
</tbody>
</table>

**Update a metric minimum and maximum value to match a template**

For assessment results to be properly calculated, the Min and Max values of a metric that uses a template must be equal to the smallest and largest template definition Value, respectively.

Role required: assessment_admin or admin

The system sets the Min and Max fields automatically when you create a metric of the Template data type, based on the template definition values. However, the system does not update these fields for existing metrics if you add a new template definition to a template or if you update the Value of an existing template definition. If the new Value is less than the minimum value of any metrics that use the template or greater than the maximum value, update the metrics accordingly.

To edit the minimum and maximum values for a question that has the Template data type:

1. Navigate to Assessments > Metric Definition > Metrics.
2. Configure the list to show the Min and Max columns.
3. Run the following list filter condition: [Template] [is] [select the template you updated]
4. Ensure the Min and Max values match the smallest and largest template definition Value for the selected template, respectively.

   If the values do not match, edit the Min and Max directly from the list.

   **Note:** When the data type is Template, a UI policy prevents the editing of Min and Max from the form.

---

**Category users and stakeholders**

Users who take assessments are individuals in your organization who have specific knowledge of the assessment categories and the records being assessed. A person who is qualified to answer assessment questions from metrics in a specific category becomes a category user when associated to that category. A category user then becomes a stakeholder when associated to a specific assessable record.

The system determines which assessable records and questions a user receives by looking at the metric categories and assessable records for which those users are stakeholders. Assessment administrators can create and manage category users and stakeholders.

**Note:** Category users and stakeholders are used only for scheduled assessments.

---

**Category users**

Category users are users who can potentially answer assessment questions about a particular metric category for scheduled assessments. Category users should have special knowledge of the categories and the metrics those categories contain. A category user becomes a stakeholder when associated to an assessable record. Create at least one category user for each category you want to use for assessment questionnaires. There is no need for category users if the category contains only scripted **metrics**.

---

**Stakeholders**

A stakeholder is a category user with specific product or service knowledge, who is associated to an assessable record. A stakeholder is familiar with the assessable record and all the metrics within a specific category. The same category user can be associated to multiple assessable records, in which case the system creates a stakeholder record for each association.

There are multiple ways to create stakeholders:

- **Configure the system to create stakeholders automatically.**
- **Associate multiple category users to multiple assessable records.**
- **Associate multiple category users to one assessable record.**
- **Associate one category user to one assessable record.**

**Note:** Ensure you establish the desired user and assessable record associations to categories before attempting to creating stakeholders.

---

**Create a category user**

Create category users by associating users in the system to metric categories.

Role required: assessment_admin or admin
When you create category users, choose users who are knowledgeable and can answer questions from that category. For example, a purchasing agent is a good category user for metrics that evaluate a vendor’s discount practices.

1. **Navigate to** Assessments > Metric Definitions > Categories.
2. **Open a category record.**

   ![Note: The category must be associated to a metric type that has the Schedule type set to Scheduled.]

3. **In the Users related list, click Edit.**
4. **Select the appropriate users for this category.**

**Create stakeholders automatically**

You can configure the system to create stakeholders automatically from all category users and assessable records associated with a category using the **Create stakeholders** check box on the Metric Category form.

Role required: assessment_admin or admin

If you associate a user to the category, the system makes the resulting category user a stakeholder for all the assessable records associated to the category. Similarly, if you associate a new assessable record to the category, the system makes all category users stakeholders for that record if they are not already stakeholders.

![Note: Use the Create stakeholders check box with caution. You can end up with more stakeholders than you want and a large amount of unnecessary assessment data. Automatic stakeholder creation is best suited to assessment implementations in which category users are knowledgeable about all or most of the assessable records associated to each category.]

1. **Navigate to** Assessments > Metric Definition > Categories.
2. **Select a category.**
3. **Associate category users and assessable records to the category.**
4. **Select the Create stakeholders check box.**
5. **Click** Update.
   
   All the category users are associated to all the assessable records as stakeholders.

6. **In the Assessable Records related list, click Edit.**
7. **Using the slushbucket, associate an assessable record to the category.**
8. **Click Save.**
   The system makes all category users stakeholders for the new assessable record.

9. **Delete stakeholders as needed.**

   **Associate multiple category users to multiple assessable records**
   The stakeholder list helper in the create stakeholders module is the most efficient way to associate multiple category users to multiple assessable records in a single interface.
   
   **Role required:** assessment_admin or admin
   
   You can select category users from one category at a time.
   
   **Note:** You cannot edit or delete stakeholders using the list helper.

1. **Navigate to Assessments > Advanced > Create Stakeholders.**
   The stakeholder list helper appears.
2. Select a metric type from the list of available types.

   **Note:** Only metric types for scheduled assessments are available. On-demand assessments do not use category users or stakeholders.

3. Select a category from the list of available categories.

   **Note:** Only categories within the selected metric type are available.

The system populates the **Category User** and **Assessable Records** lists with category users and assessable records associated to the selected category.

4. Select one or more category users from the **Category Users** list.
5. Select one or more assessable records from the **Assessable Records** list.
6. Click the **Associate** arrow between the lists to complete the association.

A message above the list helper advises you that the selected category users are now stakeholders for the selected assessable records.

Delete a stakeholder for multiple assessable records

You can delete stakeholders for multiple assessable records.

Role required: assessment_admin or admin

1. Navigate to **Assessments > Advanced > Assessment Stakeholders**.
2. Sort the list by **Assessable Record** or **Category User** depending on the perspective you want.
3. Select the check box for each stakeholder you want to delete.
4. Select **Delete** in the **Actions** choice list.
5. Click **OK** to confirm the action.

The system deletes the stakeholders.
Associate one category user to one assessable record
You can create a single stakeholder using the list in the Assessment Stakeholders module.
Role required: assessment_admin or admin
Associate any category user to any assessable record.

1. Navigate to Assessments > Advanced > Assessment Stakeholders.
2. Click New. On the Assessment Stakeholders form, fill in these fields:
   - **Category user**: Select a category user.
   - **Assessable record**: Select an assessable record.
3. Click Submit.
   The selected category user becomes a stakeholder for the selected assessable record. To verify the association, navigate to the assessable record and note that the selected category user is on the Category users related list.

   ![Assessment Stakeholders](image)

   **Note**: Do not create stakeholders from category users and assessable records of different metric types.

Associate multiple category users to one assessable record
You can create many stakeholders for a single assessable record from the Assessable Record form.
Role required: assessment_admin or admin
You can also edit or delete stakeholders from the form.

1. Navigate to Assessments > Assessable Records.
2. Open a record from the list.
3. In the **Category users** related list, click **Edit**.
   These category users are the stakeholders for this assessable record.
4. Use the slushbucket to edit the category users associated to this assessable record. Add category users to create stakeholders. Remove category users to delete stakeholders. The system only shows category users for categories associated to the assessable record. For example, if an assessable record is only associated to the Compliance Score and Support Rating categories, you do not see User Satisfaction category users.

Delete a stakeholder for one assessable record
You can delete stakeholders for one assessable record.

Role required: assessment_admin or admin

1. Navigate to **Assessments > Assessable Records**.
2. Open an assessable record.
3. In the **Category Users** related list, select the check box for each stakeholder you want to delete.
4. Select **Delete** in the **Actions** choice list.
5. Click **OK** to confirm the action.
   The system deletes the stakeholders.

### Generate an on-demand assessment

Use on-demand assessments to familiarize yourself with the basic assessment process and test your questionnaires using minimal configuration.

Role required: assessment_admin or admin

Select the **assessable records** to evaluate, create the categories and questions, and then assign an assessment to a user in the system. Pre-configured **stakeholders** are not used for on-demand assessments.

1. Create a **metric type** and set the **Schedule type** to **On demand** to allow for testing of your assessment configuration.
2. Generate the **assessable records** for the metric type you created.
3. Create the **metric category** required to evaluate the assessable records selected.
4. Create one or more assessment questions, or **metrics**, for each category.
5. **Publish the assessment**.
6. Perform an **on-demand assessment** to test your categories and metrics.
7. Analyze the assessment ratings in an **assessment scorecard** or **decision matrix**.

**On-demand assessments**

On-demand assessments can be generated for metric types with the Schedule type field set to **On demand**.

For the system to properly generate on-demand assessments, the metric type must be active and published. The metric type must also be associated to at least one metric category. That metric category must be associated to one or more of each of the following items:

- Assessable record
- Metric

By default, an assessment administrator can generate an on-demand assessment for one assessable record or **multiple assessable records**.

**Generate an on-demand assessment for one assessable record**

When you generate an on-demand assessment from the Assessable Record form, the resulting assessment contains questions from the categories associated to the assessable record.

Role required: assessment_admin or admin

1. Navigate to **Assessments > Assessable Records**.
2. Open an assessable record associated to a metric type that has the **On demand** schedule type.
3. On the Assessable Record form, click **Assign Assessment**.
The Select Assessor dialog box appears.

4. Select a user from the Recent Assessors list or select a different user.

5. Click OK.

The system generates an assessment instance assigned to the selected user.

Generate an on-demand assessment for multiple assessable records
When you generate an on-demand assessment from the Assessment Metric Type form, the resulting assessment contains questions from all categories associated to any assessable records for the metric type.

Role required: assessment_admin or admin

For example, if there are 15 assessable records associated to at least one category with assessment metrics, the assessment contains questions for all 15 assessable records.

1. Navigate to Assessments > Metric Definition > Types.

2. Open a metric type that has the On demand schedule type.

3. On the Assessment Metric Type form, click Assign Assessment.

   The Select Assessor dialog box appears.

4. Select a user from the Recent Assessors list or select a different user.

5. Click OK.

The system generates an assessment instance assigned to the selected user.

Generate an assessment with the on-demand API
The Assign Assessment buttons call an API to generate on-demand assessments.

Role required: assessment_admin or admin

1. To generate an assessment, call the from any script in the system, such as a business rule or client script.

2. Use the sys_ids of these items:
   - An assessable record to evaluate. The assessable record must be associated with an on-demand type and at least one category that contains non-scripted metrics.
   - One or more users who should perform the assessment. The API generates a questionnaire about the specified assessable record for each user.
Schedule an assessment

After you have evaluated your questionnaires using on-demand assessments, edit your categories and metrics as needed, reset your metric type record, and select the users who are qualified to evaluate the assessable records.

Role required: assessment_admin or admin

1. Open the metric type you created for the on-demand assessment and set the Schedule type to Scheduled.
2. Make sure the categories and metrics you created for the on-demand assessment are correct.
3. Create category users who have special knowledge of your categories.
4. Create stakeholders by associating category users to specific assessable records.
5. Set a schedule for automatic assessment generation or generate the assessment manually. This procedure must be done by a system administrator.
6. Configure email notifications to remind users of their assigned assessments and to report to managers when an employee misses an assessment deadline.
7. Analyze the assessment ratings in an assessment scorecard or decision matrix.

Schedule types

You can schedule assessments for preconfigured users or send them to any user on demand.

On-demand assessments require less setup. Scheduled assessments define users, or stakeholders, who have specific knowledge of the records being evaluated, and automatically send out assessment questionnaires to those users at scheduled intervals. The best practice is to configure an on-demand assessment first to familiarize yourself with the process and test your questionnaires. When you are satisfied with your categories and questions, reconfigure for a scheduled assessment. These configuration paths are the easiest for both assessment types. Refer to Key Terms for definitions of the terms used in these procedures.

Set an assessment generation schedule

You can set assessment generation schedules. You must set a schedule for each metric type individually.

Role required: assessment_admin or admin

1. Navigate to Assessments > Metric Definition > Types.
2. Open the appropriate metric type record.
3. Click the reference icon next to the Scheduled job field to open the Schedule Item record.
4. Locate the Trigger type field and set a recurring schedule for the scheduled job.

For example, if you want to generate assessment components each month, select the Interval or Repeat trigger type and specify a Repeat value of 30 days. Alternatively, select Day in Month and specify a Run time and Run day of month.

The optimal frequency of assessment generation is subjective. When you set the schedule, keep in mind the number of records to evaluate, how often your organization requires updated assessment results, the time and effort required of users to complete assessments, and other relevant factors.

Publish a metric type

Before it is possible to generate assessments, an assessment administrator must publish the associated metric type.

Role required: assessment_admin or admin
The State field on the Assessment Metric Type form indicates whether the type is published. The default state is Draft, which disables the system from generating assessments.

1. Navigate to Assessments > Metric Definition > Types.
2. Open a metric type record, and click Publish.
   
   The Publish button is available only if the state is Draft and there is at least one metric associated with the type.

   **Note:** A metric type cannot be moved back to the Draft state after it has been published.

**Scheduled assessments**

The system generates a unique scheduled job for each metric type with the Schedule type field set to Scheduled.

The system generates a unique scheduled job for each metric type with the Schedule type field set to Scheduled. Each scheduled job generates assessment components for the related metric type. By default, the scheduled job runs when an administrator executes it manually, but administrators can set a schedule to generate assessments automatically on a recurring basis.

For the system to properly generate scheduled assessments, the metric type must be active and published. The metric type must also be associated to at least one metric category. That metric category must be associated to one or more of each of the following items:

- Assessable record
- Stakeholder associated to one of the assessable records
- Metric

**Generate a scheduled assessment manually**

Administrators can generate scheduled assessments manually.

Role required: assessment_admin or admin

Use this option, for example, if you have set a schedule but want to generate assessments before the next scheduled run date.

1. Navigate to Assessments > Metric Definition > Types.
2. Open the appropriate metric type record.
3. Click Generate Assessments to trigger the scheduled job immediately.

   **Note:** Be careful to click Generate Assessments, not Generate Assessable Records.

**Generate a vendor type assessment manually**

The Vendor Performance feature provides a direct method of generating assessments for the Vendor metric type.

Role required: admin

1. Navigate to Vendor Performance > Admin > Generate Assessments.
2. Click Generate Assessments to execute the scheduled job for the Vendor type.

**Clean up assessment data**

The assessment process generates a considerable amount of data, some of which is not useful after a short time.

Role required: assessment_admin or admin
The assessment process generates a considerable amount of data, some of which is not useful after a short time. Assessments include a scheduled job called **Remove Old Assessment Data** that is available to administrators only. The scheduled job removes these items if they are more than a year old:

- Assessment instance questions
- Assessment instances
- Metric results

By default, the scheduled job is executed manually. Administrators can configure the scheduled job to run automatically on a recurring schedule.

1. Navigate to **System Scheduler > Scheduled Jobs > Scheduled Jobs**.
2. Open the **Remove Old Assessment Data** record.
3. On the Schedule Item form, set the **Trigger type** field to run the scheduled job on a recurring schedule.
   
   It is recommended to set the scheduled job to run on a weekly or monthly basis.
4. Optional: Click **Execute Now** to run the scheduled job.

**Assessment instances**

An assessment instance represents one occurrence of a questionnaire assigned to one user.

The system generates assessment instances only when the required conditions are met, as described in **Scheduled assessments** and **On-demand assessments**, and there are non-scripted metrics in at least one category.

When the system generates scheduled assessments for a metric type, each assessment instance contains questions about assessable records and categories related to the stakeholder to which it is assigned.

**Example:**

Recall that there can be multiple stakeholder records associated with one user record. Minh Leclare is a stakeholder for these items related to the **Vendor** metric type:

<table>
<thead>
<tr>
<th>Assessable record</th>
<th>Category</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amazon</td>
<td>User Satisfaction</td>
</tr>
<tr>
<td>Acme</td>
<td>User Satisfaction</td>
</tr>
<tr>
<td>Acme</td>
<td>Reliability</td>
</tr>
<tr>
<td>Cisco</td>
<td>Reliability</td>
</tr>
</tbody>
</table>

When the system generates a scheduled assessment, Minh is assigned one assessment instance. Minh must evaluate Amazon, Acme, and Cisco by answering questions from the categories for which she is a stakeholder. Assuming that there are three questions in the User Satisfaction category and six questions in Reliability, Minh's questionnaire contains three questions about Amazon, nine questions about Acme, and six questions about Cisco.

When the system generates an on-demand assessment for a specific assessable record, the assessment instance contains questions about that assessable record and all its associated categories. When the system generates an on-demand assessment for a metric type, the assessment instance contains questions about all that metric type's assessable records and their associated categories.

View an assessment instance
An assessment instance represents one occurrence of a questionnaire assigned to one user.

Role required: admin, survey_admin, or assessment_admin

1. Navigate to **Assessments > Assessment Instances**. The following sub-modules are available based on the state of the instances:
   - **Ready to take**: Displays assessment instances that are ready to be taken by the user. By default, these instances are sorted in ascending order by the **Number** field.
   - **In progress**: Displays assessment instances that are in progress. By default, these instances are sorted in ascending order by the **Number** field.
   - **Completed**: Displays assessment instances that are complete. By default, these instances are sorted in descending order by the **Taken on** field.
   - **Cancelled**: Displays assessment instances that are cancelled. By default, these instances are sorted in ascending order by the **Number** field.
   - **All**: Displays assessment instances in all states. By default, these instances are sorted in ascending order by the **Number** field.

2. Click an assessment instance number to open the record from the required sub-module. By default, the following fields are displayed in the Assessment Instance form for all sub-modules other than **Completed**.

   **Note**: When you open an instance in the **Completed** sub-module, you are redirected to the User’s Response page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Auto-generated record number.</td>
</tr>
<tr>
<td>Metric type</td>
<td>Metric type of this assessment.</td>
</tr>
<tr>
<td>Assessment group</td>
<td>Assessment group to which this assessment belongs.</td>
</tr>
<tr>
<td>Due date</td>
<td>Date by which the assessment instance must be completed. The system populates the due date from the value in the metric type <strong>Assessment duration</strong> field. The system generates email notifications related to the due date.</td>
</tr>
<tr>
<td>State</td>
<td>State of the assessment.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain associated with the instance.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User this assessment is assigned to. This field becomes read-only when the state is <strong>In progress</strong>, <strong>Complete</strong>, or <strong>Canceled</strong>.</td>
</tr>
<tr>
<td>Signature</td>
<td>Name of the signature record attached to this assessment. A signature requires that assessment recipients acknowledge that they have read any assertions attached to a questionnaire.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Signature result</td>
<td>Verification provided by the recipient when a signature is required. This value is either the recipient's full name from the User (sys_user) table or checked, indicating that the recipient acknowledged reading the assertion by selecting a check box.</td>
</tr>
</tbody>
</table>

3. Click **Take assessment** to open the questionnaire.

This button is available if all the following conditions are true for the assessment instance:

- It is **Assigned to** you.
- The **State** is **Ready to take** or **In progress**.
- The associated metric type is **Active**.

**Configure trigger conditions for an assessment**

Trigger conditions specify when to send a particular assessment and who to send the assessment to.

Role required: assessment_admin or admin

1. Navigate to **Assessments > Admin > Trigger Conditions**.
2. Complete the fields as described in the table:

<table>
<thead>
<tr>
<th>Trigger Condition form</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>Assessment</td>
<td>(Required) Metric type to generate assessment instances for. Triggered assessments only work if the metric type is set to the <strong>On demand</strong> schedule type.</td>
</tr>
<tr>
<td>Table</td>
<td>(Required) Table to run the trigger condition on. You can select only tables in the current application scope. The table must have a connection to the assessable records for the selected <strong>Assessment</strong>. For example, you might want to send a vendor assessment when incidents close that are related to vendors you assess. In this case, select the Incident (Incident) table. After you select a table, ensure there is at least one option for the <strong>Assessable Record Field</strong>. If there is not, select a different table.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>User field</td>
<td>(Required) Field that stores the users you want to send the assessment. You can select any field, on the selected Table or on a related table, that references the User (sys_user) table. Use the tree picker to select a field.</td>
</tr>
<tr>
<td>Repeat Interval</td>
<td>Minimum period that must pass before the trigger condition can resend the assessment to the same user. For example, assume the repeat interval is set to 30 days. Even if the same user is eligible for multiple assessments from this trigger condition, the system can only send the user one assessment every 30 days.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this trigger condition is active (selected).</td>
</tr>
<tr>
<td>Business rule</td>
<td>(Admin only) Business rule the system creates to monitor the selected table. When the condition is met, the business rule sends the assessment to the correct user. No configuration is necessary for this business rule.</td>
</tr>
<tr>
<td>Trigger randomly</td>
<td>Check box that determines whether to send the assessment to the appropriate user every time the condition is met (cleared) or only a percentage of the time (selected), as specified in the Probability (%) field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Probability (%)</td>
<td>Probability out of 100 that the assessment will be sent each time the condition is met. For example, if the probability is set to 50, the system sends the assessment approximately 50% of the time the conditions are met, assuming there are no repeat interval restrictions. This field is visible and required only when the Trigger randomly check box is selected.</td>
</tr>
<tr>
<td>Assessable Record Field</td>
<td>(Required) Field on the selected Table that determines which assessable record will be the subject of the assessment. Only appropriate reference fields on the selected Table are available to select. If there are no Assessable Record Field options available, you must select a different Table. If the selected Assessment evaluates records on the Company [core_company] table and the selected Table is Incident, the only Assessable Record Field options are fields on the Incident table that reference the Company table. For example, Company or, if vendor ticketing is enabled, Vendor. If you select Vendor, the trigger condition sends an assessment about the Vendor for the incident, assuming there is an assessable record for the associated company. The assessment contains questions from all metric categories associated with the assessable record.</td>
</tr>
<tr>
<td>Related Field 1 – Related Field 4</td>
<td>Field that contains a value you want to store for reporting purposes. You can pick any reference field on the selected Table. When the trigger condition generates an assessment instance, the system stores the value from the triggering record. Select up to four fields. For example, if you select the Incident table, you might select Caller and Vendor as related fields. That stores the caller and vendor associated with the incident as Related record 1 and Related record 2 in the assessment instance record. To view these fields, configure the Assessment Instance form.</td>
</tr>
<tr>
<td>Description</td>
<td>Summary information to identify the trigger condition.</td>
</tr>
</tbody>
</table>
### Assessment trigger conditions

A trigger condition tells the system who to send a designated assessment to and when, based on specific conditions.

With trigger conditions, assessment administrators can configure the system to generate assessments each time a specific action occurs, such as when an incident or change request closes. The trigger condition sends the assessment to specified users who are related to the triggering record, such as incident callers or change request assignees. You can choose to send the assessment every time the condition is met, or set a probability for the system to send the assessment at random when the condition is met.

#### Trigger condition configuration

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>(Required) Condition builder that defines the criteria that must be true to send the assessment. For example, if you want to send an assessment whenever an incident closes, create the condition (State) (is) (Closed).</td>
</tr>
</tbody>
</table>

#### Trigger condition example

Modesto Scroggie is the caller on an incident that is assigned to Boris Catino, a service desk technician. Boris contacts a vendor to resolve Modesto's issue and sets the **Vendor** field to **Microsoft**. When the incident closes, the system creates an assessment instance assigned to Boris so he can evaluate Microsoft as a vendor.

Because two related fields were selected as part of the trigger condition, the assessment instance stores the following information from the incident:

- **Related record 1**: User: Modesto Scroggie
- **Related record 2**: Company: Microsoft

**Note:** Even though the trigger condition is set to be triggered every time the conditions are met, the **Repeat Interval** setting ensures that Boris does not receive another assessment if another vendor incident assigned to him closes within 30 days of the first one.
Enable manager notifications

Users with the assessment_admin role can enable the Notify manager assessment is overdue email notification.

Role required: assessment_admin or admin

This notification sends emails to assessors’ managers when assessors do not complete their assigned assessments on time. For more information, see the table of assessment notifications. You must enable or disable this email notification separately for each metric type.

1. Navigate to Assessments > Metric Definition > Types.
2. Open a metric type.
3. Select the Notify if overdue check box.

To disable manager notifications, clear the check box.

4. Save the record.

Note: The assessor’s user record must have a manager specified in the Manager field to use this notification. You might need to configure the form to use this field.

Assessment notifications

You can configure the system to send email notifications for assessments.

You can configure any of the following types of notification during the process of generating assessable records:

- Notify assessment user: This message notifies you of an assigned assessment and includes the type, the due date, and basic instructions. The message also contains a link to the record where you take the assessment.

  Note: If a user has a pending assessment, then the system will not generate another instance of the same assessment.

- Remind assessment user: This message reminds you of the due date if half the time passes and you have not completed the assessment. The message content is the same as the first notification.

- Notify manager assessment is overdue: If you do not complete an assessment by the due date, the system may send a notification to your manager, depending on configuration.

  Note: By default, the system runs a script every 30 days to cancel expired assessment and survey instances that are in the Work in progress or Ready to take states.
Assessment notification workflow
The system sends assessment notifications according to the Notify assessment user workflow. Users with the workflow_admin, workflow_creator, or workflow_publisher roles can view workflows.

1. To open the graphical Workflow Editor, navigate to Workflow > Workflow Editor.
2. In the activity menu, click the link to choose an existing workflow.

![Workflow Window]

3. Select Notify assessment user from the Workflow Versions list.
The workflow appears.
View a metric result

Metric results contain values that represent an evaluated record's performance for a specific metric, based on a single evaluation from one user or from the execution of a script. Metric results contain actual values as well as calculated values. The system uses values from metric results to calculate category results.

Role required: assessment_admin or admin

If there is an active scripted metric when the assessment is generated, the system automatically produces a metric result for each associated assessable record. The system produces an additional metric result for each question a user answers on a completed assessment questionnaire. If multiple users complete questionnaires with the same questions on the same assessable records, the system produces metric results for each user's responses. For example, three users complete questionnaires that contain the same four questions about the Acme Corporation record. The system produces 12 metric results: one per user for each question.

1. Navigate to Assessments > Results > Metric Results.
2. Open the metric result record you want to view.
All fields on the form except **Updated** and **String value** are read-only.

**Metric Result form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment group</td>
<td><strong>Assessment group</strong> to which the metric result is associated.</td>
</tr>
<tr>
<td>Metric</td>
<td>Name of the metric to which these metric result values apply.</td>
</tr>
<tr>
<td>Data type</td>
<td>Data type of the metric.</td>
</tr>
<tr>
<td>Method</td>
<td><strong>method</strong> of the metric.</td>
</tr>
<tr>
<td>Updated</td>
<td>Date and time the metric result was last updated.</td>
</tr>
<tr>
<td>Source</td>
<td>Source record of the assessable record evaluated.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User who completed the assessment questionnaire. This field is blank when the method is <strong>Script</strong>.</td>
</tr>
<tr>
<td>Instance</td>
<td><strong>Assessment instance</strong> completed by the <strong>Assigned to</strong> user. This field is blank when the method is <strong>Script</strong>.</td>
</tr>
</tbody>
</table>

**Actual value**

Unscaled value from a user response or script, depending on the method:

- **Assessment**: Value obtained from the user response to the assessment instance question. The actual value is determined by the metric data type:
  - **Checkbox**: The actual value is 0 if the check box is cleared and 1 if it is selected.
  - **Choice** or **Likert Scale**: The actual value is equal to the Value of the metric definition associated with the chosen answer option.
  - **Date, Date/Time, or String**: The actual value is -1 to indicate that these data types do not contribute to category result calculations.
  - **Template**: The actual value is equal to the Value of the template definition associated with the chosen answer option.
  - **Yes/No**: The actual value is 0 if the response is No and 1 if it is Yes.

- **Script**: Value the script placed in the **actual_result** variable.

This field is hidden and left blank when the data type is **Duration**.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Duration value</td>
<td>Specific kind of actual value that is only applicable if the data type is <strong>Duration</strong>. The duration value is the value obtained by the script query from the <strong>actual_result</strong> parameter, such as the average duration of outages for a vendor.</td>
</tr>
<tr>
<td>Scaled value</td>
<td>Appropriate value from the <strong>scaled_result</strong> variable in the associated metric script. The code in a scripted metric defines a scaling scheme for the actual values it obtains. For example, a scripted metric queries the CMDB to return the number of configuration items (CIs) for a vendor. The code includes this scaling scheme, where <strong>actual_result</strong> is the number of CIs, and <strong>scaled_result</strong> is a representation of the quantity of CIs:</td>
</tr>
</tbody>
</table>
|                     | if (actual_result < 1)  
|                     |     scaled_result = 0;  
|                     | else if (actual_result < 1000)  
|                     |     scaled_result = 1;  
|                     | else if (actual_result < 10000)  
|                     |     scaled_result = 2;  
|                     | else if (actual_result < 25000)  
|                     |     scaled_result = 3;  
|                     | else if (actual_result < 100000)  
|                     |     scaled_result = 4;  
|                     | else  
|                     |     scaled_result = 5;  
|                     | If the script detects 315 CIs for the vendor, the **Actual value** is 315 and the **Scaled value** is 1 for this metric result.  
|                     | ![Note: Although this field is visible only when the method is **Script**, the system populates the field with the **Actual value** when the method is **Assessment**, as the scaled value is used in the **Normalized value** calculation.](image)                                                                                                                                                                                                                                                                                                  |
| Normalized value    | Adjusted value that accounts for weights, scale definition, minimum and maximum values, and other factors that impact the metric (like the survey responses or the input value—the actual value given by the user). See the example for **Normalized value** in **View an assessment category result**.                                                                                                                                                                                                                                                                         |
### Field & Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String value</td>
<td>Value that displays the response as it appears on a questionnaire. In some cases this is the same as the <strong>Actual value</strong>, such as when the metric data type is <strong>Percentage</strong>. The string value is <strong>N/A</strong> for unanswered questions of certain data types. For the <strong>Attachment</strong> data type, the names of the attached files are displayed as comma-separated values.</td>
</tr>
</tbody>
</table>

### Assessment results

In the Assessments application, when the system processes completed questionnaires or gathers values returned from scripted metric queries, it generates assessment result records called metric and category results.

Assessment administrators can view assessment results.

The system calculates **metric results** first, normalizes the scores, and then calculates **category results**. Each metric and category result record stores data from one assessment group, for a particular category and source record evaluated. Specifically:

- Metric results: store data calculated from one evaluation of one metric.
- Category results: store data calculated from a weighted average of all metrics in the category.

**Note:** Although results data is available to view in the form of metric and category result records, the most meaningful way to view results is in **scorecards** and decision matrixes. These tools display only the most pertinent data in graphical, comparative formats.

### Excluded Responses

The system creates metric results for responses but does not include them in category result calculations if any of the following are true:

- The user selects the **Not Applicable** answer option on a questionnaire.

- The user does not answer the question and the **data type** is not Checkbox.

- The question data type is one of the following: Date, Date/Time, or String.

- The metric result **Actual value**, **Scaled value**, and **Normalized value** fields are set to -1.

### Metric Attachments

After a survey or assessment is submitted, any attachments that have been added by a user are moved to the metric result record. The names of the attached files are added to the **String value** field on the Metric Result form.

**Note:** You cannot add or remove attachments from a metric result.

### Assessments overview module

The assessment overview module is a type of homepage that displays various assessment reports, such as results by category and assessments by state.
Prerequisites

You can view the overview page and refresh, add, delete, and rearrange report widgets.

Role required: assessment_admin
To use the Assessments Overview module, navigate to Assessments > Overview and click elements within the reports to obtain more information.

The available reports are:

<table>
<thead>
<tr>
<th>Report</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessable Records by Type</td>

**Assessment results calculation**

For every assessment group, there are assessment results.

Data calculated from an evaluation of one metric is classified as a metric result. Data calculated from the weighted average of all metric results in a category is classified as a category result. The system calculates some assessment results when the assessment is generated, and others when users complete questionnaires.

**View a bubble chart for assessments**

Assessment administrators can view bubble charts to compare the relative standing of assessable records in three metric categories.

Role required: assessment_admin or admin

1. Navigate to Assessments > Admin > Bubble Charts.
2. Click a Name to open the bubble chart record.
3. Under Related Links, click View Bubble Chart.

**Note:** Demand managers and vendor managers can view bubble charts through the Demand Management and Vendor Performance applications. See Project Portfolio Management for more information.

**Bubble charts for assessments**

A bubble chart is a dynamically updated graph that plots assessment results for multiple assessable records.

Assessment administrators can create and use bubble charts to compare the relative standing of assessable records in three metric categories. The X- and Y-axes each represent a different category. Assessable records are plotted on the chart as circular markers, or bubbles, which vary in size according to scores for the third category.

Create a bubble chart
Assessment administrators can create bubble charts to compare the relative standing of assessable records in three metric categories.

To create a bubble chart, navigate to Assessments > Admin > Bubble Charts and create a record (see table for field descriptions).

Note: For color fields, either HTML color names or hexadecimal (hex) values are acceptable. For hex values, the # character is optional. Values are not case-sensitive. For example, all of the following values are valid: LightGray, lightgray, #D3D3D3, d3d3d3.
## Bubble Chart form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Descriptive name for the bubble chart. <strong>Bubble Chart</strong> is appended to the name when you view the bubble chart.</td>
</tr>
<tr>
<td>• Top left label</td>
<td>Label text for the top left, top right, bottom left, and bottom right quadrants, respectively. Choose labels that help interpret results. For example, a bubble chart that displays vendor assessment results might have the following quadrant labels, where vendors in the top right quadrant have the best scores:</td>
</tr>
<tr>
<td>• Top right label</td>
<td>• <strong>Top left label</strong>: Resource</td>
</tr>
<tr>
<td>• Bottom left label</td>
<td>• <strong>Top right label</strong>: Essential Partner</td>
</tr>
<tr>
<td>• Bottom right label</td>
<td>• <strong>Bottom left label</strong>: Poor Performer</td>
</tr>
<tr>
<td></td>
<td>• <strong>Bottom right label</strong>: Reevaluate</td>
</tr>
<tr>
<td>• Top left color</td>
<td>Border colors for the top left, top right, bottom left, and bottom right quadrants, respectively. Bubbles are the color of the quadrant they are in.</td>
</tr>
<tr>
<td>• Top right color</td>
<td></td>
</tr>
<tr>
<td>• Bottom left color</td>
<td></td>
</tr>
<tr>
<td>• Bottom right color</td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Metric type associated with this bubble chart. Only results for assessable records of the selected metric type are plotted on the bubble chart.</td>
</tr>
<tr>
<td>• X-Axis label</td>
<td>Label text for the X-, Y-, and Z-axis categories of the bubble chart. These labels appear along the X- and Y-axes, if applicable, and in bubble score summary windows. The metric category name is usually a good label. If these fields are left empty, the bubble chart automatically displays the selected category names as the labels.</td>
</tr>
<tr>
<td>• Y-Axis label</td>
<td></td>
</tr>
<tr>
<td>• Z-Axis label</td>
<td></td>
</tr>
<tr>
<td><strong>Metric X category</strong></td>
<td>Metric category each axis represents. Results for the Z-axis category determine the size of each bubble. The Z-axis should generally represent the most important category out of the three.</td>
</tr>
<tr>
<td><strong>Metric Y category</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Metric Z category</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Quadrant label color</strong></td>
<td>Color of the label text for the quadrant borders.</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>Check box that enables (selected) or disables (cleared) the bubble chart as the default. There can be only one default bubble chart per metric type.</td>
</tr>
</tbody>
</table>

### Bubble chart components

The X- and Y-axes each represent a different metric category. Assessable records are plotted on the chart as circular markers, or bubbles, which vary in size according to scores for the third category.

The bubble chart page has these components:

- **Bubble Chart**
  - **X- and Y-axes**: Each axis represents a metric category.
• **Bubbles**: Each labeled bubble represents an average of category result data for an assessable record. Point to a bubble to view an assessable record score summary. Click a bubble or bubble label to view the scorecard for the assessable record.

• **Source record list**: List of all records defined by the **Table** and **Condition** fields for the associated **metric type**. Note that the bubble chart only plots records for which there are assessment results. The assessment results are actually associated with the assessable records for each of the listed source records.
Assessable record score summaries

Point to a bubble to display a score summary for the assessable record the bubble represents.

The summary displays the assessable record's average score for each category in the following order: X-axis category, Y-axis category, Z-axis category. The scores are based on data from the last 12 months.

![Bubble chart score summary](image)

**View an assessment scorecard**

The Assessments application prepares printable scorecards. A scorecard displays easy-to-interpret assessment results, in which the current calculated ratings for an assessable record are compared to previous ratings or to the ratings of other records.

Role required: assessment_admin or admin

Users can examine ratings over time, compare ratings for one assessable record with all assessable records in a table, or compare the ratings of two assessable records. All ratings are averages for the time range selected. The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed assessments and scripted metrics.

Administrators can display a scorecard for any table by creating a Related Link on assessable records. The system provides this link on the Company form by default when Vendor Performance is active.

The Vendor Performance application provides an enhanced scorecard view for vendors.

See Vendor Performance in : Project Portfolio Suite.

1. Navigate to Assessments > Assessable Records.
2. Open a record.

**Create a link to a scorecard**

Users with the admin role can create UI actions that allow users to view scorecards from tables.
Role required: assessment_admin or admin

1. Generate **assessable records** you want to evaluate.
   For example, you might create a metric type called **Project** to assess project management records.

2. Navigate to **System Definition > UI Actions**.

3. Open the View Scorecard record.

4. Right-click the header bar and select **Insert and Stay** from the context menu to create a duplicate record.

5. Change the **Table** name to the table on which you want the UI action to appear.
   For example, you might select Project (pm_project).

6. Do not edit the **Action name** field or the **Condition** script.

7. Save the record.

8. Navigate to the table on which you created the UI action and open an assessable record.
   a) In this example, navigate to **Project > Projects > All**.
   b) Open any record in the list.
   c) Click **View Scorecard** under **Related Links** to open the scorecard for that assessable record.
The scorecard appears with the title in the form of `<table display name> Scorecard`. For example, a scorecard for an assessable record in the Project `[pm_project]` table is named `Project Scorecard`.

**Note:** Content does not appear in the scorecard unless the associated assessable record has assessment results or related live feed conversations.

9. Insert a new View Scorecard UI action record for each table where you want the related link to appear.

**Export a quiz scorecard as an image**

You can export scorecards as images.

Role required: assessment_admin or admin

1. Click the menu icon and select **Save as PNG** or **Save as JPEG** as the download format.
2. When the export is complete, select **Download** to save the scorecard image to a storage location.

---

**Assessment scorecard averages**

The Averages view compares the current ratings for an assessable record in each metric category with the average, minimum, and maximum values from all assessable records in the filter. All ratings are from assessments generated over the trailing twelve months (TTM).
Select a filter option to compare the current record against all assessable records in that filter. An assessment administrator configures these options in the Filter field field in the Assessment Metric Type form.

Rating variances are highlighted as follows:

- **Red**: Ratings are below average in this category. The Diff value displays a negative number.
- **Green**: Ratings are above average in this category. The Diff value displays a positive number.
- **White**: Ratings are average in this category. The Diff value is 0.0.

In the following example, the ratings of the current group are compared against other groups for which Don Goodliffe is the manager.

![Group scorecard with ratings filter](image)

**Assessment scorecard categories**

The Categories view displays a bar chart showing the average ratings for each category in the selected time interval.

Select from these reporting periods:

- All History
- Last 3 Months
- Last 12 Months
Scorecard categories

Assessment scorecard category metrics
The Category Metrics view displays the weighted average results for each metric within a category. Use this view to learn how individual metrics affect the overall rating for the category.
Select a metric category from the choice list to display the chart.
Scorecard category metrics

Assessment scorecard head-to-head compare view
The Head to Head Compare view allows you to compare the ratings of two assessable records of the same type. Select an assessable record from the choice list to compare against the current record’s trailing twelve month (TTM) ratings.

Head to head compare
The Diff column displays the difference between each assessable record’s most recent TTM ratings. By default, the system selects the first assessable record in the list when you open this view. The scorecard displays three years of ratings for the comparison record. All ratings are expressed as averages.
Scorecard head to head compare

**Overall Rating**
The Overall Rating is calculated as:

\[
\frac{\text{(sum of normalized values in category result)}}{\text{(number of assessment groups)}}
\]

In the following example, the calculation is

\[
\frac{2.13 + 2.86 + 3.79 + 1.43 + 2.39 + 3.7}{2} = 8.15
\]
<table>

#### Overall Rating on the Group Scorecard

**Assessment scorecard history**

The History view compares the current ratings for each category with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the **Diff** column indicate the trend of the current assessment against the previous assessment.

- **3 Years**: To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The **Diff** column shows the discrepancy between the current ratings and the previous calendar year's ratings.
Scorecard history - 3 years

- **4 Quarters**: Quarterly assessments compare the average rating for each category in the current quarter against the average ratings from the previous four quarters. The **Diff** column shows the discrepancy between the current ratings and the previous quarter’s ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the 3rd quarter of 2013, then the previous quarters appear as 2nd (2013), 1st (2013), 4th (2012), and 3rd (2012). All four of the previous quarters appear, whether or not there was any data for those quarters.

Scorecard history - 4 quarters

**Live feed view of assessable records**

The live feed view displays live feed conversations that apply to the assessable record. Users can view the group feed, including tagged comments, and add comments of their own.
To configure a live feed view, an assessment administrator selects the Live feed check box on the Assessable Record form. Live feed is available on the scorecard even if there are no category results for the other views.

The live feed view provides these viewing options:

- **My Feed**: Displays the user’s My Feed preferences.
- **Company**: Displays the user’s company feed.
- **Groups**: Displays all available groups and gives the logged in user the option to leave or join a group. Select a group to display that group’s conversations.
- **Tags**: Displays all the tags found in live feed comments. Click a tag to display the conversations containing that tag.

Has anyone had problems getting hardware this past month? I had a Linux server approved but still haven’t gotten it.

Yes, my network has not even been ordered yet. When I asked procurement about it they made some excuse that they cannot get anything until they get ok from CFO.

Live Feed group scorecard
Assessment scorecard ratings
The scorecard ratings section displays various ratings for the assessable record.

Select one of several views that present different ratings:

- Averages
- Categories
- Category Metrics
- Head to Head Compare
- History
- Live Feed

Some views display an overall rating column, which lists categories used to evaluate the assessable record. Only categories in which the assessable record has been evaluated appear on the scorecard. If the ratings section does not display any data, the assessable record or category results associated to the assessable record have been deleted.

Click a category to view the category record. Point to a category to display a line chart that shows the rating trend for that category.

Vendor scorecard trend chart

Set up and administer quizzes
Set up and administer quizzes.

Role required: assessment_admin or admin

1. Optional: Create reusable question templates for quizzes.
2. Create the quiz using the Quiz Designer or with forms accessed from the navigation menu.
   The quiz record includes specifics such as duration, notification preferences, a questionnaire introduction, and ending notes displayed to recipients.
3. Edit the default category or create additional categories as needed.
   The system creates a category with the same name as the quiz.
4. Define users for each category.
   These are the recipients who answer the questions in a category. You can define different users for each category.
5. Create the questions for each category.
6. Create the answers for each question and determine if the questions are scored.
   You can create unique answers or select preconfigured answers from a template.

Publish and distribute the quiz. You can send the quiz to a single user or all users in each category.
Review the results from the submitted quizzes in reports and scorecards.

Quizzes
Quizzes are questionnaires you can assign to one or more users to assess their knowledge of any subject. The quiz functionality is built on the assessment engine and provides many of the same features as assessments and surveys.

Each question is scored, and the overall score indicates the percentage of questions the user answered correctly. A quiz may have categories of questions that are assigned only to some users. You can assign weighting values to individual questions or categories of questions that make them more or less important when calculating the overall score. Quizzes require activation by a system administrator.

- An administrator can create a quiz for any purpose and assign it to a single user or multiple users.
- A quiz can contain one or more categories of questions. Each category can be assigned to users who answer only the questions in that category.
- The system can send email notifications to these users:
  - Recipients: The recipient can receive notification of an assigned quiz, a quiz whose allowed duration is at 50%, and a quiz that is overdue.
  - Recipient's manager: The recipient's manager can receive notification when a quiz is overdue.
  - Quiz manager: The quiz manager can receive notification of an overdue quiz to which he or she is assigned.
- Quizzes can contain questions that are scored or not scored. Unscored questions assess opinions or involve dates and are not counted in the final score. Scored questions specify correct answers and are scored either as 0% or 100%. You can apply a weighting scale to scored questions to establish their relative importance. You can designate questions with these data types as scored questions:
  - Checkbox
  - Choice
  - Duration
  - Likert Scale
  - Numeric Scale
  - Template
  - Yes/No
- A quiz question can be dependent on the response to any scored question. For example, you can create a dependent question requesting additional information that appears only if a recipient answers No to a specific question.

Important terms

The quiz application involves several terms.
### Terms used in quiz application

<table>
<thead>
<tr>
<th>Terms</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Quizzes</strong></td>
<td>A quiz contains information such as duration, state, and notification controls and lists the existing categories. Text fields on the quiz form allow an administrator to create introductory content and end notes that are displayed to the recipient.</td>
</tr>
<tr>
<td><strong>Categories</strong></td>
<td>A quiz category represents a theme for quiz questions. Each category contains one or more questions and names the recipients for the questions in that category. By default, the system creates one category with the same name as the quiz. You can create additional categories as needed. Categories can be weighted higher or lower to determine the importance of that category in the overall score.</td>
</tr>
<tr>
<td><strong>Questions</strong></td>
<td>A quiz question is a question configured for a category and sent only to the users for that category. Questions have a wide variety of data types and can be individually weighted higher or lower. Questions may be scored or unscored.</td>
</tr>
<tr>
<td><strong>Category user</strong></td>
<td>A category user is the recipient of questions for a specific category. You can select different users to answer the questions for each category.</td>
</tr>
<tr>
<td><strong>Templates</strong></td>
<td>A template is a question data type that provides reusable rating scales for answers to questions. For example, the answer template named Satisfaction contains a satisfaction scale ranging from Very Satisfied to Very Dissatisfied.</td>
</tr>
</tbody>
</table>

### Quiz roles

The Quizzes application uses these roles. No role is required to take quizzes that are assigned to you.

<table>
<thead>
<tr>
<th>Role Title (Name)</th>
<th>Role Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>assessment administrator (assessment_admin)</td>
<td>Can administer the Assessments application and all quiz records. Can access all the modules of the Assessments application.</td>
</tr>
<tr>
<td>Administrator (admin)</td>
<td>Can access all aspects of the assessment and survey processes. Only administrators can modify survey notifications, create survey modules, and import surveys.</td>
</tr>
</tbody>
</table>

**Note:** The itil_admin role and the survey_admin role contain the assessment_admin role.
Data types for quizzes
You need to choose a data type for each quiz question. Various data types helps you collect and analyze different kinds of data.

### Available data types

<table>
<thead>
<tr>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attachment</td>
<td>Question with a Manage Attachments icon that allows users to attach one or more files.</td>
</tr>
<tr>
<td>Boolean</td>
<td>Question with a check box or a Yes/No list for user responses.</td>
</tr>
<tr>
<td>Choice</td>
<td>List of predefined options. For more information, see the definition for Choices in the Create quiz questions topic. Multiple correct answers are supported.</td>
</tr>
<tr>
<td>Date</td>
<td>Date field.</td>
</tr>
<tr>
<td>Date/Time</td>
<td>Time and date field.</td>
</tr>
<tr>
<td>Number</td>
<td>Number field with predefined minimum and maximum values. The default is 1-10.</td>
</tr>
<tr>
<td>Percentage</td>
<td>Percentage field with a prescribed range.</td>
</tr>
<tr>
<td>Scale</td>
<td>Predefined Likert scale. Answer options appear as radio buttons. Multiple correct answers are supported.</td>
</tr>
<tr>
<td>Image Scale</td>
<td>Predefined set of images. Five emojis similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Multiple correct answers are supported.</td>
</tr>
<tr>
<td>Numeric scale</td>
<td>Selectable number scale. The default is 1-5. Answer options appear as radio buttons. Multiple correct answers are supported.</td>
</tr>
<tr>
<td>String</td>
<td>Single or multi-line text field.</td>
</tr>
<tr>
<td>Template</td>
<td>Choice list of templates that provide a predefined scale of options. For details, see Configure a template question. Multiple correct answers are supported.</td>
</tr>
<tr>
<td>Reference</td>
<td>Choice list of fields from a specified reference table. This data type does not support reference qualifiers.</td>
</tr>
</tbody>
</table>

Activate the quiz designer
Administrators can activate the Quiz Designer plugin.

Role required: assessment_admin or admin

1. Navigate to System Definition > Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.

If the plugin depends on other plugins, these plugins are listed along with their activation status.
If the plugin has optional features that depend on other plugins, those plugins are listed under **Some files will not be loaded because these plugins are inactive**. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).

4. Optional: If available, select the **Load demo data** check box.

Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.

You can also load demo data after the plugin is activated by clicking the **Load Demo Data Only** related link on the System Plugin form.

5. Click **Activate**.

**Quiz Overview module**

The Quiz Overview module is a homepage that displays various reports on data such as results for each category and quizzes that are complete, pending, or in progress.

Role required: assessment_admin or admin

Users with the **assessment_admin** role can view the overview page and refresh, add, delete, and rearrange widgets.

1. Navigate to **Quizzes > Overview**.
2. Click elements within reports to obtain more information. The available reports are:

<table>
<thead>
<tr>
<th>Report</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quizzes by State</td>
<td>Assessment Instance (asmt_assessment_instance)</td>
</tr>
<tr>

<td>Metric Results (asmt_metric_result)</td>
</tr>
<tr>
<td>Number of Incorrect Answers</td>
<td>Metric Results (asmt_metric_result)</td>
</tr>
</tbody>
</table>

**Quiz designer**

The quiz designer provides a single interface that users with the assessment_admin role can use to create, edit, and distribute quizzes.

You can also use it to edit existing quizzes and change scoring parameters.

Alternatively, you can use the modules of the **assessment engine** to create and edit the records that make up a quiz. All quiz records are stored in assessment tables and displayed in Quiz views of those tables. For details, see **Create quizzes with forms**.

**Tools on the Quiz Designer**

The quiz designer includes a design canvas, a header bar, and many controls that you can use to create quizzes.

To open the quiz designer, navigate to **Quizzes > Quiz Designer**.

The designer contains the following elements:

- Controls
- Header bar
• Design canvas

**Controls**

Controls for the supported question data types are available in the Controls palette. Drag and drop a control onto the designer canvas to create a question of that type.

![Question controls](image)

<td></td>
</tr>
</tbody>
</table>

## Header Bar

The header bar contains tabs that display different views and a menu of various functions.
Click one of the following tabs to change the view in the canvas:

- **Design**: Add categories and questions, and configure the properties of each. This is the default view of the canvas when you open the designer.
- **Configuration**: Create introductions and end notes for quizzes, and select a signature.
- **Availability**: Select the recipients for each category in the quiz.

Point to the menu icon (≡) in the upper right of the quiz designer to select the following options:

- **Save**: Saves the current quiz.
- **Preview**: Displays a preview of the quiz as it appears to the recipients.
- **Publish**: Distributes the quiz to the selected recipients.
- **Save and Publish**: Saves and distributes the quiz in one step.
- **New Quiz**: Opens a fresh canvas for a new quiz.
- **Load Quiz**: Opens a list of existing quizzes that you can select and edit.

The availability of each option depends on the status of the quiz that is opened in the quiz designer.

**Design Canvas**

New quizzes open in the Design view. The quiz Name field appears above first category in the canvas. A blank question field appears in the category container.

**Create a quiz**

When you create a quiz, you can create one or more categories and then add questions to each category.

Role required: assessment_admin or admin

Each category can be assigned to a different user or the same users. You can also customize each question and make it dependent on the response to another question.

Create a quiz using these procedures:

**Create quiz categories**

A category represents a theme for evaluating a specific element of the quiz topic and contains questions pertaining to that theme.

Role required: assessment_admin or admin

When you create a quiz, the system creates a default category, using the name of the quiz. You can use this category, modify it, or create additional categories as needed. To have any results, a category must contain scored questions.

1. Navigate either Quizzes > Quiz Designer or Quizzes > Quizzes and click Quiz Designer in the list header.
2. Enter the name of the quiz in the Name field. The system uses this name as the name of the quiz and the first category.
3. To configure the category, click the gear icon in its title bar.
   
   The Properties dialog box appears. You can change the name of the category, add a description for it, and enter text in the Details field that introduces or explains the category to the recipients. The system updates the category as you type.
4. Click the X icon to close the category properties dialog box and save your settings.
5. To add a new category, click the + icon in the title bar of an existing category.

Create quiz questions
You can create multiple questions for each category but each question can be associated with only one category.

Role required: assessment_admin or admin

The data type that you select for each question determines how it can be answered by quiz recipients.

You can designate questions to be scored. Only scored questions are shown in the quiz results and considered when calculating the category results. You must also specify a correct answer for scored questions.

Note:
To designate a question as scored, you must use Assessment forms. For instructions, see Configure a scored question.

1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.
2. To configure the question, click in the gear icon in its title bar. The Properties dialog box appears for the question.
3. Fill in the fields on the form, as appropriate.

**Question property fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>(Required) Name of the question. Create a concise and easily recognizable name for your question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as the question on quizzes. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Type</td>
<td>(Read-only) Data type selected for this question. See the table in controls for possible data types.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this question is available on a quiz. If a question is marked inactive, it does not appear on quizzes generated after the question becomes inactive.</td>
</tr>
<tr>
<td>Boolean option</td>
<td>Whether a check box or a Yes/No list appears as the option for the Boolean question.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box for requiring users to answer the question. Users cannot submit quizzes until they answer all mandatory questions, which are denoted by a red field status indicator. This field is available when the question does not have a dependency and the question data type is not Boolean with a check box option.</td>
</tr>
<tr>
<td>String option</td>
<td>Setting for the appearance of a string field in a question. This field is available when the question type is String. The string options are:</td>
</tr>
<tr>
<td></td>
<td>- Single line: Single line text field 40 characters in length that allows strings of any length.</td>
</tr>
<tr>
<td></td>
<td>- String line wide: Full page width text field that allows a single line entry of any length.</td>
</tr>
<tr>
<td></td>
<td>- Multiline: Full page width multi-line text field that allows word wrap and returns.</td>
</tr>
<tr>
<td>Min</td>
<td>Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.</td>
</tr>
<tr>
<td>Max</td>
<td>Highest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box for including Not Applicable as an option for this question. Users can select Not Applicable if they do not have sufficient information to respond to a question. User responses of Not Applicable are excluded from results calculations. This field is available when the question does not have a dependency and the question data type is not Boolean with a check box option.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box for displaying answer options in a random order whenever the question appears in a quiz. Answer preference is sometimes influenced by the order in which options appear, which can result in biased results. Randomizing options can help prevent this bias. Note: Randomizing options for certain questions may make those questions confusing for users. In general, only randomize options that do not follow a logical order.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question that is displayed on the quiz. Include details that help users understand how to answer the question. You can also enter HTML text in this field with the WYSIWYG editor. For example, include HTML to embed links and images.</td>
</tr>
<tr>
<td>Correct answer</td>
<td>Answer option that you want to be selected by users. When you specify a correct answer for a question, the system scores the question. This field is available for all data types except Date, Date/Time, and String. Multiple correct answers are supported for a few data types. See data type.</td>
</tr>
<tr>
<td>Choices</td>
<td>Options for a question with a data type of Choice or Scale. The system automatically adds text and values that you can edit for each option. Click the + icon to add an option, or click the X icon to delete an option. By default, the system arranges options in the order established by their values. To change the order, drag and drop the options.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displayed when</td>
<td>Condition builder that hides or displays the question depending on the answer to another question in the same category. Select an existing question from the list with a data type of Boolean, Choice, Scale, or Template. Create the condition that must exist for recipients to see the dependent question, using the is or is one of operator. The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.</td>
</tr>
</tbody>
</table>

4. To create any special conditions that must be met for a question to appear on the quiz, click the **Dependency** tab. Fill in the fields, as appropriate.

Dependent questions appear on the quiz when a recipient selects a specific answer or combination of answers to another question in the same category.

5. Select a question in the Displayed when field. The system selects the appropriate operator and displays the possible answers for the selected question.

6. Select the answers that satisfy the condition. Selected answers are indicated by a check mark.

7. Click X to close the question properties dialog box and save your settings.

8. To add a question with the same data type as an existing question in the category, click the + in the title bar of the existing question.
9. Drag questions to change their order within a category or move them between categories.

10. To delete a question, click the X in its title bar.

Configure a quiz
You can configure an entire quiz.

Role required: assessment_admin or admin

The values you enter and select on this page are applied to the entire quiz.

In the quiz designer, click Configuration and then fill in the fields as described in the table.

### Quiz designer configuration

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check box for enabling the distribution of this quiz to recipients.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of this configuration or the quiz to which it is attached.</td>
</tr>
<tr>
<td>Introduction</td>
<td>Introductory content to display on quizzes. You can add a welcome message or background information about the quiz.</td>
</tr>
<tr>
<td>Signature</td>
<td>(Optional) Acknowledgement by a quiz recipient of requirements, admonitions, or expectations related to a quiz.</td>
</tr>
<tr>
<td>Return URL</td>
<td>Destination address of a web page that is presented to users after they submit a completed quiz. When a return URL is configured, the End note content does not appear.</td>
</tr>
<tr>
<td>End note</td>
<td>Content that is displayed to recipients after they submit a completed quiz. You can add a thank you message, follow-up instructions, or other applicable information. End notes are not displayed if a Return URL is specified.</td>
</tr>
<tr>
<td>Duration</td>
<td>Amount of time that recipients are given to complete this quiz, starting from the time that the quiz is generated. The default duration is 14 days.</td>
</tr>
<tr>
<td>Manager</td>
<td>Assessment manager for this quiz. These users are only responsible for managing the quiz process and not the results. The system notifies the manager when submissions for this quiz are past due.</td>
</tr>
<tr>
<td>Notify manager if overdue</td>
<td>Check box for sending email notifications to a recipient's manager when that user fails to submit an assigned quiz before the due date.</td>
</tr>
</tbody>
</table>

Select a quiz recipient
When the system distributes a quiz, it sends email notifications to the category users and their managers.

Role required: assessment_admin or admin
A category can have one or more assigned users, and the same user can be assigned to more than one category.

The system also creates a link to the quiz in the recipients’ My Assessments & Surveys portal. Users can only answer questions in the categories that they are assigned to.

To select the recipients for each quiz category, click Availability and then fill in the fields as described in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select category</td>
<td>Category for which the selected users are recipients.</td>
</tr>
<tr>
<td>Add users</td>
<td>Users selected as recipients for this category. The choice list shows all users in the system.</td>
</tr>
</tbody>
</table>

Publish a quiz

When you publish a quiz, the system sends email notifications to the recipients and to their managers. A card in each recipient’s My Assessments & Surveys portal displays a link to the quiz.

Role required: assessment_admin or admin

1. If you want to see the quiz as the recipients will see it, point to the menu icon in the upper right of the quiz designer and click Preview.
2. When you are satisfied with the quiz, click Save and Publish or Publish to distribute it.

Create quizzes with forms

As an alternative to the Quiz Designer, you can create a complete quiz using records in the Assessment application.

All the elements of a quiz, the categories, questions, and answers, are stored in tables used by the assessment engine and are displayed in quiz views of these tables. Users creating quizzes in the Assessment application must have the assessment_admin role.

Create a quiz using assessment forms by following the procedures in the order shown here:

- Create the quiz.
- Set up the categories.
- Create the questions for the quiz.
- Create the answers for the questions.
- Distribute the quizzes to recipients.

Note: The recommended method of creating and editing quizzes is to use the quiz designer, which provides a single, intuitive interface for creating and editing quizzes quickly. If you determine that you need to add specific features to your quiz not offered through the quiz designer, you can do so by using some of the specific procedures described here.

Set up a category

A category represents a theme for evaluating a specific element of the quiz topic and contains questions pertaining to that theme.

When you create a quiz, the system creates a default category with the name of the quiz. You can use this category, modify it, or create additional categories as needed. Categories are records in the Quiz view of the Metric Category table.
Categories have **weighting values** that contribute to the overall score for the quiz. By default, all categories are given a weighting value of 10. You can assign any weight to your categories. To have any results, a category must contain scored questions.

You can create a new category or edit an existing one from the **Metric Categories** related list of a quiz record.

Select a user for a category

Category users are the recipients of the questions for each category.

A category can have one or more assigned users, and the same user can be assigned to more than one category. When the system distributes a quiz, it sends an email notification, if configured, to the category users and creates a link to the appropriate questionnaire in their assessments and surveys portal. Users can only answer questions attached to their assigned categories.

To select users for a category, select the **Users** related list in a category record, and click **Edit**.
Create questions

A category can have multiple questions associated with it.

Each question can only be associated with one category. Each question has an answer data type that determines how recipients answer the question. Questions are records in the Quiz view of the Assessment Metric table.

To create questions, open a category record and create a question record from the Assessment Metrics related list. Alternatively, you can navigate to Quiz Management > Questions and create a new record (see table).

**Warning:** When you create a **Choice** or **Likert Scale** question, you must reopen the Assessment Metric form after you submit it to create answers. If you distribute a questionnaire without creating the answers for questions with these data types, recipients are unable to answer the questions. If the questions are mandatory, the recipients are unable to submit their questionnaires.
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>(Required) Name of the question.</td>
</tr>
<tr>
<td>Category</td>
<td>(Required) Category the question belongs to. The system populates this category if you create a new question from the Metric Category form.</td>
</tr>
</tbody>
</table>

**Note:** You cannot change the category if the Depends on field is set or if another metric depends on this metric.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Method | Setting that determines how to use the question.  
  - **Assessment**: Makes the question available on a quiz distributed to users. The **Assessment** method is compatible with all data types except **Duration**.
  - **Script**: Queries the database without user participation. Scripted questions are of limited value for quizzes, because they do not assess a user's knowledge of a topic.  
  
  **Note**: If you select a **Data type** that is incompatible with the selected **Method**, the system automatically changes the **Method** to the correct value. |
| Weight | Numeric value that represents the importance of this question relative to other questions in the same category. By default, the weight is 10. For weighting suggestions, see [weight categories and metrics](#). This field is available and required unless the **Data type** is **Date**, **Date/Time**, or **String**. These data types are not included in results calculations. |
| Order | (Required) Numeric value that determines the order of the question in the category. The question with the smallest order value appears as the first question in the category's section. By default, the order is 100.  
  
  **Note**: It does not matter which order value you use for metrics with the **Script** method, because they do not appear on questionnaires. |
| Active | Check box that determines whether this question appears on quizzes. If a question is inactive, it does not appear on quizzes generated after the question becomes inactive. |
| Mandatory | Check box for requiring users to answer the question. Users cannot submit questionnaires until they provide valid responses to all mandatory questions, which are denoted by a red field status indicator.  
  
  This field is available only if the **Method** is **Assessment**, the **Depends on** field is empty, and the **Data type** is not **Checkbox**. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow not applicable</td>
<td>Check box for including <em>Not Applicable</em> as a possible answer for this question. Users can select <em>Not Applicable</em> if they do not have sufficient information to respond to a question. User responses of <em>Not Applicable</em> are excluded from results.</td>
</tr>
<tr>
<td>Question</td>
<td>The question that is displayed in quizzes. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question and what it evaluates. Include details that help users understand how to answer the question or when you need HTML enhanced details for your question. You can create HTML text in this field with the WYSIWYG editor, such as embedding links and images.</td>
</tr>
<tr>
<td>Depends on</td>
<td>An existing question that this question is dependent on. You can select <em>Checkbox</em>, <em>Choice</em>, <em>Likert Scale</em>, <em>Template</em>, and <em>Yes/No</em> questions from the same category as this question. Then use the Displayed when field to set the conditions for displaying this question. The system prevents the creation of recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.</td>
</tr>
<tr>
<td>Question Type</td>
<td>(Required) Format of the expected response data. See the table of <em>data types</em> for details.</td>
</tr>
<tr>
<td>Data type</td>
<td>(Required) Format of the expected response data. See the table of <em>data types</em> for details.</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box for displaying the possible answers for this question in a random order whenever the question appears. Answer preference is sometimes influenced by the order in which answer options appear, which can result in biased results. Randomizing answer options can help prevent this bias. This check box is available only if the <em>Data type</em> is <em>Choice</em> or <em>Likert Scale</em>.</td>
</tr>
</tbody>
</table>

Note: You cannot change the data type if another question depends on this question

Note: Randomizing answer options for certain questions may make those questions confusing for users. In general, only randomize answer options that do not follow a logical order.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scale definition</td>
<td>Setting that determines whether lesser or greater numerical values equate to a good score in quiz result calculations. Select <strong>Low</strong> if lesser numerical values are better. Select <strong>High</strong> if greater numerical values are better. The default value is <strong>High</strong>. This field is available and required unless the <strong>Data type</strong> is <strong>Date</strong>, <strong>Date/Time</strong>, or <strong>String</strong>. The results for these data types are not included in results calculations. When the <strong>Scored</strong> check box is selected, the scale value is set to <strong>High</strong> and the field is hidden.</td>
</tr>
<tr>
<td>Min</td>
<td>Lowest numerical value that can be used as an answer option. This field is available and required only if <strong>Data type</strong> is <strong>Number</strong>, <strong>Duration</strong>, or <strong>Percentage</strong>.</td>
</tr>
<tr>
<td>Max</td>
<td>Highest numerical value that can be used as an answer option or scaled value. This field is available and required if <strong>Data type</strong> is <strong>Number</strong>, <strong>Duration</strong>, or <strong>Percentage</strong>.</td>
</tr>
</tbody>
</table>
| String option     | Setting for the appearance of a string field in a question. This field is available when the question type is **String**. The string options are:  
  - **Single line**: Single line text field 40 characters in length that allows strings of any length.  
  - **String line wide**: Full page width text field that allows a single line entry of any length.  
  - **Multiline**: Full page width multiline text field that allows word wrap and returns. |
| Scored            | Check box for using answers in scoring the category results and showing them in the quiz results. Scored questions are available for these data types:  
  - Choice  
  - Likert Scale  
  - Template  
  - Checkbox  
  - Yes/No  
  
Selecting this check box hides the **Scale definition** field and sets the value in that field to **High**. |

**Note:** For information about how to set the scale definition for data types that do not require you to set a numerical value, see [Data types for assessments](#).
Create answers for questions

Questions with Choice or Likert Scale data types must have defined answer options, called metric definitions.

When you create a question with one of these data types, the Assessment Metric Definitions related list appears. Each metric definition appears as one answer option for a question on a quiz. For example, the question **What type of men's trousers are not permitted by company policy?** might have these three answers configured as metric definitions: Slacks, Jeans, and Casual cotton.

To create an answer option, open the question record you want to edit and click New in the Assessment Metric Definitions related list. Be sure to give each option a Value. The system uses this number to establish the order in which the answers appear in the quiz.

Distribute a quiz

When you finish configuring the answers for the quiz questions, you are ready to distribute the quiz.

You can send the quiz to all the category users configured for the quiz or to a single category user.

1. Navigate to Quiz Management > Quizzes.
2. Open the quiz record, and click Publish. The quiz is placed in the Published state, and it is sent to all its category users. You can edit and resend published quizzes. See Modifying Published Quizzes to learn how various modifications affect the quiz contents.
3. To resend a quiz, click the appropriate button:
• **Assign Quiz**: Send the quiz to one category user.
• **Send Quizzes**: Send the quiz to all of its category users.

**Note**: These buttons are hidden if there are no category users defined for the quiz.
Modify a published quiz
Post changes to existing questions immediately. Make new questions available to users who have not started the quiz.

You can edit a quiz even after it has been distributed, with these results:

- Added questions are available only on quizzes that are distributed after this change.
- Changes to existing questions are immediately available to users before the quiz is submitted or during the retake period. This includes changes to the answers, such as additional choices or changes to the data type.
- Deleted questions are also deleted from the distributed quizzes in users’ queues.

**Edit a quiz**

You can update a quiz after the quiz has been distributed.

Role required: assessment_admin or admin

- Questions that you add are available only on quizzes that are distributed after the update.
- Before a quiz is submitted or during the retake period:
  - Changes to existing questions are immediately available to users. This includes changes to the answers, such as additional choices or changes to the data type.
  - Deleted questions are deleted from distributed quizzes in users’ queues.

Open the quiz: Group the Service Details form with one of the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quizzes &gt; Quiz Designer</td>
<td>Point to the menu icon in the quiz header bar and select Load Quiz.</td>
</tr>
<tr>
<td>Quizzes &gt; Quizzes</td>
<td>Right-click a quiz in the list and select Quiz Designer.</td>
</tr>
<tr>
<td>Quizzes &gt; Quizzes</td>
<td>Open a quiz from the list and click Quiz Designer in the header of the Assessment Metric Type form.</td>
</tr>
</tbody>
</table>

Configure a scored question

Only scored questions are considered when calculating category and quiz results.

Role required: assessment_admin or admin

A question must have a correct answer specified to be scored. Only results for scored questions are displayed in the quiz scorecard.

1. Navigate to Quizzes > Quizzes.
2. Open the quiz containing the questions you want to mark as scored.
3. In the Metric Categories related list on the Assessment Metric Type form, select the category for the questions you want to mark as scored.
4. In the Assessment Metrics related list on the Metric Category form, select a question from the list.
5. In the Question Type section of the Assessment Metric form, select the Scored check box. This check box is not available if the question’s data type is not supported for scoring.
6. Select the Correct answer for the question.

**Note:** Multiple correct answers are supported for a few data types. See Data types for quizzes.

7. Click Update.
8. Repeat the process for all the questions in the category that you want the system to score.
9. Return to the list of metric categories, select another category, and configure scoring for the appropriate questions in that category.

Configure a template question
You can configure template questions when designing quizzes.

Role required: assessment_admin or admin
1. Drag the Template data type icon into a category container.
2. Click the gear icon in the question title bar to open the template properties dialog box.
3. Select a predefined scale from the list.

Question entry fields appear for that template.
4. Enter one or more questions that are appropriate for the template.
5. Click the arrow to the right of a question to configure its properties. You must provide a name for each question.
6. Click the up or down arrow to move between questions, or click the back arrow to return to the template properties dialog box.

7. Configure the properties for the remaining questions.

8. Click the X icon to close the template properties dialog box and save your settings.

Enable a quiz retake

You can configure a quiz to allow recipients to resubmit their answers as many times as they like, until the quiz's due date.

Role required: assessment_admin or admin

Results are not calculated until the quiz's configured duration has elapsed. The card in the user's queue remains visible until the quiz's due date and displays a button to allow retakes.

1. Navigate to Assessments > Metric Definition > Types.

2. Remove the Evaluation method = Assessment filter condition so you can see all the records in the list.

3. Open the quiz.

4. In the Assessment Metric Type form, select the Allow retake check box and save the record.
View a quiz result
You can view quiz results for each question and category, or view the quiz scorecard for a detailed breakdown.

Role required: assessment_admin or admin

Quiz results are stored in the Metric Result (asmt_metric_result) table and display recipients' answers to each question in a category.

Navigate to **Quizzes > Quiz Results**.

Quiz reports
Quizzes provide several global reports so that assessment administrators can view important statistics.

You can share these reports with specific users or groups and change the display options.

For detailed field information and reporting options, click the link for the chart Type. To sort a column in ascending or descending order, click the arrow in the column heading.

<table>

View a quiz scorecard
You can view scorecards for a quiz record.

Role required: assessment_admin or admin

For detailed information about scorecards, see Quiz scorecards.
1. Navigate to Quizzes > Quizzes.
2. Open a quiz record.
   - The scorecard link is hidden if there are no quiz results to report.
4. The scorecard contains a header that displays the name of the quiz and a section that displays results or a comparison of ratings. You can select from these principal views:
   - Category Results
   - Question Results
   - Average Ratings
   - History

Quiz scorecards
The Quizzes application prepares printable scorecards.

A scorecard analyzes category and question responses and compares current ratings with previous ratings. You can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages for the time range selected.

The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed quizzes.

Category results
The Category Results view is a stacked bar chart of responses to all questions in a category.
Select the category to display from the choice list above the chart. Category results are only calculated for scored questions.

This view displays responses that use the following data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

**Note:** The Checkbox and Yes/No data types are combined into the Boolean data type in the Quiz designer.
Quiz Scorecard

Category Results: [Data]

Dress Code:
- Pants: [Data]
- Shirts: [Data]
- Skirt Length: [Data]

Legend:
- Casual Cotton: Orange
- Jeans: Purple
- Muscle-T: Blue
- N/A: Blue
- No: Red
- Polo: Green
- Yes: Yellow
To view details about a specific response to a question, point to the colored segment representing a specific response. The chart displays the count for those responses and the percentage it represents of the total responses to that question.

Quiz category result details

Question results
The Question Results view shows the results for all questions in a quiz.
Select a question by name from the choice list to display the results in a pie chart or a bar chart, based on the data type.

Pie chart

The pie chart shows question results for these data types:
- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

Note: The Checkbox and Yes/No data types are combined into the Boolean data type in the Quiz designer.
Quiz scorecard question results - pie chart
Bar chart

A bar chart appears when question results use this data type:
- Percentage

By default, all results for percentage questions use a report range of 20% segments. To configure a report range, navigate to Reports > Administration > Report Ranges.

Average ratings
The Average Ratings view displays a bar chart of the weighted average rating for each question in a category.

Use this view to learn how individual questions affect the overall rating for the category. Select a category from the second choice list above the chart. Ratings are only calculated for scored questions.
Average Ratings view

To view the effect of each question's ratings on the entire category's ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question's weighted average.
Quiz scorecard rating detail

Scorecard history

The History view compares the current ratings for the categories and their questions with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the Diff column indicate the trend of the current ratings against the previous ratings. Ratings are only calculated for scored questions questions.

Point to a category to display a line chart that shows the rating trend for that category. Click a category to view the Metric Category form containing the questions.

Scorecard trend chart

- **3 Years**: To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The Diff column shows the discrepancy between the current ratings and the previous calendar year’s ratings.
Scorecard history - 3 years

- **4 Quarters:** Quarterly quizzes compare the average rating for each question and category in the current quarter against the average ratings from the previous four quarters. The Diff column shows the discrepancy between the current ratings and the previous quarter’s ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the 3rd quarter of 2013, then the previous quarters appear as 2nd (2013), 1st (2013), 4th (2012), and 3rd (2012). All four of the previous quarters appear, whether or not there was any data for those quarters.
View an assessment category result
Category results contain values that represent an evaluated record's performance in a specific metric category. Each category result record stores data from one assessment group. Category result values are calculated based on category and metric weights and from metric result values for the same category.

Role required: assessment_admin or admin

Note: The system does not include metric results from certain responses in category result calculations. To compensate, the system adjusts the weight of the other normalized metric result values within the same category.

1. Navigate to Assessments > Results > Category Results.
2. Click the reference icon next to an assessment group number to open the category result record.
3. View the Assessment Category Result form. All fields on the form are read-only.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>Name of the metric category that the category result values apply to.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Rating | Rating is used on scorecards and decision matrixes. Rating is updated dynamically as users complete assessments. Rating is calculated as:  

\[
\text{Rating} = \frac{\text{Sum of all normalized values that share a particular assessment group, category, and assessable record}}{\text{Number of assessment instances for the assessment group}}
\]

For example: In the Assessment Category Results table example, the assessment group ASG0000801 with category Politeness from group NY DB (the assessable record) has a Rating value 8.86.

On the associated Metric Results table, you can see that there are 4 instances of this group: AINST0000801, AINST0000802, AINST0000803, and AINST0000804.

The system calculated the rating using  

\[
(5.14+5.14+1.43+5.71+5.14+4.29+4.29+4.29) / 4 = 8.86
\]
### Field | Description
--- | ---
**Assessment group** | Assessment group to which the category result is associated. The category result **Rating** and **Normalized value** are calculated from metric results in this assessment group only.

**Normalized value** | Calculated value that measures the **Rating** relative to the weights of categories used to assess the record evaluated. The normalized value is calculated as follows: 

\[
\text{Normalized value} = \text{Rating} \times \left( \frac{\text{Associated category weight}}{\text{Sum of weights of all categories the source record has category results for in this assessment group}} \right)
\]

Example: A source record has four associated category results in assessment group ASG0000907, one for each of these categories:

- Importance Rating (weight = 10)
- Product Reliability (weight = 9)
- Company Alignment (weight = 9)
- Compliance Score (weight = 9)

If this source record’s category result for Product Reliability has a Rating of 7.81, the normalized value calculation is:

\[
7.81 \times \left( \frac{9}{10+9+9+9} \right) = 1.9
\]

**Weight** | Weight of the associated category. You may need to configure the form to see this field.

**Source** | Record evaluated as the assessment subject. You may need to configure the form to see this field.

---

**Create a decision matrix**

The name and labels on a decision matrix are closely linked to the categories you choose for the axes. For that reason, first select the metric type and define the X and Y axes before you fill in other fields on the Decision Matrix form.

Role required: assessment_admin or admin

1. Navigate to **Assessments > Admin > Decision Matrixes**.
2. Click **New** and then select the metric **Type** to plot results for.
3. Right-click the form header and select **Save**.
   The X Axis and Y Axis related lists appear.
4. Define which metric categories the axes represent. Each axis can represent a single category or multiple categories. You must specify at least one category per axis in order for the decision matrix to render properly.

   The available categories are limited to those associated to the metric type selected. To avoid confusion, always update the text for the axis and quadrant labels after editing or adding metric categories to an axis.
Decision matrix axes

5. Fill in the remaining fields on the Decision Matrix form (see table) and save the record.
### Decision Matrix form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the decision matrix, which appears as the title on the decision matrix page. It is recommended to include the axis categories in the name. For example, if you selected Importance Rating as the X-axis and User Satisfaction as the Y-axis, you might name the matrix Importance vs. User Satisfaction.</td>
</tr>
<tr>
<td>Type</td>
<td>Metric type associated with this decision matrix. Only results for assessable records of the selected metric type are plotted on the decision matrix.</td>
</tr>
<tr>
<td>Default</td>
<td>Determines whether or not this is the default decision matrix. The default decision matrix opens when you click View Matrix on a scorecard. Select the check box to set the matrix as the default decision matrix. The system prevents you from creating more than one default decision matrix per metric type. If there is already a default decision matrix for the type and you try to save a different matrix with the check box selected, an error message appears. The maximum values for the default decision matrix are controlled by the Maximum number of items to show for a decision matrix field filter property (com.snc.assessment.decision_matrix_filter_max_entries), which has a default value of 1000.</td>
</tr>
</tbody>
</table>

### Quadrant Design Section

<table>
<thead>
<tr>
<th>Quadrant label color</th>
<th>Color of the label text for the quadrants. Each quadrant label displays in the center of the quadrant. You can enter an HTML color name or hex value for this and the other color fields.</th>
</tr>
</thead>
<tbody>
<tr>
<td>X-Axis label</td>
<td>Label text for the X-axis of the decision matrix. It is recommended to include the metric category name in the label text. For example, for an X-axis category of Importance Rating, the X-axis label is Importance.</td>
</tr>
<tr>
<td>Plotted item color</td>
<td>Color used to display plotted items.</td>
</tr>
<tr>
<td>Top left label</td>
<td>Label text for the top left quadrant. For an X-axis labeled Importance and Y-axis labeled Support, you might label the top left quadrant Low importance, high support.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Top left color</td>
<td>Fill color for the top left quadrant.</td>
</tr>
<tr>
<td>Bottom left label</td>
<td>Label text for the bottom left quadrant.</td>
</tr>
<tr>
<td>Bottom left color</td>
<td>Fill color for the bottom left quadrant.</td>
</tr>
<tr>
<td>Bottom left label</td>
<td>Label text for the bottom left quadrant.</td>
</tr>
<tr>
<td>Bottom left color</td>
<td>Fill color for the bottom left quadrant.</td>
</tr>
<tr>
<td>Y-Axis label</td>
<td>Label text for the Y-axis of the decision matrix.</td>
</tr>
<tr>
<td>Highlight item color</td>
<td>Color of highlighted plotted items. When you view a decision matrix from an assessable record's scorecard, the assessable record plotted item appears in the highlight color. Specify a highlight color that is different than the Plotted item color.</td>
</tr>
<tr>
<td>Top right label</td>
<td>Label text for the top right quadrant.</td>
</tr>
<tr>
<td>Top right color</td>
<td>Fill color for the top right quadrant.</td>
</tr>
<tr>
<td>Bottom right label</td>
<td>Label text for the bottom right quadrant.</td>
</tr>
<tr>
<td>Bottom right color</td>
<td>Fill color for the bottom right quadrant.</td>
</tr>
<tr>
<td>Related Lists</td>
<td></td>
</tr>
<tr>
<td>X Axis</td>
<td>Lists categories that define the X-axis of the decision matrix.</td>
</tr>
<tr>
<td>Y Axis</td>
<td>Lists categories that define the Y-axis of the decision matrix.</td>
</tr>
</tbody>
</table>

**Decision matrixes**

Assessment results obtained by questionnaires and scripted metrics can be mapped to decision matrixes.

Assessment administrators can view and create these dynamically updated graphs, which make it possible to compare assessable records by category. Decision matrixes display data from a trailing twelve month (TTM) period.
**Note:** Assessment administrators can access decision matrixes through the Assessment application and vendor managers can access them through the [Vendor Performance](#) application.

## Decision matrix components

The decision matrix page has these components:

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Options</td>
<td>Select the subset of assessable records you want to view. The filter options available vary by metric type, based on the <strong>Filter</strong> field and <strong>Filter condition</strong> field settings for each type. The maximum values in the filter are controlled by the <strong>Maximum number of items to show for a decision matrix field filter</strong> property (com.snc.assessment.decision_matrix_filter_max_entries), which has a default value of 1000.</td>
</tr>
<tr>
<td>Scale</td>
<td>Select the scale for the decision matrix. The greater the scale, the larger the decision matrix appears.</td>
</tr>
<tr>
<td>X- and Y-axes</td>
<td>Each axis represents one or more metric categories. If multiple categories are used for an axis, their respective <strong>metrics</strong> determine the positioning of the plotted items.</td>
</tr>
<tr>
<td>Component</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Plotted items</td>
<td>The labeled points you see on a decision matrix, called plotted items, represent averages of category result data for assessable records. Point to a plotted item label to view a rating summary for that assessable record. Click a plotted item label to view the scorecard for the assessable record.</td>
</tr>
</tbody>
</table>
### Plotted item rating summaries

If you point to a plotted item label on a decision matrix, a rating summary appears. The summary displays the assessable record’s average ratings for each axis. If an axis represents one metric category, the ratings are calculated averages from results for that category. If an axis represents multiple categories, the ratings are calculated averages from weighted results for all of the categories.

The summary shows:

- Current rating
- Difference between the current rating and the rating from the previous year
- Ratings from each previous year, going back three years

![Rating Summary](image)

### Take an assessment

Assessments that are assigned to you appear in your assessment and survey queue as a card that displays the assessment name, state, due date, and the associated incident number. Click **Take Survey** when you are ready.

Role required: none
Overdue surveys and assessments are marked with a red icon and red due date. You must answer every required question, indicated by a red bar, before you can submit the assessment as complete. If you start to take an assessment but cannot complete it, save your responses and return to it later. When you have answered all the questions and are satisfied with the responses, submit the assessment.

By default, you cannot modify your answers to an assessment after submission. However, if the administrator has configured an assessment to allow retakes, you can edit your answers and resubmit the questionnaire. Completed assessments configured for retake remain in the queue until their due date and display the Modify Assessment button on the card.

1. Navigate to **Self-Service > My Assessments & Surveys**.

   **Note:** Users with the assessment_admin role can display other users’ assessments and surveys in addition to their own. Use the **Show all** and **Show assigned to me** related links to show and hide assessments and surveys. Click a card assigned to another user to open the associated metric type or survey definition.

2. On the assessment card, note the due date.

   **Note:** Depending on the configuration, you may receive email notifications to remind you of the due date.

3. Click **Take Assessment** to open the questionnaire.

   Assessment questionnaires are arranged in sections: first by record, then by category. Each record appears as a section title. Questions for the record appear below, grouped by category. Each category appears as a subsection below the record name. Click the collapse icon (��) or expand icon (展) to hide or show the questions in a category, or all the categories and questions for a record. Colored bars indicate the status of each question.
4. Answer each question to the best of your ability. Point to a question for more information.

If you are unsure of how to respond to a question or if a question does not apply to a particular record, select **Not Applicable**, if available.

5. Read any assertions present at the end of the assessment and acknowledge with a signature, if required.

A signature can require you to select a check box or authenticate your full name, which the system displays in a read-only field. You cannot submit your answers to the assessment until you provide the required signature.
6. Save or submit the assessment.
   - **Save**: Saves your responses without submitting them. You can close the questionnaire and access it later from your queue.
   - **Submit**: Submits the completed assessment when you are finished.

7. If prompted, enter your user name and password to verify your full name signature.
   If all the questions are answered with valid values, a success message appears. If the system detects an unanswered mandatory question or invalid response, the assessment is not submitted, and a message appears at the top of the questionnaire explaining the error. Questions with problems are temporarily highlighted.

8. You can modify your responses to the assessment until its due date. To update your answers and resubmit an assessment that permits retakes, click **Modify Assessment**.

**Assessment questionnaires**

In the assessment process, users complete assessment questionnaires on topics of interest to provide subjective data for future business decisions.
No special role is required to complete an assessment. You are eligible to complete assessments that are assigned to you. For example, you might be expected to evaluate vendors your organization works with, based on traits related to customer service. The system stores your responses so decision makers can compare the performance of the items you evaluate. You and your manager may receive email notifications as reminders of important assessment information.

**Metric types and assessable records**

In the Assessments application, assessment administrators create and administer metric types and assessable records.

A metric type defines a set of records an organization wants to evaluate, such as vendors, projects, or employees. For each type, the system generates unique assessable records that link the type to records that need to be evaluated, such as the individual records for the vendors Amazon and Intel. There may be multiple assessable records for the same source record if the source record meets the criteria for more than one type. For example, you might want to evaluate a record on the Company table, such as Intel, as a vendor and as a manufacturer, with different categories and metrics.

For configuration suggestions, see [Administrator tasks](#).

**Assessable records**

An assessable record links a source record you want to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees.

You use assessments to evaluate the assessable record. The system generates assessable records from the source records that match the table and conditions set on the Assessment Metric Type form. You evaluate the assessable records with metric categories and metrics, which define traits and values to assess. For metric types with the **On demand** schedule type, you can [Define a new smartphone table title](#) from the Assessable Record form. This method of assessment generation makes it easy to create and preview short questionnaires or to quickly obtain assessment results for specific assessable records.

**Delete an assessable record**

When you delete an assessable record, the system deletes any stakeholders for the record.

Role required: assessment_admin or admin

> **Note:** If a source record is deleted, the system deletes the associated assessable record. To delete the source record, you must first delete all associated metric results and category results.

Delete the assessable record:

- To delete a single record, open the record and click **Delete**.
- To delete multiple records, use the Assessable Records list.

**View an assessable record**

View the Assessable Record form to edit preferences and perform various actions.

Role required: assessment_admin or admin

1. Navigate to **Assessments > Assessable Records**.
2. Open a record from the list.
By default, the list displays only assessable records with **Active** metric types.

3. **On the Assessable Record form**, edit fields and perform other actions as necessary (see table).

### Viewing Assessable Records

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>(Read-Only) Assessable record name based on the display value of the source record. The name appears on assessment questionnaires.</td>
</tr>
<tr>
<td>Source</td>
<td>(Read-Only) Source record the assessable record is linked to. The <strong>Source</strong> reflects the table name and source record display value. For example, if the <strong>Name</strong> field is the display value for the Company table, <strong>Amazon</strong> has the Source value <strong>Company: Amazon</strong>.</td>
</tr>
<tr>
<td>Live feed</td>
<td>Check box that, when selected, creates a live feed group for the assessable record, which appears on the scorecard. If you clear the check box after a live feed group has been created, the system deletes the live feed group and all its messages.</td>
</tr>
<tr>
<td>Type</td>
<td>(Read-Only) Metric type from which the assessable record was generated.</td>
</tr>
<tr>
<td>Decision matrix</td>
<td>Check box that, when selected, enables this assessable record’s results data to appear on decision matrixes of the same metric type. Decision matrixes are graphs that plot the assessment results for multiple assessable records. If you clear the check box, the assessable record still appears on the default decision matrixes if you click the View Matrix related link on the assessable record’s scorecard.</td>
</tr>
<tr>
<td>Live feed group</td>
<td>(Read-Only) Live feed group for this assessable record. When you select the Live feed check box and save the record, the system populates this field.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>All metric categories associated with the assessable record. An assessable record must be associated to a category to be evaluated. Click <strong>Edit</strong> to add or remove category associations. Note that it is often more efficient to associate assessable records to categories using the Metric Category form.</td>
</tr>
<tr>
<td>Category users</td>
<td>All stakeholders who can take assessment questionnaires about this assessable record. Click <strong>Edit</strong> to create and delete stakeholders. For more information about this and other methods of creating stakeholders, see Stakeholders. This related list is available only when the associated metric type has the Scheduled schedule type.</td>
</tr>
</tbody>
</table>

### Domain separation in Assessments

This is an overview of domain separation and Assessments. Domain separation allows you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

### Overview

**Support: Level 2**

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

As an assessment creator, assessment_admin can create or edit an assessment in their assigned domain. A Global domain assessment_admin can create or edit assessment in any domain.

As an assessment taker, a user in a particular domain can see assessable records in the Global domain, in the user’s domain, and in any child domains. Users in the Global domain can see all assessable records.

### How domain separation works in Assessments

If the metric type is global:

- All the categories and metric should be Global
- Assessable records can be from different domains
- When the assessment is assigned to a user, then:
  - Users in the Global domain can see all assessable records
  - Users in a particular domain can see assessable records in the Global domain, in their domain, and in any child domains
  - If the user does not have access to any of the assessable records (for example, the metric type is Global, but all assessable records are in Acme domain and a user in the XYZ domain
is assigned the assessment), the assessment instance is not created and an “Instance could not be created” error message occurs.

If the metric type is not Global:
- All categories and metrics must be in the same domain as the metric type
- All assessable records must be in the same domain as the metric type
- You can assign assessments to users that are in the Global domain, in the domain of the metric type, or in any parent of the domain of the metric type

**Approvals**

Approvals can be defined for all tasks and allow users or groups to be associated with a task, for the purpose of either approving or rejecting that task. Approvals are defined by navigating to System Policy > Approvals.

The following information defines an approval:

<table>
<thead>
<tr>
<th>Approval definition information</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
<td><strong>Input value</strong></td>
</tr>
<tr>
<td>Approver</td>
<td>A reference to the user who is responsible for approving the related record.</td>
</tr>
<tr>
<td></td>
<td>Choices are:</td>
</tr>
<tr>
<td></td>
<td>- Not Yet Requested (This state indicates that you are not yet asking your approvers to approve this request. Until you set the status to Requested they will receive no email notifications about the request.)</td>
</tr>
<tr>
<td></td>
<td>- Requested</td>
</tr>
<tr>
<td></td>
<td>- Approved</td>
</tr>
<tr>
<td></td>
<td>- Rejected</td>
</tr>
<tr>
<td>Approving</td>
<td>A document_id reference field to the record being approved, on any table.</td>
</tr>
<tr>
<td>Comments</td>
<td>A journal field for storing comments regarding the approval.</td>
</tr>
<tr>
<td>Approval Summarizer</td>
<td>A formatter that displays key fields relevant to the approval from the referenced document. This summarizer will not display if there is no record referenced.</td>
</tr>
</tbody>
</table>

**Approval engines**

The differences in the way that companies handle their approvals, as well as the differences between approvals for the various applications (such as Service Catalog Requests and Change Management), calls for supporting flexibility in setting up approvals within applications. This flexibility is provided through the selection of an "approval engine" that is used to manage the approvals for each of the Task tables (that is, all tables that extend the Task table).

There are three different approval engine options available for each Task table.
Approval engine options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval Rules</td>
<td>A simple set of rules that are evaluated until one matches for the Task table. The matching approval rule is used to create the users that are to approve the task. Set up approval rules by navigating to System Policy &gt; Approvals.</td>
</tr>
<tr>
<td>Process Guides</td>
<td>A sequence of approval steps over which you may control how approvals and rejections are handled. This option is deprecated and should not be used.</td>
</tr>
<tr>
<td>Turn off Engines</td>
<td>Turn off both approval engines for this Task table. This option should be selected and is made read-only when a workflow is used to manage the approval process for the table. <strong>Caution:</strong> Not turning off the approval engines might have a performance or behavioral impact on your instance.</td>
</tr>
</tbody>
</table>

Set up an approval engine

To manage the approvals for each of the Task tables in the system, set up an approval engine.

1. Navigate to System Properties > Approval Engines.

   The following page appears with the Approval Engine option for each Task table in the system. If the Approval Engine option is greyed out and shows Turn engines off, read the Notes in the same row. The most common reason an approval engine is turned off is that a workflow is managing the approvals on the table. Having the approval engine turned off prevents conflicts with the workflow that could cause a range of issues. If you want to use an approval engine on the table, set the workflow to inactive.
Select the Approval Engine to be used for each of the Task tables. The valid options are:
- Approval Rules - Use Approval Rules to create approvals
- Process Guides - Use Process Guides to create approvals
- Turn engines off - Turn the approval engines off for this table (use this when Workflow is being used to manage approvals)

<table>
<thead>
<tr>
<th>Table</th>
<th>Name</th>
<th>Approval Engine</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change Phase</td>
<td>change_phase</td>
<td>Turn engines off</td>
<td></td>
</tr>
<tr>
<td>Change Request</td>
<td>change_request</td>
<td>Turn engines off</td>
<td>Workflows are managing approvals on this table.</td>
</tr>
<tr>
<td>IMAC</td>
<td>change_request_imac</td>
<td>Turn engines off</td>
<td></td>
</tr>
<tr>
<td>Change Task</td>
<td>change_task</td>
<td>Process Guides</td>
<td></td>
</tr>
<tr>
<td>HR Case</td>
<td>hr_case</td>
<td>Turn engines off</td>
<td>Workflows are managing approvals on this table.</td>
</tr>
<tr>
<td>HR Task</td>
<td>hr_task</td>
<td>Approval Rules</td>
<td></td>
</tr>
<tr>
<td>Incident</td>
<td>incident</td>
<td>Turn engines off</td>
<td></td>
</tr>
<tr>
<td>Incident Task</td>
<td>incident_task</td>
<td>Turn engines off</td>
<td></td>
</tr>
<tr>
<td>Request new Knowledge Base</td>
<td>kb_knowledge_base_request</td>
<td>Turn engines off</td>
<td>Workflows are managing approvals on this table.</td>
</tr>
<tr>
<td>KB Submission</td>
<td>kb_submission</td>
<td>Turn engines off</td>
<td></td>
</tr>
<tr>
<td>Problem</td>
<td>problem</td>
<td>Turn engines off</td>
<td></td>
</tr>
<tr>
<td>Problem Task</td>
<td>problem_task</td>
<td>Turn engines off</td>
<td></td>
</tr>
<tr>
<td>Reconcile Duplicate Task</td>
<td>reconcile_duplicate_task</td>
<td>Turn engines off</td>
<td></td>
</tr>
<tr>
<td>Release Phase</td>
<td>release_phase</td>
<td>Turn engines off</td>
<td></td>
</tr>
<tr>
<td>Feature Task</td>
<td>release_task</td>
<td>Turn engines off</td>
<td></td>
</tr>
</tbody>
</table>

2. Select the **approval engine option** for each Task table from the choice list.
3. Click **Save**.

These preferences are saved as system properties that are named `glide.approval_engine.<table_name>`. 
Approval rules

Many organizations rely on an approval process to ensure that requests are reasonable and fit an organization’s budget.

The service catalog can use these classes of approvals:

<table>
<thead>
<tr>
<th>Approvals</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Title</strong></td>
</tr>
<tr>
<td>Gating approvals</td>
</tr>
<tr>
<td>Process approvals</td>
</tr>
<tr>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>Must occur before a request can be initiated. For example, allow a manager to reject an employee’s request for a company car.</td>
</tr>
<tr>
<td>Take place within an execution plan process that has been initiated. For example, allow the security group to reject a request for access to SSN even though the employee’s manager approved it.</td>
</tr>
</tbody>
</table>

**Note:** To enable approval processes to operate smoothly, make sure that the appropriate users have the correct role, and that the role grants access to the necessary tables for users in all the relevant departments and domains.

Set automatic approval rules

Approval rules can automatically set the approval state to something other than Not yet requested. As a result, an approval rule can create a set of approvers. You can also start the approval process by setting the approval state to **Requested**.

Prerequisites

Role required: admin

Approval rules have two new fields:

- **Run rule before:** If true, the approval rule runs before the record is inserted/updated.
- **Set State:** If this rule applies, then the task record’s approval state is automatically set to this value.

**Note:** The **Set State** field only behaves as expected if the **Run rule before** check box is enabled.

- In the example below, this rule automatically sets the state of the task to Approved thereby auto-approving the task.
Approval Rules fields

Gating approvals

A gating approval acts as a gate through which a request must pass before it can start.

Until all gating approvals are met, no notifications go out, no tasks get sent to technicians, and nobody starts working on the request in question.

Generate gating approvals with:

<table>
<thead>
<tr>
<th>Gating approvals</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Title</strong></td>
</tr>
<tr>
<td>Approval rules</td>
</tr>
<tr>
<td>Item-based approvals</td>
</tr>
</tbody>
</table>

Set up a gating approval via an approval rule

You can set up a gating approval via an approval rule.

Role required: admin

1. From the left navigation pane, select System Policy > Approval Rules.
2. Click New.
### Approval rules

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of this rule.</td>
</tr>
<tr>
<td>Table</td>
<td>Task table to which this rule applies. For most service catalog approvals, select <strong>Request</strong>.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>The list shows only tables and database views that are <strong>in the same scope</strong> as the approval rule.</td>
</tr>
<tr>
<td>Active</td>
<td>Indicator of whether the rule is active (defaults to true).</td>
</tr>
<tr>
<td>Run Rule Before</td>
<td>Indicator of whether the rule runs before or after the request record is saved. For most approvals, select this check box.</td>
</tr>
<tr>
<td>User</td>
<td>User who must approve this request (can be empty).</td>
</tr>
<tr>
<td>Group</td>
<td>Group that must approve this request (can be empty).</td>
</tr>
<tr>
<td>Set State</td>
<td>Value of the approval field on the task in after this rule runs. In most cases, select <strong>Requested</strong>.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition under which the rule applies.</td>
</tr>
<tr>
<td>Script</td>
<td>An optional server script to programmatically specify who the approver should be. For example, for the one-line script <code>current.requested_for.manager</code>, ServiceNow checks the <code>requested_for</code> reference field on the current record. It then locates the manager field on the referenced record and assigns that person as the approver. For other examples, see the Script field on approval rules provided by ServiceNow.</td>
</tr>
</tbody>
</table>

#### Notes and limitations:

1. You can have as many rules as you want on a given table. If more than one rule applies, you'll get more than one approver.

2. You can't get duplicate approvers, for example, if two rules both want Fred Luddy to approve a particular request, the system will only create one approval entry for him.

3. By default all requests start out in a **Not yet requested** approval state. Approval notifications will not go out until the request's approval state is set to **Requested**. You can do that manually, or you can do it in script, but the easiest way to do it is to use the **Set State** field to automatically set the request to **Requested**.

**Set up a gating approval based on the item being ordered**

In addition to adding approvals via approval rules, you can also add approvals based on what kind of item is being ordered.
In addition to adding approvals via approval rules, you can also add approvals based on what kind of item is being ordered. We can, for example, specify that all Blackberrys need to be approved by David Loo.

To do so, navigate to the item in question and scroll to the related list of required approvers. There are two lists:

- **Approved By Group**: A list of groups that have to approve requests for this item
- **Approved By**: A list of users who have to approve requests for this item

**Approved By Group**

<table>
<thead>
<tr>
<th>Approval group</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hardware</td>
</tr>
</tbody>
</table>

**Approved By**

<table>
<thead>
<tr>
<th>Approver</th>
</tr>
</thead>
<tbody>
<tr>
<td>David Loo</td>
</tr>
</tbody>
</table>

In the example above, this request must be approved by all members of the Hardware group and by David Loo.

Notes and limitations:

1. As with approval rules, you are protected against duplicate entries. Thus if David Loo is a member of the hardware group, as well as being a standalone approver, he will only get one approval request.

2. Item-based approved work in addition to rather than instead of approval rules so you can (and probably will) use both.

**Process approvals**

Once a request has passed its gating approvals, any relevant execution plans are initiated. Those plans, in turn, create a sequence of required tasks. You can add an approval step to an execution plan, which is configured to occur at the appropriate point.

From the left navigation pane, select **Service Catalog > Execution Plans**, and then select the plan to which to add an approval step. Then click the **New Approval** button.
To add an Approval

The Approval Task screen appears. Just like a regular Service Catalog execution task, an approval execution task has:

- **Name**: The name of this task
- **Order**: Sequence of this task within the plan
- **SLA**: SLA to which this task applies
- **Delivery Time**: Time allowed for the completion of this task

After you create the task, right click the title bar and select **Save**. Two related lists appear at the bottom of the screen:

- **Approved By Group**: A list of groups that must approve the request before this task is complete
- **Approved By**: A list of users who must approve the request before this task is complete
In the example above, this security approval task must be approved by Fred Luddy.

**Note:** When an in-process approval is rejected, that particular line item is canceled as well, but the request itself isn’t necessarily canceled. Thus if one ordered a blackberry and a laptop, and the blackberry was rejected, the laptop request would continue being processed.

**Approve with a process guide**

Process guides work similarly to approval rules in that their execution is controlled via a condition. The default version of approval tasks allows you to specify that the approval in question be approved by:

1. One or more specific people
2. One or more groups of people
You can optionally use Process Guides instead of approval tasks. Process guides are more flexible in that they allow for:

1. "Any of" or "All of" approvals
2. Sequenced approvals

You can link a process guide to an execution task.

1. From the left navigation pane, select **System Policy > Process Guides**.
2. Create a new guide.
3. Set the table to **Catalog task**.
4. Fill in a condition under which this guide should attach.

Example #1: Apply to all "Capacity Review" tasks.

![Add Condition](image)

Example #2: Apply to all "Capacity Review" tasks where there requester is in Atlanta.

![Add Condition](image)

Process guide tips and tricks:

1. All catalog tasks are generated when a request is first submitted, but tasks which aren’t active yet have a state of “pending”. So if you do not want to send out approval requests until a task has actually started, add "state=open" as part of your condition.

2. There is a “Default” process guide in the system for catalog tasks with a sequence number of 10,000. It behaves exactly the same way the old, pre-process guide code did in regards to approvals. Approvals are based on the execution of task-related lists.

**Schematic of a hypothetical approval process**

In the diagram below of a hypothetical approval process, the gating approval is color coded blue and an in-process approval is orange.
Approval process

Approval summarizer formatter

The approval summarizer formatter creates the summary at the bottom of an approval form. The approval summarizer displays different information depending on what is being approved, such as a change request or a service catalog request. Following are two examples.
Summary of Item being approved

**Change Request**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>CHG0000001</td>
</tr>
<tr>
<td>Requested by</td>
<td>David Loo</td>
</tr>
<tr>
<td>Affected CI</td>
<td>Sales Force Automation</td>
</tr>
<tr>
<td>Type</td>
<td>Normal</td>
</tr>
<tr>
<td>Risk</td>
<td>High</td>
</tr>
<tr>
<td>Impact</td>
<td>3 - Low</td>
</tr>
<tr>
<td>Short description</td>
<td>Rollback Oracle Version</td>
</tr>
<tr>
<td>Description</td>
<td>Performance of the Siebel SFA software has been severely degraded since the upgrade performed this weekend. We moved to an unsupported Oracle DB version. Need to rollback the Oracle instance to a supported version.</td>
</tr>
</tbody>
</table>
Summary of a catalog request

The **Deny** button allows the approver to deny one or more requested items in a multi-item request, before approving the overall request. If a requested item is denied, the workflow for that item never starts. The approver can then choose to **Accept** the item.

**Note:** When the overall request is approved, you must ensure this **Deny** button is hidden. If this button is used after request approval, the requested item workflow is canceled, leaving the stage in an inconsistent state. Similarly, the **Accept** button on requested items should only appear before the overall request is approved or rejected.

**Summarizers**

Approval summarizers are stored in the Macro (sys_ui_macro) table.

From the left navigation pane, select **System UI > UI Macros**. Summarizers use a naming convention of approval_summarizer_ + `<table_name>` (for example, approval_summarizer_change_request is the summarizer for change requests, while approval_summarizer_sc_request is the summarizer for service catalog requests).

Each summarizer is written in Jelly script, which is used to define internal forms. The script is stored in the large XML field at the bottom of the UI Macro form.

**Change an approval summarizer**

You can modify existing approval summaries to include additional information.

These are advanced customizations that might not be appropriate for all implementations, and require creating a custom form.

1. Navigate to **System UI > UI Macros**.
2. Open the summarizer you want to change.
3. Copy the script to another location before editing, in case you need to revert it.
4. Modify the script.
5. Click Update.

Create a new custom approval summarizer
After you add a new table that has approvals to an instance, you can add a custom activity formatter by creating a new UI macro and then add it to the appropriate form.

approval_summarizer can only be used on approval forms in the global scope.

1. Navigate to System UI > UI Macros
2. Click New.
3. Give the macro a name that follows the summarizer naming convention: approval_summarizer_<tablename>
4. Complete the rest of the form and click Submit.
5. Create an activity formatter and add it to the appropriate form.

To learn more about activity formatters, see Activity formatter.

Approval with e-signature
Approval with e-signature allows users to approve requests by re-entering their login credentials.

Approval with e-signature supports the following authentication credentials:
- User name and password matching a user in the local database.
- User name and password matching a user authorized by an external identity provider as part of a SAML 2.0 single sign-on integration.

Activate Approval with e-Signature plugin
The Approval with e-Signature plugin (com.glide.e_signature_approvals) allows users to approve requests by re-entering their login credentials.

Role required: admin
1. Navigate to System Definition > Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.

If the plugin depends on other plugins, these plugins are listed along with their activation status.

If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. Optional: If available, select the Load demo data check box.

Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.

You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.
5. Click Activate.

De-activate e-signatures
Use this procedure to de-activate e-signatures.
Although plugins cannot be removed, e-signatures can be disabled.

1. Navigate to System Definition > E-Signature Registry.
2. Set Enabled to False on any tables where e-signatures are no longer required.

Use e-signature approvals

Users can approve requests with an e-signature.

Users can approve requests with an e-signature by:

- Selecting the Approve or Reject option on a list context menu.
- Clicking the Approve or Reject button on a form.
- Changing a request record's State to Approved in either the list-editor or form.

Selecting any of these options presents the user with an Approver Authentication window, which requests the user's credentials again.

Installed with approval with e-signature

Installing approval with e-signature installs certain properties.

- Module - E-Signature Registry
- UI Action - Approve (on table sysapproval_approver, with no action name)
- UI Action - Approve (on table sysapproval_approver, with no action name)
- UI Action - Approve (on table sysapproval_approver, with the action name authenticated_list_approval)
- UI Page - form_login_validate_dialog
- UI Page - login_validate_dialog
- UI page: saml2_esignature_login, the re-authentication page that appears when an approver tries to approve a request.
- Properties: see E-signature SAML properties
- Client Script - Authenticate Approver
- Script Include - User
- Script Include - UserAuthentication
- Processor: eSigSaml2AssertionConsumer

Installing the plugin also disables the two out-of-the-box Approve UI Actions on the sysapproval_approver table.

Select an approval table

By default, activating the Approval with E-signature plugin enables e-signature for all tables for which a previous approval exists.

E-signature approvals can also be enabled on a table-by-table basis. To enable e-signatures for a table:

1. Navigate to System Definition > E-Signature Registry.
2. In Table name, use the drop-down list to select a specific table.

Table Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>A table drop-down to select the table that requires e-signatures.</td>
</tr>
</tbody>
</table>
Set up an approval from a local database

To set up Approvals with e-signature using credentials from a local database:

1. Activate the Approval with e-signatures plugin.
2. Create user records for approval users.

Use Multi-Provider SSO to set up an SSO approval for a SAML 2.0 authentication

An SSO approval with e-signature requires configuration on the SAML IdP and the ServiceNow instance.

The SAML IdP must support and honor the forceAuthn attribute in SAML assertion requests. E-signature does not function without this IdP setting. To set up an approval with e-signature using credentials from a SAML 2.0 authentication:

1. Activate or upgrade to SAML 2.0 with the Integration - Multiple Provider Single Sign-On Installer plugin.
2. Activate the Approval with E-Signature plugin.
3. Navigate to Multi-Provider SSO > Identity Providers and verify your 2.0 SAML IdP configuration Advanced tab shows the Force AuthnRequest attribute checked.
   Your SAML 2.0 IdP must support the Force AuthnRequest attribute, or e-signature is not supported.
4. On the eSignature Approval tab, enter the following e-signature SAML properties:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assertion Consumer URL for eSignature</td>
<td>This property defaults to the appropriate URL. To configure this property,</td>
</tr>
<tr>
<td>authentication</td>
<td>click the lock icon to make this field editable. After edits, click the icon</td>
</tr>
<tr>
<td></td>
<td>to lock the field.</td>
</tr>
<tr>
<td>Assertion Consumer Index for eSignature</td>
<td>If your Service Provider has more than one URL set for the AssertionConsumerURL, you can set the index to use for eSignature, starting with index 1 or more.</td>
</tr>
<tr>
<td>authentication</td>
<td></td>
</tr>
<tr>
<td>AuthnRequest URL for eSignature Authentication</td>
<td>You can enter the URL that points to the SAML 2.0 IdP AuthnRequest URL for eSignature authentication. If the URL is the same as the Assertion Consumer URL, you can leave this setting blank.</td>
</tr>
<tr>
<td>Authentication Pop-up Dialog Width</td>
<td>When a user approves a request using eSignature, a dialog opens and a user</td>
</tr>
<tr>
<td></td>
<td>can enter credentials. This setting controls the width of that dialog box.</td>
</tr>
<tr>
<td></td>
<td>The default is 500.</td>
</tr>
<tr>
<td>Authentication Pop-up Dialog Height</td>
<td>When a user approves a request using eSignature, a dialog opens and a user</td>
</tr>
<tr>
<td></td>
<td>can enter credentials. This setting controls the height of that dialog box.</td>
</tr>
<tr>
<td></td>
<td>The default is 300.</td>
</tr>
</tbody>
</table>

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
5. Click the **Generate Metadata** button underneath the tabs to regenerate the service provider metadata. Copy this data and update it on the SAML IdP.

**Set up e-signature approvals**

The setup required depends on where user credentials are stored.

See the section that matches the source of your user credentials:

- Setting up approvals from a local database
- E-signature SAML properties

**Note:** ADFS 2.0 does not support re-authentication requests that E-Signature requires.

**Approval status**

The approval status of a change request is determined by looking at the current status of all the approvers.

If any approver has rejected the change, the approval status will be Rejected. If all approvers have approved the change, the approval status will be Approved. If all approvers are in the Not Requested status or if there are no approvers, the change status will be Not Requested, otherwise the status will be Requested.

For added flexibility when creating approvals, including the ability to set up an “one of” approval where only one person of a group of approvers needs to approve, consider using **Workflows**.

**Generate an approval using approval rules**

The system can automatically generate an approval request to individuals or groups when specific criteria are met. The automatic generation of approval requests is driven using the System Policy feature.
In the sample below, a change opened in the category **network** is assigned to the System Administrator:

![Approval Rules](image)

### Approval Rules

When an approver is automatically added based on approval rules, the status of the approval automatically defaults to "Requested".

### Generate approvals using the approvers related list

It is possible to manually add approvers to a request.

Additional approvers can be added by clicking the **Edit** button in the Approvers section near the bottom of a request. When an approver is added manually, the status for that approver defaults to "Not Requested". When the status of the approver is changed to 'Requested', the approver will be sent an email requesting approval action.

### Generate approvals using workflows

Workflows are a powerful and flexible method of generating approvals. Use workflows to create group approvals and user approvals.

A variety of variables are available to fine-tune the approval process, including the actions that occur when approval or rejection take place. When a workflow activity generates an approval record, the system populates the **Workflow activity** field on the approval record with a reference to the activity. Do not use this field when creating business logic. For more information, see Approval and Rollback Activities.

**Note:** Conflicts can arise when the approval process for a table is managed by both the workflow engine and the approval engine. In general, if there is a workflow that manages the approval process for a table, the approval engine should be turned off for that table.

### Multiple approvers

With multiple approvers, all approvers must authorize the request before the status will change to "Approved".

Should any approver reject the request, the status will immediately be set to "Rejected".

### Receive notifications

Individuals who are designated approvers automatically receive approval notifications, including approval status updates.
Approval notifications will be sent at the following times:

- When an individual is assigned as an approver either automatically or manually. If a group is chosen, then all members of the group will be sent an email. By default, the email an approver receives will contain a "mailto" link that will allow the approver to either approve or reject the request directly from their email system.
- When the request reaches approved status, the person assigned to the request will receive an email indicating it has been approved.

The details contained in the emails and the points at which they are sent can be tailored using System Definition > Business Rules and System Policy.

Note for Blackberry users: In order to see the "mailto" links mentioned above to approve or reject a request (i.e. 'Click here to approve CHG55555' or 'Click here to reject CHG55555'), your Blackberry device must be using version 4.5 of their software which supports HTML emails. If your Blackberry device is using an earlier version, you will not be able to view or use the "mailto" links. However, as a workaround, users can reply to the email and add the statements state:approved or state:rejected within the body of the email before sending it to force the automatic approval/rejection functionality.

If you create an appropriate Inbound Email Action, you can let approvers respond to approval email notifications with a simple "yes" or "no" answer.

**Dynamic approval forms**

When you are looking at an approval request, the form has a context-appropriate summary of the item to be approved.

For example, if you're looking at a Change Management approval request, you'll see details from the relevant change request. For a Service Catalog approval request, you'll get details of the request.

![Approval Form](image)

**Rollback Oracle Version**

Performance of the Siebel SFA software has been severely degraded since the upgrade performed this weekend. We moved to an unsupported Oracle DB version. Need to rollback the Oracle instance to a supported version.

**Change request approval example**
Scripts and engines execution order

Scripts, assignment rules, business rules, workflows, escalations, and engines all take effect in relation to a database operation, such as insert or update. In many cases, the order of these events is important.

Note: Client-based code that executes in the browser, using Ajax or running as JavaScript, will always execute before the form submission to the server.

The order of execution is as follows:

1. Before business rules: Scripts configured to execute before the database operation with an order less than 1000.

2. Before engines. The following are not executed in any specific order:
   - Approval engine (for task and sys_approval_approver tables)
   - Assignment rules engine (for task tables)
   - Data policy engine
   - Escalation engine
   - Field normalization engine
   - Role engine - keeps role changes in sync with sys_user_has_role table (for sys_user, sys_user_group, sys_user_grmember, and sys_user_role tables)
   - Execution plan engine (for task tables)
   - Update version engine - creates version entry when sys_update_xml entry is written (for sys_update_xml table)
   - Workflow engine (for default workflows)

3. Before business rules: Scripts configured to execute before the database operation with an order greater than or equal to 1000.
4. The database operation (insert, update, delete).

5. After business rules: Scripts configured to execute after the database operation with an order less than 1000.

6. After engines. The following are not executed in any specific order:
   - Label engine
   - Listener engine
   - Table notifications engine
   - Role engine - keeps role changes in sync with sys_user_has_role table (for sys_user, sys_user_group, sys_user_grmember and sys_user_role tables)
   - Text indexing engine
   - Update sync engine
   - Data lookup engine inserts or updates
   - Workflow engine (for deferred workflows)
   - Trigger engine (for all Flow Designer flows)

7. Email notifications. The following are executed based on the weight of the notification record:
   - Notifications sent on an insert, update, or delete
   - Event-based notifications

8. After business rules. Scripts configured to execute after the database operation with an order greater than or equal to 1000.

Geolocation

The geolocation feature uses Google Maps to track users, plan efficient routes between locations, and assist in finding accurate travel times for applications that require this information, such as Work Management.

The system locates users from latitude and longitude information provided by their mobile devices or browsers. Tracking the location of certain users can improve business processes such as the completion of work order tasks. For example, in work management geolocation, the system updates an agent's position each time that agent updates a task record. When the system updates an agent's location frequently, agents and dispatchers can use features like auto-routing to create efficient schedules.

Geolocation features can be configured by users with the admin role.

Activate geolocation

An administrator can activate the Geolocation plugin.

1. Navigate to System Definition > Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
   - If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. Optional: If available, select the **Load demo data** check box.

Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.

You can also load demo data after the plugin is activated by clicking the **Load Demo Data Only** related link on the System Plugin form.

5. Click **Activate**.

### Installed with geolocation

The following components are installed with Geolocation:

**Modified by Geolocation**

The Geolocation plugin adds a field called **Geolocation tracked** to the User `[sys_user]` table. This field allows the system to track individual users by their geographical coordinates.

**Business rules installed with geolocation**

Business rules are added with activation of Geolocation.

<table>
<thead>
<tr>
<th>Business Rules</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>---</td>
</tr>
<tr>
<td>GeoLocation Data updated</td>
</tr>
</tbody>
</table>

**Client scripts installed with geolocation**

Client scripts are added with activation of Geolocation.

<table>
<thead>
<tr>
<th>Client Scripts</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>---</td>
</tr>
<tr>
<td>Update Geolocation on Task</td>
</tr>
</tbody>
</table>

**Properties installed with geolocation**

Geolocation provides the following configurable properties in **Geolocation > Administration > Geolocation Properties**.

The Google Maps plugin provides additional **map properties** that are used to implement and control specific geolocation features. You must have a **private key** for Google Maps API for Business to take advantage of the properties listed here.
### Properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.geolocation.allow.toll.roads</td>
<td>Allow toll roads to be used. Allows the system to use toll roads when auto-routing an agent's tasks.</td>
</tr>
</tbody>
</table>
|                                                 | * **Type**: True/false  
* **Default value**: True                                                                                                                                  |
| glide.geolocation.default.start.time             | Default start time for all agents when no schedule is set. This value sets the start time for a day other than the current day, when no scheduled task exists or is continued from the previous day. This property uses a 24 hour clock. |
|                                                 | * **Type**: String  
* **Default value**: 08:00                                                                                                                                   |
| glide.geolocation.evening.rush.hours             | Evening rush hour span, formatted as 14:30-16:00. All times are expressed as a range, separated by a dash with no spaces. Times not using this format are ignored. This property must be used with the work.management.morning.rush.hours and work.management.rush.travel.buffer properties and uses a 24 hour clock. |
|                                                 | * **Type**: String  
* **Default**: 0                                                                                                                                            |
| glide.geolocation.history.cleanup                | Number of days to keep history data. ServiceNow keeps agent geolocation history records for the number of days specified by this value.                                                                      |
|                                                 | * **Type**: Integer  
* **Default value**: 30                                                                                                                                      |
| glide.geolocation.morning.rush.hours             | Morning rush hour span, formatted as 06:30-08:00. This property uses a 24 hour clock. All times are expressed as a range, separated by a dash with no spaces. Times not using this format are ignored. This property must be used with the work.management.evening.rush.hours and work.management.rush.travel.buffer properties. |
|                                                 | * **Type**: String  
* **Default**: 0                                                                                                                                            |
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.geolocation.proximity</td>
<td>Minimum distance an agent must move to be considered in a new location (in meters). This setting establishes a geolocation perimeter that prevents ServiceNow from creating unnecessary history records when an agent has multiple tasks in the same vicinity. An example of this might be when an agent has several tasks in one building. The system assumes that all task activity within the specified radius is part of a single record and does not create additional records when the agent moves from task to task around the building.</td>
</tr>

</tbody>
</table>

**Geolocation Google key**

Geolocation requires a Google Maps API for Business license to enable the use of Google driving time estimates and to use Google Maps. Applications, such as Work Management, have functionality that requires this license.

If you are using auto-routing or auto-dispatch in Work Management, both the Google Maps API for Business private key and the client ID must be set for precise time estimates. Without these values, driving times for auto-routing and auto-dispatch are not available, and a rough estimate or fixed time is used. Use these properties, found in System Properties > Google Maps Google Maps, to enable the geolocation feature.

- Client ID for Google Maps API for Business: Google client ID for your organization. This ID is from Google and starts with gme-, such as gme-mycompanyname.
- Private key for Google Maps API for Business: Key required to get accurate driving time estimates from Google for some features of Geolocation. An example of an encoded key is: vNIXE0xscrmjlyV-12Nj_BvUPaw=

**Geolocation history**

The Geolocation History (geo_history) table contains the history of each tracked user's location over time.

To view geolocation history, navigate to Geolocation > Geolocation History. The record list shows time stamped location data for all users configured for geolocation tracking.

The following system properties, located in Geolocation > Administration > Geolocation Properties, control the data that appears in this table.

- Minimum distance an agent must move to be considered in a new location (in meters): Perimeter that defines a single location in which multiple tasks are present. This property prevents the system from creating unnecessary history records when multiple tasks are in the same general location.
- Maximum distance an agent can be from a specific location and still be placed at that location (in meters): Distance that a user can be from a specified location and still be placed at that location when the system creates history data.
- Number of days to keep history data: Time period for which the system retains history data.
- Minimum amount of time between updating the user’s location (in seconds): Time period the system waits before updating a user’s location, regardless of how often the user accesses tasks.

**Location tracking**

Geolocation adds the **Geolocation tracked** field to the User form. In the default view of a user record, select the **Geolocation tracked** check box to enable location tracking for the user.

When a user has geolocation tracking enabled, the system updates the user’s geographic coordinates whenever the user opens, or loads, a record from the Task (task) table or from a table that extends Task. After this initial update, the system continues to update the user’s geographic coordinates at a recurring interval if the user does not close or reload the record. To edit the length of this interval, navigate to **Geolocation > Administration > Geolocation Properties** and change the setting for the property that regulates the update interval for the user’s location. The default setting for this property is 300 seconds (5 minutes).

**Note:** The system can update geographic coordinates only for users who have location services enabled in their browsers. Even users who have the **Geolocation tracked** check box selected may be prompted by their browsers to share or withhold their location.

**State flows**

State flows enable an administrator to customize transitions from one state to another in tables derived from the Task (task) table and configure the system to perform work during transitions to specific states.

An example of a state transition is when the **State** field in an incident changes from **Active** to **Awaiting User Info**. An administrator might want to trigger an event during this transition or make a specific field mandatory when the incident reaches the end state.

State transitions in the Field Service Management application were reimplemented to use state flows. For information about customizing Field Service Management state flows, see **State flow customization**.

**Installed with state flows**

Several types of components are installed with state flows.

**Tables installed with state flows**

Tables are added with state flows.

**Tables**

State flows adds the following tables.

**Tables for state flows**

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>State Flow (sf_state_flow)</td>
<td>Contains state flow definitions. This table contains all state flow definitions, including those for work orders and work order tasks.</td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Work Order Flow (sf_work_order)</td>
<td>Contains state flow definitions for work orders. This table is installed when Field Service Management is activated.</td>
</tr>
<tr>
<td>Work Task Flow (sf_work_task)</td>
<td>Contains state flow definitions for work order tasks. This table is installed when Field Service Management is activated.</td>
</tr>
</tbody>
</table>

**Business rules installed with state flows**
Business rules are added with state flows.

**Business rules**
State flows adds the following business rules.

**Business rules for state flows**

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assert Field Uniqueness in State Flow</td>
<td>State Flow (sf_state_flow)</td>
<td>Ensures that business rules and UI actions are not accidentally copied to new state flows.</td>
</tr>
<tr>
<td>Check Client Script</td>
<td>State Flow (sf_state_flow)</td>
<td>Adds a client script to new records.</td>
</tr>
<tr>
<td>Check Event Rule</td>
<td>State Flow (sf_state_flow)</td>
<td>Adds or deletes event rules, as the event field is updated.</td>
</tr>
<tr>
<td>Check Work Notes Rule</td>
<td>State Flow (sf_state_flow)</td>
<td>Adds or deletes work note rules, as the work notes for a state flow are updated.</td>
</tr>
<tr>
<td>Create Business Rule</td>
<td>State Flow (sf_state_flow)</td>
<td>Automatically creates a business rule when automatic conditions or script are present.</td>
</tr>
<tr>
<td>Create script for Field controls</td>
<td>State Flow (sf_state_flow)</td>
<td>Create scripts for field controls, when they are in use.</td>
</tr>
<tr>
<td>Create UI Action</td>
<td>State Flow (sf_state_flow)</td>
<td>Automatically creates a UI action when manual conditions or script are filled in.</td>
</tr>
<tr>
<td>Delete Related Elements</td>
<td>State Flow (sf_state_flow)</td>
<td>When state flows are deleted, delete all related client scripts, business rules, UI actions and overrides.</td>
</tr>
<tr>
<td>Remove script for Field controls</td>
<td>State Flow (sf_state_flow)</td>
<td>If all field controls are disabled, see if any of the client scripts should be removed.</td>
</tr>
<tr>
<td>State Change</td>
<td>State Flow (sf_state_flow)</td>
<td>Get the correct state choice value when the state is changed.</td>
</tr>
<tr>
<td>Business rule</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>

<tr>
<td>Update dependent records</td>
<td>State Flow</td>
<td>When a state flow is made active or inactive, ensure the business rule and UI actions are made active or inactive as well.</td>
</tr>
<tr>
<td></td>
<td>(sf_state_flow)</td>
<td></td>
</tr>
</tbody>
</table>

**Script includes installed with state flows**

Script includes are added with state flows.

**Script includes**

State flows adds the following script includes.

**Script includes for state flows**

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>StateFlow</td>
<td>Implements state flows and supports creation of state flow elements, such as business rules, UI actions, dictionary overrides, and client scripts.</td>
</tr>
<tr>
<td>StateFlowAJAX</td>
<td>Allows access to state flow functionality from client scripts.</td>
</tr>
</tbody>
</table>

**Use state flows**

You can create custom state flows for any table that uses states.

Make state transitions occur in any order or skip specific states according to your business practices. State flows can manage the behavior of fields and field visibility on a task form. State flows can also trigger system events that perform work such as sending email notifications.

Administrators can configure state flows to:

- Limit the choice list for the State field to contain only those states that are valid for the flow.
- Define the behavior and visibility of specific fields on a task form when state transitions occur and for certain end states.
- Configure events that are triggered when a task changes states.
- Set up UI actions and business rules to implement certain state transitions, or while the task is in certain states.

The State Flow plugin installs records used by work management to control state transitions for work orders and work order tasks. For detailed information about using work management state flows, see State flow customization.

Creating and customizing state flows requires scripting knowledge. Users with the admin role can create state flow records.

**Dictionary overrides for state flows**

A dictionary override in a state flow defines the starting state for all new records in a specific table.

You set an override in tables that extend a base table only, so that your customizations are applied only to the extended table.
1. In a state flow record, select an **Ending state**.
   
   This is the override value which becomes the starting state for all new records in the table named.

2. Click **Create Default Value**.
   
   The system populates the Dictionary override field with a value of state, which is the field in the task table affected by the override. The Dictionary override field is read-only. After the override is created, the system hides the **Create Default Value** button on all subsequent state flow forms for that table.

**Events triggered on state changes**

You can configure a state flow to trigger a registered system event when a task transitions from a starting state to a specified end state.

For example, you can use events to trigger email notifications and create script actions. When you attach an event to a state flow, the system creates a business rule called State Flow Events for <table name> for the table specified in the state flow. If you specify a start and end state, the business rule executes when the record transitions from the start state to the end state. If the state flow only specifies an end state, the business rule executes whenever that end state is reached. The system creates one business rule for all state flows containing events on a single table. When all events or all state flows on a table are deleted, the system deletes the business rule.

**Field controls**

You can define controls for individual fields that are enforced when a record transitions between states.

Settings in the Field Controls section of the State Flow form enable you to apply field controls when the system detects a specified state transition or when the end state is the current state when the form is opened. The control is applied only to existing fields on the form. State flows cannot add fields to the form.

For example, you might want the Problem field to be visible when an incident moves to the Awaiting Problem state. If the incident state changes to Awaiting User Info, you hide the Problem field and make the Caller field mandatory.

The best practice when creating field controls is to configure state flow records with an ending state only and to create the correct behavior for every ending state you want to control. This ensures that the field controls are set properly when the user selects a new state, and also when the user returns a record’s State field to the original state. Only specify a full state transition, with both a starting and ending state, when you want a particular behavior for that precise state transition.

**Note:** State flows use client scripts to enforce field controls. It is possible that your settings can be changed by existing UI policies, which execute after client scripts.

The system creates the following objects as needed to enforce field properties in state flows:
Field Controls

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Business rule</td>
<td>State Flow Notes for &lt;table name&gt;</td>
<td>Enforces mandatory fields for the table on which that field behavior is defined.</td>
</tr>
<tr>
<td>Client script (onLoad)</td>
<td>&lt;table name&gt; state flow</td>
<td>Sets possible states and initial mandatory, read-only, and visible properties when a record is loaded.</td>
</tr>
<tr>
<td>Client script (onChange)</td>
<td>&lt;table name&gt; change state flow</td>
<td>Sets updated mandatory, read-only, and visible properties when a record is changed.</td>
</tr>
</tbody>
</table>

Rebuild state flows

You can rebuild state flows when a mismatch between existing and new sys_ids occurs.

When you use an XML file to import a state flow record into an instance, the system attempts to match the incoming states with existing states by comparing sys_ids. Because the sys_ids of items in a choice list can vary between instances, the system can fail to match the states, even though they are otherwise identical.

When matching fails, the start and end states of affected records are left blank or contain numeric values. To repair these records navigate to State Flows > Admin > Rebuild State Flows. This module runs a script that compares the numerical value of each item in the State field choice list until it finds a match in the imported state flow record.

Create a state flow

Creating State Flows.

2. Fill in the fields, as appropriate.

The system enforces the field controls with the same client script that filters the choice list for the State field.

Creating state flows

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

<tr>
<td>Automatic condition string</td>
<td>Conditions for running the business rule that cannot be defined with the condition builder, such as evaluating if the proposed transition is a valid flow. This condition has an (and) relationship with the condition in the Automatic condition field.</td>
</tr>
<tr>
<td>Automatic condition</td>
<td>Conditions for running the business rule that can be defined for fields in the target table. This condition has an (and) relationship with the condition in the Automatic condition string field.</td>
</tr>
<tr>
<td>Automatic script</td>
<td>Script that performs additional work when the condition is true. This script can do tasks such as update the date and time the transition occurred or notify someone using email when a specific state change occurs. Automatic state transitions occur when changes are made to the task record.</td>
</tr>
<tr>
<td>Business rule</td>
<td>Name of the business rule created for this transition. Two conditions must be satisfied before this business rule can run. The task must be on a specific starting state, and the Automatic condition must be true. If both of these conditions are satisfied, the business rule performs the transition requested, using the starting and ending states from the State Flow form.</td>
</tr>
<tr>
<td>Field Controls</td>
<td>Determines field properties when a record transitions between states or reaches a specific end state.</td>
</tr>
<tr>
<td>Mandatory fields</td>
<td>Makes the selected fields required when this transition occurs, or when the end state is the current state.</td>
</tr>
<tr>
<td>Read only fields</td>
<td>Prevents the selected fields from being edited when this transition occurs, or when the end state is the current state.</td>
</tr>
<tr>
<td>Visible fields</td>
<td>Displays the selected fields when this transition occurs, or when the end state is the current state.</td>
</tr>
<tr>
<td>Not mandatory</td>
<td>Makes the selected fields optional when this transition occurs, or when the end state is the current state.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Not read only</td>
<td>Makes the selected fields editable when this transition occurs, or when the end state is the current state.</td>
</tr>
<tr>
<td>Not visible</td>
<td>Hides the selected fields when this transition occurs, or when the end state is the current state.</td>
</tr>
</tbody>
</table>

3. Determine if you want the state transition method to be manual or automatic and open the appropriate section on the form.

- Manual: Click **Create UI Action** to create a button on the task form that enables users to execute the transition manually. The system uses the value in the Name field as the label for the UI action. The UI action executes the script in the Manual Script field when the conditions are true. For example, a manual transition can create an **Activate** button when an incident is in the New state that enables a user to mark the incident as active.

- Automatic: Click **Create Business Rule** to create the business rule. The business rule executes the script in the Automatic Script field when the conditions are true. For example, a business rule created by the system can set an incident state to Assigned when the Assigned to field is populated. Business rules are automatically deleted when the state flow record is deleted. For more information, see *Business Rules*.

4. Optional: Click **Create Client Script** to create the script that limits the values offered in a task record's State field to valid states for that transition.

5. Configure the fields in the Field Controls section to control how specific fields display when a task record changes states.

**State flow cleanup**

The business rules, client scripts, and UI actions that the system creates automatically to perform custom transitions exist only while the state flow records that use them are present.

When all the state flows on a table are deleted, the system attempts to delete any unnecessary programming elements that were created on that table, using these criteria:

<table>
<thead>
<tr>
<th>Element</th>
<th>Deleted When</th>
</tr>
</thead>
<tbody>
<tr>
<td>UI action</td>
<td>The state flow that created it is deleted.</td>
</tr>
<tr>
<td>Business rule</td>
<td></td>
</tr>
<tr>
<td>Dictionary override</td>
<td></td>
</tr>
<tr>
<td>Business rule that processes events triggered by a state flow</td>
<td>All state flows for the table specified that have events configured are deleted.</td>
</tr>
<tr>
<td>Client script (onLoad)</td>
<td>All state flows for the table are deleted.</td>
</tr>
<tr>
<td>Client script (onChange)</td>
<td>All state flows with field controls are deleted.</td>
</tr>
<tr>
<td>Work notes business rule</td>
<td>All state flows with field controls or work notes are deleted</td>
</tr>
</tbody>
</table>

**Work notes**

Work notes are an important part of the state flow process and are used to communicate information about state transitions.
The state flow adds these work notes to the Work notes field of any task making this transition. These rules apply to state flow work notes:

- For a state flow with no Starting state, the work note is added every time the task transitions to the Ending state.
- For a state flow with a Starting state and an Ending state, the work note is added only when the task transitions from that starting state to that ending state.
- If two state flows with work notes have the same Ending state, but only one has a Starting state, the system adds the work notes from the state flow with the starting state. This better matches the state flow work note to the more important transition between specific starting and ending states.

**Domain separation and State Flows**

This is an overview of domain separation and State Flows. Domain separation allows you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

**Overview**

**Support: Data only**

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see [Application support for domain separation](#).

**Survey Management**

With the ServiceNow® Survey Management application you can create, send, and collect responses for basic surveys. If installed, you can also use the Survey widget to set up a survey within Service Portal.

**Explore**

- Assesments and Surveys release notes

Get started with Survey Management

Two versions of the application are supported, Survey Management, which is the latest version, and Legacy Surveys. Survey Management improves the user interface and extends the capabilities of the Legacy Surveys application.

Note: Survey Management does not support domain separation.

Configuring surveys

There are many options for advanced configuration in Survey Management:

- Create a survey, add questions, and choose recipients, all in one interface.
- Create conditional questions, which appear only when users answer other questions a certain way.
- Restrict a survey so only specific survey users can take it, and send invitations to those users simultaneously. Alternatively, make the survey a public survey so that any user can take the survey, even anonymous users (users who have not logged in to the ServiceNow system).
  
  Tip: The assessment_take2 UI page should be public for public surveys. If that page is not public, anonymous users do not have access to the page and public surveys do not work.

- Set a schedule to automatically assign a survey to users and to limit how often the same user can take a survey.
- Customize the look and feel of survey questionnaires.
- Save anonymous survey responses.
- Convert survey responses to numerical scores and view them on scorecards.
- Deactivate a survey for maintenance or to retire it without deleting it.

Note: Because surveys use the same tables and other back-end components as assessments, you may see assessment elements such as table and field names in certain places throughout the survey feature.

Legacy Surveys

Survey administrators can continue to use legacy survey functionality and data, however, it is recommended that you migrate legacy surveys to the Survey Management application. Concurrent use of both survey applications can cause confusion and redundancy.

Survey wizards are not impacted and cannot be migrated.

Note: The Legacy Surveys application is not described in the documentation that you are viewing. It is documented on the ServiceNow wiki.

<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Survey question</td>
<td>A question that appears on a survey questionnaire for the associated survey definition. Survey questions are comparable to legacy survey questions.</td>
</tr>
<tr>
<td>Survey user</td>
<td>User who is authorized to receive invitations for a restricted survey.</td>
</tr>
<tr>
<td>Survey instance</td>
<td>Represents one survey questionnaire assigned to one user. Survey instances are comparable to legacy survey instances.</td>
</tr>
<tr>
<td>Trigger condition</td>
<td>Defines a rule that enables the system to send a survey when an action occurs on a table, such as when an incident closes. Trigger conditions are comparable to legacy survey conditions.</td>
</tr>
<tr>
<td>Scorecard</td>
<td>Visual representation of survey responses. Scorecards display a variety of data summaries for one survey definition.</td>
</tr>
</tbody>
</table>

**Survey questionnaires**

All surveys that are assigned to you appear in your personal assessment and survey queue. No special role is required to complete a survey but you must be logged in and the survey must be assigned to you. When you submit a survey, the system stores your responses.

**Survey notification**

If the system is configured to send email, it sends you a notification when a survey is assigned to you. The message contains a link to the survey and instructions for viewing the assessment and survey queue.

*Take a survey*

Surveys that are assigned to you, and that are not complete, appear in your assessment and survey queue.

Role required: none

Each assessment or survey appears as a card in the queue. The card contains helpful information, including the survey name, state, and due date, and a button to launch the questionnaire. Overdue surveys are clearly marked with a red icon and red due date. You must answer every mandatory question, indicated by a red asterisk, before you can submit the survey. If you start to take a survey but cannot complete it, save your responses and return to it later. When you have answered all the questions and are satisfied with the responses, submit the survey.

1. Navigate to **Self-Service > My Assessments & Surveys**.

   Users with the assessment_admin role, including survey administrators, can display other users' assessments and surveys in addition to their own. Use the Show all and Show assigned to me related links at the bottom of the queue to show and hide assessments and surveys. Click a card assigned to another user to open the associated metric type or survey definition.

2. Click **Take Survey** on a survey card to open the questionnaire.
If there is more than one survey category, you can click the collapse or expand icon to hide or show the questions in the category.

3. Answer each question to the best of your ability.
If you are unsure of how to respond to a question or if a question does not apply to a particular record, select Not Applicable, if available.

4. Complete one of the following steps.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Save your responses without submitting them</td>
<td>Click Save. You can close the questionnaire and access it later from your queue.</td>
</tr>
<tr>
<td></td>
<td>Note: The system does not save the survey if there are invalid responses, such as a letter in a date field. You must enter valid responses or remove invalid responses before you can save the survey.</td>
</tr>
<tr>
<td>Submit the survey after answering all questions</td>
<td>Click Submit. You cannot return to the questionnaire after submitting.</td>
</tr>
<tr>
<td></td>
<td>Note: If there is an unanswered mandatory question or an invalid response, an error message appears and the problematic questions are temporarily highlighted.</td>
</tr>
</tbody>
</table>

Domain separation for Survey Management

This is an overview of domain separation as it pertains to Survey Management. Domain separation allows you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

Support: Data only

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

As a survey creator, survey_admin can create surveys in the assigned domain. A Global domain survey_admin can create or edit surveys in any domain.

As a survey taker, a user can access the survey record and take the survey based on the domain of the survey record and user. Global domain users can take a survey in any domain.

How domain separation works in Survey Management

There are several main areas to consider in how domain separation works in Survey Management.

Survey Management in domain separated instances
The following domains are available by default after activating the Domain Support-Domain Extensions Installer (com.glide.domain.msp_extensions.installer) plugin. Only ServiceNow employees can activate this plugin.

- Global
- Acme
- Cisco

**Access to surveys in domain-separated instances**

Based on the domain of the survey record and users, users can access the survey record and take the survey.

Global domain users can access survey records in any domain. Users in any other domain can access records in their domain and in Global domain. For example, users in the Acme domain can access records in the Acme domain and the Global domain.

Global domain users can take a survey in any domain. Users in any other domain can take surveys in their domain as well as the Global domain. For example, users in Acme domain can take surveys in the Acme domain and the Global domain.

<table>
<thead>
<tr>
<th>Location of the survey record</th>
<th>Users who can access and take the survey</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Global</td>
</tr>
<tr>
<td>Global</td>
<td>Yes</td>
</tr>
<tr>
<td>Acme</td>
<td>Yes</td>
</tr>
<tr>
<td>Cisco</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Any domain user can assign a survey in that domain to the same domain user or a Global domain user. For example, an Acme domain user can assign a survey to a Global domain user or an Acme domain user. Users from other domains are not visible to the Acme domain user.

Although the Global domain user can view a survey from other domains, this user cannot assign the survey of one domain to a user from a different domain. For example, a Global domain user can assign a survey from the Acme domain to another Global domain user or an Acme domain user, but not to a Cisco domain user.

**Note:** When a task is closed in a child domain and the assigned survey is either in the child domain or the Global domain, the user from the child domain can then take the survey.

**Trigger conditions in domain-separated instances**

A Global domain user can create a triggered condition for a survey from any domain. The Global domain user can create an incident and trigger the survey by selecting a user from the other domain in the User field under Caller. However, the Global user cannot assign the survey to the user of different domain.

A user can assign a trigger condition to a survey if the user belongs to the Global domain or the Survey domain.

If there is no domain path for a trigger condition, users from any domain can view the trigger condition. For example, in the asmt_condition table that has no column for the domain path, users from the Acme domain can view the trigger condition created by the Cisco domain users.
Survey responses and results

There is a metric result record for each user response to each question on every survey instance. Survey results for each question and category are calculated automatically based on the metric result records.

If you use survey result calculations for results and scorecards, ensure that the positive indicator field for the question is set appropriately, based on the answer options. To have any results, a category must contain scored questions.

Survey responses

Survey responses are stored in the Metric Result (asmt_metric_result) table and display the recipients’ answers to each question in a category. To view general results, navigate to Survey > Survey Responses. To view results for a particular criterion, use a filter on the Metric Result (asmt_metric_result) table. For example, to view results based on the assignment group, apply a filter condition for assignment group.
Category results are stored in the Assessment Category Result (asmt_category_result) table and display the overall ratings for each category based on the weighted value for each scored question. To view these results, navigate to Assessments > Results > Category results and filter the results using the (Type.Evaluation method) (is) (Survey) condition.
Survey scorecards

A scorecard provides a visual breakdown of survey responses, based on the way questions were answered, by category. To access a scorecard, see View a survey scorecard.

View results for all surveys

You can view the survey responses that are stored on the Metric Result (asmt_metric_result) table.

Role required: survey_admin or survey_reader

1. Navigate to Survey > Survey Responses.

   Do not confuse this module with Survey > Legacy Surveys > Survey Responses, which displays legacy survey responses.

   The Type column displays the survey definition each response is associated with.
2. Select a response to view its details.

**View the results for a survey**

You can view the responses for one survey definition. Survey results are stored on the Metric Result (asmt_metric_result) table.

Role required: survey_admin or survey_reader

1. Navigate to **Survey > View Surveys**
2. Open a survey definition.
3. Under **Related Links**, click **View Responses**, which is available only if there are results.
4. Open a metric result to view more detail.

The results are grouped by metric, which is what questions are called in assessments.

The metric result contains the user's response and calculated values of interest to advanced survey administrators. Because the Metric Result table is also used by the assessment feature, many field names are not clear in the context of surveys.

### Metric result fields

List of field descriptions for the Metric Result form.
## Metric Result form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment group</td>
<td>Assessment group to which the metric result belongs. An assessment group is a container for survey instances and results generated in a single occurrence. The system generates an assessment group every time at least one survey instance is created. If multiple survey instances are created at once, such as when a survey administrator sends invitations to a list of survey users, they are all stored in the same assessment group.</td>
</tr>
<tr>
<td>Metric</td>
<td>Question that the user answered.</td>
</tr>
<tr>
<td>Data type</td>
<td>Data type of the question the user answered.</td>
</tr>
<tr>
<td>Method</td>
<td>Assessment method. Always Assessment for surveys.</td>
</tr>
<tr>
<td>Updated</td>
<td>Date and time the metric result was last updated.</td>
</tr>
<tr>
<td>Source</td>
<td>Survey definition from which the associated survey instance was generated.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User who completed the survey questionnaire.</td>
</tr>
<tr>
<td>Instance</td>
<td>Survey instance completed by the Assigned to user.</td>
</tr>
<tr>
<td>Actual value</td>
<td>Value obtained from the user response to the question. The actual value is determined by the question data type:</td>
</tr>
<tr>
<td></td>
<td>• Checkbox: The actual value is 0 if the checkbox is cleared and 1 if it is selected.</td>
</tr>
<tr>
<td></td>
<td>• Choice or Likert Scale: The actual value is equal to the Value of the metric definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>• Date, Date/Time, or String: The actual value is -1 to indicate that these data types do not contribute to category result calculations.</td>
</tr>
<tr>
<td></td>
<td>• Template: The actual value is equal to the Value of the template definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>• Yes/No: The actual value is 0 if the response is No and 1 if it is Yes.</td>
</tr>
<tr>
<td>Normalized value</td>
<td>Adjusted value that accounts for the Scale definition setting, minimum and maximum values, and other factors.</td>
</tr>
<tr>
<td></td>
<td>The equation that generates the value and an example calculation appear in Example: calculate the normalized value for a survey metric.</td>
</tr>
<tr>
<td>String value</td>
<td>Value that displays the response as it appears on a questionnaire. In some cases this is the same as the Actual value, such as when the question data type is Percentage. The string value is N/A for unanswered questions of certain data types.</td>
</tr>
</tbody>
</table>
Example: calculate the normalized value for a survey metric
The normalized value is calculated based on a linear equation and the scale definition of the metric.

**Equation used to calculate the normalized value**

\[
\text{Normalized value} = \frac{\text{Input Value} - \text{Min value defined in metric}}{\text{Max value defined in metric} - \text{Min value defined in metric}} \times \frac{\text{current metric weight}}{\text{sum of valid metric weight}} \times \text{scale_factor}
\]

**Note:** The normalized values are directly proportional to the scale definition of the metric. If the scale definition is low, that is, the lower scale values are better, then \(\text{Normalized value} = 1.0 - \text{Normalized value}\).

**Example**

Calculate the normalized value for the **Please rate the competency of the technician** metric. The metric has the following values:

<table>
<thead>
<tr>
<th>Values of the metric</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Input value</td>
<td>3</td>
</tr>
<tr>
<td>Minimum value</td>
<td>1</td>
</tr>
<tr>
<td>Maximum value</td>
<td>6</td>
</tr>
<tr>
<td>Current metric weight</td>
<td>10</td>
</tr>
<tr>
<td>Number of responses</td>
<td>6</td>
</tr>
<tr>
<td></td>
<td>• 4 of type=number</td>
</tr>
<tr>
<td></td>
<td>• 1 of type=yes/no</td>
</tr>
<tr>
<td></td>
<td>• 1 of type=string (invalid data type; value cannot be calculated)</td>
</tr>
<tr>
<td>Valid metric weight of each response</td>
<td>10</td>
</tr>
<tr>
<td>Scale factor</td>
<td>10</td>
</tr>
</tbody>
</table>

\[
\text{Normalized value} = \frac{3 - 1}{6 - 1} \times \frac{10}{(10 + 10 + 10 + 10 + 10)} \times 10 = 0.8
\]

Several data types are ignored because the values cannot be calculated. These invalid data types include string, date, and datetime.

For reporting purposes, use the Metric Result (asmt_metric_result) table.

**View a survey scorecard**

A survey scorecard provides a visual breakdown of survey responses by category, based on the way questions were answered.

Role required: survey_admin or survey_reader

A scorecard displays charts for survey results, in which category and question responses are analyzed and current ratings are compared with previous ratings. Users can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages.
for the time range selected. The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed surveys.

1. Navigate to Survey > View Surveys.
2. Open a survey definition.
3. Under Related Links, click View Scorecard. The interactive scorecard displays the following filters:
   - Question Results: Displays the result of all questions or an individual question.
   - Category Results: Displays the results of all questions associated with an individual category or all categories.
   - Average Ratings: Displays the result of weighted average rating for each survey question in an individual category or all categories.
   - History: Displays the result of all questions in comparison with their history (by calendar year or quarters).

<i>Note: The scorecard link is hidden if there are no survey results to report.</i>

**Survey scorecard category results**
The Category Results view is a stacked bar chart showing survey results for all questions in an individual category or all categories by respondent count.

Select a category from the list to display the questions from that category in the chart.

This view displays responses that use the following data types:
- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No
- Multiple selection
- Image Scale
- Numeric Scale

<i>Note: The Checkbox and Yes/No data types are combined into the Boolean data type in the Survey Designer</i>
Survey category results

To view details about a specific response, point to the colored bar to display the response, the number of responses, and the percentage it represents of all the responses to that question.

Survey scorecard category results detail
Survey scorecard question results
The Question Results filter displays the result of all questions or an individual question using charts or lists. For the String, Attachment, Date, Date/time, Reference, and Ranking data types, the results are displayed in the list view. The results of all other data types are displayed in the pie chart view.

Pie chart
The pie chart shows question results for all data types other than those that are displayed in the list view. See Survey question data types.

- Checkbox
- Boolean
- Choice
- Likert Scale
- Number
- Percentage
- Template
- Yes/No
- Image Scale
- Multiple selection

Note: The Checkbox and Yes/No data types are combined into the Boolean data type in the Survey Designer.
Service Desk Satisfaction Survey

Survey Scorecard

How courteous and respectful was the technician who responded? (1=poor, 6=excellent)

- 2 = 2 (14.29%)
- 3 = 2 (14.29%)
- 4 = 9 (54.29%)
- 5 = 1 (7.14%)
- 6 = 3 (6.32%)
Survey scorecard average ratings

The Average Ratings view displays the weighted average rating for each survey question in an individual category or all categories.

Use this view to learn how individual questions affect the overall rating for the category. Select a survey category from the choice list to display the chart for that category.
To view the effect of each question's ratings on the entire category's ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question's weighted average.

**Average ratings detail**

**Survey scorecard history**
The History view compares the current ratings for the categories and their questions with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the **Diff** column indicate the trend of the current survey against the previous survey.

Point to a category to display a line chart that shows the rating trend for that category. Click a category to view the Survey Category form containing the survey questions.
3 years

To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The **Diff** column shows the discrepancy between the current ratings and the previous calendar year's ratings.
### Service Desk Satisfaction Survey

#### Survey Scorecard

<td>0.00</td>
</tr>
</tbody>
</table>

**Survey scorecard history - 3 years**
4 quarters

Quarterly surveys compare the average rating for each question and category in the current quarter against the average ratings from the previous four quarters. The **Diff** column shows the discrepancy between the current ratings and the previous quarter's ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the 3rd quarter of 2015, then the previous quarters appear as 2nd (2015), 1st (2015), 4th (2014), and 3rd (2014). All four of the previous quarters appear, whether or not there was any data for those quarters.

Survey scorecard history - 4 quarters
Export a survey scorecard as an image
You can export a scorecard as an image to use in presentations or other documents.
Role required: admin or survey_admin

1. Click the menu icon (ثلاثة نقاط) and select **Save as PNG** or **Save as JPEG** and wait for the export to complete.

2. Click **Download** and save the scorecard image to a storage location.
Survey administration

Survey administrators—users with the survey_admin role—create and maintain surveys and configure how they are distributed and published. Surveys on Service Portal are also supported. Survey administration includes the following procedures.

- Create, customize, and publish surveys.
- Write and maintain survey questions.
- Define trigger conditions for when surveys are sent to users, such as when an incident closes.
- Maintain surveys and survey questions as the organization's needs change.

To set up surveys in Service Portal, you must first install Service Portal and then configure the Survey widget on the page. The base system includes the Survey widget.

Surveys in Service Portal

If Service Portal is installed, you can use the Survey widget to set up surveys, quizzes, assessments, risk assessments, and attestations in Service Portal. Surveys for users on mobile devices are fully supported in Service Portal.

To create an intuitive interface for your users, you can set up surveys in Service Portal. You must first install Service Portal and then configure the survey widget on the page. To learn more about configuring a widget, see configure widget instances.
To configure a Survey widget on a page, CTRL + right-click the widget heading and select
**Instance Options**.

**Service Portal: Instance options (properties) for the Survey widget**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max records</td>
<td>Number of surveys to list on the Service Portal homepage. The user can click the <strong>View all</strong> link to view all items. Default: 5</td>
</tr>
<tr>
<td>Title of the widget</td>
<td>Text that appears in the title bar of the surveys widget. Default: <strong>My Surveys</strong></td>
</tr>
</tbody>
</table>
Each survey on the My Surveys page contains a progress bar and a description. The color in the progress bar increases as a survey is completed. In the case of a triggered record, the table title is used for the survey description.

For mobile users, the *Pagination setting for Service Portal view* survey designer property is set to one question per page by default.
View the overview of all surveys

Use this homepage to view various survey reports such as results by metric type and state. You can refresh, add, delete, and rearrange widgets. All reports on the Survey Overview page have demo data.

Role required: admin or survey_admin

You can refresh, add, delete, and rearrange widgets. All reports on the Survey Overview page have demo data.

1. Navigate to Survey > Overview.
   The following reports are available:

<table>
<thead>
<tr>
<th>Report</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assignment group Customer Satisfaction 90 day average</td>
<td>Metric Result (asmt_metric_result)</td>
</tr>
<tr>
<td>Service Desk Survey ‘Timely Response’ 90 Days</td>
<td>Metric Result (asmt_metric_result)</td>
</tr>
<tr>
<td>Surveys by Metric Type and State</td>
<td>Assessment Instance (asmt_assessment_instance)</td>
</tr>
<tr>
<td>Service Desk Survey ‘Overall Experience’ 60 Days</td>
<td>Metric Result (asmt_metric_result)</td>
</tr>
<tr>
<td>Service Desk Survey ‘Tech Courteous’ 90 Days</td>
<td>Metric Result (asmt_metric_result)</td>
</tr>
<tr>
<td>Service Desk Survey ‘First Call Resolve’ 60 Days</td>
<td>Metric Result (asmt_metric_result)</td>
</tr>
<tr>
<td>Service Desk Survey ‘Tech Competence’ 60 Days</td>
<td>Metric Result (asmt_metric_result)</td>
</tr>
</tbody>
</table>

2. To view the required information, click elements within the reports.
3. To refresh, edit, or close a widget, point to the widget and select the required option.

Survey designer

Users with the survey_admin role can use the survey designer. The survey designer lets you create survey categories and questions, configure the details, and publish the survey to specific users or groups.

You can assign a survey to individual users or groups who receive all the questions from all the categories. You can also customize each question and make it dependent on the response to another question. The following describes the procedures you follow to create and publish a survey.

- Create survey categories.
- Create questions within each category.
- Configure survey details, such as introductory and closing remarks and time limit.
- Select recipients for the survey.
- Publish the survey to the selected users or groups.
Note: The survey designer replaces the survey creator in the Legacy Surveys application. If you are using Internet Explorer version 8 or earlier, the system redirects you to the survey creator.

Survey designer elements
The survey designer is accessible from **Survey > Survey Designer**.

The survey designer contains controls, a header bar, and the design canvas.

Controls

To create a question, drag the appropriate data type control from the **Controls** palette and drop it onto the designer canvas.
The assessment engine provides a built-in result calculation feature that converts responses to scored question data types to a score from 0 through 10.

### Question data types

<table>
<thead>
<tr>
<th>Data type</th>
<th>Scored</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attachment</td>
<td>No</td>
<td>Question with a Manage Attachments icon that allows users to attach one or more files.</td>
</tr>
<tr>
<td>Boolean</td>
<td>Yes</td>
<td>Question with a check box or Yes and No choices for user responses.</td>
</tr>
<tr>
<td>Choice</td>
<td>Yes</td>
<td>List of predefined options. For more information, see the definition of the Choices field in Create a question in the survey designer.</td>
</tr>
<tr>

<tr>
<td>Data type</td>
<td>Scored</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td>Ranking</td>
<td></td>
<td>Question with an order number to be selected for each option. One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.</td>
</tr>
</tbody>
</table>

**Header bar**

The tabs on the header bar display views and a menu of functions.

- **Survey Designer**
  - **Design**: Add and configure the properties of categories and questions. This is the default view.
  - **Configuration**: Create introductions and end notes for surveys and select a **signature**.
  - **Availability**: Select the recipients for each category in the survey.

Click a tab to change the view on the canvas:

- **Design**: Add and configure the properties of categories and questions. This is the default view.
- **Configuration**: Create introductions and end notes for surveys and select a **signature**.
- **Availability**: Select the recipients for each category in the survey.

Point to the menu icon (≡) to select an option. The list of options depends on the currently open survey:

- **Save**: Save the current survey.
- **Preview**: Display a preview of the survey as it appears to recipients.
- **Publish**: Distribute the survey to the selected recipients.
- **Save and Publish**: Save and distribute the survey in one step.
- **New Survey**: Open a fresh canvas for a new survey.
- **Load Survey**: View the list of existing surveys.
Design canvas

New surveys open in the canvas of the Design view. The survey Name field appears above first category in the canvas. A blank question field appears in the category container.

Initial appearance of the Survey Designer canvas

Configure a survey in the survey designer
Configuration settings apply to the entire survey.

Role required: admin or survey_admin

Select Configuration in the survey designer and complete the Survey Designer Configuration form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Select the check box to enable the distribution of this survey to recipients.</td>
</tr>
<tr>
<td>Anonymize responses</td>
<td>Select the check box to collect survey responses anonymously. Recipients are not listed with survey results. When a user submits a survey, the system clears the Assigned to field for the associated survey instance. Also, survey responses for anonymous surveys do not contain Assigned to values.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of this configuration or the survey to which it is attached.</td>
</tr>
<tr>
<td>Introduction</td>
<td>Introductory content to display on surveys. You can add a welcome message or background information about the survey.</td>
</tr>
<tr>
<td>Signature</td>
<td>Acknowledgement by a survey recipient of requirements, admonitions, or expectations related to a survey.</td>
</tr>
</tbody>
</table>

Note: The Assigned to field is cleared. However, each response record includes the Created By and Updated By fields that are accessible to users with the survey_admin role.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Return URL</td>
<td>Destination address of a web page that is presented to users after they submit a completed survey. When a return URL is configured, the End note content does not appear.</td>
</tr>
<tr>
<td>End note</td>
<td>Content that is displayed to recipients after they submit a completed survey. You can add a thank you message, follow-up instructions, or other applicable information. End notes are not displayed if a Return URL is specified.</td>
</tr>
</tbody>
</table>
| Pagination setting for Service Portal view | Specify how the user will see pages on the desktop or tablet view in Service Portal.  
- **Category**: Display each category on a separate page.  
- **Question**: Display each question on a separate page. This happens for mobile regardless of this setting.  
- **None**: All items on a single page—no pagination  
Default: **Category**  

**Note**: This field appears only when Service Portal is installed. |
| Duration                      | Amount of time that recipients are given to complete this survey, starting from the time that the survey is generated. The default duration is 14 days.                                                        |

**Note**: By default, the system runs the Cancel Expired Assessments script every 30 days to cancel expired survey, assessment, and quiz instances that are in the Work in progress or Ready to take states. |

---

**Survey categories**

Survey categories provide a way to group questions of a similar theme for a given survey. There must be at least one survey category per survey definition and every survey question must be associated with a category. When you create a survey, the system generates one category, which all the questions belong to.

For simple surveys, one category is usually enough. Consider creating additional categories if you want to accomplish any of the following tasks.

- Separate groups of questions into collapsible sections by category on the survey questionnaire.
- Report on category scores, which are calculated based on responses for all questions within each category.

Create a category in the survey designer
A category represents a theme for evaluating a specific element of the survey topic and contains questions pertaining to that theme.

Role required: admin or survey_admin

When you create a survey, the system creates a default category, using the name of the survey. You can use this category, modify it, and create additional categories as needed. To have any results, a category must contain scored questions.

1. Navigate to Survey > Survey Designer.
2. Enter the name of the survey in the Name field.
   The system uses this name as the name of the survey and of the first category.
3. To configure the category, click the gear icon in its title bar and complete the following steps in the Properties dialog box.
   a) Enter a new name and a description for the category.
   b) Enter text in the Details field that introduces or explains the category to recipients.
   c) Click the X icon to close the Properties dialog box and save your settings.

4. To add a new category, click the + icon in the title bar of an existing category.
   The new category appears below the category that you selected to create it. You can click the X icon in a category header to delete a category that you added in error.

Create a survey category in a survey
You can modify an existing survey to add one or more survey categories.

Role required: admin or survey_admin

Only one category is required for each survey, but you can add additional categories as needed.

1. Navigate to Survey > View Surveys.
2. Open a survey definition.
3. In the Metric Categories related list, open a category or click New.
   Each survey category is stored as a record on the Metric Category (asmt_metric_category) table with a modified view for survey use.
4. Enter the survey category name and description.
   The category name appears on questionnaires when either of the following is true.
   - There is more than one category for the survey.
   - There is only one category and its name is different from the survey definition name. If you create a survey using the survey creator, the category name is the same as the survey definition name.

5. Right-click the form header and click Save.
   The Assessment Metrics and Users related lists appear.
6. Click Update.

Create a question in the survey designer
You can create multiple questions for each category in the survey designer, but each question can only be associated with one category.

Role required: admin or survey_admin

The data type that you select for each question determines how it can be answered by survey recipients.

1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.
2. To configure the question, click the gear icon in its title bar. The Properties dialog box opens.
3. Complete the form.

**Question property fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Concise name of the question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as the question on surveys. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Type</td>
<td>Data type selected for this question. See the table in Controls for the available data types.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this question is available on a survey. A question does not appear on surveys that are generated after the question becomes inactive.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box to require users to answer the question. Mandatory questions are denoted by a red field status indicator and must be answered before the survey can be submitted. This field is available when the question does not have a dependency and the question type is not Boolean with a check box option.</td>
</tr>
<tr>
<td>Allow Additional Information</td>
<td>If selected, the Additional Information Label field is enabled. The Additional Information Label field value is displayed as a field on the survey response page to provide additional information for a question.</td>
</tr>
<tr>
<td>Note:</td>
<td>This is not applicable for the String and Template data types.</td>
</tr>
<tr>
<td>Boolean option</td>
<td>Whether a check box or a Yes/No list appears as the option for a Boolean question.</td>
</tr>
<tr>
<td>String option</td>
<td>Setting for the appearance of a string field in a question. This field is available when the question type is String. The string options include the following.</td>
</tr>
<tr>
<td>Single line</td>
<td>Single-line text field 40 characters in length that allows strings of any length.</td>
</tr>
<tr>
<td>String line wide</td>
<td>Full page width text field that allows a single-line entry of any length.</td>
</tr>
<tr>
<td>Multiline</td>
<td>Full page width multiline text field that allows word wrap and returns.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Min</td>
<td>Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is <strong>Number</strong>, <strong>Percentage</strong>, or <strong>Numeric Scale</strong>.</td>
</tr>
<tr>
<td>Max</td>
<td>Highest positive whole number that users can enter or select to answer the question. This field is available when the question type is <strong>Number</strong>, <strong>Percentage</strong>, or <strong>Numeric Scale</strong>.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box for including <strong>Not Applicable</strong> as an option for this question. Users can select <strong>Not Applicable</strong> if they do not have sufficient information to respond to a question. User responses of <strong>Not Applicable</strong> are excluded from results calculations. This field is available when the question does not have a dependency and the question type is not <strong>Boolean</strong> with a check box option.</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box for displaying answer options in a random order. Answer preference is sometimes influenced by the order in which options appear, which can result in biased results. Randomizing options can help prevent this bias.</td>
</tr>
<tr>
<td><strong>Note:</strong> Randomizing options for certain questions may make those questions confusing for users. In general, only randomize options that do not follow a logical order.</td>
<td></td>
</tr>
<tr>
<td>Positive indicator</td>
<td>Setting that determines whether smaller or larger numerical values equate to a good score in result calculations. Select <strong>Low values</strong> if smaller numerical values are better, such as for a question that measures the number of incidents for a vendor. Select <strong>High values</strong> if larger numerical values are better, such as for a question that measures user satisfaction on a scale of one to five.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question that is displayed on the survey. Include details that help users understand how to answer the question.</td>
</tr>
</tbody>
</table>
4. To create any special conditions that must be met before the question appears on the survey, click the Dependency tab. The question must have a data type of **Boolean**, **Choice**, **Scale**, or **Template**.

5. Select a question in the **Displayed when** field. The system selects the appropriate operator and displays the possible answers for the selected question.

6. Select the answer that satisfies the condition. You can select more than one answer. Selected answers are indicated by a check mark. The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.

7. Click the X icon to close the question properties dialog box and save your settings.

8. To add a question with the same data type as an existing question in the category, click the + icon in the title bar of the existing question.

9. Drag and drop questions to change their order within a category or move them between categories.

10. To delete a question, click the X icon in its title bar.

**Survey question data types**
You must choose a data type for each survey question. The data type determines the format of the question and the kind of data that is collected on survey questionnaires.
The following data types are available for surveys:

**Attachment data type**

On questionnaires, users can attach one or more files to a question. Users click the Manage Attachments icon and select one or more files in the Attachments pop-up window to attach to the question. From this window, users can:

- View a list of the attached files.
- View an attached file in a separate window.
- Rename an attached file.
- Add or delete files

Once a survey has been submitted, attachments cannot be updated or deleted.

Any type of file supported by the platform can be attached to a question. One or more files can be attached to a question while taking a survey or completing an assessment.

The assessment administrator can see the attachments associated with an individual question as well as those associated with the survey.

See [Administering Attachments](#) for more information.

**Boolean data type**

On questionnaires, users select a check box beside a statement or leave it cleared.

If you select **Boolean**, you must fill in the **Scale definition** field. Select **High** if it is best when users select the check box.

**Choice data type**

On questionnaires, users select a value from a list of choices.

If you select **Choice**, you must fill in the **Scale definition** field and create answer options. Select **High** for the scale definition if the answer option with the largest metric definition **Value** is best.
Note: The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

Date and Date/Time data types

The Date and Date/Time data types are similar.

- **Date**: On questionnaires, users select a date.

- **Date/Time**: On questionnaires, users select a date and time.
Likert Scale data type

On questionnaires, users select a multiple choice value from a custom Likert scale. Each answer option is represented by a radio button on the scale. A Likert scale question that evaluates an application's ease of use might have the answer options Easy, Average, and Difficult.

If you select Likert Scale, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

**Note:** The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

Number data type

On questionnaires, users enter a number.
If you select Number, you must fill in these additional fields:

- **Scale definition**: Select **High** if a larger number is better, such as for a question that measures the number of sales made in a quarter.
- **Min** and **Max**: Enter the smallest and largest numbers users can enter. State the range of acceptable answers in the question text.

### Percentage data type

On questionnaires, users enter a number.

If you select **Percentage**, you must fill in these additional fields:

- **Scale definition**: Select **High** if a larger percentage is better, such as for a question that measures the percentage of work an agent has completed.
- **Min** and **Max**: Enter the smallest and largest numbers users can enter. Generally 0 and 100 are appropriate minimum and maximum values. If you choose values other than 0 and 100, it is usually best to state the range of acceptable answers in the question text.

### Reference data type

On questionnaires, users select a value from a list that is generated from a specified reference table. The response field supports auto-completion.

**Note**: Reference qualifiers are not supported.

For example, a user could select a user name in response to a question if you specify User (sys_user) as the reference table.
String data type

On questionnaires, users enter text. When you select String, the String option field appears. Select one of the following options to determine how the string field appears on questionnaires:

- Single line
Template data type

On questionnaires, users select a value from a predefined series of answer options. To use this data type, a question template must be defined.

If you select **Template**, you must fill in these additional fields:

- **Template**: Select a template.
- **Scale definition**: Select **High** if the answer option with the largest template definition **Value** is best.

Yes/No data type

On questionnaires, users select **Yes** or **No** from a list.
If you select Yes/No, you must fill in the Scale definition field. Select High if Yes is the best answer.

**Image Scale data type**

On questionnaires, users select an image from a predefined set of images as their response. Image scale questions can also be used in a template for better performance with surveys that have the same type of answer options.

Five emojis, similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Two images can be uploaded, one for selected case and another for unselected case. Larger size images are reduced to 64 x 64 pixels.

The result behavior depends on the presence of uploaded images. If no selected image is uploaded, then the question shows up blank.

<table>
<thead>
<tr>
<th>Selected image</th>
<th>Unselected image</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Unselected image loads. Clicking on the image changes it to the selected image.</td>
</tr>
<tr>
<td>Yes</td>
<td>No</td>
<td>Selected image loads with 50% opacity. Clicking on the image changes the opacity to 100%.</td>
</tr>
<tr>
<td>No</td>
<td>Yes</td>
<td>A blank placeholder box is displayed.</td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>A blank placeholder box is displayed.</td>
</tr>
</tbody>
</table>

**Note:** N/A option is not supported for image scale type question.

**Multiple selection data type**

On questionnaires, users can select multiple check boxes indicating all answers that apply. For instance, a user can be instructed to “Select all that apply” in a multiple selection question.
Ranking data type

On questionnaires, users can select a different order number for each option to rank them. Drag-and-drop functionality is also supported, which allows a user to either fill in the number, or simply drag an option.

One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.

*Edit a survey in the survey designer*
You can modify surveys using the survey designer.

Role required: admin or survey_admin
You can edit a survey even after it has been distributed, with the following results.

- Added questions are available only on surveys that are distributed after this change.
- Changes to existing questions are immediately available to users before the survey is submitted or during the retake period. This includes changes to the answers, such as additional choices or changes to the data type.
- Deleted questions are also deleted from the distributed surveys in user queues.

1. Navigate to **Survey > Survey Designer**.
2. Point to the menu icon in the survey header bar, and select **Load Survey**.
3. Select a survey from the list and modify it as needed.
4. Point to the menu icon in the survey header bar, and select **Save** or **Save and Publish**.

When you publish the edited survey, the system generates survey instances for any associated survey users.

**Configure category weights for a survey**

You can assign a weight to each category in a survey. The system calculates results from the weight that you configure.

Configure the Survey Category form to display the **Weight** field.

Role required: admin or survey_admin

Weights are set to a value of **10** by default but can be changed.

1. Navigate to **Survey > View Surveys** and select a survey from the list.
2. In the Survey Definition form, select a category from the **Metric Categories** related list.
3. Edit the default weight value.
4. Click **Update**.

**View a survey instance**

A survey instance represents one questionnaire assigned to one user. You view an instance to verify that survey instances were created, to check the state of a survey instance, or to reassign a survey instance.

Role required: admin or survey_admin

1. Navigate to **Survey > Survey Instances**. The following sub-modules are available based on the state of the instances:
   - **Ready to take**: Displays survey instances that are ready to be taken by the user. By default, these instances are sorted in ascending order by the **Number** field.
   - **In progress**: Displays survey instances that are in progress. By default, these instances are sorted in ascending order by the **Number** field.
   - **Completed**: Displays survey instances that are complete. By default, these instances are sorted in descending order by the **Taken on** field.
   - **Cancelled**: Displays survey instances that are cancelled. By default, these instances are sorted in ascending order by the **Number** field.
   - **All**: Displays survey instances in all states. By default, these instances are sorted in ascending order by the **Number** field.

2. Open a survey instance from the required sub-module. By default, the following fields are displayed in the Survey Instance form for all sub-modules other than **Completed**.

---

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
- When you open an instance in the **Completed** sub-module, you are redirected to the User's Response page.
- Each survey instance is stored as a record on the Assessment Instance (asmt_assessment_instance) table with a modified view for survey use.

### Survey Instance form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Automatically generated record number.</td>
</tr>
<tr>
<td>Metric type</td>
<td>Survey definition this survey instance was created from. Survey definitions are stored on the Assessment Instance table, and the field label on that table is <strong>Metric type</strong>.</td>
</tr>
<tr>
<td>Due date</td>
<td>Date by which the survey instance should be completed.</td>
</tr>
<tr>
<td></td>
<td>The system populates the due date based on the <strong>Assessment duration</strong> of the associated survey definition, which is set to 14 days by default.</td>
</tr>
<tr>
<td></td>
<td>The survey due date is not enforced in the base system.</td>
</tr>
<tr>
<td></td>
<td>If you want to enforce the due date, consider using a workflow or other mechanism to send survey recipients reminders when a survey is overdue.</td>
</tr>
<tr>
<td>State</td>
<td>State of the survey instance.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User this survey instance is assigned to.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain associated with the instance.</td>
</tr>
<tr>
<td>Expiration date</td>
<td>Date on which the assigned user can receive a new instance of the same survey definition.</td>
</tr>
<tr>
<td></td>
<td>The system automatically populates the expiration date based on the <strong>Schedule period</strong> of the associated survey definition.</td>
</tr>
<tr>
<td>Related Link</td>
<td>Shows a read-only version of the survey responses completed by the user.</td>
</tr>
</tbody>
</table>

**Note:** By default, the system runs the **Cancel Expired Assessments** script every 30 days to cancel expired survey, assessment, and quiz instances that are in the Work in progress or Ready to take states.
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment Instance Questions</td>
<td>All instance question records, which store user response values for each question on the survey questionnaire. The following columns are relevant to surveys:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Category</strong>: Displays the survey categories the questions belong to.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Metric</strong>: Displays the survey questions.</td>
</tr>
</tbody>
</table>

### Survey users and groups

Survey users and survey user groups help survey administrators control who can take a survey. Survey administrators can restrict a survey so that only specified users can access it unless a survey administrator manually assigns the survey to a different user. Survey user groups provide a way to quickly designate multiple survey users.

### Administering survey users

The list of survey users for a survey is visible on the Survey Definition and Survey Category forms. You can add or remove users from the list of survey users at any point. Note that designating a survey user does not automatically generate a survey instance for that user unless both of the following conditions are true:

- The survey definition **Schedule** period is set to **Daily**, **Weekly**, **Monthly**, or **Yearly**. In this case the system assigns a new survey instance to each survey user at the beginning of each schedule period.
- The user has no instances of the survey that are incomplete or that have not yet reached their expiration date.

You can designate survey users from the Survey Designer, the Survey Definition form, or the Survey Category form.

**Note:** If there are trigger conditions for a survey, do not create survey users. Instead, use the Trigger Conditions form to assign users.

### Create a survey user group

Survey user groups are groups that have the **Type** field set to survey and that display only the information most relevant to surveys. You can assign survey groups or any user group to surveys.

Role required: admin, user_admin, or survey_admin

Though it is possible to designate members of any group as survey users, one reason to create a survey group is to view it conveniently in the survey **User Groups** module.

1. Navigate to **Survey > Administration > User Groups**.
2. Click **New**.
3. Complete the Group form.
4. Right-click the form header and click **Save**.
   The **Group Members** and **Groups** related lists appear.
5. To add group members, complete the following steps.
   a) In the **Group Members** related list, click **Edit**.
   b) Select users from the list on the left and add them to the **Group Members List** on the right.
c) Click **Save**.

**Select recipients for a survey in the Survey Designer**
You can assign survey users while designing or modifying the survey.

Role required: admin or survey_admin

1. In the Survey Designer, click the **Availability** tab.
2. Under **Accessible by:** select the **Specific users** option, then select users.
3. If desired, select the **Survey groups only** check box, then select survey user groups or other groups.
4. Click **Save**.

**Designate a survey user**
You can designate one survey user at a time from the Survey Definition form.

Role required: admin or survey_admin

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition.
   There must be at least one category.
3. In the **Survey Users** related list, click **New**.
4. Select a **User**.
5. Click **Submit**.
   The Survey Definition form reopens.
6. Optional: To remove survey users, in the **Survey Users** related list, select the check box beside the user, and then select **Delete** from the action list below the list.

**Designate or remove multiple survey users at one time**
Use the Survey Category form to designate or remove multiple survey users at a time.

Role required: admin or survey_admin

1. Open a survey definition.
2. In the **Metric Categories** related list, open a category.
   You can choose any category. The system applies survey user changes to all the survey’s categories automatically.
3. In the **Users** related list, click **Edit**.
4. Use the slushbucket to add or remove survey users.
5. Click **Save** to return to the survey category.
   The changes are also reflected in the **Survey Users** related list on the survey definition.

**Allow recipients to retake a survey**
You can configure a survey to allow recipients to resubmit their answers as many times as they like, up to the survey’s due date.

Configure the Survey Definition form to display the **Allow retake** field. For more information, see
**Configuring the form layout**.

Role required: admin or survey_admin

Results are not calculated for the survey until the configured duration has elapsed. The card in the user’s queue remains visible until the due date of the survey, and a button is displayed to allow retakes.

1. Navigate to **Surveys > View Surveys**.
2. Select a survey from the list.
3. Select the Allow retake check box.
4. Click Update.

**Copy a survey**

Create a copy of a survey with at least one category to reduce the effort of creating another survey with similar data.

Role required: survey_admin or admin

All associated questions (type), configurations, categories, metrics, domain separation rules, and role-based categories are copied. Assigned users, category users, instances, and trigger conditions are not copied.

1. Navigate to Survey > View Surveys.
2. Open a survey definition.
3. Perform any of the following steps:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Platform</td>
<td>In the title bar, click Copy.</td>
</tr>
<tr>
<td>From Platform</td>
<td>In the title bar, select Copy from the context menu.</td>
</tr>
<tr>
<td>From survey designer</td>
<td>1. In the title bar, click Survey Designer.</td>
</tr>
<tr>
<td></td>
<td>2. In the Survey Designer title bar, point to the menu icon (≡) on the header bar and click Copy Survey</td>
</tr>
</tbody>
</table>

**Publish a survey**

You must publish a survey to enable people to receive and complete survey instances.

Role required: admin or survey_admin

The State field on the Survey Definition form indicates whether the survey is in the Draft or Published state.

**Note:** You cannot return a survey to the Draft state after it has been published. You do have the option to deactivate a survey by clearing the Active check box.

1. Navigate to Survey > View Surveys and select a survey to publish.
2. Click Publish.

When you publish a survey, the system generates survey instances for any associated survey users. You can assign the survey to other users manually.

**Publish a survey in the Survey Designer**

You must save changes to a survey before you can publish it to the specified recipients or groups.

Role required: admin or survey_admin

1. In the Survey Designer, point to the menu and select Load Survey.
2. Select a survey to publish.
3. To preview the survey as a user, point to the menu icon and click Preview.
4. When you are satisfied with the survey, click either **Save and Publish** or **Publish** to distribute it. When you publish a survey, the system sends email notifications to the recipients and to their managers. The system displays a link to the survey on a card in each recipient’s My Assessments & Surveys portal.

**Customize the appearance of a survey**

Assessment and survey administrators can set properties to customize the color of various elements on the questionnaires.

Role required: admin or survey_admin

**Note:**
- For color properties, enter either an HTML color name or hexadecimal (hex) value. For hex values, the # character is required. Values are not case-sensitive.
- For example, all of the following formats are valid: LightGray, lightgray, #D3D3D3. A preview of the color appears next to the field.

Note that the customizations you make apply to all assessments and surveys.

1. Navigate to either of the following modules.
   - Assessments > Admin > Assessment Properties
   - Survey > Administration > Properties

2. On the properties page, edit the properties as needed. Refer to the screenshot below to see what parts of assessment questionnaires are controlled by the properties.

3. Click **Save**. You may need to clear the browser’s cache to see updates.

**Assessment and survey properties**

You can configure a variety of properties to customize the appearance of assessment and survey questionnaires, require authentication for user signatures, open surveys in the service portal view from emails, and limit the number of items shown in a decision matrix field filter.
### Survey definitions

A survey definition is the root record upon which a survey is built.

The survey designer generates a survey definition automatically when you save or publish the survey. Survey administrators may want to modify the survey definition to configure additional options for the survey, or to publish the survey when it is ready for distribution.

Survey administrators and survey readers can also send survey invitations directly to users from the survey definition.

**Modify a survey definition**

You can configure additional options for a survey definition.

Role required: admin or survey_admin

1. Navigate to **Survey > View Surveys**.

   Each survey definition is stored as a record on the Assessment Metric Type [asmt_metric_type] table with a modified view for survey use.

---

**Assessment and survey properties**

<table>
<thead>
<tr>
<th>Property</th>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
</table>
| sn_portal_surveys.sp_survey.email_redirection | Allow survey link from email to open in service portal view | When Yes is selected, a survey accessed from a link in an email opens in the Service Portal.  
*Note:* This property applies only to surveys.  
- Default value: No |
| com.snc.assessment.signature_authentication | Require authentication for user signature. | When Yes is selected, this property requires credentials for a full name signature.  
- Default value: Yes |
| css.assessment.question.header.background.color | Assessment question header background color | Sets the background color of question headers on assessment and survey questionnaires.  
- Default value: #767676 |
| css.assessment.caption.background.color | Assessment caption background color | Sets the background color of the caption on assessment and survey questionnaires.  
- Default value: #eee |
| com.snc.assessment.decision_matrix_filter_max_entries | Maximum number of items to show for a decision matrix field filter |  
- Default value: 1000 |
| css.assessment.caption.font.color | Assessment caption font color | Sets the font color of the caption text on assessment and survey questionnaires.  
- Default value: #ffffff |
2. Open a survey definition. The **Response Trend** chart with the weekly trend of the survey instance count, and the **Survey Summary** chart with the overall summary response based on instance states are displayed.

3. Modify the fields on the Survey Definition form, as appropriate.

**Survey Definition form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

</table>
| Signature     | Acknowledgement by a survey recipient of requirements, admonitions, or policies related to the survey. The signature may require the recipient to select a check box or to type a full signature to verify having read these assertions. You can display assertions without requiring a signature. Select an existing signature from the list or click New to create a new one. The signature form contains these fields:  
  - **Name**: Descriptive name for this signature.  
  - **Signature type**: Type of signature required. The selections are **Check box**, **Full name**, or **Assertion only**. If **Assertion only** is selected, no signature is required to submit the survey.  
  - **Assertion**: Text you want to display to recipients.  

By default, a property called **Require authentication for user signature** (com.snc.assessment.signature_authentication) requires users to authenticate when providing a full name signature. |
| Schedule period | Option that determines how often a user can take the same survey and whether the system generates survey instances on a schedule.  

**Note**: If you use a trigger condition for a survey, ensure the schedule period is set to **No Limit**. Trigger conditions use a different method to regulate how often users can receive survey instances. |
<p>| Allow retake   | Check box that allows users to modify their answers to a completed survey. Users can resubmit a survey as many times as they want until the due date. After that date, the system removes the survey from the user's My Assessments &amp; Surveys page. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Scheduled job                             | Scheduled job the system creates for this survey definition when the schedule period is a repeating interval. The system sets the scheduled job to run according to the selected schedule period. If you change the schedule period and save the survey definition:  
  - The system deletes the old scheduled job. If you selected a recurring schedule period:  
  - A new scheduled job is created.  
  For example, if you change the schedule period from **Daily** to **Weekly** and save the record:  
  - The system deletes the daily scheduled job.  
  - Creates a weekly one set to run a week from the current date.  
  This field is visible to administrators only if the schedule period is **Daily**, **Weekly**, **Monthly**, or **Yearly**. |
| Pagination setting for Service Portal view | The setting on which the pagination is based for desktop or tablet view in Service Portal.                                                                                                                   |
|                                           | - Category: default  
  - Question: 1 question per page (automatic for mobile)  
  - None: no pagination                                                                                                                                                                                      |
|                                           | **Note:** This field is displayed only when Service Portal is installed.                                                                                                                                 |
| Assessment duration                       | The length of time to complete assigned survey instances, starting from the time the survey instance is generated. The assessment duration sets the Due date for each survey instance. The default duration is 14 days. Configure the form to see this field.                                                                        |
|                                           | **Note:** By default, the system runs the **Cancel Expired Assessments** script every 30 days to cancel expired survey, assessment, and quiz instances that are in the Work in progress or Ready to take states.                                                                 |
| Send notifications                        | Select the check box to send notifications for the survey when it is published. Configure the form to see the field.                                                                                           |

### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment Instances</td>
<td>All survey instances for this survey. Configure the form to add this related list to see it.</td>
</tr>
</tbody>
</table>

**Note:** If you add a related list to the form, use list control to omit the New button. The system generates survey instances to produce functional surveys.

4. **Save the record.**

**Schedule periods**

The available schedule periods are **Only Once, No Limit, Daily, Weekly, Monthly, and Yearly.**

The default schedule period is **No Limit.** When you set the schedule period to anything except **Only Once** or **No Limit,** the system creates a corresponding scheduled job. The scheduled job performs the following actions:

- Ensures that a user can take one survey instance of the same survey per schedule period.
- Generates a new survey instance for each survey user at the beginning of the new schedule period, as long as the survey user does not have an incomplete instance of that survey. A survey instance is incomplete if the state is not **Complete.**

For example, if you set the schedule period to **Monthly** and someone attempts to send survey invitations twice in the same day, the system generates survey instances for the survey users the first time only. At the beginning of the next schedule period, the system generates another survey instance for each survey user who completed the previous one.

Schedule periods are enforced by the **Expiration date** field on the survey instance. As long as the survey instance expiration date has not passed, the assigned user cannot receive a new survey instance. When the system generates a survey instance and the schedule period is anything except **No Limit,** the **Expiration date** field is automatically set to the appropriate date. For example, if the schedule period is **Weekly,** the expiration date is a week after the survey instance is generated.

If you change the schedule period, the scheduled job updates automatically to the correct schedule. However, users who have survey instances for the survey cannot receive new survey instances until their existing survey instances expire, regardless of the new schedule period.

Consider the following example: Sal Pindell receives a survey instance when the schedule period is **Weekly.** The next day, a survey administrator changes the schedule period to **No Limit.** Sal cannot receive another survey instance until one of the following actions occurs:

- Seven days pass from the time Sal's survey instance was generated.
- A survey administrator deletes Sal's survey instance.

After one of these actions occurs, Sal can receive a new survey instance anytime, as long as he has no incomplete instances of the survey.

**Note:** If you use a trigger condition for a survey, ensure the schedule period is set to **No Limit.** Trigger conditions use a different method to regulate how often users can receive survey instances.

### Create a survey designer template question

You can create a question that uses choice lists from a template.
Role required: admin or survey_admin

1. Navigate to **Survey > Survey Designer** and load a survey or create a new survey.
2. Drag the **Template** data type icon into a category container.
3. Click the gear icon in the question title bar to open the template properties dialog box.
4. Select a predefined scale from the list.
Question entry fields appear for that template.

5. Enter one or more questions that are appropriate for the template.
6. Click the arrow to the right of a question to configure its properties. You must provide a name for each question.
7. Click the back arrow to return to the template properties dialog box.
8. Configure the properties for the remaining questions.
9. Click the X icon to close the template properties dialog box and save your settings.

Survey questions

Survey questions appear on survey questionnaires for the associated survey definition.

The survey creator generates questions and answer options automatically. However, it provides only the basic configuration options for questions, such as the question text and the data type. You may want to create additional questions or set advanced configuration options for the questions, including making a question appear conditionally or making a question mandatory. You can also use question templates to define reusable sets of answer options.

Survey questions are available from Survey > Questions. The list displays information about each question, including the associated survey definition listed in the Type column, and the data type. Survey administrators can modify these questions.

Create or modify survey questions
You can create and administer survey questions.

Role required: admin or survey_admin
Changes to a survey, such as the addition of questions or the modification of question templates, do not apply immediately to the existing survey instances. However, the changes apply immediately to any new survey instances that are created after the changes are saved.

1. Navigate to Survey > View Surveys.
2. Open a survey definition.
3. In the Metric Categories related list, open a category.
4. In the Assessment Metrics related list, open an existing question or click New. Each survey question is stored as a record on the Assessment Metric (asmt_metric) table with a modified view for survey use.
5. Complete the Survey Question form.

The fields that appear depend on the selected Data type.

### Survey Question form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the question. When you create a survey, the question name is the same as the text in the Question field.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to use for the question, which appears on survey questionnaires.</td>
</tr>
<tr>
<td>Data type</td>
<td>Data type of the question. The fields for the response depend on the data type.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If another question depends on this question, you cannot change the data type.</td>
</tr>
<tr>
<td>Template</td>
<td>Question template to use for the answer options. This field is visible and required only if the data type is Template.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If another question depends on this question, you cannot change the template.</td>
</tr>
<tr>
<td>Scale definition</td>
<td>Setting that determines whether smaller or larger numerical values equate to a good score in result calculations. Select Low if smaller numerical values are better, such as for a question that measures the number of incidents for a vendor. Select High if larger numerical values are better, such as for a question that measures user satisfaction on a scale of one to five. This field is visible and required only when certain data types are selected.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box that determines whether to present the answer options for this question in a random order each time a user opens the survey. Answer preference is sometimes influenced by the order in which answer options appear, which can result in biased results. Randomize answer options to help prevent this bias. This field is visible only if the data type is Choice or Likert Scale.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box that makes the question mandatory (selected) or optional (cleared) on survey questionnaires. Users cannot submit questionnaires until they provide valid responses to all mandatory questions, which are denoted by a red field status indicator. This field is visible only when the Depends on field is empty and the data type is not Checkbox. Questions that depend on other questions and check box questions cannot be mandatory.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box that determines whether to include a Not Applicable answer option for this question on survey questionnaires. User responses of Not Applicable are excluded from results calculations. This field is visible only if the data type is Choice, Likert Scale, Template, or Yes/No.</td>
</tr>
<tr>
<td>Allow Additional Information</td>
<td>If selected, the Additional Information Label field is enabled. The Additional Information Label field value is displayed as a field on the survey response page to provide additional information for a question. Note: This is not applicable for the String and Template data types.</td>
</tr>
</tbody>
</table>
### ServiceNow Kingston  Now Platform Capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depends on</td>
<td>Setting used to make this a conditional question, meaning that it only appears when users answer another question a certain way. To make a question depend on another question, select an existing question from the list, which displays Checkbox, Choice, Template, and Yes/No questions of the same category as this question. Then, use the Displayed when field to set the conditions that cause this question to appear on surveys. The system prevents the creation of recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.</td>
</tr>
<tr>
<td>Displayed when</td>
<td>Answer options for the selected Depends on question which, when chosen on surveys, display this question. This field is visible and required only when the Depends on field is set.</td>
</tr>
<tr>
<td>Min</td>
<td>Smallest numerical value to be used as an answer option for this question. This field is visible and required only if the data type is Choice, Likert Scale, Number, or Percentage.</td>
</tr>
<tr>
<td>Max</td>
<td>Largest numerical value to be used as an answer option for this question. This field is visible and required only if the data type is Choice, Likert Scale, Number, or Percentage.</td>
</tr>
<tr>
<td>String option</td>
<td>Selection that determines what kind of response text box appears for this question on survey questionnaires. This field is visible and required only if the data type is String.</td>
</tr>
</tbody>
</table>

6. Save the record.

**Note:**
- Be sure to create answer options if you select the Choice or Likert Scale data type.
- You cannot delete a survey question (metric) with user responses. To delete a survey question with user responses, you should delete the responses, and then delete the survey question.

**Survey question data types**

You must choose a data type for each survey question. The data type determines the format of the question and the kind of data that is collected on survey questionnaires.

The following data types are available for surveys:

---

© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Attachment data type

On questionnaires, users can attach one or more files to a question.
Users click the Manage Attachments icon and select one or more files in the Attachments pop-up window to attach to the question. From this window, users can:

- View a list of the attached files.
- View an attached file in a separate window.
- Rename an attached file.
- Add or delete files

Once a survey has been submitted, attachments cannot be updated or deleted.

Any type of file supported by the platform can be attached to a question. One or more files can be attached a question while taking a survey or completing an assessment.

The assessment administrator can see the attachments associated with an individual question as well as those associated with the survey.

See Administering Attachments for more information.

Boolean data type

On questionnaires, users select a check box beside a statement or leave it cleared.

If you select Boolean, you must fill in the Scale definition field. Select High if it is best when users select the check box.

Choice data type

On questionnaires, users select a value from a list of choices.

If you select Choice, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.
**Date and Date/Time data types**

The **Date** and **Date/Time** data types are similar.

- **Date**: On questionnaires, users select a date.

- **Date/Time**: On questionnaires, users select a date and time.
Likert Scale data type

On questionnaires, users select a multiple choice value from a custom Likert scale. Each answer option is represented by a radio button on the scale. A Likert scale question that evaluates an application’s ease of use might have the answer options Easy, Average, and Difficult.

If you select Likert Scale, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

Note: The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

Number data type

On questionnaires, users enter a number.
If you select **Number**, you must fill in these additional fields:

- **Scale definition**: Select **High** if a larger number is better, such as for a question that measures the number of sales made in a quarter.
- **Min** and **Max**: Enter the smallest and largest numbers users can enter. State the range of acceptable answers in the question text.

**Percentage data type**

On questionnaires, users enter a number.

If you select **Percentage**, you must fill in these additional fields:

- **Scale definition**: Select **High** if a larger percentage is better, such as for a question that measures the percentage of work an agent has completed.
- **Min** and **Max**: Enter the smallest and largest numbers users can enter. Generally **0** and **100** are appropriate minimum and maximum values. If you choose values other than **0** and **100**, it is usually best to state the range of acceptable answers in the question text.

**Reference data type**

On questionnaires, users select a value from a list that is generated from a specified reference table. The response field supports auto-completion.

*Note: Reference qualifiers are not supported.*

For example, a user could select a user name in response to a question if you specify User (sys_user) as the reference table.
String data type

On questionnaires, users enter text. When you select **String**, the **String option** field appears. Select one of the following options to determine how the string field appears on questionnaires:

- **Single line**
Template data type

On questionnaires, users select a value from a predefined series of answer options. To use this data type, a question template must be defined.

If you select Template, you must fill in these additional fields:

- **Template**: Select a template.
- **Scale definition**: Select **High** if the answer option with the largest template definition **Value** is best.

Yes/No data type

On questionnaires, users select **Yes** or **No** from a list.
If you select Yes/No, you must fill in the Scale definition field. Select High if Yes is the best answer.

**Image Scale data type**

On questionnaires, users select an image from a predefined set of images as their response. Image scale questions can also be used in a template for better performance with surveys that have the same type of answer options.

Five emojis, similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Two images can be uploaded, one for selected case and another for unselected case. Larger size images are reduced to 64 x 64 pixels.

The result behavior depends on the presence of uploaded images. If no selected image is uploaded, then the question shows up blank.

<table>
<thead>
<tr>
<th>Selected Image</th>
<th>Unselected image</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Unselected image loads. Clicking on the image changes it to the selected image.</td>
</tr>
<tr>
<td>Yes</td>
<td>No</td>
<td>Selected image loads with 50% opacity. Clicking on the image changes the opacity to 100%.</td>
</tr>
<tr>
<td>No</td>
<td>Yes</td>
<td>A blank placeholder box is displayed.</td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>A blank placeholder box is displayed.</td>
</tr>
</tbody>
</table>

**Note:** N/A option is not supported for image scale type question.

**Multiple selection data type**

On questionnaires, users can select multiple check boxes indicating all answers that apply. For instance, a user can be instructed to “Select all that apply” in a multiple selection question.
Ranking data type

On questionnaires, users can select a different order number for each option to rank them. Drag-and-drop functionality is also supported, which allows a user to either fill in the number, or simply drag an option.

One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.

Survey question template

Question templates define reusable sets of answer options for survey questions.
Question templates define reusable rating scales for answering questions, where each answer option on the scale is a template definition. For example, the template named **Satisfaction** represents a satisfaction scale and contains the following template definitions: **Very Satisfied**, **Satisfied**, **Neutral**, **Dissatisfied**, and **Very Dissatisfied**.

![Template definition](image)

**Template definition**

Templates are available for survey questions that have **Data type** set to **Template**. The following question templates are available in the base system. You can create or update a template as described in [Create a survey question template](#).

**Default question templates**

<table>
<thead>
<tr>
<th>Name</th>
<th>Template definitions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amount</td>
<td>None, Few or little, Average amount, Many, Quite a lot</td>
</tr>
<tr>
<td>Complexity</td>
<td>Very Complex, Complex, Moderate, Simple, Very Simple</td>
</tr>
<tr>
<td>Frequency</td>
<td>Never, Seldom, Sometimes, Most of the time, All of the time</td>
</tr>
<tr>
<td>Likert 5</td>
<td>Strongly Disagree, Disagree, Neutral, Agree, Strongly Agree</td>
</tr>
<tr>
<td>Quality</td>
<td>Very Poor, Poor, Average, Good, Very Good</td>
</tr>
<tr>
<td>Satisfaction</td>
<td>Very Dissatisfied, Dissatisfied, Neutral, Satisfied, Very Satisfied</td>
</tr>
<tr>
<td>Size</td>
<td>Very Small, Small, Average, Large, Very Large</td>
</tr>
</tbody>
</table>

**Create a survey question template**

You can create and administer question templates.

**Role required:** admin or survey_admin

Changes to a survey, such as the modification of question templates, apply to existing survey instances immediately. Templates that you create are available for use with both surveys and assessments.

1. **Navigate to Survey > Templates.**
   - Each template is stored as a record on the Assessment Metric Template (asmt_template) table.
2. **Click New.**
3. **Enter a Name.**
4. **Right-click the form header and click Save.**
5. **In the Assessment Template Definitions related list, click New.**
Create a template definition for each answer option you want to appear on a question.

6. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>Enter the text to appear as the answer option.</td>
</tr>
<tr>
<td>Value</td>
<td>Enter a numeric value, greater than or equal to zero, to which the answer option equates. Values are used in results calculations. When you view questions that use templates, answer options appear in order from smallest to largest Value. Each template definition for a given template must have a unique Value.</td>
</tr>
</tbody>
</table>

7. Click Update.

Update min and max values to match templates
If you use survey result calculation data, ensure that the Min and Max values for a question that uses a template are equal to the smallest and largest template definition Value.

Role required: admin or survey_admin

When you create a question of the Template data type, the system sets the Min and Max fields based on the template definition values. The fields for existing questions are not updated if you add a new template definition to a template or if you update the Value of an existing template. If the new Value is less than the minimum value or greater than the maximum value of any questions that use the template, update the questions accordingly.

1. Navigate to Survey > Questions.
2. Configure the list to show the Min and Max columns.
3. Add the following list filter condition: (Template) (is) (<select the template you updated>).
4. Ensure the Min and Max values match the smallest and largest template definition Value for the selected template.
   If the values do not match, edit the Min and Max values directly from the list.

   Note: When the data type is Template, a UI policy prevents the editing of Min and Max from the form.

Create or modify answer options
You must create answer options, called metric definitions, for survey questions that have Data type set to Choice or Likert Scale.

Role required: admin or survey_admin

Changes to a survey, such as the addition or modification of answer options, apply to existing survey instances immediately.

1. Navigate to Survey > Questions.
2. Open a choice or Likert scale survey question.
3. In the Assessment Metric Definitions related list, open a metric definition or click New.
   Each answer option is stored as a record on the Assessment Metric Definition (asmt_metric_definition) table.
4. Complete the Assessment Metric Definition form.
Assessment Metric Definition fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>Text to appear as the answer option.</td>
</tr>
<tr>
<td>Value</td>
<td>Numeric value, greater than or equal to zero, to which the answer option equates. Values determine the order in which answer options appear. See the example below. Values are also used to calculate survey results. Each metric definition for a given question must have a different Value.</td>
</tr>
</tbody>
</table>

5. Click Submit.

On survey questionnaires, the answer options for a question appear in order from smallest to largest Value. For example, consider the survey question How do you feel? with the answer options Good, Neutral, and Bad. The following table shows the answer option order based on the Value.

<table>
<thead>
<tr>
<th>Answer option</th>
<th>Value</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Good</td>
<td>1</td>
<td>First</td>
</tr>
<tr>
<td>Neutral</td>
<td>3</td>
<td>Second</td>
</tr>
<tr>
<td>Bad</td>
<td>5</td>
<td>Third</td>
</tr>
</tbody>
</table>

If you use survey result calculations, ensure the question Scale definition is set appropriately based on the answer options. In the previous example, if you want the answer option Good to earn the highest score, the scale definition should be Low because Good has the smallest value.

Change the order of survey questions
You can easily reorder survey questions at the category level or the question level.

Role required: admin or survey_admin

You can change the order in which the questions in one category appear relative to those in other categories for the same survey definition. If you add a new question manually after you create other questions, you may want to change the order of questions.

When you create questions using the survey creator, the system sets the Order field for the first question to 101, the second to 102, and so on. After you create a new question outside of the survey creator, the Order is set to 100 by default, which means it appears before all questions generated by the survey creator.

1. Navigate to Survey > View Surveys and open the appropriate survey definition.
2. In the Metric Categories related list, edit the values in the Order column.
3. To change the order of questions within a category, complete the following steps.
   a) Open the Assessment Metrics related list.
   b) Edit the values in the Order column.
Survey trigger conditions

Trigger conditions specify when to send a particular survey and the persons to send it to.

Survey administrators can use trigger conditions to configure the system to generate a survey instance each time a specified action occurs on a specified table, for example, when an incident or change request closes. The system sends the survey to users that are related to the triggering record, for example, incident callers or change request assignees. You can choose to send a survey every time the condition is met, or you can set a probability for the system to send a survey at random when the condition is met.

Trigger conditions are ideal for sending transactional surveys. Transactional surveys generally measure satisfaction with a recent experience, such as closing an incident or purchasing an item.

**Note:** Trigger conditions are comparable to survey conditions in legacy surveys. If you migrate a legacy survey that has survey conditions, ensure that the survey conditions are deactivated before you recreate them as trigger conditions.

Configure a trigger condition for a survey

Configure trigger conditions to specify when to send a particular survey and the persons to send it to.

Role required: admin or survey_admin

1. Navigate to Survey > Trigger Conditions.
2. Click New.

   **Note:** Do not specify particular users for a triggered survey because only the specified users are allowed to take the survey.

3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment</td>
<td>Survey to send.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to run the trigger condition on. You can select only tables in the current application scope. For example, to send a survey whenever an incident closes, select the Incident (incident) table.</td>
</tr>
<tr>
<td>User field</td>
<td>Field that stores the users you want to send the survey. You can select any field, on the selected table or on a referenced table, that references the User (sys_user) table. Use the tree picker to select a field.</td>
</tr>
</tbody>
</table>

**Note:** To avoid requiring users to log in to take a survey with a trigger condition, set the survey to Public.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Repeat interval</td>
<td>Minimum period that must pass before the trigger condition can resend the survey to the same user. For example, assume the repeat interval is set to 30 days. Even if the same user qualifies for multiple surveys from this trigger condition, the system can send only one survey every 30 days.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Ensure that the Schedule period of the selected survey definition is set to <strong>No Limit</strong>. If the schedule period is set to a different value, it prevents the trigger condition from sending surveys as expected.</td>
</tr>
<tr>
<td>Application</td>
<td>(Admin only) Application is set to Core.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this trigger condition is active (selected).</td>
</tr>
<tr>
<td>Business rule</td>
<td>(Admin only) Business rule the system creates to monitor the selected table. When the condition is met, the business rule sends the survey to the correct user. No configuration is necessary for this business rule.</td>
</tr>
<tr>
<td>Trigger randomly</td>
<td>Check box that determines whether to send the survey to the appropriate user every time the condition is met (cleared) or only a percentage of the time (selected).</td>
</tr>
<tr>
<td>Probability (%)</td>
<td>Approximate probability that the survey is sent each time the condition is met. For example, if the probability is set to 50, the system sends the survey approximately 50% of the time the conditions are met. There are no repeat interval restrictions is assumed. This field is visible and required only when Trigger randomly is selected.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Related Field 1- 4</td>
<td>Field that contains a value you want to store for reporting purposes. You can pick any reference field on the selected table. When the trigger condition generates a survey instance, the system stores the value from the triggering record. Specify up to four fields. For example, select the Incident table, <strong>Assigned to</strong> and <strong>Problem</strong> as related fields. The system stores the assigned user and problem associated with the incident as Related record 1 and Related record 2 in the survey instance record. To view the fields, configure the form for any survey instance. <strong>Note:</strong> You cannot use a related field for the ticket number because you cannot select the Number column. You can, however, use the trigger_id column of the table.</td>
</tr>
<tr>
<td>Description</td>
<td>Summary information to identify the trigger condition. <strong>Note:</strong> For a triggered record, the table title is used for the survey description.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition builder that defines the criteria that must be true to send the survey. For example, to send a survey whenever an incident closes, create the condition <strong>(State) (is) (Closed)</strong>.</td>
</tr>
</tbody>
</table>

You can also create a trigger condition directly from the survey creator. If you select **Certain users can take this survey, based on conditions** in the Survey User Access section, the Trigger Condition form opens automatically when you click **Save as Draft** or **Publish**.
<table>

</tbody>
</table>

Submit
Trigger condition example
You can send out auto-triggered surveys when an incident is closed or resolved.

A trigger condition is configured as follows:

- **Assessment**: Service Desk Satisfaction Survey
- **Table**: Incident (incident)
- **User field**: Caller
- **Repeat interval**: 30 days
- **Active**: true
- **Trigger randomly**: false
- **Related Field 1**: Assigned to
- **Related Field 2**: Problem
- **Condition**: (State) is (Closed) or (State) is (Resolved)

Fannie Steese is the caller on incident INC00004305 that is assigned to Boris Catino, a service desk technician. Boris creates PRB010101 based on Fannie’s complaint and closes the incident. The system creates a survey instance assigned to Fannie so she can rate her satisfaction with the incident experience.

Because two related fields were selected as part of the trigger condition, the survey instance stores the following information from the incident:

- User (Related Field 1): Boris Catino
- Problem (Related Field 2): PRB010101
- Task (automatically created): INC00004305

Because the task field is automatically populated, UI-based filtering by dot-walking on incidents (or any task-based table) is supported when creating a report on survey results. For example, you can query all survey instances related to incidents assigned to a group (survey reports on all incidents assigned to networking group, for instance).

**Note:** Even though the trigger condition is set to be triggered each time that the conditions are met, the Repeat interval setting ensures that Fannie does not receive another survey for another of her incidents closes within 30 days of the first incident.

Survey report example based on task field

One of the most common use cases for Surveys is to send out an auto-triggered survey when an incident, request, or task is closed. Once you get the survey results back, you can filter the results by users and groups related to the ticket, such as Assignment Group, or Assignee.

Filtering the survey results provides more detail on how people and teams are performing based on ticket data. Since this information is automatically captured, you can dot-walk while filtering the data (instead of utilizing a related field on the Survey trigger condition form, as previously required).
To create a report on incident-triggered survey responses by Assignment group, set up the report on the Task Assessment Details by navigating to ReportsView/Run and clicking Create a report.

Survey distribution

There are several ways for survey administrators to distribute surveys to users. Surveys are distributed using any of the following methods.

- Send survey invitations to users
- Share a survey URL that opens the survey directly.
- Create a module that opens a survey.

Send survey invitations to users

You can send survey invitations using the Assign Survey or Send Invitations buttons on the Survey Definition form.

Role required: admin or survey_admin

Use the Send Invitations button to immediately assign survey instances to each survey user that is listed in the survey definition. Use the Assign Survey button to assign a survey instance to any one user at a time.

Each of the buttons generates survey instances assigned to the appropriate users. In addition, if the instance is configured to send email, the system generates survey notifications. For either button to be available, the survey definition must meet all of the following conditions.

- **Active** check box is selected.
- **State** is Published.
Survey is associated with at least one question.

**Note:** You (or a trigger) can send more than one instance of a survey to a user at any time.

1. Navigate to **Survey > View Surveys**.
2. Select an active, published survey.
3. Complete one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assign a survey to users listed in the Survey Users related list</td>
<td>Click Send invitations.</td>
</tr>
<tr>
<td>Assign a survey to any user</td>
<td>Click Assign Survey and select one or more users, and then click OK.</td>
</tr>
</tbody>
</table>

The system creates a survey instance assigned to the user or users, assuming the user is eligible to receive a new survey instance. When you use the **Assign Survey** button, the selected user is not saved as a survey user.

**Survey URLs**

You can distribute a survey by giving survey users a survey URL.

Survey administrators can obtain one of the following types of URLs.

- A general URL for a survey, which users can open to take the survey questionnaire. The following process occurs.
  - When someone opens the URL, the system ensures that the person is logged in. It then searches for an instance of the associated survey that is assigned to the logged-in user.
  - If a survey instance is found, the appropriate action occurs based on the **State** of the survey instance (see table). If there are multiple active survey instances (**Ready to take** or **In progress**), the instance with the earliest due date opens.
  - If no survey instance is found, the system creates a new instance for the survey, assigns it to the user, and opens the survey questionnaire.

- A URL for a specific survey instance, which the assigned user can open to take the survey questionnaire. The following process occurs.
  - When someone opens the URL, the system ensures the person is logged in as the user the survey instance is assigned to. Only the assigned user can access the survey questionnaire.
  - The appropriate action occurs, depending on the **State** of the survey instance (see table).

### Survey states

<table>
<thead>
<tr>
<th>Survey instance state</th>
<th>Action upon opening URL</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Ready to take:</strong> User has not saved any responses.</td>
<td>The survey questionnaire appears for the user to begin. The user can save or submit responses.</td>
</tr>
<tr>
<td><strong>In progress:</strong> User has saved at least one response.</td>
<td>The survey questionnaire appears for the user to continue. Any previously saved responses are displayed. The user can save or submit responses.</td>
</tr>
<tr>
<td>Survey instance state</td>
<td>Action upon opening URL</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------</td>
</tr>
</tbody>
</table>
| **Complete**: User has submitted all required responses. | If the schedule period is **No Limit** or if the period restriction has expired, the survey questionnaire for a new survey instance appears for the user to begin.  
If the schedule period restricts the number of times a user can take the same survey, and the period restriction has not expired since the user last completed survey, an error message appears. |

If someone opens a URL for an unpublished or deactivated survey, an error message appears.

Obtain and distribute a general survey URL

You can distribute a general survey URL to allow any eligible user to open a survey questionnaire.

Role required: admin or survey_admin

The general URL is available on the Survey Definition form and on the survey creator. You can also email the URL for a public survey that is published.

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition from the Assessment Metric Types list.
3. To view or copy the URL, click the **View Survey URL** related link.
   This related link is visible only if the survey definition is **Active**.
4. To distribute the URL to users, paste the copied URL as desired, or click the **Email** button to send via email.
   The **Email** button is visible only for a public survey that is published.

When a survey user clicks the general survey URL, the system creates a survey instance for the survey user as long as the user does not have an instance in the **Ready to take** state. The system is configured by default to send an email notification when a survey instance is generated.

As a result, the survey user receives a second notification in addition to the notification that you sent with the general survey URL. This may confuse the survey user. To avoid this issue, you can deactivate auto-notification.

Deactivate auto-notification for surveys

When you send a survey notification with a general survey URL to a survey user, the user may receive a second system-generated notification. To avoid this issue, you can deactivate auto-notification.

Role required: admin or survey_admin

1. Navigate to **System Notification > Email > Notifications**.
2. Open the **Survey User Invite** notification.
3. Configure the form to add the **Send to event creator** check box to the **Who will receive** section.
   The **Send to event creator** check box is selected by default.
4. Clear the **Send to event creator** check box.
   The system will no longer send auto-notification messages to survey users.

Obtain a survey instance URL

You can distribute a survey instance URL to allow the assigned user to open a survey questionnaire.

Role required: admin or survey_admin
The survey instance URL is available on the survey instance record.

1. Navigate to Survey > Survey Instances.
2. Open the instance for the survey.
3. To view or copy the URL, click View Instance URL related link.
   The related link is available only when the survey instance State is Ready to take or In progress and the associated survey definition is Active.
4. In the dialog box, select and copy the URL then click OK or Cancel.
5. Distribute the URL to the assigned user.

Test a survey URL
When there are survey users associated with a survey, the survey is restricted so only those users can use the survey URL. You can test the survey URL to ensure it is restricted.

Role required: admin or survey_admin
1. Navigate to Survey > View Surveys and open a survey for which you are not a survey user.
2. Under Related Links, click View Survey URL.
3. Copy the URL and click OK or Cancel.
4. Navigate to the URL.
   You see a message that you are not authorized to take the survey.

Create a survey module
You can create a module that opens a survey.

Role required: admin or survey_admin

When a user clicks a survey module, the system performs one of the following actions, depending on the configuration options for the survey and other factors.

- Creates a new survey instance
- Opens an existing survey instance
- Displays an error message.

1. Perform the appropriate action for your version of the UI:
   - UI16: Point to the application menu that contains the module to which you want to add the survey module and click the edit application (pencil) icon.
   - UI15: Right-click the application menu you want to add the module to and select Edit Application Menu
2. In the Modules related list, click New.
3. Complete the following fields.
   - Link type: Assessment
     Do not select Survey, which is used for legacy surveys only.
   - Assessment: Select the survey you want the module to open.
4. Complete and save the form.

Sharing surveys: export and import
You can export a survey and then import it to a different ServiceNow instance.

Note: Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see System update sets.
The system exports a single XML file that contains a survey definition (asmt_metric_type) and the associated records, including the following.

- Assessment Metric Template (asmt_template)
- Assessment Template Definition (asmt_template_definition)
- Metric definitions (asmt_metric_definition) (survey question answer options)
- Scheduled Jobs associated with the Survey (sys_trigger)
- Survey categories (asmt_metric_category)
- Survey questions (asmt_metric)
- Survey users (asmt_m2m_category_user)
- Trigger Condition (asmt_condition)

Export a survey
You can export a survey and then import it to another instance.
Role required: admin, survey_reader, or survey_admin
For information about update sets, see System update sets.

1. Navigate to Survey > View Surveys.
2. Right-click the name of a record to show the context menu.
3. Select Export Assessment.
4. If applicable, follow the prompt in your browser to save the XML file.

Import a survey
You can import a survey that has been exported as an XML file. The exported XML file does not contain result data.
Role required: admin or survey_admin

Note: Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see System update sets.

1. Verify that the target instance has assessments enabled.
2. Follow the steps in Import an XML file to import the assessment.

Use update sets for surveys and assessments
Use an update set to capture changes to surveys and assessments.
Role required: admin or survey_admin

When developing surveys and assessments, you can use an update set to capture the changes and move them from a development instance to a production instance. Once an update set is created and marked current, all of the updates to the following tables are recorded in the update set.

The following tables are now update set enabled and also extend the application file:

- Assessment Metric Templates (asmt_template)
- Assessment Template Definitions (asmt_template_definition)
- Assessment Metric Definitions (asmt_metric_definition): survey question answer options
- Schedule (sys_trigger): scheduled jobs associated with the survey
- Assessment Metric Categories (asmt_metric_category): survey categories
- Assessment Metrics (asmt_metric): survey questions
- Assessment Category Users (asmt_m2m_category_user): survey users
- Trigger Conditions (asmt_condition)
Legacy survey migration

Users with the survey_admin role can migrate legacy survey data to create copies of legacy surveys and their related records in assessment tables. The Survey Management application, which is built on the assessment engine, is available as an alternative to legacy surveys.

The following legacy survey components are migrated:
- Survey masters
- Supported survey questions and question choices
- Survey instances
- Survey responses

Legacy survey conditions are not migrated and must be recreated as trigger conditions.

**Note:**
- The Legacy Surveys and Legacy Administration modules are available on instances upgraded from a previous release but not available for new instances. Customers using legacy survey or survey wizard should plan to migrate to the Survey Management application to create modern and high quality surveys for their users.
- The following legacy survey plugins are inactive by default, and are available upon request:
  - Best Practice - Task Survey Management (ID: com.snc.bestpractice.task_survey)
  - Survey Management (ID: com.glideapp.survey)
  - Assessment Components (ID: com.snc.assessment)
  - Survey Wizard (ID: com.glideapp.survey_wizard)
- Survey wizards cannot be migrated.

**Migrate a legacy survey**

Migrate a legacy survey and its related records to take advantage of a more powerful feature set.

Role required: admin or survey_admin

To avoid timing out for very large surveys, you can disable the transaction quota. See Transaction quotas.

1. Navigate to Survey > Legacy Surveys > Masters.
   The list of legacy survey masters appears. By default, the list shows only survey masters that have not been migrated. To show all survey masters, remove the Assessment is empty breadcrumb.
2. Open a survey and click the Migrate to Assessment related link.
   A dialog box describes what happens when you migrate the survey. Note that certain types of survey questions cannot be migrated.
3. Click OK.
   The system generates records on assessment tables based on the survey master, eligible questions and choices, results, and other related survey components. The original survey components are unaffected.
   System messages may appear at the top of the Survey form to notify you of questions that could not be migrated and to advise you to review migrated Multiple Choice questions.
4. Optional: Click the reference icon beside the Assessment field to view the new survey definition.
5. Optional: Remove survey users from the assessment survey if you want all users to be able to take it.
When you migrate a survey, any users who have taken it are automatically associated with the assessment survey and become survey users. When there are survey users associated with an assessment survey, only those users can take it.

6. Deactivate any survey conditions associated with the survey by completing the following steps.
   a) Navigate to **Survey > Legacy Administration > Survey Conditions**.
   b) In the **Active** column, ensure the value is false for any survey conditions that reference the migrated survey.

7. Navigate to **Survey > Administration > Trigger Conditions** to create new trigger conditions for the migrated survey.

The **Migrate to Assessment** related link on the legacy survey record becomes unavailable after the migration. However, if you delete the record referenced in the **Assessment** field, the related link reappears and you can migrate the legacy survey again.

**Survey question migration**

Before you migrate a legacy survey, understand that some legacy survey questions cannot be migrated due to incompatible question types.

Legacy survey questions are migrated from the Survey Question (survey_question_new) table to the Assessment Metric (asmt_metric) table. In legacy surveys, the **Type** field on the Survey Question table determines how the question renders on the survey questionnaire. In assessment surveys, the **Data type** field on the Assessment Metric table serves a similar purpose. Certain legacy survey types are not supported in assessment surveys.

The following table shows the conversion path for each legacy survey question type to an assessment data type, if there is one.

<table>
<thead>
<tr>
<th>Legacy survey type</th>
<th>Assessment data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Break</td>
<td>Not available</td>

<td>Yes / No</td>
</tr>
</tbody>
</table>

**Migrated components**

When you migrate a survey, the system maps records from survey tables to assessment tables.

To create a functional survey on the assessment framework, the system converts survey records to the most logical equivalent assessment survey records. This may mean multiple assessment survey records represent one legacy survey record.

**Migrated components**

<table>
<thead>
<tr>
<th>Survey component</th>
<th>Assessment survey components</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey master (survey_master)</td>
<td>• Survey definition (asmt_metric_type)</td>
</tr>
<tr>
<td></td>
<td>• Assessable record (asmt_assessable_record), for system use only</td>
</tr>
<tr>
<td></td>
<td>• Survey category (asmt_metric_category)</td>
</tr>
<tr>
<td>Survey question (survey_question_new)</td>
<td>• Survey question (asmt_metric)</td>
</tr>
<tr>
<td>Question choice (question_choice)</td>
<td>• Assessment metric definition (asmt_metric_definition)</td>
</tr>
<tr>
<td>Survey instance (survey_instance)</td>
<td>• Assessment group (asmt_assessment), for system use only</td>
</tr>
<tr>
<td></td>
<td>• Survey instance (asmt_assessment_instance)</td>
</tr>
<tr>
<td>Survey response (survey_response)</td>
<td>• Survey instance question (asmt_assessment_instance_question)</td>
</tr>
<tr>
<td></td>
<td>• Survey response (asmt_metric_result)</td>
</tr>
<tr>
<td></td>
<td>• Category result (asmt_category_result), for system use only</td>
</tr>
</tbody>
</table>

**Migrated question review**

To maintain accurate result calculations, you may need to make minor adjustments to some of the migrated survey records to ensure results are calculated correctly.

**Note:** The assessment engine provides a built-in result calculation feature that converts each survey response to a score between 0 and 10. The configuration required to maintain accurate result calculations is advanced and is not recommended for basic survey implementations. If you do not plan to use result calculation data, ignore the information in this section.

For each legacy question migrated, the system creates a survey question record on the Assessment Metric (asmt_metric) table. For legacy questions of the Multiple Choice and Select
Box types, the system also creates a metric definition record, on the Assessment Metric Definition (asmt_metric_definition) table, for each legacy question choice.

Comparable metric definitions and survey question choices

<table>
<thead>
<tr>
<th>Survey question choice field</th>
<th>Related metric definition field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text</td>
<td>Display</td>
</tr>
<tr>
<td>Value (can be any string value)</td>
<td>Value (must be a numerical value)</td>
</tr>
<tr>
<td>Order</td>
<td>Value (metric definition with smallest Value is first)</td>
</tr>
</tbody>
</table>

When the system migrates legacy survey question choices, it uses the legacy Order to set each metric definition Value. For the legacy question choice with the smallest Order, the corresponding metric definition Value is set to 1. For the legacy question choice with the next smallest Order, the metric definition Value is 2, and so on.

The Scale definition field on the migrated Survey Question form determines whether smaller or bigger metric definition values equate to a good score in survey result calculations. By default, the scale definition is set to High, meaning bigger values are good. When you migrate a legacy survey, check that the default scale definition makes sense for each question.

For example, the following tables depict a sample migrated question and the metric definitions automatically created for it. Recall that the system uses the order of the legacy survey question choices to set the metric definition value. Excellent has the lowest Order value, so when the system creates a metric definition for this question choice, the Value is set to 1. In this case the default scale definition value, High, does not make sense, as the system will calculate the worst scores for responses of Excellent.

Legacy question: Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Question choice text</th>
<th>Question choice value</th>
<th>Question choice order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>A</td>
<td>100</td>
</tr>
<tr>
<td>Good</td>
<td>B</td>
<td>200</td>
</tr>
<tr>
<td>Fair</td>
<td>C</td>
<td>300</td>
</tr>
<tr>
<td>Poor</td>
<td>D</td>
<td>400</td>
</tr>
</tbody>
</table>

Migrated question: Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Metric definition display</th>
<th>Metric definition value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>1</td>
</tr>
<tr>
<td>Good</td>
<td>2</td>
</tr>
<tr>
<td>Fair</td>
<td>3</td>
</tr>
<tr>
<td>Poor</td>
<td>4</td>
</tr>
</tbody>
</table>

If there are no Order values for the legacy survey question choices, the system sets each corresponding metric definition Value based on the alphanumeric order of the legacy Text value.
Migrated question: Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Metric definition display</th>
<th>Metric definition value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>1</td>
</tr>
<tr>
<td>Good</td>
<td>2</td>
</tr>
<tr>
<td>Fair</td>
<td>3</td>
</tr>
<tr>
<td>Poor</td>
<td>4</td>
</tr>
</tbody>
</table>

You may also need to change the Scale definition setting for other migrated questions. For details, see the scale definition recommendations for each survey question data type.

**Quizzes**

Quizzes are questionnaires you can assign to one or more users to assess their knowledge of any subject. The quiz functionality is built on the assessment engine and provides many of the same features as assessments and surveys.

Each question is scored, and the overall score indicates the percentage of questions the user answered correctly. A quiz may have categories of questions that are assigned only to some users. You can assign weighting values to individual questions or categories of questions that make them more or less important when calculating the overall score. Quizzes require activation by a system administrator.

- An administrator can create a quiz for any purpose and assign it to a single user or multiple users.
- A quiz can contain one or more categories of questions. Each category can be assigned to users who answer only the questions in that category.
- The system can send email notifications to these users:
  - Recipients: The recipient can receive notification of an assigned quiz, a quiz whose allowed duration is at 50%, and a quiz that is overdue.
  - Recipient's manager: The recipient's manager can receive notification when a quiz is overdue.
  - Quiz manager: The quiz manager can receive notification of an overdue quiz to which he or she is assigned.
- Quizzes can contain questions that are scored or not scored. Unscored questions assess opinions or involve dates and are not counted in the final score. Scored questions specify correct answers and are scored either as 0% or 100%. You can apply a weighting scale to scored questions to establish their relative importance. You can designate questions with these data types as scored questions:
  - Checkbox
  - Choice
  - Duration
  - Likert Scale
  - Numeric Scale
  - Template
  - Yes/No
- A quiz question can be dependent on the response to any scored question. For example, you can create a dependent question requesting additional information that appears only if a recipient answers No to a specific question.
Important terms

The quiz application involves several terms.

Terms used in quiz application

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quizzes</td>
<td>A quiz contains information such as duration, state, and notification controls and lists the existing categories. Text fields on the quiz form allow an administrator to create introductory content and end notes that are displayed to the recipient.</td>
</tr>
<tr>
<td>Categories</td>
<td>A quiz category represents a theme for quiz questions. Each category contains one or more questions and names the recipients for the questions in that category. By default, the system creates one category with the same name as the quiz. You can create additional categories as needed. Categories can be weighted higher or lower to determine the importance of that category in the overall score.</td>
</tr>
<tr>
<td>Questions</td>
<td>A quiz question is a question configured for a category and sent only to the users for that category. Questions have a wide variety of data types and can be individually weighted higher or lower. Questions may be scored or unscored.</td>
</tr>
<tr>
<td>Category user</td>
<td>A category user is the recipient of questions for a specific category. You can select different users to answer the questions for each category.</td>
</tr>
<tr>
<td>Templates</td>
<td>A template is a question data type that provides reusable rating scales for answers to questions. For example, the answer template named Satisfaction contains a satisfaction scale ranging from Very Satisfied to Very Dissatisfied.</td>
</tr>
</tbody>
</table>

Quiz roles

The Quizzes application uses these roles. No role is required to take quizzes that are assigned to you.

Quiz roles

<table>
<thead>
<tr>
<th>Role Title (Name)</th>
<th>Role Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>assessment administrator (assessment_admin)</td>
<td>Can administer the Assessments application and all quiz records. Can access all the modules of the Assessments application.</td>
</tr>
</tbody>
</table>

Note: The itil_admin role and the survey_admin role contain the assessment_admin role.
<table>
<thead>
<tr>
<th>Role Title (Name)</th>
<th>Role Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrator (admin)</td>
<td>Can access all aspects of the assessment and survey processes. Only administrators can modify survey notifications, create survey modules, and import surveys.</td>
</tr>
</tbody>
</table>

Set up and administer quizzes

Set up and administer quizzes.

Role required: assessment_admin or admin

1. Optional: Create reusable question templates for quizzes.
2. Create the quiz using the Quiz Designer or with forms accessed from the navigation menu.
   The quiz record includes specifics such as duration, notification preferences, a questionnaire introduction, and ending notes displayed to recipients.
3. Edit the default category or create additional categories as needed.
   The system creates a category with the same name as the quiz.
4. Define users for each category.
   These are the recipients who answer the questions in a category. You can define different users for each category.
5. Create the questions for each category.
6. Create the answers for each question and determine if the questions are scored.
   You can create unique answers or select preconfigured answers from a template.

Publish and distribute the quiz. You can send the quiz to a single user or all users in each category.

Review the results from the submitted quizzes in reports and scorecards.

Activate the quiz designer

Administrators can activate the Quiz Designer plugin.

Role required: assessment_admin or admin

1. Navigate to System Definition > Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   If the plugin depends on other plugins, these plugins are listed along with their activation status.
   If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. Optional: If available, select the Load demo data check box.
   Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
   You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.
5. Click Activate.

**Quiz Overview module**

The Quiz Overview module is a homepage that displays various reports on data such as results for each category and quizzes that are complete, pending, or in progress.

Role required: assessment_admin or admin

Users with the assessment_admin role can view the overview page and refresh, add, delete, and rearrange widgets.

1. Navigate to Quizzes > Overview.
2. Click elements within reports to obtain more information. The available reports are:

<table>
<thead>
<tr>
<th>Report</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quizzes by State</td>
<td>Assessment Instance (asmt_assessment_instance)</td>
</tr>
<tr>
<td>Total Questions by Quiz</td>
<td>Assessment Metric (asmt_metric)</td>
</tr>
<tr>
<td>Questions by Data Type</td>
<td>Assessment Metric (asmt_metric)</td>
</tr>
<tr>
<td>Correct Answers by Assigned User</td>
<td>Metric Results (asmt_metric_result)</td>
</tr>
<tr>
<td>Number of Correct Answers</td>
<td>Metric Results (asmt_metric_result)</td>
</tr>
<tr>
<td>Incorrect Answers by Assigned User</td>
<td>Metric Results (asmt_metric_result)</td>
</tr>
<tr>
<td>Number of Incorrect Answers</td>
<td>Metric Results (asmt_metric_result)</td>
</tr>
</tbody>
</table>

**Quiz designer**

The quiz designer provides a single interface that users with the assessment_admin role can use to create, edit, and distribute quizzes.

You can also use it to edit existing quizzes and change scoring parameters.

Alternatively, you can use the modules of the assessment engine to create and edit the records that make up a quiz. All quiz records are stored in assessment tables and displayed in Quiz views of those tables. For details, see [Create quizzes with forms](#).

**Tools on the Quiz Designer**

The quiz designer includes a design canvas, a header bar, and many controls that you can use to create quizzes.

To open the quiz designer, navigate to Quizzes > Quiz Designer.

The designer contains the following elements:

- Controls
- Header bar
- Design canvas

**Controls**

Controls for the supported question data types are available in the Controls palette. Drag and drop a control onto the designer canvas to create a question of that type.
**Question controls**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Description</th>
<th>Scored</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attachment</td>
<td>Question with a Manage Attachments icon that allows users to attach one or more files.</td>

<td>Question with a check box or a Yes/No list for user responses.</td>
<td></td>
</tr>
<tr>
<td>Data type</td>
<td>Description</td>
<td>Scored</td>
</tr>
<tr>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
<td>--------</td>
</tr>
<tr>
<td>Choice</td>
<td>List of predefined options. For more information, see the definition for Choices Create quiz questions. Multiple correct answers are supported.</td>
<td>Y</td>
</tr>
<tr>
<td>Date</td>
<td>Date field.</td>
<td>N</td>
</tr>
<tr>
<td>Date/Time</td>
<td>Date and time field.</td>
<td>N</td>
</tr>
<tr>
<td>Number</td>
<td>Number field with predefined minimum and maximum values. The default is 1-10.</td>
<td>N</td>
</tr>
<tr>
<td>Percentage</td>
<td>Percentage field with a prescribed range.</td>
<td>N</td>
</tr>
<tr>
<td>Scale</td>
<td>Predefined Likert scale. Answer options appear as radio buttons. Multiple correct answers are supported.</td>
<td>Y</td>
</tr>
<tr>
<td>Numeric Scale</td>
<td>Selectable number scale. The default is 1-5. Answer options appear as radio buttons. Multiple correct answers are supported.</td>
<td>Y</td>
</tr>
<tr>
<td>Image Scale</td>
<td>Predefined set of images. Five emojis similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Multiple correct answers are supported.</td>
<td>Y</td>
</tr>
<tr>
<td>String</td>
<td>Single or multiline text field.</td>
<td>N</td>
</tr>
<tr>
<td>Template</td>
<td>Choice list of templates that provide a predefined scale of options. For details, see Configure a template question. Multiple correct answers are supported.</td>
<td>Y</td>
</tr>
<tr>
<td>Reference</td>
<td>Choice list of fields from a specified reference table. This data type does not support reference qualifiers.</td>
<td></td>
</tr>
</tbody>
</table>

**Header Bar**

The header bar contains tabs that display different views and a menu of various functions.

Click one of the following tabs to change the view in the canvas:

- **Design**: Add categories and questions, and configure the properties of each. This is the default view of the canvas when you open the designer.
- **Configuration**: Create introductions and end notes for quizzes, and select a signature.
- **Availability**: Select the recipients for each category in the quiz.
Point to the menu icon ( dụng cụ) in the upper right of the quiz designer to select the following options:

- **Save**: Saves the current quiz.
- **Preview**: Displays a preview of the quiz as it appears to the recipients.
- **Publish**: Distributes the quiz to the selected recipients.
- **Save and Publish**: Saves and distributes the quiz in one step.
- **New Quiz**: Opens a fresh canvas for a new quiz.
- **Load Quiz**: Opens a list of existing quizzes that you can select and edit.

The availability of each option depends on the status of the quiz that is opened in the quiz designer.

**Design Canvas**

New quizzes open in the Design view. The quiz Name field appears above first category in the canvas. A blank question field appears in the category container.

**Create a quiz**

When you create a quiz, you can create one or more categories and then add questions to each category.

Role required: assessment_admin or admin

Each category can be assigned to a different user or the same users. You can also customize each question and make it dependent on the response to another question.

Create a quiz using these procedures:

**Create quiz categories**

A category represents a theme for evaluating a specific element of the quiz topic and contains questions pertaining to that theme.

Role required: assessment_admin or admin

When you create a quiz, the system creates a default category, using the name of the quiz. You can use this category, modify it, or create additional categories as needed. To have any results, a category must contain scored questions.

1. Navigate either **Quizzes > Quiz Designer** or **Quizzes > Quizzes** and click **Quiz Designer** in the list header.
2. Enter the name of the quiz in the Name field. The system uses this name as the name of the quiz and the first category.
3. To configure the category, click the gear icon in its title bar.
   - The Properties dialog box appears. You can change the name of the category, add a description for it, and enter text in the Details field that introduces or explains the category to the recipients. The system updates the category as you type.
4. Click the X icon to close the category properties dialog box and save your settings.
5. To add a new category, click the + icon in the title bar of an existing category.

Create quiz questions
You can create multiple questions for each category but each question can be associated with only one category.

Role required: assessment_admin or admin
The data type that you select for each question determines how it can be answered by quiz recipients.

You can designate questions to be scored. Only scored questions are shown in the quiz results and considered when calculating the category results. You must also specify a correct answer for scored questions.

Note:
To designate a question as scored, you must use Assessment forms. For instructions, see Configure a scored question.

1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.
2. To configure the question, click in the gear icon in its title bar. The Properties dialog box appears for the question.
3. Fill in the fields on the form, as appropriate.

**Question property fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>(Required) Name of the question. Create a concise and easily recognizable name for your question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as the question on quizzes. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Type</td>
<td>(Read-only) Data type selected for this question. See the table in controls for possible data types.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this question is available on a quiz. If a question is marked inactive, it does not appear on quizzes generated after the question becomes inactive.</td>
</tr>
<tr>
<td>Boolean option</td>
<td>Whether a check box or a Yes/No list appears as the option for the Boolean question.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box for requiring users to answer the question. Users cannot submit quizzes until they answer all mandatory questions, which are denoted by a red field status indicator. This field is available when the question does not have a dependency and the question controls is not Boolean with a check box option.</td>
</tr>
<tr>
<td>String option</td>
<td>Setting for the appearance of a string field in a question. This field is available when the question type is String. The string options are:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Single line</strong>: Single line text field 40 characters in length that allows strings of any length.</td>
</tr>
<tr>
<td></td>
<td>- <strong>String line wide</strong>: Full page width text field that allows a single line entry of any length.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Multiline</strong>: Full page width multi-line text field that allows word wrap and returns.</td>
</tr>
<tr>
<td>Min</td>
<td>Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.</td>
</tr>
<tr>
<td>Max</td>
<td>Highest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box for including <strong>Not Applicable</strong> as an option for this question. Users can select <strong>Not Applicable</strong> if they do not have sufficient information to respond to a question. User responses of <strong>Not Applicable</strong> are excluded from results calculations. This field is available when the question does not have a dependency and the question <strong>data type</strong> is not <strong>Boolean</strong> with a check box option.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box for displaying answer options in a random order whenever the question appears in a quiz. Answer preference is sometimes influenced by the order in which options appear, which can result in biased results. Randomizing options can help prevent this bias. <strong>Note:</strong> Randomizing options for certain questions may make those questions confusing for users. In general, only randomize options that do not follow a logical order.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question that is displayed on the quiz. Include details that help users understand how to answer the question. You can also enter HTML text in this field with the WYSIWYG editor. For example, include HTML to embed links and images.</td>
</tr>
<tr>
<td>Correct answer</td>
<td>Answer option that you want to be selected by users. When you specify a correct answer for a question, the system scores the question. This field is available for all data types except <strong>Date</strong>, <strong>Date/Time</strong>, and <strong>String</strong>. Multiple correct answers are supported for a few data types. See <a href="#">data type</a>.</td>
</tr>
<tr>
<td>Choices</td>
<td>Options for a question with a data type of <strong>Choice</strong> or <strong>Scale</strong>. The system automatically adds text and values that you can edit for each option. Click the + icon to add an option, or click the X icon to delete an option. By default, the system arranges options in the order established by their values. To change the order, drag and drop the options.</td>
</tr>
<tr>
<td>Dependency</td>
<td></td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Displayed when</td>
<td>Condition builder that hides or displays the question depending on the answer to another question in the same category. Select an existing question from the list with a data type of Boolean, Choice, Scale, or Template. Create the condition that must exist for recipients to see the dependent question, using the is or is one of operator. The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.</td>
</tr>
</tbody>
</table>

4. To create any special conditions that must be met for a question to appear on the quiz, click the Dependency tab. Fill in the fields, as appropriate.

Dependent questions appear on the quiz when a recipient selects a specific answer or combination of answers to another question in the same category.

5. Select a question in the Displayed when field. The system selects the appropriate operator and displays the possible answers for the selected question.

6. Select the answers that satisfy the condition. Selected answers are indicated by a check mark.

7. Click X to close the question properties dialog box and save your settings.

8. To add a question with the same data type as an existing question in the category, click the + in the title bar of the existing question.
9. Drag questions to change their order within a category or move them between categories.
10. To delete a question, click the X in its title bar.

Configure a template question
You can configure template questions when designing quizzes.

Role required: assessment_admin or admin

1. Drag the Template data type icon into a category container.
2. Click the gear icon in the question title bar to open the template properties dialog box.
3. Select a predefined scale from the list.

   ![Template Properties Dialog Box](image)

   Question entry fields appear for that template.

4. Enter one or more questions that are appropriate for the template.
5. Click the arrow to the right of a question to configure its properties. You must provide a name for each question.
6. Click the up or down arrow to move between questions, or click the back arrow to return to the template properties dialog box.
7. Configure the properties for the remaining questions.
8. Click the X icon to close the template properties dialog box and save your settings.

**Configure a scored question**

Only scored questions are considered when calculating category and quiz results.

Role required: assessment_admin or admin

A question must have a correct answer specified to be scored. Only results for scored questions are displayed in the quiz scorecard.

1. Navigate to Quizzes > Quizzes.
2. Open the quiz containing the questions you want to mark as scored.
3. In the Metric Categories related list on the Assessment Metric Type form, select the category for the questions you want to mark as scored.
4. In the Assessment Metrics related list on the Metric Category form, select a question from the list.
5. In the Question Type section of the Assessment Metric form, select the Scored check box.
This check box is not available if the question’s data type is not supported for scoring.

6. Select the **Correct answer** for the question.

   **Note:** Multiple correct answers are supported for a few data types. See *Data types for quizzes*.

7. Click **Update**.

8. Repeat the process for all the questions in the category that you want the system to score.

9. Return to the list of metric categories, select another category, and configure scoring for the appropriate questions in that category.

**Configure a quiz**

You can configure an entire quiz.

Role required: assessment_admin or admin

The values you enter and select on this page are applied to the entire quiz.

In the quiz designer, click **Configuration** and then fill in the fields as described in the table.

**Quiz designer configuration**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check box for enabling the distribution of this quiz to recipients.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of this configuration or the quiz to which it is attached.</td>
</tr>
<tr>
<td>Introduction</td>
<td>Introductory content to display on quizzes. You can add a welcome message or background information about the quiz.</td>
</tr>
<tr>
<td>Signature</td>
<td>(Optional) Acknowledgement by a quiz recipient of requirements, admonitions, or expectations related to a quiz.</td>
</tr>
<tr>
<td>Return URL</td>
<td>Destination address of a web page that is presented to users after they submit a completed quiz. When a return URL is configured, the <em>End note</em> content does not appear.</td>
</tr>
<tr>
<td>End note</td>
<td>Content that is displayed to recipients after they submit a completed quiz. You can add a thank you message, follow-up instructions, or other applicable information. End notes are not displayed if a Return URL is specified.</td>
</tr>
<tr>
<td>Duration</td>
<td>Amount of time that recipients are given to complete this quiz, starting from the time that the quiz is generated. The default duration is 14 days.</td>
</tr>
<tr>
<td>Manager</td>
<td>Assessment manager for this quiz. These users are only responsible for managing the quiz process and not the results. The system notifies the manager when submissions for this quiz are past due.</td>
</tr>
</tbody>
</table>
### Select a quiz recipient

When the system distributes a quiz, it sends email notifications to the category users and their managers.

**Role required:** assessment_admin or admin

A category can have one or more assigned users, and the same user can be assigned to more than one category.

The system also creates a link to the quiz in the recipients' My Assessments & Surveys portal. Users can only answer questions in the categories that they are assigned to.

To select the recipients for each quiz category, click **Availability** and then fill in the fields as described in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notify manager if overdue</td>
<td>Check box for sending email notifications to a recipient's manager when that user fails to submit an assigned quiz before the due date.</td>
</tr>
</tbody>
</table>

### Publish a quiz

When you publish a quiz, the system sends email notifications to the recipients and to their managers. A card in each recipient's My Assessments & Surveys portal displays a link to the quiz.

**Role required:** assessment_admin or admin

1. If you want to see the quiz as the recipients will see it, point to the menu icon in the upper right of the quiz designer and click **Preview**.
2. When you are satisfied with the quiz, click **Save and Publish** or **Publish** to distribute it.

### Copy a quiz

Create a copy of a quiz with at least one category to reduce the effort of creating another quiz with similar data.

**Role required:** assessment_admin or admin

All associated questions (type), configurations, categories, metrics, domain separation rules, and role-based categories are copied. Assigned users, category users, instances, and trigger conditions are not copied.

1. Navigate to Quizzes > Quizzes.
2. Select a quiz.
3. Perform any of the following steps:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Platform</td>
<td>In the title bar, click <strong>Copy</strong>.</td>
</tr>
</tbody>
</table>
### ServiceNow

#### Kingston

#### Now Platform Capabilities

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Platform</td>
<td>In the title bar, select <strong>Copy</strong> from the context menu.</td>
</tr>
</tbody>
</table>
| From quiz designer   | 1. In the title bar, click **Quiz Designer**.  
                          2. In the Quiz Designer title bar, point to the menu icon on the header bar and click **Copy Quiz**. |

---

**Edit a quiz**

You can update a quiz after the quiz has been distributed.

Role required: assessment_admin or admin

- Questions that you add are available only on quizzes that are distributed after the update.
- Before a quiz is submitted or during the **retake period**:  
  - Changes to existing questions are immediately available to users. This includes changes to the answers, such as additional choices or changes to the data type.  
  - Deleted questions are deleted from distributed quizzes in users’ queues.

Open the quiz: Group the Service Details form with one of the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quizzes &gt; Quiz Designer</td>
<td>Point to the menu icon in the quiz header bar and select <strong>Load Quiz</strong>.</td>
</tr>
<tr>
<td>Quizzes &gt; Quizzes</td>
<td>Right-click a quiz in the list and select <strong>Quiz Designer</strong>.</td>
</tr>
<tr>
<td>Quizzes &gt; Quizzes</td>
<td>Open a quiz from the list and click <strong>Quiz Designer</strong> in the header of the Assessment Metric Type form.</td>
</tr>
</tbody>
</table>

---

**Enable a quiz retake**

You can configure a quiz to allow recipients to resubmit their answers as many times as they like, until the quiz’s due date.

Role required: assessment_admin or admin

Results are not calculated until the quiz’s configured duration has elapsed. The card in the user’s queue remains visible until the quiz’s due date and displays a button to allow retakes.

1. Navigate to **Assessments > Metric Definition > Types**.
2. Remove the **Evaluation method = Assessment** filter condition so you can see all the records in the list.
3. Open the quiz.
4. In the **Assessment Metric Type** form, select the **Allow retake** check box and save the record.

---

**View a quiz result**

You can view quiz results for each question and category, or view the quiz scorecard for a detailed breakdown.

Role required: assessment_admin or admin
Quiz results are stored in the Metric Result (asmt_metric_result) table and display recipients' answers to each question in a category.

Navigate to **Quizzes > Quiz Results**.

View a quiz designer scorecard
The quiz scorecard opens in the Category Results view.

For detailed information about scorecards, see [Quiz Scorecards](#).

1. Navigate to **Quizzes > Quizzes**.
2. Open the quiz whose results you want to view.
3. Under **Related Links**, select **View Scorecard**.
   - The scorecard for the selected quiz opens in the Category Results view.
4. Select a category to view from the choice list above the chart.
View a quiz category result
Category results are stored in the Assessment Category Result (asmt_category_result) table and display the overall ratings for each category based on the weighted value for each scored question.

1. To view category results, navigate to Quizzes > Category Results.

![Assessment Category Results Image]

2. The system calculates results from the weight configured for each category. Weights are set to a value of 10 by default but can be changed. To edit a category’s weight:

3. Navigate to Quizzes > Categories, and select a category from the list.

4. In the Metric Category form, edit the default value in the Weight field.

5. Click Update.

Note: You can also edit the weight of a question in the Quiz view of the Assessment Metric form.

Take a quiz
All available quizzes assigned to you appear in your personal assessment and survey queue. When you submit a quiz, the system stores your responses. If a quiz allows retakes, you can resubmit it as many times as you like until its due date.

Role required: none
No special role is required to complete a quiz, but you must be logged in and the quiz must be assigned to you.

If configured to send email, the system sends you a notification when a quiz is assigned to you. The message contains a link to the quiz and instructions for viewing the assessment and survey queue.

Each quiz assigned to you appears in your assessment and survey queue as a card that contains information about the quiz, including a launch button. Overdue quizzes are marked with a red icon and red due date.

You must answer every required question, indicated by a red star, before you can submit the quiz. If you start to take a quiz but cannot complete it, save your responses and return to it later. When you have answered all the questions and are satisfied with the responses, submit the quiz.

By default, you cannot modify your answers to a quiz after submission. However, if the administrator has configured this quiz to allow retakes, the quiz remains in your queue after you
finish it and the card shows a Modify Quiz button. You can retake the quiz as many times as you like before the due date.

1. Navigate to **Self-Service > My Assessments & Surveys**.
2. Click **Take Quiz** on a quiz card to open the questionnaire. If there is more than one quiz category, you can click the collapse or expand icon to hide or show the questions in the category.
3. Answer each question to the best of your ability. If you are unsure of how to respond to a question or if a question does not apply to you, select Not Applicable, if that choice is available.
4. Click **Save** at any time to save your responses without submitting them. You can reopen the quiz from your queue when you are ready to work on it again.
5. When you are ready to submit the completed quiz, read any assertions that require your attention.
6. If present, select the check box to acknowledge the assertion. If your full name is displayed, you are required to provide authentication to acknowledge the assertion after you submit the quiz.
7. Click **Submit**.
8. If prompted, enter your user name and password to verify your signature. If you provided valid answers for all mandatory questions, a success message appears, displaying any end note that was configured. If the quiz allows retakes, the card remains in your queue with a **Modify Quiz** button after submission. If retakes are not permitted, the card disappears from your queue.
9. If the system displays an error message indicating that a question has an invalid response or must still be answered, correct the error and resubmit the quiz.
10. To edit your answers and resubmit a quiz that permits retakes, click **Modify Quiz**. You can modify your responses to the quiz until its due date.

**View a quiz instance**

View an instance to verify that quiz instances were created, to check the state of a quiz instance, or to reassign a quiz instance. A quiz instance represents one questionnaire assigned to one user.

Role required: admin or assessment_admin

1. Navigate to **Quizzes > Quiz Instances**.

The following submodules are available based on the state of the instances:

- **Ready to take**: Displays quiz instances that the user can take. By default, these instances are sorted in ascending order by the **Number** field.
- **In progress**: Displays quiz instances that are in progress. By default, these instances are sorted in ascending order by the **Number** field.
- **Completed**: Displays quiz instances that are complete. By default, these instances are sorted in descending order by the **Taken on** field.
- **Cancelled**: Displays quiz instances that are canceled. By default, these instances are sorted in ascending order by the **Number** field.
- **All**: Displays quiz instances in all states. By default, these instances are sorted in ascending order by the **Number** field.

2. From the required submodule, click a quiz instance.

**Note**: When you select an instance in the **Completed** submodule, you are redirected to the User’s Response page.
3. In the form, fill the fields. By default, the following fields are displayed for all submodules other than the Completed submodule.

**Quiz instance form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Automatically generated record number.</td>
</tr>
<tr>
<td>Metric type</td>
<td>Metric type of this quiz.</td>
</tr>
<tr>
<td>Due Date</td>
<td>Date by which the quiz instance should be completed.</td>
</tr>
<tr>
<td></td>
<td>The system populates the due date based on the Assessment duration of the</td>
</tr>
<tr>
<td></td>
<td>associated quiz definition, which is set to 14 days by default.</td>
</tr>
<tr>
<td></td>
<td>The quiz due date is not enforced in the base system. If you want to</td>
</tr>
<tr>
<td></td>
<td>enforce the due date, consider using a workflow or other mechanism to send</td>
</tr>
<tr>
<td></td>
<td>survey recipients reminders when a survey is overdue.</td>
</tr>
<tr>
<td>State</td>
<td>State of the quiz.</td>

<tr>
<td>Assigned to</td>
<td>User that the quiz instance is assigned to. This field becomes read-only</td>
</tr>
<tr>
<td></td>
<td>when the state is In progress, Complete, or Canceled.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain associated with the instance.</td>
</tr>
<tr>
<td>Related Link</td>
<td>Shows a read-only version of the survey responses completed by the user.</td>
</tr>
<tr>
<td>Assessment Instance Questions</td>
<td>All instance question records that store user response values for each question on the quiz questionnaire. The following columns are relevant to quiz:</td>
</tr>
<tr>
<td></td>
<td>• Category: Displays the quiz categories the questions belong to.</td>
</tr>
<tr>
<td></td>
<td>• Metric: Displays the quiz questions.</td>
</tr>
</tbody>
</table>

**Note:** By default, the system runs the Cancel Expired Assessments script every 30 days to cancel expired survey, assessment, and quiz instances that are in the Work in progress or Ready to take states.

**Quiz scorecards**

The Quizzes application prepares printable scorecards. A scorecard analyzes category and question responses and compares current ratings with previous ratings. You can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages for the time range selected.
The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed quizzes.

**Category results**

The Category Results view is a stacked bar chart of responses to all questions in a category. Select the category to display from the choice list above the chart. Category results are only calculated for **scored questions**.

This view displays responses that use the following **data types**:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

**Note:** The **Checkbox** and **Yes/No** data types are combined into the **Boolean** data type in the **Quiz designer**.
To view details about a specific response to a question, point to the colored segment representing a specific response. The chart displays the count for those responses and the percentage it represents of the total responses to that question.

**Quiz category result details**

**Question results**

The Question Results view shows the results for all questions in a quiz.
Select a question by name from the choice list to display the results in a pie chart or a bar chart, based on the data type.

**Pie chart**

The pie chart shows question results for these [data types]:
- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

**Note:** The **Checkbox** and **Yes/No** data types are combined into the **Boolean** data type in the **Quiz designer**.
Quiz scorecard question results - pie chart
Bar chart

A bar chart appears when question results use this data type:

- Percentage

By default, all results for percentage questions use a report range of 20% segments. To configure a report range, navigate to Reports > Administration > Report Ranges.

Average ratings

The Average Ratings view displays a bar chart of the weighted average rating for each question in a category.

Use this view to learn how individual questions affect the overall rating for the category. Select a category from the second choice list above the chart. Ratings are only calculated for scored questions.
Average Ratings view

To view the effect of each question’s ratings on the entire category’s ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question’s weighted average.
Quiz reports

Quizzes provide several global reports so that assessment administrators can view important statistics.

You can share these reports with specific users or groups and change the display options.

For detailed field information and reporting options, click the link for the chart **Type**. To sort a column in ascending or descending order, click the arrow in the column heading.

### Quiz reports

<table>

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
### Wizards

The Wizards functionality, which enabled administrators to create wizards that provide a step-by-step sequence of dialog boxes that lead the user through a procedure, was deprecated in the Eureka release. However, some users are still able to access this functionality if they enabled its plugin in previous releases.

For more information about this functionality, see [https://docs.servicenow.com/bundle/archive/page/archive/fuji-archive.html](https://docs.servicenow.com/bundle/archive/page/archive/fuji-archive.html).

### Self-service

The Self-Service application gives supported end users a clean, simple front end to their IT support organization.

By default, the Self-Service application provides access to common actions, such as viewing your homepage, accessing the Service Catalog, viewing knowledge articles, working with incidents, and taking surveys.

### Service catalog requests

This page contains links to content on service catalog requests.

### Add new request items

Use ServiceNow's web-based interface to add new items to a request.

Roles required: Only an administrator or a user with the catalog_admin role can add a new item to a submitted request.

Modifying a request does not resubmit it to the approval process.

1. Navigate to **Service Catalog > Open Records > Requests** and open an existing request.
2. Click **Add New Item**.
3. In the dialog box that appears, choose an item and a quantity to add.
4. Click **OK**.
Amazon EC2 instance request from the Service Catalog

Users can request the provisioning and deletion of virtual computers (Linux or Windows) in the Amazon EC2 virtual computing environment through the ServiceNow Service Catalog. The Amazon EC2 offering requires the purchase and activation of ServiceNow Orchestration Automaton.

Request an instance

Request the provisioning of a new Amazon EC2 instance through the service catalog.

1. Navigate to Self-Service > Service Catalog.
2. Select Amazon EC2 Instance from the Request Application Infrastructure category.

3. Select the operating system, the type of instance (Large or Small), and the number of instances requested.
   See the specifications for Large and Small instances in Amazon EC2 Instance Types.
4. Type a reason for the request.
EC2 Service Catalog

5. Click **Order Now** to order the instance.

The Order Status form appears, summarizing the request. A status bar tracks the progress of the approval and provisioning of the EC2 instance.
Upon successful creation of the instance, you receive an email containing the instance ID, IP address, and the public DNS for the instances created.

**Terminate an instance**

Shut down an Amazon EC2 instance through the service catalog.

1. Navigate to **Service Catalog > Routine Changes > Terminate Amazon EC2 Instance**.
   - A list appears displaying the instances that are assigned to you.
2. Select an instance from the list and click **Order**.
   - This list does not support multi-line selection, and there is no **undo** feature.

**Check-out redirect property**

A property called One-step checkout redirect (glide.vm.checkout_redirect) controls the view presented to virtual machine requesters in the service catalog.

By default, this property is set to **false**, which redirects the view to the Order Status form when the requester clicks **Order Now**. When this property is set to **true**, ServiceNow redirects the requester to his or her My Virtual Assets portal. This property is located in **Cloud Management > Administration > Properties**.

**Delete request items**

Use ServiceNow's web-based interface to delete items from a request.

All users can delete items from their own requests any time prior to delivery. Modifying a request does not resubmit it to the approval process.

1. Navigate to **Service Catalog > Open Records > Requests** and open an existing request.
2. In the **Requested Items** related list, select the check box beside the item to delete.
3. In the **Actions** choice list, select Delete.
   ServiceNow recalculates the price and delivery date for the order.

### Place a request

Use ServiceNow's web-based interface for ordering predefined goods and services.

1. Navigate to **Self-Service > Service Catalog**.
   The default catalog view organizes items in categories and subcategories.
2. Select an item to order.

Note: Some items are order guides, which combine related items for easier ordering. For example, an order guide called New Employee Hire presents a list of items that new employees typically receive (desk, phone, computer, email account). After you select...
the items you want to order, the order guide requests the information required and shows a separate time to delivery for each item ordered.

The order screen requests any additional information that’s needed, such as the requester’s name or location and the date the item is needed. It also displays the item’s delivery time after approval.

Delivery time

3. Enter complete and accurate information to expedite your order.
4. Order any other items required.
5. Click **Order Now** when the order is complete.

ServiceNow displays a confirmation screen for your order:
Order submitted

You can view the order’s progress in the **Stage** column.

**Note:** It may be useful to note the order number for future reference.

ServiceNow automatically notifies the approvers if approval is required and creates work orders to fulfill the order according to your organization’s process. For example, if you order a new notebook computer, the purchasing group might receive a work order to order the computer, and the desktop services group might receive a work order to configure the new computer and deliver it to your office after it arrives.

### Create incidents and change requests from a requested item

You can quickly open an incident or a change request from a requested item. It also maintains a relationship between the requested item, and its associated incidents or change requests.
The administrator must enable the **Create Change** and **Create Incident** UI actions for the Requested Item (sc_req_item) table. The administrator must set the **Active** field to `true` when editing these UI actions.

Role required: itil

1. Navigate to **Self-Service > Requested Items**.
2. Open a requested item.
3. Click the Additional actions menu icon and select **Create Change** or **Create Incident**

**View request status**

Use ServiceNow's web-based interface to view the status of a request.

1. Navigate to **Self-Service > Requested Items**.
2. Click your order number to view details.
3. View the order's progress in the **Stage** field.
4. Check the Backordered field, and if the item is backordered, review comments for information about its return to stock.

Customize homepages

If you are assigned at least one role in the system, you can create a customized homepage that you can see when you log in.

The content on your homepage comes from a variety of sources, such as graphs and charts generated from a report, application modules, a service catalog category, the scrolling news widget, which is the News knowledge category.

1. Navigate to **Self-Service > Homepage**.
2. Add any item to the homepage by clicking the add content icon (+) or the Add content link at the top.

A window will open that lets you select from a number of different homepage items you can add. Some items pertain to specific features and applications, such as CMS content blocks and the Work Management dispatch map. So the list of items varies depending on what is active on your system.

3. Reposition elements on your homepage by dragging and dropping them to a new location.

4. To remove a homepage item, click the (X) on the right side of the item’s header.

Delete custom homepages

You can delete any of your custom homepages if you no longer need them.

1. Click the Delete page link at the bottom of the homepage.

2. Click Ok to confirm the deletion.

How Help the Help Desk identifies devices

Help the Help Desk uses a predefined series of queries to identify and update existing CIs in the CMDB or to create a new CI if no match is found.

These queries attempt to match devices using the three criteria listed here, in this order. Updates to an existing CI require only a single match as the list is evaluated. For example, if a device’s name has changed, but the MAC address is the same, the CI with the matching MAC address is updated.

- Serial number in the `cmdb_ci_computer` table
- MAC address in the `cmdb_ci_network_adapter` table
- Computer name in the `cmdb_ci_computer` table
Note: Discovery Identifiers are incompatible with Help the Help Desk queries.

Script Include

The script include CIIdentifierForHelpDesk provides the logic for updating existing CIs or creating a new CI if no matching device exists in the CMDB. Do not modify this script. Errors introduced into this script can result in update failures or in new CIs being created for every device found.

Running Help the Help Desk

Help the Help Desk is a tool that enables users to populate the CMDB automatically with information about their Windows computer. Help the Help Desk is a small Web application that downloads and runs locally, using a login script to gather information such as serial number, computer name, disk configuration, network configuration, installed software, memory, and much more.

To detect all system software successfully on a 64-bit machine, make sure to run the Help the Help Desk script from a 64-bit browser. A 64-bit browser can detect both 64-bit and 32-bit software, but a 32-bit browser cannot detect 64-bit software.

1. On your instance, navigate to Self Service > Help the Help Desk.
2. Click Start the Scan to Help the Help Desk.
   You are prompted to run or save the discovery.hta script.
3. If your browser is Internet Explorer, run the script. If you are using any other browser, click Save and save the script to the local machine.
4. To execute the saved script, double click the file.
   The script runs a series of WMI queries to gather information about the Windows machine. When it is done, the data is sent back to your ServiceNow instance and used to populate the configuration database (CMDB).

Service Delegation

Service delegation is the ability to designate other users to view and interact with approvals sent or tasks assigned to you, and to receive copies of all email notifications sent to you.

Note: Users to whom you delegate responsibility see all pending tasks and approvals regardless of the delegation period.

Note: Delegation does not cascade. When a user acts as a delegate for another user, the delegate cannot in turn delegate to a third party. The original delegate is the only user who receives assignments and notifications. Delegation does not grant the delegate access to tasks where the caller or requester is the user for whom the delegate was created.

Add the Delegates related list to a user profile

To delegate approvals and tasks to another user, configure your user profile form to display the Delegates related list.

Role required: personalize_form or admin.

1. Navigate to Self-Service > My Profile.
2. On the form context menu, navigate to **Configure > Related Lists**, and then add the **Delegate->User** related list.

The Delegates related list displays at the bottom of the user profile form.

**Delegate approvals and tasks to another user**

If a user is out of the office, that user can delegate responsibilities to other users for a period of time.

1. Navigate to **Self Service > My Profile**.
2. In the **Delegates** related list, click **New**.

![Delegate approvals and tasks to another user](image)

If the list is not visible, configure the form to add the **Delegate->User** related list.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
3. Select the Delegate (User).
4. Set the period of time.
5. Specify the responsibilities the delegate will assume using the following check boxes. You can delegate:
   - **Approvals**: The delegate can approve items on your behalf.
   - **Assignments**: The delegate can view and work on tasks assigned to you.
   - **CC notifications**: The delegate receives a copy of email notifications sent to you, except those marked as Meeting Invitation.

   **Note**: If the **Approvals** check box is selected but **CC notifications** is not, the delegate does not receive approvals.

   - **Meeting invitations**: The delegate receives a copy of email notifications sent of the type Meeting Invitation.

   **Note**: You must select an active user as your delegate. The instance only delegates to active users.

A sample delegation looks like this:

```
Delegation Options

Note: If your delegate gets email notifications, they will be the same email notifications sent to you. The delegate may be confused to see “Incident assigned to you” emails, so make sure they know they are a delegate.
```
Service Portal

Service Portal is a portal framework that allows administrators to build a mobile-friendly self service experience for users. It interacts with parts of the ServiceNow platform, so users can access specific platform features using Service Portal. It is an alternative to the Content Management System (CMS) based on more modern technologies.

Both expert developers and beginners can configure Service Portal.

Less technical users can make basic configuration changes to the UI using Branding Editor and other components of Service Portal. More advanced users can edit and extend portals, pages, and widgets. Expert users can use the Widget Editor tool to write scripts to power a portal, and even create rich web applications on the Now Platform.

Understanding Service Portal

Service Portal provides a modular user interface framework for quick and easy building of application portals and dashboards for the platform. It helps developers and non-technical administrators create attractive and engaging user experiences that drive employee adoption of critical enterprise applications.

How do you use Service Portal?

Service Portal is an application included in the platform UI, however it includes a visual layer for you to do most of your configuration. In the application navigator, navigate to Service Portal > Service Portal configuration to view the configuration page.

The Service Portal configuration page provides a unique, intuitive way of viewing all the pieces of your portal and how they interact with one another. The configuration page allows you to take advantage of a real-time preview, while configuring portal settings. Use each of the tiles on the configuration homepage to assemble the different components of your portal.

If you prefer the platform layout for configuring Service Portal, you still have the option of creating your portal components within the platform UI. The two options are not separate. Everything you create in the Service Portal configuration page also appears in a table in the platform UI.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Who uses Service Portal?

Several different kinds of users can configure a portal.

- Limited coding: Service Portal was designed so that even users with limited coding ability or knowledge of the platform UI could set up a portal.
- ServiceNow Experts: Users with an understanding of the ServiceNow platform can create portals, set up URL redirects, and view all the components of the portal in a table. Most portal configuration takes place in the Service Portal configuration page, but in specific circumstances, Service Portal administrators may need to do additional configuration directly within the platform.
- Developers: Advanced customizations and new widget creation are tasks for a developer or someone who understands AngularJS and Twitter bootstrap.

In all cases, the user configuring a portal must have the **admin** or **sp_admin** role.

Basic concepts

You should have a basic understanding of all the following components that make up a portal:

- **Themes**: Themes define the look and feel of the whole portal, but can be overridden by other style configurations.
- **Pages**: Pages control where and how you store portal content. Pages do not have a defined relationship to portal records, they simply exist.
- **Widgets**: Components in Service Portal are called widgets. You can use HTML templates, CSS, client scripts, server scripts, and any JavaScript dependencies to define what a widget does. From an AngularJS standpoint, widgets are essentially a superset of an Angular directive.
- Most of the data in Service Portal is managed in different locations throughout the system.
  
  For example, if you are building a knowledge portal, the data exists in Service Portal, but the knowledge articles are authored and managed in the Knowledge application. The same is true for any other type of content you plan to leverage. Take time to understand which tables contain and control the data you are working with in Service Portal.

Additional resources

Service Portal is built using several well known technologies. Use the following websites as resources to help you understand and configure your portal:

- **Twitter Bootstrap**
- **CSS 3 Flexbox**
- **AngularJS**

Service Portal core concepts

Service Portal contains two parts: a framework and a portal. The framework is composed of a set of APIs, Angular services, directives, and tools that help to build portals. The portal is a group of pages linked by page IDs.
After you enter a URL, the framework uses the suffix and picks the appropriate portal to determine the theme and configurations. Then it loads the configured default portal homepage unless the URL has a specified ID.

Each widget added to a page becomes its own instance. A widget instance is basically the application of a widget in a page. Because widgets are reusable and can appear on different pages to do different things, the manifestation of a widget on a page is referred to as a Widget Instance. The page loads with content represented by widgets.

Widget instances get their logic from the base widget template, client scripts, server scripts, and depending on the widget, CSS.
Activate Service Portal

If Service Portal is not active on your instance, you can activate it from the plugin module. You must have the administrator role to activate a plugin.

Locate the Service Portal for Enterprise Service Management (com.glide.service-portal.esm) plugin in the list of plugins. Activate the plugin and select the option to include demo data. For more information on activating a plugin, see the Activate a plugin topic.

Activating Service Portal automatically activates the following plugins:

- Service Portal - Knowledge Base (com.glide.service-portal.knowledge-base)
- Service Portal - Service Catalog (com.glide.service-portal.service-catalog)
- Service Portal - Service Status (com.glide.service-portal.service-status)
- Service Portal Configuration Pages (com.glide.service-portal.config)
- Service Portal Designer (com.glide.service-portal.designer)
- Service Portal Social QA (com.glide.service-portal.sqanda)
- Service Portal Surveys (com.glide.service-portal.survey)

Content Management and Service Portal

Service Portal is a compelling alternative to the Content Management System (CMS) with a refined user experience. It does not duplicate CMS or platform UI functionality. Users who have sophisticated experiences delivered through CMS may need to invest time into transitioning to Service Portal, especially if the CMS implementation includes complex and customized Service Catalog forms.

Service Portal compatibility with existing CMS sites

ServiceNow continues to support CMS in current and upcoming releases. If you have existing CMS sites and activate Service Portal on your instance, your CMS sites will continue to work, as CMS and Service Portal are separate applications.

Differences between Service Portal and CMS

Service Portal is an alternative to CMS based on more modern technologies. Major differences include:

Underlying technology

CMS uses Jelly, which is not a widely used technology. Service Portal instead uses AngularJS, server-side JavaScript, HTML, and CSS. Any scripts that use Jelly do not work in Service Portal. Building widgets in Service Portal requires knowledge of AngularJS.

Visual layer

CMS uses iFrames which can be difficult to work with, limited in terms of styling, and susceptible to upgrade issues. Service Portal, on the other hand, is a self-contained application that accesses data from other tables on the platform. This enables fine-tuned control over style and responsive design.

Mobile first

Unlike CMS, Service Portal is optimized for a mobile environment. For this reason, the following apply to the Service Portal environment:
Any scripts used in Service Portal can only use APIs supported in a mobile environment. For example, some APIs used in your Service Catalog client scripts may not be supported. For a list of supported APIs, see Service Portal and client scripts.

Service Portal forms support a maximum of two-columns. As a result, any highly customized Service Catalog forms, such as catalog items and record producers that use containers and variable sets, must be simplified to work in a two-column layout.

If transitioning to Service Portal, review the following resource: Mobile client GlideForm (g form) scripting and migration.

To understand how core CMS components are configured in Service Portal, refer to the following table.

### CMS and Service Portal components

<table>
<thead>
<tr>
<th>CMS component</th>
<th>Service Portal equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content site</td>
<td>Portal</td>
</tr>
<tr>
<td>Content page</td>
<td>Page</td>
</tr>
<tr>
<td>Content types</td>
<td>Content types link a table to a content page. In Service Portal, content types are no longer required. Record data is queried and displayed using base system widgets. You can add widgets to any number of Service Portal pages. Learn more: Service Portal widgets.</td>
</tr>
<tr>
<td>Layout and dropzones</td>
<td>In Service Portal, pages are made up of containers, rows, and columns. Learn more: Pages.</td>
</tr>
<tr>
<td>Content block</td>
<td>A content block is a reusable piece of content. In Service Portal, content blocks are replaced by widgets. Learn more: Service Portal widgets.</td>
</tr>
<tr>
<td>Service Catalog</td>
<td>Service Catalog pages are rendered using the SC Catalog Item widget in Service Portal. For this reason, Service Catalog forms such as catalog items and record producers are shared between your CMS implementation and Service Portal. If you have a highly customized Service Catalog, you may need to invest time in simplifying your Service Catalog items and client scripts so that they render as expected in Service Portal. Learn more: Service Catalog forms in Service Portal.</td>
</tr>
<tr>
<td>Theme</td>
<td>Theme</td>
</tr>
<tr>
<td>CSS</td>
<td>CSS</td>
</tr>
</tbody>
</table>

### CMS and Service Catalog customizations

Service Portal comes with base system widgets to address common use cases and to display record data. Even though there is no direct migration path from CMS to Service Portal, there may be some items, such as catalog items or knowledge articles, that render as expected in Service Portal without any effort.
However, because Service Portal is supported in a mobile environment, you may need to modify any customized forms and scripts. This approach ensures that the items display well on a mobile device and present a better user experience. Before transitioning to Service Portal, you may need to:

- Refactor client scripts used in your CMS/Service Catalog to use supported mobile APIs and global objects. For a list of supported APIs, see Service Portal and client scripts.
- Build widgets to replace UI Macros and other unsupported scripts. If using a UI Macro in a catalog item form and referencing values on the form, you can use the following workaround instead: Replace a Service Catalog form script with a widget.
- Simplify any complex forms used in your Service Catalog to fit the Service Portal two-column form layout.
- Consider which release supports the required functionality. You may want to upgrade your instance before transitioning to ensure that you have the required base system features.

**CMS to Service Portal transition**

Your CMS may include complex forms and customizations that do not render as expected in Service Portal. Use this guide to understand how best to modify your CMS and Service Catalog implementation for Service Portal adoption, and to understand how a conversion may affect your users.

If you are considering transitioning from CMS to Service Portal, make sure that you understand the impact of moving to a mobile environment. Review the Mobile client GlideForm (g form) scripting and migration.

**Support level and transition actions**

<table>
<thead>
<tr>
<th>CMS component</th>
<th>Service Portal support</th>
<th>Possible transition actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data lookups</td>
<td>The client-side component of a data lookup is not supported in Service Portal. However, the data lookup is applied in the platform when a record is submitted or updated in Service Portal.</td>
<td>While data lookups are not applied in the Service Portal, the record updates as expected in the platform UI when submitted or updated in the Service Portal. If your CMS is used by requesters only, this limitation may not affect your implementation.</td>
</tr>
<tr>
<td>Content blocks</td>
<td>Because Content blocks use Jelly, they are not supported in Service Portal.</td>
<td>In the Service Portal, content blocks are replaced by widgets. Widgets are highly customizable components that can query record data, display and update records, and gather user input. Base system widgets generally cover most use cases. Just as you add content blocks to a page in your CMS, you can add widgets to a page using the Service Portal Designer.</td>
</tr>
<tr>
<td>CMS component</td>
<td>Service Portal support</td>
<td>Possible transition actions</td>
</tr>
<tr>
<td>----------------</td>
<td>------------------------</td>
<td>----------------------------</td>
</tr>
</tbody>
</table>
| UI Macros      | Because UI Macros use Jelly, they are not supported in Service Portal. | • In Service Portal, you can use widgets instead of UI Macros. Base system widgets generally cover most use cases, but for custom solutions, you can develop new widgets using AngularJS.  
• If your implementation includes UI Macros in Service Catalog forms that reference other fields or variables in the form, you can embed the widget inside a Service Catalog variable. Learn more: [Replace a Service Catalog form script with a widget](#). |
| UI actions     | All server-side UI actions are supported in Service Portal, although setRedirectURL() operations are ignored because Service Portal forms handle redirection in a different way than the platform. The form widget ignores all UI actions marked as Client. | • Refactor any UI actions to remove setRedirectURL() operations.  
• Check that UI actions are not marked as client. |
| Catalog client scripts | Only UI Type options **Mobile / Service Portal** and **All** are supported. UI type **Desktop** is not supported in Service Portal. For a list of supported APIs, see [Service Portal and client scripts](#). | • Update your scripts to remove any unsupported client APIs.  
• Check that the script UI Type is set to **Mobile / Service Portal** or **All**. |

**Note:** Synchronous JavaScript calls are not supported in Service Portal and must be replaced by asynchronous calls. For example, the getXMLWait() method of the GlideAjax class is not supported in Service Portal. Instead, use one of the following supported asynchronous methods:  
• getXML(Function callback)  
• getXMLAnswer(Function callback)  

For additional information on GlideAjax, refer to [GlideAjax](#).

To understand the impact of updating your CMS to work in a mobile environment, review [Mobile client GlideForm (g form) scripting and migration](#).
<table>
<thead>
<tr>
<th>CMS component</th>
<th>Service Portal support</th>
<th>Possible transition actions</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>UI policies</td>
<td>Scripted UI policies can only use APIs supported in Service Portal. For a list of supported APIs, see [Service Portal and client scripts](https:// servicenow.com).</td>
<td>Update your scripts to remove any unsupported client APIs.</td>
<td></td>
</tr>
<tr>
<td>Service Catalog variables</td>
<td>Service Catalog variables are supported in Service Portal with the following exceptions:</td>
<td>- If embedding a widget in a catalog item form, you can use the UI Macro variable type. Learn more: [Replace a Service Catalog form script with a widget](https:// servicenow.com).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- UI Macros and UI pages variable types are not supported.</td>
<td>- If using variable with annotations, make sure to test your catalog items in Service Portal to ensure that help text displays as expected.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Validation Scripts for variables are not supported. Supported validation types include:</td>
<td></td>
<td></td>
</tr>
<tr>

**Service Catalog forms in Service Portal**

Service Catalog forms are rendered within Service Portal widgets in a two-column layout. Complex forms may not display as expected.

**Recommendations when creating Service Catalog forms**

Use the following recommendations as a guide to building scalable forms that can be used in both applications:

- Keep forms simple. Because forms with multiple containers, variable sets, and client scripts do not always display as expected in Service Portal, keep forms short to eliminate conversion and debugging issues.
• Think in mobile. Any support for Catalog Client Scripts or Catalog UI Policies is the same as in mobile. Review the following resource: Mobile client GlideForm (g form) scripting and migration.

Form rendering in Service Portal

Containers and variable sets within Service Catalog forms are translated into a two-column layout when implemented in Service Portal. Service Catalog forms are rendered in Service Portal using the following rules:

• Only the top-level container settings are honored. If there are other containers within the top-level container, they are rendered as a single column. If there are container splits or nested containers within these additional containers, they are rendered as a single column. A top-level container is not a child of any other container.
• There can be a maximum of two columns in Service Portal. If your implementation includes forms with more than two columns, the fields are reorganized into two-columns in Service Portal.
• Variable sets are treated as containers. All previously listed rules apply to variable sets as well as any containers within them.
• Default variable size is not supported in Service Portal.

For other forms in the platform, the view determines how the form displays in Service Portal. For base system tables, the form opens in the Service Portal using the Service Portal table form view.

Example layout conversions

The following examples demonstrate how Service Catalog forms display in Service Portal.

Single-column form

A Service Catalog form with:

• Two containers.
• A single-column layout.
Service Catalog form

In Service Portal, the single-column layout renders as expected.
Two-column layout with subcontainers

A Service Catalog form with:
- A container with a two-column layout.
- A subcontainer with a single-column layout.
- A subcontainer with a two-column layout.
Service Catalog form

In Service Portal, the two-column layout setting of the subcontainer is ignored. The subcontainer renders as a single column.
## Service Portal result

### Two-column layout with variable sets and subcontainers

A Service Catalog form with:
- Containers with single-column and two-column layouts.
- Variable sets with a two-column layout within containers.
In Service Portal, the two-column layout settings of the variable sets are ignored when inside a container column.
Containers within variable sets

A Service Catalog form with:

- Variable sets with single-column layouts.
- A container with a single-column layout with a container split within a single-column variable set.
- A container with a two-column layout within a single-column variable set.

Service Catalog form

In Service Portal, the container split and two-column container settings are ignored when inside a single-column variable set.
Nested containers

A Service Catalog form with:

- Containers that contain variable sets.
- Variable sets that contain nested containers.

Service Catalog form

In Service Portal, nested container formatting is ignored and displays as a single-column.
<table>

</table>

**Service Portal result**
Render a complex form in Service Portal using an iFrame

Because complex forms do not display as expected in Service Portal, you can render catalog items, record producers, and order guides in Service Portal using an iFrame. This workaround is a temporary solution to enable your Service Portal to function as expected while you simplify any complex Service Catalog forms.

When rendering items in an iFrame in Service Portal, the following limitations apply:

- On catalog items and record producers, the attachment icon is not visible. As a result, users cannot attach any files during the submission. As a workaround, you can add the attachment button to your form.
- Click-through for the hover-over icon is not available.
- Forms are not optimized for a mobile environment.

Use the attached resources and follow the instructions detailed in the Community post: Service Catalog on Service Portal.

Note: Be sure to make changes in a test environment before updating your production instance.

Replace a Service Catalog form script with a widget

You can use widgets in Service Portal to replace UI Macros. If your Service Catalog form includes a UI Macro that references other fields or variables on the form, you can create a widget to hold reusable code and embed it within the Service Catalog form. Use special syntax to access any variable fields on the form.

Role required: admin or sp_admin

1. Create a widget that performs the action you would like to use in catalog item forms. See step 7 for a simple example widget that accesses another variable on the form.
2. Open a catalog item that previously used a UI Macro or other reusable component not supported in Service Portal.
3. In related lists, add a new variable to the catalog item.
4. Configure the variable form to add the Widget field.
5. In the Type field, select Macro.
6. In the Widget field, select a widget that performs the desired action.
7. Optional: Use the $scope.page.g_form() or $scope.page.field syntax in the embedded widget to access the catalog item values.
   This example shows how to modify the value of a single-line text variable with the name color associated with the catalog item.

Widget HTML Template

```html
<div>
  Data from catalog variable:
  <h1>{{ c.data.message }}</h1>
</div>
```

Widget client script

```javascript
function($scope) {
  var c = this;
```
//Watch for changes in the color variable
$scope.$watch(function () {
  return $scope.page.g_form.getValue('color');
}, function (value) {
  //Update local data object with data from variable
c.data.message = value ? 'Content of color variable: ' + value : '';
});

You can use the following to access variable or catalog item fields:

- $scope.page.g_form(): The g_form instance on the form. You can use all supported g_form methods described in Service Portal and client scripts. For example, g_form.setValue('variable_name', 'new value');.
- $scope.page.field(): The object that represents the variable.

When you open the catalog item in the Service Portal, the embedded widget accesses the variable fields associated with the catalog item.

What color would you like?

Blue

Data from catalog variable:

Content of color variable: Blue

Unsupported features in Service Portal

Service Portal is an alternative presentation layer for the platform. As such, not all features of the platform are extended to Service Portal. Consider your full application and the abilities of Service Portal before making considerable investments. ServiceNow will continue to enhance Service Portal over time.

Not currently supported

- Domain separation at Levels 1-3. However, Service Portal does include support for domain separation at the Data only level. For more information, see Application support for domain separation and Domain separation in Service Portal.
No plans to support

- @ Mentions
- Click-through/pop-ups
- Embedded HTML outside of HTML fields
- Embedded lists
- UI macros
- Formatters
- UI actions marked as Client
- Nested container Catalog variables
- Survey wizards
- OpenFrame

Some client scripting globals are also unavailable in Service Portal. For more information, see Service Portal and client scripts.

Service Portal and client scripts

You can use client scripts and catalog client scripts in the Service Portal if the UI Type is set to Mobile/Service Portal or All. Client scripts and catalog client scripts are used with the Form widget and SC Catalog Item widget, as opposed to a widget client controller.

Before flagging a script as Mobile/Service Portal or All, make sure that you are only using the mobile APIs. Setting a client script to Mobile does not ensure that it will work, it simply flags that the script should be attempted by the mobile app or the Service Portal. Many of your existing client scripts can be set to All as long as the API calls are supported by the mobile client scripting environment.

The topics in this section require advanced coding knowledge and an understanding of Service Portal APIs.

Checking desktop vs mobile runtime

You might want to mark a client script compatible with both desktop and mobile, but still do something different depending on the runtime. You can use this script:

```javascript
if (window === null)
  // Write your mobile compatible code here
else
  // Write your desktop compatible code here
```

Unsupported client scripting globals

The following globals and APIs are unavailable in client scripts and catalog client scripts used in the Service Portal:

- window
- document
- $
- jQuery
- $$
- $j
Note: Widget client controllers are full Angular controllers and are not subject to the unsupported client script globals listed here. Use jQuery and Angular as needed.

Embedded widgets & g_form

When using the Service Catalog variable type **Macro** and **Macro with Label** you can pick a widget to embed in a catalog item form. Within the client controller for the embedded widget you can access the field object and catalog item g_form instance using:

- `$scope.page.field`
- `$scope.page.g_form()`

For more information, see [Replace a Service Catalog form script with a widget](#).

Supported client side APIs

These are the supported client scripting APIs you can use in onLoad, onChange, and onSubmit client scripts.

For detailed class and method information, see the API reference.

<td></td>
<td>· showRelatedList(relatedTableName)</td>
</tr>
<tr>
<td></td>
<td>· showRelatedLists()</td>
</tr>
<tr>
<td></td>
<td>· submit(submitActionName)</td>
</tr>
</tbody>
</table>

Note: Using the variables.var_name notation with the g_form API is not supported in Service Portal. g_form as a global object cannot be used in a widget client controller or in a UI script.
<table>
<thead>
<tr>
<th>Class</th>
<th>Available methods</th>
</tr>
</thead>
<tbody>
<tr>
<td>g_list</td>
<td>· get(fieldName) &lt;br&gt; · addItem(value, displayValue) &lt;br&gt; · removeItem(value) &lt;br&gt; · reset() &lt;br&gt; · setQuery(queryString) &lt;br&gt; · setDefaultOperator(operator) &lt;br&gt; · getDefaultOperator()</td>
</tr>
<tr>
<td>g_service_catalog</td>
<td>isOrderGuide()</td>
</tr>
<tr>
<td>GlideAjax</td>
<td>new GlideAjax(scriptIncludeName) &lt;br&gt; · addParam (name, value) &lt;br&gt; · getParam (name) &lt;br&gt; · getXML(callback) &lt;br&gt; · getXMLAnswer(callback) &lt;br&gt; · getJSON(callback) &lt;br&gt; · setErrorCallback(errorCallback) &lt;br&gt; · getURL() &lt;br&gt; · getParams() &lt;br&gt; · execute() &lt;br&gt; · successCallback(data, status, xhr) &lt;br&gt; · errorCallback(xhr) &lt;br&gt; · setScope(scope)</td>
</tr>
</tbody>
</table>

**Note:**

Because the mobile platform does not allow synchronous GlideAjax calls, the `getXMLWait()` method in a GlideAjax call will not work in the Service Portal. Instead, use one of the following:

- `getXML(Function callback)`
- `getXMLAnswer(Function callback)`
### GlideRecord

<table>
<thead>
<tr>

<td>• setLimit(maxInt)</td>
</tr>
<tr>
<td></td>
<td>• getLimit()</td>
</tr>
<tr>
<td></td>
<td>• getMessage(messageKey, callback)</td>
</tr>
</tbody>
</table>

### Usage examples

#### g_list

The `g_list` global helps you set the filter of a glide list element or a list collector variable. Use this API in place of the `g_filter` API on desktop client scripts.

```javascript
function onLoad() {
    var myListCollector = g_list.get("my_list_collector");
    myListCollector.reset();

    myListCollector.setQuery("active=true^category=8c7b22230b402200b0b02c6317673a62");
    myListCollector.addItem('3a700d39af5f4fc0aab978df90f4c692', 'Power Supply');
    myListCollector.addItem('1cb93419a3a248318da8f814140b42f6', 'Backpack');
}
```

#### g_service_catalog

`g_service_catalog` is only available in Service Portal service catalog item scripts. Use this API to know if your catalog item script is run as part of an order guide or on its own.

```javascript
function onLoad() {
    if (window) // if CMS, don't run this
        return;

    // g_service_catalog api for Service Portal and Mobile
    var isOrderGuide = g_service_catalog.isOrderGuide();
    g_form.setValue("is_order_guide", isOrderGuide ? "Yes!" : "Nope :("");
}
Unsupported form scripts for Service Portal

Because Service Portal doesn’t use Jelly, not all form customizations are available.

### Supported and unsupported form scripts

<table>
<thead>
<tr>
<th>Form script</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client scripts</td>
<td>Service Portal uses UI type set to <strong>All</strong> or <strong>Mobile/Service Portal</strong>. Client Scripts marked as <strong>Desktop</strong> rely on legacy APIs that aren’t supported by Service Portal. Before flagging a script as Mobile or All, make sure you are only using mobile APIs.</td>
</tr>
<tr>
<td>UI Actions</td>
<td>All server-side UI actions are supported in Service Portal, although selfRedirect(URL) operations are ignored because Service Portal forms handle redirection in a different way than the platform. Any UI Actions marked as <strong>Client</strong> are ignored by the form widget.</td>
</tr>
<tr>
<td>UI Policies</td>
<td>Supported, although you should use only declarative UI Policies. Avoid scripting unless the outcome cannot be achieved through the condition builder.</td>
</tr>
<tr>
<td>UI Macros</td>
<td>Not supported as UI macros use Jelly.</td>
</tr>
<tr>
<td>Formatters</td>
<td>Not supported as formatters use Jelly.</td>
</tr>
</tbody>
</table>

### Domain separation in Service Portal

This is an overview of domain separation and the Service Portal. Domain separation allows you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

#### Overview

**Support: Data only**

Domain separation provides complete data isolation for domain-specific users. Domain separation in this application is supported at the **Data only** level, meaning it supports the data security model of separating visibility of data from one domain to another. To learn more, see [Application support for domain separation](#).

#### How domain separation works in Service Portal

Elements of the Service Portal platform such as settings, portals, pages and widgets cannot be domain-separated. However, the data within widgets does display, based on domain. Separate portals with different URLs can be created to provide different experiences for different domains.
Set up Service Portal

Set up a site for your users using Service Portal.

Requirements

Role required

admin or sp_admin

Before you begin

Take the following into consideration before configuring Service Portal:

- Who are you building your site for and why?
- What information do you want to include in your site?
- What do you want the mobile experience to be for users?
- Which platform applications do you plan to use in your portal?

You can use parts of the platform, such as knowledge articles and catalog items, as the content for your portal.

For example, if you are building a knowledge portal, the content displays in Service Portal, but the knowledge articles are authored and managed in the Knowledge application. The same is true for any other type of content you plan to leverage. It is important to take time to understand the table structure of data to become acquainted with content.

- How customized is your service catalog? Catalog client scripts and UI policies only work in Service Portal if they use the mobile GlideForm API, so you may need to make some changes.

What to do

Create a portal

A portal is the engine that houses all the references to content for your site. The portal record defines the URL extension for a site, as well as things like the knowledge base, catalog, and homepage. You can also use the portal record to define the header menu and the portal branding.

From the Service Portal configuration page, click the New Portal tile. Use the fields on the form to associate pages to the portal.

- Create a portal

Create a page

Pages are the centerpiece of the end user experience. Page definitions not only control the layout of the content, they craft the experience for the user. Pages also help define mobile responsiveness, which is a key component in the user experience.

Use any existing page included with Service Portal as an example for your own creation.

Use the Service Portal Designer to create pages, assign layouts, and add widgets.
Create a widget

Widgets are the power behind the portal. Widgets are highly customizable and can be used to provide an endless variety of experiences for your users. Anytime you add a widget to a page it becomes an instance of itself. Each widget instance has its own record so you can configure it specifically for each use. For example, you can add several Icon Link widgets to a page and configure them to link to different areas with different icons. None of the widgets are affected by the others.

You can start by cloning an existing widget and making changes to your cloned version. Developers with an advanced understanding of AngularJS can create widgets from scratch.

Create a portal homepage

When a portal is referenced by the URL suffix, it lands on a home page. This homepage is often labeled index in website language. The home page is probably the most important page of your portal as it houses the major information and actions that your users see.

- Assign a homepage to a portal

Configure the header menu

The header menu in a portal is comprised of two separate widgets: a header widget, which determines the style of the header, and the menu widget, which determines the actual items that appear in the header. Configure both widgets for the header menu to appear and act like a header menu in your portal.

- Create a portal header menu
- Add a header or footer to a portal

Configure the branding for the portal

With the Branding Editor, you can configure the styles and theme of your portal in a view with real-time updates. You can see how your portal appears to users with the click of a button. More advanced users still have the option of creating CSS style sheets for the portal theme. However, they cannot take advantage of the real-time update that the Branding Editor provides. Changes made in the Branding Editor or to specific components of the portal (such as a widget or a page container) override any customizations made to the theme.

- Configure portal branding
- Create a portal theme

Next steps

- Configure search in the portal.
- Limit user access to specific components.
- Set up URL redirects.

Service Portal configuration page

Most Service Portal configuration is accessible through the Service Portal configuration page landing page.
In your instance, access the Service Portal configuration page by navigating to Service Portal > Service Portal configuration. The Service Portal configuration page opens in a new tab in your browser.
Service Portal
Create rich, engaging and modern experiences to help your business run better
Select one of the options below to continue

- **Branding Editor**
  Customized your portal's title, logo and theme colors. Preview changes as you make them

- **Designer**
  Create and layout pages with drag-and-drop functionality. Preview pages as you make changes

- **Page Editor**
  Configure the properties of pages, containers and widgets from a map view

- **Widget Editor**
  Create widgets from scratch or customize an existing one. Write HTML, CSS, and Javascript with real-time preview

- **New Portal**
  Create a new Service Portal

- **Get Help**
  Browse guides, tutorials and videos to learn how to set up, configure and customize your portals
You can also access the configuration page by appending your URL with sp_config. For example, https://<instance name>.service-now.com/sp_config.

Use each option on the Service Portal config page to set up the different parts of your portal.

**Service Portal properties**

The Service Portal properties page provides several configuration options for Service Portal. Administrators can access these properties by navigating to **Service Portal > Properties**.

<table>
<thead>
<tr>
<th>Property</th>

<td>- End Date Descending: The most recent end date appears first.</td>
</tr>
</tbody>
</table>

If **user criteria** (**com.glide.service-portal.user-criteria**) is enabled, the following properties also appear in the Service Portal properties page:

**User criteria properties**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable use of User Criteria records instead of Roles fields for Service Portal entitlements glide.service_portal.user_criteria_enabled</td>
<td>Defines permissions for Service Portal widgets, widget instances, pages, and search sources.</td>
</tr>
<tr>
<td></td>
<td>- Type: true</td>
</tr>
<tr>
<td></td>
<td>- Default value: true</td>
</tr>
<tr>
<td></td>
<td>- More information: <a href="https://servicenow.com">User criteria for Service Portal</a></td>
</tr>
<tr>
<td>List of roles (comma-separated) that bypass User Criteria validation in Service Portal glide.sp.entitlement.override</td>
<td>Allows users with a specific role to see any page, widget, widget instance, or search source regardless of user criteria.</td>
</tr>
<tr>
<td></td>
<td>- Type: string</td>
</tr>
<tr>
<td></td>
<td>- Default value: admin</td>
</tr>
</tbody>
</table>

**Create a portal**

Create a portal using the Service Portal configuration page.

Role required: admin or sp_admin

The Branding Editor affects the look of your portal and essentially changes the CSS for the pages. The changes you make in the Branding Editor are recorded in the portal record in the following fields. If you have experience with CSS and HTML you can configure these fields in the portal form directly as accessed through the portal UI. By theming your portal in the Branding Editor instead, you can take advantage of the real-time theme preview.

1. Navigate to Service Portal > Portals, then click New.
2. Complete the portal form using the following fields.
## Portal form fields

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Title</strong></td>
<td>The name you use to define your portal. In the browser header and for bookmarks, the title appears as <code>&lt;Portal Title&gt; - &lt;Page Title&gt;</code></td>
</tr>
<tr>
<td><strong>URL Suffix</strong></td>
<td>The value that appears appended to an instance URL when you access a portal. For example, if you use <code>sp</code>, the instance URL for that portal would be <code>&lt;instance name&gt;.service-now.com/sp</code>. Make sure this value is unique and is not the same as any other portal.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>Avoid using reserved words in your URL to prevent errors when navigating to your portal page. Words such as portal and cms should not be used. Also avoid any javascript protected terms.</td>
</tr>
<tr>
<td><strong>Homepage</strong></td>
<td>The page you want users to see first after they sign in.</td>
</tr>
<tr>
<td><strong>Knowledge base</strong></td>
<td>Name of the knowledge base you want associated with the portal. The knowledge base you select here determines what information appears for the knowledge base page. For example, if you select <code>IT</code>, only the article categories defined for the IT knowledge base appear in the <code>KB categories widget</code>.</td>
</tr>
<tr>
<td><strong>Social QA Knowledge Base</strong></td>
<td>Name of the knowledge base where you want to store questions and answers from portal users.</td>
</tr>
<tr>
<td><strong>KB home page</strong></td>
<td>The home page you created that you want users to see when they go to a knowledge base.</td>
</tr>
<tr>
<td><strong>Login page</strong></td>
<td>The page you created for users to be authenticated.</td>
</tr>
<tr>
<td><strong>Logo</strong></td>
<td>Logo that appears in the page header. You can also configure the logo in the Branding Editor.</td>
</tr>
<tr>
<td><strong>Icon</strong></td>
<td>The icon that appears in the address bar for your portal. Each portal you create can have a different icon.</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>The portal you want to use as your main portal.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Quick start config</td>
<td>Schema that defines configuration items in the Branding Editor. In JSON format, you can define fields and records used to generate your branding options.</td>
</tr>
<tr>
<td></td>
<td>```</td>
</tr>
<tr>
<td></td>
<td>[{</td>
</tr>
<tr>
<td></td>
<td>&quot;tagline&quot;: {</td>
</tr>
<tr>
<td></td>
<td>&quot;table&quot;: &quot;sp_instance&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;sys_id&quot;: &quot;34fe3d96cb20020000f8d856634c9cf4&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;field&quot;: &quot;title&quot;</td>
</tr>
<tr>
<td></td>
<td>},</td>
</tr>
<tr>
<td></td>
<td>&quot;hero_background&quot;: {</td>
</tr>
<tr>
<td></td>
<td>&quot;table&quot;: &quot;sp_container&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;sys_id&quot;: &quot;be98a8d2cb20020000f8d856634c9c63&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;field&quot;: &quot;background_image&quot;</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
<tr>
<td>CSS variables</td>
<td>Portal-specific Sass variables. You can overwrite existing theme variables here.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope. This field is uneditable and <strong>Global</strong> by default.</td>
</tr>
<tr>
<td>404 page</td>
<td>The default page your users see whenever a page cannot load properly. You can also define a default 404 page using the system property <strong>glide.service_portal.default_404_page</strong>.</td>
</tr>
<tr>
<td>Catalog</td>
<td>Catalog listed in the <strong>sc_catalog</strong> table to use in the portal.</td>
</tr>
<tr>
<td>Catalog home page</td>
<td>Catalog page that you created in the portal to represent the catalog.</td>
</tr>
<tr>
<td>Main menu</td>
<td>Reference to the menu in the <strong>(sp_instance_menu)</strong> table that appears in the header.</td>
</tr>
<tr>
<td>Theme</td>
<td>Refers to a theme in the (sp_theme) table that defines the style and branding for the portal. The theme is the lowest level of style configuration and any changes made in the Branding Editor or to specific portal components (such as widget or container CSS) override those styles.</td>
</tr>
</tbody>
</table>

### Theme

- Stock
**Associate a portal with a catalog**

You can associate a portal with any catalog. Only one catalog can be associated with a portal. By default, Service Portal is associated with Service Catalog.

Role required: admin or sp_admin

1. Navigate to Service Portal > Portals.
2. Click the Service Portal record.
3. In the Catalog field, select the desired catalog. The categories and catalog items associated with the selected catalog are displayed in Service Portal.
4. For the Main menu field, click Open Record.
5. From the Menu Items section, Click the Service Catalog record.
6. In the Label field, specify the label for the selected catalog. The catalog label is displayed in the main menu of Service Portal.
7. Click Update.

**Service Portal styles**

Pages are made up of containers, columns, rows, widgets, and widget instances. You can configure the CSS of each component, or use the CSS defined in theme and branding as global definitions for the portal. If you do not define CSS in theme or branding, Bootstrap defaults are used.

You can define CSS in your portal at multiple levels.

**Bootstrap defaults**

If no other CSS is defined, all elements use Bootstrap version 3.3.6 defaults.

**Branding editor theme colors/Portal CSS**

CSS defined in the Branding Editor Theme Colors tab. Changes made to the theme colors in the Branding Editor appear in the CSS variables field in the portal table (`sp_portal`).
Customizing the theme colors overwrites the Bootstrap defaults.

**Theme CSS**

CSS defined in the CSS variables field in the Themes table (sp_theme). Use the Theme CSS as much as possible to allow for more flexible evolution of your portal in the future.

Using a theme overwrites the Portal CSS/Branding Editor theme colors.

**Page CSS**

CSS defined in the Page Specific CSS field in the Pages table (sp_page). Page-specific CSS overwrites the theme CSS.

**CSS classes**

You can define CSS classes elements on the page within each respective record.

**Widget CSS**

CSS defined in the CSS field in the Widgets table (sp_widget). Widget CSS overwrites container, column, and row CSS.

**Widget instance CSS**

CSS defined in the CSS field in the Instance table (sp_instance).
Widget instance CSS overwrites all other CSS definitions.

Hierarchy of style application in the Service Portal

Configure portal branding

Use Branding Editor to give your portal its own look and feel.

To access the Branding Editor, navigate to Service Portal > Service Portal Configuration, then click Branding Editor.

Select the portal you want to customize the theme for from the portal list. Then use the options on the Quick Setup and Theme Colors tabs to customize your portal.
**Branding Editor**

**Quick Setup tab options**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Portal Title</td>
<td>The name of your portal. Changing the name of the portal in the Branding Editor also changes the title on the portal form field in the platform UI.</td>
</tr>
<tr>
<td>Logo</td>
<td>The logo that appears in the header for your portal. This image is scaled to a maximum height of 46 px and a maximum width of 200 px.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Logo padding</td>
<td>Where you want the logo to sit in location to the edge of the header. This information is stored in the CSS variables section on the portal form.</td>
</tr>
<tr>
<td>Tag line &amp; background</td>
<td>Fields defined by the JSON schema in the <em>Quick start config</em> field on the portal record in the platform UI. The sample Service Portal adds <strong>Tag Line</strong> and <strong>Background</strong> to the Branding Editor using the following schema:</td>
</tr>
<tr>
<td></td>
<td>```</td>
</tr>
<tr>
<td></td>
<td>[{</td>
</tr>
<tr>
<td></td>
<td>&quot;tagline&quot;: {</td>
</tr>
<tr>
<td></td>
<td>&quot;table&quot;: &quot;sp_instance&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;sys_id&quot;: &quot;34fe3d96cb20020000f8d856634c9cf4&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;field&quot;: &quot;title&quot;</td>
</tr>
<tr>
<td></td>
<td>},</td>
</tr>
<tr>
<td></td>
<td>&quot;hero_background&quot;: {</td>
</tr>
<tr>
<td></td>
<td>&quot;table&quot;: &quot;sp_container&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;sys_id&quot;: &quot;be98a8d2cb20020000f8d856634c9c63&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;field&quot;: &quot;background_image&quot;</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
<tr>
<td></td>
<td>```</td>
</tr>
<tr>
<td>Tag line</td>
<td>Introduce your users to a portal page with a tag line. This text is stored in an instance of the homepage search widget.</td>
</tr>
<tr>
<td>Tag line color</td>
<td>Select a color for the tag line.</td>
</tr>
<tr>
<td>Homepage background color</td>
<td>Add a color for your background. You can type in a color name, hex color, decimal (RGB), or select from the color palate.</td>
</tr>
<tr>
<td>Background image</td>
<td>Upload an image to appear in the background of your homepage. This image is stored in the container for the widget on your homepage.</td>
</tr>
</tbody>
</table>

For any colors on the theme tab, you can use the standard color name, hex code, decimal (RGB) code, or select the color from the color palate. All the color definitions are stored in the CSS variables field of the portal form. The theme preview updates in real time as you make changes.

**Theme colors tab**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Navbar</td>
<td>Use the fields in this section to customize the colors for the header menu.</td>
</tr>
<tr>
<td>Brand</td>
<td>Use the fields in this section to customize the page colors. For example, the page background or the widget background.</td>
</tr>
<tr>
<td>Text</td>
<td>Use the fields in this section to customize the color of the text on a page.</td>
</tr>
</tbody>
</table>

Changes made to the theme colors in the Branding Editor appear in the CSS variables field of the portal form in the platform UI.
Create a portal theme

If you need more customization than Branding Editor can provide, you can create your own custom theme.

Only users with an understanding of CSS should create custom themes.

1. Navigate to Service Portal > Themes, then click New.

2. Complete the form fields and select Save.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of your theme. Use this name to associate the theme with your portal. This name is not visible to users, you should know it to apply the correct theme to a portal.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Application</td>
<td>The record scope. The header menu record and the source table must have the same application scope.</td>
</tr>
<tr>
<td>Header</td>
<td>List of headers and footers from the sp_header_footer table that you can associate with a portal theme. Headers and footers are widgets and can be configured the same way.</td>
</tr>
<tr>
<td>Footer</td>
<td>List of headers and footers from the sp_header_footer table that you can associate with a portal theme.</td>
</tr>
<tr>
<td>Fixed header</td>
<td>Locks the header at the top of the page so that when a user scrolls the header remains on the screen.</td>
</tr>
<tr>
<td>Fixed footer</td>
<td>Locks the footer at the bottom of the page so that when a user scrolls the footer remains on the screen.</td>
</tr>
<tr>
<td>CSS variables</td>
<td>CSS custom properties that you can use to change the color and styles in a portal. For example, the stock theme uses some of the following variables:</td>
</tr>
</tbody>
</table>

```css
$sp-logo-margin-x:  15px !default;
$sp-tagline-color:  $text-color !default;
$navbar-inverse-bg:  #3a3f51 !default;
```

3. To add a style sheet to the theme, in the **CSS Include** related list, click **New**.
CSS include record

4. Complete the style sheet form fields, the click **Save**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the CSS Include. Remember this name to associate the CSS Include with the theme.</td>
</tr>
<tr>
<td>Application</td>
<td>The record scope. The header menu record and the source table must have the same application scope.</td>
</tr>
<tr>
<td>Source</td>
<td>Select one of the following options:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Style Sheet</strong>: Add an internal style sheet that has been uploaded to the CSS table (sp_css). For example, ng-sortable.min.css. Internal style sheets use standard CSS in the CSS field.</td>
</tr>
<tr>
<td></td>
<td>- <strong>URL</strong>: Link to an external style sheet. Use external style sheets to use the same CSS as a corporate website or other online resource.</td>
</tr>
<tr>
<td>Style sheet</td>
<td>Associate a style sheet or CSS file URL, depending on which option you select in the Source field.</td>
</tr>
</tbody>
</table>

5. To add a JavaScript include to the theme, in the **JS Include** related list, click **New**.
JS Include record

6. Complete the style sheet form fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display name</td>
<td>Name of the CSS Include. Remember this name to associate the CSS Include with the theme.</td>
</tr>
<tr>
<td>Application</td>
<td>The record scope. The header menu record and the source table must have the same application scope.</td>
</tr>
<tr>
<td>Source</td>
<td>Select one of the following options:</td>
</tr>
<tr>
<td></td>
