administrators only. The scheduled job removes these items if they are more than a year old: 

- Assessment instance questions 
- Assessment instances
• Metric results

By default, the scheduled job is executed manually. Administrators can configure the scheduled job to run automatically on a recurring schedule.

1. Navigate to System Scheduler Scheduled Jobs Scheduled Jobs.
2. Open the Remove Old Assessment Data record.
3. On the Schedule Item form, set the Trigger type field to run the scheduled job on a recurring schedule.
   It is recommended to set the scheduled job to run on a weekly or monthly basis.
4. Click Execute Now to run the scheduled job.

Assessment instances
An assessment instance represents one occurrence of a questionnaire assigned to one user.

The system generates assessment instances only when the required conditions are met, as described in Scheduled assessments and On-demand assessments, and there are non-scripted metrics in at least one category.

When the system generates scheduled assessments for a metric type, each assessment instance contains questions about assessable records and categories related to the stakeholder to which it is assigned.

Example:
Recall that there can be multiple stakeholder records associated with one user record. Minh Leclare is a stakeholder for these items related to the Vendor metric type:

<table>
<thead>
<tr>
<th>Assessable record</th>
<th>Category</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amazon</td>
<td>User Satisfaction</td>
</tr>
<tr>
<td>Acme</td>
<td>User Satisfaction</td>
</tr>
<tr>
<td>Acme</td>
<td>Reliability</td>
</tr>
<tr>
<td>Cisco</td>
<td>Reliability</td>
</tr>
</tbody>
</table>

When the system generates a scheduled assessment, Minh is assigned one assessment instance. Minh must evaluate Amazon, Acme, and Cisco by answering questions from the categories for which she is a stakeholder. Assuming that there are three questions in the User Satisfaction category and six questions in Reliability, Minh’s questionnaire contains three questions about Amazon, nine questions about Acme, and six questions about Cisco.

When the system generates an on-demand assessment for a specific assessable record, the assessment instance contains questions about that assessable record and all its associated categories. When the system generates an on-demand assessment for a metric type, the assessment instance contains questions about all that metric type’s assessable records and their associated categories.

View an assessment instance
An assessment instance represents one occurrence of a questionnaire assigned to one user.

Role required: admin, survey_admin, or assessment_admin

1. Navigate to Assessments Assessment Instances. The following sub-modules are available based on the state of the instances:
   • Ready to take: Displays assessment instances that are ready to be taken by the user. By default, these instances are sorted in ascending order by the Number field.
• In progress: Displays assessment instances that are in progress. By default, these instances are sorted in ascending order by the Number field.
• Completed: Displays assessment instances that are complete. By default, these instances are sorted in descending order by the Taken on field.
• Cancelled: Displays assessment instances that are cancelled. By default, these instances are sorted in ascending order by the Number field.
• All: Displays assessment instances in all states. By default, these instances are sorted in ascending order by the Number field.

2. Click an assessment instance number to open the record from the required sub-module. By default, the following fields are displayed in the Assessment Instance form for all sub-modules other than Completed.

**Note:** When you open an instance in the Completed sub-module, you are redirected to the User's Response page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Auto-generated record number.</td>
</tr>
<tr>
<td>Metric type</td>
<td>Metric type of this assessment.</td>
</tr>
<tr>
<td>Assessment group</td>
<td>Assessment group to which this assessment belongs.</td>
</tr>
<tr>
<td>Due date</td>
<td>Date by which the assessment instance must be completed. The system populates the due date from the value in the metric type Assessment duration field. The system generates email notifications related to the due date. <strong>Note:</strong> By default, the system runs the Cancel Expired Assessments script every 30 days to cancel expired survey, assessment, and quiz instances that are in the Work in progress or Ready to take states.</td>
</tr>
<tr>
<td>State</td>
<td>State of the assessment.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain associated with the instance.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User this assessment is assigned to. This field becomes read-only when the state is In progress, Complete, or Canceled.</td>
</tr>
<tr>
<td>Signature</td>
<td>Name of the signature record attached to this assessment. A signature requires that assessment recipients acknowledge that they have read any assertions attached to a questionnaire.</td>
</tr>
</tbody>
</table>
3. Click Take assessment to open the questionnaire.

This button is available if all the following conditions are true for the assessment instance:

- It is Assigned to you.
- The State is Ready to take or In progress.
- The associated metric type is Active.

Configure trigger conditions for an assessment

Trigger conditions specify when to send a particular assessment and who to send the assessment to.

Role required: assessment_admin or admin

1. Navigate to Assessments Admin Trigger Conditions.
2. Complete the fields as described in the table:

Table 1024: Trigger Condition form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment</td>
<td>[Required] Metric type to generate assessment instances for. Triggered assessments only work if the metric type is set to the On demand schedule type.</td>
</tr>
<tr>
<td>Table</td>
<td>[Required] Table to run the trigger condition on. You can select only tables in the current application scope. The table must have a connection to the assessable records for the selected Assessment. For example, you might want to send a vendor assessment when incidents close that are related to vendors you assess. In this case, select the Incident [incident] table. After you select a table, ensure there is at least one option for the Assessable Record Field. If there is not, select a different table.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>User field</td>
<td>[Required] Field that stores the users you want to send the assessment. You can select any field, on the selected Table or on a related table, that references the User [sys_user] table. Use the tree picker to select a field.</td>
</tr>
<tr>
<td>Repeat Interval</td>
<td>Minimum period that must pass before the trigger condition can resend the assessment to the same user. For example, assume the repeat interval is set to 30 days. Even if the same user is eligible for multiple assessments from this trigger condition, the system can only send the user one assessment every 30 days.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this trigger condition is active (selected).</td>
</tr>
<tr>
<td>Business rule</td>
<td>[Admin only] Business rule the system creates to monitor the selected table. When the condition is met, the business rule sends the assessment to the correct user. No configuration is necessary for this business rule.</td>
</tr>
<tr>
<td>Trigger randomly</td>
<td>Check box that determines whether to send the assessment to the appropriate user every time the condition is met (cleared) or only a percentage of the time (selected), as specified in the Probability (%) field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Probability (%)</td>
<td>Probability out of 100 that the assessment will be sent each time the condition is met. For example, if the probability is set to 50, the system sends the assessment approximately 50% of the time the conditions are met, assuming there are no repeat interval restrictions. This field is visible and required only when the Trigger randomly check box is selected.</td>
</tr>
<tr>
<td>Assessable Record Field</td>
<td>[Required] Field on the selected Table that determines which assessable record will be the subject of the assessment. Only appropriate reference fields on the selected Table are available to select. If there are no Assessable Record Field options available, you must select a different Table.</td>
</tr>
<tr>
<td></td>
<td>If the selected Assessment evaluates records on the Company [core_company] table and the selected Table is Incident, the only Assessable Record Field options are fields on the Incident table that reference the Company table. For example, Company or, if vendor ticketing is enabled, Vendor. If you select Vendor, the trigger condition sends an assessment about the Vendor for the incident, assuming there is an assessable record for the associated company. The assessment contains questions from all metric categories associated with the assessable record.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is not available if the selected Assessment is a metric type used for surveys. See <em>Survey trigger conditions</em> on page 2521.</td>
</tr>
<tr>
<td>Related Field 1 – Related Field 4</td>
<td>Field that contains a value you want to store for reporting purposes. You can pick any reference field on the selected Table. When the trigger condition generates an assessment instance, the system stores the value from the triggering record. Select up to four fields. For example, if you select the Incident table, you might select Caller and Vendor as related fields. That stores the caller and vendor associated with the incident as Related record 1 and Related record 2 in the assessment instance record. To view these fields, configure the Assessment Instance form.</td>
</tr>
</tbody>
</table>
Assessment trigger conditions
A trigger condition tells the system who to send a designated assessment to and when, based on specific conditions.

With trigger conditions, assessment administrators can configure the system to generate assessments each time a specific action occurs, such as when an incident or change request closes. The trigger condition sends the assessment to specified users who are related to the triggering record, such as incident callers or change request assignees. You can choose to send the assessment every time the condition is met, or set a probability for the system to send the assessment at random when the condition is met.

Table 1025: Trigger condition configuration

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Summary information to identify the trigger condition.</td>
</tr>
<tr>
<td>Condition</td>
<td>[Required] Condition builder that defines the criteria that must be true to send the assessment. For example, if you want to send an assessment whenever an incident closes, create the condition [State] [is] [Closed].</td>
</tr>
</tbody>
</table>

Trigger condition example

Modesto Scroggie is the caller on an incident that is assigned to Boris Catino, a service desk technician. Boris contacts a vendor to resolve Modesto’s issue and sets the Vendor field to Microsoft. When the incident closes, the system creates an assessment instance assigned to Boris so he can evaluate Microsoft as a vendor.

Because two related fields were selected as part of the trigger condition, the assessment instance stores the following information from the incident:

- Related record 1: User: Modesto Scroggie
- Related record 2: Company: Microsoft
Note: Even though the trigger condition is set to be triggered every time the conditions are met, the Repeat Interval setting ensures that Boris does not receive another assessment if another vendor incident assigned to him closes within 30 days of the first one.

Enable manager notifications

Users with the assessment_admin role can enable the Notify manager assessment is overdue email notification.

Role required: assessment_admin or admin

This notification sends emails to assessors’ managers when assessors do not complete their assigned assessments on time. For more information, see the table of assessment notifications. You must enable or disable this email notification separately for each metric type.

1. Navigate to Assessments Metric Definition Types.
2. Open a metric type.
3. Select the Notify if overdue check box.

To disable manager notifications, clear the check box.

4. Save the record.

Note: The assessor’s user record must have a manager specified in the Manager field to use this notification. You might need to configure the form to use this field.

Assessment notifications

You can configure the system to send email notifications for assessments.

You can configure any of the following types of notification during the process of generating assessable records:

• Notify assessment user: This messages notifies you of an assigned an assessment and includes the type, the due date, and basic instructions. The message also contains a link to the record where you take the assessment.

  Note: If a user has a pending assessment, then the system will not generate another instance of the same assessment.

• Remind assessment user: This message reminds you of the due date if half the time passes and you have not completed the assessment. The message content is the same as the first notification.

• Notify manager assessment is overdue: If you do not complete an assessment by the due date, the system may send a notification to your manager, depending on configuration.

  Note: By default, the system runs a script every 30 days to cancel expired assessment and survey instances that are in the Work in progress or Ready to take states.
Assessment notification workflow
The system sends assessment notifications according to the Notify assessment user workflow. Users with the workflow_admin, workflow_creator, or workflow_publisher roles can view workflows.

1. To open the graphical Workflow Editor, navigate to Workflow Workflow Editor.
2. In the activity menu, click the link to choose an existing workflow.

![Figure 425: Workflow Window](image)

3. Select Notify assessment user from the Workflow Versions list.
   The workflow appears.
View a metric result

Metric results contain values that represent an evaluated record's performance for a specific metric, based on a single evaluation from one user or from the execution of a script. Metric results contain actual values as well as calculated values. The system uses values from metric results to calculate category results.

Role required: assessment_admin or admin

If there is an active scripted metric when the assessment is generated, the system automatically produces a metric result for each associated assessable record. The system produces an additional metric result for each question a user answers on a completed assessment questionnaire. If multiple users complete questionnaires with the same questions on the same assessable records, the system produces metric results for each user's responses. For example, three users complete questionnaires that contain the same four questions about the Acme Corporation record. The system produces 12 metric results: one per user for each question.

1. Navigate to Assessments Results Metric Results.
2. Open the metric result record you want to view.
All fields on the form except Updated and String value are read-only.

### Table 1026: Metric Result form fields

<table>
<thead>
<tr>

<td><em>Assessment instance</em> completed by the Assigned to user. This field is blank when the method is Script.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Actual value    | Unscaled value from a user response or script, depending on the method:  
|                 | • Assessment: Value obtained from the user response to the assessment instance question. The actual value is determined by the metric data type:  
|                 | • Checkbox: The actual value is 0 if the check box is cleared and 1 if it is selected.  
|                 | • Choice or Likert Scale: The actual value is equal to the Value of the metric definition associated with the chosen answer option.  
|                 | • Date, Date/Time, or String: The actual value is -1 to indicate that these data types do not contribute to category result calculations.  
|                 | • Template: The actual value is equal to the Value of the template definition associated with the chosen answer option.  
|                 | • Yes/No: The actual value is 0 if the response is No and 1 if it is Yes.  
|                 | • Script: Value the script placed in the actual_result variable.  
|                 | This field is hidden and left blank when the data type is Duration.  
| Duration value  | Specific kind of actual value that is only applicable if the data type is Duration. The duration value is the value obtained by the script query from the actual_result parameter, such as the average duration of outages for a vendor.  

© 2018 ServiceNow. All rights reserved.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Scaled value  | Appropriate value from the scaled_result variable in the associated metric script. The code in a scripted metric defines a scaling scheme for the actual values it obtains. For example, a scripted metric queries the CMDB to return the number of configuration items (CIs) for a vendor. The code includes this scaling scheme, where actual_result is the number of CIs, and scaled_result is a representation of the quantity of CIs:  
  
  ```java
  if (actual_result < 1)  
    scaled_result = 0;  
  else if (actual_result < 1000)  
    scaled_result = 1;  
  else if (actual_result < 10000)  
    scaled_result = 2;  
  else if (actual_result < 25000)  
    scaled_result = 3;  
  else if (actual_result < 100000)  
    scaled_result = 4;  
  else  
    scaled_result = 5;  
  ```
  
  If the script detects 315 CIs for the vendor, the Actual value is 315 and the Scaled value is 1 for this metric result.  
  
  **Note:** Although this field is visible only when the method is Script, the system populates the field with the Actual value when the method is Assessment, as the scaled value is used in the Normalized value calculation.  

| Normalized value | Adjusted value that accounts for weights, scale definition, minimum and maximum values, and other factors that impact the metric (like the survey responses or the input value—the actual value given by the user). See the example for Normalized value in View an assessment category result on page 2387. |

| String value | Value that displays the response as it appears on a questionnaire. In some cases this is the same as the Actual value, such as when the metric data type is Percentage. The string value is N/A for unanswered questions of certain data types. For the Attachment data type, the names of the attached files are displayed as comma-separated values. |
**Assessment results**
In the Assessments application, when the system processes completed questionnaires or gathers values returned from scripted metric queries, it generates assessment result records called metric and category results.

Assessment administrators can view assessment results.

The system calculates **metric results** first, normalizes the scores, and then calculates **category results**. Each metric and category result record stores data from one assessment group, for a particular category and source record evaluated. Specifically:

- Metric results: store data calculated from one evaluation of one metric.
- Category results: store data calculated from a weighted average of all metrics in the category.

**Note:** Although results data is available to view in the form of metric and category result records, the most meaningful way to view results is in **scorecards** and decision matrixes. These tools display only the most pertinent data in graphical, comparative formats.

**Excluded Responses**

The system creates metric results for responses but does not include them in category result calculations if any of the following are true:

- The user selects the Not Applicable answer option on a questionnaire.
- The user does not answer the question and the **data type** is not Checkbox.
- The question data type is one of the following: Date, Date/Time, or String.
- The metric result Actual value, Scaled value, and Normalized value fields are set to -1.

**Metric Attachments**

After a survey or assessment is submitted, any attachments that have been added by a user are moved to the metric result record. The names of the attached files are added to the **String value** field on the Metric Result form.

**Note:** You cannot add or remove attachments from a metric result.

**Assessments overview module**

The assessment overview module is a type of homepage that displays various assessment reports, such as results by category and assessments by state.

**Prerequisites**

You can view the overview page and refresh, add, delete, and rearrange report widgets.

Role required: assessment_admin

</tbody>
</table>

Assessment results calculation
For every assessment group, there are assessment results.

Data calculated from an evaluation of one metric is classified as a metric result. Data calculated from the weighted average of all metric results in a category is classified as a category result. The system calculates some assessment results when the assessment is generated, and others when users complete questionnaires.

View a bubble chart for assessments
Assessment administrators can view bubble charts to compare the relative standing of assessable records in three metric categories.

Role required: assessment_admin or admin
1. Navigate to Assessments Admin Bubble Charts.
2. Click a Name to open the bubble chart record.
3. Under Related Links, click View Bubble Chart.

Note: Demand managers and vendor managers can view bubble charts through the Demand Management and Vendor Performance applications. See Project Portfolio Management for more information.

Bubble charts for assessments
A bubble chart is a dynamically updated graph that plots assessment results for multiple assessable records.

Assessment administrators can create and use bubble charts to compare the relative standing of assessable records in three metric categories. The X- and Y-axes each represent a different category. Assessable records are plotted on the chart as circular markers, or bubbles, which vary in size according to scores for the third category.
Create a bubble chart
Assessment administrators can create bubble charts to compare the relative standing of assessable records in three metric categories.

To create a bubble chart, navigate to Assessments Admin Bubble Charts and create a record (see table for field descriptions).

**Note:** For color fields, either HTML color names or hexadecimal (hex) values are acceptable. For hex values, the # character is optional. Values are not case-sensitive. For example, all of the following values are valid: LightGray, lightgray, #D3D3D3, d3d3d3.

![Bubble Chart form](image)

**Figure 428: Bubble Chart form**
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name for the bubble chart. Bubble Chart is appended to the name when you view the bubble chart.</td>
</tr>
<tr>
<td>• Top left label</td>
<td>Label text for the top left, top right, bottom left, and bottom right quadrants, respectively. Choose labels that help interpret results. For example, a bubble chart that displays vendor assessment results might have the following quadrant labels, where vendors in the top right quadrant have the best scores:</td>
</tr>
<tr>
<td>• Top right label</td>
<td>• Top left label: Resource</td>
</tr>
<tr>
<td>• Bottom left label</td>
<td>• Top right label: Essential Partner</td>
</tr>
<tr>
<td>• Bottom right label</td>
<td>• Bottom left label: Poor Performer</td>
</tr>
<tr>
<td></td>
<td>• Bottom right label: Reevaluate</td>
</tr>
<tr>
<td>• Top left color</td>
<td>Border colors for the top left, top right, bottom left, and bottom right quadrants, respectively. Bubbles are the color of the quadrant they are in.</td>

<td></td>
</tr>
<tr>
<td>• Bottom left color</td>
<td></td>
</tr>
<tr>
<td>• Bottom right color</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>Metric type associated with this bubble chart. Only results for assessable records of the selected metric type are plotted on the bubble chart.</td>
</tr>
<tr>
<td>• X-Axis label</td>
<td>Label text for the X-, Y-, and Z-axis categories of the bubble chart. These labels appear along the X- and Y-axes, if applicable, and in bubble score summary windows. The metric category name is usually a good label. If these fields are left empty, the bubble chart automatically displays the selected category names as the labels.</td>
</tr>
<tr>
<td>• Y-Axis label</td>
<td></td>
</tr>
<tr>
<td>• Z-Axis label</td>
<td></td>
</tr>
<tr>
<td>• Metric X category</td>
<td>Metric category each axis represents. Results for the Z-axis category determine the size of each bubble. The Z-axis should generally represent the most important category out of the three.</td>
</tr>
<tr>
<td>• Metric Y category</td>
<td></td>
</tr>
<tr>
<td>• Metric Z category</td>
<td></td>
</tr>
<tr>
<td>Quadrant label color</td>
<td>Color of the label text for the quadrant borders.</td>
</tr>
<tr>
<td>Default</td>
<td>Check box that enables (selected) or disables (cleared) the bubble chart as the default. There can be only one default bubble chart per metric type.</td>
</tr>
</tbody>
</table>

**Bubble chart components**

The X- and Y-axes each represent a different metric category. Assessable records are plotted on the chart as circular markers, or bubbles, which vary in size according to scores for the third category.
The bubble chart page has these components:

- **Bubble Chart**
  - X- and Y-axes: Each axis represents a metric category.
  - Bubbles: Each labeled bubble represents an average of category result data for an assessable record. Point to a bubble to view an assessable record score summary. Click a bubble or bubble label to view the scorecard for the assessable record.

- **Source record list:** List of all records defined by the Table and Condition fields for the associated metric type. Note that the bubble chart only plots records for which there are assessment results. The assessment results are actually associated with the assessable records for each of the listed source records.
### Vendor Quality Bubble Chart

This chart illustrates the quality of vendors based on reliability and alignment. Each bubble represents a vendor, with size indicating market value.

Assessable record score summaries

Point to a bubble to display a score summary for the assessable record the bubble represents.

The summary displays the assessable record's average score for each category in the following order: X-axis category, Y-axis category, Z-axis category. The scores are based on data from the last 12 months.

Figure 430: Bubble chart score summary

View an assessment scorecard

The Assessments application prepares printable scorecards. A scorecard displays easy-to-interpret assessment results, in which the current calculated ratings for an assessable record are compared to previous ratings or to the ratings of other records.

Role required: assessment_admin or admin

Users can examine ratings over time, compare ratings for one assessable record with all assessable records in a table, or compare the ratings of two assessable records. All ratings are averages for the time range selected. The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed assessments and scripted metrics.

Administrators can display a scorecard for any table by creating a Related Link on assessable records. The system provides this link on the Company form by default when Vendor Performance is active.

The Vendor Performance application provides an enhanced scorecard view for vendors.

See Vendor Performance in Project Portfolio Suite.

1. Navigate to Assessments Assessable Records.
2. Open a record.

Create a link to a scorecard

Users with the admin role can create UI actions that allow users to view scorecards from tables.

Role required: assessment_admin or admin

1. Generate assessable records you want to evaluate.

   For example, you might create a metric type called Project to assess project management records.
2. Navigate to System Definition UI Actions.
3. Open the View Scorecard record.
4. Right-click the header bar and select Insert and Stay from the context menu to create a duplicate record.
5. Change the Table name to the table on which you want the UI action to appear. For example, you might select Project [pm_project].

![UI Action Image](image)

6. Do not edit the Action name field or the Condition script.
7. Save the record.
8. Navigate to the table on which you created the UI action and open an assessable record.
   a) In this example, navigate to Project Projects All.
   b) Open any record in the list.
   c) Click View Scorecard under Related Links to open the scorecard for that assessable record.

   The scorecard appears with the title in the form of <table display name> Scorecard. For example, a scorecard for an assessable record in the Project [pm_project] table is named Project Scorecard.

**Note:** Content does not appear in the scorecard unless the associated assessable record has assessment results or related live feed conversations.
9. Insert a new View Scorecard UI action record for each table where you want the related link to appear.

*Export a quiz scorecard as an image*

You can export scorecards as images.

**Role required:** assessment_admin or admin

1. Click the menu icon and select Save as PNG or Save as JPEG as the download format.
2. When the export is complete, select Download to save the scorecard image to a storage location.

---

**Assessment scorecard averages**

The Averages view compares the current ratings for an assessable record in each metric category with the average, minimum, and maximum values from all assessable records in the filter. All ratings are from assessments generated over the trailing twelve months (TTM).

Select a filter option to compare the current record against all assessable records in that filter. An assessment administrator configures these options in the Filter field field in the Assessment Metric Type form.

Rating variances are highlighted as follows:

- **Red:** Ratings are below average in this category. The Diff value displays a negative number.
- **Green:** Ratings are above average in this category. The Diff value displays a positive number.
- **White:** Ratings are average in this category. The Diff value is 0.0.
In the following example, the ratings of the current group are compared against other groups for which Don Goodliffe is the manager.

**Figure 431: Group scorecard with ratings filter**

*Assessment scorecard categories*

The Categories view displays a bar chart showing the average ratings for each category in the selected time interval.

Select from these reporting periods:

- All History
- Last 3 Months
- Last 12 Months
Figure 432: Scorecard categories

Assessment scorecard category metrics
The Category Metrics view displays the weighted average results for each metric within a category. Use this view to learn how individual metrics affect the overall rating for the category.

Select a metric category from the choice list to display the chart.
Figure 433: Scorecard category metrics

Assessment scorecard head-to-head compare view
The Head to Head Compare view allows you to compare the ratings of two assessable records of the same type. Select an assessable record from the choice list to compare against the current record's trailing twelve month (TTM) ratings.

Head to head compare
The Diff column displays the difference between each assessable record's most recent TTM ratings. By default, the system selects the first assessable record in the list when you open this view. The scorecard displays three years of ratings for the comparison record. All ratings are expressed as averages.
Overall Rating

The Overall Rating is calculated as:

\[
\text{Overall Rating} = \frac{\text{sum of normalized values in category result}}{\text{number of assessment groups}}
\]

In the following example, the calculation is

\[
\frac{(2.13 + 2.86 + 3.79 + 1.43 + 2.39 + 3.7)}{2} = 8.15
\]
<table>

<td>3.7</td>
</tr>
</tbody>
</table>

Figure 435: Normalized values
Figure 436: Overall Rating on the Group Scorecard

Assessment scorecard history
The History view compares the current ratings for each category with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the Diff column indicate the trend of the current assessment against the previous assessment.

- 3 Years: To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The Diff column shows the discrepancy between the current ratings and the previous calendar year's ratings.
Figure 437: Scorecard history - 3 years

- 4 Quarters: Quarterly assessments compare the average rating for each category in the current quarter against the average ratings from the previous four quarters. The Diff column shows the discrepancy between the current ratings and the previous quarter's ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the 3rd quarter of 2013, then the previous quarters appear as 2nd [2013], 1st [2013], 4th [2012], and 3rd [2012]. All four of the previous quarters appear, whether or not there was any data for those quarters.

Figure 438: Scorecard history - 4 quarters

*Live feed view of assessable records*

The live feed view displays live feed conversations that apply to the assessable record. Users can view the group feed, including tagged comments, and add comments of their own.
To configure a live feed view, an assessment administrator selects the Live feed check box on the Assessable Record form. Live feed is available on the scorecard even if there are no category results for the other views.

The live feed view provides these viewing options:

- My Feed: Displays the user's My Feed preferences.
- Company: Displays the user's company feed.
- Groups: Displays all available groups and gives the logged in user the option to leave or join a group. Select a group to display that group's conversations.
- Tags: Displays all the tags found in live feed comments. Click a tag to display the conversations containing that tag.
Figure 439: Live Feed group scorecard
Assessment scorecard ratings

The scorecard ratings section displays various ratings for the assessable record.

Select one of several views that present different ratings:

- Averages
- Categories
- Category Metrics
- Head to Head Compare
- History
- Live Feed

Some views display an overall rating column, which lists categories used to evaluate the assessable record. Only categories in which the assessable record has been evaluated appear on the scorecard. If the ratings section does not display any data, the assessable record or category results associated to the assessable record have been deleted.

Click a category to view the category record. Point to a category to display a line chart that shows the rating trend for that category.

Figure 440: Vendor scorecard trend chart

Set up and administer quizzes

Set up and administer quizzes.

Role required: assessment_admin or admin

1. Create reusable question templates for quizzes.
2. Create the quiz using the Quiz Designer or with forms accessed from the navigation menu.
   The quiz record includes specifics such as duration, notification preferences, a questionnaire introduction, and ending notes displayed to recipients.
3. Edit the default category or create additional categories as needed.
   The system creates a category with the same name as the quiz.
4. Define users for each category.
   These are the recipients who answer the questions in a category. You can define different users for each category.
5. Create the questions for each category.
6. Create the answers for each question and determine if the questions are scored.

   You can create unique answers or select preconfigured answers from a template.

Publish and distribute the quiz. You can send the quiz to a single user or all users in each category.

Review the results from the submitted quizzes in reports and scorecards.

Quizzes
Quizzes are questionnaires you can assign to one or more users to assess their knowledge of any subject. The quiz functionality is built on the assessment engine and provides many of the same features as assessments and surveys.

Each question is scored, and the overall score indicates the percentage of questions the user answered correctly. A quiz may have categories of questions that are assigned only to some users. You can assign weighting values to individual questions or categories of questions that make them more or less important when calculating the overall score. Quizzes require activation by a system administrator.

- An administrator can create a quiz for any purpose and assign it to a single user or multiple users.
- A quiz can contain one or more categories of questions. Each category can be assigned to users who answer only the questions in that category.
- The system can send email notifications to these users:
  - Recipients: The recipient can receive notification of an assigned quiz, a quiz whose allowed duration is at 50%, and a quiz that is overdue.
  - Recipient's manager: The recipient's manager can receive notification when a quiz is overdue.
  - Quiz manager: The quiz manager can receive notification of an overdue quiz to which he or she is assigned.

- Quizzes can contain questions that are scored or not scored. Unscored questions assess opinions or involve dates and are not counted in the final score. Scored questions specify correct answers and are scored either as 0% or 100%. You can apply a weighting scale to scored questions to establish their relative importance. You can designate questions with these data types as scored questions:
  - Checkbox
  - Choice
  - Duration
  - Likert Scale
  - Numeric Scale
  - Template
  - Yes/No

- A quiz question can be dependent on the response to any scored question. For example, you can create a dependent question requesting additional information that appears only if a recipient answers No to a specific question.

Important terms

The quiz application involves several terms.
Table 1029: Terms used in quiz application

<table>
<thead>
<tr>
<th>term</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quizzes</td>
<td>A quiz contains information such as duration, state, and notification controls and lists the existing categories. Text fields on the quiz form allow an administrator to create introductory content and end notes that are displayed to the recipient.</td>
</tr>
<tr>
<td>Categories</td>
<td>A quiz category represents a theme for quiz questions. Each category contains one or more questions and names the recipients for the questions in that category. By default, the system creates one category with the same name as the quiz. You can create additional categories as needed. Categories can be weighted higher or lower to determine the importance of that category in the overall score.</td>
</tr>
<tr>
<td>Questions</td>
<td>A quiz question is a question configured for a category and sent only to the users for that category. Questions have a wide variety of data types and can be individually weighted higher or lower. Questions may be scored or unscored.</td>
</tr>
<tr>
<td>Category user</td>
<td>A category user is the recipient of questions for a specific category. You can select different users to answer the questions for each category.</td>
</tr>
<tr>
<td>Templates</td>
<td>A template is a question data type that provides reusable rating scales for answers to questions. For example, the answer template named Satisfaction contains a satisfaction scale ranging from Very Satisfied to Very Dissatisfied.</td>
</tr>
</tbody>
</table>

**Quiz roles**

The Quizzes application uses these roles. No role is required to take quizzes that are assigned to you.

Table 1030: Quiz roles

<table>
<thead>
<tr>
<th>Role Title [Name]</th>
<th>Role Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>assessment administrator [assessment_admin]</td>
<td>Can administer the Assessments application and all quiz records. Can access all the modules of the Assessments application.</td>
</tr>
</tbody>
</table>

**Note:** The itil_admin role and the survey_admin role contain the assessment_admin role.
Role Title [Name]                           Role Description
Administrator [admin]                        Can access all aspects of the assessment and survey processes. Only administrators can modify survey notifications, create survey modules, and import surveys.

Data types for quizzes
You need to choose a data type for each quiz question. Various data types helps you collect and analyze different kinds of data.

Table 1031: Available data types

<table>
<thead>
<tr>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attachment</td>
<td>Question with a Manage Attachments icon that allows users to attach one or more files.</td>
</tr>
<tr>
<td>Boolean</td>
<td>Question with a check box or a Yes/No list for user responses.</td>
</tr>
<tr>
<td>Choice</td>
<td>List of predefined options. For more information, see the definition for Choices in the Create quiz questions on page 2354 topic. Multiple correct answers are supported.</td>
</tr>
<tr>
<td>Date</td>
<td>Date field.</td>
</tr>
<tr>
<td>Date/Time</td>
<td>Time and date field.</td>
</tr>
<tr>
<td>Number</td>
<td>Number field with predefined minimum and maximum values. The default is 1-10.</td>
</tr>
<tr>
<td>Percentage</td>
<td>Percentage field with a prescribed range.</td>
</tr>
<tr>
<td>Scale</td>
<td>Predefined Likert scale. Answer options appear as radio buttons. Multiple correct answers are supported.</td>
</tr>
<tr>
<td>Image Scale</td>
<td>Predefined set of images. Five emojis similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Multiple correct answers are supported.</td>
</tr>
<tr>
<td>Numeric scale</td>
<td>Selectable number scale. The default is 1-5. Answer options appear as radio buttons. Multiple correct answers are supported.</td>
</tr>
<tr>
<td>String</td>
<td>Single or multi-line text field.</td>
</tr>
<tr>
<td>Template</td>
<td>Choice list of templates that provide a predefined scale of options. For details, see Configure a template question. Multiple correct answers are supported.</td>
</tr>
<tr>
<td>Reference</td>
<td>Choice list of fields from a specified reference table. This data type does not support reference qualifiers.</td>
</tr>
</tbody>
</table>
Activate the quiz designer
Administrators can activate the Quiz Designer plugin.

Role required: assessment_admin or admin

1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
   - If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. If available, select the Load demo data check box.
   - Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
   - You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.
5. Click Activate.

Quiz Overview module
The Quiz Overview module is a homepage that displays various reports on data such as results for each category and quizzes that are complete, pending, or in progress.

Role required: assessment_admin or admin

Users with the assessment_admin role can view the overview page and refresh, add, delete, and rearrange widgets.

1. Navigate to Quizzes Overview.
2. Click elements within reports to obtain more information. The available reports are:

<table>
<thead>
<tr>
<th>Report</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quizzes by State</td>
<td>Assessment Instance [asmt_assessment_instance]</td>
</tr>
<tr>
<td>Total Questions by Quiz</td>

<td>Metric Results [asmt_metric_result]</td>
</tr>
<tr>
<td>Number of Incorrect Answers</td>
<td>Metric Results [asmt_metric_result]</td>
</tr>
</tbody>
</table>

Quiz designer
The quiz designer provides a single interface that users with the assessment_admin role can use to create, edit, and distribute quizzes.

You can also use it to edit existing quizzes and change scoring parameters.

Alternatively, you can use the modules of the assessment engine to create and edit the records that make up a quiz. All quiz records are stored in assessment tables and displayed in Quiz views of those tables. For details, see Create quizzes with forms.
Tools on the Quiz Designer

The quiz designer includes a design canvas, a header bar, and many controls that you can use to create quizzes.

To open the quiz designer, navigate to Quizzes Quiz Designer.

The designer contains the following elements:

- Controls
- Header bar
- Design canvas

Controls

Controls for the supported question data types are available in the Controls palette. Drag and drop a control onto the designer canvas to create a question of that type.
Table 1032: Question controls

</tr>
</tbody>
</table>

**Header Bar**

The header bar contains tabs that display different views and a menu of various functions.

Click one of the following tabs to change the view in the canvas:
• Design: Add categories and questions, and configure the properties of each. This is the default view of the canvas when you open the designer.
• Configuration: Create introductions and end notes for quizzes, and select a signature.
• Availability: Select the recipients for each category in the quiz.

Point to the menu icon (≡) in the in the upper right of the quiz designer to select the following options:
• Save: Saves the current quiz.
• Preview: Displays a preview of the quiz as it appears to the recipients.
• Publish: Distributes the quiz to the selected recipients.
• Save and Publish: Saves and distributes the quiz in one step.
• New Quiz: Opens a fresh canvas for a new quiz.
• Load Quiz: Opens a list of existing quizzes that you can select and edit.
• Copy Quiz: Creates a copy of the quiz.

The availability of each option depends on the status of the quiz that is opened in the quiz designer.

Design Canvas

New quizzes open in the Design view. The quiz Name field appears above first category in the canvas. A blank question field appears in the category container.

Create a quiz

When you create a quiz, you can create one or more categories and then add questions to each category.

Role required: assessment_admin or admin

Each category can be assigned to a different user or the same users. You can also customize each question and make it dependent on the response to another question.

Create a quiz using these procedures:

Create quiz categories

A category represents a theme for evaluating a specific element of the quiz topic and contains questions pertaining to that theme.

Role required: assessment_admin or admin

When you create a quiz, the system creates a default category, using the name of the quiz. You can use this category, modify it, or create additional categories as needed. To have any results, a category must contain scored questions.

1. Navigate either Quizzes Quiz Designer or Quizzes Quizzes and click Quiz Designer in the list header.
2. Enter the name of the quiz in the Name field. The system uses this name as the name of the quiz and the first category
3. To configure the category, click the gear icon in its title bar.

The Properties dialog box appears. You can change the name of the category, add a description for it, and enter text in the Details field that introduces or explains the category to the recipients. The system updates the category as you type.
4. Click the X icon to close the category properties dialog box and save your settings.
5. To add a new category, click the + icon in the title bar of an existing category.

Create quiz questions
You can create multiple questions for each category but each question can be associated with only one category.

Role required: assessment_admin or admin

The data type that you select for each question determines how it can be answered by quiz recipients.

You can designate questions to be scored. Only scored questions are shown in the quiz results and considered when calculating the category results. You must also specify a correct answer for scored questions.

**Note:**
To designate a question as scored, you must use Assessment forms. For instructions, see Configure a scored question.

1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.
2. To configure the question, click in the gear icon in its title bar. The Properties dialog box appears for the question.
3. Fill in the fields on the form, as appropriate.

**Table 1033: Question property fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>[Required] Name of the question. Create a concise and easily recognizable name for your question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.</td>
</tr>
<tr>
<td>Question</td>

<tr>
<td>Active</td>
<td>Check box that determines whether this question is available on a quiz. If a question is marked inactive, it does not appear on quizzes generated after the question becomes inactive.</td>
</tr>
<tr>
<td>Boolean option</td>
<td>Whether a check box or a Yes/No list appears as the option for the Boolean question.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box for requiring users to answer the question. Users cannot submit quizzes until they answer all mandatory questions, which are denoted by a red field status indicator. This field is available when the question does not have a dependency and the question Controls is not Boolean with a check box option.</td>
</tr>
</tbody>
</table>
| String option       | Setting for the appearance of a string field in a question. This field is available when the question type is String. The string options are:  
                      • Single line: Single line text field 40 characters in length that allows strings of any length.  
                      • String line wide: Full page width text field that allows a single line entry of any length.  
                      • Multiline: Full page width multi-line text field that allows word wrap and returns. |
<p>| Min                 | Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.                                           |
| Max                 | Highest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.                                           |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow not applicable</td>
<td>Check box for including Not Applicable as an option for this question. Users can select Not Applicable if they do not have sufficient information to respond to a question. User responses of Not Applicable are excluded from results calculations. This field is available when the question does not have a dependency and the question data type is not Boolean with a check box option.</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box for displaying answer options in a random order whenever the question appears in a quiz. Answer preference is sometimes influenced by the order in which options appear, which can result in biased results. Randomizing options can help prevent this bias. Note: Randomizing options for certain questions may make those questions confusing for users. In general, only randomize options that do not follow a logical order.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question that is displayed on the quiz. Include details that help users understand how to answer the question. You can also enter HTML text in this field with the WYSIWYG editor. For example, include HTML to embed links and images.</td>
</tr>
<tr>
<td>Correct answer</td>
<td>Answer option that you want to be selected by users. When you specify a correct answer for a question, the system scores the question. This field is available for all data types except Date, Date/Time, and String. Multiple correct answers are supported for a few data types. See data types.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Choices</td>
<td>Options for a question with a data type of Choice or Scale. The system automatically adds text and values that you can edit for each option. Click the + icon to add an option, or click the X icon to delete an option. By default, the system arranges options in the order established by their values. To change the order, drag and drop the options.</td>
</tr>
</tbody>
</table>

**Dependency**

| Displayed when | Condition builder that hides or displays the question depending on the answer to another question in the same category. Select an existing question from the list with a data type of Boolean, Choice, Scale, or Template. Create the condition that must exist for recipients to see the dependent question, using the is or is one of operator. The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A. |

4. To create any special conditions that must be met for a question to appear on the quiz, click the Dependency tab. Fill in the fields, as appropriate.

   Dependent questions appear on the quiz when a recipient selects a specific answer or combination of answers to another question in the same category

5. Select a question in the Displayed when field. The system selects the appropriate operator and displays the possible answers for the selected question.

6. Select the answers that satisfy the condition. Selected answers are indicated by a check mark.
7. Click X to close the question properties dialog box and save your settings.
8. To add a question with the same data type as an existing question in the category, click the + in the title bar of the existing question.
9. Drag questions to change their order within a category or move them between categories.
10. To delete a question, click the X in its title bar.

Configure a quiz
You can configure an entire quiz.
Role required: assessment_admin or admin
The values you enter and select on this page are applied to the entire quiz.
In the quiz designer, click Configuration and then fill in the fields as described in the table.

<table>
<thead>
<tr>
<th>Table 1034: Quiz designer configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>

</tr>
<tr>
<td>Manager</td>
</tr>
<tr>
<td>Notify manager if overdue</td>
</tr>
</tbody>
</table>
Select a quiz recipient
When the system distributes a quiz, it sends email notifications to the category users and their managers.

Role required: assessment_admin or admin

A category can have one or more assigned users, and the same user can be assigned to more than one category.

The system also creates a link to the quiz in the recipients’ My Assessments & Surveys portal. Users can only answer questions in the categories that they are assigned to.

To select the recipients for each quiz category, click Availability and then fill in the fields as described in the table.

**Table 1035: Select recipients**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select category</td>
<td>Category for which the selected users are recipients.</td>
</tr>
<tr>
<td>Add users</td>
<td>Users selected as recipients for this category. The choice list shows all users in the system.</td>
</tr>
</tbody>
</table>

Publish a quiz
When you publish a quiz, the system sends email notifications to the recipients and to their managers. A card in each recipient's My Assessments & Surveys portal displays a link to the quiz.

Role required: assessment_admin or admin

1. If you want to see the quiz as the recipients will see it, point to the menu icon in the upper right of the quiz designer and click Preview.
2. When you are satisfied with the quiz, click Save and Publish or Publish to distribute it.
Create quizzes with forms
As an alternative to the Quiz Designer, you can create a complete quiz using records in the Assessment application.

All the elements of a quiz, the categories, questions, and answers, are stored in tables used by the assessment engine and are displayed in quiz views of these tables. Users creating quizzes in the Assessment application must have the assessment_admin role.

Create a quiz using assessment forms by following the procedures in the order shown here:

• Create the quiz.
• Set up the categories.
• Create the questions for the quiz.
• Create the answers for the questions.
• Distribute the quizzes to recipients.

**Note:** The recommended method of creating and editing quizzes is to use the quiz designer, which provides a single, intuitive interface for creating and editing quizzes quickly. If you determine that you need to add specific features to your quiz not offered through the quiz designer, you can do so by using some of the specific procedures described here.

Set up a category
A category represents a theme for evaluating a specific element of the quiz topic and contains questions pertaining to that theme.

When you create a quiz, the system creates a default category with the name of the quiz. You can use this category, modify it, or create additional categories as needed. Categories are records in the Quiz view of the Metric Category table.

Categories have **weighting values** that contribute to the overall score for the quiz. By default, all categories are given a weighting value of 10. You can assign any weight to your categories. To have any results, a category must contain scored questions.

You can create a new category or edit an existing one from the Metric Categories related list of a quiz record.
Select a user for a category

Category users are the recipients of the questions for each category.

A category can have one or more assigned users, and the same user can be assigned to more than one category. When the system distributes a quiz, it sends an email notification, if configured, to the category users and creates a link to the appropriate questionnaire in their assessments and surveys portal. Users can only answer questions attached to their assigned categories.

To select users for a category, select the Users related list in a category record, and click Edit.
Create questions
A category can have multiple questions associated with it.

Each question can only be associated with one category. Each question has an answer data type that determines how recipients answer the question. Questions are records in the Quiz view of the Assessment Metric table.

To create questions, open a category record and create a question record from the Assessment Metrics related list. Alternatively, you can navigate to Quiz Management Questions and create a new record (see table).

**Warning:** When you create a Choice or Likert Scale question, you must reopen the Assessment Metric form after you submit it to create answers. If you distribute a questionnaire without creating the answers for questions with these data types, recipients are unable to answer the questions. If the questions are mandatory, the recipients are unable to submit their questionnaires.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>[Required] Name of the question.</td>
</tr>
<tr>
<td>Category</td>
<td>[Required] Category the question belongs to. The system populates this category if you create a new question from the Metric Category form.</td>
</tr>
</tbody>
</table>

**Note:** You cannot change the category if the Depends on field is set or if another metric depends on this metric.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Method     | Setting that determines how to use the question.  
- Assessment: Makes the question available on a quiz distributed to users. The Assessment method is compatible with all data types except Duration.  
- Script: Queries the database without user participation. Scripted questions are of limited value for quizzes, because they do not assess a user's knowledge of a topic.  

**Note:** If you select a Data type that is incompatible with the selected Method, the system automatically changes the Method to the correct value. |
| Weight     | Numeric value that represents the importance of this question relative to other questions in the same category. By default, the weight is 10. For weighting suggestions, see *weight categories and metrics*. This field is available and required unless the Data type is Date, Date/Time, or String. These data types are not included in results calculations. |
| Order      | [Required] Numeric value that determines the order of the question in the category. The question with the smallest order value appears as the first question in the category's section. By default, the order is 100.  

**Note:** It does not matter which order value you use for metrics with the Script method, because they do not appear on questionnaires. |
<p>| Active     | Check box that determines whether this question appears on quizzes. If a question is inactive, it does not appear on quizzes generated after the question becomes inactive. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mandatory</td>
<td>Check box for requiring users to answer the question. Users cannot submit questionnaires until they provide valid responses to all mandatory questions, which are denoted by a red field status indicator. This field is available only if the Method is Assessment, the Depends on field is empty, and the Data type is not Checkbox.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box for including Not Applicable as a possible answer for this question. Users can select Not Applicable if they do not have sufficient information to respond to a question. User responses of Not Applicable are excluded from results.</td>
</tr>
<tr>
<td>Question</td>
<td>The question that is displayed in quizzes. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question and what it evaluates. Include details that help users understand how to answer the question or when you need HTML enhanced details for your question. You can create HTML text in this field with the WYSIWYG editor, such as embedding links and images.</td>
</tr>
<tr>
<td>Depends on</td>
<td>An existing question that this question is dependent on. You can select Checkbox, Choice, Likert Scale, Template, and Yes/No questions from the same category as this question. Then use the Displayed when field to set the conditions for displaying this question. The system prevents the creation of recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.</td>
</tr>
<tr>
<td>Question Type</td>
<td>[Required] Format of the expected response data. See the table of data types for details.</td>
</tr>
</tbody>
</table>

**Note:** You cannot change the data type if another question depends on this question.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Randomize answers</td>
<td>Check box for displaying the possible answers for this question in a random order whenever the question appears. Answer preference is sometimes influenced by the order in which answer options appear, which can result in biased results. Randomizing answer options can help prevent this bias. This check box is available only if the Data type is Choice or Likert Scale. Note: Randomizing answer options for certain questions may make those questions confusing for users. In general, only randomize answer options that do not follow a logical order.</td>
</tr>
<tr>
<td>Scale definition</td>
<td>Setting that determines whether lesser or greater numerical values equate to a good score in quiz result calculations. Select Low if lesser numerical values are better. Select High if greater numerical values are better. The default value is High. This field is available and required unless the Data type is Date, Date/Time, or String. The results for these data types are not included in results calculations. When the Scored check box is selected, the scale value is set to High and the field is hidden. Note: For information about how to set the scale definition for data types that do not require you to set a numerical value, see Data types for assessments on page 2264.</td>
</tr>
<tr>
<td>Min</td>
<td>Lowest numerical value that can be used as an answer option. This field is available and required only if Data type is Number, Duration, or Percentage.</td>
</tr>
<tr>
<td>Max</td>
<td>Highest numerical value that can be used as an answer option or scaled value. This field is available and required if Data type is Number, Duration, or Percentage.</td>
</tr>
<tr>

<td>• Yes/No</td>
</tr>
<tr>
<td></td>
<td>Selecting this check box hides the Scale definition field and sets the value in that field to High.</td>
</tr>
<tr>
<td>Correct answer</td>
<td>[Required] Desired answer to a scored question. This field is available when the Scored check box is selected. Multiple correct answers are supported for a few data types. See Data types for quizzes on page 2348.</td>
</tr>
<tr>
<td>Template</td>
<td>Answer template to use with this question. This field is available when the Data type is Template.</td>
</tr>
<tr>
<td>Related List</td>
<td></td>
</tr>
<tr>
<td>Assessment Metric Definitions</td>
<td>List of options for this question. This related list is available only if the Data type is Choice or Likert Scale.</td>
</tr>
</tbody>
</table>

Create answers for questions

Questions with Choice or Likert Scale data types must have defined answer options, called metric definitions.

When you create a question with one of these data types, the Assessment Metric Definitions related list appears. Each metric definition appears as one answer option for a question on a quiz. For example,
the question What type of men’s trousers are not permitted by company policy? might have these three answers configured as metric definitions: Slacks, Jeans, and Casual cotton.

To create an answer option, open the question record you want to edit and click New in the Assessment Metric Definitions related list. Be sure to give each option a Value. The system uses this number to establish the order in which the answers appear in the quiz.

Distribute a quiz

When you finish configuring the answers for the quiz questions, you are ready to distribute the quiz.

You can send the quiz to all the category users configured for the quiz or to a single category user.

1. Navigate to Quiz Management Quizzes.
2. Open the quiz record, and click Publish. The quiz is placed in the Published state, and it is sent to all its category users. You can edit and resend published quizzes. See Modifying Published Quizzes to learn how various modifications affect the quiz contents.
3. To resend a quiz, click the appropriate button:
   • Assign Quiz: Send the quiz to one category user.
   • Send Quizzes: Send the quiz to all of its category users.

**Note:** These buttons are hidden if there are no category users defined for the quiz.
Modify a published quiz
Post changes to existing questions immediately. Make new questions available to users who have not started the quiz.

You can edit a quiz even after it has been distributed, with these results:

- Added questions are available only on quizzes that are distributed after this change.
- Changes to existing questions are immediately available to users before the quiz is submitted or during the retake period. This includes changes to the answers, such as additional choices or changes to the data type.
- Deleted questions are also deleted from the distributed quizzes in users' queues.

**Edit a quiz**

You can update a quiz after the quiz has been distributed.

Role required: assessment_admin or admin

You can only edit a quiz that has the same application scope as that of your current session.

- Questions that you add are available only on quizzes that are distributed after the update.
- Before a quiz is submitted or during the retake period:
  - Changes to existing questions are immediately available to users. This includes changes to the answers, such as additional choices or changes to the data type.
  - Deleted questions are deleted from distributed quizzes in users' queues.

**Open the quiz:**

Group the Service Details form with one of the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quizzes Quiz Designer</td>
<td>Point to the menu icon in the quiz header bar and select Load Quiz.</td>
</tr>
<tr>
<td>Quizzes Quizzes</td>
<td>Right-click a quiz in the list and select Quiz Designer.</td>
</tr>
<tr>
<td>Quizzes Quizzes</td>
<td>Open a quiz from the list and click Quiz Designer in the header of the Assessment Metric Type form.</td>
</tr>
</tbody>
</table>

**Configure a scored question**

Only scored questions are considered when calculating category and quiz results.

Role required: assessment_admin or admin

A question must have a correct answer specified to be scored. Only results for scored questions are displayed in the quiz scorecard.

1. Navigate to Quizzes Quizzes.
2. Open the quiz containing the questions you want to mark as scored.
3. In the Metric Categories related list on the Assessment Metric Type form, select the category for the questions you want to mark as scored.
4. In the Assessment Metrics related list on the Metric Category form, select a question from the list.
5. In the Question Type section of the Assessment Metric form, select the Scored check box.
   - This check box is not available if the question's data type is not supported for scoring.
6. Select the Correct answer for the question.
7. Click Update.
8. Repeat the process for all the questions in the category that you want the system to score.
9. Return to the list of metric categories, select another category, and configure scoring for the appropriate questions in that category.

Configure a template question
You can configure template questions when designing quizzes.

Role required: assessment_admin or admin

1. Drag the Template data type icon into a category container.
2. Click the gear icon in the question title bar to open the template properties dialog box.
3. Select a predefined scale from the list.

Question entry fields appear for that template.
4. Enter one or more questions that are appropriate for the template.
5. Click the arrow to the right of a question to configure its properties. You must provide a name for each question.
6. Click the up or down arrow to move between questions, or click the back arrow to return to the template properties dialog box.
7. Configure the properties for the remaining questions.
8. Click the X icon to close the template properties dialog box and save your settings.

Enable a quiz retake
You can configure a quiz to allow recipients to resubmit their answers as many times as they like, until the quiz’s due date.

Role required: assessment_admin or admin

Results are not calculated until the quiz’s configured duration has elapsed. The card in the user’s queue remains visible until the quiz’s due date and displays a button to allow retakes.

1. Navigate to Assessments Metric Definition Types.
2. Remove the Evaluation method = Assessment filter condition so you can see all the records in the list.
3. Open the quiz.
4. In the Assessment Metric Type form, select the Allow retake check box and save the record.
**View a quiz result**
You can view quiz results for each question and category, or view the quiz scorecard for a detailed breakdown.

Role required: assessment_admin or admin

Quiz results are stored in the Metric Result [asmt_metric_result] table and display recipients' answers to each question in a category.

Navigate to Quizzes Quiz Results.

---

**Quiz reports**

Quizzes provide several global reports so that assessment administrators can view important statistics.

You can share these reports with specific users or groups and change the display options.

For detailed field information and reporting options, click the link for the chart Type. To sort a column in ascending or descending order, click the arrow in the column heading.

View a quiz scorecard
You can view scorecards for a quiz record.
Role required: assessment_admin or admin

For detailed information about scorecards, see Quiz scorecards.

1. Navigate to Quizzes Quizzes.
2. Open a quiz record.
   The scorecard link is hidden if there are no quiz results to report.
4. The scorecard contains a header that displays the name of the quiz and a section that displays results or a comparison of ratings. You can select from these principal views:
   • Category Results
   • Question Results
   • Average Ratings
   • History

Quiz scorecards
The Quizzes application prepares printable scorecards.
A scorecard analyzes category and question responses and compares current ratings with previous ratings. You can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages for the time range selected.

The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed quizzes.

**Category results**
The Category Results view is a stacked bar chart of responses to all questions in a category.

Select the category to display from the choice list above the chart. Category results are only calculated for *scored questions*.

This view displays responses that use the following *data types*:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

**Note:** The Checkbox and Yes/No data types are combined into the Boolean data type in the *Quiz designer*. 

© 2018 ServiceNow. All rights reserved. 2379
Figure 442: Quiz category results
To view details about a specific response to a question, point to the colored segment representing a specific response. The chart displays the count for those responses and the percentage it represents of the total responses to that question.

Figure 443: Quiz category result details

Question results
The Question Results view shows the results for all questions in a quiz.
Select a question by name from the choice list to display the results in a pie chart or a bar chart, based on the data type.

Pie chart
The pie chart shows question results for these data types:
- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

Note: The Checkbox and Yes/No data types are combined into the Boolean data type in the Quiz designer
Figure 444: Quiz scorecard question results - pie chart
Bar chart

A bar chart appears when question results use this data type:

- Percentage

By default, all results for percentage questions use a report range of 20% segments. To configure a report range, navigate to Reports Administration Report Ranges.

Average ratings

The Average Ratings view displays a bar chart of the weighted average rating for each question in a category.

Use this view to learn how individual questions affect the overall rating for the category. Select a category from the second choice list above the chart. Ratings are only calculated for scored questions.
Figure 445: Average Ratings view

To view the effect of each question's ratings on the entire category's ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question's weighted average.
Scorecard history

The History view compares the current ratings for the categories and their questions with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the Diff column indicate the trend of the current ratings against the previous ratings. Ratings are only calculated for scored questions.

Point to a category to display a line chart that shows the rating trend for that category. Click a category to view the Metric Category form containing the questions.

- 3 Years: To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The Diff column shows the discrepancy between the current ratings and the previous calendar year's ratings.
Figure 448: Scorecard history - 3 years

- 4 Quarters: Quarterly quizzes compare the average rating for each question and category in the current quarter against the average ratings from the previous four quarters. The Diff column shows the discrepancy between the current ratings and the previous quarter's ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the 3rd quarter of 2013, then the previous quarters appear as 2nd [2013], 1st [2013], 4th [2012], and 3rd [2012]. All four of the previous quarters appear, whether or not there was any data for those quarters.
View an assessment category result

Category results contain values that represent an evaluated record's performance in a specific metric category. Each category result record stores data from one assessment group. Category result values are calculated based on category and metric weights and from metric result values for the same category.

Role required: assessment_admin or admin

---

**Note:** The system does not include metric results from certain responses in category result calculations. To compensate, the system adjusts the weight of the other normalized metric result values within the same category.

1. Navigate to Assessments Results Category Results.
2. Click the reference icon (ildo) next to an assessment group number to open the category result record.
3. View the Assessment Category Result form. All fields on the form are read-only.

Table 1037: Assessment Category Result form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>Name of the metric category that the category result values apply to.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Rating</td>
<td>Rating is used on scorecards and decision matrixes. Rating is updated dynamically as users complete assessments. Rating is calculated as:</td>
</tr>
<tr>
<td></td>
<td>(Sum of all normalized values that share a particular assessment group, category, and assessable record) / (Number of assessment instances for the assessment group)</td>
</tr>
<tr>
<td></td>
<td>For example: In the Assessment Category Results table example, the assessment group ASG0000801 with category Politeness from group NY DB (the assessable record) has a Rating value 8.86.</td>
</tr>
<tr>
<td></td>
<td>On the associated Metric Results table, you can see that there are 4 instances of this group: AINST0000801, AINST0000802, AINST0000803, and AINST0000804.</td>
</tr>
<tr>
<td></td>
<td>The system calculated the rating using (5.14+5.14+1.43+5.71+5.14+4.29+4.29+4.29) / 4 = 8.86</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment group</td>
<td>Assessment group to which the category result is associated. The category result Rating and Normalized value are calculated from metric results in this assessment group only.</td>
</tr>
</tbody>
</table>
| Normalized value    | Calculated value that measures the Rating relative to the weights of categories used to assess the record evaluated. The normalized value is calculated as follows: 

\[
\text{Normalized value} = \text{Rating} \times \left( \frac{\text{Associated category weight}}{\text{Sum of weights of all categories the source record has category results for in this assessment group}} \right)
\]

Example: A source record has four associated category results in assessment group ASG0000907, one for each of these categories:

- Importance Rating (weight = 10)  
- Product Reliability (weight = 9)  
- Company Alignment (weight = 9)  
- Compliance Score (weight = 9)  

If this source record's category result for Product Reliability has a Rating of 7.81, the normalized value calculation is: 

\[
7.81 \times \left[ \frac{9}{(10+9+9+9)} \right] = 1.9
\]

<table>
<thead>
<tr>
<th>Weight</th>
<th>Weight of the associated category. You may need to configure the form to see this field.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source</td>
<td>Record evaluated as the assessment subject. You may need to configure the form to see this field.</td>
</tr>
</tbody>
</table>

### Create a decision matrix

The name and labels on a decision matrix are closely linked to the categories you choose for the axes. For that reason, first select the metric type and define the X and Y axes before you fill in other fields on the Decision Matrix form.

Role required: assessment_admin or admin

1. Navigate to Assessments Admin Decision Matrixes.
2. Click New and then select the metric Type to plot results for.
3. Right-click the form header and select Save. The X Axis and Y Axis related lists appear.
4. Define which metric categories the axes represent. Each axis can represent a single category or multiple categories. You must specify at least one category per axis in order for the decision matrix to render properly.
The available categories are limited to those associated to the metric type selected. To avoid confusion, always update the text for the axis and quadrant labels after editing or adding metric categories to an axis.

Figure 450: Decision matrix axes

5. Fill in the remaining fields on the Decision Matrix form (see table) and save the record.
## Decision Matrix

**Name:** Importance vs User Satisfaction  
**Type:** Vendor  
**Quadrant Design**
- **Quadrant label color:** #333333  
- **X-Axis label:** Importance  
- **Y-Axis label:** User Satisfaction  
- **Plotted item color:** #666666  
- **Highlight item color:** Purple  
- **Top left label:** Low importance, high satisfaction  
- **Top right label:** High importance, high satisfaction  
- **Bottom left label:** Low importance, low satisfaction  
- **Bottom right label:** High importance, low satisfaction

<td>Lists categories that define the X-axis of the decision matrix.</td>
</tr>
<tr>
<td>Y Axis</td>
<td>Lists categories that define the Y-axis of the decision matrix.</td>
</tr>
</tbody>
</table>
**Decision matrixes**

Assessment results obtained by questionnaires and scripted metrics can be mapped to decision matrixes. Assessment administrators can view and create these dynamically updated graphs, which make it possible to compare assessable records by category. Decision matrixes display data from a trailing twelve month (TTM) period.

---

**Note:** Assessment administrators can access decision matrixes through the Assessment application and vendor managers can access them through the *Vendor Performance* application.

---

**Decision matrix components**

The decision matrix page has these components:

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Options</td>
<td>Select the subset of assessable records you want to view. The filter options available vary by metric type, based on the Filter field and Filter condition field settings for each type. The maximum values in the filter are controlled by the Maximum number of items to show for a decision matrix field filter property (com.snc.assessment.decision_matrix_filter_max_entries), which has a default value of 1000.</td>
</tr>
<tr>
<td>Filter</td>
<td>Select the scale for the decision matrix. The greater the scale, the larger the decision matrix appears.</td>

<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Plotted items</td>
<td>The labeled points you see on a decision matrix, called plotted items, represent averages of category result data for assessable records. Point to a plotted item label to view a rating summary for that assessable record. Click a plotted item label to view the scorecard for the assessable record.</td>
</tr>
</tbody>
</table>
Plotted item rating summaries

If you point to a plotted item label on a decision matrix, a rating summary appears. The summary displays the assessable record's average ratings for each axis. If an axis represents one metric category, the ratings are calculated averages from results for that category. If an axis represents multiple categories, the ratings are calculated averages from weighted results for all of the categories.

The summary shows:

- Current rating
- Difference between the current rating and the rating from the previous year
- Ratings from each previous year, going back three years

Figure 451: Decision matrix rating summary

Take an assessment

Assessments that are assigned to you appear in your assessment and survey queue as a card that displays the assessment name, state, due date, and the associated incident number. Click Take Survey when you are ready.

Role required: none
Overdue surveys and assessments are marked with a red icon and red due date. You must answer every required question, indicated by a red bar, before you can submit the assessment as complete. If you start to take an assessment but cannot complete it, save your responses and return to it later. When you have answered all the questions and are satisfied with the responses, submit the assessment.

By default, you cannot modify your answers to an assessment after submission. However, if the administrator has configured an assessment to allow retakes, you can edit your answers and resubmit the questionnaire. Completed assessments configured for retake remain in the queue until their due date and display the Modify Assessment button on the card.

1. Navigate to Self-Service My Assessments & Surveys.

   **Note:** Users with the assessment Admin role can display other users’ assessments and surveys in addition to their own. Use the Show all and Show assigned to me related links to show and hide assessments and surveys. Click a card assigned to another user to open the associated metric type or survey definition.

2. On the assessment card, note the due date.

   **Note:** Depending on the configuration, you may receive email notifications to remind you of the due date.

3. Click Take Assessment to open the questionnaire.

   Assessment questionnaires are arranged in sections: first by record, then by category. Each record appears as a section title. Questions for the record appear below, grouped by category. Each category appears as a subsection below the record name. Click the collapse icon (:hidden) or expand icon (:[hidden]) to hide or show the questions in a category, or all the categories and questions for a record. Colored bars indicate the status of each question.
4. Answer each question to the best of your ability. Point to a question for more information.

If you are unsure of how to respond to a question or if a question does not apply to a particular record, select Not Applicable, if available.

5. Read any assertions present at the end of the assessment and acknowledge with a signature, if required.

A signature can require you to select a check box or authenticate your full name, which the system displays in a read-only field. You cannot submit your answers to the assessment until you provide the required signature.
6. Save or submit the assessment.
   - Save: Saves your responses without submitting them. You can close the questionnaire and access it later from your queue.
   - Submit: Submits the completed assessment when you are finished.

7. If prompted, enter your user name and password to verify your full name signature.
   If all the questions are answered with valid values, a success message appears. If the system detects an unanswered mandatory question or invalid response, the assessment is not submitted, and a message appears at the top of the questionnaire explaining the error. Questions with problems are temporarily highlighted.

8. You can modify your responses to the assessment until its due date. To update your answers and resubmit an assessment that permits retakes, click Modify Assessment.
Assessment questionnaires

In the assessment process, users complete assessment questionnaires on topics of interest to provide subjective data for future business decisions.

No special role is required to complete an assessment. You are eligible to complete assessments that are assigned to you. For example, you might be expected to evaluate vendors your organization works with, based on traits related to customer service. The system stores your responses so decision makers can compare the performance of the items you evaluate. You and your manager may receive email notifications as reminders of important assessment information.

Metric types and assessable records

In the Assessments application, assessment administrators create and administer metric types and assessable records.

A metric type defines a set of records an organization wants to evaluate, such as vendors, projects, or employees. For each type, the system generates unique assessable records that link the type to records that need to be evaluated, such as the individual records for the vendors Amazon and Intel. There may be multiple assessable records for the same source record if the source record meets the criteria for more than one type. For example, you might want to evaluate a record on the Company table, such as Intel, as a vendor and as a manufacturer, with different categories and metrics.

For configuration suggestions, see Assessment administrator tasks on page 2259.

Assessable records

An assessable record links a source record you want to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees.

You use assessments to evaluate the assessable record. The system generates assessable records from the source records that match the table and conditions set on the Assessment Metric Type form. You evaluate the assessable records with metric categories and metrics, which define traits and values to assess. For metric types with the On demand schedule type, you can generate on-demand assessments from the Assessable Record form. This method of assessment generation makes it easy to create and preview short questionnaires or to quickly obtain assessment results for specific assessable records.

You can set up an assessment description that includes information from multiple fields on an assessable record and is displayed on multiple lines. This set up provides the user who is taking the assessment with a more detailed and understandable description of the information being requested on the assessment questionnaire. Create a multi-line description using table titles, which can be defined to use one or more fields from the selected table. See Define a new smartphone table title for more information.

Delete an assessable record

When you delete an assessable record, the system deletes any stakeholders for the record.

Role required: assessment_admin or admin

Note: If a source record is deleted, the system deletes the associated assessable record. To delete the source record, you must first delete all associated metric results and category results.

Delete the assessable record:

- To delete a single record, open the record and click Delete.
- To delete multiple records, use the Assessable Records list.
View an assessable record

View the Assessable Record form to edit preferences and perform various actions.

Role required: assessment_admin or admin

1. Navigate to Assessments Assessable Records.
2. Open a record from the list.
   By default, the list displays only assessable records with Active metric types.
3. On the Assessable Record form, edit fields and perform other actions as necessary (see table).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>[Read-Only] Assessable record name based on the display value of the source record. The name appears on assessment questionnaires.</td>
</tr>
<tr>
<td>Source</td>
<td>[Read-Only] Source record the assessable record is linked to. The Source reflects the table name and source record display value. For example, if the Name field is the display value for the Company table, the assessable record for a company record named Amazon has the Source value Company: Amazon.</td>
</tr>
<tr>
<td>Live feed</td>
<td>Check box that, when selected, creates a live feed group for the assessable record, which appears on the scorecard. If you clear the check box after a live feed group has been created, the system deletes the live feed group and all its messages.</td>
</tr>
<tr>
<td>Type</td>
<td>[Read-Only] Metric type from which the assessable record was generated.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Decision matrix</td>
<td>Check box that, when selected, enables this assessable record's results data to appear on decision matrixes of the same metric type. Decision matrixes are graphs that plot the assessment results for multiple assessable records. If you clear the check box, the assessable record still appears on the default decision matrixes if you click the View Matrix related link on the assessable record's scorecard.</td>
</tr>
<tr>
<td>Live feed group</td>
<td>[Read-Only] Live feed group for this assessable record. When you select the Live feed check box and save the record, the system populates this field.</td>
</tr>
</tbody>
</table>

**Related Links**

- **View Scorecard**: Opens the scorecard for the assessable record.

**Related Lists**

- **Category**: All metric categories associated with the assessable record. An assessable record must be associated to a category to be evaluated. Click Edit to add or remove category associations. Note that it is often more efficient to associate assessable records to categories using the Metric Category form.

- **Category users**: All stakeholders who can take assessment questionnaires about this assessable record. Click Edit to create and delete stakeholders. For more information about this and other methods of creating stakeholders, see [Stakeholders](#).

Domain separation and Assessments

This is an overview of domain separation and Assessments. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

**Overview**

Support: Level 2
Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

As an assessment creator, assessment_admin can create or edit an assessment in their assigned domain. A Global domain assessment_admin can create or edit assessment in any domain.

As an assessment taker, a user in a particular domain can see assessable records in the Global domain, in the user's domain, and in any child domains. Users in the Global domain can see all assessable records.

**How domain separation works in Assessments**

If the metric type is global:

- All the categories and metric should be Global
- Assessable records can be from different domains
- When the assessment is assigned to a user, then:
  - Users in the Global domain can see all assessable records
  - Users in a particular domain can see assessable records in the Global domain, in their domain, and in any child domains
  - If the user does not have access to any of the assessable records (for example, the metric type is Global, but all assessable records are in Acme domain and a user in the XYZ domain is assigned the assessment), the assessment instance is not created and an "Instance could not be created" error message occurs.

If the metric type is not Global:

- All categories and metrics must be in the same domain as the metric type
- All assessable records must be in the same domain as the metric type
- You can assign assessments to users that are in the Global domain, in the domain of the metric type, or in any parent of the domain of the metric type

**Approvals**

Approvals can be defined for all tasks and allow users or groups to be associated with a task, for the purpose of either approving or rejecting that task. Approvals are defined by navigating to System Policy Approvals.

The following information defines an approval:

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approver</td>
<td>A reference to the user who is responsible for approving the related record.</td>
</tr>
</tbody>
</table>
Approval engines

The differences in the way that companies handle their approvals, as well as the differences between approvals for the various applications (such as Service Catalog Requests and Change Management), calls for supporting flexibility in setting up approvals within applications. This flexibility is provided through the selection of an "approval engine" that is used to manage the approvals for each of the Task tables (that is, all tables that extend the Task table).

There are three different approval engine options available for each Task table.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval Rules</td>
<td>A simple set of rules that are evaluated until one matches for the Task table. The matching approval rule is used to create the users that are to approve the task. Set up approval rules by navigating to System Policy Approvals.</td>
</tr>
<tr>
<td>Process Guides</td>
<td>A sequence of approval steps over which you may control how approvals and rejections are handled. This option is deprecated and should not be used.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Turn off Engines</td>
<td>Turn off both approval engines for this Task table. This option should be selected and is made read-only when a workflow is used to manage the approval process for the table.</td>
</tr>
<tr>
<td></td>
<td><strong>Caution:</strong> Not turning off the approval engines might have a performance or behavioral impact on your instance.</td>
</tr>
</tbody>
</table>

Set up an approval engine

To manage the approvals for each of the Task tables in the system, set up an approval engine.

1. Navigate to **System Properties Approval Engines**.

   The following page appears with the Approval Engine option for each Task table in the system. If the Approval Engine option is greyed out and shows Turn engines off, read the Notes in the same row. The most common reason an approval engine is turned off is that a workflow is managing the approvals on the table. Having the approval engine turned off prevents conflicts with the workflow that could cause a range of issues. If you want to use an approval engine on the table, set the workflow to inactive.
2. Select the *approval engine option* for each Task table from the choice list.

3. Click Save.
   These preferences are saved as system properties that are named `glide.approval_engine.<table_name>`. 
**Approval rules**

Many organizations rely on an approval process to ensure that requests are reasonable and fit an organization’s budget.

The service catalog can use these classes of approvals:

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gating approvals</td>
<td>Must occur before a request can be initiated. For example, allow a manager to reject an employee’s request for a company car.</td>
</tr>
<tr>
<td>Process approvals</td>
<td>Take place within an execution plan process that has been initiated. For example, allow the security group to reject a request for access to SSN even though the employee’s manager approved it.</td>
</tr>
</tbody>
</table>

**Note:** To enable approval processes to operate smoothly, make sure that the appropriate users have the correct role, and that the role grants access to the necessary tables for users in all the relevant departments and domains.

**Set automatic approval rules**

Approval rules can automatically set the approval state to something other than Not yet requested. As a result, an approval rule can create a set of approvers. You can also start the approval process by setting the approval state to Requested.

**Prerequisites**

Role required: admin

Approval rules have two new fields:

- Run rule before: If true, the approval rule runs before the record is inserted/updated.
- Set State: If this rule applies, then the task record’s approval state is automatically set to this value.

**Note:** The Set State field only behaves as expected if the Run rule before check box is enabled.

- In the example below, this rule automatically sets the state of the task to Approved thereby auto-approving the task.
Gating approvals

A gating approval acts as a gate through which a request must pass before it can start. Until all gating approvals are met, no notifications go out, no tasks get sent to technicians, and nobody starts working on the request in question.

Generate gating approvals with:

**Table 1043: Gating approvals**

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval rules</td>
<td>Can apply to the service catalog as well as any other task table.</td>
</tr>
<tr>
<td>Item-based approvals</td>
<td>Flag specific catalog items as requiring specific approvals. Any requests for these items automatically require these approvals.</td>
</tr>
</tbody>
</table>

*Set up a gating approval via an approval rule*

You can set up a gating approval via an approval rule.

Role required: admin

1. From the left navigation pane, select System Policy Approval Rules.
2. Click New.
### Table 1044: Approval rules

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Name of this rule.</td>
</tr>
<tr>
<td><strong>Table</strong></td>
<td>Task table to which this rule applies. For most service catalog approvals, select Request.</td>
</tr>
<tr>
<td><strong>Active</strong></td>
<td>Indicator of whether the rule is active (defaults to true).</td>
</tr>
<tr>
<td><strong>Run Rule Before</strong></td>
<td>Indicator of whether the rule runs before or after the request record is saved. For most approvals, select this check box.</td>
</tr>
<tr>
<td><strong>User</strong></td>
<td>User who must approve this request (can be empty).</td>
</tr>
<tr>
<td><strong>Group</strong></td>
<td>Group that must approve this request (can be empty).</td>
</tr>
<tr>
<td><strong>Set State</strong></td>
<td>Value of the approval field on the task in after this rule runs. In most cases, select Requested.</td>
</tr>
<tr>
<td><strong>Condition</strong></td>
<td>Condition under which the rule applies.</td>
</tr>
<tr>
<td><strong>Script</strong></td>
<td>An optional server script to programmatically specify who the approver should be. For example, for the one-line script current.requested_for.manager, ServiceNow checks the requested_for reference field on the current record. It then locates the manager field on the referenced record and assigns that person as the approver. For other examples, see the Script field on approval rules provided by ServiceNow.</td>
</tr>
</tbody>
</table>

**Note:** The list shows only tables and database views that are in the same scope as the approval rule.

**Notes and limitations:**

1. You can have as many rules as you want on a given table. If more than one rule applies, you'll get more than one approver.
2. You can't get duplicate approvers, for example, if two rules both want Fred Luddy to approve a particular request, the system will only create one approval entry for him.
3. By default all requests start out in a Not yet requested approval state. Approval notifications will not go out until the request's approval state is set to Requested. You can do that manually, or you can do it in script, but the easiest way to do it is to use the Set State field to automatically set the request to Requested.
Set up a gating approval based on the item being ordered
In addition to adding approvals via approval rules, you can also add approvals based on what kind of item is being ordered.

In addition to adding approvals via approval rules, you can also add approvals based on what kind of item is being ordered. We can, for example, specify that all Blackberrys need to be approved by David Loo.

To do so, navigate to the item in question and scroll to the related list of required approvers. There are two lists:

- Approved By Group: A list of groups that have to approve requests for this item
- Approved By: A list of users who have to approve requests for this item

![Figure 453: Approve list](image)

In the example above, this request must be approved by all members of the Hardware group and by David Loo.

Notes and limitations:

1. As with approval rules, you are protected against duplicate entries. Thus if David Loo is a member of the hardware group, as well as being a standalone approver, he will only get one approval request.
2. Item-based approved work in addition to rather than instead of approval rules so you can (and probably will) use both.

Process approvals

Once a request has passed its gating approvals, any relevant execution plans are initiated.

Those plans, in turn, create a sequence of required tasks. You can add an approval step to an execution plan, which is configured to occur at the appropriate point.

From the left navigation pane, select Service Catalog Execution Plans, and then select the plan to which to add an approval step. Then click the New Approval button.
The Approval Task screen appears. Just like a regular Service Catalog execution task, an approval execution task has:

- Name: The name of this task
- Order: Sequence of this task within the plan
- SLA: SLA to which this task applies
- Delivery Time: Time allowed for the completion of this task

After you create the task, right click the title bar and select Save. Two related lists appear at the bottom of the screen:

- Approved By Group: A list of groups that must approve the request before this task is complete
- Approved By: A list of users who must approve the request before this task is complete
### Figure 455: Approval task

In the example above, this security approval task must be approved by Fred Luddy.

**Note:** When an in-process approval is rejected, that particular line item is canceled as well, but the request itself isn't necessarily canceled. Thus if one ordered a blackberry and a laptop, and the blackberry was rejected, the laptop request would continue being processed.

### Approve with a process guide

Process guides work similarly to approval rules in that their execution is controlled via a condition. The default version of approval tasks allows you to specify that the approval in question be approved by:

1. One or more specific people
2. One or more groups of people

You can optionally use Process Guides instead of approval tasks. Process guides are more flexible in that they allow for:
1. "Any of" or "All of" approvals
2. Sequenced approvals

You can link a process guide to an execution task.
1. From the left navigation pane, select System Policy Process Guides.
2. Create a new guide.
3. Set the table to Catalog task.
4. Fill in a condition under which this guide should attach.

Example #1: Apply to all "Capacity Review" tasks.

```
Add Condition

- + State is Open
  - + and Delivery task is Capacity Review
```

Example #2: Apply to all "Capacity Review" tasks where the requester is in Atlanta.

```
Add Condition

- + State is Open
  - + and Delivery task is Capacity Review
  - + and Request item.Request.Requested for Location is Atlanta
```

Process guide tips and tricks:

1. All catalog tasks are generated when a request is first submitted, but tasks which aren’t active yet have a state of “pending”. So if you do not want to send out approval requests until a task has actually started, add "state=open" as part of your condition.
2. There is a "Default" process guide in the system for catalog tasks with a sequence number of 10,000. It behaves exactly the same way the old, pre-process guide code did in regards to approvals. Approvals are based on the execution of task-related lists.

Schematic of a hypothetical approval process

In the diagram below of a hypothetical approval process, the gating approval is color coded blue and an in-process approval is orange.
The approval summarizer formatter creates the summary at the bottom of an approval form. The approval summarizer displays different information depending on what is being approved, such as a change request or a service catalog request. Following are two examples.
figure 457: summary of a change request

<table>
<thead>
<tr>
<th>Summary of item being approved</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change Request</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Number</th>
<th>CHG0000001</th>
<th>Requested by</th>
<th>David Loo</th>
</tr>
</thead>
<tbody>
<tr>
<td>Affected CI</td>
<td>Sales Force Automation</td>
<td>Type</td>
<td>Normal</td>
</tr>
<tr>
<td>Planned start date</td>
<td>2016-07-27 16:00:00</td>
<td>Risk</td>
<td>High</td>
</tr>
<tr>
<td>Planned end date</td>
<td>2016-07-27 18:00:00</td>
<td>Impact</td>
<td>3 - Low</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Short description</th>
<th>Rollback Oracle Version</th>
</tr>
</thead>
</table>

| Description | Performance of the Siebel SFA software has been severely degraded since the upgrade performed this weekend. We moved to an unsupported Oracle DB version. Need to rollback the Oracle instance to a supported version. |
The Deny button allows the approver to deny one or more requested items in a multi-item request, before approving the overall request. If a requested item is denied, the workflow for that item never starts. The approver can then choose to Accept the item.

**Note:** When the overall request is approved, you must ensure this Deny button is hidden. If this button is used after request approval, the requested item workflow is canceled, leaving the stage in an inconsistent state. Similarly, the Accept button on requested items should only appear before the overall request is approved or rejected.

### Summarizers

Approval summarizers are stored in the Macro [sys_ui_macro] table.

From the left navigation pane, select System UI UI Macros. Summarizers use a naming convention of approval_summarizer_ + '<table_name>' (for example, approval_summarizer_change_request is the summarizer for change requests, while approval_summarizer_sc_request is the summarizer for service catalog requests).

Each summarizer is written in Jelly script, which is used to define internal forms. The script is stored in the large XML field at the bottom of the UI Macro form.

**Change a summarizer**

You can modify existing approval summaries to include additional information.

These are advanced customizations that might not be appropriate for all implementations, and require creating a custom form.

1. Navigate to System UI UI Macros.
2. Open the summarizer you want to change.
3. Copy the script to another location before editing, in case you need to revert it.
4. Modify the script.
5. Click Update.

Create a new custom summarizer
After you add a new table that has approvals to an instance, you can add a custom summarizer by creating a new UI macro.

approval_summarizer can only be used on approval forms in the global scope.

1. Navigate to System UI UI Macros
2. Click New.
3. Give the macro a name that follows the summarizer naming convention: approval_summarizer_<tablename>
4. Complete the rest of the form and click Submit.
5. Add the custom summarizer to the appropriate form.

Approval with e-signature
Approval with e-signature allows users to approve requests by re-entering their login credentials.

Approval with e-signature supports the following authentication credentials:

- User name and password matching a user in the local database.
- User name and password matching a user authorized by an external identity provider as part of a SAML 2.0 single sign-on integration.

Activate Approval with e-Signature plugin

The Approval with e-Signature plugin (com.glide.e_signature_approvals) allows users to approve requests by re-entering their login credentials.

Role required: admin

1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
   - If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. If available, select the Load demo data check box.
   - Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
   - You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.
5. Click Activate.

De-activate e-signatures

Use this procedure to de-activate e-signatures.

Although plugins cannot be removed, e-signatures can be disabled.

1. Navigate to System Definition E-Signature Registry.
2. Set Enabled to False on any tables where e-signatures are no longer required.

Use e-signature approvals

Users can approve requests with an e-signature.

Users can approve requests with an e-signature by:

- Selecting the Approve or Reject option on a list context menu.
- Clicking the Approve or Reject button on a form.
- Changing a request record's State to Approved in either the list-editor or form.

Selecting any of these options presents the user with an Approver Authentication window, which requests the user's credentials again.

Installed with approval with e-signature

Installing approval with e-signature installs certain properties.

- Module - E-Signature Registry
- UI Action - Approve (on table sysapproval_approver, with no action name)
- UI Action - Approve (on table sysapproval_approver, with no action name)
- UI Action - Approve (on table sysapproval_approver, with the action name authenticated_list_approval)
- UI Page - form_login_validate_dialog
- UI Page - login_validate_dialog
- UI page: saml2_esignature_login, the re-authentication page that appears when an approver tries to approve a request.
- Properties: see E-signature SAML properties
- Client Script - Authenticate Approver
- Script Include - User
- Script Include - UserAuthentication
- Processor: eSigSaml2AssertionConsumer

Installing the plugin also disables the two out-of-the-box Approve UI Actions on the sysapproval_approver table.

Select an approval table

By default, activating the Approval with E-signature plugin enables e-signature for all tables for which a previous approval exists.

E-signature approvals can also be enabled on a table-by-table basis. To enable e-signatures for a table:

1. Navigate to System Definition E-Signature Registry .
2. In Table name, use the drop-down list to select a specific table.

### Table 1045: Table Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>A table drop-down to select the table that requires e-signatures.</td>
</tr>
<tr>
<td>Enabled</td>
<td>If selected, e-signature is required. Clear this option to remove the e-signature requirement.</td>
</tr>
</tbody>
</table>
Set up an approval from a local database

Enable users to authorize e-signature approvals using local database credentials.

1. Activate the Approval with e-signatures plugin.
2. Create user records for approval users.

Use Multi-Provider SSO to set up an SSO approval for a SAML 2.0 authentication

An SSO approval with e-signature requires configuration on the SAML IdP and the ServiceNow instance. The SAML IdP must support and honor the forceAuthn attribute in SAML assertion requests. E-signature does not function without this IdP setting. To set up an approval with e-signature using credentials from a SAML 2.0 authentication:

1. Activate or upgrade to SAML 2.0 with the Integration - Multiple Provider Single Sign-On Installer plugin.
2. Activate the Approval with E-Signature plugin.
3. Navigate to Multi-Provider SSO Identity Providers and verify your 2.0 SAML IdP configuration Advanced tab shows the Force AuthnRequest attribute checked.
   Your SAML 2.0 IdP must support the Force AuthnRequest attribute, or e-signature is not supported.
4. On the eSignature Approval tab, enter the following e-signature SAML properties:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Assertion Consumer URL for eSignature authentication</strong></td>
<td>This property defaults to the appropriate URL. To configure this property, click the lock icon to make this field editable. After edits, click the icon to lock the field.</td>
</tr>
<tr>
<td><strong>Assertion Consumer Index for eSignature authentication</strong></td>

<td>When a user approves a request using eSignature, a dialog opens and a user can enter credentials. This setting controls the width of that dialog box. The default is 500.</td>
</tr>
<tr>
<td><strong>Authentication Pop-up Dialog Height</strong></td>
<td>When a user approves a request using eSignature, a dialog opens and a user can enter credentials. This setting controls the height of that dialog box. The default is 300.</td>
</tr>
</tbody>
</table>
5. Click the Generate Metadata button underneath the tabs to regenerate the service provider metadata. Copy this data and update it on the SAML IdP.

Set up e-signature approvals

The setup required depends on where user credentials are stored.

See the section that matches the source of your user credentials:

- Setting up approvals from a local database
- E-signature SAML properties

**Note:** ADFS 2.0 does not support re-authentication requests that E-Signature requires.

Approval status

The approval status of a change request is determined by looking at the current status of all the approvers.

If any approver has rejected the change, the approval status will be Rejected. If all approvers have approved the change, the approval status will be Approved. If all approvers are in the Not Requested status or if there are no approvers, the change status will be Not Requested, otherwise the status will be Requested.

For added flexibility when creating approvals, including the ability to set up an “one of” approval where only one person of a group of approvers needs to approve, consider using **Workflows**.

Generate an approval using approval rules

The system can automatically generate an approval request to individuals or groups when specific criteria are met. The automatic generation of approval requests is driven using the System Policy feature.

In the sample below, a change opened in the category network is assigned to the System Administrator:
Figure 459: Approval Rules

When an approver is automatically added based on approval rules, the status of the approval automatically defaults to "Requested".

Generate approvals using the approvers related list

It is possible to manually add approvers to a request.

Additional approvers can be added by clicking the Edit button in the Approvers section near the bottom of a request. When an approver is added manually, the status for that approver defaults to Not Yet Requested. When the status of the approver changes to Requested, the approver is sent an email requesting approval action.

Generate approvals using workflows

Workflows are a powerful and flexible method of generating approvals. Use workflows to create group approvals and user approvals.

A variety of variables are available to fine-tune the approval process, including the actions that occur when approval or rejection take place. When a workflow activity generates an approval record, the system populates the Workflow activity field on the approval record with a reference to the activity. Do not use this field when creating business logic. For more information, see Approval and Rollback Activities.

Note: Conflicts can arise when the approval process for a table is managed by both the workflow engine and the approval engine. In general, if there is a workflow that manages the approval process for a table, the approval engine should be turned off for that table.

Multiple approvers

With multiple approvers, all approvers must authorize the request before the status will change to "Approved".

Should any approver reject the request, the status will immediately be set to "Rejected".

Receive notifications

Individuals who are designated approvers automatically receive approval notifications, including approval status updates.

Approval notifications will be sent at the following times:
• When an individual is assigned as an approver either automatically or manually. If a group is chosen, then all members of the group will be sent an email. By default, the email an approver receives will contain a "mailto" link that will allow the approver to either approve or reject the request directly from their email system.
• When the request reaches approved status, the person assigned to the request will receive an email indicating it has been approved.

The details contained in the emails and the points at which they are sent can be tailored using System Definition Business Rules and System Policy.

Note for Blackberry users: In order to see the "mailto" links mentioned above to approve or reject a request (i.e. 'Click here to approve CHG55555' or 'Click here to reject CHG55555'), your Blackberry device must be using version 4.5 of their software which supports HTML emails. If your Blackberry device is using an earlier version, you will not be able to view or use the "mailto" links. However, as a workaround, users can reply to the email and add the statements state:approved or state:rejected within the body of the email before sending it to force the automatic approval/rejection functionality.

If you create an appropriate Inbound Email Action, you can let approvers respond to approval email notifications with a simple "yes" or "no" answer.

Dynamic approval forms

When you are looking at an approval request, the form has a context-appropriate summary of the item to be approved.

For example, if you're looking at a Change Management approval request, you'll see details from the relevant change request. For a Service Catalog approval request, you'll get details of the request.

<table>
<thead>
<tr>

Comments:

Looks good

Summary of Item Under Review:

Rollback Oracle Version

Performance of the Siebel SFA software has been severely degraded since the upgrade performed this weekend. We moved to an unsupported Oracle DB version. Need to rollback the Oracle instance to a supported version.

Figure 460: Change request approval example
Scripts and engines execution order

Scripts, assignment rules, business rules, workflows, escalations, and engines all take effect in relation to a database operation, such as insert or update. In many cases, the order of these events is important.

**Note:** Client-based code that executes in the browser, using Ajax or running as JavaScript, will always execute before the form submission to the server.

The order of execution is as follows:

1. **Before** business rules: Scripts configured to execute before the database operation with an order less than 1000.

2. **Before** engines. The following are not executed in any specific order:
   - Approval engine (for task and sys_approval_approver tables)
   - Assignment rules engine (for task tables)
   - Data policy engine
   - Escalation engine
   - Field normalization engine
   - Role engine - keeps role changes in sync with sys_user_has_role table (for sys_user, sys_user_group, sys_user_grmember, and sys_user_role tables)
   - Execution plan engine (for task tables)
   - Update version engine - creates version entry when sys_update_xml entry is written (for sys_update_xml table)
   - Workflow engine (for default workflows)

3. **Before** business rules: Scripts configured to execute before the database operation with an order greater than or equal to 1000.
4. The database operation (insert, update, delete).

5. *After* business rules: Scripts configured to execute after the database operation with an order less than 1000.

6. *After* engines. The following are not executed in any specific order:
   - Label engine
   - Listener engine
   - Table notifications engine
   - Role engine - keeps role changes in sync with `sys_user_has_role` table (for `sys_user`, `sys_user_group`, `sys_user_grmember` and `sys_user_role` tables)
   - Text indexing engine
   - Update sync engine
   - Data lookup engine inserts or updates
   - Workflow engine (for deferred workflows)
   - Trigger engine (for all Flow Designer flows)

7. Email notifications. The following are executed based on the weight of the notification record:
   - Notifications sent on an insert, update, or delete
   - Event-based notifications

8. *After* business rules. Scripts configured to execute after the database operation with an order greater than or equal to 1000.

**Geolocation**

The geolocation feature uses Google Maps to track users, plan efficient routes between locations, and assist in finding accurate travel times for applications that require this information, such as Work Management.

The system locates users from latitude and longitude information provided by their mobile devices or browsers. Tracking the location of certain users can improve business processes such as the completion of work order tasks. For example, in work management geolocation, the system updates an agent's position each time that agent updates a task record. When the system updates an agent's location frequently, agents and dispatchers can use features like auto-routing to create efficient schedules.

Geolocation features can be configured by users with the admin role.

**Activate geolocation**

An administrator can activate the Geolocation plugin.

1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
   - If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. If available, select the Load demo data check box.
Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.

You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.

5. Click Activate.

Installed with geolocation

Several component types are installed with Geolocation.

Modified by Geolocation

The Geolocation plugin adds a field called *Geolocation tracked* to the User [sys_user] table. This field allows the system to track individual users by their geographical coordinates.

Business rules installed with geolocation

Business rules are added with activation of Geolocation.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GeoLocation Data updated</td>
<td>User [sys_user]</td>
<td>Populates the Latitude and Longitude fields on the Geolocation History [geo_history] table when the Latitude and Longitude fields are updated on the User [sys_user] table.</td>
</tr>
</tbody>
</table>

Client scripts installed with geolocation

Client scripts are added with activation of Geolocation.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update Geolocation on Task</td>
<td>Task [task]</td>
<td>Populates the Latitude and Longitude fields on a user record with GPS coordinates when that user loads any record on the Task table or a table that extends Task. This occurs only when geolocation tracking is enabled for the user.</td>
</tr>
</tbody>
</table>

Properties installed with geolocation

Geolocation provides the following configurable properties in Geolocation Administration Geolocation Properties.

The Google Maps plugin provides additional *map properties* that are used to implement and control specific geolocation features. You must have a *private key* for Google Maps API for Business to take advantage of the properties listed here.
<table>

</tr>
</tbody>
</table>

Geolocation Google key

Geolocation requires a Google Maps API for Business license to enable the use of Google driving time estimates and to use Google Maps. Applications, such as Field Service Management, have functionality that requires this license.

If you are using auto-routing or auto-dispatch in Field Service Management, both the Google Maps API for Business private key and the client ID must be set for precise time estimates. Without these values, driving times for auto-routing and auto-dispatch are not available, and a rough estimate or fixed time is used. Use these properties, found in System Properties Google Maps Google Maps, to enable the geolocation feature.

- Client ID for Google Maps API for Business: Google client ID for your organization. This ID is from Google and starts with gme-, such as gme-mycompanyname.
- Private key for Google Maps API for Business: Key required to get accurate driving time estimates from Google for some features of Geolocation. An example of an encoded key is: vNIXE0xscrmjlyV-12Nj_BvUPaw=

Geolocation history

The Geolocation History [geo_history] table contains the history of each tracked user’s location over time.

To view geolocation history, navigate to GeolocationGeolocation History. The record list shows time stamped location data for all users configured for geolocation tracking.
The following system properties, located in Geolocation Administration Geolocation Properties, control the data that appears in this table.

- Minimum distance an agent must move to be considered in a new location (in meters): Perimeter that defines a single location in which multiple tasks are present. This property prevents the system from creating unnecessary history records when multiple tasks are in the same general location.
- Maximum distance an agent can be from a specific location and still be placed at that location (in meters): Distance that a user can be from a specified location and still be placed at that location when the system creates history data.
- Number of days to keep history data: Time period for which the system retains history data.
- Minimum amount of time between updating the user's location (in seconds): Time period the system waits before updating a user's location, regardless of how often the user accesses tasks.

Location tracking

Geolocation adds the Geolocation tracked field to the User form. In the default view of a user record, select the Geolocation tracked check box to enable location tracking for the user.

When a user has geolocation tracking enabled, the system updates the user's geographic coordinates whenever the user opens, or loads, a record from the Task [task] table or from a table that extends Task. After this initial update, the system continues to update the user's geographic coordinates at a recurring interval if the user does not close or reload the record. To edit the length of this interval, navigate to Geolocation Administration Geolocation Properties and change the setting for the property that regulates the update interval for the user's location. The default setting for this property is 300 seconds (5 minutes).

**Note:** The system can update geographic coordinates only for users who have location services enabled in their browsers. Even users who have the Geolocation tracked check box selected may be prompted by their browsers to share or withhold their location.

State flows

State flows enable an administrator to customize transitions from one state to another in tables derived from the Task [task] table and configure the system to perform work during transitions to specific states.

An example of a state transition is when the State field in an incident changes from Active to Awaiting User Info. An administrator might want to trigger an event during this transition or make a specific field mandatory when the incident reaches the end state.

State transitions in the Field Service Management application were reimplemented to use state flows. For information about customizing Field Service Management state flows, see State flow customization.

Installed with state flows

Several types of components are installed with state flows.

Tables installed with state flows

Tables are added with state flows.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>State Flow [sf_state_flow]</td>
<td>Contains state flow definitions. This table contains all state flow definitions, including those for work orders and work order tasks.</td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Work Order Flow [sf_work_order]</td>
<td>Contains state flow definitions for work orders. This table is installed when Field Service Management is activated.</td>
</tr>
<tr>
<td>Work Task Flow [sf_work_task]</td>
<td>Contains state flow definitions for work order tasks. This table is installed when Field Service Management is activated.</td>
</tr>
</tbody>
</table>

**Business rules installed with state flows**

Business rules are added with state flows.

<table>
<thead>
<tr>
<th>Business rule</th>

<td>Adds or deletes event rules, as the event field is updated.</td>
</tr>
<tr>
<td>Check Work Notes Rule</td>
<td>State Flow [sf_state_flow]</td>
<td>Adds or deletes work note rules, as the work notes for a state flow are updated.</td>
</tr>
<tr>
<td>Create Business Rule</td>
<td>State Flow [sf_state_flow]</td>
<td>Automatically creates a business rule when automatic conditions or script are present.</td>
</tr>
<tr>
<td>Create script for Field controls</td>
<td>State Flow [sf_state_flow]</td>
<td>Create scripts for field controls, when they are in use.</td>
</tr>
<tr>
<td>Create UI Action</td>
<td>State Flow [sf_state_flow]</td>
<td>Automatically creates a UI action when manual conditions or script are filled in.</td>
</tr>
<tr>
<td>Delete Related Elements</td>
<td>State Flow [sf_state_flow]</td>
<td>When state flows are deleted, delete all related client scripts, business rules, UI actions and overrides.</td>
</tr>
<tr>
<td>Remove script for Field controls</td>
<td>State Flow [sf_state_flow]</td>
<td>If all field controls are disabled, see if any of the client scripts should be removed.</td>
</tr>
<tr>
<td>State Change</td>
<td>State Flow [sf_state_flow]</td>
<td>Get the correct state choice value when the state is changed.</td>
</tr>
<tr>
<td>Business rule</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>----------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Update dependent records</td>
<td>State Flow</td>
<td>When a state flow is made active or inactive, ensure the business rule and UI actions are made active or inactive as well.</td>
</tr>
</tbody>
</table>

**Script includes installed with state flows**

Script includes are added with state flows.

**Table 1047: Script includes for state flows**

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>StateFlow</td>
<td>Implements state flows and supports creation of state flow elements, such as business rules, UI actions, dictionary overrides, and client scripts.</td>
</tr>
<tr>
<td>StateFlowAJAX</td>
<td>Allows access to state flow functionality from client scripts.</td>
</tr>
</tbody>
</table>

**Use state flows**

You can create custom state flows for any table that uses states.

Make state transitions occur in any order or skip specific states according to your business practices. State flows can manage the behavior of fields and field visibility on a task form. State flows can also trigger system events that perform work such as sending email notifications.

Administrators can configure state flows to:

- Limit the choice list for the State field to contain only those states that are valid for the flow.
- Define the behavior and visibility of specific fields on a task form when state transitions occur and for certain end states.
- Configure events that are triggered when a task changes states.
- Set up UI actions and business rules to implement certain state transitions, or while the task is in certain states.

The State Flow plugin installs records used by work management to control state transitions for work orders and work order tasks. For detailed information about using work management state flows, see State flow customization.

Creating and customizing state flows requires scripting knowledge. Users with the admin role can create state flow records.

**Dictionary overrides for state flows**

A dictionary override in a state flow defines the starting state for all new records in a specific table.

You set an override in tables that extend a base table only, so that your customizations are applied only to the extended table.

1. In a state flow record, select an Ending state.
   
   This is the override value which becomes the starting state for all new records in the table named.
2. Click Create Default Value.

The system populates the Dictionary override field with a value of state, which is the field in the task table affected by the override. The Dictionary override field is read-only. After the override is created, the system hides the Create Default Value button on all subsequent state flow forms for that table.

**Events triggered on state changes**

You can configure a state flow to trigger a registered system event when a task transitions from a starting state to a specified end state.

For example, you can use events to trigger email notifications and create script actions. When you attach an event to a state flow, the system creates a business rule called State Flow Events for <table name> for the table specified in the state flow. If you specify a start and end state, the business rule executes when the record transitions from the start state to the end state. If the state flow only specifies an end state, the business rule executes whenever that end state is reached. The system creates one business rule for all state flows containing events on a single table. When all events or all state flows on a table are deleted, the system deletes the business rule.

**Field controls**

You can define controls for individual fields that are enforced when a record transitions between states.

Settings in the Field Controls section of the State Flow form enable you to apply field controls when the system detects a specified state transition or when the end state is the current state when the form is opened. The control is applied only to existing fields on the form. State flows cannot add fields to the form.

For example, you might want the Problem field to be visible when an incident moves to the Awaiting Problem state. If the incident state changes to Awaiting User Info, you hide the Problem field and make the Caller field mandatory.

When creating field controls, configure state flow records with an ending state only and to create the correct behavior for every ending state you want to control. This configuration ensures that the field controls are set properly when the user selects a new state, and also when the user returns a record's State field to the original state. Only specify a full state transition, with both a starting and ending state, when you want a particular behavior for that precise state transition.

**Note:** State flows use client scripts to enforce field controls. It is possible that your settings can be changed by existing UI policies, which execute after client scripts.

The system creates the following objects, as needed, to enforce field properties in state flows:

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Business rule</td>
<td>State Flow Notes for &lt;table name&gt;</td>
<td>Enforces mandatory fields for the table on which that field behavior is defined.</td>
</tr>
<tr>
<td>Client script (onLoad)</td>
<td>&lt;table name&gt; state flow</td>
<td>Sets possible states and initial mandatory, read-only, and visible properties when a record is loaded.</td>
</tr>
</tbody>
</table>
### Rebuild state flows

You can rebuild state flows when a mismatch between existing and new sys_ids occurs.

When you use an XML file to import a state flow record into an instance, the system attempts to match the incoming states with existing states by comparing sys_ids. Because the sys_ids of items in a choice list can vary between instances, the system can fail to match the states, even though they are otherwise identical.

When matching fails, the start and end states of affected records are left blank or contain numeric values. To repair these records navigate to State Flows Admin Rebuild State Flows. This module runs a script that compares the numerical value of each item in the State field choice list until it finds a match in the imported state flow record.

### State flow cleanup

### Work notes

#### Create a state flow

Creating State Flows.

2. Fill in the fields, as appropriate.

   The system enforces the field controls with the same client script that filters the choice list for the State field.

#### Table 1049: Creating state flows

<table>
<thead>

<td>Script that defines what the UI action does when the conditions are true. This script runs when the user clicks a button or a related link.</td>
</tr>
<tr>
<td>UI action</td>
<td>[Read Only] Name of the button that the system creates to enable this transition. The system creates the label using the same name as the state flow record that created it.</td>
</tr>
<tr>
<td>Automatic condition string</td>
<td>Conditions for running the business rule that cannot be defined with the condition builder, such as evaluating if the proposed transition is a valid flow. This condition has an [and] relationship with the condition in the Automatic condition field.</td>
</tr>
<tr>
<td>Automatic condition</td>
<td>Conditions for running the business rule that can be defined for fields in the target table. This condition has an [and] relationship with the condition in the Automatic condition string field.</td>
</tr>
<tr>
<td>Automatic script</td>
<td>Script that performs additional work when the condition is true. This script can do tasks such as update the date and time the transition occurred or notify someone using email when a specific state change occurs. Automatic state transitions occur when changes are made to the task record.</td>
</tr>
<tr>
<td>Business rule</td>
<td>Name of the business rule created for this transition. Two conditions must be satisfied before this business rule can run. The task must be on a specific starting state, and the Automatic condition must be true. If both of these conditions are satisfied, the business rule performs the transition requested, using the starting and ending states from the State Flow form.</td>
</tr>
<tr>
<td>Field Controls (Determines field properties when a record transitions between states or reaches a specific end state.)</td>
<td></td>
</tr>
<tr>
<td>Mandatory fields</td>
<td>Makes the selected fields required when this transition occurs, or when the end state is the current state.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Read only fields</td>
<td>Prevents the selected fields from being edited when this transition occurs, or when the end state is the current state.</td>
</tr>
<tr>
<td>Visible fields</td>
<td>Displays the selected fields when this transition occurs, or when the end state is the current state.</td>
</tr>
<tr>
<td>Not mandatory</td>
<td>Makes the selected fields optional when this transition occurs, or when the end state is the current state.</td>
</tr>
<tr>
<td>Not read only</td>
<td>Makes the selected fields editable when this transition occurs, or when the end state is the current state.</td>
</tr>
<tr>
<td>Not visible</td>
<td>Hides the selected fields when this transition occurs, or when the end state is the current state.</td>
</tr>
</tbody>
</table>

3. Determine if you want the state transition method to be manual or automatic and open the appropriate section on the form.
   - Manual: Click Create UI Action to create a button on the task form that enables users to execute the transition manually. The system uses the value in the Name field as the label for the UI action. The UI action executes the script in the Manual Script field when the conditions are true. For example, a manual transition can create an Activate button when an incident is in the New state that enables a user to mark the incident as active.
   - Automatic: Click Create Business Rule to create the business rule. The business rule executes the script in the Automatic Script field when the conditions are true. For example, a business rule created by the system can set an incident state to Assigned when the Assigned to field is populated. Business rules are automatically deleted when the state flow record is deleted. For more information, see Business Rules.

4. Click Create Client Script to create the script that limits the values offered in a task record's State field to valid states for that transition.

5. Configure the fields in the Field Controls section to control how specific fields display when a task record changes states.

State flow cleanup

The business rules, client scripts, and UI actions that the system creates automatically to perform custom transitions exist only while the state flow records that use them are present.

When all the state flows on a table are deleted, the system attempts to delete any unnecessary programming elements that were created on that table, using these criteria:

<table>
<thead>
<tr>
<th>Element</th>
<th>Deleted When</th>
</tr>
</thead>
<tbody>
<tr>
<td>UI action</td>
<td>The state flow that created it is deleted.</td>
</tr>
<tr>
<td>Business rule</td>
<td></td>
</tr>
<tr>
<td>Dictionary override</td>
<td></td>
</tr>
<tr>
<td>Element</td>
<td>Deleted When</td>
</tr>
<tr>
<td>------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Business rule that processes events triggered by a state flow</td>
<td>All state flows for the table specified that have events configured are deleted.</td>
</tr>
<tr>
<td>Client script (onLoad)</td>
<td>All state flows for the table are deleted.</td>
</tr>
<tr>
<td>Client script (onChange)</td>
<td>All state flows with field controls are deleted.</td>
</tr>
<tr>
<td>Work notes business rule</td>
<td>All state flows with field controls or work notes are deleted</td>
</tr>
</tbody>
</table>

Work notes

Work notes are an important part of the state flow process and are used to communicate information about state transitions.

The state flow adds these work notes to the Work notes field of any task making this transition.

These rules apply to state flow work notes:

• For a state flow with no Starting state, the work note is added every time the task transitions to the Ending state.
• For a state flow with a Starting state and an Ending state, the work note is added only when the task transitions from that starting state to that ending state.
• If two state flows with work notes have the same Ending state, but only one has a Starting state, the system adds the work notes from the state flow with the starting state. This better matches the state flow work note to the more important transition between specific starting and ending states.

Domain separation and State Flows

This is an overview of domain separation and State Flows. Domain separation is not supported in this application. For more information, see Application support for domain separation.

Overview

Support: Data only

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

Survey Management

With the ServiceNow® Survey Management application you can create, send, and collect responses for basic surveys. If installed, you can also use the Survey widget to set up a survey within Service Portal.

Explore

- Assessments and Surveys release notes
- Upgrade to London
- Get started with Survey Management on page 2439

Set up

- Survey Management roles on page 2441

Administer

- Survey designer on page 2467
- Survey users and groups on page 2490
- Customize the appearance of a survey on page 2493
Get started with Survey Management

Two versions of the application are supported, Survey Management, which is the latest version, and Legacy Surveys. Survey Management improves the user interface and extends the capabilities of the Legacy Surveys application.

Note: Survey Management does not support domain separation.

Configuring surveys

There are many options for advanced configuration in Survey Management:

• Create a survey, add questions, and choose recipients, all in one interface.
• Create conditional questions, which appear only when users answer other questions a certain way.
• Restrict a survey so only specific survey users can take it, and send invitations to those users simultaneously. Alternatively, make the survey a public survey so that any user can take the survey, even users who have not logged in to the ServiceNow system.
• Set a schedule to automatically assign a survey to users and to limit how often the same user can take a survey.
• Customize the look and feel of survey questionnaires.
• Save anonymous survey responses.
• Convert survey responses to numerical scores and view them on scorecards.
• Deactivate a survey for maintenance or to retire it without deleting it.
**Note:** Because surveys use the same tables and other back-end components as assessments, you may see assessment elements such as table and field names in certain places throughout the survey feature.

---

**Legacy Surveys**

Survey administrators can continue to use legacy survey functionality and data, however, it is recommended that you migrate legacy surveys to the Survey Management application. Concurrent use of both survey applications can cause confusion and redundancy.

Survey wizards are not impacted and cannot be migrated.

**Note:** The Legacy Surveys application is not described in the documentation that you are viewing. It is documented on the ServiceNow wiki.

</tbody>
</table>

Survey questionnaires

All surveys that are assigned to you appear in your personal assessment and survey queue.
No special role is required to complete a survey but you must be logged in and the survey must be assigned to you. When you submit a survey, the system stores your responses.

**Survey notification**

If the system is configured to send email, it sends you a notification when a survey is assigned to you. The message contains a link to the survey and instructions for viewing the assessment and survey queue.

*Take a survey*

Surveys that are assigned to you, and that are not complete, appear in your assessment and survey queue.

Role required: none

Each assessment or survey appears as a card in the queue. The card contains helpful information, including the survey name, state, and due date, and a button to launch the questionnaire. Overdue surveys are clearly marked with a red icon and red due date. You must answer every mandatory question, indicated by a red asterisk, before you can submit the survey. If you start to take a survey but cannot complete it, save your responses and return to it later. When you have answered all the questions and are satisfied with the responses, submit the survey.

1. Navigate to **Self-Service My Assessments & Surveys**.

   Users with the assessment_admin role, including survey administrators, can display other users’ assessments and surveys in addition to their own. Use the Show all and Show assigned to me related links at the bottom of the queue to show and hide assessments and surveys. Click a card assigned to another user to open the associated metric type or survey definition.

2. Click **Take Survey** on a survey card to open the questionnaire.

   If there is more than one survey category, you can click the collapse or expand icon to hide or show the questions in the category.

3. Answer each question to the best of your ability.

   If you are unsure of how to respond to a question or if a question does not apply to a particular record, select Not Applicable, if available.

4. Complete one of the following steps.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Save your responses without submitting them</td>
<td>Click Save. You can close the questionnaire and access it later from your queue.</td>
</tr>
<tr>
<td><strong>Note:</strong> The system does not save the survey if there are invalid responses, such as a letter in a date field. You must enter valid responses or remove invalid responses before you can save the survey.</td>
<td></td>
</tr>
<tr>
<td>Submit the survey after answering all questions</td>
<td>Click Submit. You cannot return to the questionnaire after submitting.</td>
</tr>
<tr>
<td><strong>Note:</strong> If there is an unanswered mandatory question or an invalid response, an error message appears and the problematic questions are temporarily highlighted.</td>
<td></td>
</tr>
</tbody>
</table>
Domain separation for Survey Management

This is an overview of domain separation as it pertains to Survey Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

Support: Data only

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

As a survey creator, survey_admin can create surveys in the assigned domain. A Global domain survey_admin can create or edit surveys in any domain.

As a survey taker, a user can access the survey record and take the survey based on the domain of the survey record and user. Global domain users can take a survey in any domain.

How domain separation works in Survey Management

There are several main areas to consider in how domain separation works in Survey Management.

Survey Management in domain-separated instances

The following domains are available by default after activating the Domain Support-Domain Extensions Installer [com.glide.domain.msp_extensions.installer] plugin. Only ServiceNow employees can activate this plugin.

- Global
- Acme
- Cisco

Access to surveys in domain-separated instances

Based on the domain of the survey record and users, users can access the survey record and take the survey.

Global domain users can access survey records in any domain. Users in any other domain can access records in their domain and Global domain. For example, users in the Acme domain can access records in the Acme domain and the Global domain.

Global domain users can take a survey in any domain. Users in any other domain can take surveys in their domain as well as the Global domain. For example, users in Acme domain can take surveys in the Acme domain and the Global domain.

<table>
<thead>
<tr>
<th>Location of the survey record</th>
<th>Users who can access and take the survey</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Global</td>
</tr>
<tr>
<td>Global</td>
<td>Yes</td>
</tr>
<tr>
<td>Acme</td>
<td>Yes</td>
</tr>
<tr>
<td>Cisco</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Any domain user can assign a survey in that domain to the same domain user or a Global domain user. For example, an Acme domain user can assign a survey to a Global domain user or an Acme domain user. Users from other domains are not visible to the Acme domain user.

Although the Global domain user can view a survey from other domains, this user cannot assign the survey of one domain to a user from a different domain. For example, a Global domain user can assign a survey from the Acme domain to another Global domain user or an Acme domain user, but not to a Cisco domain user.

**Note:** When a task is closed in a child domain and the assigned survey is either in the child domain or the global domain, the user from the child domain can then take the survey.

**Trigger conditions in domain-separated instances**

A Global domain user can create a triggered condition for a survey from any domain. The Global domain user can create an incident and trigger the survey by selecting a user from the other domain in the User field under Caller. However, the Global user cannot assign the survey to the user of different domain.

A user can assign a trigger condition to a survey if the user belongs to the Global domain or the Survey domain.

If there is no domain path for a trigger condition, users from any domain can view the trigger condition. For example, in the asmt_condition table that has no column for the domain path, users from the Acme domain can view the trigger condition created by the Cisco domain users.

**Survey responses and results**

There is a metric result record for each user response to each question on every survey instance. Survey results for each question and category are calculated automatically based on the metric result records.

If you use survey result calculations for results and scorecards, ensure that the positive indicator field for the question is set appropriately, based on the answer options. To have any results, a category must contain scored questions.

**Survey responses**

Survey responses are stored in the Metric Result [asmt_metric_result] table and display the recipients' answers to each question in a category. To view general results, navigate to Survey Survey Responses. To view results for a particular criterion, use a filter on the Metric Result [asmt_metric_result] table. For example, to view results based on the assignment group, apply a filter condition for assignment group.
Category results

Category results are stored in the Assessment Category Result [asmt_category_result] table and display the overall ratings for each category based on the weighted value for each scored question. To
view these results, navigate to Assessments Results Category results and filter the results using the [Type.Evaluation method] [is] [Survey] condition.

Figure 463: Assessment category results

Survey scorecards

A scorecard provides a visual breakdown of survey responses, based on the way questions were answered, by category. To access a scorecard, see View a survey scorecard on page 2451.

View results for all surveys

You can view the survey responses that are stored on the Metric Result [asmt_metric_result] table.

Role required: survey_admin or survey_reader

1. Navigate to Survey Survey Responses.
   
   Do not confuse this module with Survey Legacy Surveys Survey Responses, which displays legacy survey responses.
The Type column displays the survey definition each response is associated with.
2. Select a response to view its details.

View the results for a survey

You can view the responses for one survey definition. Survey results are stored on the Metric Result [asmt_metric_result] table.

Role required: survey_admin or survey_reader

1. Navigate to SurveyView Surveys
2. Open a survey definition.
3. Under Related Links, click View Responses, which is available only if there are results.
   The results are grouped by metric, which is what questions are called in assessments.
4. Open a metric result to view more detail.
   The metric result contains the user's response and calculated values of interest to advanced survey administrators. Because the Metric Result table is also used by the assessment feature, many field names are not clear in the context of surveys.

Metric result fields

List of field descriptions for the Metric Result form.
### Table 1054: Metric Result form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Assessment group</strong></td>
<td>Assessment group to which the metric result belongs. An assessment group is a container for survey instances and results generated in a single occurrence. The system generates an assessment group every time at least one survey instance is created. If multiple survey instances are created at once, such as when a survey administrator sends invitations to a list of survey users, they are all stored in the same assessment group.</td>
</tr>
<tr>
<td><strong>Metric</strong></td>
<td>Question that the user answered.</td>
</tr>
<tr>
<td><strong>Data type</strong></td>
<td>Data type of the question the user answered.</td>
</tr>
<tr>
<td><strong>Method</strong></td>
<td>Assessment method. Always Assessment for surveys.</td>
</tr>
<tr>
<td><strong>Updated</strong></td>
<td>Date and time the metric result was last updated.</td>
</tr>
<tr>
<td><strong>Source</strong></td>
<td>Survey definition from which the associated survey instance was generated.</td>
</tr>
<tr>
<td><strong>Assigned to</strong></td>
<td>User who completed the survey questionnaire.</td>
</tr>
<tr>
<td><strong>Instance</strong></td>
<td>Survey instance completed by the Assigned to user.</td>
</tr>
<tr>
<td><strong>Actual value</strong></td>
<td>Value obtained from the user response to the question. The actual value is determined by the question data type:</td>
</tr>
<tr>
<td></td>
<td>• Checkbox: The actual value is 0 if the check box is cleared and 1 if it is selected.</td>
</tr>
<tr>
<td></td>
<td>• Choice or Likert Scale: The actual value is equal to the Value of the metric definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>• Date, Date/Time, or String: The actual value is -1 to indicate that these data types do not contribute to category result calculations.</td>
</tr>
<tr>
<td></td>
<td>• Template: The actual value is equal to the Value of the template definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>• Yes/No: The actual value is 0 if the response is No and 1 if it is Yes.</td>
</tr>
<tr>
<td><strong>Normalized value</strong></td>
<td>Adjusted value that accounts for the Scale definition setting, minimum and maximum values, and other factors. The equation that generates the value and an example calculation appear in <em>Example: calculate the normalized value for a survey metric</em> on page 2450.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>String value</td>
<td>Value that displays the response as it appears on a questionnaire. In some cases this is the same as the Actual value, such as when the question data type is Percentage. The string value is N/A for unanswered questions of certain data types.</td>
</tr>
</tbody>
</table>

**Example: calculate the normalized value for a survey metric**

The normalized value is calculated based on a linear equation and the scale definition of the metric.

**Equation used to calculate the normalized value**

\[
\text{Normalized value} = \frac{(\text{Input Value} - \text{Min value defined in metric})}{(\text{Max value defined in metric} - \text{Min value defined in metric})} \times \frac{\text{current metric weight}}{(\text{sum of valid metric weight})} \times \text{scale\_factor}
\]

**Note:** The normalized values are directly proportional to the scale definition of the metric. If the scale definition is low, that is, the lower scale values are better, then \(\text{Normalized value} = 1.0 - \text{Normalized value}\).

**Example**

Calculate the normalized value for the Please rate the competency of the technician metric. The metric has the following values:

**Table 1055: Values of the metric**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input value</td>
<td>3</td>
</tr>
<tr>
<td>Minimum value</td>
<td>1</td>
</tr>
<tr>
<td>Maximum value</td>
<td>6</td>
</tr>
<tr>
<td>Current metric weight</td>
<td>10</td>
</tr>
<tr>
<td>Number of responses</td>
<td>6</td>
</tr>
<tr>
<td></td>
<td>• 4 of type=number</td>
</tr>
<tr>
<td></td>
<td>• 1 of type=yes/no</td>
</tr>
<tr>
<td></td>
<td>• 1 of type=string (invalid data type; value cannot be calculated)</td>
</tr>
<tr>
<td>Valid metric weight of each response</td>
<td>10</td>
</tr>
<tr>
<td>Scale factor</td>
<td>10</td>
</tr>
</tbody>
</table>

\[
\text{Normalized value} = \frac{(3 - 1)}{(6 - 1)} \times \frac{10}{(10 + 10 + 10 + 10 + 10)} \times 10 = 0.8
\]

Several data types are ignored because the values cannot be calculated. These invalid data types include string, date, and datetime.

For reporting purposes, use the Metric Result [asmt_metric_result] table.
View a survey scorecard

A survey scorecard provides a visual breakdown of survey responses by category, based on the way questions were answered.

Role required: survey_admin or survey_reader

A scorecard displays charts for survey results, in which category and question responses are analyzed and current ratings are compared with previous ratings. Users can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages for the time range selected. The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed surveys.

1. Navigate to Survey View Surveys.
2. Open a survey definition.
3. Under Related Links, click View Scorecard. The interactive scorecard displays the following filters:
   - Question Results: Displays the result of all questions or an individual question.
   - Category Results: Displays the results of all questions associated with an individual category or all categories.
   - Average Ratings: Displays the result of weighted average rating for each survey question in an individual category or all categories.
   - History: Displays the result of all questions in comparison with their history (by calendar year or quarters).
   - Sentiment Analysis Results: Displays the results of sentiment analysis for the survey.

**Note:** The scorecard link is hidden if there are no survey results to report.

*Survey scorecard category results*
The Category Results view is a stacked bar chart showing survey results for all questions in an individual category or all categories by respondent count.

Select a category from the list to display the questions from that category in the chart.

This view displays responses that use the following data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No
- Multiple selection
- Image Scale
- Numeric Scale

**Note:** The Checkbox and Yes/No data types are combined into the Boolean data type in the Survey Designer
Figure 464: Survey category results

To view details about a specific response, point to the colored bar to display the response, the number of responses, and the percentage it represents of all the responses to that question.

Figure 465: Survey scorecard category results detail
Survey scorecard question results
The Question Results filter displays the result of all questions or an individual question using charts or lists. For the String, Attachment, Date, Date/time, Reference, and Ranking data types, the results are displayed in the list view. The results of all other data types are displayed in the pie chart view.

Pie chart
The pie chart shows question results for all data types other than those that are displayed in the list view. See Survey question data types on page 2480.

- Checkbox.
- Boolean.
- Choice.
- Likert Scale.
- Number.
- Percentage.
- Yes/No.
- Image Scale.
- Multiple Selection.
- Template. The question result shows the aggregated net promoter score (NPS) with promoters, detractors, and passives.

<table>
<thead>
<tr>
<th>Question score</th>
<th>NPS category</th>
</tr>
</thead>
<tbody>
<tr>
<td>9 or 10</td>
<td>Promoter</td>
</tr>
<tr>
<td>7 or 8</td>
<td>Passive or Neutral</td>
</tr>
<tr>
<td>0 to 6</td>
<td>Detractor</td>
</tr>
</tbody>
</table>

The result is calculated as:

- \( \% \text{Promoters} = \frac{\text{Number of promoters}}{\text{Sample size}} \)
- \( \% \text{Detractors} = \frac{\text{Number of detractors}}{\text{Sample size}} \)
- \( \% \text{Passives} = \frac{\text{Number of passives}}{\text{Sample size}} \)
- \( \text{NPS} = \% \text{Promoters} - \% \text{Detractors} \)

Note: The Checkbox and Yes/No data types are combined into the Boolean data type in the survey designer.
Service Desk Satisfaction Survey

Survey Scorecard

How courteous and respectful was the technician who responded? (1=poor, 6=excellent)

- 2 = 2 (14.29%)
- 3 = 2 (14.29%)
- 4 = 9 (54.29%)
- 5 = 1 (7.14%)

© 2018 ServiceNow. All rights reserved.
Survey scorecard average ratings
The Average Ratings view displays the weighted average rating for each survey question in an individual category or all categories.

Use this view to learn how individual questions affect the overall rating for the category. Select a survey category from the choice list to display the chart for that category.
Service Desk Satisfaction Survey

Survey Scorecard

Average question rating in category: Service Desk Satisfaction Survey

- How courteous and...
- How satisfied are...
- How satisfied were...
- Please rate the t...
- Was technician ab...

Average Normalized value
To view the effect of each question's ratings on the entire category's ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question's weighted average.

![Graph showing Compare Plans and Benefit Satisfaction](image)

**Figure 468: Average ratings detail**

*Survey scorecard history*

The History view compares the current ratings for the categories and their questions with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the Diff column indicate the trend of the current survey against the previous survey.

Point to a category to display a line chart that shows the rating trend for that category. Click a category to view the Survey Category form containing the survey questions.
3 years

To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The Diff column shows the discrepancy between the current ratings and the previous calendar year's ratings.

Figure 470: Survey scorecard history - 3 years
4 quarters

Quarterly surveys compare the average rating for each question and category in the current quarter against the average ratings from the previous four quarters. The Diff column shows the discrepancy between the current ratings and the previous quarter's ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the 3rd quarter of 2015, then the previous quarters appear as 2nd [2015], 1st [2015], 4th [2014], and 3rd [2014]. All four of the previous quarters appear, whether or not there was any data for those quarters.
Figure 471: Survey scorecard history - 4 quarters
Export a survey scorecard as an image
You can export a scorecard as an image to use in presentations or other documents.

Role required: admin or survey_admin

1. Click the menu icon ( ) and select Save as PNG or Save as JPEG and wait for the export to complete.

2. Click Download and save the scorecard image to a storage location.
Survey administration

Survey administrators—users with the survey_admin role—create and maintain surveys and configure how they are distributed and published. Surveys on Service Portal are also supported.

Survey administration includes the following procedures.

- Create, customize, and publish surveys.
- Write and maintain survey questions.
- Define trigger conditions for when surveys are sent to users, such as when an incident closes.
- Maintain surveys and survey questions as the organization’s needs change.

To set up surveys in Service Portal, you must first install Service Portal and then configure the Survey widget on the page. The base system includes the Survey widget.

Surveys in Service Portal

If Service Portal is installed, you can use the Survey widget to set up surveys, quizzes, assessments, risk assessments, and attestations in Service Portal. Surveys for users on mobile devices are fully supported in Service Portal.

To create an intuitive interface for your users, you can set up surveys in Service Portal on page 2610. You must first install Service Portal and then configure the survey widget on the page. To learn more about configuring a widget, see configure widget instances.
To configure a Survey widget on a page, CTRL + right-click the widget heading and select Instance Options.

### Table 1057: Service Portal: Instance options (properties) for the Survey widget

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max records</td>
<td>Number of surveys to list on the Service Portal homepage. The user can click the View all link to view all items. Default: 5</td>
</tr>
<tr>
<td>Title of the widget</td>
<td>Text that appears in the title bar of the surveys widget. Default: My Surveys</td>
</tr>
</tbody>
</table>
Each survey on the My Surveys page contains a progress bar and a description. The color in the progress bar increases as a survey is completed. In the case of a triggered record, the table title is used for the survey description.

For mobile users, the *Pagination setting for Service Portal view* survey designer property is set to one question per page by default.
One Click survey

A One Click survey has no introduction page in Service Portal. This survey does not have the Submit and Cancel buttons in the desktop and iPad view.

**Note:**
- The One Click Survey field should be selected in the survey definition.
- If the public access is enabled for a One Click survey, a user can submit the survey without having to log in.

A kiosk survey is a One Click survey with only one question of any of the following types:
- Image Scale
- Choice
- Likert Scale
- Numeric Scale
- Yes/No

When you click the answer of the kiosk survey question in Service Portal, the survey is submitted and the end note is displayed on the same page as that of the survey questions.

**Note:**
- A kiosk survey does not have any Submit or Cancel buttons.
- A kiosk survey cannot have a signature, dependent questions, or additional information.

URI parameters for One Click survey

Pass these URI parameters through the createAssessment() API to store their values in the asmt_assessment_instance table for both platform view and Service Portal view.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_refresh_interval</td>
<td>Refresh time (in seconds) after the survey submission to create another instance. For example, sysparm_refresh_interval=5.</td>
</tr>
<tr>
<td>sysparm_trigger_table</td>
<td>Location that is stored as the Trigger Table field in the asmt_assessment_instance table. For example, sysparm_trigger_table=incident.</td>
</tr>
<tr>
<td>sysparm_trigger_id</td>
<td>Location sysId that is stored as the Trigger ID field in the asmt_assessment_instance table. For example, sysparm_trigger_id=1c741bd70b2322007518478d83673af3.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>sysparm_kiosk</td>
<td>When set to true, both sysparm_trigger_table and sysparm_trigger_id parameters should be specified. This is a mandatory parameter for kiosk requests. For example, sysparm_kiosk=true.</td>
</tr>
</tbody>
</table>

### View the overview of all surveys

Use this homepage to view various survey reports such as results by metric type and state. You can refresh, add, delete, and rearrange widgets. All reports on the Survey Overview page have demo data.

Role required: admin or survey_admin

1. Navigate to Survey Overview.
   The following reports are available:

   **Table 1059:**

<table>
<thead>
<tr>
<th>Report</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Surveys by Metric Type and State</td>
<td>Assessment Instance [asmt_assessment_instance]</td>
</tr>
<tr>
<td>Assignment group Customer Satisfaction 90 day average</td>
<td>Metric Result [asmt_metric_result]</td>
</tr>
<tr>
<td>Service Desk Survey 'Overall Experience' 60 Days</td>
<td>Metric Result [asmt_metric_result]</td>
</tr>
<tr>
<td>Service Desk Survey 'Timely Response' 90 Days</td>
<td>Metric Result [asmt_metric_result]</td>
</tr>
<tr>
<td>Service Desk Survey 'First Call Resolve' 60 Days</td>
<td>Metric Result [asmt_metric_result]</td>
</tr>
<tr>
<td>Service Desk Survey 'Tech Courteous' 90 Days</td>
<td>Metric Result [asmt_metric_result]</td>
</tr>
<tr>
<td>Service Desk Survey 'Tech Competence' 60 Days</td>
<td>Metric Result [asmt_metric_result]</td>
</tr>
</tbody>
</table>

2. Click elements within the reports to view the required information.
3. To refresh, edit, or close a widget, point to the widget and select the required option.

### Survey designer

Users with the survey_admin role can use the survey designer. The survey designer lets you create survey categories and questions, configure the details, and publish the survey to specific users or groups.

You can assign a survey to individual users or groups who receive all the questions from all the categories. You can also customize each question and make it dependent on the response to another question. The following describes the procedures you follow to create and publish a survey.

- Create survey categories.
- Create questions within each category.
- Configure survey details, such as introductory and closing remarks and time limit.
- Select recipients for the survey.
- Publish the survey to the selected users or groups.

**Note:** The survey designer replaces the survey creator in the Legacy Surveys application. If you are using Internet Explorer version 8 or earlier, the system redirects you to the survey creator.

Survey designer elements
The survey designer is accessible from Survey Survey Designer.

The survey designer contains controls, a header bar, and the design canvas.

**Controls**

To create a question, drag the appropriate data type control from the Controls palette and drop it onto the designer canvas.
Figure 472: Controls
The assessment engine provides a built-in result calculation feature that converts responses to scored question data types to a score from 0 through 10.

<table>
<thead>
<tr>
<th>Data type</th>
<th>Scored</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attachment</td>
<td>No</td>
<td>Question with a Manage Attachments icon that allows users to attach one or more files.</td>

<tr>
<td>Image Scale</td>
<td>Yes</td>
<td>Question with a choice of images that can be selected. A template can be used to apply the same images to multiple questions.</td>
</tr>
<tr>
<td>Multiple Selection</td>
<td>Yes</td>
<td>Question with multiple check boxes that can be selected.</td>
</tr>
<tr>
<td>Ranking</td>
<td></td>
<td>Question with an order number to be selected for each option. One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.</td>
</tr>
</tbody>
</table>

**Header bar**

The tabs on the header bar display views and a menu of functions. Click a tab to change the view on the canvas:
- **Design**: Add and configure the properties of categories and questions. This is the default view.
- **Configuration**: Create introductions and end notes for surveys and select a signature.
- **Availability**: Select the recipients for each category in the survey.

Point to the menu icon (≡) to select an option. The list of options depends on the currently open survey.
- **Save**: Save the current survey without changing its state.
- **Preview**: Display a preview of the survey as it appears to recipients.
- **Publish**: Distribute the survey to the selected recipients.
- **Save and Publish**: Save the survey to the Draft state and distribute the survey in one step.
- **New Survey**: Open a fresh canvas for a new survey.
- **Load Survey**: View the list of existing surveys.
- **Copy Survey**: Copy the current survey.

**Design canvas**

New surveys open in the canvas of the Design view. The survey Name field appears above first category in the canvas. A blank question field appears in the category container.
Configure a survey in the survey designer
Configuration settings apply to the entire survey.
Role required: admin or survey_admin

Select Configuration in the survey designer and complete the Survey Designer Configuration form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Select the check box to enable the distribution of this survey to recipients.</td>
</tr>
<tr>
<td>Anonymize responses</td>
<td>Select the check box to collect survey responses anonymously. Recipients are not listed with survey results. When a user submits a survey, the system clears the Assigned to field for the associated survey instance. Also, survey responses for anonymous surveys do not contain Assigned to values.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of this configuration or the survey to which it is attached.</td>
</tr>
<tr>
<td>Introduction</td>
<td>Introductory content to display on surveys. You can add a welcome message or background information about the survey.</td>
</tr>
<tr>
<td>Signature</td>
<td>Acknowledgement by a survey recipient of requirements, admonitions, or expectations related to a survey.</td>
</tr>
</tbody>
</table>

**Note:** The Assigned to field is cleared. However, each response record includes the Created By and Updated By fields that are accessible to users with the survey_admin role.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Return URL</td>
<td>Destination address of a web page that is presented to users after they submit a completed survey. When a return URL is configured, the End note content does not appear.</td>
</tr>
<tr>
<td>End note</td>
<td>Content that is displayed to recipients after they submit a completed survey. You can add a thank you message, follow-up instructions, or other applicable information. End notes are not displayed if a Return URL is specified.</td>
</tr>
<tr>
<td>Public Survey</td>
<td>Enables public access to the survey. No login is required to take a public survey and users or non-users can respond anonymously. For completed public surveys, the Assigned to field value is Guest.</td>
</tr>
<tr>
<td>Note:</td>
<td>This check box is available only after you save the survey.</td>
</tr>
<tr>
<td>Survey Publish URL</td>
<td>Specifies a URL of the survey that can be shared with users.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is available only after you publish the survey.</td>
</tr>
</tbody>
</table>
| Pagination setting for Service Portal view | Specify how the user will see pages on the desktop or tablet view in Service Portal.  
  • Category: Display each category on a separate page.  
  • Question: Display each question on a separate page. This happens for mobile regardless of this setting.  
  • None: All items on a single page—no pagination  
  Default: Category  
  Note: This field appears only when Service Portal is installed.                                                                                          |
| One Click Survey            | Enables a One Click survey in Service Portal.                                                                                                                                                              |
| Note:                       | This option can be selected if the Pagination setting for Service Portal view is set to None.                                                                                                             |
### Source Table
Table whose field is used as a dynamic value for a question in a triggered survey.

**Note:** When you select a source table, ensure that its relevant field is selected as Source Field value of a metric.

### Allow Sentiment Analysis
Enables sentiment analysis for this survey.

### Duration
Amount of time that recipients are given to complete this survey, starting from the time that the survey is generated. The default duration is 14 days.

**Note:** By default, the system runs the Cancel Expired Assessments script every 30 days to cancel expired survey, assessment, and quiz instances that are in the Work in progress or Ready to take states.

---

**Survey categories**
Survey categories provide a way to group questions of a similar theme for a given survey.

There must be at least one survey category per survey definition and every survey question must be associated with a category. When you create a survey, the system generates one category, which all the questions belong to.

For simple surveys, one category is usually enough. Consider creating additional categories if you want to accomplish any of the following tasks.

- Separate groups of questions into collapsible sections by category on the survey questionnaire.
- Report on category scores, which are calculated based on responses for all questions within each category.

**Create a category in the survey designer**
A category represents a theme for evaluating a specific element of the survey topic and contains questions pertaining to that theme.

**Role required:** admin or survey_admin

When you create a survey, the system creates a default category, using the name of the survey. You can use this category, modify it, and create additional categories as needed. To have any results, a category must contain scored questions.

1. Navigate to Survey Survey Designer.
2. Enter the name of the survey in the Name field. The system uses this name as the name of the survey and of the first category.
3. To configure the category, click the gear icon in its title bar and complete the following steps in the Properties dialog box.
   a) Enter a new name and a description for the category.
   b) Enter text in the Details field that introduces or explains the category to recipients.
c) Click the X icon to close the Properties dialog box and save your settings.

4. To add a new category, click the + icon in the title bar of an existing category. The new category appears below the category that you selected to create it. You can click the X icon in a category header to delete a category that you added in error.

Create a survey category in a survey
You can modify an existing survey to add one or more survey categories.

Role required: admin or survey_admin

Only one category is required for each survey, but you can add additional categories as needed.

1. Navigate to Survey View Surveys.
2. Open a survey definition.
3. In the Metric Categories related list, open a category or click New.
   Each survey category is stored as a record on the Metric Category [asmt_metric_category] table with a modified view for survey use.
4. Enter the survey category name and description.
   The category name appears on questionnaires when either of the following is true.
   • There is more than one category for the survey.
   • There is only one category and its name is different from the survey definition name. If you create a survey using the survey creator, the category name is the same as the survey definition name.
5. Right-click the form header and click Save.
   The Assessment Metrics and Users related lists appear.
6. Click Update.

Create a question in the survey designer
You can create multiple questions for each category in the survey designer, but each question can only be associated with one category.

Role required: admin or survey_admin

The data type that you select for each question determines how it can be answered by survey recipients.

1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.
2. To configure the question, click the gear icon in its title bar.
   The Properties dialog box opens.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Concise name of the question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as the question on surveys. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Type</td>
<td>Data type selected for this question. See the table in <em>Controls</em> for the available data types.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this question is available on a survey. A question does not appear on surveys that are generated after the question becomes inactive.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box to require users to answer the question. Mandatory questions are denoted by a red field status indicator and must be answered before the survey can be submitted.</td>
</tr>
<tr>
<td></td>
<td>This field is available when the question does not have a dependency and the question type is not Boolean with a check box option.</td>
</tr>
<tr>
<td>Allow Additional Information</td>
<td>If selected, the Additional Information Label field is enabled. The Additional Information Label field value is displayed as a field on the survey response page to provide additional information for a question.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This is not applicable for the String and Template data types.</td>
</tr>
<tr>
<td>Boolean option</td>
<td>Whether a check box or a Yes/No list appears as the option for a Boolean question.</td>
</tr>
<tr>
<td>String option</td>
<td>Setting for the appearance of a string field in a question. This field is available when the question type is String. The string options include the following.</td>
</tr>
<tr>
<td></td>
<td>• Single line: Single-line text field 40 characters in length that allows strings of any length.</td>
</tr>
<tr>
<td></td>
<td>• String line wide: Full page width text field that allows a single-line entry of any length.</td>
</tr>
<tr>
<td></td>
<td>• Multiline: Full page width multiline text field that allows word wrap and returns</td>
</tr>
<tr>
<td>Min</td>
<td>Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Max</td>
<td>Highest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box for including Not Applicable as an option for this question. Users can select Not Applicable if they do not have sufficient information to respond to a question. User responses of Not Applicable are excluded from results calculations. This field is available when the question does not have a dependency and the question type is not Boolean with a check box option.</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box for displaying answer options in a random order. Answer preference is sometimes influenced by the order in which options appear, which can result in biased results. Randomizing options can help prevent this bias. <strong>Note:</strong> Randomizing options for certain questions may make those questions confusing for users. In general, only randomize options that do not follow a logical order.</td>
</tr>
<tr>
<td>Positive indicator</td>
<td>Setting that determines whether smaller or larger numerical values equate to a good score in result calculations. Select Low values if smaller numerical values are better, such as for a question that measures the number of incidents for a vendor. Select High values if larger numerical values are better, such as for a question that measures user satisfaction on a scale of one to five.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| **Source Field**              | Source table field that appears as a dynamic value for the question in a triggered survey. When this field value is selected, a ${param} placeholder is added at the end of the question label.  
  
  **Note:** You can move this placeholder anywhere in the question label.  
  
  When a user takes the survey, the question with dynamic value is included in the survey instance and ${param} placeholder is replaced with the source field value.  
  
  If the record table specified in the trigger condition does not match the source table specified for the survey, or if the system fails to get the dynamic value from the source record, the ${param} placeholder is not replaced by any value and is displayed as is in the question.  
  
  For example, if the survey is triggered from a PRB record and the survey question is configured with a dynamic value from Incident, the ${param} placeholder in the survey question label is not replaced by any dynamic value and is displayed as is.  
  
  **Note:** When survey questions are translated to other languages by a survey admin, the ${param} placeholder should not be translated. |
| Allow Sentiment Analysis      | Includes this question for the sentiment analysis of a survey.  
  
  **Note:** This field is available only for String type questions. |
| Details                       | Information about the question that is displayed on the survey. Include details that help users understand how to answer the question. |
### Choices

Options for a question with a data type of Choice or Scale. The system automatically adds text and values that you can edit for each option. You must have at least two options, and each option must have a unique value.

Click the + icon to add an option, or click the X icon to delete an option. By default, the system arranges options in the order established by their values. To change the order, drag and drop the options.

**Note:** Value numbers also contribute to the calculations of survey response scores, which can be used by advanced survey administrators.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Choices</td>
<td>Options for a question with a data type of Choice or Scale. The system automatically adds text and values that you can edit for each option. By default, the system arranges options in the order established by their values. To change the order, drag and drop the options. <strong>Note:</strong> Value numbers also contribute to the calculations of survey response scores, which can be used by advanced survey administrators.</td>
</tr>
</tbody>
</table>

4. To create any special conditions that must be met before the question appears on the survey, click the Dependency tab.
   The question must have a data type of Boolean, Choice, Scale, or Template.

5. Select a question in the Displayed when field.
   The system selects the appropriate operator and displays the possible answers for the selected question.

6. Select the answer that satisfies the condition.
   You can select more than one answer. Selected answers are indicated by a check mark.
   The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.

7. Click the X icon to close the question properties dialog box and save your settings.

8. To add a question with the same data type as an existing question in the category, click the + icon in the title bar of the existing question.

9. Drag and drop questions to change their order within a category or move them between categories.

10. To delete a question, click the X icon in its title bar.
Survey question data types
You must choose a data type for each survey question. The data type determines the format of the question and the kind of data that is collected on survey questionnaires.

The following data types are available for surveys:

Attachment data type

On questionnaires, users can attach one or more files to a question.

Users click the Manage Attachments icon and select one or more files in the Attachments pop-up window to attach to the question. From this window, users can:

• View a list of the attached files.
• View an attached file in a separate window.
• Rename an attached file.
• Add or delete files

Once a survey has been submitted, attachments cannot be updated or deleted.

Any type of file supported by the platform can be attached to a question. One or more files can be attached a question while taking a survey or completing an assessment.

The assessment administrator can see the attachments associated with an individual question as well as those associated with the survey.

See Administering Attachments for more information.

Boolean data type

On questionnaires, users select a check box beside a statement or leave it cleared.

If you select Boolean, you must fill in the Scale definition field. Select High if it is best when users select the check box.

Choice data type

On questionnaires, users select a value from a list of choices.
If you select Choice, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

**Note:** The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

**Date and Date/Time data types**

The Date and Date/Time data types are similar.

- **Date:** On questionnaires, users select a date.

- **Date/Time:** On questionnaires, users select a date and time.
Likert Scale data type

On questionnaires, users select a multiple choice value from a custom Likert scale. Each answer option is represented by a radio button on the scale. A Likert scale question that evaluates an application's ease of use might have the answer options Easy, Average, and Difficult.

If you select Likert Scale, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

Note: The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

Number data type

On questionnaires, users enter a number.
If you select Number, you must fill in these additional fields:

- Scale definition: Select High if a larger number is better, such as for a question that measures the number of sales made in a quarter.
- Min and Max: Enter the smallest and largest numbers users can enter. State the range of acceptable answers in the question text.

**Percentage data type**

On questionnaires, users enter a number.

If you select Percentage, you must fill in these additional fields:

- Scale definition: Select High if a larger percentage is better, such as for a question that measures the percentage of work an agent has completed.
- Min and Max: Enter the smallest and largest numbers users can enter. Generally 0 and 100 are appropriate minimum and maximum values. If you choose values other than 0 and 100, it is usually best to state the range of acceptable answers in the question text.

**Reference data type**

On questionnaires, users select a value from a list that is generated from a specified reference table. The response field supports auto-completion.

**Note:** Reference qualifiers are not supported.

For example, a user could select a user name in response to a question if you specify User [sys_user] as the reference table.
String data type

On questionnaires, users enter text. When you select String, the String option field appears. Select one of the following options to determine how the string field appears on questionnaires:

- Figure 474: Single line
Figure 475: Single line wide

Figure 476: Multiline

**Template data type**

On questionnaires, users select a value from a predefined series of answer options. To use this data type, a question template must be defined.

If you select Template, you must fill in these additional fields:

- **Template**: Select a template.
- **Scale definition**: Select High if the answer option with the largest template definition Value is best.

**Yes/No data type**

On questionnaires, users select Yes or No from a list.

If you select Yes/No, you must fill in the Scale definition field. Select High if Yes is the best answer.
Image Scale data type

On questionnaires, users select an image from a predefined set of images as their response. Image scale questions can also be used in a template for better performance with surveys that have the same type of answer options.

Five emojis, similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Two images can be uploaded, one for selected case and another for unselected case. Larger size images are reduced to 64 x 64 pixels.

The result behavior depends on the presence of uploaded images. If no selected image is uploaded, then the question shows up blank.

<table>

</tr>
<tr>
<td>No</td>
<td>No</td>
<td>A blank placeholder box is displayed.</td>
</tr>
</tbody>
</table>

Note: N/A option is not supported for image scale type question.

Multiple selection data type

On questionnaires, users can select multiple check boxes indicating all answers that apply. For instance, a user can be instructed to “Select all that apply” in a multiple selection question.
Ranking data type

On questionnaires, users can select a different order number for each option to rank them. Drag-and-drop functionality is also supported, which allows a user to either fill in the number, or simply drag an option.

1. Please rate following device in order of importance.

One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.

Edit a survey in the survey designer
You can modify surveys using the survey designer.

Role required: admin or survey_admin
You can edit a survey even after it has been distributed, with the following results.

- Added questions are available only on surveys that are distributed after this change.
- Changes to existing questions are immediately available to users before the survey is submitted or during the retake period. This includes changes to the answers, such as additional choices or changes to the data type.
- Deleted questions are also deleted from the distributed surveys in user queues.

**Note:** You can only edit a survey that has the same application scope as that of your current session.

1. Navigate to Survey Survey Designer.
2. Point to the menu icon in the survey header bar, and select Load Survey.
3. Select a survey from the list and modify it as needed.

**Configure category weights for a survey**

You can assign a weight to each category in a survey. The system calculates results from the weight that you configure.

Configure the Survey Category form to display the Weight field.

Role required: admin or survey_admin

Weights are set to a value of 10 by default but can be changed.

1. Navigate to Survey View Surveys and select a survey from the list.
2. In the Survey Definition form, select a category from the Metric Categories related list.
3. Edit the default weight value.
4. Click Update.

**View a survey instance**

A survey instance represents one questionnaire assigned to one user. You view an instance to verify that survey instances were created, to check the state of a survey instance, or to reassign a survey instance.

Role required: admin or survey_admin

1. Navigate to Survey Survey Instances. The following sub-modules are available based on the state of the instances:
   - Ready to take: Displays survey instances that are ready to be taken by the user. By default, these instances are sorted in ascending order by the Number field.
   - In progress: Displays survey instances that are in progress. By default, these instances are sorted in ascending order by the Number field.
   - Completed: Displays survey instances that are complete. By default, these instances are sorted in descending order by the Taken on field.
   - Cancelled: Displays survey instances that are cancelled. By default, these instances are sorted in ascending order by the Number field.
   - All: Displays survey instances in all states. By default, these instances are sorted in ascending order by the Number field.

2. Open a survey instance from the required sub-module. By default, the following fields are displayed in the Survey Instance form for all sub-modules other than Completed.

**Note:**

- When you open an instance in the Completed sub-module, you are redirected to the User's Response page.
• Each survey instance is stored as a record on the Assessment Instance [asmt_assessment_instance] table with a modified view for survey use.

Table 1062: Survey Instance form

<table>

### Survey users and groups

Survey users and survey user groups help survey administrators control who can take a survey.

Survey administrators can restrict a survey so that only specified users can access it unless a survey administrator manually assigns the survey to a different user. Survey user groups provide a way to quickly designate multiple survey users.

### Administering survey users

The list of survey users for a survey is visible on the Survey Definition and Survey Category forms. You can add or remove users from the list of survey users at any point. Note that designating a survey user does not automatically generate a survey instance for that user unless both of the following conditions are true:

- The survey definition Schedule period is set to Daily, Weekly, Monthly, or Yearly. In this case the system assigns a new survey instance to each survey user at the beginning of each schedule period.
- The user has no instances of the survey that are incomplete or that have not yet reached their expiration date.

You can designate survey users from the Survey Designer, the Survey Definition form, or the Survey Category form.

**Note:** If there are trigger conditions for a survey, do not create survey users. Instead, use the Trigger Conditions form to assign users.

### Create a survey user group

Survey user groups are groups that have the Type field set to survey and that display only the information most relevant to surveys. You can assign survey groups or any user group to surveys.

Role required: admin, user_admin, or survey_admin
Though it is possible to designate members of any group as survey users, one reason to create a survey group is to view it conveniently in the survey User Groups module.

1. Navigate to Survey Administration User Groups.
2. Click New.
3. Complete the Group form.
4. Right-click the form header and click Save. The Group Members and Groups related lists appear.
5. To add group members, complete the following steps.
   a) In the Group Members related list, click Edit.
   b) Select users from the list on the left and add them to the Group Members List on the right.
   c) Click Save.

Select recipients for a survey in the Survey Designer
You can assign survey users while designing or modifying the survey.
Role required: admin or survey_admin
1. In the Survey Designer, click the Availability tab.
2. Under Accessible by:, select the Specific users option, then select users.
3. If desired, select the Survey groups only check box, then select survey user groups or other groups.
4. Click Save.

Designate a survey user
You can designate one survey user at a time from the Survey Definition form.
Role required: admin or survey_admin
1. Navigate to Survey View Surveys.
2. Open a survey definition.
   There must be at least one category.
3. In the Survey Users related list, click New.
4. Select a User.
5. Click Submit.
   The Survey Definition form reopens.
6. To remove survey users, in the Survey Users related list, select the check box beside the user, and then select Delete from the action list below the list.

Designate or remove multiple survey users at one time
Use the Survey Category form to designate or remove multiple survey users at a time.
Role required: admin or survey_admin
1. Open a survey definition.
2. In the Metric Categories related list, open a category.
   You can choose any category. The system applies survey user changes to all the survey's categories automatically.
3. In the Users related list, click Edit.
4. Use the slushbucket to add or remove survey users.
5. Click Save to return to the survey category.
   The changes are also reflected in the Survey Users related list on the survey definition.
Allow recipients to retake a survey
You can configure a survey to allow recipients to resubmit their answers as many times as they like, up to the survey's due date.

Configure the Survey Definition form to display the Allow retake field. For more information, see Configuring the form layout.

Role required: admin or survey_admin

Results are not calculated for the survey until the configured duration has elapsed. The card in the user's queue remains visible until the due date of the survey, and a button is displayed to allow retakes.

1. Navigate to Surveys View Surveys.
2. Select a survey from the list.
3. Select the Allow retake check box.
4. Click Update.

Copy a survey

Create a copy of a survey with at least one category. All associated questions (type), configurations, categories, metrics, domain separation rules, and role-based categories are copied. Assigned users, category users, instances, and trigger conditions are not copied.

Role required: survey_admin or admin

1. Navigate to Survey View Surveys.
2. Open a survey definition.
3. Perform any of the following steps:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Platform</td>
<td>In the title bar, click Copy.</td>
</tr>
<tr>
<td>From Platform</td>
<td>In the title bar, select Copy from the context menu.</td>
</tr>
</tbody>
</table>
| From survey designer | 1. In the title bar, click Survey Designer.  
                            2. In the Survey Designer title bar, point to the menu icon ( ) on the header bar and click Copy Survey |

Publish a survey

You must publish a survey to enable people to receive and complete survey instances.

Role required: admin or survey_admin

The State field on the Survey Definition form indicates whether the survey is in the Draft or Published state.

**Note:** You cannot return a survey to the Draft state after it has been published. You do have the option to deactivate a survey by clearing the Active check box.

1. Navigate to SurveyView Surveys and select a survey to publish.
2. Click Publish.
When you publish a survey, the system generates survey instances for any associated survey users. You can assign the survey to other users manually.

**Publish a survey in the Survey Designer**
You must save changes to a survey before you can publish it to the specified recipients or groups.

Role required: admin or survey_admin

1. In the Survey Designer, point to the menu and select Load Survey.
2. Select a survey to publish.
3. To preview the survey as a user, point to the menu icon and click Preview.
4. When you are satisfied with the survey, click either Save and Publish or Publish to distribute it.

   When you publish a survey, the system sends email notifications to the recipients and to their managers. The system displays a link to the survey on a card in each recipient's My Assessments & Surveys portal.

**Customize the appearance of a survey**
Assessment and survey administrators can set properties to customize the color of various elements on the questionnaires.

Role required: admin or survey_admin

---

**Note:**

- For color properties, enter either an HTML color name or hexadecimal (hex) value. For hex values, the # character is required. Values are not case-sensitive.
- For example, all of the following formats are valid: LightGray, lightgray, #D3D3D3. A preview of the color appears next to the field.

---

Note that the customizations you make apply to all assessments and surveys.

1. Navigate to either of the following modules.
   - Assessments Admin Assessment Properties
   - Survey Administration Properties

2. On the properties page, edit the properties as needed.

Refer to the screenshot below to see what parts of assessment questionnaires are controlled by the properties.
3. Click Save.
   You may need to clear the browser’s cache to see updates.

Assessment and survey properties
You can configure a variety of properties to customize the appearance of assessment and survey questionnaires, require authentication for user signatures, open surveys in the service portal view from emails, and limit the number of items shown in a decision matrix field filter.

Table 1063: Assessment and survey properties

<table>
<thead>
<tr>
<th>Property</th>

<td>Assessment question header background color</td>
<td>Sets the background color of question headers on assessment and survey questionnaires.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default value: #767676</td>
</tr>
</tbody>
</table>
**Survey definitions**

A survey definition is the root record upon which a survey is built.

The survey designer generates a survey definition automatically when you save or publish the survey. Survey administrators may want to modify the survey definition to configure additional options for the survey, or to publish the survey when it is ready for distribution.

Survey administrators and survey readers can also send survey invitations directly to users from the survey definition.

*Modify a survey definition*

You can configure additional options for a survey definition.

**Role required:** admin or survey_admin

1. Navigate to Survey View Surveys.
   
   Each survey definition is stored as a record on the Assessment Metric Type [asmt_metric_type] table with a modified view for survey use.

2. Open a survey definition. The Response Trend chart with the weekly trend of the survey instance count, and the Survey Summary chart with the overall summary response based on instance states are displayed.

3. Modify the fields on the Survey Definition form, as appropriate.

**Note:** You can only edit a survey that has the same application scope as that of your current session.

</tbody>
</table>
| Scheduled job         | Scheduled job the system creates for this survey definition when the schedule period is a repeating interval. The system sets the scheduled job to run according to the selected schedule period. If you change the schedule period and save the survey definition:  
  • The system deletes the old scheduled job.  
If you selected a recurring schedule period:  
  • A new scheduled job is created.  
For example, if you change the schedule period from Daily to Weekly and save the record:  
  • The system deletes the daily scheduled job.  
  • Creates a weekly one set to run a week from the current date.  
This field is visible to administrators only if the schedule period is Daily, Weekly, Monthly, or Yearly.                                                                                                                                                                                                                                               |
<p>| Assessment duration   | The length of time to complete assigned survey instances, starting from the time the survey instance is generated. The assessment duration sets the Due date for each survey instance. The default duration is 14 days. Configure the form to see this field.                                                                                                                                                                                                                                               |
| Note                  | By default, the system runs the Cancel Expired Assessments script every 30 days to cancel expired survey, assessment, and quiz instances that are in the Work in progress or Ready to take states.                                                                                                                                                                                                                                                             |
| Send notifications    | Select the check box to send notifications for the survey when it is published. Configure the form to see the field.                                                                                                                                                                                                                                                                                                                                                                             |
| Other Options         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |</p>
<table>

<tbody>
<tr>
<td>Improvement Initiatives</td>
<td>Displays improvement initiatives associated with the survey.</td>
</tr>
</tbody>
</table>

**Note:** This related list is available only when there is at least one improvement initiative record.

4. Save the record.

**Schedule periods**

The available schedule periods are Only Once, No Limit, Daily, Weekly, Monthly, and Yearly.

The default schedule period is No Limit. When you set the schedule period to anything except Only Once or No Limit, the system creates a corresponding scheduled job. The scheduled job performs the following actions.

- Ensures that a user can take one survey instance of the same survey per schedule period.
- Generates a new survey instance for each survey user at the beginning of the new schedule period, as long as the survey user does not have an incomplete instance of that survey. A survey instance is incomplete if the state is not Complete.

For example, if you set the schedule period to Monthly and someone attempts to send survey invitations twice in the same day, the system generates survey instances for the survey users the first time only. At the beginning of the next schedule period, the system generates another survey instance for each survey user who completed the previous one.

Schedule periods are enforced by the Expiration date field on the survey instance. As long as the survey instance expiration date has not passed, the assigned user cannot receive a new survey instance.
When the system generates a survey instance and the schedule period is anything except No Limit, the Expiration date field is automatically set to the appropriate date. For example, if the schedule period is Weekly, the expiration date is a week after the survey instance is generated.

If you change the schedule period, the scheduled job updates automatically to the correct schedule. However, users who have survey instances for the survey cannot receive new survey instances until their existing survey instances expire, regardless of the new schedule period.

Consider the following example: Sal Pindell receives a survey instance when the schedule period is Weekly. The next day, a survey administrator changes the schedule period to No Limit. Sal cannot receive another survey instance until one of the following actions occurs.

- Seven days pass from the time Sal's survey instance was generated.
- A survey administrator deletes Sal's survey instance.

After one of these actions occurs, Sal can receive a new survey instance anytime, as long as he has no incomplete instances of the survey.

**Note:** If you use a trigger condition for a survey, ensure the schedule period is set to No Limit. Trigger conditions use a different method to regulate how often users can receive survey instances.

---

**Create a survey designer template question**

You can create a question that uses choice lists from a template.

**Role required:** admin or survey_admin

1. Navigate to Survey Survey Designer and load a survey or create a new survey.
2. Drag the Template data type icon into a category container.
3. Click the gear icon in the question title bar to open the template properties dialog box.
4. Select a predefined scale from the list.
Question entry fields appear for that template.

5. Enter one or more questions that are appropriate for the template.
6. Click the arrow to the right of a question to configure its properties. You must provide a name for each question.
7. Click the back arrow to return to the template properties dialog box.
8. Configure the properties for the remaining questions.
9. Click the X icon to close the template properties dialog box and save your settings.

Survey questions

Survey questions appear on survey questionnaires for the associated survey definition.

The survey creator generates questions and answer options automatically. However, it provides only the basic configuration options for questions, such as the question text and the data type. You may want to create additional questions or set advanced configuration options for the questions, including making a question appear conditionally or making a question mandatory. You can also use question templates to define reusable sets of answer options.

Survey questions are available from Survey Questions. The list displays information about each question, including the associated survey definition listed in the Type column, and the data type. Survey administrators can modify these questions.

Create or modify survey questions
You can create and administer survey questions.
Role required: admin or survey_admin

Changes to a survey, such as the addition of questions or the modification of question templates, do not apply immediately to the existing survey instances. However, the changes apply immediately to any new survey instances that are created after the changes are saved.

1. Navigate to Survey View Surveys.
2. Open a survey definition.
3. In the Metric Categories related list, open a category.
4. In the Assessment Metrics related list, open an existing question or click New.
   Each survey question is stored as a record on the Assessment Metric [asmt_metric] table with a modified view for survey use.
5. Complete the Survey Question form.
   The fields that appear depend on the selected Data type.

Table 1065: Survey Question form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the question. When you create a survey, the question name is the same as the text in the Question field.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to use for the question, which appears on survey questionnaires.</td>
</tr>
<tr>
<td>Data type</td>
<td>Data type of the question. The fields for the response depend on the data type.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If another question depends on this question, you cannot change the data type.</td>
</tr>
<tr>
<td>Template</td>
<td>Question template to use for the answer options.</td>
</tr>
<tr>
<td></td>
<td>This field is visible and required only if the data type is Template.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If another question depends on this question, you cannot change the template.</td>
</tr>
<tr>
<td>Scale definition</td>
<td>Setting that determines whether smaller or larger numerical values equate to a good score in result calculations. Select Low if smaller numerical values are better, such as for a question that measures the number of incidents for a vendor. Select High if larger numerical values are better, such as for a question that measures user satisfaction on a scale of one to five.</td>
</tr>
<tr>
<td></td>
<td>This field is visible and required only when certain data types are selected.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box that determines whether to present the answer options for this question in a random order each time a user opens the survey. Answer preference is sometimes influenced by the order in which answer options appear, which can result in biased results. Randomize answer options to help prevent this bias.</td>
</tr>
<tr>
<td></td>
<td>This field is visible only if the data type is Choice or Likert Scale.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Randomizing answer options may make a question confusing. In general, only randomize answer options that do not follow a logical order.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box that makes the question mandatory (selected) or optional (cleared) on survey questionnaires. Users cannot submit questionnaires until they provide valid responses to all mandatory questions, which are denoted by a red field status indicator.</td>
</tr>
<tr>
<td></td>
<td>This field is visible only when the Depends on field is empty and the data type is not Checkbox. Questions that depend on other questions and check box questions cannot be mandatory.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box that determines whether to include a Not Applicable answer option for this question on survey questionnaires. User responses of Not Applicable are excluded from results calculations.</td>
</tr>
<tr>
<td></td>
<td>This field is visible only if the data type is Choice, Likert Scale, Template, or Yes/No.</td>
</tr>
<tr>
<td>Allow Additional Information</td>
<td>If selected, the Additional Information Label field is enabled. The Additional Information Label field value is displayed as a field on the survey response page to provide additional information for a question.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This is not applicable for the String and Template data types.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Depends on</td>
<td>Setting used to make this a conditional question, meaning that it only appears when users answer another question a certain way. To make a question depend on another question, select an existing question from the list, which displays Checkbox, Choice, Template, and Yes/No questions of the same category as this question. Then, use the Displayed when field to set the conditions that cause this question to appear on surveys. The system prevents the creation of recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.</td>
</tr>
<tr>
<td>Displayed when</td>
<td>Answer options for the selected Depends on question which, when chosen on surveys, display this question. This field is visible and required only when the Depends on field is set.</td>
</tr>
<tr>
<td>Min</td>
<td>Smallest numerical value to be used as an answer option for this question. This field is visible and required only if the data type is Choice, Likert Scale, Number, or Percentage.</td>
</tr>
<tr>
<td>Max</td>
<td>Largest numerical value to be used as an answer option for this question. This field is visible and required only if the data type is Choice, Likert Scale, Number, or Percentage.</td>
</tr>
<tr>
<td>String option</td>
<td>Selection that determines what kind of response text box appears for this question on survey questionnaires. This field is visible and required only if the data type is String.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>

<tr>
<td>Source Field</td>
<td>Source table field that appears as a dynamic value for the question in a triggered survey. When this field value is selected, a ${param} placeholder is added at the end of the question label.</td>
</tr>
<tr>
<td></td>
<td>Note: You can move this placeholder anywhere in the question label.</td>
</tr>
<tr>
<td></td>
<td>When a user takes the survey, the question with dynamic value is included in the survey instance and ${param} placeholder is replaced with the source field value.</td>
</tr>
<tr>
<td></td>
<td>If the record table specified in the trigger condition does not match the source table specified for the survey, or if the system fails to get the dynamic value from the source record, the ${param} placeholder is not replaced by any value and is displayed as is in the question.</td>
</tr>
<tr>
<td></td>
<td>For example, if the survey is triggered from a PRB record and the survey question is configured with a dynamic value from Incident, the ${param} placeholder in the survey question label is not replaced by any dynamic value and is displayed as is.</td>
</tr>
<tr>
<td></td>
<td>Note: When survey questions are translated to other languages by a survey admin, the ${param} placeholder should not be translated.</td>
</tr>
<tr>
<td>Allow Sentiment Analysis</td>
<td>Includes this question for the sentiment analysis of a survey.</td>
</tr>
<tr>
<td></td>
<td>Note: This field is available only for String type questions.</td>
</tr>
<tr>
<td>Related Lists</td>
<td>Answer options for this question.</td>
</tr>
<tr>
<td>Assessment Metric Definitions</td>
<td>This related list is available only if the Data type is Choice or Likert Scale.</td>
</tr>
</tbody>
</table>

6. Save the record.

**Note:**

- Be sure to create answer options if you select the Choice or Likert Scale data type.
• You cannot delete a survey question (metric) with user responses. To delete a survey question with user responses, you should delete the responses, and then delete the survey question.

Survey question data types
You must choose a data type for each survey question. The data type determines the format of the question and the kind of data that is collected on survey questionnaires.

The following data types are available for surveys:

Attachment data type

On questionnaires, users can attach one or more files to a question.

Users click the Manage Attachments icon and select one or more files in the Attachments pop-up window to attach to the question. From this window, users can:
- View a list of the attached files.
- View an attached file in a separate window.
- Rename an attached file.
- Add or delete files

Once a survey has been submitted, attachments cannot be updated or deleted.

Any type of file supported by the platform can be attached to a question. One or more files can be attached a question while taking a survey or completing an assessment.

The assessment administrator can see the attachments associated with an individual question as well as those associated with the survey.

See Administering Attachments for more information.

Boolean data type

On questionnaires, users select a check box beside a statement or leave it cleared.

If you select Boolean, you must fill in the Scale definition field. Select High if it is best when users select the check box.

Choice data type

On questionnaires, users select a value from a list of choices.
If you select Choice, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

**Note:** The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

### Date and Date/Time data types

The Date and Date/Time data types are similar.

- **Date:** On questionnaires, users select a date.

- **Date/Time:** On questionnaires, users select a date and time.
Likert Scale data type

On questionnaires, users select a multiple choice value from a custom Likert scale. Each answer option is represented by a radio button on the scale. A Likert scale question that evaluates an application’s ease of use might have the answer options Easy, Average, and Difficult.

If you select Likert Scale, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

Note: The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

Number data type

On questionnaires, users enter a number.
If you select Number, you must fill in these additional fields:

- Scale definition: Select High if a larger number is better, such as for a question that measures the number of sales made in a quarter.
- Min and Max: Enter the smallest and largest numbers users can enter. State the range of acceptable answers in the question text.

Percentage data type

On questionnaires, users enter a number.

If you select Percentage, you must fill in these additional fields:

- Scale definition: Select High if a larger percentage is better, such as for a question that measures the percentage of work an agent has completed.
- Min and Max: Enter the smallest and largest numbers users can enter. Generally 0 and 100 are appropriate minimum and maximum values. If you choose values other than 0 and 100, it is usually best to state the range of acceptable answers in the question text.

Reference data type

On questionnaires, users select a value from a list that is generated from a specified reference table. The response field supports auto-completion.

Note: Reference qualifiers are not supported.

For example, a user could select a user name in response to a question if you specify User [sys_user] as the reference table.
String data type

On questionnaires, users enter text. When you select String, the String option field appears. Select one of the following options to determine how the string field appears on questionnaires:

- Figure 477: Single line
Template data type

On questionnaires, users select a value from a predefined series of answer options. To use this data type, a question template must be defined.

If you select Template, you must fill in these additional fields:

- Template: Select a template.
- Scale definition: Select High if the answer option with the largest template definition Value is best.

Yes/No data type

On questionnaires, users select Yes or No from a list.

If you select Yes/No, you must fill in the Scale definition field. Select High if Yes is the best answer.
**Image Scale data type**

On questionnaires, users select an image from a predefined set of images as their response. Image scale questions can also be used in a template for better performance with surveys that have the same type of answer options.

Five emojis, similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Two images can be uploaded, one for selected case and another for unselected case. Larger size images are reduced to 64 x 64 pixels.

The result behavior depends on the presence of uploaded images. If no selected image is uploaded, then the question shows up blank.

<table>
<thead>
<tr>
<th>Selected image</th>
<th>Unselected image</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Unselected image loads. Clicking on the image changes it to the selected image.</td>
</tr>
<tr>
<td>Yes</td>
<td>No</td>
<td>Selected image loads with 50% opacity. Clicking on the image changes the opacity to 100%.</td>
</tr>
<tr>
<td>No</td>
<td>Yes</td>
<td>A blank placeholder box is displayed.</td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>A blank placeholder box is displayed.</td>
</tr>
</tbody>
</table>

**Note:** N/A option is not supported for image scale type question.

**Multiple selection data type**

On questionnaires, users can select multiple check boxes indicating all answers that apply. For instance, a user can be instructed to “Select all that apply” in a multiple selection question.
Ranking data type

On questionnaires, users can select a different order number for each option to rank them. Drag-and-drop functionality is also supported, which allows a user to either fill in the number, or simply drag an option.

1. Please rate following device in order of importance.

One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.

Survey question template
Question templates define reusable sets of answer options for survey questions.

Question templates define reusable rating scales for answering questions, where each answer option on the scale is a template definition. For example, the template named Satisfaction represents a satisfaction
scale and contains the following template definitions: Very Satisfied, Satisfied, Neutral, Dissatisfied, and Very Dissatisfied.

Figure 480: Template definition

Templates are available for survey questions that have Data type set to Template. The following question templates are available in the base system. You can create or update a template as described in Create a survey question template on page 2518.

Table 1066: Default question templates

<table>
<thead>
<tr>
<th>Name</th>
<th>Template definitions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amount</td>
<td>None, Few or little, Average amount, Many, Quite a lot</td>
</tr>
<tr>
<td>Complexity</td>
<td>Very Complex, Complex, Moderate, Simple, Very Simple</td>
</tr>
<tr>
<td>Frequency</td>
<td>Never, Seldom, Sometimes, Most of the time, All of the time</td>
</tr>
<tr>
<td>Likert 5</td>
<td>Strongly Disagree, Disagree, Neutral, Agree, Strongly Agree</td>
</tr>
<tr>
<td>Quality</td>
<td>Very Poor, Poor, Average, Good, Very Good</td>
</tr>
<tr>
<td>Satisfaction</td>
<td>Very Dissatisfied, Dissatisfied, Neutral, Satisfied, Very Satisfied</td>
</tr>
<tr>
<td>Size</td>
<td>Very Small, Small, Average, Large, Very Large</td>
</tr>
</tbody>
</table>

Create a survey question template

You can create and administer question templates.

Role required: admin or survey_admin

Changes to a survey, such as the modification of question templates, apply to existing survey instances immediately. Templates that you create are available for use with both surveys and assessments.

1. Navigate to Survey Templates.
   Each template is stored as a record on the Assessment Metric Template [asmt_template] table.
2. Click New.
3. Enter a Name.
4. Right-click the form header and click Save.
5. In the Assessment Template Definitions related list, click New.
   Create a template definition for each answer option you want to appear on a question.
6. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>Enter the text to appear as the answer option.</td>
</tr>
<tr>
<td>Value</td>
<td>Enter a numeric value, greater than or equal to zero, to which the answer option equates. Values are used in results calculations. When you view questions that use templates, answer options appear in order from smallest to largest Value. Each template definition for a given template must have a unique Value.</td>
</tr>
</tbody>
</table>

7. Click Update.

Update min and max values to match templates

If you use survey result calculation data, ensure that the Min and Max values for a question that uses a template are equal to the smallest and largest template definition Value.

Role required: admin or survey_admin

When you create a question of the Template data type, the system sets the Min and Max fields based on the template definition values. The fields for existing questions are not updated if you add a new template definition to a template or if you update the Value of an existing template. If the new Value is less than the minimum value or greater than the maximum value of any questions that use the template, update the questions accordingly.

1. Navigate to Survey Questions.
2. Configure the list to show the Min and Max columns.
3. Add the following list filter condition: [Template] [is] [<select the template you updated>].
4. Ensure the Min and Max values match the smallest and largest template definition Value for the selected template.
   If the values do not match, edit the Min and Max values directly from the list.

   **Note:** When the data type is Template, a UI policy prevents the editing of Min and Max from the form.

Create or modify answer options

You must create answer options, called metric definitions, for survey questions that have Data type set to Choice or Likert Scale.

Role required: admin or survey_admin

Changes to a survey, such as the addition or modification of answer options, apply to existing survey instances immediately.

1. Navigate to Survey Questions.
2. Open a choice or Likert scale survey question.
3. In the Assessment Metric Definitions related list, open a metric definition or click New.
   Each answer option is stored as a record on the Assessment Metric Definition [asmt_metric_definition] table.
4. Complete the Assessment Metric Definition form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>Text to appear as the answer option.</td>
</tr>
<tr>
<td>Value</td>
<td>Numeric value, greater than or equal to zero, to which the answer option equates. Values determine the order in which answer options appear. See the example below. Values are also used to calculate survey results. Each metric definition for a given question must have a different Value.</td>
</tr>
</tbody>
</table>

5. Click Submit.

On survey questionnaires, the answer options for a question appear in order from smallest to largest Value. For example, consider the survey question How do you feel? with the answer options Good, Neutral, and Bad. The following table shows the answer option order based on the Value.

<table>
<thead>
<tr>
<th>Answer option</th>
<th>Value</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Good</td>
<td>1</td>
<td>First</td>
</tr>
<tr>
<td>Neutral</td>
<td>3</td>
<td>Second</td>
</tr>
<tr>
<td>Bad</td>
<td>5</td>
<td>Third</td>
</tr>
</tbody>
</table>

If you use survey result calculations, ensure the question Scale definition is set appropriately based on the answer options. In the previous example, if you want the answer option Good to earn the highest score, the scale definition should be Low because Good has the smallest value.

*Change the order of survey questions*

You can easily reorder survey questions at the category level or the question level.

**Role required: admin or survey_admin**

You can change the order in which the questions in one category appear relative to those in other categories for the same survey definition. If you add a new question manually after you create other questions, you may want to change the order of questions.

When you create questions using the survey creator, the system sets the Order field for the first question to 101, the second to 102, and so on. After you create a new question outside of the survey creator, the Order is set to 100 by default, which means it appears before all questions generated by the survey creator.

1. Navigate to Survey View Surveys and open the appropriate survey definition.
2. In the Metric Categories related list, edit the values in the Order column.
3. To change the order of questions within a category, complete the following steps.
   a) Open the Assessment Metrics related list.
b) Edit the values in the Order column.

4. Click Update.

Survey trigger conditions

Trigger conditions specify when to send a particular survey and the persons to send it to.

Survey administrators can use trigger conditions to configure the system to generate a survey instance each time a specified action occurs on a specified table, for example, when an incident or change request closes. The system sends the survey to users that are related to the triggering record, for example, incident callers or change request assignees. You can choose to send a survey every time the condition is met, or you can set a probability for the system to send a survey at random when the condition is met.

Trigger conditions are ideal for sending transactional surveys. Transactional surveys generally measure satisfaction with a recent experience, such as closing an incident or purchasing an item.

### Note:
Trigger conditions are comparable to survey conditions in legacy surveys. If you migrate a legacy survey that has survey conditions, ensure that the survey conditions are deactivated before you recreate them as trigger conditions.

**Configure a trigger condition for a survey**

You can configure trigger conditions to specify when to send a particular survey and the persons to send it to.

Role required: admin or survey_admin

1. Navigate to SurveyTrigger Conditions.
2. Click New.

### Note:
Do not specify particular users for a triggered survey because only the specified users are allowed to take the survey.

3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment</td>
<td>Survey to send.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to run the trigger condition on. You can select only tables in the current application scope. For example, to send a survey whenever an incident closes, select the Incident [incident] table.</td>
</tr>
<tr>
<td>User field</td>
<td>Field that stores the users you want to send the survey. You can select any field, on the selected table or on a referenced table, that references the User [sys_user] table. Use the tree picker to select a field.</td>
</tr>
</tbody>
</table>

### Note:
To avoid requiring users to log in to take a survey with a trigger condition, set the survey to Public.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Repeat interval</td>
<td>Minimum period that must pass before the trigger condition can resend the survey to the same user. For example, assume the repeat interval is set to 30 days. Even if the same user qualifies for multiple surveys from this trigger condition, the system can send only one survey every 30 days.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Ensure that the Schedule period of the selected survey definition is set to No Limit. If the schedule period is set to a different value, it prevents the trigger condition from sending surveys as expected.</td>
</tr>
<tr>
<td>Application</td>
<td>[Admin only] Application is set to Global.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this trigger condition is active (selected).</td>
</tr>
<tr>
<td>Business rule</td>
<td>[Admin only] Business rule the system creates to monitor the selected table. When the condition is met, the business rule sends the survey to the correct user. No configuration is necessary for this business rule.</td>
</tr>
<tr>
<td>Trigger randomly</td>
<td>Check box that determines whether to send the survey to the appropriate user every time the condition is met (cleared) or only a percentage of the time (selected).</td>
</tr>
<tr>
<td>Probability (%)</td>
<td>Approximate probability that the survey is sent each time the condition is met. For example, if the probability is set to 50, the system sends the survey approximately 50% of the time the conditions are met. There are no repeat interval restrictions is assumed. This field is visible and required only when Trigger randomly is selected.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Related Field 1- 4</td>
<td>Field that contains a value you want to store for reporting purposes. You can pick any reference field on the selected table. When the trigger condition generates a survey instance, the system stores the value from the triggering record. Specify up to four fields. For example, select the Incident table, Assigned to and Problem as related fields. The system stores the assigned user and problem associated with the incident as Related record 1 and Related record 2 in the survey instance record. To view the fields, configure the form for any survey instance.</td>
</tr>
<tr>
<td>Description</td>
<td>Summary information to identify the trigger condition.</td>
</tr>
<tr>

**Trigger condition example**

You can send out auto-triggered surveys when an incident is closed or resolved.

A trigger condition is configured as follows:

- Assessment: Service Desk Satisfaction Survey
- Table: Incident [incident]
- User field: Caller
- Repeat interval: 30 days
- Active: true
- Trigger randomly: false
- Related Field 1: Assigned to
- Related Field 2: Problem
- Condition: [State] [is] [Closed] [or] [State] [is] [Resolved]

Fannie Steese is the caller on incident INC00004305 that is assigned to Boris Catino, a service desk technician. Boris creates PRB010101 based on Fannie's complaint and closes the incident. The system creates a survey instance assigned to Fannie so she can rate her satisfaction with the incident experience.

Because two related fields were selected as part of the trigger condition, the survey instance stores the following information from the incident:

- User (Related Field 1): Boris Catino
- Problem (Related Field 2): PRB010101
- Task (automatically created): INC00004305

Because the task field is automatically populated, UI-based filtering by dot-walking on incidents (or any task-based table) is supported when creating a report on survey results. For example, you can query all survey instances related to incidents assigned to a group (survey reports on all incidents assigned to networking group, for instance).

---

**Note:** Even though the trigger condition is set to be triggered each time that the conditions are met, the Repeat interval setting ensures that Fannie does not receive another survey for another of her incidents closes within 30 days of the first incident.

---

**Survey report example based on task field**

One of the most common use cases for Surveys is to send out an auto-triggered survey when an incident, request, or task is closed. Once you get the survey results back, you can filter the results by users and groups related to the ticket, such as Assignment Group, or Assignee.

Filtering the survey results provides more detail on how people and teams are performing based on ticket data. Since this information is automatically captured, you can dot-walk while filtering the data (instead of utilizing a related field on the Survey trigger condition form, as previously required).

<table>
<thead>
<tr>
<th>Number</th>
<th>Metric type</th>
<th>Due date</th>
<th>State</th>
<th>Assigned to</th>
<th>Trigger table</th>
<th>Trigger ID</th>
<th>Task</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWST0012001</td>
<td>Customer Satisfaction Survey</td>
<td>2016-09-20</td>
<td>Ready to take</td>
<td>System Administrator</td>
<td>Incident [incident]</td>
<td>Incident: INC00012008</td>
<td>INC00012008</td>
</tr>
</tbody>
</table>
To create a report on incident-triggered survey responses by Assignment group, set up the report on the Task Assessment Details by navigating to Reports View/Run and clicking Create a report.

Survey distribution

There are several ways for survey administrators to distribute surveys to users.

Surveys are distributed using any of the following methods.

- Send survey invitations to users
- Share a survey URL that opens the survey directly.
- Create a module that opens a survey.

Send survey invitations to users
You can send survey invitations using the Assign Survey or Send Invitations buttons on the Survey Definition form.

Role required: admin or survey_admin

Use the Send Invitations button to immediately assign survey instances to each survey user that is listed in the survey definition. Use the Assign Survey button to assign a survey instance to any one user at a time.

Each of the buttons generates survey instances assigned to the appropriate users. In addition, if the instance is configured to send email, the system generates survey notifications. For either button to be available, the survey definition must meet all of the following conditions.

- Active check box is selected.
- State is Published.
- Survey is associated with at least one question.

**Note:** You (or a trigger) can send more than one instance of a survey to a user at any time.

1. Navigate to Survey View Surveys.
2. Select an active, published survey.
3. Complete one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assign a survey to users listed in the Survey Users related list</td>
<td>Click Send invitations.</td>
</tr>
</tbody>
</table>
### Assign a survey to any user

Click Assign Survey and select one or more users, and then click OK.

The system creates a survey instance assigned to the user or users, assuming the user is eligible to receive a new survey instance. When you use the Assign Survey button, the selected user is not saved as a survey user.

### Survey URLs

You can distribute a survey by giving survey users a survey URL.

Survey administrators can obtain one of the following types of URLs:

- A general URL for a survey, which users can open to take the survey questionnaire. The following process occurs.
  - When someone opens the URL, the system ensures that the person is logged in. It then searches for an instance of the associated survey that is assigned to the logged-in user.
  - If a survey instance is found, the appropriate action occurs based on the State of the survey instance (see table). If there are multiple active survey instances (Ready to take or In progress), the instance with the earliest due date opens.
  - If no survey instance is found, the system creates a new instance for the survey, assigns it to the user, and opens the survey questionnaire.

- A URL for a specific survey instance, which the assigned user can open to take the survey questionnaire. The following process occurs.
  - When someone opens the URL, the system ensures the person is logged in as the user the survey instance is assigned to. Only the assigned user can access the survey questionnaire.
  - The appropriate action occurs, depending on the State of the survey instance (see table).

### Table 1070: Survey states

<table>
<thead>
<tr>
<th>Survey instance state</th>
<th>Action upon opening URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ready to take: User has not saved any responses.</td>
<td>The survey questionnaire appears for the user to begin. The user can save or submit responses.</td>
</tr>
<tr>
<td>In progress: User has saved at least one response.</td>
<td>The survey questionnaire appears for the user to continue. Any previously saved responses are displayed. The user can save or submit responses.</td>
</tr>
<tr>
<td>Complete: User has submitted all required responses.</td>
<td>If the schedule period is No Limit or if the period restriction has expired, the survey questionnaire for a new survey instance appears for the user to begin. If the schedule period restricts the number of times a user can take the same survey, and the period restriction has not expired since the user last completed survey, an error message appears.</td>
</tr>
</tbody>
</table>

If someone opens a URL for an unpublished or deactivated survey, an error message appears.
Obtain and distribute a general survey URL

You can distribute a general survey URL to allow any eligible user to open a survey questionnaire.

Role required: admin or survey_admin

The general URL is available on the Survey Definition form and on the survey creator. You can also email the URL for a public survey that is published.

1. Navigate to Survey View Surveys.
2. Open a survey definition from the Assessment Metric Types list.
3. To view or copy the URL, click the View Survey URL related link.
   This related link is visible only if the survey definition is Active.
4. To distribute the URL to users, paste the copied URL as desired, or click the Email button to send via email.
   The Email button is visible only for a public survey that is published.

When a survey user clicks the general survey URL, the system creates a survey instance for the survey user as long as the user does not have an instance in the Ready to take state. The system is configured by default to send an email notification when a survey instance is generated.

As a result, the survey user receives a second notification in addition to the notification that you sent with the general survey URL. This may confuse the survey user. To avoid this issue, you can deactivate auto-notification.

Deactivate auto-notification for surveys

When you send a survey notification with a general survey URL to a survey user, the user may receive a second system-generated notification. To avoid this issue, you can deactivate auto-notification.

Role required: admin or survey_admin

1. Navigate to System Notification Email Notifications.
2. Open the Survey User Invite notification.
3. Configure the form to add the Send to event creator check box to the Who will receive section.
   The Send to event creator check box is selected by default.
4. Clear the Send to event creator check box.
   The system will no longer send auto-notification messages to survey users.

Obtain a survey instance URL

You can distribute a survey instance URL to allow the assigned user to open a survey questionnaire.

Role required: admin or survey_admin

The survey instance URL is available on the survey instance record.

1. Navigate to Survey Survey Instances.
2. Open the instance for the survey.
3. To view or copy the URL, click View Instance URL related link.
   The related link is available only when the survey instance State is Ready to take or In progress and the associated survey definition is Active.
4. In the dialog box, select and copy the URL then click OK or Cancel.
5. Distribute the URL to the assigned user.

Test a survey URL

When there are survey users associated with a survey, the survey is restricted so only those users can use the survey URL. You can test the survey URL to ensure it is restricted.
Role required: admin or survey_admin

1. Navigate to Survey View Surveys and open a survey for which you are not a survey user.
2. Under Related Links, click View Survey URL.
3. Copy the URL and click OK or Cancel.
4. Navigate to the URL.
   You see a message that you are not authorized to take the survey.

*Create a survey module*
You can create a module that opens a survey.

Role required: admin or survey_admin

When a user clicks a survey module, the system performs one of the following actions, depending on the configuration options for the survey and other factors.

- Creates a new survey instance
- Opens an existing survey instance
- Displays an error message.

1. Perform the appropriate action for your version of the UI:
   - UI16: Point to the application menu that contains the module to which you want to add the survey module and click the edit application (pencil) icon.
   - UI15: Right-click the application menu you want to add the module to and select Edit Application Menu

2. In the Modules related list, click New.
3. Complete the following fields.
   - Link type: Assessment
     Do not select Survey, which is used for legacy surveys only.
   - Assessment: Select the survey you want the module to open.

4. Complete and save the form.

*Sharing surveys: export and import*
You can export a survey and then import it to a different ServiceNow instance.

**Note:** Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see System update sets.

The system exports a single XML file that contains a survey definition [asmt_metric_type] and the associated records, including the following.

- Assessment Metric Template [asmt_template]
- Assessment Template Definition [asmt_template_definition]
- Metric definitions [asmt_metric_definition] (survey question answer options)
- Scheduled Jobs associated with the Survey [sys_trigger]
- Survey categories [asmt_metric_category]
- Survey questions [asmt_metric]
- Survey users [asmt_m2m_category_user]
- Trigger Condition [asmt_condition]

*Export a survey*
You can export a survey and then import it to another instance.
Role required: admin, survey_reader, or survey_admin

For information about update sets, see System update sets.

1. Navigate to Survey View Surveys.
2. Right-click the name of a record to show the context menu.
3. Select Export Assessment.
4. If applicable, follow the prompt in your browser to save the XML file.

**Import a survey**

You can import a survey that has been exported as an XML file. The exported XML file does not contain result data.

Role required: admin or survey_admin

---

**Note:** Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see System update sets.

---

1. Verify that the target instance has assessments enabled.
2. Follow the steps in Import an XML file to import the assessment.

**Use update sets for surveys and assessments**

Use an update set to capture changes to surveys and assessments.

Role required: admin or survey_admin

When developing surveys and assessments, you can use an update set to capture the changes and move them from a development instance to a production instance. Once an update set is created and marked current, all of the updates to the following tables are recorded in the update set.

The following tables are now update set enabled and also extend the application file:

- Assessment Metric Templates [asmt_template]
- Assessment Template Definitions [asmt_template_definition]
- Assessment Metric Definitions [asmt_metric_definition]: survey question answer options
- Schedule [sys_trigger]: scheduled jobs associated with the survey
- Assessment Metric Categories [asmt_metric_category]: survey categories
- Assessment Metrics [asmt_metric]: survey questions
- Assessment Category Users [asmt_m2m_category_user]: survey users
- Trigger Conditions [asmt_condition]

**Sentiment analysis for surveys**

You can use sentiment analysis to determine whether user responses for a survey are considered positive, negative, or neutral.

Activate the Sentiment Analysis (com.snc.sentiment_analysis) plugin.

For a survey, you can select questions that should be used for analysis. The survey responses of these questions are sent to the thirdparty platforms for analysis through the specified connector configurations.

---

**Note:** You can only use string type questions for sentiment analysis.

---

The sentiment analysis results are displayed under Survey Question Sentiment Results. The sentiment label is based on the normalized score:
Table 1071: Sentiment label

<table>
<thead>
<tr>
<th>Normalized score</th>
<th>Sentiment label</th>
</tr>
</thead>
<tbody>
<tr>
<td>-1 to 0</td>
<td>Negative</td>
</tr>
<tr>
<td>0</td>
<td>Neutral</td>
</tr>
<tr>
<td>0 to 1</td>
<td>Positive</td>
</tr>
</tbody>
</table>

*Configure a sentiment connector*

Specify the service URL and other configuration information for third party APIs that are used for sentiment analysis.

Role required: admin

1. Change the scope of the current session to Sentiment Analysis.
2. Navigate to Sentiment Analysis Sentiment Connector Configurations.
3. Add or edit the connector configuration for a third party vendor such as Google, IBM Watson, and MS Azure.

*Note:* By default, placeholders are available for configuring connectors for Google, IBM Watson, and MS Azure.

Table 1072: Sentiment connector fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the sentiment analysis connector configuration.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to activate the connector configuration.</td>
</tr>
<tr>
<td>Credential Alias</td>
<td>Credential alias associated with the connector configuration. It has a reference to the system level table (sys_alias_list).</td>
</tr>
<tr>
<td>Default</td>
<td>Check box to make this as the default connector configuration.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the connector configuration.</td>
</tr>
<tr>
<td>Script</td>
<td>Script to call the Sentiment Analysis API and the normalize the values.</td>
</tr>
</tbody>
</table>

4. Configure the connector credentials
   a) Open the record referred in the Credential Alias field.
   b) Under the Connections tab, select the connection.
   c) In the Connection URL field, enter the value.
   d) Open the record referred in the Credentials field.
   e) Enter the credential information.

*Note:*
- You should obtain the connection credentials from the respective third-party vendors.
• If the credential is an API key, specify its value. If the credential is basic authentication, that is, user name and password, specify the corresponding information.

f) Select the Active check box and click Update.

5. Select the Active check box for the connector configuration and click Update.

Sentiment analysis properties
You can use the sentiment analysis properties to customize the Sentiment Analysis module.

Table 1073: Sentiment analysis properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Response time for the outbound call of Sentiment Analysis API (sn_nlp_sentiment.glide.sentiment.transaction.timeout)</td>
<td>Maximum time (milliseconds) expected for executing the outbound call for Sentiment Analysis API before it’s timeout.</td>
</tr>
</tbody>
</table>

Sentiment analysis results
The sentiment analysis results view contains a bar chart that displays the percentage of positive, negative, and neutral results, along with the instance count for each category.

Color indicators
Following are the color indicators in the bar chart:

• Green: Positive
• Red: Negative
• Blue: Neutral

Legacy survey migration
Users with the survey_admin role can migrate legacy survey data to create copies of legacy surveys and their related records in assessment tables. The Survey Management application, which is built on the assessment engine, is available as an alternative to legacy surveys.

The following legacy survey components are migrated:

• Survey masters
• Supported survey questions and question choices
• Survey instances
• Survey responses

Legacy survey conditions are not migrated and must be recreated as trigger conditions.

Note:

• The Legacy Surveys and Legacy Administration modules are available on instances upgraded from a previous release but not available for new instances. Customers using legacy survey or survey wizard should plan to migrate to the Survey Management application to create modern and high quality surveys for their users.
• The following legacy survey plugins are inactive by default, and are available upon request:
  • Best Practice - Task Survey Management (ID: com.snc.bestpractice.task_survey)
Migrate a legacy survey
Migrate a legacy survey and its related records to take advantage of a more powerful feature set.

Role required: admin or survey_admin

To avoid timing out for very large surveys, you can disable the transaction quota. See Transaction quotas.

1. Navigate to SurveyLegacy SurveysMasters.
   The list of legacy survey masters appears. By default, the list shows only survey masters that have not been migrated. To show all survey masters, remove the Assessment is empty breadcrumb.

2. Open a survey and click the Migrate to New Survey Management related link or Migrate to New Survey Management in the title bar.
   A dialog box describes what happens when you migrate the survey. Note that certain types of survey questions cannot be migrated.

3. Click OK.
   The system generates records on assessment tables based on the survey master, eligible questions and choices, results, and other related survey components. The original survey components are unaffected.
   System messages may appear at the top of the Survey form to notify you of questions that could not be migrated and to advise you to review migrated Multiple Choice questions.

4. Click the reference icon beside the Assessment field to view the new survey definition.

5. Remove survey users from the assessment survey if you want all users to be able to take it.
   When you migrate a survey, any users who have taken it are automatically associated with the assessment survey and become survey users. When there are survey users associated with an assessment survey, only those users can take it.

6. Deactivate any survey conditions associated with the survey by completing the following steps.
   a) Navigate to Survey Legacy Administration Survey Conditions.
   b) In the Active column, ensure the value is false for any survey conditions that reference the migrated survey.

7. Navigate to Survey Administration Trigger Conditions to create new trigger conditions for the migrated survey.

The Migrate to Assessment related link on the legacy survey record becomes unavailable after the migration. However, if you delete the record referenced in the Assessment field, the related link reappears and you can migrate the legacy survey again.

Survey question migration
Before you migrate a legacy survey, understand that some legacy survey questions cannot be migrated due to incompatible question types.

Legacy survey questions are migrated from the Survey Question [survey_question_new] table to the Assessment Metric [asmt_metric] table. In legacy surveys, the Type field on the Survey Question table determines how the question renders on the survey questionnaire. In assessment surveys, the Data type field on the Assessment Metric table serves a similar purpose. Certain legacy survey types are not supported in assessment surveys.

The following table shows the conversion path for each legacy survey question type to an assessment data type, if there is one.
### Table 1074: Survey question migration

</tr>
<tr>
<td>Yes / No</td>
<td>Yes/No</td>
</tr>
</tbody>
</table>

**Migrated components**

When you migrate a survey, the system maps records from survey tables to assessment tables.

To create a functional survey on the assessment framework, the system converts survey records to the most logical equivalent assessment survey records. This may mean multiple assessment survey records represent one legacy survey record.

### Table 1075: Migrated components

<table>
<thead>
<tr>
<th>Survey component</th>
<th>Assessment survey components</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey master [survey_master]</td>
<td>• Survey definition [asmt_metric_type]</td>
</tr>
<tr>
<td></td>
<td>• Assessable record [asmt_assessable_record], for system use only</td>
</tr>
<tr>
<td></td>
<td>• Survey category [asmt_metric_category]</td>
</tr>
<tr>
<td>Survey question [survey_question_new]</td>
<td>• Survey question [asmt_metric]</td>
</tr>
</tbody>
</table>
Survey component | Assessment survey components
--- | ---
Question choice [question_choice] | • Assessment metric definition [asmt_metric_definition]
Survey instance [survey_instance] | • Assessment group [asmt_assessment], for system use only • Survey instance [asmt_assessment_instance]
Survey response [survey_response] | • Survey instance question [asmt_assessment_instance_question] • Survey response [asmt_metric_result] • Category result [asmt_category_result], for system use only

**Migrated question review**

To maintain accurate result calculations, you may need to make minor adjustments to some of the migrated survey records to ensure results are calculated correctly.

**Note:** The assessment engine provides a built-in result calculation feature that converts each survey response to a score between 0 and 10. The configuration required to maintain accurate result calculations is advanced and is not recommended for basic survey implementations. If you do not plan to use result calculation data, ignore the information in this section.

For each legacy question migrated, the system creates a survey question record on the Assessment Metric [asmt_metric] table. For legacy questions of the Multiple Choice and Select Box types, the system also creates a metric definition record, on the Assessment Metric Definition [asmt_metric_definition] table, for each legacy question choice.

**Table 1076: Comparable metric definitions and survey question choices**

<table>
<thead>
<tr>
<th>Survey question choice field</th>
<th>Related metric definition field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text</td>
<td>Display</td>
</tr>
<tr>
<td>Value (can be any string value)</td>
<td>Value (must be a numerical value)</td>
</tr>
<tr>
<td>Order</td>
<td>Value (metric definition with smallest Value is first)</td>
</tr>
</tbody>
</table>

When the system migrates legacy survey question choices, it uses the legacy Order to set each metric definition Value. For the legacy question choice with the smallest Order, the corresponding metric definition Value is set to 1. For the legacy question choice with the next smallest Order, the metric definition Value is 2, and so on.

The Scale definition field on the migrated Survey Question form determines whether smaller or bigger metric definition values equate to a good score in survey result calculations. By default, the scale definition is set to High, meaning bigger values are good. When you migrate a legacy survey, check that the default scale definition makes sense for each question.

For example, the following tables depict a sample migrated question and the metric definitions automatically created for it. Recall that the system uses the order of the legacy survey question choices to set the metric definition value. Excellent has the lowest Order value, so when the system creates a metric
definition for this question choice, the Value is set to 1. In this case the default scale definition value, High, does not make sense, as the system will calculate the worst scores for responses of Excellent.

Table 1077: Legacy question: Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Question choice text</th>
<th>Question choice value</th>
<th>Question choice order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>A</td>
<td>100</td>
</tr>
<tr>
<td>Good</td>
<td>B</td>
<td>200</td>
</tr>
<tr>
<td>Fair</td>
<td>C</td>
<td>300</td>
</tr>
<tr>
<td>Poor</td>
<td>D</td>
<td>400</td>
</tr>
</tbody>
</table>

Table 1078: Migrated question: Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Metric definition display</th>
<th>Metric definition value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>1</td>
</tr>
<tr>
<td>Good</td>
<td>2</td>
</tr>
<tr>
<td>Fair</td>
<td>3</td>
</tr>
<tr>
<td>Poor</td>
<td>4</td>
</tr>
</tbody>
</table>

If there are no Order values for the legacy survey question choices, the system sets each corresponding metric definition Value based on the alphanumeric order of the legacy Text value.

Table 1079: Migrated question: Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Metric definition display</th>
<th>Metric definition value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>1</td>
</tr>
<tr>
<td>Good</td>
<td>2</td>
</tr>
<tr>
<td>Fair</td>
<td>3</td>
</tr>
<tr>
<td>Poor</td>
<td>4</td>
</tr>
</tbody>
</table>

You may also need to change the Scale definition setting for other migrated questions. For details, see the scale definition recommendations for each survey question data type.

Quizzes

Quizzes are questionnaires you can assign to one or more users to assess their knowledge of any subject. The quiz functionality is built on the assessment engine and provides many of the same features as assessments and surveys.

Each question is scored, and the overall score indicates the percentage of questions the user answered correctly. A quiz may have categories of questions that are assigned only to some users. You can assign weighting values to individual questions or categories of questions that make them more or less important when calculating the overall score. Quizzes require activation by a system administrator.

- An administrator can create a quiz for any purpose and assign it to a single user or multiple users.
• A quiz can contain one or more categories of questions. Each category can be assigned to users who answer only the questions in that category.
• The system can send email notifications to these users:
  • Recipients: The recipient can receive notification of an assigned quiz, a quiz whose allowed duration is at 50%, and a quiz that is overdue.
  • Recipient's manager: The recipient's manager can receive notification when a quiz is overdue.
  • Quiz manager: The quiz manager can receive notification of an overdue quiz to which he or she is assigned.
• Quizzes can contain questions that are scored or not scored. Unscored questions assess opinions or involve dates and are not counted in the final score. Scored questions specify correct answers and are scored either as 0% or 100%. You can apply a weighting scale to scored questions to establish their relative importance. You can designate questions with these data types as scored questions:
  • Checkbox
  • Choice
  • Duration
  • Likert Scale
  • Numeric Scale
  • Template
  • Yes/No
• A quiz question can be dependent on the response to any scored question. For example, you can create a dependent question requesting additional information that appears only if a recipient answers No to a specific question.

Important terms

The quiz application involves several terms.

<table>
<thead>
<tr>
<th>Table 1080: Terms used in quiz application</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Quizzes</strong></td>
</tr>
<tr>
<td><strong>Categories</strong></td>
</tr>
<tr>
<td><strong>Questions</strong></td>
</tr>
</tbody>
</table>
Category user
A category user is the recipient of questions for a specific category. You can select different users to answer the questions for each category.

Templates
A template is a question data type that provides reusable rating scales for answers to questions. For example, the answer template named Satisfaction contains a satisfaction scale ranging from Very Satisfied to Very Dissatisfied.

Quiz roles
The Quizzes application uses these roles. No role is required to take quizzes that are assigned to you.

Table 1081: Quiz roles

<table>
<thead>
<tr>
<th>Role Title [Name]</th>
<th>Role Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>assessment administrator [assessment_admin]</td>
<td>Can administer the Assessments application and all quiz records. Can access all the modules of the Assessments application.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The itil_admin role and the survey_admin role contain the assessment_admin role</td>
</tr>
<tr>
<td>Administrator [admin]</td>
<td>Can access all aspects of the assessment and survey processes. Only administrators can modify survey notifications, create survey modules, and import surveys.</td>
</tr>
</tbody>
</table>

Set up and administer quizzes

Set up and administer quizzes.

Role required: assessment_admin or admin

1. Create reusable question templates for quizzes.
2. Create the quiz using the Quiz Designer or with forms accessed from the navigation menu.
   The quiz record includes specifics such as duration, notification preferences, a questionnaire introduction, and ending notes displayed to recipients.
3. Edit the default category or create additional categories as needed.
   The system creates a category with the same name as the quiz.
4. Define users for each category.
   These are the recipients who answer the questions in a category. You can define different users for each category.
5. Create the questions for each category.
6. Create the answers for each question and determine if the questions are scored.
   You can create unique answers or select preconfigured answers from a template.
Publish and distribute the quiz. You can send the quiz to a single user or all users in each category.
Review the results from the submitted quizzes in reports and scorecards.

Activate the quiz designer

Administrators can activate the Quiz Designer plugin.
Role required: assessment_admin or admin

1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
   - If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. If available, select the Load demo data check box.
   - Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
   - You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.
5. Click Activate.

Quiz Overview module

The Quiz Overview module is a homepage that displays various reports on data such as results for each category and quizzes that are complete, pending, or in progress.
Role required: assessment_admin or admin

Users with the assessment_admin role can view the overview page and refresh, add, delete, and rearrange widgets.

1. Navigate to Quizzes Overview.
2. Click elements within reports to obtain more information. The available reports are:

<table>
<thead>
<tr>
<th>Report</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quizzes by State</td>
<td>Assessment Instance [asmt_assessment_instance]</td>
</tr>
<tr>

<td>Metric Results [asmt_metric_result]</td>
</tr>
</tbody>
</table>
Quiz designer

The quiz designer provides a single interface that users with the assessment_admin role can use to create, edit, and distribute quizzes.

You can also use it to edit existing quizzes and change scoring parameters.

Alternatively, you can use the modules of the assessment engine to create and edit the records that make up a quiz. All quiz records are stored in assessment tables and displayed in Quiz views of those tables. For details, see Create quizzes with forms.

Tools on the Quiz Designer

The quiz designer includes a design canvas, a header bar, and many controls that you can use to create quizzes.

To open the quiz designer, navigate to Quizzes Quiz Designer.

The designer contains the following elements:

- Controls
- Header bar
- Design canvas

Controls

Controls for the supported question data types are available in the Controls palette. Drag and drop a control onto the designer canvas to create a question of that type.
### Table 1082: Question controls

<td>Choice list of templates that provide a predefined scale of options. For details, see Configure a template question. Multiple correct answers are supported.</td>
<td>Y</td>
</tr>
<tr>
<td>Reference</td>
<td>Choice list of fields from a specified reference table. This data type does not support reference qualifiers.</td>
<td></td>
</tr>
</tbody>
</table>

**Header Bar**

The header bar contains tabs that display different views and a menu of various functions.

Click one of the following tabs to change the view in the canvas:
Design: Add categories and questions, and configure the properties of each. This is the default view of the canvas when you open the designer.

Configuration: Create introductions and end notes for quizzes, and select a signature.

Availability: Select the recipients for each category in the quiz.

Point to the menu icon ( □□□ ) in the upper right of the quiz designer to select the following options:

- Save: Saves the current quiz.
- Preview: Displays a preview of the quiz as it appears to the recipients.
- Publish: Distributes the quiz to the selected recipients.
- Save and Publish: Saves and distributes the quiz in one step.
- New Quiz: Opens a fresh canvas for a new quiz.
- Load Quiz: Opens a list of existing quizzes that you can select and edit.
- Copy Quiz: Creates a copy of the quiz.

The availability of each option depends on the status of the quiz that is opened in the quiz designer.

Design Canvas

New quizzes open in the Design view. The quiz Name field appears above first category in the canvas. A blank question field appears in the category container.

Create a quiz

When you create a quiz, you can create one or more categories and then add questions to each category.

Role required: assessment_admin or admin

Each category can be assigned to a different user or the same users. You can also customize each question and make it dependent on the response to another question.

Create a quiz using these procedures:

*Create quiz categories*

A category represents a theme for evaluating a specific element of the quiz topic and contains questions pertaining to that theme.

Role required: assessment_admin or admin

When you create a quiz, the system creates a default category, using the name of the quiz. You can use this category, modify it, or create additional categories as needed. To have any results, a category must contain scored questions.

1. Navigate either Quizzes Quiz Designer or Quizzes Quizzes and click Quiz Designer in the list header.
2. Enter the name of the quiz in the Name field. The system uses this name as the name of the quiz and the first category.
3. To configure the category, click the gear icon in its title bar. The Properties dialog box appears. You can change the name of the category, add a description for it, and enter text in the Details field that introduces or explains the category to the recipients. The system updates the category as you type.
4. Click the X icon to close the category properties dialog box and save your settings.
5. To add a new category, click the + icon in the title bar of an existing category.

Create quiz questions
You can create multiple questions for each category but each question can be associated with only one category.

Role required: assessment_admin or admin

The data type that you select for each question determines how it can be answered by quiz recipients.

You can designate questions to be scored. Only scored questions are shown in the quiz results and considered when calculating the category results. You must also specify a correct answer for scored questions.

Note:
To designate a question as scored, you must use Assessment forms. For instructions, see Configure a scored question.

1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.
2. To configure the question, click in the gear icon in its title bar. The Properties dialog box appears for the question.
3. Fill in the fields on the form, as appropriate.

**Table 1083: Question property fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>[Required] Name of the question. Create a concise and easily recognizable name for your question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as the question on quizzes. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Type</td>
<td>[Read-only] Data type selected for this question. See the table in Controls for possible data types.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this question is available on a quiz. If a question is marked inactive, it does not appear on quizzes generated after the question becomes inactive.</td>
</tr>
<tr>
<td>Boolean option</td>
<td>Whether a check box or a Yes/No list appears as the option for the Boolean question.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box for requiring users to answer the question. Users cannot submit quizzes until they answer all mandatory questions, which are denoted by a red field status indicator.</td>
</tr>
<tr>
<td>String option</td>
<td>Setting for the appearance of a string field in a question. This field is available when the question type is String. The string options are:</td>
</tr>
<tr>
<td></td>
<td>• Single line: Single line text field 40 characters in length that allows strings of any length.</td>
</tr>
<tr>
<td></td>
<td>• String line wide: Full page width text field that allows a single line entry of any length.</td>
</tr>
<tr>
<td></td>
<td>• Multiline: Full page width multi-line text field that allows word wrap and returns.</td>
</tr>
<tr>
<td>Min</td>
<td>Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.</td>
</tr>
<tr>
<td>Max</td>
<td>Highest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box for including Not Applicable as an option for this question. Users can select Not Applicable if they do not have sufficient information to respond to a question. User responses of Not Applicable are excluded from results calculations. This field is available when the question does not have a dependency and the question data type is not Boolean with a check box option.</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box for displaying answer options in a random order whenever the question appears in a quiz. Answer preference is sometimes influenced by the order in which options appear, which can result in biased results. Randomizing options can help prevent this bias. Note: Randomizing options for certain questions may make those questions confusing for users. In general, only randomize options that do not follow a logical order.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question that is displayed on the quiz. Include details that help users understand how to answer the question. You can also enter HTML text in this field with the WYSIWYG editor. For example, include HTML to embed links and images.</td>
</tr>
<tr>
<td>Correct answer</td>
<td>Answer option that you want to be selected by users. When you specify a correct answer for a question, the system scores the question. This field is available for all data types except Date, Date/Time, and String. Multiple correct answers are supported for a few data types. See data types.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Choices</td>
<td>Options for a question with a data type of Choice or Scale. The system automatically adds text and values that you can edit for each option. Click the + icon to add an option, or click the X icon to delete an option. By default, the system arranges options in the order established by their values. To change the order, drag and drop the options.</td>
</tr>
<tr>
<td>Dependency</td>
<td></td>
</tr>
<tr>
<td>Displayed when</td>
<td>Condition builder that hides or displays the question depending on the answer to another question in the same category. Select an existing question from the list with a data type of Boolean, Choice, Scale, or Template. Create the condition that must exist for recipients to see the dependent question, using the is or is one of operator. The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.</td>
</tr>
</tbody>
</table>

4. To create any special conditions that must be met for a question to appear on the quiz, click the Dependency tab. Fill in the fields, as appropriate.

Dependent questions appear on the quiz when a recipient selects a specific answer or combination of answers to another question in the same category

5. Select a question in the Displayed when field. The system selects the appropriate operator and displays the possible answers for the selected question.

6. Select the answers that satisfy the condition. Selected answers are indicated by a check mark.
7. Click X to close the question properties dialog box and save your settings.
8. To add a question with the same data type as an existing question in the category, click the + in the title bar of the existing question.
9. Drag questions to change their order within a category or move them between categories.
10. To delete a question, click the X in its title bar.

*Configure a template question*
You can configure template questions when designing quizzes.

Role required: assessment_admin or admin

1. Drag the Template data type icon into a category container.
2. Click the gear icon in the question title bar to open the template properties dialog box.
3. Select a predefined scale from the list.
Question entry fields appear for that template.

4. Enter one or more questions that are appropriate for the template.
5. Click the arrow to the right of a question to configure its properties. You must provide a name for each question.
6. Click the up or down arrow to move between questions, or click the back arrow to return to the template properties dialog box.

7. Configure the properties for the remaining questions.

8. Click the X icon to close the template properties dialog box and save your settings.

*Configure a scored question*

Only *scored* questions are considered when calculating category and quiz results.

Role required: assessment_admin or admin

A question must have a correct answer specified to be scored. Only results for scored questions are displayed in the *quiz scorecard*.

1. Navigate to Quizzes Quizzes.

2. Open the quiz containing the questions you want to mark as scored.

3. In the Metric Categories related list on the Assessment Metric Type form, select the category for the questions you want to mark as scored.

4. In the Assessment Metrics related list on the Metric Category form, select a question from the list.

5. In the Question Type section of the Assessment Metric form, select the Scored check box.
This check box is not available if the question's data type is not supported for scoring.

6. Select the Correct answer for the question.

**Note:** Multiple correct answers are supported for a few data types. See *Data types for quizzes* on page 2348.

7. Click Update.
8. Repeat the process for all the questions in the category that you want the system to score.
9. Return to the list of metric categories, select another category, and configure scoring for the appropriate questions in that category.

**Configure a quiz**

You can configure an entire quiz.

Role required: assessment_admin or admin

The values you enter and select on this page are applied to the entire quiz.

In the quiz designer, click Configuration and then fill in the fields as described in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check box for enabling the distribution of this quiz to recipients.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of this configuration or the quiz to which it is attached.</td>
</tr>
<tr>
<td>Introduction</td>
<td>Introductory content to display on quizzes. You can add a welcome message or background information about the quiz.</td>
</tr>
<tr>
<td>Signature</td>
<td>[Optional] Acknowledgement by a quiz recipient of requirements, admonitions, or expectations related to a quiz.</td>
</tr>
<tr>
<td>Return URL</td>
<td>Destination address of a web page that is presented to users after they submit a completed quiz. When a return URL is configured, the End note content does not appear.</td>
</tr>
<tr>
<td>End note</td>
<td>Content that is displayed to recipients after they submit a completed quiz. You can add a thank you message, follow-up instructions, or other applicable information. End notes are not displayed if a Return URL is specified.</td>
</tr>
<tr>
<td>Duration</td>
<td>Amount of time that recipients are given to complete this quiz, starting from the time that the quiz is generated. The default duration is 14 days.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manager</td>
<td>Assessment manager for this quiz. These users are only responsible for managing the quiz process and not the results. The system notifies the manager when submissions for this quiz are past due.</td>
</tr>
<tr>
<td>Notify manager if overdue</td>
<td>Check box for sending <em>email notifications</em> to a recipient's manager when that user fails to submit an assigned quiz before the due date.</td>
</tr>
</tbody>
</table>

**Note:**
- This related link is available only for survey_admin, assessment_admin and survey_reader with bm_viewer role.
- You must opt in to Benchmarks to view the dashboard. See *Enable Benchmarks*
- This is applicable only for a published quiz.

---

*Select a quiz recipient*

When the system distributes a quiz, it sends email notifications to the category users and their managers.

**Role required:** assessment_admin or admin

A category can have one or more assigned users, and the same user can be assigned to more than one category.

The system also creates a link to the quiz in the recipients’ My Assessments & Surveys portal. Users can only answer questions in the categories that they are assigned to.

To select the recipients for each quiz category, click Availability and then fill in the fields as described in the table.

### Table 1085: Select recipients

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select category</td>
<td>Category for which the selected users are recipients.</td>
</tr>
</tbody>
</table>
Add users

Users selected as recipients for this category. The choice list shows all users in the system.

Publish a quiz
When you publish a quiz, the system sends email notifications to the recipients and to their managers. A card in each recipient's My Assessments & Surveys portal displays a link to the quiz.

Role required: assessment_admin or admin
1. If you want to see the quiz as the recipients will see it, point to the menu icon in the upper right of the quiz designer and click Preview.
2. When you are satisfied with the quiz, click Save and Publish or Publish to distribute it.

Copy a quiz
Create a copy of a quiz with at least one category. All associated questions (type), configurations, categories, metrics, domain separation rules, and role-based categories are copied. Assigned users, category users, instances, and trigger conditions are not copied.

Role required: assessment_admin or admin
1. Navigate to Quizzes Quizzes.
2. Select a quiz.
3. Perform any of the following steps:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Platform</td>
<td>In the title bar, click Copy.</td>
</tr>
<tr>
<td>From Platform</td>
<td>In the title bar, select Copy from the context menu.</td>
</tr>
<tr>
<td>From quiz designer</td>
<td>1. In the title bar, click Quiz Designer.</td>
</tr>
<tr>
<td></td>
<td>2. In the Quiz Designer title bar, point to the menu icon on the header bar</td>
</tr>
<tr>
<td></td>
<td>and click Copy Quiz</td>
</tr>
</tbody>
</table>

Edit a quiz
You can update a quiz after the quiz has been distributed.

Role required: assessment_admin or admin
You can only edit a quiz that has the same application scope as that of your current session.
• Questions that you add are available only on quizzes that are distributed after the update.
• Before a quiz is submitted or during the retake period:
  • Changes to existing questions are immediately available to users. This includes changes to the answers, such as additional choices or changes to the data type.
  • Deleted questions are deleted from distributed quizzes in users' queues.

Open the quiz: Group the Service Details form with one of the following options:
<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Quizzes Quiz Designer</strong></td>
<td>Point to the menu icon in the quiz header bar and select Load Quiz.</td>
</tr>
<tr>
<td><strong>Quizzes Quizzes</strong></td>
<td>Right-click a quiz in the list and select Quiz Designer.</td>
</tr>
<tr>
<td><strong>Quizzes Quizzes</strong></td>
<td>Open a quiz from the list and click Quiz Designer in the header of the Assessment Metric Type form.</td>
</tr>
</tbody>
</table>

Enable a quiz retake

You can configure a quiz to allow recipients to resubmit their answers as many times as they like, until the quiz's due date.

Role required: assessment_admin or admin

Results are not calculated until the quiz's configured duration has elapsed. The card in the user's queue remains visible until the quiz's due date and displays a button to allow retakes.

1. Navigate to Assessments Metric Definition Types.
2. Remove the Evaluation method = Assessment filter condition so you can see all the records in the list.
3. Open the quiz.
4. In the Assessment Metric Type form, select the Allow retake check box and save the record.

View a quiz result

You can view quiz results for each question and category, or view the quiz scorecard for a detailed breakdown.

Role required: assessment_admin or admin

Quiz results are stored in the Metric Result [asmt_metric_result] table and display recipients' answers to each question in a category.

Navigate to Quizzes Quiz Results.

View a quiz designer scorecard

The quiz scorecard opens in the Category Results view.
For detailed information about scorecards, see Quiz Scorecards.

1. Navigate to Quizzes Quizzes.
2. Open the quiz whose results you want to view.
   The scorecard for the selected quiz opens in the Category Results view.
4. Select a category to view from the choice list above the chart.
View a quiz category result

Category results are stored in the Assessment Category Result [asmt_category_result] table and display the overall ratings for each category based on the weighted value for each scored question.

1. To view category results, navigate to Quizzes Category Results.

2. The system calculates results from the weight configured for each category. Weights are set to a value of 10 by default but can be changed. To edit a category's weight:
   3. Navigate to Quizzes Categories, and select a category from the list.
   4. In the Metric Category form, edit the default value in the Weight field.
   5. Click Update.

   **Note:** You can also edit the weight of a question in the Quiz view of the Assessment Metric form.

Take a quiz

All available quizzes assigned to you appear in your personal assessment and survey queue. When you submit a quiz, the system stores your responses. If a quiz allows retakes, you can resubmit it as many times as you like until its due date.

Role required: none

No special role is required to complete a quiz, but you must be logged in and the quiz must be assigned to you.

If configured to send email, the system sends you a notification when a quiz is assigned to you. The message contains a link to the quiz and instructions for viewing the assessment and survey queue.

Each quiz assigned to you appears in your assessment and survey queue as a card that contains information about the quiz, including a launch button. Overdue quizzes are marked with a red icon and red due date.

You must answer every required question, indicated by a red star, before you can submit the quiz. If you start to take a quiz but cannot complete it, save your responses and return to it later. When you have answered all the questions and are satisfied with the responses, submit the quiz.

By default, you cannot modify your answers to a quiz after submission. However, if the administrator has configured this quiz to allow retakes, the quiz remains in your queue after you finish it and the card shows a Modify Quiz button. You can retake the quiz as many times as you like before the due date.

1. Navigate to Self-Service My Assessments & Surveys.
2. Click Take Quiz on a quiz card to open the questionnaire. If there is more than one quiz category, you can click the collapse or expand icon to hide or show the questions in the category.

3. Answer each question to the best of your ability. If you are unsure of how to respond to a question or if a question does not apply to you, select Not Applicable, if that choice is available.

4. Click Save at any time to save your responses without submitting them. You can reopen the quiz from your queue when you are ready to work on it again.

5. When you are ready to submit the completed quiz, read any assertions that require your attention.

6. If present, select the check box to acknowledge the assertion. If your full name is displayed, you are required to provide authentication to acknowledge the assertion after you submit the quiz.

7. Click Submit.

8. If prompted, enter your user name and password to verify your signature. If you provided valid answers for all mandatory questions, a success message appears, displaying any end note that was configured. If the quiz allows retakes, the card remains in your queue with a Modify Quiz button after submission. If retakes are not permitted, the card disappears from your queue.

9. If the system displays an error message indicating that a question has an invalid response or must still be answered, correct the error and resubmit the quiz.

10. To edit your answers and resubmit a quiz that permits retakes, click Modify Quiz. You can modify your responses to the quiz until its due date.

View a quiz instance

A quiz instance represents one questionnaire assigned to one user. View an instance to verify that quiz instances were created, to check the state of a quiz instance, or to reassign a quiz instance.

Role required: admin or assessment_admin

1. Navigate to Quizzes Quiz Instances.

   The following sub-modules are available based on the state of the instances:
   - Ready to take: Displays quiz instances that are ready to be taken by the user. By default, these instances are sorted in ascending order by the Number field.
   - In progress: Displays quiz instances that are in progress. By default, these instances are sorted in ascending order by the Number field.
   - Completed: Displays quiz instances that are complete. By default, these instances are sorted in descending order by the Taken on field.
   - Cancelled: Displays quiz instances that are canceled. By default, these instances are sorted in ascending order by the Number field.
   - All: Displays quiz instances in all states. By default, these instances are sorted in ascending order by the Number field.

2. Click a quiz instance from the required sub-module. By default, the following fields are displayed for all sub-modules other than Completed.

   Note: When you select an instance in the Completed sub-module, you are redirected to the User's Response page.

<table>
<thead>
<tr>

<td></td>
</tr>
</tbody>
</table>
| Assessment Instance Questions | All instance question records that store user response values for each question on the quiz questionnaire. The following columns are relevant to quiz:  
• Category: Displays the quiz categories the questions belong to.  
• Metric: Displays the quiz questions. |

**Quiz scorecards**

The Quizzes application prepares printable scorecards. A scorecard analyzes category and question responses and compares current ratings with previous ratings. You can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages for the time range selected.

The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed quizzes.
Category results

The Category Results view is a stacked bar chart of responses to all questions in a category. Select the category to display from the choice list above the chart. Category results are only calculated for scored questions.

This view displays responses that use the following data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

**Note:** The Checkbox and Yes/No data types are combined into the Boolean data type in the Quiz designer.
Figure 482: Quiz category results
To view details about a specific response to a question, point to the colored segment representing a specific response. The chart displays the count for those responses and the percentage it represents of the total responses to that question.

![Diagram showing response details](image)

Figure 483: Quiz category result details

**Question results**

The Question Results view shows the results for all questions in a quiz. Select a question by name from the choice list to display the results in a pie chart or a bar chart, based on the data type.

**Pie chart**

The pie chart shows question results for these *data types*:

- Checkbox
- Choice
- Likert Scale

- Yes/No

**Note:** The Checkbox and Yes/No data types are combined into the Boolean data type in the Quiz designer.
Figure 484: Quiz scorecard question results - pie chart
Bar chart

A bar chart appears when question results use this data type:

- Percentage

By default, all results for percentage questions use a report range of 20% segments. To configure a report range, navigate to Reports Administration Report Ranges.

Average ratings

The Average Ratings view displays a bar chart of the weighted average rating for each question in a category.

Use this view to learn how individual questions affect the overall rating for the category. Select a category from the second choice list above the chart. Ratings are only calculated for scored questions.
Figure 485: Average Ratings view

To view the effect of each question's ratings on the entire category's ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question's weighted average.
Quiz reports

Quizzes provide several global reports so that assessment administrators can view important statistics. You can share these reports with specific users or groups and change the display options.

For detailed field information and reporting options, click the link for the chart Type. To sort a column in ascending or descending order, click the arrow in the column heading.

**Wizards**

Administrators can create wizards to provide a step-by-step sequence of dialog boxes that lead the user through a procedure.

Administrators can create wizards to provide a step-by-step sequence of dialog boxes that lead the user through a procedure. For example, a wizard may lead users through reporting an incident (creating an incident record) without opening a list or form.

![Figure 487: Record generator wizard](image)
Create a basic wizard

This example creates a basic wizard that reports an incident.

1. Activate the system wizards application, if necessary.
2. Navigate to System Wizards Wizards.

3. Click New.
4. Enter the wizard Name of Report Incident.
5. Right-click the header and select Save.

Define a wizard variable

How to define a wizard variable.

**Note:** To learn more, see *Define a variable.*

Define wizard variables:
Figure 488: Basic variables

1. In the Wizard Variable related list, click New.
2. Enter the variable details.
   - Type: Multiple Choice
   - Name: incident
   - Question: What are you having difficulties with?
3. Right-click the header and select Save.
4. In the Question Choices related list, click New.
5. Enter Email Issue in the Text and Value fields, and click Submit.
6. Repeat steps 4 – 5 for the following question choices:
   - Computer Issue
   - Password Reset
7. In the Wizard Variable related list, click New.
8. Enter the variable details and click Submit.
   - Type: Wide Single Line Text
   - Name: description
   - Question: Please describe your symptoms

Create the first panel

Create the first panel of the example wizard.

Note: To learn more, see Wizard Panels.

1. In the Wizard Panels related list, click New.
2. Select a Type of A panel that prompts the user to answer questions.
3. Enter the panel details.
   - Name: Service Questions
   - Title: Service Desk Wizard
4. Right-click the header and select Save.
5. In the Variables related list, click Edit....
6. Using the *slushbucket*, select and arrange the variables as listed:
   1. What are you having difficulties with?
   2. Please describe your symptoms
7. Click Update.

Create the second panel option

How to create the second panel option.
1. In the Wizard Panels related list, click New.
2. Select a Type of a panel that creates something (like a change request or an incident).
3. Enter the panel details and click Submit.
   - Name: Email Incident
   - Table: Incident [incident]
   - Final View: ess
4. Right-click the header and select Save.
5. In the Field Setters related list, click New.
6. Enter the field setter details and click Submit.
   - Type: Set field to a variable
   - Field: Short description
   - Variable: description
7. In the Field Setters related list, click New.
8. Enter the field setter details and click Submit.
   - Type: Set field to a specific value
   - Field: Category
   - Value: software
9. Repeat steps 1 – 8 to create additional panels with the values listed in the table.

### Table 1088: Second panel options table

<table>
<thead>
<tr>
<th>Step 3. Panel Name</th>
<th>Step 8. Category Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Computer Incident</td>
<td>hardware</td>
</tr>
<tr>
<td>Password Incident</td>
<td>network</td>
</tr>
</tbody>
</table>
Test the wizard

Run through several scenarios to test transition logic and record generation.

1. Navigate to System Wizards Wizards.
2. Click Report Incident.
3. Click Test.
4. Enter the following information and click Next.
   a. What are you having difficulties with?: Email Issue
   b. Please describe your symptoms: Can't access email
5. Verify that a new record is created and the values match step 4.
6. Repeat steps 1 – 5 to test each multiple choice answer.

Wizard transitions

Transitions define logic used to move between panels in wizards.

Transition logic may be based on a predefined order (basic panel flow) or user input (defined transitions).

Note: The System Wizards application is not active by default.

Use basic panel flow in a wizard

Basic panel flow moves through wizard panels in order, without the need to define logic for each transition. A wizard may use either basic panel flow or defined transitions, but not both.

1. Open the wizard.
2. Select the Basic panel flow check box. If necessary, configure the wizard form to add the field.
3. Enter the First panel in the reference field.
4. For each panel, define an Order. If necessary, configure the panel form to add the field.
Define a panel transition

Specify the conditions to move from one wizard panel to another.

1. Open the panel.
2. In the Transitions related list, click New or select the transition to edit.
3. Using the condition builder, define a transition condition based on wizard variables. Leave the condition empty to use the transition in all cases.
4. In the To field, select the next panel.
5. In the From field, select the previous panel.
6. Define a Transition script that runs when the transition is used.
Wizard variables

Wizard variables are questions that collect and store user input. Define variables for a wizard and then add them to wizard panels.

Use data collected by wizard variables to:

- Define transition conditions.
- Set field values in record generators.
- Define dynamic functionality with UI policy and client scripts.
- Implement advanced functionality with wizard scripts.

**Note:** The System Wizards application is not active by default.

Add a variable to a panel

Collect user input by adding variables to a panel.

Add variables to a panel that prompts user to answer questions (wizard panel) or a survey panel (requires Survey Wizard plugin):

1. Navigate to System Wizards Wizards.
2. Open the wizard.
3. In the Wizard Panels related list, open the panel to which you are adding a variable.
4. In the Variables related list, click Edit.
5. Using the slushbucket, add and arrange the order in which variables appear on the panel. Only variables defined on the wizard are available on a panel.
Define a question choice

Some variable types require choices. For example, a multiple choice question—such as What kind of e-mail account do you want?—requires options—such as Exchange and UNIX.

1. Open the variable definition.
2. In the Question Choices related list, click New.
3. Enter the question choice details and save the record.
   - Text - option the user sees
   - Value - value stored in the variable
4. Repeat steps 2 – 3 for all available options.

Define a wizard variable

Collect and store user input in a wizard variable.

1. Navigate to System Wizards Wizards .
2. Open the wizard to which you are adding a variable.
3. In the Wizard Variable related list, click New.
4. Select the variable Type.
   Wizards use the same variable types as service catalog items.
5. Enter the name used by the system, for example: resolved_to_satisfaction.
6. Enter an order number and select the name of the associated Wizard in the Expert field.
7. Enter a descriptive question in the Question field.
8. Enter the remaining variable details if necessary and save the record.

Publish the basic wizard
Create a wizard launcher to make the wizard available through the service catalog homepage.

**Note:** To learn more, see *Publish a Wizard.*
1. Navigate to Service Catalog Wizards.
   
   If you do not see Wizards under Service Catalog, complete the next step.
2. To add the Wizards module to the Service Catalog, perform the appropriate action for your version of the UI:

   | UI16 | 1. Navigate to System Definition Application Menus.
   |      | 2. Select Service Catalog.
   | UI15 | Right-click the Service Catalog application menu and select Edit Application Menu.

3. Click New.
4. Enter the wizard launcher details and save the record.
   - Name - Report an Incident
   - Category: Can We Help You?
   - Wizard: Report Incident
   - Active: select the check box

Link to a Wizard

Provide access to wizards via links, such as defining a new module or sending a link via email (public wizards only).

<table>
<thead>
<tr>
<th>Desired Action</th>
<th>URL schema</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start a new wizard or resume an in progress wizard if the user is logged in</td>
<td>https://&lt;base URL&gt;/nav_to.do?uri=expert_shell.do?sysparm_sys_id=&lt;wizard_sys_id&gt;</td>
</tr>
<tr>
<td>Require the user to restart a wizard from the beginning regardless of previous progress</td>
<td>https://&lt;base URL&gt;/nav_to.do?uri=expert_shell.do?sysparm_sys_id=&lt;wizard_sys_id&gt;%26sysparm_initial=true</td>
</tr>
</tbody>
</table>

Example - Define a Wizard Module in Self-Service:

1. Navigate to System Wizards Wizards.
2. Open the wizard.
3. In the Roles field, add the user roles that have access to the wizard.
4. Right-click the header and copy the sys_id for the wizard.
5. Click Update.
6. In the navigation pane, right-click Self-Service and select Edit Application.
7. In the Modules related list, click New.
8. Enter the following information and save the record.
   • Title and Order
   • Link type: URL (from arguments)
   • Arguments: /expert_shell.do?sysparm_sys_id=<wizard sys_id from step 2>

Create a public page

A public page is accessible to all users without having to log in or have a particular user role.

Create a public page:
1. Navigate to System Definition Public Pages. (You may need to enable the module, as it is not active by default.)
2. Click New.
3. Enter the name of the UI page specified (for example, test_page)

Make a wizard public

Public wizards are available for use without logging in.

Reasons to make a wizard public include:
• Allowing non-users to report an incident
• Collecting anonymous survey responses (requires Survey Wizard Plugin)

Once a wizard is made public, deliver it using a link via email or a module on the welcome page (available before a user has logged in).

Make a role public

Enable the public role to read and write wizard variables.

Add public to all relevant roles for the wizard:
1. Add public to the Roles field.
2. For each wizard variable defined for that wizard, add public to the read roles and write roles fields. (You may need to personalize the form to add the read roles and write roles).
3. Similarly, add public to the read roles and write roles fields for each variable associated with each wizard panel for that wizard.

Modify a script

Modify record generator panels to allow users with no role to create records using the wizard.

Modify the script for all record generators (wizard panels) within the wizard.
1. Navigate to System Wizards Wizards.
2. Open the relevant wizard.
3. In the Wizard Panels related list, open the record generator panel(s).
4. Enter the following script in the Script field for each record generator (Personalize the form to add the Script field, if necessary):
# Process description

Enable and Select the Wizard

Select the wizard to be made public:

1. **Activate** the Wizards application in the application navigator.
2. Navigate to **System Wizards Wizards**
3. Select and open the wizard to be made public.

# Publish a wizard

Specify how users access a wizard and what roles are necessary to access it.

Administrators grant users access to published wizards by two means.

- Using links
- As an item in the service catalog

Administrators can also restrict user access to wizards by role and make wizards available to the public (users that are not logged in).

---

**Note:** The System Wizards application is not active by default. To use wizards, see **Activate a System Wizard**.

---

To define the user roles that have access to a wizard:

1. Navigate to **System Wizards Wizards**.
2. Open the wizard.
3. In the Roles field, define the user roles that have access to the wizard. Leave the field blank to allow access for all users.

---

**Send a public wizard link via email**

After a wizard is configured as public, it can be delivered via email to anyone, including recipients who are not ServiceNow users.
To send a link to the public wizard via email:

1. Navigate to System Wizards Wizards .
2. Open the wizard.
3. Right-click the header and copy the sys_id for the wizard.
4. Create an email with an email link, using the URL schema:
   
   https://<base URL>/nav_to.do?uri=expert_shell.do?sysparm_sys_id=<wizard sys_id from step 3>

Test the page
Verify the wizard is functional for a public user.
Log out, then click the module (in this example, the Test module under the Self-Service application).

Add a wizard to the service catalog

Make a wizard available through the service catalog homepage.

1. Navigate to Service Catalog Wizards .
2. Click New.
3. Enter the wizard launcher details and save the record.
   - Name - name by which the wizard appears in the service catalog
   - Category - category under which the wizard appears
   - Wizard - reference to the wizard
   - Active - select the check box
   - Short Description and Description (optional)
Create a public module within the parent application, pointing to the wizard,

1. Copy the `sys_id` for the wizard: right-click the wizard header, and copy the wizard's `sys_id`.
2. In the application navigator, right-click the parent application name (for example, Self-Service) and select Edit Application Menu.
3. Add public to the Roles field.
4. In the Modules section, select New to create a new module, with the following fields, then select Submit to save the record.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Module title (for example, Test)</td>
</tr>
<tr>
<td>Link type</td>
<td>URL (from Arguments)</td>
</tr>
<tr>
<td>Roles</td>
<td>public</td>
</tr>
<tr>
<td>Arguments</td>
<td><code>expert_shell.do?sysparm_sys_id=&lt;sys_id of the Wizard&gt;</code></td>
</tr>
</tbody>
</table>

**Survey wizards**

The Survey Wizard plugin creates surveys using wizards.
Advantages versus other survey functionality include the ability to:

- Ask different questions based on responses (dynamic surveys)
- Create multiple page surveys
- Record answers for partially completed surveys

This plugin integrates with the Best Practice - Task Survey Management plugin. Because the plugin relates to the Legacy Surveys application, the plugin is documented on the ServiceNow wiki.

**Configure the survey property**

How to configure the survey properties (apply to all survey wizards and surveys).

1. Navigate to Survey Wizards Survey Properties.
2. Ensure the Enable the enhanced task survey capabilities. Survey distribution is controlled by Survey Conditions. property is enabled (select the check box).

**Create a page**

How to create the survey pages (wizard panels) and add questions.

1. Navigate to Survey Wizards All and open the survey wizard.
2. In the Survey Panels related list, click New.
3. Enter the Name, Title, and Description.
4. Right-click the header and select Save.
5. In the Variables related list, click Edit....
6. Using the `slushbucket`, select and arrange survey questions on the panel.
7. Repeat steps 1 – 6 for each page of the survey wizard.
Create a dynamic effect optional
Create dynamic effects, such as hiding or showing fields on a panel based on answers.

1. Navigate to Survey Wizards Wizard Policy Wizard UI Policy or Survey Wizards Wizard Policy Wizard Client Scripts
2. Click New.
3. Enter the UI policy or client script details.

**Note:** For more information, see *wizard scripts*.

Define a transition
Transitions define the logic used to move between pages (wizard panels) in a survey.
Use panels and transition logic to implement multiple page surveys and dynamic effects, such as skipping pages based on answers.

Define transitions:
1. Navigate to Survey Wizards All and open the survey wizard.
2. Open a survey panel.
3. In the Wizard Panel Transitions related list, click New.
4. Enter the transition details and click Submit.
5. Repeat steps 1 – 4 for all transitions between pages in the survey wizard.

**Note:** To learn more, see *Wizard Transitions*.

Create a survey condition
How to create a survey condition that controls when and to whom the survey wizard is sent.

Create a *survey condition* that controls when and to whom the survey wizard is sent:

1. Navigate to Survey Wizards Survey Conditions.
2. Click New.
3. Select a Type of Survey Wizard. Only a survey or survey wizard is sent (determined by Type), even if both are defined for the condition.
4. Enter the condition details.
5. Click Submit.

Create the email notification
Create an email notification to deliver the survey wizard.

Role required: admin or survey_admin

1. Navigate to System Policy Email Notifications.
2. Filter the list to view notifications with an Event Name of task.send_survey, which is the event that is triggered when survey conditions are met.
3. Open a survey notification in the filtered list or click New.
4. Enter the email notification details. If you are creating a new notification, be sure to adjust conditions and weight to avoid conflicts with existing survey notifications (Event Name of task.send_survey).
5. Click Update or Submit.

Create the survey wizard

How to create the survey wizard.

The following steps provide an overview of building a survey wizard.

1. **Activate the Survey Wizard plugin**, if necessary.
2. Navigate to Survey Wizards All.
3. Click New.
4. Enter the survey wizard Name.
5. In the Roles field, add the public role.
6. Right-click the header and select Save.

Define a question

How to define survey questions (wizard variables).

1. In the Wizard Variable related list, click New.
2. Enter the variable details.
3. In the Read roles field, add the public role.
   Configure the form to add the Read roles field, if necessary.
4. Click Submit.
5. Repeat steps 1 – 4 for all questions in the survey.

**Note:** To learn more, see [Define a Wizard Variable](#).

Installed components

Fields, tables, a business rule, a script include, an application, a survey wizard panel, and demo data (optional).

The following tables are modified:

<table>
<thead>
<tr>
<th>Display Name (Table Name)</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey Conditions (survey_conditions)</td>
<td>Add fields to determine which survey is sent when conditions are met:</td>
</tr>
<tr>
<td></td>
<td>• Type - either a survey or survey wizard</td>
</tr>
<tr>
<td></td>
<td>• Survey_wizard - reference to applicable survey wizard</td>
</tr>
</tbody>
</table>
The following tables are added:

<table>
<thead>
<tr>
<th>Display Name (Table Name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey Panel (expert_panel_survey)</td>
<td>Adds a survey panel to wizards. Extends the expert_panel table</td>
</tr>
<tr>
<td>Survey Wizard (expert_survey)</td>
<td>Stores survey wizards. Extends expert</td>
</tr>
</tbody>
</table>

The SurveyUtils script include is added to record responses during survey panel transitions.

The Task Survey Events business rule is modified to include logic for sending survey wizards. Customers who have modified this business rule can not install the updated version automatically.

For information about the link generated from the business rule script, see Survey Wizard - Multiple Instances on the ServiceNow Community.

The plugin adds Survey as a new type of wizard panel. Survey wizards are created using survey panels. Survey wizard responses are saved when the user navigates between survey panels (clicks Next or Previous), as opposed to saving responses only at the end (surveys). This feature allows a logged in user to resume a survey that is in progress and allows survey readers to collect response data for partially completed surveys. To support the ability to resume surveys in progress, survey wizard answers are also temporarily stored in XML in the expert_instance table. When the user clicks Done on the last panel of the survey wizard, the record in the expert_instance table is deleted.

For information about having more than one instance of a given Wizard in play at a time, see Survey Wizard - Multiple Instances on the ServiceNow Community.

Demo data is available with this plugin. If you choose to install demo data, a sample survey wizard, called Customer Satisfaction Survey, is added to the database.

Request survey wizard

Before activating this plugin, consider the installed components, dependencies, and impact.

- Installed Components - fields, tables, a business rule, a script include, an application, a survey wizard panel, and demo data (optional). For more details, see Installed Components.
- Dependencies - Best Practice - Task Survey Management (inactive by default)
- Impact - adds fields to existing tables, installs the Best Practice - Task Survey Management plugin, and modifies the Task Survey Events business rule. You may choose to install a demo survey with the plugin. The plugin integrates with standard survey functionality, so there is no need to transition
existing surveys to survey wizards. However, survey administrators must specify a type (survey or survey wizard) for new survey conditions.

1. In the HI Service Portal, click Service Requests Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.

| Reason/Comments | Provide any information that would be helpful for the ServiceNow personnel activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows. |

3. Click Submit.

**Test the survey wizard**

How to test the survey wizard.

1. Navigate to Survey Wizards All and open the survey wizard.
2. Click Try it.
3. Answer survey questions and verify the transition logic based on answers, if applicable.
4. At survey completion, click Done.
5. Navigate to Survey Wizards Survey Instances.
6. Search for and open the most recent instance of the survey wizard.
7. Verify that your survey answers are properly recorded.
8. Run through several scenarios to test transition logic and data collection.

**Create a survey wizard (demo)**

This example creates a survey using a survey wizard.

This example creates a survey using a survey wizard (requires the Survey Wizard plugin). The survey uses dynamic features that are available using wizards.

*Create the survey wizard demo*

Create the survey wizard.

1. **Activate the Survey Wizard plugin**, if necessary.
2. Navigate to Survey Wizards All.
3. Click New.
4. In the Name field, enter Software Needs Analysis.
5. In the Roles field, add the public role.
6. Right-click the header and select Save.

![Survey Wizard](image)

**Define a survey question**
How to define survey questions (wizard variables).

1. In the Wizard Variable related list, click New.
2. Enter the variable details as listed in the table.
3. In the Read roles field, add the public role.
   Configure the form to add the Read roles field, if necessary.
4. Click Submit.
5. Repeat steps 1 – 4 for all variables in the table.

<td>select the check box</td>
</tr>
<tr>
<td>Short description</td>
<td>If Other is true, show Specify</td>
</tr>
<tr>
<td>Wizard Conditions</td>
<td>other is true</td>
</tr>
</tbody>
</table>

4. Right-click the header and select Save.
5. In the Wizard UI Policy Actions related list, click New.
6. Enter the action details and click Update.
   - Variable Name: otherprod
   - Mandatory: True
   - Visible: True

**Define a transition demo**
How to define transitions.

1. Navigate to Survey Wizards All and select Software Needs Analysis.
2. Open a survey panel as listed in the table.
3. In the Wizard Panel Transitions related list, click New.
4. Enter the transition details and click Submit.
5. Repeat steps 1 – 4 for all panel transitions in the table.

Table 1095: Panel transition details table

<table>
<thead>
<tr>
<th>Panel</th>
<th>Condition</th>
<th>Order</th>
<th>To</th>
</tr>
</thead>
<tbody>
<tr>
<td>Describe Needs</td>
<td>office is true</td>
<td>100</td>
<td>Microsoft Office</td>
</tr>
<tr>
<td>Describe Needs</td>
<td>creativesuite is true</td>
<td>200</td>
<td>Adobe Creative Suite</td>
</tr>
<tr>
<td>Describe Needs</td>
<td></td>
<td>300</td>
<td>End Note</td>
</tr>
<tr>
<td>Microsoft Office</td>
<td>creativesuite is true</td>
<td>100</td>
<td>Adobe Creative Suite</td>
</tr>
<tr>
<td>Microsoft Office</td>
<td></td>
<td>200</td>
<td>End Note</td>
</tr>
<tr>
<td>Adobe Creative Suite</td>
<td></td>
<td>100</td>
<td>End Note</td>
</tr>
</tbody>
</table>

**Test the survey wizard demo**
How to test the survey wizard.

1. Navigate to Survey Wizards All and select Software Needs Analysis.
2. Click Try It.
3. In the Business software you use (select all that apply) question, select: Microsoft Office, Other.
4. Verify that the Please specify field appears and is mandatory when Other is selected (UI policy created in Dynamic Effects).
5. Click Next.
6. Verify that the Office panel appears.
7. Enter test values for the questions and click Next.
8. Verify that the End Note panel appears (the transition logic skips the Adobe Creative Suite panel when the Adobe Creative Suite check box is not selected on the first panel).
9. Click Done.
11. Search for and open the most recent instance of the Software Needs Analysis survey wizard.
12. Verify that your survey answers are properly recorded.
13. Run through several scenarios to test transition logic and data collection.
Configure the survey
How to configure the survey.

1. Navigate to Survey Wizards Survey Properties.
2. Ensure the Enable the enhanced task survey capabilities. Survey distribution is controlled by Survey Conditions. property is enabled (select the check box).
4. Click New.
5. Enter the condition details and click Submit.

<table>
<thead>
<tr>
<th>Name</th>
<th>Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Survey Wizard</td>
</tr>
<tr>
<td>Survey wizard</td>
<td>Software Needs Analysis</td>
</tr>
<tr>
<td>Active</td>
<td>select the check box</td>
</tr>
<tr>
<td>Table</td>
<td>Incident</td>
</tr>
<tr>
<td>User field</td>
<td>Caller</td>
</tr>
<tr>
<td>Description</td>
<td>Send software survey to all users with software questions</td>
</tr>
<tr>
<td>Condition</td>
<td>Category is Software</td>
</tr>
</tbody>
</table>

6. Navigate to System Policy Email Notifications.
7. Click New.
8. Enter the email notification details and click Submit.

<table>
<thead>
<tr>
<th>Name</th>
<th>Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Software Survey</td>
</tr>
<tr>
<td>Event Name</td>
<td>task.send_survey</td>
</tr>
<tr>
<td>Table</td>
<td>Incident</td>
</tr>
<tr>
<td>User field</td>
<td>event.parm1</td>
</tr>
<tr>
<td>Active</td>
<td>select the check box</td>
</tr>
<tr>
<td>Conditions</td>
<td>Category is Software</td>
</tr>
<tr>
<td>Subject</td>
<td>Please take the software survey (Incident ${number})</td>
</tr>
<tr>
<td>Message</td>
<td>Please complete this survey to help us evaluate our ongoing software needs. &lt;a href=${event.parm2}&gt;Click here to take the survey.&lt;/a&gt;</td>
</tr>
</tbody>
</table>

9. Filter the Email Notifications list using the condition: Event Name is task.send_survey and Table is Incident.
10. If any other notifications exist, increase their Weight value so that only the Software Survey is sent when the incident category is software (the Software Survey has a Weight of 0, so it has the highest priority of any notifications for the incident table).

Wizard panels

Wizard panels are screens that appear in a defined order. Each step in a wizard is represented by a panel. A wizard panel prompts users to answer questions. Wizard panel type-specific information is:

- Title - label that appears above the panel in wizard view.
- Description - text that appears above questions in wizard view.
- Variables - questions that collect user input. To learn more, see Wizard Variables.

Note: The System Wizards application is not active by default.

Catalog order and checkout panels

What catalog order and checkout panels display.

A catalog order panel displays listings for service catalog items in tabbed view. A catalog checkout panel displays an order confirmation screen for the items on the preceding catalog order panel. Use these panels to create an order guide using wizards.
KB viewers

What a KB viewer panel displays.

A KB Viewer panel displays a knowledge base article. KB Viewer type-specific information is:
- KB Article - reference to the desired knowledge base article
- Title - label that appears above the article in wizard view

Record generators

A record generator panel creates a record in a table, such as an incident or change request.

There is no transition after the Record Generator. The following table includes fields specific to the Record Generator.

Table 1098: Generator type-specific information

<table>
<thead>
<tr>
<th>Title</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>table in which to create a record (select Global when using a script)</td>
</tr>
<tr>
<td>Template</td>
<td>(optional) define field values on the new record using a template</td>
</tr>
<tr>
<td>Final view</td>
<td>(optional) enter the view in which to show the submitted form (such as ESS)</td>
</tr>
<tr>
<td>Script</td>
<td>script that runs when the panel is used. To learn more, see wizard scripts.</td>
</tr>
<tr>
<td>Field setters</td>
<td>define field values in the target table.</td>
</tr>
</tbody>
</table>

Field setters

A field setter defines a field value for a record created by a record generator.

Table 1099: Field setters

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Template</td>
<td>Name of the record generator panel.</td>
</tr>
<tr>
<td>Type</td>
<td>To define a static value (the same for each record created by the record generator), select Set field to a specific value. To define a value based on a wizard variable, select Set field to a variable.</td>
</tr>
<tr>
<td>Field</td>
<td>Select the field name.</td>
</tr>
<tr>
<td>Value</td>
<td>Enter the value (static) or select the wizard variable name.</td>
</tr>
</tbody>
</table>
Redirect panel

A Redirect panel specifies a URL to which the user is taken upon transition to the panel.

Redirect type-specific information is:

• URL - URL location to which user should be taken
• Advanced - select this option to use a script
• Script - script that runs when the panel is used. To learn more, see wizard scripts.

Change a banner setting

How to change a banner setting.

Steps displayed in the banner can be manually defined or automatically generated.

To change the banner settings:

1. Navigate to System Wizards Wizards.
2. Create or open a wizard.
3. Set the Banner type field:
   • Select Fixed number of (user defined) steps for manually defined steps.
   • Select Generated based on panel history for automatically generated steps. Automatically generated steps do not display initially but are added as the user reaches each step. Automatic banner text is generated using the Title field of each wizard panel.
   • Select None to disable the wizard banner.

Create a fixed wizard banner step

How to create fixed wizard banner steps.

Steps displayed in this banner can be manually defined or automatically generated.

1. Select Fixed number of (user defined) steps from the Banner type dropdown.
2. Select the Banner steps related list and click New.
3. Assign a name to your banner step. This name is what appears on the wizard.
4. Assign a display order (such as 100, 200, 300).
5. Repeat steps 2 – 4 for each banner step in the wizard.
6. On the wizard record, click the Wizard Panels related list.
7. In the Banner step field, enter the banner step that is completed when the wizard panel is displayed. Completed steps display in green in the wizard banner.

Note: You may need to configure the list to add the Banner step field.
Create a panel

How a user creates a panel.

1. Navigate to System Wizards Wizards.
2. Open the wizard to which you are adding a panel.
3. In the Wizard Panels related list, click New.
4. Select the type of panel to create.
5. Enter basic panel information.

Table 1100: Basic panel information

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Brief description of the panel</td>
</tr>
<tr>
<td>Expert</td>
<td>Name of the wizard</td>
</tr>
<tr>
<td>Title</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Next message</td>
<td>Label on the button that transitions to the next panel. This option does not apply for the last panel</td>
</tr>
<tr>
<td>Previous message</td>
<td>Label on the button that transitions to the previous panel. This option does not apply for the first panel</td>
</tr>
</tbody>
</table>

6. Enter type-specific information and save the record.
   - Prompts user to answer questions (wizard panel)
   - Survey (requires Survey Wizard Plugin)

Edit a panel

An Edit Panel button is available on wizard panels when testing the wizard. The button is available if the user can write to the expert record.

To control who can access this button, edit the write ACL on the Wizard [expert] table.

1. Navigate to System Wizards Wizards.
2. Open the wizard containing the panel you want to edit.
3. Click Try It.
4. Click Edit Panel.

Use wizard banners

The wizard banner is a graphical flow of wizard steps displayed at the top of a wizard.
Activate a system wizard
The System Wizards application is not active by default.
To activate system wizards:
1. Navigate to System Definition Application Menus.
2. In the breadcrumbs, click All to display both active and inactive applications.
4. Ensure the Active field is set to true.

Define a wizard variable
How to define a wizard variable.

Note: To learn more, see Define a variable.

Define wizard variables:
Figure 492: Basic variables

1. In the Wizard Variable related list, click New.
2. Enter the variable details.
   - Type: Multiple Choice
   - Name: incident
   - Question: What are you having difficulties with?
3. Right-click the header and select Save.
4. In the Question Choices related list, click New.
5. Enter Email Issue in the Text and Value fields, and click Submit.
6. Repeat steps 4 – 5 for the following question choices:
   - Computer Issue
   - Password Reset
7. In the Wizard Variable related list, click New.
8. Enter the variable details and click Submit.
   - Type: Wide Single Line Text
   - Name: description
   - Question: Please describe your symptoms

Define a basic transition

How to define a transition.

Note: To learn more, see *Wizard Transitions.*
Define transitions:
1. In the Wizard Panels related list, click Service Questions.
2. In the Wizard Panel Transitions related list, click New.
3. Enter the transition details and click Submit.
4. Repeat steps 2 – 3 for all panel transitions in the table.

Table 1101: Panel transition details table

<table>
<thead>
<tr>

</tbody>
</table>

Advanced customization

An advantage of wizards is the ability to implement advanced, custom functionality with a user-friendly interface.

Create advanced wizards using:

- Wizard UI policy and client scripts: create dynamic effects and validation for wizards, panels, and variables.
- *wizard scripts*: run scripts from record generator panels, transitions, and UI policies.

Create an advanced wizard (demo)

This example creates a wizard that associates assets and details and then creates a contract with this information.

The wizard uses a script to create a new record.
Create the wizard

How to create the wizard.

1. *Activate the system wizards application*, if necessary.
2. Navigate to System Wizards Wizards.
3. Click New.
4. In the Name field, enter Contract Creation.
5. Right-click the header and select Save.

![Wizard creation](image)

Define a variable

How to define a variable.

1. In the Wizard Variable related list, click New.
2. Enter the variable details and save the record.
3. Repeat steps 1 – 2 for all variables in the table.

### Table 1104: Wizard Variables Details Table

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Question</th>
<th>Additional configuration</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>Single Line Text</td>
<td>short_description</td>
<td>Enter short description for contract</td>
<td></td>
</tr>
</tbody>
</table>
Create a panel demo

How to create the first two panels and add variables.

1. In the Wizard Panels related list, click New.
2. Select the panel Type of Prompts user to answer questions.
3. Enter the Name, then right-click the header and select Save.
4. In the Variables related list, click Edit....
5. Using the *slushbucket*, select and arrange the variables as listed in the table.

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Question</th>
<th>Additional configuration</th>

</tbody>
</table>

Create the third panel and add a field setter

How to create the third panel and add field setters.

1. In the Wizard Panels related list, click New.
2. Select the panel Type of Creates something (record generator).
3. Enter the following information, then right-click the header and select Save.
   - Name: 3 Contract No Assets
   - Table: Contract [ast_contract]
4. In the Field Setters related list, click New.
5. Enter the field setter details and save the record.
6. Repeat steps 4 – 5 for all field setters in the table.

Table 1106: Field setter details table

<table>
<thead>
<tr>
<th>Type</th>
<th>Field</th>
<th>Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set field to a variable</td>
<td>Contract type</td>
<td>contract_type</td>
</tr>
<tr>
<td>Set field to a variable</td>
<td>Short description</td>
<td>short_description</td>
</tr>
</tbody>
</table>
Create the fourth panel and add a script

How to create the fourth panel and add a script.

1. In the Wizard Panels related list, click New.
2. Select the panel Type of Creates something (record generator).
3. Enter the following information, then right-click the header and select Save.
   - Name: 4 Create Contract and Assets
   - Table: Global
4. Paste the example script into the Script field. Configure the form to add the field, if necessary.

Example script:

```javascript
//Call the createContract function to obtain the ID of the created contract
var contract_id = createContract();

//Construct a url that will be used to redirect the user after submission
var uri = ('ast_contract.do?sysparm_query=sys_id='+ contract_id);

//Redirect the user to the url
wizard.redirect= uri;
gs.addInfoMessage('Contract created');

//Create a new contract
function createContract(){
    var cc = new GlideRecord('ast_contract');

    //set values from wizard variables - note the format wizard.variable
    cc.sys_class_name= wizard.contract_type;
    cc.starts= wizard.starts;
    cc.ends= wizard.ends;
    cc.short_description= wizard.short_description;
    var cntr = cc.insert();

    //We created a new contract and have the id so now we need the assets to associate
    associateAssets(cntr);
    return cntr;
}

//This is the way we loop through the elements in a list collector - assets in this case
function associateAssets(id){
    var items = wizard.asset_select.toString();
    items = items.split(',
    for(var i =0; i < items.length; i++){
        var sys_id = items[i];
        if(sys_id != ''){
            var rl = new GlideRecord('ast_contract_instance');
            rl.ast_contract= id;
            rl.ci_item= sys_id;
            rl.insert();}}}
```

<table>
<thead>
<tr>

<td>starts</td>
</tr>
</tbody>
</table>
Define a transition (advanced demo)

How to define a transition.

1. Open a panel.
2. In the Wizard Panel Transitions related list, click New.
3. Enter the transition details and save the record.
4. Repeat steps 1 – 3 for all panel transitions in the table.

Table 1107: Panel transition details table

<table>
<thead>
<tr>
<th>Panel</th>
<th>Condition</th>
<th>From</th>
<th>To</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Contract Screen</td>
<td>assets is Yes</td>
<td>1 Contract Screen</td>
<td>2 Asset Screen</td>
</tr>
<tr>
<td>1 Contract Screen</td>

<td>3 Contract No Assets</td>
</tr>
<tr>
<td>2 Asset Screen</td>
<td></td>
<td>2 Asset Screen</td>
<td>4 Create Contract and Assets</td>
</tr>
</tbody>
</table>

Test the wizard for a record with no assets

Run through several scenarios to test transition logic and record generation.

1. Open the wizard record and click Test.
2. Enter the following information and click Next.
   - Associate assets?: No
   - Which type of contract?: select a value other than the default
   - Start Date: enter a date
   - End Date: enter a date
   - Enter short description for contract: enter a description
3. Verify that a new record is created and the values match step 2.
Test the wizard for a record with an asset

Test the wizard for a record with assets.

1. Open the wizard record and click Test.
2. Enter the following information and click Next.
   - Associate assets?: Yes
   - Which type of contract?: select a value other than the default
   - Start Date: enter a date
   - End Date: enter a date
   - Enter short description for contract: enter a description

3. Verify that the asset screen opens.
4. Select assets to add to the list and click Next.
5. Verify that a new record is created and the values match steps 2 and 4.
Publish the wizard demo

Restrict access to users with asset role.

1. Open the wizard.
2. In the Roles field, select asset and save the record.

Add the wizard as a module in the Asset Contracts application

Add the wizard as a module in the Asset Contracts application.

1. Open the wizard.
2. Copy the sys_id.
3. In the navigation pane, right-click Asset Contracts and select Edit Application.
4. In the Modules related list, click New.
5. Enter the following information and save the record.
   - Title: Create Contract
   - Order: 10
   - Link type: URL (from arguments)
   - Arguments: /expert_shell.do?sysparm_sys_id=<wizard sys_id from step 2>
Service Portal

Service Portal is a portal framework that allows administrators to build a mobile-friendly self service experience for users. It interacts with parts of the ServiceNow platform, so users can access specific platform features using Service Portal. It is an alternative to the Content Management System (CMS) based on more modern technologies.

Both expert developers and beginners can configure Service Portal.

Less technical users can make basic configuration changes to the UI using Branding Editor and other components of Service Portal. More advanced users can edit and extend portals, pages, and widgets. Expert users can use the Widget Editor tool to write scripts to power a portal, and even create rich web applications on the Now Platform.

Understanding Service Portal

Service Portal provides a modular user interface framework for quick and easy building of application portals and dashboards for the platform. It helps developers and non-technical administrators create attractive and engaging user experiences that drive employee adoption of critical enterprise applications.

How do you use Service Portal?

Service Portal is an application included in the platform UI, however it includes a visual layer for you to do most of your configuration. In the application navigator, navigate to Service Portal Service Portal configuration to view the configuration page.

The Service Portal configuration page provides a unique, intuitive way of viewing all the pieces of your portal and how they interact with one another. The configuration page allows you to take advantage of a real-time preview, while configuring portal settings. Use each of the tiles on the configuration homepage to assemble the different components of your portal.

If you prefer the platform layout for configuring Service Portal, you still have the option of creating your portal components within the platform UI. The two options are not separate. Everything you create in the Service Portal configuration page also appears in a table in the platform UI.

Who uses Service Portal?

Several different kinds of users can configure a portal.

- Limited coding: Service Portal was designed so that even users with limited coding ability or knowledge of the platform UI could set up a portal.
- ServiceNow Experts: Users with an understanding of the ServiceNow platform can create portals, set up URL redirects, and view all the components of the portal in a table. Most portal configuration takes place in the Service Portal configuration page, but in specific circumstances, Service Portal administrators may need to do additional configuration directly within the platform.
- Developers: Advanced customizations and new widget creation are tasks for a developer or someone who understands AngularJS and Twitter bootstrap.

In all cases, the user configuring a portal must have the admin or sp_admin role.

Basic concepts

You should have a basic understanding of all the following components that make up a portal:

- **Themes**: Themes define the look and feel of the whole portal, but can be overridden by other style configurations.
- **Pages**: Pages control where and how you store portal content. Pages do not have a defined relationship to portal records, they simply exist.
- **Widgets**: Components in Service Portal are called widgets. You can use HTML templates, CSS, client scripts, server scripts, and any JavaScript dependencies to define what a widget does. From an AngularJS standpoint, widgets are essentially a superset of an Angular directive.
- Most of the data in Service Portal is managed in different locations throughout the system.

For example, if you are building a knowledge portal, the data exists in Service Portal, but the knowledge articles are authored and managed in the Knowledge application. The same is true for any other type of
content you plan to leverage. Take time to understand which tables contain and control the data you are working with in Service Portal.

Additional resources

Service Portal is built using several well known technologies. Use the following websites as resources to help you understand and configure your portal:

- Twitter Bootstrap
- CSS 3 Flexbox
- AngularJS

Service Portal core concepts

Service Portal contains two parts: a framework and a portal. The framework is composed of a set of APIs, Angular services, directives, and tools that help to build portals. The portal is a group of pages linked by page IDs.
After you enter a URL, the framework uses the suffix and picks the appropriate portal to determine the theme and configurations. Then it loads the configured default portal homepage unless the URL has a specified ID.

Each widget added to a page becomes its own instance. A widget instance is basically the application of a widget in a page. Because widgets are reusable and can appear on different pages to do different things, the manifestation of a widget on a page is referred to as a Widget Instance. The page loads with content represented by widgets.

Widget instances get their logic from the base widget template, client scripts, server scripts, and depending on the widget, CSS.
Activate Service Portal

If Service Portal is not active on your instance, you can activate it from the plugin module. You must have the administrator role to activate a plugin.

Locate the Service Portal for Enterprise Service Management [com.glide.service-portal.esm] plugin in the list of plugins. Activate the plugin and select the option to include demo data. For more information on activating a plugin, see the Activate a plugin topic.

Activating Service Portal automatically activates the following plugins:

- Service Portal - Knowledge Base [com.glide.service-portal.knowledge-base]
- Service Portal - Service Catalog [com.glide.service-portal.service-catalog]
- Service Portal - Service Status [com.glide.service-portal.service-status]
- Service Portal Configuration Pages [com.glide.service-portal.config]
- Service Portal Designer [com.glide.service-portal.designer]
- Service Portal Social QA [com.glide.service-portal.sqanda]
- Service Portal Surveys [com.glide.service-portal.survey]

Content Management and Service Portal

Service Portal is a compelling alternative to the Content Management System (CMS) with a refined user experience. It does not duplicate CMS or platform UI functionality. Users who have sophisticated experiences delivered through CMS may need to invest time into transitioning to Service Portal, especially if the CMS implementation includes complex and customized Service Catalog forms.

Service Portal compatibility with existing CMS sites

ServiceNow continues to support CMS in current and upcoming releases. If you have existing CMS sites and activate Service Portal on your instance, your CMS sites will continue to work, as CMS and Service Portal are separate applications.

Differences between Service Portal and CMS

Service Portal is an alternative to CMS based on more modern technologies. Major differences include:

**Underlying technology**

CMS uses Jelly, which is not a widely used technology. Service Portal instead uses AngularJS, server-side JavaScript, HTML, and CSS. Any scripts that use Jelly do not work in Service Portal. Building widgets in Service Portal requires knowledge of AngularJS.

**Visual layer**

CMS uses iFrames which can be difficult to work with, limited in terms of styling, and susceptible to upgrade issues. Service Portal, on the other hand, is a self-contained application that accesses data from other tables on the platform. This enables fine-tuned control over style and responsive design.

**Mobile first**

Unlike CMS, Service Portal is optimized for a mobile environment. For this reason, the following apply to the Service Portal environment:
• Any scripts used in Service Portal can only use APIs supported in a mobile environment. For example, some APIs used in your Service Catalog client scripts may not be supported. For a list of supported APIs, see Service Portal and client scripts on page 2635.

• Service Portal forms support a maximum of two-columns. As a result, any highly customized Service Catalog forms, such as catalog items and record producers that use containers and variable sets, must be simplified to work in a two-column layout.

If transitioning to Service Portal, review the following resource: Mobile client GlideForm (g form) scripting and migration.

To understand how core CMS components are configured in Service Portal, refer to the following table.

Table 1108: CMS and Service Portal components

<table>
<thead>
<tr>
<th>CMS component</th>
<th>Service Portal equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content site</td>
<td>Portal</td>
</tr>
<tr>
<td>Content page</td>
<td>Page</td>
</tr>
<tr>
<td>Content types</td>
<td>Content types link a table to a content page. In Service Portal, content types are no longer required. Record data is queried and displayed using base system widgets. You can add widgets to any number of Service Portal pages. Learn more: Service Portal widgets on page 2688.</td>
</tr>
<tr>
<td>Layout and dropzones</td>
<td>In Service Portal, pages are made up of containers, rows, and columns. Learn more: Pages.</td>
</tr>
<tr>
<td>Content block</td>
<td>A content block is a reusable piece of content. In Service Portal, content blocks are replaced by widgets. Learn more: Service Portal widgets on page 2688.</td>
</tr>
<tr>
<td>Service Catalog</td>
<td>Service Catalog pages are rendered using the SC Catalog Item widget in Service Portal. For this reason, Service Catalog forms such as catalog items and record producers are shared between your CMS implementation and Service Portal. If you have a highly customized Service Catalog, you may need to invest time in simplifying your Service Catalog items and client scripts so that they render as expected in Service Portal. Learn more: Service Catalog forms in Service Portal on page 2620.</td>
</tr>
<tr>
<td>Theme</td>
<td>Theme</td>
</tr>
<tr>
<td>CSS</td>
<td>CSS</td>
</tr>
</tbody>
</table>
CMS and Service Catalog customizations

Service Portal comes with base system widgets to address common use cases and to display record data. Even though there is no direct migration path from CMS to Service Portal, there may be some items, such as catalog items or knowledge articles, that render as expected in Service Portal without any effort.

However, because Service Portal is supported in a mobile environment, you may need to modify any customized forms and scripts. This approach ensures that the items display well on a mobile device and present a better user experience. Before transitioning to Service Portal, you may need to:

- Refactor client scripts used in your CMS/Service Catalog to use supported mobile APIs and global objects. For a list of supported APIs, see Service Portal and client scripts on page 2635.
- Build widgets to replace UI Macros and other unsupported scripts. If using a UI Macro in a catalog item form and referencing values on the form, you can use the following workaround instead: Replace a Service Catalog form script with a widget on page 2633.
- Simplify any complex forms used in your Service Catalog to fit the Service Portal two-column form layout.
- Consider which release supports the required functionality. You may want to upgrade your instance before transitioning to ensure that you have the required base system features.

CMS to Service Portal transition

Your CMS may include complex forms and customizations that do not render as expected in Service Portal. Use this guide to understand how best to modify your CMS and Service Catalog implementation for Service Portal adoption, and to understand how a conversion may affect your users.

If you are considering transitioning from CMS to Service Portal, make sure that you understand the impact of moving to a mobile environment. Review the Mobile client GlideForm (g form) scripting and migration.

Support level and transition actions

<table>
<thead>
<tr>
<th>CMS component</th>
<th>Service Portal support</th>
<th>Possible transition actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data lookups</td>
<td>The client-side component of a data lookup is not supported in Service Portal. However, the data lookup is applied in the platform when a record is submitted or updated in Service Portal.</td>
<td>While data lookups are not applied in the Service Portal, the record updates as expected in the platform UI when submitted or updated in the Service Portal. If your CMS is used by requesters only, this limitation may not affect your implementation.</td>
</tr>
<tr>
<td>Content blocks</td>
<td>Because Content blocks use Jelly, they are not supported in Service Portal.</td>
<td>In the Service Portal, content blocks are replaced by widgets. Widgets are highly customizable components that can query record data, display and update records, and gather user input. Base system widgets generally cover most use cases. Just as you add content blocks to a page in your CMS, you can add widgets to a page using the Service Portal Designer.</td>
</tr>
<tr>
<td>CMS component</td>
<td>Service Portal support</td>
<td>Possible transition actions</td>
</tr>
<tr>
<td>---------------</td>
<td>------------------------</td>
<td>----------------------------</td>
</tr>
</tbody>
</table>
| UI Macros     | Because UI Macros use Jelly, they are not supported in Service Portal. | • In Service Portal, you can use widgets instead of UI Macros. Base system widgets generally cover most use cases, but for custom solutions, you can develop new widgets using AngularJS.  
• If your implementation includes UI Macros in Service Catalog forms that reference other fields or variables in the form, you can embed the widget inside a Service Catalog variable. Learn more: Replace a Service Catalog form script with a widget on page 2633. |
| UI actions    | All server-side UI actions are supported in Service Portal, although setRedirectURL() operations are ignored because Service Portal forms handle redirection in a different way than the platform.  
The form widget ignores all UI actions marked as Client. | • Refactor any UI actions to remove setRedirectURL() operations.  
• Check that UI actions are not marked as client. |
<table>
<thead>
<tr>
<th>CMS component</th>
<th>Service Portal support</th>
<th>Possible transition actions</th>
</tr>
</thead>
</table>
| Catalog client scripts | Only UI Type options Mobile / Service Portal and All are supported. UI type Desktop is not supported in Service Portal. For a list of supported APIs, see Service Portal and client scripts on page 2635. | • Update your scripts to remove any unsupported client APIs.  
• Check that the script UI Type is set to Mobile / Service Portal or All.  
Note: Synchronous JavaScript calls are not supported in Service Portal and must be replaced by asynchronous calls. For example, the getXMLWait() method of the GlideAjax class is not supported in Service Portal. Instead, use one of the following supported asynchronous methods:  
• getXML(Function callback)  
• getXMLAnswer(Function callback)  
For additional information on GlideAjax, refer to GlideAjax. |
| UI policies         | Scripted UI policies can only use APIs supported in Service Portal. For a list of supported APIs, see Service Portal and client scripts on page 2635.                                                                 | Update your scripts to remove any unsupported client APIs.  
To understand the impact of updating your CMS to work in a mobile environment, review Mobile client GlideForm (g form) scripting and migration. |
<table>
<thead>
<tr>
<th>CMS component</th>
<th>Service Portal support</th>
<th>Possible transition actions</th>
</tr>
</thead>
</table>
| Service Catalog variables | Service Catalog variables are supported in Service Portal with the following exceptions:  
• UI Macros and UI pages variable types are not supported.  
• Validation Scripts for variables are not supported. Supported validation types include:  
  • The Mandatory field on the variable form.  
  • Read-only variables.  
  • All fields in the Availability tab of the variable form.  
• Default variable size is not supported.  
• Expanding and collapsing help text is not supported. Rather, the Help text and Instructions fields defined in the Annotations tab on the variable form are always expanded. The Help tag does not display.  
• The List Collector variable displays as a choice list instead of a slushbucket in the Service Portal. | • If embedding a widget in a catalog item form, you can use the UI Macro variable type. Learn more: [Replace a Service Catalog form script with a widget](on page 2633).  
• If using variable with annotations, make sure to test your catalog items in Service Portal to ensure that help text displays as expected. |
| Order guides           | Order Guides in Service Portal use the Order Guide widget.                                                                                                                                                               | Large order guides can cause performance issues in the Service Portal. If you have large order guides, you can:  
  • Break them into multiple order guides.  
  • Simplify variables used in the order guides.  
  • As a temporary solution, you can render the Service Catalog item using an iFrame. See [Service Catalog forms in Service Portal](on page 2620). |
| Record producers       | Record producers are used in Service Portal with the following differences:  
• The sort order for catalog items in record producers is not honored.  
• Date values do not honor time zone when the record producer submits a record. | Make sure to test all record producers used in Service Portal to make sure that they behave as expected.                                                                                                                   |

<td>The Service Portal includes a base system Shopping Cart widget.</td>
<td>Use the Shopping Cart widget.</td>
</tr>
</tbody>
</table>

Service Catalog forms in Service Portal

Service Catalog forms are rendered within Service Portal widgets in a two-column layout. Complex forms may not display as expected.

Recommendations when creating Service Catalog forms

Use the following recommendations as a guide to building scalable forms that can be used in both applications:
• Keep forms simple. Because forms with multiple containers, variable sets, and client scripts do not always display as expected in Service Portal, keep forms short to eliminate conversion and debugging issues.
• Think in mobile. Any support for Catalog Client Scripts or Catalog UI Policies is the same as in mobile. Review the following resource: Mobile client GlideForm (g form) scripting and migration.

Form rendering in Service Portal

Containers and variable sets within Service Catalog forms are translated into a two-column layout when implemented in Service Portal. Service Catalog forms are rendered in Service Portal using the following rules:

• Only the top-level container settings are honored. If there are other containers within the top-level container, they are rendered as a single column. If there are container splits or nested containers within these additional containers, they are rendered as a single column. A top-level container is not a child of any other container.
• There can be a maximum of two columns in Service Portal. If your implementation includes forms with more than two columns, the fields are reorganized into two-columns in Service Portal.
• Variable sets are treated as containers. All previously listed rules apply to variable sets as well as any containers within them.
• Default variable size is not supported in Service Portal.

For other forms in the platform, the view determines how the form displays in Service Portal. For base system tables, the form opens in the Service Portal using the Service Portal table form view.

Example layout conversions

The following examples demonstrate how Service Catalog forms display in Service Portal.

Single-column form

A Service Catalog form with:
• Two containers.
• A single-column layout.
In Service Portal, the single-column layout renders as expected.

Figure 494: Service Catalog form
Two-column layout with subcontainers

A Service Catalog form with:
- A container with a two-column layout.
- A subcontainer with a single-column layout.
- A subcontainer with a two-column layout.

Figure 495: Service Portal result
Figure 496: Service Catalog form

In Service Portal, the two-column layout setting of the subcontainer is ignored. The subcontainer renders as a single column.
Two-column layout with variable sets and subcontainers

Figure 497: Service Portal result

A Service Catalog form with:
- Containers with single-column and two-column layouts.
- Variable sets with a two-column layout within containers.
In Service Portal, the two-column layout settings of the variable sets are ignored when inside a container column.
<table>

**Figure 503: Service Portal result**
Render a complex form in Service Portal using an iFrame

Because complex forms do not display as expected in Service Portal, you can render catalog items, record producers, and order guides in Service Portal using an iFrame. This workaround is a temporary solution to enable your Service Portal to function as expected while you simplify any complex Service Catalog forms.

When rendering items in an iFrame in Service Portal, the following limitations apply:

- On catalog items and record producers, the attachment icon is not visible. As a result, users cannot attach any files during the submission. As a workaround, you can add the attachment button to your form.
- Click-through for the hover-over icon is not available.
- Forms are not optimized for a mobile environment.

Use the attached resources and follow the instructions detailed in the Community post: Service Catalog on Service Portal.

Note: Be sure to make changes in a test environment before updating your production instance.

Replace a Service Catalog form script with a widget

You can use widgets in Service Portal to replace UI Macros. If your Service Catalog form includes a UI Macro that references other fields or variables on the form, you can create a widget to hold reusable code and embed it within the Service Catalog form. Use special syntax to access any variable fields on the form.

Role required: admin or sp_admin

1. Create a widget that performs the action you would like to use in catalog item forms. See step 7 for a simple example widget that accesses another variable on the form.
2. Open a catalog item that previously used a UI Macro or other reusable component not supported in Service Portal.
3. In related lists, add a new variable to the catalog item.
4. Configure the variable form to add the Widget field.
5. In the Type field, select Macro.
6. In the Widget field, select a widget that performs the desired action.
7. Use the $scope.page.g_form() or $scope.page.field syntax in the embedded widget to access the catalog item values.

This example shows how to modify the value of a single-line text variable with the name color associated with the catalog item.

**Widget HTML Template**

```html
<div>
  Data from catalog variable:
  <h1>{{ c.data.message }}</h1>
</div>
```

**Widget client script**

```javascript
function($scope) {

  var c = this;

  //Watch for changes in the color variable
  $scope.$watch(function () {
    return $scope.page.g_form.getValue('color');
  }, function (value) {
```

© 2018 ServiceNow. All rights reserved. 2633
You can use the following to access variable or catalog item fields:

- `$scope.page.g_form()`: The `g_form` instance on the form. You can use all supported `g_form` methods described in *Service Portal and client scripts* on page 2635. For example, `g_form.setValue('variable_name', 'new value');`.
- `$scope.page.field()`: The object that represents the variable.

When you open the catalog item in the Service Portal, the embedded widget accesses the variable fields associated with the catalog item.

**Supported features in Service Portal**

Service Portal is an alternative presentation layer for the platform. As such, not all features of the platform are extended to Service Portal. Consider your full application and the abilities of Service Portal before making considerable investments.

**Not currently supported**

- Domain separation

**No plans to support**

- @ Mentions
- Click-through/pop-ups
- UI macros
• Formatters
• UI actions marked as Client
• Nested container Catalog variables
• Survey wizards

Service Portal and client scripts

You can use client scripts and catalog client scripts in the Service Portal if the UI Type is set to Mobile / Service Portal or All. Client scripts and catalog client scripts are used with the Form widget and SC Catalog Item widget, as opposed to a widget client controller.

Before flagging a script as Mobile/Service Portal or All, make sure that you are only using the mobile APIs. Setting a client script to Mobile does not ensure that it will work, it simply flags that the script should be attempted by the mobile app or the Service Portal. Many of your existing client scripts can be set to All as long as the API calls are supported by the mobile client scripting environment.

The topics in this section require advanced coding knowledge and an understanding of Service Portal APIs.

Checking desktop vs mobile runtime

You might want to mark a client script compatible with both desktop and mobile, but include behavior that depends on the runtime. You can use this script:

```javascript
if (window === null)
    // Write your mobile compatible code here
else
    // Write your desktop compatible code here
```

Unsupported client scripting globals

Widget client controllers are full Angular controllers and are not subject to the unsupported client script globals listed here. Use jQuery and Angular as needed.

The following globals and APIs are unavailable in client scripts and catalog client scripts used in the Service Portal:
• window
• document
• $
• jQuery
• $$
• $j
• angular

Embedded widgets & g_form

When using the Service Catalog variable type Macro and Macro with Label, you can pick a widget to embed in a catalog item form. Within the client controller for the embedded widget you can access the field object and catalog item g_form instance using:

• $scope.page.field
• $scope.page.g_form()
**g_list and g_service_catalog in client scripts used with Service Portal**

The `g_list` global helps you set the filter of a Glide list element or a list collector variable. Use this API in place of the `g_filter` API on desktop client scripts.

```javascript
function onLoad() {
  var myListCollector = g_list.get("my_list_collector");
  myListCollector.reset();

  myListCollector.setQuery("active=true^category=8c7b22230b402200b0b02c6317673a62");
  myListCollector.addItem('3a700d39af5f4fc0aab978df90f4c692', 'Power Supply');
  myListCollector.addItem('1cb93419a3a248318da8f814140b42f6', 'Backpack');
}
```

`g_service_catalog` is only available in Service Portal service catalog item scripts. Use this API to know if your catalog item script is run as part of an order guide or on its own.

```javascript
function onLoad() {
  if (window) // if CMS, don't run this
    return;

  // g_service_catalog api for Service Portal and Mobile
  var isOrderGuide = g_service_catalog.isOrderGuide();
  g_form.setValue("is_order_guide", isOrderGuide ? "Yes!" : "Nope :(");
}
```

**Supported client script types and APIs**

Some client scripts are not supported in Service Portal. Others must have a UI type set to All or Mobile / Service Portal. If using a client script in the Service Portal, only client-side APIs supported in a mobile environment can be used.

**Client script support in Service Portal**

<table>
<thead>
<tr>
<th>Client script</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Catalog client scripts</td>
<td>Service Portal requires that the UI Type field be set to All or Mobile / Service Portal. Client Scripts marked as Desktop rely on legacy APIs that are not supported in Service Portal. Before flagging a script as Mobile / Service Portal or All, make sure you are only using supported client-side APIs.</td>
</tr>
<tr>
<td>Client script</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>

</tr>
<tr>
<td></td>
<td>• setScope(scope)</td>
</tr>
</tbody>
</table>

**Note:** Because the mobile platform does not allow synchronous GlideAjax calls, the getXMLWait() method in a GlideAjax call does not work in the Service Portal. Instead, use one of the asynchronous calls such as getXML(Function callback) or getXMLAnswer(Function callback).
Activate Service Portal validation scripts

Validate user input in a specific field type using a validation script. In new instances, Service Portal includes XML, Script, Script (Plain), Email, and Version validation scripts by default. If upgrading from a previous release, the Mobile and Service Portal version is not active by default. You must activate the Mobile and Service Portal version of the validation script to validate user input in the Service Portal.

Role required: admin

Service Portal requires that the UI Type field be set to All or Mobile / Service Portal. Client Scripts marked as Desktop rely on legacy APIs that are not supported in Service Portal. Before flagging a script as Mobile / Service Portal or All, make sure you are only using supported client-side APIs. See Supported client script types and APIs on page 2636.

**Note:** To change the UI Type from Mobile / Service Portal to All, delete the Desktop version from your instance to avoid activating conflicting scripts. Before deleting the Desktop version, make a backup in case you need to revert any changes.

1. Navigate to System Definition Validation Scripts.
2. Open the Mobile / Service Portal version of the validation script you would like to use in the Service Portal.
3. Click the Active flag to activate the validation script.
4. Set the UI Type to All to use the validation script in desktop, mobile, and Service Portal environments. To avoid activating conflicting validation scripts, you must first delete the Desktop version of the script.
   a) Navigate to the desktop version of the validation script you would like to replace. Desktop versions have the UI Type field set to Desktop.
   b) Open the record.
c) Right-click the header menu and select Export XML (This Record) to create a backup of the record.
d) Once the export completes, click Delete and confirm the selection.
e) Navigate back to the validation script set to Active in earlier steps and change the UI Type to All.

User input into the designated field type in the Service Portal and Mobile environments is validated for correct formatting. For example, if you activated the Email validation script for use in the Service Portal, invalid user input into an Email field generates an error and prevents the browser from submitting the form.

Note: On a desktop browser, the field is validated when you submit the record. On a mobile browser, the field is validated when you navigate away from the field.

Domain separation in Service Portal

This is an overview of domain separation and the Service Portal. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

Support: Data only
Domain separation provides complete data isolation for domain-specific users. Domain separation in this application is supported at the Data only level, meaning it supports the data security model of separating visibility of data from one domain to another. To learn more, see Application support for domain separation.

How domain separation works in Service Portal

Elements of the Service Portal platform such as settings, portals, pages and widgets cannot be domain-separated. However, the data within widgets does display, based on domain. Separate portals with different URLs can be created to provide different experiences for different domains.

Set up Service Portal

Set up a site for your users using Service Portal.

Requirements

Role required: admin or sp_admin

Before you begin

Take the following into consideration before configuring Service Portal:

- Who are you building your site for and why?
• What information do you want to include in your site?
• What do you want the mobile experience to be for users?
• Which platform applications do you plan to use in your portal?

You can use parts of the platform, such as knowledge articles and catalog items, as the content for your portal.

For example, if you are building a knowledge portal, the content displays in Service Portal, but the knowledge articles are authored and managed in the Knowledge application. The same is true for any other type of content you plan to leverage. It is important to take time to understand the table structure of data to become acquainted with content.

• How customized is your service catalog? Catalog client scripts and UI policies only work in Service Portal if they use the mobile GlideForm API, so you may need to make some changes.

What to do

Create a portal

A portal is the engine that houses all the references to content for your site. The portal record defines the URL extension for a site, as well as things like the knowledge base, catalog, and homepage. You can also use the portal record to define the header menu and the portal branding.

From the Service Portal configuration page, click the New Portal tile. Use the fields on the form to associate pages to the portal.

• Create a portal on page 2647

Create a page

Pages are the centerpiece of the end user experience. Page definitions not only control the layout of the content, they craft the experience for the user. Pages also help define mobile responsiveness, which is a key component in the user experience.

Use any existing page included with Service Portal as an example for your own creation.

Use the Service Portal Designer to create pages, assign layouts, and add widgets.

• Create and edit a page using the Service Portal Designer on page 2668

Create a widget

Widgets are the power behind the portal. Widgets are highly customizable and can be used to provide an endless variety of experiences for your users. Anytime you add a widget to a page it becomes an instance of itself. Each widget instance has its own record so you can configure it specifically for each use. For example, you can add several Icon Link widgets to a page and configure them to link to different areas with different icons. None of the widgets are affected by the others.
You can start by cloning an existing widget and making changes to your cloned version. Developers with an advanced understanding of AngularJS can create widgets from scratch.

**Create a portal homepage**

When a portal is referenced by the URL suffix, it lands on a home page. This homepage is often labeled index in website language. The home page is probably the most important page of your portal as it houses the major information and actions that your users see.

- **Assign a homepage to a portal** on page 2674

**Configure the header menu**

The header menu in a portal is comprised of two separate widgets: a header widget, which determines the style of the header, and the menu widget, which determines the actual items that appear in the header. Configure both widgets for the header menu to appear and act like a header menu in your portal.

- **Create a portal header menu** on page 2661
- **Add a header or footer to a portal** on page 2661

**Configure the branding for the portal**

With the Branding Editor, you can configure the styles and theme of your portal in a view with real-time updates. You can see how your portal appears to users with the click of a button. More advanced users still have the option of creating CSS style sheets for the portal theme. However, they cannot take advantage of the real-time update that the Branding Editor provides. Changes made in the Branding Editor or to specific components of the portal (such as a widget or a page container) override any customizations made to the theme.

- **Configure portal branding** on page 2653
- **Create a portal theme** on page 2656

**Next steps**

- Configure search in the portal.
- Limit user access to specific components.
- Set up URL redirects.

**Service Portal configuration page**

Most Service Portal configuration is accessible through the Service Portal configuration page landing page. In your instance, access the Service Portal configuration page by navigating to Service Portal Service Portal configuration. The Service Portal configuration page opens in a new tab in your browser.
Service Portal
Create rich, engaging and modern experiences to help your business run better
Select one of the options below to continue

- **Branding Editor**
  - Customize your portal's title, logo and theme colors.
  - Preview changes as you make them

- **Designer**
  - Create and layout pages with drag-and-drop functionality.
  - Preview pages as you make changes

- **Page Editor**
  - Configure the properties of pages, containers and widgets from a map view

- **Widget Editor**
  - Create widgets from scratch or customize an existing one.
  - Write HTML, CSS, and Javascript with real-time preview

- **New Portal**
  - Create a new Service Portal

- **Get Help**
  - Browse guides, tutorials and videos to learn how to set up, configure and customize your portals
You can also access the configuration page by appending your URL with `sp_config`. For example, `https://<instance name>.service-now.com/sp_config`.

Use each option on the Service Portal config page to set up the different parts of your portal.

**Service Portal properties**

The Service Portal properties page provides several configuration options for Service Portal. Administrators can access these properties by navigating to Service Portal Properties.

**Table 1109: Service Portal Properties**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default 404 page (page ID or <code>sp_page sys_id</code>) for Service Portal</td>

<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: admin</td>
</tr>
</tbody>
</table>

Create a portal

Create a portal using the Service Portal configuration page.

Role required: admin or sp_admin

The Branding Editor affects the look of your portal and essentially changes the CSS for the pages. The changes you make in the Branding Editor are recorded in the portal record in the following fields. If you have experience with CSS and HTML you can configure these fields in the portal form directly as accessed through the portal UI. By theming your portal in the Branding Editor instead, you can take advantage of the real-time theme preview.

1. Navigate to Service Portal Portals, then click New.
2. Complete the portal form using the following fields.

**Table 1111: Portal form fields**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The name you use to define your portal. In the browser header and for bookmarks, the title appears as <code>&lt;Portal Title&gt; - &lt;Page Title&gt;</code></td>
</tr>
<tr>
<td>URL Suffix</td>
<td>The value that appears appended to an instance URL when you access a portal. For example, if you use <code>sp</code>, the instance URL for that portal would be <code>&lt;instance name&gt;.service-now.com/sp</code>. Make sure this value is unique and is not the same as any other portal.</td>
</tr>
<tr>
<td>Homepage</td>
<td>The page you want users to see first after they sign in.</td>
</tr>
<tr>
<td>Knowledge base</td>
<td>Name of the knowledge base you want associated with the portal. The knowledge base you select here determines what information appears for the knowledge base page. For example, if you select <code>IT</code>, only the article categories defined for the IT knowledge base appear in the <code>KB categories widget</code>.</td>
</tr>
<tr>
<td>Social QA Knowledge Base</td>
<td>Name of the knowledge base where you want to store questions and answers from portal users.</td>
</tr>
<tr>
<td>KB home page</td>
<td>The home page you created that you want users to see when they go to a knowledge base.</td>
</tr>
<tr>
<td>Login page</td>
<td>The page you created for users to be authenticated.</td>
</tr>
<tr>
<td>Logo</td>
<td>Logo that appears in the page header. You can also configure the logo in the Branding Editor.</td>
</tr>
<tr>
<td>Icon</td>
<td>The icon that appears in the address bar for your portal. Each portal you create can have a different icon.</td>
</tr>
<tr>
<td>Default</td>
<td>The portal you want to use as your main portal.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Quick start config | Schema that defines configuration items in the Branding Editor. In JSON format, you can define fields and records used to generate your branding options.  

```
[
    "tagline": {
        "table": "sp_instance",
        "sys_id": "34fe3d96cb20020000f8d856634c9cf4",
        "field": "title"
    },
    "hero_background": {
        "table": "sp_container",
        "sys_id": "be98a8d2cb20020000f8d856634c9c63",
        "field": "background_image"
    }
]
``` |
| CSS variables    | Portal-specific Sass variables. You can overwrite existing theme variables here.                                                                |
| Application      | Application scope. This field is uneditable and Global by default.                                                                               |
| 404 page         | The default page your users see whenever a page cannot load properly. You can also define a default 404 page using the system property glide.service_portal.default_404_page. |
| Catalog          | Catalog listed in the sc_catalog table to use in the portal.                                                                                      |
| Catalog home page | Catalog page that you created in the portal to represent the catalog.                                                                            |
| Main menu        | Reference to the menu in the [sp_instance_menu] table that appears in the header.                                                                |
| Theme            | Refers to a theme in the [sp_theme] table that defines the style and branding for the portal. The theme is the lowest level of style configuration and any changes made in the Branding Editor or to specific portal components (such as widget or container CSS) override those styles. |

Associate a portal with a catalog

You can associate a portal with any catalog. Only one catalog can be associated with a portal. By default, Service Portal is associated with Service Catalog.

Role required: admin or sp_admin

1. Navigate to Service Portal Portals.
2. Click the Service Portal record.
3. In the Catalog field, select the desired catalog. The categories and catalog items associated with the selected catalog are displayed in Service Portal.
4. For the Main menu field, click Open Record.
5. From the Menu Items section, click the Service Catalog record.
6. In the Label field, specify the label for the selected catalog. The catalog label is displayed in the main menu of Service Portal.
7. Click Update.

Service Portal styles

Pages are made up of containers, columns, rows, widgets, and widget instances. You can configure the CSS of each component, or use the CSS defined in theme and branding as global definitions for the portal. If you do not define CSS in theme or branding, Bootstrap defaults are used.

You can define CSS in your portal at multiple levels.

**Bootstrap defaults**

If no other CSS is defined, all elements use Bootstrap version 3.3.6 defaults.

**Branding editor theme colors/Portal CSS**

CSS defined in the Branding Editor Theme Colors tab. Changes made to the theme colors in the Branding Editor appear in the CSS variables field in the portal table [sp_portal].
Customizing the theme colors overwrites the Bootstrap defaults.

**Theme CSS**
CSS defined in the CSS variables field in the Themes table `[sp_theme]`. Use the Theme CSS as much as possible to allow for more flexible evolution of your portal in the future.

Using a theme overwrites the Portal CSS/Branding Editor theme colors.

**Page CSS**
CSS defined in the Page Specific CSS field in the Pages table `[sp_page]`.

Page-specific CSS overwrites the theme CSS.

**CSS classes**
You can define CSS classes elements on the page within each respective record.

**Widget CSS**
CSS defined in the CSS field in the Widgets table `[sp_widget]`.

Widget CSS overwrites container, column, and row CSS.
**Widget instance CSS**

CSS defined in the CSS field in the Instance table [sp_instance].

Widget instance CSS overwrites all other CSS definitions.

---

**Figure 506: Hierarchy of style application in the Service Portal**

**Configure portal branding**

Use Branding Editor to give your portal its own look and feel.

To access the Branding Editor, navigate to Service Portal Service Portal Configuration, then click Branding Editor.

Select the portal you want to customize the theme for from the portal list. Then use the options on the Quick Setup and Theme Colors tabs to customize your portal.
Figure 507: Branding Editor

|                         |   "hero_background": {                                                                            |
|                         |     "table" : "sp_container",                                                                  |
|                         |     "sys_id" : "be98a8d2cb20020000f8d856634c9c63",                                               |
|                         |     "field" : "background_image" }                                                               |
|                         | }]                                                                                              |
| Tag line                | Introduce your users to a portal page with a tag line. This text is stored in an instance of the homepage search widget.                                                                                                                                                   |
| Tag line color          | Select a color for the tag line.                                                                                                                            | |
| Homepage background color | Add a color for your background. You can type in a color name, hex color, decimal (RGB), or select from the color palate.                                                                                       |
| Background image        | Upload an image to appear in the background of your homepage. This image is stored in the container for the widget on your homepage.                                                                                             |

For any colors on the theme tab, you can use the standard color name, hex code, decimal (RGB) code, or select the color from the color palate. All the color definitions are stored in the CSS variables field of the portal form. The theme preview updates in real time as you make changes.

Table 1113: Theme colors tab

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Navbar</td>
<td>Use the fields in this section to customize the colors for the header menu.</td>
</tr>
<tr>
<td>Brand</td>
<td>Use the fields in this section to customize the page colors. For example, the page background or the widget background.</td>
</tr>
<tr>
<td>Text</td>
<td>Use the fields in this section to customize the color of the text on a page.</td>
</tr>
</tbody>
</table>
Changes made to the theme colors in the Branding Editor appear in the CSS variables field of the portal form in the platform UI.

Create a portal theme

If you need more customization than Branding Editor can provide, you can create your own custom theme. Only users with an understanding of CSS should create custom themes.

1. Navigate to Service Portal Themes, then click New.

2. Complete the form fields and select Save.
### Table 1114: Theme form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of your theme. Use this name to associate the theme with your portal. This name is not visible to users, you should know it to apply the correct theme to a portal.</td>
</tr>
<tr>
<td>Application</td>
<td>The record scope. The header menu record and the source table must have the same application scope.</td>
</tr>
<tr>
<td>Header</td>
<td>List of headers and footers from the sp_header_footer table that you can associate with a portal theme. Headers and footers are widgets and can be configured the same way.</td>
</tr>
<tr>
<td>Footer</td>
<td>List of headers and footers from the sp_header_footer table that you can associate with a portal theme.</td>
</tr>
<tr>
<td>Fixed header</td>
<td>Locks the header at the top of the page so that when a user scrolls the header remains on the screen.</td>
</tr>
<tr>
<td>Fixed footer</td>
<td>Locks the footer at the bottom of the page so that when a user scrolls the footer remains on the screen.</td>
</tr>
<tr>
<td>CSS variables</td>
<td>CSS custom properties that you can use to change the color and styles in a portal. For example, the stock theme uses some of the following variables:</td>
</tr>
<tr>
<td></td>
<td>$sp-logo-margin-x: 15px !default;</td>
</tr>
<tr>
<td></td>
<td>$sp-tagline-color: $text-color !default;</td>
</tr>
<tr>
<td></td>
<td>$navbar-inverse-bg: #3a3f51 !default;</td>
</tr>
</tbody>
</table>

3. To add a style sheet to the theme, in the CSS Include related list, click New.
4. Complete the style sheet form fields, then click Save.

**Table 1115: Style sheet form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the CSS Include. Remember this name to associate the CSS Include with the theme.</td>
</tr>
<tr>
<td>Application</td>
<td>The record scope. The header menu record and the source table must have the same application scope.</td>
</tr>
<tr>
<td>Source</td>
<td>Select one of the following options:</td>
</tr>
<tr>
<td></td>
<td>• Style Sheet: Add an internal style sheet that has been uploaded to the CSS table [sp_css]. For example, ng-sortable.min.css. Internal style sheets use standard CSS in the CSS field.</td>
</tr>
<tr>
<td></td>
<td>• URL: Link to an external style sheet. Use external style sheets to use the same CSS as a corporate website or other online resource.</td>
</tr>
<tr>
<td>Style sheet</td>
<td>Associate a style sheet or CSS file URL, depending on which option you select in the Source field.</td>
</tr>
</tbody>
</table>
5. To add a JavaScript include to the theme, in the JS Include related list, click New.

</table>

Configure a portal header menu

Service Portal is designed to allow customers to have deep control over the behavior of their portals. One of the main navigation controls for users is the header main menu. The menu options are determined by the assignment of a main menu to the portal, but the look and behavior of the menu is defined within the theme and associated header.

Configuring a portal header with a menu involves several steps:

1. Create a header and add it to a theme.
   Until you add a theme with a header to a portal, the header menu does not display.

2. Create a main menu with menu items and assign it to the portal.
   The main menu record is where you assign which navigation options appear in the header. For example, you can add a menu item that links to another page within your portal, such as the service catalog.

The main menu and header form a header menu when associated with a theme and a portal.
Add a header or footer to a portal

Use the theme to add a header or footer to your portal.

1. Navigate to the portal theme (Service Portal Service Portal Configuration Portal Tables Themes) then click the theme you want to add the header or footer to.

2. In the header or footer field, select the header or footer you want to use for your portal.
   If you are just getting started, you can reuse the base system Stock Header or Sample Footer widgets.

3. Select Fixed Header or Fixed Footer to lock the header or footer in one place so when users scroll up or down they remain in the same location on the page.

4. To configure the appearance of the header, in the Service Portal configuration page, open the Branding Editor. Under the Theme Colors tab, use the color selectors in the Navbar section to control the colors in the header.

Create a portal header menu

Create a menu with menu items to display in the header of a portal.

1. In the Service Portal configuration page (Service Portal Service Portal Configuration), navigate to Portal Tables Instance with Menu and click New.

2. Complete the fields in the menu form.
Table 1117: Menu fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Name of the header menu. You need to know this when you associate the menu with your portal.</td>
</tr>
</tbody>
</table>
| Additional options, JSON format | Advanced configuration options. For example, use this field to enable the shopping cart in the header menu with the following code:  
```json
{
  "enable_cart": {
    "displayValue": "true",
    "value": true
  }
}
``` |
| Application                   | The record scope. The header menu record and the source table must have the same application scope. |
| Widget                        | The widget that the header menu is based on. Select a menu-type widget from the list. For example, the header menu widget that is included as a base system widget. |

3. Save the form, and then click Menu Items from the related lists.
4. Click New and complete the menu item form.

Table 1118: Menu item fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Name that appears for the item in the menu</td>
</tr>
<tr>
<td>Parent menu</td>
<td>This field should already contain the name of the menu you are adding items to. You can change the value as needed to other menus</td>
</tr>
<tr>
<td>Parent menu item</td>
<td>Use this field to nest menu items within other menu items</td>
</tr>
<tr>
<td>Order</td>
<td>Value that determines where the item appears in the menu in relation to other menu items</td>
</tr>
<tr>
<td>Type</td>
<td>The kind of page the item links to. For example, you can link to another page in the portal, or an external URL. Form fields vary depending on the option you select from this list. Select Scripted list for more advanced options.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Page</td>
<td>Name of the portal page the item links to. This option is available if you select Page as the menu item type.</td>
</tr>
<tr>
<td>Condition</td>
<td>Determines what conditions are required for menu items to show in the header. For example, the condition <code>gs.hasRole(&quot;sp_admin&quot;)</code> restricts access to menu items to users with the sp_admin role. Hide a menu item by setting this value to false. For more information on what conditions to use in the Condition field, see Create a UI action.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Icon that appears beside the menu item</td>
</tr>
</tbody>
</table>

5. Click Submit.
6. After you create a menu and menu items, add the menu to a portal.
   a) Navigate to Service Portal Portals, then open the portal you want to add a menu to.
   b) From the main menu field, click the reference lookup icon, then select the appropriate menu by name.
Figure 510: Select a menu

© 2018 ServiceNow. All rights reserved.
c) Click Save.

Associate the menu you created with a portal, then create a header with a theme for your menu.

**Service Portal pages**

Use pages to organize content, ensure responsive mobile optimization, and design meaningful portal user experiences for your customers. A page houses containers and rows, which then contain widgets. By manipulating the layout of the page, and the widgets within it, you can construct your desired user experience.

- Pages are referenced using the page ID.
- Pages can be referenced in more than one portal.
- Use base system pages as templates.

Containers

Containers are markup artifacts that are put on a page to contain the layouts that house the widgets. You can view containers and how they make up a page in the Service Portal Designer (Service Portal Service Portal Configuration Designer). Open a page in the Service Portal Designer, then click anything on the page. In the top left corner, breadcrumbs appear to show you which element on the page you have selected. Use the breadcrumbs to select a container, then click the edit icon (edit icon).

Figure 512: Service Portal Designer breadcrumbs

You can also edit a container by navigating to the Page Editor and selecting the container node in the tree view. In this view, you can:

- Change the layout of widgets on a page.
- Determine the number of columns on a page.
- Determine whether to scale with changes to the browser window.
- Add a background color to a portion of a page.
- Add an background image to a portion of a page.
- View the current layout of the widgets within the page.
Create and edit a page using the Service Portal Designer

Create or edit a page and use layouts to organize the columns that house the widgets.

These steps are intended for users with little to no coding experience. The Service Portal Designer includes several layers of customization from simply adding widgets in a particular configuration on a page, to adding CSS classes.

1. Navigate to Service Portal Service Portal Configuration.
2. Click Designer.
3. Switch to the portal you want to design pages for by selecting the portal name in the header.
4. From the Service Portal Designer, select a page to customize or click Add a new page.
5. Under Layouts, select Container and drag it onto the page.
6. Drag one of the other layouts and drop it in the container.
   This layout defines the structure of your page and the space available to drop widgets. The structure of the layout aligns with the Bootstrap grid template and always adds up to 12.
7. Use the filter to search for a widget, then drag the widget to the layout.
Drag containers, layouts, then widgets onto a page.

Drag and drop a set of columns from the left pane or use the plus (+) button - then drag and drop widgets inside.
8. Edit page properties.
   a) Click Edit Page Properties.
      The page record from the Pages table [sp_page] opens.
   b) Edit the form.

   Table 1119: Page fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Internal name of the page. Use the title to search for a page in the Service Portal Designer.</td>
</tr>
<tr>
<td>ID</td>
<td>A unique ID for the page. The ID is what you use to assign a page to a portal. It also determines the URL for the page, for example <a href="https://instance">https://instance</a> name.service-now.com/doc_portal/?id=doc_page, where doc_page is the page ID.</td>
</tr>
<tr>
<td>Application</td>
<td>The application scope.</td>
</tr>
<tr>
<td>Public</td>
<td>Enables the page to be accessed without the need for authentication. If Public is selected, all users can view the page no matter the roles listed.</td>
</tr>
<tr>
<td>Draft</td>
<td>Mark a page as draft to limit user ability to view the page while you are still creating it. Only users with the admin role can view a page in draft, all other users see a 404 page.</td>
</tr>
<tr>
<td>Roles</td>
<td>Limit user access to a page by role.</td>
</tr>
<tr>
<td>Short description</td>
<td>Describes the portal page. This field is not public facing.</td>
</tr>
<tr>
<td>Page Specific CSS</td>
<td>Unless a page has Page Specific CSS, the page inherits CSS from the Theme and Branding. If you need a page to look different, the Page Specific CSS overrides the inheritance from the Theme and Branding.</td>
</tr>
<tr>
<td>Dynamic page title</td>
<td>Create variables to generate descriptive titles depending on the content loaded into a page.</td>
</tr>
<tr>
<td>Clone Page</td>
<td>Enables you to make a copy of a page that can be modified. If you clone a base system page, a new widget instance is created for each widget on the page.</td>
</tr>
</tbody>
</table>

9. Edit container properties.
   a) Click within the container you would like to edit, or select Container in the breadcrumbs.
   b) Click the edit icon [edit].
      The container record from the Containers table [sp_container] opens.
   c) Edit the form.

   Table 1120: Container fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

<td>Internal name of the container.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Order</td>
<td>The order in which the containers appear on a page. To set a container to appear above all other containers, give the container the lowest number in the Order field.</td>
</tr>
<tr>
<td>Page</td>
<td>The page in which the container appears.</td>
</tr>
<tr>
<td>Screen reader title</td>
<td>The title used by a screen reader.</td>
</tr>
<tr>
<td>Application</td>
<td>The application scope.</td>
</tr>
<tr>
<td>Width</td>
<td>Width of the container. Options include:</td>
</tr>
<tr>
<td></td>
<td>- Fixed</td>
</tr>
<tr>
<td></td>
<td>- Fluid</td>
</tr>
<tr>
<td>Parent class</td>
<td>Parent CSS class for the container.</td>
</tr>
<tr>
<td>CSS class</td>
<td>The CSS classes for the container. Overwrites page-specific CSS.</td>
</tr>
<tr>
<td>Background color</td>
<td>The background color of the container.</td>
</tr>
<tr>
<td>Background image</td>
<td>Background image for the container.</td>
</tr>
<tr>
<td>Background style</td>
<td>The display style of a background image. Options include:</td>
</tr>
<tr>
<td></td>
<td>- Default</td>
</tr>
<tr>
<td></td>
<td>- Cover</td>
</tr>
<tr>
<td></td>
<td>- Contain</td>
</tr>
<tr>
<td></td>
<td>- Repeating</td>
</tr>
<tr>
<td>Bootstrap alternative</td>
<td>Selecting this field removes the standard Bootstrap grid classes and disables the Bootstrap grid system in the container. If selected, the following are not applied:</td>
</tr>
<tr>
<td></td>
<td>- The Width field in the container record.</td>
</tr>
<tr>
<td></td>
<td>- Standard Bootstrap class in the row record within the container.</td>
</tr>
<tr>
<td></td>
<td>- The Size - xs, Size - sm, Size - md, and Size - lg fields in column records within the container.</td>
</tr>
<tr>
<td></td>
<td>Only select this field if you plan to provide custom CSS classes and CSS for the container, row, and column records.</td>
</tr>
<tr>
<td>Move to header</td>
<td>If selected, the container sticks to the header and does not scroll. Use this option to create a subheader.</td>
</tr>
</tbody>
</table>

10. To switch to a different page, click the Pages tab in the left pane, then select the next page you want to configure.

11. Use the Preview button in the header to view your page as you design it. You can also use Preview to view your page in mobile or tablet mode through the controls presented in the header.
Figure 514: Designer tablet view
Add a subheader to a page

Select a container record to serve as a page subheader. A subheader sticks to the page header and does not scroll.

Role required: admin

1. From the Service Portal configuration page (Service Portal Service Portal Configuration) open the Service Portal Designer.
2. Open the page you want to add a subheader to.
3. Click the container that you would like to use as a subheader, or select the container using the breadcrumbs.
4. Click the edit icon (редактировать).
5. Select Move to header.
Assign a homepage to a portal

Edit your portal record to specify any page as your homepage.

When a portal is referenced by the URL suffix, it lands on a home page. This homepage is often labeled index in website language. The home page is probably the most important page of your portal as it houses the major information and actions that your users see.

1. From any page in the Service Portal Designer, click Edit Portal Properties.
Figure 516: Edit Portal Properties

2. From the Homepage list, select the page you want for your portal homepage and click Save.
Figure 517: Select a homepage
Assign a default error page

Create a default 404 error page for your portal using a system property.

You can assign an error page to a portal using the portal form. If you do not assign an error page using that form, the system uses the default 404 page containing the breakout game widget. Use the default 404 page property [glide.service_portal.default_404_page] to configure the default error page.

Create a page before adding it as the default error page.

1. Navigate to Service Portal Properties.
2. In the Default 404 page for Service Portals, type the page ID found in the ID field of the page form.

Add SEO information to Service Portal pages

Improve the searchability of Service Portal pages by adding meta tags and descriptive titles.

You can add SEO information to Service Portal pages by:

• Associating public pages with meta tags to optimize search from external search engines.
• Using record data loaded in a page to dynamically generate descriptive page titles and meta tags.

Dynamic meta tags and titles

Some pages in the Service Portal load record data based on a URL parameter. You can add meta tags and page titles that vary depending on the record loaded in the page.

Using Service Catalog as an example, the following URL includes a sys_id parameter in addition to the page ID. Different content is loaded depending on the value of the sys_id parameter.

https://<yourInstance>.service-now.com/sp?id=sc_cat_item&sys_id=060f3afa3731300054b6a3549dbe5d3e

If a page loads dynamic content, you can:

• Add meta tags to the page.
• Add meta tags that vary based on content.
• Add variables that generate descriptive page titles based on content.
• Add dynamic content to a page title.
• Create targeted page titles for use with a screen reader.

For example, you can set a Service Catalog page to generate a dynamic title and meta tag based on record data associated with the sys_id in the URL parameter.
Add meta tags to a public page

Improve the searchability of Service Portal pages by adding meta tags. You can add the meta name and description attributes to a page, define the robots attribute, or create dynamic meta tags for pages that load record data based on a URL parameter.

Role required: admin or sp_admin

1. Navigate to Service Portal Pages.
2. Open a page.
3. Check that Public is selected. Pages that are not public are not indexed by external search engines.
4. Click the Meta tags related list tab.
5. Click New to create a new meta tag.
6. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Page</td>
<td>Page to apply the meta tag to.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the page. This value is read-only.</td>
</tr>
</tbody>
</table>
| Name      | The HTML meta name attribute.  
To define the meta robots attribute, add ROBOTS. |
| Content   | The HTML meta description attribute.  
If ROBOTS is defined in the Name field, you can add one of the following content values:  
• INDEX, FOLLOW: The search engine shows the page in search results and trusts any links in the page. This is the default value.  
• NOINDEX, FOLLOW: The search engine does not show the page in search results, but trusts any links in the page.  
• INDEX, NOFOLLOW: The search engine shows the page in the search results, but does not trust links in the page.  
• NOINDEX, NOFOLLOW: The search engine does not show the page in search results and does not trust links in the page.  
Alternatively, you can pass a variable into this field based on record data. For example, you can define a %description variable in this field, and create a content variable to populate the content tag with record data. |

7. Click Submit.
The meta information is added to the page header. For example:

```
<meta name="description" content="Order something from the Service Catalog">
```

8. Create a content variable to populate the content tag with record data.

If the page loads record data based on one or more URL parameters, you can add meta tags generated from the record data.

a) Open a meta tag record and check that the Content field contains a variable, or add a variable.

Depending on the available URL parameters and the meta tag you would like to define, you can add the following types of values:

<table>
<thead>
<tr>
<th>Value types</th>
<th>Description</th>
<th>Example value</th>
</tr>
</thead>
<tbody>
<tr>
<td>One URL parameter variable</td>
<td>Populates the content tag with the value defined in the associated content variables record.</td>
<td>%description</td>
</tr>
<tr>
<td>More than one URL parameter variable</td>
<td>Populates the content tag with the values defined in the associated content variables records.</td>
<td>%description %price</td>
</tr>
<tr>
<td>Static value and a URL parameter variable</td>
<td>Populates the content tag with a static value and the associated content variables record.</td>
<td>Catalog item: %description</td>
</tr>
</tbody>
</table>

b) In the Content variables related list, click New.

The Content variables related list is only available after saving the meta tag record.

c) Complete the form.

Associate a field with a URL query parameter. When the value of the query parameter is used to display content, a field from the same record is used to generate the content tag. You can define the field to generate the content tag through the Table field field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The variable to store the value. Must begin with % and cannot contain spaces. This value must match one of the variables defined in the Content field in the Meta tag record.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the page. This value is read-only.</td>
</tr>
<tr>
<td>Metatag</td>
<td>The meta tag to apply the dynamic variable to.</td>
</tr>
<tr>
<td>URL query parameter</td>
<td>The URL parameter that determines the record to display.</td>
</tr>
<tr>
<td>Table</td>
<td>The source table of the URL query parameter record.</td>
</tr>
<tr>
<td>Table field</td>
<td>Select a field from the table defined in the Table field. This field is used to generate the value of the content tag.</td>
</tr>
</tbody>
</table>

If more than one content variables match a variable defined in the Content field of the meta tag record, the record with the earliest Created date is used.

d) Click Submit.
The content tag loads record data. For example:

```html
<meta name="description" content="Apple iPad 3">
```

Add dynamic titles to a page

Create variables to generate descriptive titles depending on the content loaded into a page.

Role required: admin

1. Navigate to Service Portal Pages.
2. Open a page.
3. Add one or more variables to the Dynamic page title field.
   Depending on the available URL parameters and the dynamic title you would like to define, you can add the following types of values:
<table>
<thead>
<tr>
<th>Value types</th>
<th>Description</th>
<th>Example value</th>
</tr>
</thead>
<tbody>
<tr>
<td>One URL parameter variable</td>
<td>Generates a page title using the associated record of one URL parameter.</td>
<td>%question</td>
</tr>
<tr>
<td>More than one URL parameter variable</td>
<td>Generates a page title using the associated records of multiple URL parameters.</td>
<td>%question %author</td>
</tr>
<tr>
<td>Static value and a URL parameter variable</td>
<td>Generates a page title using a static value and the associated record of a URL parameter.</td>
<td>Q&amp;A: %question</td>
</tr>
</tbody>
</table>

4. Click the Dynamic page title variables related list tab.
5. Click New to create a new variable.
6. Complete the form.
   Associate a field with a URL query parameter. When the value of the query parameter is used to display content, a field from the same record is used to generate the title. You can define the field to generate the title through the Table field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The variable to store the value. Must begin with % and cannot contain spaces. This value must match one of the variables defined in the Dynamic page title field.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the page. This value is read-only.</td>
</tr>
<tr>
<td>Page</td>
<td>The page to apply the dynamic variable to.</td>
</tr>
<tr>
<td>URL query parameter</td>
<td>The URL parameter that determines the record to display.</td>
</tr>
<tr>
<td>Table</td>
<td>The source table of the URL query parameter record.</td>
</tr>
<tr>
<td>Table field</td>
<td>Select a field from the table defined in the Table field. This field is used to generate the dynamic page title.</td>
</tr>
</tbody>
</table>

If more than one dynamic page variables match a variable defined in the Dynamic page title field, the record with the earliest Created date is used.
In this example, the value of the Question field in the Social Q&A Question table populates the page title. The %question variable must also be defined in the Dynamic page title field in the page record.

7. Click Submit.

When the page loads, the record defined in the URL query parameter displays. The field defined in Table field determines the title of the page.

### Page navigation by URL

You can navigate to a portal or a page using the URL.

A Service Portal URL contains the following elements.

```
https://<base instance url>/<sp url suffix>?id=<page id>&<page parameters>
```

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Base Instance URL</td>
<td>Unique, secure web address for each instance. The default format is: https://&lt;instance name&gt;.service-now.com.</td>
</tr>
<tr>
<td>sp url suffix</td>
<td>Suffix established for the Service Portal. For example /sp.</td>
</tr>
<tr>
<td>id</td>
<td>The id of the Page to navigate to within the portal frame. For example, ? id=index.</td>
</tr>
</tbody>
</table>
London

ServiceNow

Now Platform Capabilities

Element

Description

page parameters

Some pages require additional parameters to look up a record (table,
sys_id). Find the $sp.getParameter calls in a widget server script to see
what parameters a widget uses. For more detail on this method see
GlideSPScriptable

For example, https://<instance name>.service-now.com/sp?id=kb_view2
Note: If you use article versioning with the Knowledge Management - Service Portal
(com.snc.knowledge_serviceportal) plugin enabled, you must add the article version
number to the URL to open a knowledge article in the base system or knowledge portals.
For example, instead of accessing an article using the URL https://<instance name>/sp?
id=kb_article&sys_id=KB0000005, you must include the article version number: https://<instance
name>/sp?id=kb_article&sys_id=KB0000005%20V1.0. To learn more, see Article versioning on
page 1451.

Referencing a page id
Widgets and widget instance options reference Service Portal pages using the page id. For example, a link
to the sc_home page within a widget HTML template might appear as:
<div><a href="?id=sc_home">${Order something...}</a></div>

Redirect a reference to a page ID
Multiple widgets in the Service Portal may link to a single page using a hard-coded page ID. If you want
to replace the page, all widgets that reference the page must be updated with the new page ID. Instead of
cloning and updating each widget with the new page ID, you can create a single record that automatically
redirects all references to the original page to point to the new page. This way, you can replace a page
without locating and replacing all references to the page ID.
Role required: sp_admin
To redirect all references to a page, create a record in the Page Route Maps table [sp_page_route_map].
This table enables you to redirect a reference to a page without cloning base system widgets.
Creating a record in the Page Route Maps table only redirects references to a page. It does not redirect
navigation to a page ID within a URL.
1.
2.

Navigate to Service Portal Page Route Maps .
Click New.

3.

Complete the form.
Field

Description

Short Description

Optional short description to describe the redirect.

Service Portal(s)

Portals that apply the redirect. If no Service Portal is selected,
the redirect applies to all Service Portals in the instance.

Route from

Original page you are redirecting from.

Route to

Page you are redirecting to.

Active

Whether the Page Route Map record is active. The redirect is
only applied when the record is active.

©

2018 ServiceNow. All rights reserved.

2684


<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>Priority of the Page Route Map record. If more than one active record has the same value in the Route from field, the record with the lowest order applies. Records are applied from lowest to highest. If multiple records have a matching order, the oldest record is honored.</td>
</tr>
</tbody>
</table>

4. Click Update.

All references to the page listed in the Route from field redirect to the page in the Route to field.

Include font icons on a page

Include font icons on a page so that all the widgets on the page have access to the font-icon set.

1. In the platform UI, navigate to Service Portal Pages and click the page you want to add font icons to.
2. Attach the font-icon file to the page record.
3. In the Page Specific CSS field for the page, add the CSS for the font-icon definition. Use the sys_id of the attachment as the src in the CSS.
Result

You can select an icon from the icon set for any widget on this page. For example, in the HTML widget you can use the source code option to use an icon.
Source code

```html
<p style="text-align: center;"><em class="material-icons">flight_land</em></p>
```
Service Portal widgets

Widgets are what define the content in your portal. You can use the base system widgets provided with Service Portal, clone and modify widgets, or develop custom widgets to fit your own needs.

Out of box widgets are read-only so you can benefit from future updates, which means you can't update their code. If you need to make major changes, clone the widget and give it another name and ID.

Widget library

Widgets included with Service Portal can be customized to suit your own needs or as a basic code sample for you to refer to as you are building your own widgets.

Due to the ever-changing number of widgets that exist at any given time in Service Portal, this is not a definitive list. More widget descriptions will be added as they become available.

Depending on your configuration, widgets that do not contain any information do not appear in your Service Portal page.

To view the instance options for a widget, use the widget context menu.

Example widgets
All widgets in Service Portal can be used as example code for how scripts are used in a widget. However, several out-of-box widgets have been included expressly for this purpose.

Use the example widgets to see how to use HTML, CSS, or client and server scripts in Service Portal. You can also clone and extend each widget to suit your needs.
**Announcements widget**

Users can view all active announcements.

![Announcements widget](image)

**Instance options**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Type                 | Select the type of announcements to display. Announcement types can be selected in the announcement record. Choices include:  
  • Banner  
  • Widget  
  If a type is not defined, the widget instance displays all active announcements. |
| Title                | Widget header title.                                                                                                                                                                                         |
| Glyph                | Glyph displayed to the left of the title.                                                                                                                                                                    |
| Use Display Style    | If selected, each announcement displays according to the style defined in the announcement record. Before selecting this option, consider how the widget will display if multiple announcements in the widget use different styles. |
| Paginate             | Paginates multiple announcements.                                                                                                                                                                             |
| Max Records          | Number of announcements displayed per page.                                                                                                                                                                  |
| View All Page        | Click target for View all link. The View all link only displays when:  
  • There are more announcements than can be displayed on a single page.  
    The Max Records field defines the number of records displayed per page.  
  • A view all page is defined. |
### Approvals widget

Users can approve or reject items directly within Service Portal.

![My Approvals](image)

**REQ0010001 - Dell Precision 690**
Requestor ITIL User
Price $1,875.00

**Options**

- **Reject**
- **Approve**

*Figure 519: Approvals widget*

You can enable e-signature for the approvals widget to require re-authentication for your users. For more information on enabling e-signature, see [Enable e-signature for Service Portal](#) on page 2892.

### Instance options

Use the instance options to change the appearance of the approvals widget.

**Table 1121: Approvals widget instance options**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap color</td>
<td>Color scheme for the widget. The default colors are defined by the portal theme, but if you want the instance to have a specific color, select the option from the list.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Add an icon to display beside the widget name.</td>
</tr>
<tr>
<td>Buttons stacked side by side</td>
<td>If this check box is selected, the Approve and Reject buttons appear horizontally beside each other. If this check box is cleared, the Approve and Reject buttons appear stacked vertically.</td>
</tr>
</tbody>
</table>
Approval Info widget

The Approval Info widget works in tandem with the Approval widget to display details about the approval request.

![Approval Info widget](image)

Figure 520: Approval Info widget

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max number of elements shown in the list</td>
<td>Limit the number of approvals users see on a page. The default number is 10. Only enter numbers greater than 0.</td>
</tr>
<tr>
<td>Who can view instances/who cannot view instances</td>
<td>Control who can or cannot view a widget instance with user criteria. User criteria must be enabled for this option to appear.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap color</td>
<td>Color scheme for the widget. The default colors are defined by the portal theme, but if you want the instance to have a specific color, select the option from the list.</td>
</tr>
</tbody>
</table>
Approval Record widget
The Approval Record widget shows the full record for an approval including the activity stream.

Figure 521: Approval Record widget

Instance options
The approval record widget does not include instance options.
Breadcrumbs widget
The breadcrumbs widget allows users to easily navigate around a portal.

Figure 522: Breadcrumbs widget

Instance options

The breadcrumbs widget does not have instance options. It displays information based on where a page is located in a portal.

Breakout Game widget
Add a fun, interactive 404 page to pages that do not exist using the Breakout Game widget.

Figure 523: Breakout Game widget
Instance options

The Breakout Game does not have instance option. You can use it as an example of how to use the Link Function as part of an Angular Directive.

Calculator widget

The calculator widget does simple calculations.

Use the calculator widget as an example of how to pass data between the client and server.

![Calculator widget](image)

Figure 524: Calculator widget

Instance options

The calculator widget does not include instance options.

Carousel widget

Showcase specific items in your catalog using a scrolling list of images in the carousel widget.

Use the carousel widget to showcase items on your portal page. For example, display items available in a service catalog at the top of the service catalog page.
Figure 525: Carousel widget

Add slides to the carousel widget
Use the related lists for an instance of the carousel widget to add images for the carousel widget to scroll through.

Role required: Admin or sp_admin

1. Navigate to Service Portal Widgets Carousel.
2. Open an instance of the Carousel widget.
3. From the instance of carousel form, under Related Lists, click Carousel Slides.
4. Click New and complete the form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the carousel slide. Use the name to differentiate the slide from other slide records.</td>
</tr>
<tr>
<td>Order</td>
<td>Where the slide appears in the list of slides</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>HREF/URL</td>
<td>Link to the item in the slide. For example, for a slide with a catalog item, link to page for the catalog item using the HREF <code>?id=&lt;page name&gt;&amp;sys_id=&lt;sys_id for item&gt;</code>. For more information on linking to a page within a portal, see <em>Page navigation by URL</em> on page 2683. You can also link to other sites using the URL.</td>
</tr>
<tr>
<td>Background</td>
<td>Upload an image for the slides. Carousel images should be 1022x300 pixels.</td>
</tr>
<tr>
<td>Application</td>
<td>Automatically populated with the name of the application the portal falls under.</td>
</tr>
<tr>
<td>Carousel</td>
<td>Name of the instance of the carousel widget you are adding the slide to. This field is not automatically populated and you cannot select an instance of the carousel widget if it does not have a name.</td>
</tr>
</tbody>
</table>

Repeat this step for as many slides as you want to appear in the carousel widget.

*Change Password widget*

Users can change their passwords using the Change Password widget.

---

© 2018 ServiceNow. All rights reserved.
Figure 526: Change Password widget

**Instance Options**

The Change Password widget does not have instance options.

*Cool Clock widget*

Show different times around the world using the Cool Clock widget.

Cool clocks demonstrates how to use instance options in a widgets. The time zone is loaded using an instance option. If you do not select a time zone, the widget uses a default time zone.
Figure 527: Cool Clock widget

Instance options

Table 1123: Cool clock widget instance options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Name of the clock, for example New York, NY.</td>
</tr>
<tr>
<td></td>
<td>The name appears below the clock so it helps to use a name related to the time zone.</td>
</tr>
<tr>
<td>Timezone</td>
<td>The location from which the time is displayed.</td>
</tr>
<tr>
<td></td>
<td>Use the local full name, for example, America/New York, instead of the abbreviated time zone.</td>
</tr>
<tr>
<td></td>
<td>Using the full name allows time zones to stay consistent with daylight savings time.</td>
</tr>
<tr>
<td></td>
<td>The default value is America/Los Angeles.</td>
</tr>
<tr>
<td>Second hand color</td>
<td>Color of the second hand using the hex code, RGB, or color name. The default value is red.</td>
</tr>
</tbody>
</table>

Data table from instance definition widget

Display a filtered list on your portal using the data table from instance definition widget.

After you add the data table from instance definition widget to a page, use the instance options to configure the appearance of the table.
### Incidents

*All > Active = true, priority=1 critical*

<table>

**Figure 528: Data table from instance definition widget**

**Instance options**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title of the widget. If you leave this field empty the name of the table displays as the widget name.</td>
</tr>
<tr>
<td>Table</td>
<td>The table that the widget displays records from.</td>
</tr>
<tr>
<td>Filter</td>
<td>Text field from the condition builder that you can use to limit the items returned in the table. To create a filter, use the context menu to open the widget instance in the platform. Then use the condition builder to create a filter.</td>
</tr>
<tr>
<td>Maximum entries</td>
<td>Limits the number of items displayed in the table. If there are more entries than allowed in the table, users can scroll to the next page.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Glyph</td>
<td>Icon that displays beside the widget title</td>
</tr>
<tr>
<td>Fields</td>
<td>Columns to display in the table.</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>Color scheme for the widget. The default colors are defined by the portal theme, but if you want the instance to have a specific color, select the option from the list.</td>
</tr>
<tr>
<td>Link to this page</td>
<td>Direct users to a specific page when they click a record. By default, clicking an entry in the table opens that entry in a form.</td>
</tr>
</tbody>
</table>

*Data Table from URL definition widget*

The Data Table from URL definition widget displays the table you select from the list.

Figure 529: Data Table from URL definition widget

*Instance options*

Complete the instance options to define the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title of the widget. Select the Use Instance Title check box to use this title instead of the name of the table.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Icon that displays beside the widget title</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>Color scheme for the widget. The default colors are defined by the portal theme, but if you want the instance to have a specific color, select the option from the list.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link to this page</td>
<td>Direct users to a specific page when they click a record. By default, clicking an entry in the table opens that entry in a form.</td>
</tr>
<tr>
<td>Fields</td>
<td>Columns to display in the table. For example, short description or priority.</td>
</tr>
<tr>
<td>Use Instance Title</td>
<td>Select to use the title in the Title field instead of the table title.</td>
</tr>
<tr>
<td>Enable Filter</td>
<td>Select this check box to allow users to create their own filter for the table</td>
</tr>
</tbody>
</table>

If Enable filter is enabled in the instance options, users can add custom conditions to filter the results.

![Figure 530: Data Table URL with condition builder](image)

For more information on using the condition builder, see *Create a filter in List v3*.

**Note:** The condition builder is only available in the desktop view.
**Form widget**
The form widget is a platform form within the Service Portal UI with a few differences.

![Form widget example](image)

**Figure 531: Form widget**

**URL Parameters**

The form widget accepts the following parameters within the URL
Table 1125: Form widget URL parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sys_id or sl_sys_id</td>
<td>The sys_id for the record to be displayed</td>
</tr>
<tr>
<td>table, sl_table, or t</td>
<td>The table for the record to be displayed</td>
</tr>
<tr>
<td>view or v</td>
<td>The view used to display the record</td>
</tr>
</tbody>
</table>

In the following example, the URL would display an incident with a sys_id of 1c741bd70b2322007518478d83673af3 in the portal view.

https://example.service-now.com/sp?id=form&table=incident&sys_id=1c741bd70b2322007518478d83673af3&view=portal

Scripting

Not all client scripts are supported in the Service Portal. To understand how client scripts interact with forms in the Service Portal, see Service Portal and client scripts on page 2635 and Supported client script types and APIs on page 2636.

Header menu widget

The Header Menu widget controls which options appear in the page header. Unlike other widgets in Service Portal, the header menu widget is not something you drag onto a page. Instead you configure the header menu by associating the header menu with a portal. For more information on configuring a header menu, see Configure a portal header menu on page 2660.

Figure 532: Header Menu widget

Instance options

The header menu widget does not include instance options.

Hello World widgets

The Hello World widgets are included with Service Portal as examples of how to use and create widgets. All three Hello World widgets display the same way. The real difference between them is in their underlying code base. Each version of the widget uses a different method of using the server and client script.

To view the Hello World widgets, navigate to Service Portal Service Portal Configuration then click Widget Editor. In the Widget Editor, click Check out the Hello World Example.
Figure 533: Hello World 1

Hello world 1 displays how the HTML template and the client script communicate. For more information on using the client script in Service Portal, see Widget developer guide on page 2807.

Use the widget list to switch to Hello World 2 or 3.
Figure 534: Hello World 2

Hello World 2 includes an example of how the server script can be used as well.
Figure 535: Hello World 3

For more information on Service Portal APIs, see the GlideSPSriptable API.

**HTML widget**
Use the HTML widget to directly inject HTML, text, lists, or content in general into a page.

Because the HTML widget can contain content of any kind, any example may just appear as regular text. For example, the HTML widget appears as a box of text on the 404 page.
Figure 536: HTML widget

Instance options

Table 1126: HTML widget instance options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Name for the HTML text. Users do not see this information.</td>
</tr>
<tr>
<td>HTML</td>
<td>Text box for the HTML. Use the toolbar like most word processing tool bars. For more information on using the toolbar, see Formatting icons for the HTML field editors.</td>
</tr>
</tbody>
</table>

Icon Link widget

Link to any other item.

Configure Icon Link widgets to link to a specific URL, page within the portal, or a specific category in the knowledge base or the service catalog.

Order Something

Browse the catalog for services and items you need

Figure 537: Icon Link widget
### Instance options

**Table 1127: Instance options fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Name of the icon link. Choose something that defines what the widget is linking to.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Icon for the widget.</td>

</tbody>
</table>
Sample Footer widget

The Sample Footer widget is an example of a footer you can use in your portal.

Unlike other widgets in Service Portal, you add a footer to your portal by configuring it in the Theme form. For more information on adding a footer to a portal, see Add a header or footer to a portal on page 2661.

© 2016 ServiceNow. All rights reserved.

Figure 546: Sample Footer widget

Instance options

The Sample footer widget does not include instance options.

Ticket Attachments widget

Use the attachment widget to attach items to tickets.

Attachments should be less than 24MB. You can drag files into the Attachments widget to add them to a record.

© 2018 ServiceNow. All rights reserved.

Figure 547: Ticket Attachments widget

Instance options

<tbody>
<tr>
<td>Record ID</td>
<td>The ID number of the record for the attachment.</td>
</tr>
<tr>
<td>Record table</td>
<td>Limit the records users can add an attachment to by adding a table to the attachment widget. Users can then only add attachments if they are in a record for that table.</td>
</tr>
</tbody>
</table>
Ticket Conversations widget

Record of ticket items. Users can use this widget to communicate back and forth with the fulfiller and the receiver.

Journal entries are presented in chronological order, with the oldest entries appearing at the bottom of the widget. Entries made by the user that created the record appear on the right side of the center divider. Entries made by other users appear to the left.

The Ticket Conversations widget is intended only for tables that extend task.

Limit the number of journal entries that appears in the ticket conversation widget using the glide.service_portal.stream_entry_limit system property. The default number is 100. Change the number by navigating to Service Portal Properties, and enter the new number in the Maximum number of stream entries displayed in Service Portal field.

<td>The message that displays when there are no readable journal fields. Forms that have added journal fields may not display in the Ticket Conversation widget.</td>
</tr>
</tbody>
</table>

*Ticket Location widget*
Share you location in a ticket.
Instance options

The Ticket Location widget does not include any instance options.

User Profile widget
Display user profile information.

Users can use the User Preferences section to enable accessibility in a portal.
Figure 550: User Profile widget

Instance options

The User Profile widget does not include instance options.

Weather widget
The Weather widget shows an example of how the server script interprets data from a source outside of the system.
Figure 551: Weather widget

**Instance options**

The Weather widget does not include instance options.

**Search widgets**

Several search widgets are provided with Service Portal.

You can configure search in Service Portal using any of the search widgets.

*Contextual Search widget*

Contextual Search is an embedded widget that can be added to a record producer.

By default, the widget is included in the Create Incident record producer form to display items based on keywords entered in the description. These items can be knowledge articles, service catalog items, and social Q&A records. These search results appear as the user types the information.
Figure 552: Contextual Search widget

**Faceted Search widget**

The Faceted Search widget displays search results and search facets defined for a search source. The Faceted Search widget enables end users to filter search results for a more meaningful result set.
Figure 553: Faceted Search widget

Table 1135: Faceted Search instance options

Knowledge Management widgets

Use Knowledge Management widgets to build a knowledge base for your portal.

Knowledge Management widgets are included as part of the Service Portal - knowledge base plugin [com.glide.service-portal.knowledge-base], which is activated automatically with the Service Portal for Enterprise Service Management [com.glide.service-portal.esm] plugin.

For more information on knowledge management, see Knowledge Management on page 1374.

KB also in Category widget
List of articles also included within a particular category.

The information that appears in the KB also in Category widget is determined by the knowledge article child categories. For more information, see Define a knowledge article category on page 1410.
Also in Windows

What is the Windows key?

Getting Around in Windows

Windows 8.x

Windows 8.x is designed for using touch, mouse, and keyboard together, on hardware ranging from touch-enabled tablets and laptops to PCs and all-in-one computers, including those without touch capability.

Start screen and Desktop

- 8.1: Microsoft updated the Windows 8.1 interface by returning the Start button, providing its ease of access along with the option of the Metro interface. The intent is to provide a seamless experience on desktops, laptops, tablets, and phone devices.
  By default, the Start screen is displayed. Move your mouse pointer to the bottom left corner of the screen to make the Start button appear. Click it to display the desktop; click it again to display the Start screen.
- 8: The Start screen has a default application display you can customize:
  1. Right-click any app and the Application bar will appear at the bottom, with options for the application you have selected.
  2. To add an app to the Start screen, click Pin to Start.
  If an application is already on the Start screen, you'll see Unpin from Start instead.

Power User menu

The Power User menu displays the most commonly used applications from the Control Panel, File Explorer, and Task Manager, as well as Restart, Run, Search, and Shutdown/Update. Access it in one of the following ways:

- Press Win + X

Figure 563: KB Article Page widget
Instance Options

<td>12</td>
</tr>
</tbody>
</table>

**Figure 565: KB Categories widget**

Categories are determined by the list of Knowledge Categories provided for the Knowledge Base. To view a list of categories for a knowledge base, in the platform navigate to Knowledge Administration Knowledge bases, then select the name of the knowledge base, for example IT. Categories for the knowledge base appear in the related lists. If a category does not have any associated articles, it does not appear in the portal. For more information on defining categories for a knowledge base, see *Define a knowledge article category* on page 1410.

The knowledge base a portal uses is determined in the portal form. On the Service Portal configuration page (Service Portal Service Portal configuration) click Portals in the header menu. Select a portal from the list, then in the knowledge base list, select a knowledge base.

Has anyone tried ordering accessories that are not listed on the catalog?

1

I want to order an ergonomic mouse but everything in the company catalog is pretty basic. Can I just order one online and expense it if it's the same price?

Share • Comment

4mo ago • Asked by Abel Tuter

0

You can always consult with your manager and they may be already on the approved list of accessories. You can also submit a request and we'll let you know if you should order it and expense it.

**Figure 586: Tagged Question List widget**
**Instance options**

The SQANDA Tagged Question List widget does not have any included instance options.

**Service Catalog widgets**

Use the Service Catalog widgets to build a catalog for your portal.

Most service catalog widgets are part of the Service Portal Service Catalog [com.glide.service-portal.service-catalog] plugin that is activated automatically with the Service Portal for Enterprise Service Management (com.glide.service-portal.esm) plugin.

The Service Portal - Service Catalog v2 plugin (com.glideapp.servicecatalog.portal) provides an enhanced Service Catalog experience. This plugin is active by default for zBoot users and enables the following widgets:

- Catalog Homepage Search (ID: cat-homepage-search)
- SC Scroll to top (ID: sc-scroll-to-top)
- Requests and Approvals
- Recent & Popular Items (ID: sc-recent-popular)

Most of the configuration for the Service Catalog widgets takes place in the Service Catalog application of the platform. For more information on Service Catalog, see Service Catalog.

**Enable new Service Catalog widgets in Service Portal**

For upgrade customers, enable the new Service Catalog widgets in Service Portal to access the latest features. By default, the deprecated widgets are enabled.

Role required: admin and sp_admin.

---

**Note:** For information about the deprecated Service Catalog widgets in Service Portal, see the Kingston documentation.

---

1. Activate the plugins (if applicable) in the following order.
   1. Service Portal for Enterprise Service Management (com.glide.service-portal.esm)
   2. Service Portal - Service Catalog (com.glide.service-portal.service-catalog)
   3. Service Portal - Service Catalog v2 (com.glideapp.servicecatalog.portal)

2. Enable the SC Catalog Item widget.
   a) Navigate to a catalog item.
   b) Press the Ctrl key, click on the widget, and select Instance in Page Editor.
   c) From the Widget choice list, select SC Catalog Item.

3. Enable the SC Order Guide widget.
   a) Navigate to an order guide.
   b) Press the Ctrl key, click on the widget, and select Instance in Page Editor.
   c) From the Widget choice list, select SC Order Guide.

4. Enable the SC Shopping Cart widget.
   a) Access the shopping cart.
   b) Press the Ctrl key, click on the widget, and select Instance in Page Editor.
   c) From the Widget choice list, select SC Shopping Cart.
d) In the Additional options, JSON format field, specify the following code:

"cartTemplate": "large_shopping_cart_v2.html"

e) Navigate to Catalog Administration Properties and enable the Use Cart V2 widget in Header Menu widget (glide.sc.portal.use_cart_v2_header) property.

The SC Shopping Cart widget is displayed in the header menu.

**SP Variable Editor widget**

The Variable Editor widget allows you to change the specifications you chose for an item in the Service Catalog.

You can embed the variable editor widget in the shopping cart widget, to allow users to edit and make changes to their cart items. The options included in the widget are determined by the specific catalog item and the variables that have been configured for it.

For more information on the service catalog variables that are available in Service Portal, see *Types of service catalog variables*.

<td>Verifies with each item that the user has the right roles to view the catalog item.</td>
</tr>
</tbody>
</table>

**Note:** If a category contains more than 200 items, update the following instance options on this widget for better performance:

- Category Layout: Flat
- Omit badges: True

**SC Category Page widget**

Lists the catalog items available within a certain category. Categories are determined within the Service Catalog module.

**Note:** Catalog items are sorted in ascending order by their Order value. If catalog items have the same order, they are sorted by the Name field.
Table 1152: Category page widget instance options fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Click event name</td>
<td>The name of the event that is emitted when a user clicks a catalog item. You can override the default behavior when clicking on a catalog item by providing a different event name. This would be in a situation where you embedded the category page in another widget. The default value is $sp.cat_item_list.click.</td>
</tr>
</tbody>
</table>
### Field

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of items to display per page</td>
<td>Number of items to display in the category page. Note: When defining the number of items to be displayed, consider the item data such as images and long descriptions. A large number may slow down the page performance.</td>
</tr>
<tr>
<td>Show items from Child Categories</td>
<td>Displays items in the child categories along with those in the parent category. Note: If the Category Layout instance options is set to Flat in the SC Categories widget, then set this instance option to False.</td>
</tr>
</tbody>
</table>

**SC Order Guide widget**

Use this widget (widget-sc-order-guide-v2) to request an order guide, that is, a single service catalog request for several catalog items with a specific purpose.

Configure **Order guides** using the Service Catalog in the platform UI by navigating to Service Catalog Catalog Definitions Order Guides.

The order guide form comprises the following sections:

### Describe Needs

This section displays the following that are associated with the order guide:

- Image
- Description
- Variables

### Choose Options

This section displays a list of catalog items included in the order guide based on the information provided in the Describe Needs section and the rule base configured for the order guide. Each catalog item is displayed with its name and description on an accordion.

Each accordion displays:

- Options, if a catalog item has fields that need user inputs. Note: If the fields are mandatory, a red asterisk is displayed beside Options.
- A toggle to include the catalog item in the order guide request. You can make it mandatory to include all items in the order guide request by not displaying the toggle. You can make it optional to include items in the order guide request by displaying the toggle. To display the toggle for each catalog item of the order guide, select the Show Include Toggle (Service Portal) check box while configuring the order guide. For more information, see Create an order guide.
**Note:** When an item is excluded from the order guide request, the item is not editable and the corresponding mandatory field restrictions are ignored.

**Summary**

This section provides a summary of the order guide that you can review before requesting the order guide.

**Instance options**

Use the widget instance options to customize the settings for the SC Order Guide widget. To customize the settings for this widget, press the Ctrl key, click on the widget, and select Instance Options.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Presentation</strong></td>

SC Wish List Cart widget

Use this widget to add catalog items or record producers to the wish list so that you can review them.
If the wish list is enabled for Service Catalog, SC Wish List Cart widget (sc_wishlist_cart) is available in Service Portal. Once enabled, the following options are available:

- The Wish List menu option on the main navigation bar.
- The Add to Wish List button in the Ordering widget for catalog items and record producers.
- A wish list details page that displays all items in the Wish List.

From the wish list details page, you can view or delete catalog items, clear the wish list, or navigate to the Service Catalog landing page.

![Figure 597: SC Wish List Cart widget](image)

### Instance options

Use the widget instance options to customize the settings for the SC Wish List Cart widget. To customize the settings for this widget, press the Ctrl key, click on the widget, and select Instance Options.

</table>

Enable the SC Wish List Cart widget in Service Portal

You can add catalog items or record producers to the wish list after you enable the wish list.

Role required: admin and sp_admin

1. Navigate to Service Catalog Maintain Catalogs.
2. Select Service Catalog.
3. Select the Enable Wish List check box.  
The Wish List menu option is displayed on the Service Portal header.

   **Note:** The Use the sc_layout driven cart macros (default true) (glide.sc.use_cart_layouts) property must be set to true to enable the wish list.

4. Perform these additional steps only for upgrade customers to enable the Wish List menu option in the Service Portal banner.
   a) Navigate to Service Portal Service Portal Configuration.
   b) Click Portals from the banner.
   c) Ensure that Service Portal is selected in the first choice list.
   d) Select SP Header Menu in the portal hierarchy chart.
   e) In the Additional options, JSON format field, set the enable_wishlist value as true.

   ```json
   "enable_wishlist": {
       "displayValue": "true",
       "value": true
   }
   ```
Figure 598: Enable the SC Wish List Cart widget

5. Enable the Add to Wish List icon (계획) in the Ordering widget of a catalog item or record producer:
   a) Navigate to Service Portal Service Portal Home Order Something.
Enable automatic updates to the wish list
Updates the wish list with user-specific changes from multiple tabs and platforms.
Role required: admin or sp_admin
1. Navigate to Service Portal Service Portal Home.
The Service Portal homepage is displayed.
2. Click the wish list.
3. Press the Ctrl key, click the wish list widget, and select Instance Options.
4. Select the Auto update wish list check box.
5. Perform these additional steps only for upgrade customers.
a) Navigate to Service Portal Service Portal Configuration.
b) Select Portals from the header.
c) Ensure that Service Portal is selected in the first choice list.
d) Select SP Header Menu in the portal hierarchy chart.
e) In the Additional options, JSON format field, set the auto_update_wishlist value as true.

    "auto_update_wishlist": {
        "displayValue": "true",
        "value": true}
**Figure 599: Automatic updates to the wish list**

*SC Save Bundles widget*

The Save Bundles widget allows you to save specific catalog items together for reuse.
The Save Bundles widget is embedded within the SC Shopping Cart widget.

<table>
<thead>
<tr>
<th>Create New Bundle</th>
</tr>
</thead>
<tbody>
<tr>
<td>Here, you can save the current contents of your cart as a bundle, which can be restored at any time.</td>
</tr>

Save

Figure 600: SC Save Bundles widget

Instance Options

The Save Bundles widget does not have any included instance options.

*SC Saved Carts widget*

The Saved Carts widget shows previously created and saved bundles from the Service Catalog.
When you add an existing cart bundle to a shopping cart, you have two options. You can:

- Replace the items in the shopping cart with the items in the bundle.
- Add the bundle in addition to the rest of the items in the cart.

**iPad + phone**

*Replace Cart* will remove the current contents of your cart and replace it with the bundle.

*Add to Cart* will add the contents of the bundle into your cart without removing its current contents.

SC Shopping Cart widget
The SC Shopping Cart widget (sc-shopping-cart-v2), used with Service Catalog, stores all your orders at one place.

Use the shopping cart widget to:

- Control the quantity of items in the cart.
- Add items to a cart. This information is stored in the sc_cart table.
- Define who the items are being requested for.
- Save specific items together as a bundle, which can be reloaded later. You can replace the cart items with the saved bundles, or add the bundles to the cart items.
- Remove all items from your cart.

**Enable the Shopping Cart widget**

The shopping cart widget is enabled automatically for instances upgrading to Istanbul, however, there are several ways to manually enable or disable the widget.

To enable the shopping cart for a catalog item:

1. Navigate to a catalog item on the Service Catalog page in Service Portal.
2. CTRL+right-click a catalog item widget to open the *widget instance options*.
3. Select or clear the Show Add Cart Button option to enable or disable the shopping cart for that particular catalog item.
Figure 604: Catalog item cart option

To enable the shopping cart in the portal header:

1. From the Service Portal configuration page, select the Portal editor.
2. Select the SP Header Menu in the portal hierarchy.
3. In the Additional options section, make sure the enable cart value is set to true. Set the value to false to hide the shopping cart.
Figure 605: Shopping cart in the header menu

```json
{
  "enable_cart": true,
  "displayValue": "true",
  "value": true
}
```
Enable automatic updates to the shopping cart
Updates the wish list with user-specific changes from multiple tabs and platforms.

Role required: admin or sp_admin

1. Navigate to Service Portal Service Portal Home. The Service Portal homepage is displayed.
2. Click Cart.
3. Press and hold the Ctrl key, click the wish list widget, and select Instance Options.
4. Select the Auto update cart check box.
5. Perform these steps only for upgrade customers.
   a) Navigate to Service Portal Service Portal Configuration.
   b) Select Portals from the header.
   c) Ensure that Service Portal is selected in the first choice list.
   d) Select SP Header Menu in the portal hierarchy chart.
   e) In the Additional options, JSON format field, set the auto_update_cart value as true.

"auto_update_cart": {
    "displayValue": "true",
    "value": true}
Figure 606: Automatic updates to the shopping cart
**SC Scroll to top widget**

In the Service Portal mobile view, the SC Scroll to top widget (sc_scroll_to_top) lets you scroll to the top of the screen after you scroll down.

This widget is displayed when you start to scroll upwards after reaching a specific screen height.
Figure 607: SC Scroll to top widget
Instance options

Use the widget instance options to customize the settings for the SC Scroll to top widget. To customize the settings for this widget, press the Ctrl key, click on the widget, and select Instance Options.

Service Portal configuration page widgets

Service Portal uses widgets for configuration. When you configure a page or a widget for a portal in the Service Portal Configuration page, you actually use Service Portal widgets to do so.

Service Portal configuration widgets are internal only and cannot be extended.

Configuration page widgets are included as part of the Service Portal Configuration Pages plugin [com.glide.service-portal.config], which is activated automatically when you activate the Service Portal for Enterprise Service Management plugin [com.glide.service-portal.esm].

Navigate to Service Portal Service Portal Configuration to view these widgets in action.

Service Portal Config Overview widget

The Service Portal Config Overview widget is the widget that appears on the sp_config homepage. Use this widget to navigate Service Portal Configuration.
Service Portal
Create rich, engaging and modern experiences to help your business run better
Select one of the options below to continue

- **Branding Editor**
  Customize your portal's title, logo and theme colors. Preview changes as you make them

- **Designer**
  Create and layout pages with drag-and-drop functionality. Preview pages as you make changes

- **Page Editor**
  Configure the properties of pages, containers and widgets from a map view

- **Widget Editor**
  Create widgets from scratch or customize an existing one. Write HTML, CSS, and Javascript with real-time preview

- **Get Help**
  Browse guides, tutorials and videos to learn how to set up, configure and customize your portals
**Portal config widget**
The Portal Config widget is the left panel of the Branding Editor, which you use to configure themes for your portal.

Text Success - Duis mollis, est non commodo luctus, nisi erat porttitor ligula.
Text Info - Maecenas sed diam eget risus varius blandit sit amet non magna.
Text Warning - Etiam porta sem malesuada magna mollis euismod.
Text Danger - Donec ullamcorper nulla non metus auctor fringilla.
**Widget Edit Panel widget**

The Widget Edit Panel appears on the main page of the Widget Editor in Service Portal Configuration.

Use the Widget Edit Panel to view widgets that have recently been updated, create a widget, or view an existing widget.

![Widget Edit Panel](image)

**Figure 613: Widget Edit panel**

**Service Portal service status widgets**

Use the service status widgets to display current, planned, and historical outages for business services to your end users.

The service catalog widgets are part of the Service Portal Service Status [com.glide.service-portal.service-status] plugin, which is activated automatically with the Service Portal for Enterprise Service Management [com.glide.service-portal.esm] plugin.

**Business Service Status widget**

View how services are running on your system.
The Business Service Status widget pulls information from the cmdb_ci_service table. You can change where the data comes from in a cloned version of the widget by adjusting the settings in the widget server script.

Figure 614: Business Service Status widget
Instance options

![Image of Business Service Status widget instance options]

**Figure 615: Business Service Status widget instance options**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Name of the widget. This only appears in the header for the widget instance options, it is not user-facing. To change the title for the list of services, clone and edit the widget HTML.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Icon for the widget. This is not user-facing.</td>
</tr>
<tr>
<td>Number of Services</td>
<td>The number of services displayed in the widget. The default number is 250.</td>
</tr>
</tbody>
</table>

**Current Status widget**

The Current Status widget displays any issues reported in the system.

The Current Status widget checks the cmdb_ci_outage table to see if the system is experiencing any outages.
**Instance options**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show outage details</td>
<td>Display details from the cmdb_ci_outage record</td>
</tr>
<tr>
<td>Standalone</td>
<td>Remove explanatory information. This also adds a link to more information.</td>
</tr>
</tbody>
</table>

**Planned Maintenance widget**

Describes any planned system maintenance.

The widget gathers information from the cmdb_ci_outage table. Any planned maintenance within the following five days appears in the Planned Maintenance widget.
The Planned Maintenance widget does not have any included instance options.

**Service History widget**
Displays the history of specific service’s status. For example, if the Bond Trading widget has a history of planned outages or degradations, the widget displays those with a varied color scheme to differentiate the outage type.
The Service History widget does not include any instance options.

*Service Status widget*

Service Status is a visual representation of service availability. Each colored pill correlates with a type of service availability, for example, orange represents service degradation.
The Service Status widget does not have any included instance options.

*Service Status Legend widget*
Use concurrently with the Status History widget to show what the icons in the Status History widget mean.

The Service Status Legend widget does not have any included instance options.

*Service Status Subscription widget*
Used in conjunction with the service status widget. Users subscribe to receive updates about the service status.
Instance options

The Service Status Subscription widget does not have any included instance options.

Widget instances

When you add a widget to a page using the Service Portal Designer, it creates a widget instance. A widget instance is a reference to a widget that contains a location, properties, and CSS specific to that instance. Adding the same widget multiple times to the same page creates multiple instances.

For example, the icon link widget displays as many different versions of itself as you add to a page.

Configure widget instance options

Each instance of the widget you configure remains unique, so you can have several instances of the same widgets on a page. For example, each instance of the cool clock widget on a page shows a different time zone. Configure a widget on a page by adjusting the instance options.
Role required: admin or sp_admin

Each time you add a widget to a page it creates a record on the sp_instance table with the following information:

- Reference to the column where the widget is located
- Reference to a widget
- Configuration for a widget in the form of pre-defined form fields and an Additional Options field in JSON format

1. On a page in the Service Portal Designer, point to the Edit icon in a widget to open the widget instance options. You can also access widget instance options using the control + right-click menu.

2. From the Instance Options window, make the selections you want to configure your widget. Instance options vary depending on which widget you select.
Figure 6: Configure widget instance options
Advanced users can configure the available options for a widget. For more information, see *Widget option schema* on page 2818.

**Widget context menu**

From any rendered Service Portal page you can CTRL+right-click a widget to see more configuration options in a context menu.

For example, navigate to Service Portal Service Portal Home to open a sample portal page. CTRL+right-click Knowledge Base on that page.

![Figure 625: Widget context menu](image-url)
Note: You must have the admin or sp_admin role to see the widget context menu. When you impersonate a user without one of those roles, you can still see the menu. However, a regular user signed in without those roles cannot see the menu.

### Table 1160: Widget context menu options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Widget performance</td>
<td>How long it takes for a widget to load</td>
</tr>
<tr>
<td>Instance options</td>
<td>Specify an instance of a widget. Widgets instance options vary depending on the widget you select. For example, the instance options for the cool clock widget include different time zones for each instance, so you can have the same clock four times on a page, but with all different time zones.</td>
</tr>
<tr>
<td>Instance in Page Editor</td>
<td>Opens that instance of the widget in the Page Editor</td>
</tr>
<tr>
<td>Page Designer</td>
<td>Opens the widget in the Service Portal Designer, which lets you add containers, columns, and widgets. You can add styling from the Service Portal Designer to your specific widget or to the page the widget lives on.</td>
</tr>
<tr>
<td>Edit Container Background</td>
<td>Make changes to the layout in which the widget is located.</td>
</tr>
<tr>
<td>Widget Options Schema</td>
<td>Define the actual options you can select for an instance of a widget. For more information on configuring your own instance options, see Widget option schema on page 2818.</td>
</tr>
<tr>
<td>Widget in Form Modal</td>
<td>Opens the widget form in a pop up window so you can make quick changes to the widget.</td>
</tr>
<tr>
<td>Widget in Editor</td>
<td>Opens the widget in the Widget Editor. You can use the Widget Editor to configure HTML templates, CSS, client scripts, service scripts, and demo data for the widget.</td>
</tr>
<tr>
<td>Log to console: $scope.data</td>
<td>The $scope.data object passes data from the server to the client side controller. Instead of adding console.log messages or alerts into the controller code, you can just log the $scope.data object to the browser console and view the data there.</td>
</tr>
<tr>
<td>Log to console: $scope</td>
<td>Similar to the $scope.data object, except it logs everything in $scope to the console.</td>
</tr>
</tbody>
</table>

**Widget developer guide**

Develop custom widgets in the Service Portal using AngularJS, Bootstrap, and the ServiceNow API.

**What to know before you begin**

To develop widgets, you need ServiceNow API experience to:

- Run record queries on the server.
- Create and update records.

You need AngularJS experience to:
• Bind variables to client controllers.
• Access server objects in a widget.
• Gather user input.

Optionally, you can build on the Bootstrap template by accessing Bootstrap components. Service Portal uses Bootstrap version 3.3.6.

**Parts of a widget**

Like Angular directives, widgets execute a specified behavior within a Service Portal page. A widget includes mandatory and optional scripting components.

**HTML template**

A mandatory widget component.

The HTML template requires knowledge of AngularJS to display and gather data. Use the HTML template to:

• Render the dynamic view that a user sees in the browser using information from the model and controller.
• Bind client script variables to your markup.
• Gather data from the end user.

**Client script**

A mandatory widget component.

A client script requires knowledge of both the ServiceNow API and AngularJS to create a client controller. Use the client script to:

• Map server data from JavaScript and JSON objects to client objects.
• Process data before rendering it.
• Pass data to the HTML template.
• Pass user input and data back to the server for processing.

**Server script**

A mandatory widget component.

A server script requires knowledge of the ServiceNow API to work with record data. Use the server script to:

• Set the initial state of the widget.
• Send record data to the widget client script using the data variable.
• Run server-side queries.

**Link function**

An optional widget component.

The link function requires knowledge of AngularJS. Use a link function to directly manipulate the DOM.

**Option schema**

An optional widget component.
Allows a Service Portal admin to configure a widget. Use the option schema to:

• Specify the parameters for a widget.
• Allow admin users to define instance options for a widget instance.
• Develop flexible, reusable widgets.

Angular Providers

An optional widget component.

Angular Providers require knowledge of AngularJS. Use Angular Providers to:

• Keep widgets in sync when changing records or filters.
• Share context between widgets.
• Maintain and persist state.
• Create reusable behaviors and UI components and inject them into multiple widgets.

Dependencies

An optional widget component.

A widget dependency is an external resource used by your widget such as JavaScript or CSS files.

Global objects in widgets

When a widget begins to render for the first time on a page, the server script executes first and accesses three global objects: input, options, and data. Because the input variable is a data object sent from the client script, this variable is undefined when first initialized.
When a widget is first instantiated, the server script:

1. Initializes an empty data object.
2. Initializes the input object with any data sent from the client controller, or the options object with any data used to initialize the widget.
3. Sends the data object to the client controller as JSON.

The client script:

1. Accesses the server data object using c.data.

   **Note:** By default, widgets use the c variable to represent the controller instance using controller as syntax. You can change this variable when creating or cloning widgets.

2. Uses server.update() to post changes to the data model. This method updates the server script using the input object.

   **Note:** After calling server.update(), the client script data object is automatically overwritten by the server script data object.

3. Uses c.options to access the values used to invoke the widget on the server. This object is read-only.
Using the Widget Editor

When you create a widget, a record is created in the sp_widget table. However, you can use the Widget Editor in Service Portal Configuration as your scripting environment. The Widget Editor is a full page application similar to an IDE. You can show the parts of the widget you want to edit and hide the rest, while previewing your changes in real time.

```html
<div>$ {Symbol Lookup} : <input ng-model="c.data.symbol" ></div>
<p>$ {Stock Price} : <span ng-if="!c.data.price"></span></p>
<img ng-src="http://chart.finance.yahoo.com/chart" ng-repeat="r in c.data" ng-init="r.price = r.data.price;">
```
Recommendations for developing widgets

When developing custom widgets, keep these recommendations in mind for optimal performance, scalable development, and a good user experience.

**Create a default state that provides an example to the end user**

A widget does not have instance options defined when initially added to a page. A widget in this empty state can appear blank and cause confusion. In situations where a widget requires some initial configuration, ensure that your widget has a default state that communicates to the admin what configuration is necessary.

Widgets can also be created with demo data. Demo data can also be used to:

- Clearly demonstrate the widget functionality to the user.
- Provide data when previewing the widget in the widget editor. (Demo data is not visible in the designer).

Learn more: Tutorial: Build a custom widget on page 2839.

**Embed a widget rather than clone when possible**

Embedding an existing widget into your custom widget takes advantage of pre-existing functionality without cloning or duplicating code. You can still pass parameters into the embedded widget to control its behavior.

Learn more: Embed an existing widget on page 2845

**Add limits to GlideRecord queries to improve performance**

If your server-side script uses GlideRecord queries, the setLimit function can restrict the number of records returned, and improve response time on queries. For added flexibility, you can tie this limit to an instance option rather than assigning a hard-coded value (for example: gr.setLimit(options.limit || 100)).

Learn more: GlideRecord setLimit Function

**Create a directive instead of embedding a complex widget**

When an embedded widget is called from the server, all the scripts associated with that widget are returned. If you only need a subsection of a widget, embedding the entire widget creates unnecessary overhead. Instead, use directives to share lightweight code between widgets. Directives are useful, for example, when building UI components. Complex components with server-side and client-side functionality are best left as widgets. Use a directive instead of an embedded widget to:

- Share scope or custom scope behavior with multiple widgets.
• Share a reusable, lightweight subsection of a widget.
• Share a common UI feature, such as a list or an avatar.
• Augment widget behavior.

Learn more: *Reuse components with Angular Providers* on page 2824.

**Use a service or factory to share data and persist state**

Data services and factories maintain and persist state in a widget without requiring multiple calls to the server, enabling you to:

• Keep widgets synchronized when changing records or filters.
• Share data between widgets.
• Develop more performant widgets.

Learn more: *Reuse components with Angular Providers* on page 2824.

**Handle events with a publish/subscribe service**

Avoid using `$broadcast` in the DOM. `$broadcast` dispatches the event name to all child scopes notifying registered listeners, which can be an expensive call that requires the use of the `$rootScope` global object.

Instead, use a publish/subscribe service to handle events. When using a publish/subscribe service, a clear relationship forms between your widgets through callback handlers. In this model, you can better control the state of your events.

**Use REST calls or server.get to fetch data from the server**

When you call server.update(), the entire widget is returned from the server. If your widget includes divergent code paths, multiple calls to update the server can affect performance. As a rule, use your server script to set up the initial state of your widget. For subsequent updates, use scripted REST APIs that call script includes on your instance. This practice:

• Separates business logic from UI elements.
• Centralizes your code, allowing changes to be made in one place.

You can also use server.get to pass information to the server. Use this function along with input.action to execute specific parts of the server script.

**Develop with localization, accessibility, and UI in mind**

To create the best experience for your users, follow these guidelines:

• Consider the impact of your widget in a mobile environment. For example, avoid using mouse-over and other events that do not translate to a mobile device.
Clone a widget

Take advantage of existing code by cloning and editing an existing widget.

Role required: admin or sp_admin

**Note:** Base system widgets are read only so you can benefit from future updates. To make changes, you can clone base system widgets. However, cloned widgets are considered custom and do not benefit from future updates to the widgets they were cloned from.

1. Open the Widget Editor in the Service Portal Configuration page, then select an existing widget from the Select a widget list. For example, select Hello World 2.
2. From the list menu in the widget header, click Clone “Hello World 2”.

![Clone Widget](image)

**Figure 626: Clone a widget**

3. Enter a name for the cloned widget. The widget ID is created automatically based on the widget name.
4. Select Create test page to automatically create a page containing the widget.
5. Use the check boxes to show or hide the different components of the widget editor as needed. Make changes to the HTML Template, CSS, client script, server script, or the link function.
¡Hola, mundo!
6. In order to enable a preview of your widget, use Enable Preview from the menu. Use the eye icon that appears to show or hide a preview of your widget.

If you clone a widget that uses the Angular ng-template, you must manually clone the template and change the name of the template reference in the widget.

For example, the header menu widget uses the Angular ng-template menuTemplate. If you clone the header menu widget, you must also clone the menuTemplate and give the clone a unique name. When you open the clone of the header menu widget, you can see a reference to the menuTemplate in the HTML.

![menuTemplate in header widget HTML](image)

**Figure 628: menuTemplate in header widget HTML**

Create a new widget

Create a new widget to build a custom widget from scratch.

Role required: admin or sp_admin

1. Navigate to Service Portal Service Portal Configuration Widget Editor.
2. Click Create a new widget.
3. Enter a name for the new widget. The widget ID is created automatically based on the widget name. Optionally select Create test page to automatically create a page containing the widget.
Add a Widget

My widget

my_widget

Use only lowercase letters, numbers, underscores, and hyphens

Create test page

Submit

**Note:** After completing development of a widget with a test page, delete the test page. Maintaining test pages can create clutter when managing pages.

4. Click Submit.

The widget HTML template, client script, and server script display in the widget editor. Basic script templates are included as a guide.
Widget option schema

Widget instances allow users to uniquely configure each widget they add to a page. Use the option schema to define the parameters for your widget.

Storing instance options

When developing a widget, you can edit the option schema to create parameters for your widget, or you can create a table to store instance options. If you edit the existing option schema, any instance options defined are stored in JSON format in the Additional options, JSON format field in the sp_instance table. The following field types are available:

- String
- Boolean
- Integer
- Reference
- Choice
- Field_list (depends on table)
- Field_name (depends on table)
• Glide_list

To use other field types not supported in the option schema, create an extension table to store your custom widget option schema. Using a table enables you to:
• Add any ServiceNow field type, including fields with advanced customization, to the option schema.
• Define a complex option schema.
• Search and filter instance options.

**Note:** While storing options in a table enables you to define more complex options, this method is more difficult to maintain than editing the option schema. To avoid creating unnecessary tables and adding additional server calls to your widget, edit the existing option schema when possible. Store options in a table only when complex or searchable options are required.

### Using options in a widget

Access options in the widget from both the client script and the server script using the options global variable. You can access to any option value in your widget client script or server script using options.optionName.

**Client script**

```javascript
function() {
    /* widget controller */
    var c = this;
    console.log(c.options.text_color) //Outputs the text_color option for this instance
}
```

**Server script**

```javascript
(function() {
    $sp.log(options.text_color) //Logs the value of the text_color option to the browser console.
})(());
```

### Defining default options

Before an option value is set on an instance, it appears as an undefined value when you access that option variable. Use the widget server script to specify default values for your options.

```javascript
(function() {
    options.text_color=options.text_color||"blue";
    options.maximum_entry_count=options.maximum_entry_count||5;
})
```

**Edit the widget option schema**

Widget instances allow users to uniquely configure each widget they add to a page. Edit the option schema to define basic parameters for your widget.

**Role required:** admin or sp_admin

1. Navigate to Service Portal Service Portal Configuration Widget Editor.
2. Select the widget you want to configure the option schema for.
3. Click the menu icon (📖) and select Edit option schema.
   - This option only appears for users that have the right to edit the widget.
4. Click + to add a widget option.
5. Define a label, name, type, hint and form section. More fields appear depending on the type you select.

Adding flexible widget options allows you to create more reusable widgets. You can add default values to help users understand each widget option. If you do not select a form section, the default is set to Other options.
6. Click Save. The option schema you defined is stored in JSON format in the Option schema field in the sp_widget table. Based on this option schema, each instance of the widget can use individually defined instance options.
7. Test the option schema by adding the widget to a page in the Service Portal Designer.
   a) Navigate to Service Portal Service Portal Configuration Service Portal Designer.
   b) Add the widget to a page and click the edit icon on the widget instance to view the instance options.
   c) **Configure the widget instance options.**
   d) View the configuration by navigating to the instance record in the sp_instance table. The instance options are stored in JSON format in the Additional options, JSON format field.

**Store instance options in a table**

Create a table to store widget instance options instead of editing the existing option schema. When using a table as your widget option schema, you can define custom fields using any ServiceNow field type, add filters to fields, and search or query instance options.

Role required: admin or sp_admin

To define a custom option schema, add fields to an sp_instance extension table, then set your widget to use the extension table as a data source. Using an extension table enables you to:

- Add any ServiceNow field type, including fields with advanced customization, to the option schema.
- Define complex widget options.
- Search and filter instance options.

**Note:** While storing options in a table enables you to define more complex options, this method is more difficult to maintain than editing the option schema. To avoid creating unnecessary tables and adding additional server calls to your widget, edit the existing option schema when possible. Store options in a table only when complex or searchable options are required.

1. Create a table that extends an sp_instance table to store your custom option schema.
   a) Navigate to System Definition Tables.
   b) Click New.
   c) Define a label and name.
   d) In the Extends table field, select an sp_instance table that provides the necessary fields.

<table>
<thead>
<tr>
<th>Instance table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance [sp_instance]</td>
<td>Includes base instance fields.</td>
</tr>
<tr>
<td>Instance with Table [sp_instance_table]</td>
<td>Includes sp_instance fields and fields to display table data such as Table and Filter.</td>
</tr>
</tbody>
</table>

   e) Save the form.

2. Define custom fields in the extension table.
   You can define any field type to use in your option schema by adding new columns in the Columns list.

3. Update your widget to use the extension table as a data source.
   a) Navigate to Service Portal Widgets.
   b) Open the widget you would like to create custom options for.
   c) In the Data table field, select your sp_instance extension table.
4. Configure the extension table form to display the desired fields. Fields configured on the form are available as instance options.
   a) Navigate to the extension table form: `<yourInstance>/<your_extension_table>.do`.
   b) Right-click the header menu and select Configure Form Layout.
   c) Add the fields to the form.
   d) Click Save.

5. Configure the widget to display the desired fields as instance options.
   a) Navigate to Service Portal Widgets.
   b) Open the widget that has the extension table set as the data source.
   c) Use the Fields slushbucket to select fields to display as instance options.
d) Save the form.

Test the option schema by adding the widget to a page in the Service Portal Designer. Click the edit icon on the widget instance to view the instance options. After configuring the widget instance options, view the configuration by navigating to the instance record in the sp_instance extension table.

Reuse components with Angular Providers

Angular Providers are reusable components that can be injected into multiple widgets. To ensure quick loading widgets and a high performing portal, create Angular Providers instead of overloading your client controllers with persistent data and additional logic. With Angular Providers, you can maintain data for the lifetime of your Service Portal and reuse components and data objects across multiple widgets.

Role required: admin or sp_admin

By creating an Angular Provider, you can:

- Keep widgets in sync when changing records or filters.
- Share context between widgets.
- Maintain and persist state.
- Create behaviors and inject them into multiple widgets.

To learn more, visit Angular Providers.

   The Widget Angular Providers table opens.
2. Click New to create a new record.
3. Select the type of Angular Provider.
   - Directive
   - Factory
   - Service

To facilitate migration to ECMAScript 6 in the future, consider using services over factories.

4. Define a name.
   You will use the name to associate the Provider with your widget.

5. Add a script in the Client Script field.

   A basic factory that formats a number in US currency.

   ```javascript
   function formatterFactory(){
     var myVal = Number;
     return {
       format: function(myVal) {
   ```
6. Associate the Angular Provider with a widget.
   a) Navigate to <yourInstanceURL>/sp_config?id=widget_edit.
   b) Open the widget you would like to associate with the Angular Provider.
   c) Under Related Lists, select Angular Providers.
   d) In the Angular Providers list, click New.
   e) In the Angular Provider field, select the appropriate Provider. Check the Widget field to ensure that you are associating the Angular Provider with the correct widget.

   ![New Angular Providers](image)

   f) Click Save.

7. Update the appropriate scripts in your widget to inject the Angular Provider into the widget.

   Inject the factory into your widget client script by passing the name of the factory as an argument in your client controller function. You can then access the object defined in the factory function in your widget client script.
function(formatterFactory) {
  /* widget controller */
  var c = this;
  console.log(formatterFactory.format(300));
}

If defining a directive, use the directive in the widget HTML template.

8. To edit the Angular Provider after it is registered with your widget, open the Angular Provider client script in the widget editor.
   a) Navigate to Service Portal Configuration Widget Editor.
   b) Under Edit an existing widget, select the widget associated with your Angular Provider.
   c) In the Show menu, open the Dependencies list and select the Angular Provider.

   ![Dependencies](image)

   **Note:** Only Angular Providers associated with the widget are displayed in the Dependencies list. This list includes any external resources your widget depends on.

   The Angular Provider client script displays in the widget editor. In the widget editor interface, you can edit and save your widget and Provider scripts at the same time.

To use an Angular Provider with multiple widgets, register your Provider with each widget and update the appropriate scripts.

**Embedded widgets**

Embed a widget in the HTML template, server script, or client script.

**Embed a widget in an HTML template**

Use the `<widget></widget>` element to embed a widget in an HTML template. Pass in the ID of the widget you are trying to embed as a parameter.

```html
<widget id="widget-cool-clock"></widget>
```

If a widget has an option schema, you can define instance options in JSON format.

```html
<widget id="widget-cool-clock" options='{"zone": "America/Los_Angeles","title": "San Diego, CA"}'></widget>
```

Alternatively, you can define options in the widget server script.

**HTML template**

```html
<widget id="widget-cool-clock" options='data.clockOptions'></widget>
```

**Server script**

```javascript
(function() {
  data.clockOptions = {
    "zone": "America/Los_Angeles","title": "San Diego, CA"};
});
```
**Embed a widget in a client script**

Use `spUtil.get()` to get a widget model in the client script.

```javascript
spUtil.get("widget-sc-cat-item", {sys_id: 
"your_catalog_item_sys_id"}).then(function(response) {
    c.catalogItemWidget = response;
});
```

When using the `spUtil` class in a widget client script, you must inject the class into the client script function. The following example embeds the Cool Clock widget:

**Client script**

```javascript
function(spUtil) {
    var c = this;
    spUtil.get("widget-cool-clock").then(function(response) {
        c.myClockWidget = response;
    });
}
```

**HTML template**

```html
<sp-widget widget="c.myClockWidget"></sp-widget>
```

**Embed a widget in a server script**

Use `$sp.getWidget()` to get a widget model in the server script.

```javascript
data.catalogItemWidget = $sp.getWidget("widget-sc-cat-item");
```

The following example embeds the Cool Clock widget:

**Server script**

```javascript
(function() {
    var coolClockOptions = {
        "zone": "America/Los_Angeles", 
        "title": "San Diego, CA"
    }
    data.coolClockWidget = $sp.getWidget('widget-cool-clock', coolClockOptions);
})();
```

**HTML template**

```html
<sp-widget widget="data.coolClockWidget"></sp-widget>
```

**Widget model properties**

When a widget model is called from within another widget, the HTML template, client script, and link function are loaded just as they are in the `sp_widget` record. The data property is the result of the widget server script execution. Anything that you put on the data object on the server is available in the data object on the client.

<table>
<thead>
<tr>
<th>Property name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_script</td>
<td>string</td>
<td>Widget client script field.</td>
</tr>
<tr>
<td>Property name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>--------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>css</td>
<td>string</td>
<td>Compiled CSS output from the SASS field for the widget.</td>
</tr>
<tr>
<td>data</td>
<td>object</td>
<td>Data object containing keys and values from the widget server script.</td>
</tr>
<tr>
<td>dependencies</td>
<td>array</td>
<td>Any third-party libraries to load before the widget executes.</td>
</tr>
<tr>
<td>options</td>
<td>object</td>
<td>Options used to initialize the widget.</td>
</tr>
<tr>
<td>template</td>
<td>string</td>
<td>HTML template field for the widget.</td>
</tr>
</tbody>
</table>

Embed a widget multiple times with custom options
Embed the cool clock widget multiple times using custom options.

Role required: admin or sp_admin
Create a widget that embeds multiple instances of the cool clock widget, each with a different time zone and title. Open the cool clock widget in the Widget Editor to see widget options referenced in the HTML template and the Client Script.
Figure 629: Cool Clock widget with Options highlighted

1. Clone the Cool Clock widget with the name Embedded clock.
2. Replace the code blocks with the following:

   HTML Template

   ```html
   1. <div class="clock">
   2.   <div class="square">
   3.     <svg viewBox="0 0 100 100">
   4.       <g transform="translate(50, 50)" class="({options.color})">
   5.         <circle class="clock-face" r="48"/>
   6.         <line ng-repeat="minor in c.options.tracks by $index" class="nine">
   7.           y1="42" y2="45" ng-attr-transform="rotate(360 / $index / c.options.majors)"
   8.         </line>
   9.         <line ng-repeat="major in c.options.tracks by $index" class="maj">
   10.           y1="35" y2="40" ng-attr-transform="rotate(360 / $index / c.options.majors)"
   11.         </line>
   12.         <line class="hour" y1="2" y2="-20">
   13.           ng-attr-transform="rotate((30 * c.options.hours) + c.options.minutes)"
   14.         </line>
   15.         <line class="minute" y1="14" y2="-30">
   16.           ng-attr-transform="rotate((60 * c.options.minutes) + c.options.seconds)"
   17.         </line>
   18.         <line stroke="({options.color})" class="second" y="18">
   19.         </line>
   20.     </svg>
   21. </div>
   22. <div class="text-center text-muted m-3 mr-3" 3>{{options.title}}</div></div>
   ```

   Client Script

   ```javascript
   1. function (timeout) {
   2.   var c = this;
   3.   c.darkness = "";
   4.   if (c.options.c_color || c.options.c_color.length)
   5.     c.options.c_color = "red";
   6.   var x = c.options.zone || "America/Los_Angeles";
   7.   c.date = moment().tz(x);
   8.   c.majors = new Array(12);
   9.   c.minors = new Array(60);
   10.  function tick() {
   11.    c.date = new moment().tz(x);
   12.    if (c.date.hours() % 15) var t = c.date.hours();
   13.    c.darkness = "";
   14.    if (t > 17) c.darkness = "evening";
   15.    if (t > 19) c.darkness = "night";
   16.    if (t < 5) c.darkness = "night";
   17.    if (timeout(tick, 1000))
   18.    };
   19. })();
   ```
<div class="panel panel-default">
  <div class="panel-heading">Time across the US</div>
  <div class="panel-body">
    <div class="row">
      <div class="col-sm-3" ng-repeat="myClock in c.data.clocks">
        <sp-widget widget="myClock"></sp-widget>
      </div>
    </div>
  </div>
</div>

CSS
.
  .panel {
    margin-top: 10px;
  }

Client Script
function() {
    // nothing to do here...
}

Server Script
(function() {
    var options = [
      {zone: "America/Los_Angeles", title: "San Diego"},
      {zone: "America/Denver", title: "Denver"},
      {zone: "America/Chicago", title: "Chicago"},
      {zone: "America/New_York", title: "New York"}
    ];

    data.clocks = [];
    for (var i in options) {
      data.clocks.push($sp.getWidget("widget-cool-clock", options[i]));
    }
})();

Each instance of the clock in the embedded clock widget appears with a different time zone.
Create a widget dependency

In Service Portal, you can link JavaScript and CSS files to widgets to create dependencies between widgets and third-party libraries, external style sheets, and angular modules.

Role required: admin or sp_admin

Dependencies are loaded asynchronously from the server when needed.

Widgets can have as many or as few dependencies as needed. However, the more you add, the more content a widget must download to render on the page. Keep dependencies as small as possible for more efficient load times.

1. Create a dependency package.

   A dependency package is a collection of Javascript and CSS files that can be then connected to a widget.

   a) Navigate to Service Portal Dependencies.

   b) In the dependency record, define the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of your dependency. (Useful for selecting a dependency from a dropdown list)</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for the dependency record.</td>
</tr>
<tr>
<td>Include on page load</td>
<td>Select if you want your dependency to be loaded onto the page on initial page load of Service Portal, or leave unchecked to load the dependency only when the linked widget is loaded onto a page.</td>
</tr>
</tbody>
</table>
2. **Add files to the dependency package**

   After you save the information for your dependency package, use the related lists to add JS and CSS Include files. For each related list, include the following information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Angular module name</td>
<td>Optional. Define the value if the linked JavaScript is an Angular module. Provide the name of the Angular module being loaded, so that it can be injected into the Service Portal Angular application.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display name</td>
<td>Name of the script include.</td>
</tr>
</tbody>
</table>
   | Source         | Depending on whether you add a JS Include or a CSS Include, select one of these options from the list:  
                   • URL  
                   • UI script (for a JS Include) or Style Sheet (for a CSS Include)  
                   For a JS Include, use the UI Script field to reference a UI Script found in System UI UI Scripts.  
                   For the CSS Include, use the Style Sheet field to reference a record in the sp_css table. |

3. **Add a dependency package to a widget**

   After you have created a dependency package and added files, create a relationship between the dependency and a widget.

   a) Navigate to Service Portal Widgets and find the widget record you want to add the dependency to.
   
   b) From the Dependencies related list, click Edit.
   
   c) In the slushbucket, find the dependency you created and double-click to add it to the selected items column on the right. Save the page to return to the widget record.

---

*Include a font icon in a single widget*

If you only want one widget to have access to a font icon, include the font icon in a single widget.

**Role required:** admin or sp_admin

Adding an icon to a specific widget keeps the icon scoped and prevents it from interfering with other CSS on the page.

1. In the platform UI, navigate to Service Portal Widgets, then click the widget you want to add an icon to.

2. Attach the individual icon file to the widget record.

3. In the HTML template, include something like the following:

   ```html
   <div>
     <i class='font-family'>icon_name</i> you did it!
   </div>
   ```
Make sure the class is exactly the same as the font family called out in the CSS. For example `<i class='material-icons'>` should be the same as the `.material-icons` included in the CSS. The `icon_name` should match the name of the file you attached.

4. In the CSS field for the widget, add the CSS for the font-icon definition. Most font-icon sets include a CSS file similar to the material icons one used below. Use the `sys_id` of the attachment as the `src` in the CSS.
An icon that you can select in the widget or widget instance.

To use custom font-icons across widgets, add the icon to a page or make it a widget dependency.
Include font icons as a widget dependency
You can include font icons wherever a widget is loaded by including them as a widget dependency.

Role required: admin or sp_admin

Note: CSS included as a widget dependency is not scoped and can disrupt other CSS on a page.

1. In the platform UI, navigate to Service Portal CSS and create a new style sheet.
2. Attach the font-icon set to the sp_css record you created, and use the sys_id of the attachment as the src for the font icon.
3. Navigate to Service Portal Dependencies and create a new dependency.
4. Attach the CSS record you created to the new dependency using the CSS Includes related list.
Internationalize a widget

Use the ${} or gs.getMessage() syntax in widgets to tag strings for translation so you can localize your Service Portal content.

The ${} or gs.getMessage() searches in the messages table [sys_ui_message] in the platform to see what the translation would be.

Use the HTML template to internationalize strings in a widget. Type the following in an HTML template.
Writing text as ${message} is the equivalent of writing ${gs.getMessage("message")} in other parts of the system, but written as a more legible shorthand.

**Note:** In some cases, the translation might have quotes or double quotes on it. That could lead to JavaScript errors if you are using the ${} syntax in the client script. The safest way to fetch a translated message is to do it in the server script. Then, assign the value to a client-side Angular binding.

### Translating strings in the client script

```javascript
function() {
  var c = this;
  c.message = "${This message will be internationalized}";
}
```

**HTML template:**

```html
<div>
  <!-- The output of this text will be internationalized. -->
  <p>{{c.message}}</p>
</div>
```

### Translating strings in the server script

Use the server script to translate schema options and other values during server-side runtime.

```javascript
function() {
  data.message = gs.getMessage("this message contains 'quotes'");
  // You can also translate schema options using the server script
  // For example, data.message = gs.getMessage(options.title);
}
```

**HTML template**

```html
<div>
  <p>{{c.data.message}}</p>
</div>
```

### Tutorial: Build a custom widget

Follow this tutorial to build a custom widget that displays Service Catalog items. Use this tutorial as a model to help you understand the advanced scripting power of the Service Portal.

In this tutorial, you will create the Quick Order widget. This widget:

- Displays popular items to the user prior to any search.
- Queries the Service Catalog and displays available options to the user.
- Includes an embedded SC Catalog Item widget, allowing the user to view and order items within the Quick Order widget.
- Uses an Angular Provider to display a category icon beside each queried item.

*Create a widget and set up a template*

Create the Quick Order widget to query items in the Service Catalog.
Role required: admin or sp_admin

1. Navigate to Service Portal Service Portal Configuration and click Widget Editor.
2. Click Create a new widget.

3. Define the following values.
   - Widget Name: Quick Order
   - Widget ID: quick_order
   - Create a test page: Active
   - Page ID: quick_order

Adding a widget to a test page creates a record in each of the following tables:
   - sp_page
   - sp_container
   - sp_row
   - sp_column
• sp_instance
• sp_widget

Note: You can use the Page Editor in Service Portal Configuration to view the hierarchy of elements on your test page.

4. Click Submit.
5. From the Widget Editor, open the Quick Order widget.
6. Add the following simple template to the HTML field.

```html
<div class="panel panel-primary">
  <div class="panel-heading">Request an item from the catalog</div>
  <div class="panel-body">
    My catalog results
  </div>
</div>
```

7. Click Save.
8. Preview your test page in a new tab using the following URL: <yourInstanceUrl>/sp?id=quick_order.

Your widget template displays on the test page.

Add a server script to query an instance table
After adding your widget and creating a basic template, you can define more advanced scripts that enable the user to query data from an instance table. Using client and server scripts, you can pass the data model between the client and server by querying data from the database, displaying it to the user, and sending any updates back to the server.

Role required: admin or sp_admin

1. From the Widget Editor, open the Quick Order widget.
2. Select Server Script to open the server script field.
3. Replace the default server script with the following custom script.

```javascript
(function() {
  if (input.keywords != null && input.keywords != '')
    data.items = getCatalogItems(input.keywords);

  function getCatalogItems(keywords) {
    var sc = new GlideRecord('sc_cat_item');
    sc.addActiveQuery();
    sc.addQuery('123TEXTQUERY321', keywords);
    sc.addQuery('sys_class_name', 'NOT IN', 'sc_cat_item_wizard,sc_cat_item_content');
    sc.addQuery('sc_catalogs', '0d08b13c3330100c8b837659bba8fb4');
    sc.setLimit(100);
    sc.orderByDesc("ir_query_score");
    sc.query();
    var results = [];
    while (sc.next()) {
      if (!$sp.canReadRecord(sc))
        continue;

      var item = {};
      $sp.getRecordDisplayValues(item, sc, 'name,price,sys_id');
      results.push(item);
    }
    return results;
  }

  $sp.getDisplayValue('results', results);
}
```

© 2018 ServiceNow. All rights reserved. 2841
item.category = sc.getValue('category');
    results.push(item);
}
return results;
})();

This script performs a keyword search on the sc_cat_item table using the 123TEXTQUERY321 query method.

4. Replace the HTML template with the following script:

```html
<div class="panel panel-primary">
    <div class="panel-heading">Request an item from the catalog</div>
    <div class="panel-body">
        <input class="form-control" type="search" placeholder="Start typing here to search the list of catalog items" ng-model="c.data.keywords" ng-change="c.server.update()" ng-model-options="{debounce: 250}" />
        <ul class="list-group result-container">
            <li class="list-group-item" ng-repeat="item in c.data.items">
                <a href>{{item.name}}</a><span class="pull-right">{{item.price}}</span>
            </li>
        </ul>
    </div>
</div>
```

This template adds a search field and displays the results of the query performed in the server script using the following Angular directives. To learn more about these directives, review the Angular API Reference.

Table 1161: Angular directives used in the template

<table>
<thead>
<tr>
<th>Angular directive</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ng-model</td>
<td>Automatically reads and writes value changes to the model variable c.data.keywords.</td>
</tr>
<tr>
<td>ng-model-options</td>
<td>Configures ng-model behavior. In this template, ng-model updates the model after a user has stopped typing for 250 milliseconds.</td>
</tr>
<tr>
<td>ng-change</td>
<td>Executes c.server.update() after the model value changes. This function posts the data object to the server script. After the script is executed, the data object is automatically updated with the new values from the server generated data object.</td>
</tr>
<tr>
<td>ng-repeat</td>
<td>Creates a template from the parent element and child elements. For each item in c.data.items, an instance of the template is created and the expressions {{item.name}} and {{item.price}} are replaced with the values from each item.</td>
</tr>
</tbody>
</table>

5. Add the following script to the CSS - SCSS field:

```css
.result-container {
    margin-top: 10px;
}
```

6. Refresh your test page preview to view the changes.

As you type in the search box, matching catalog items appear. Try searching for ipad.
Manage the empty state of a widget
Display a list of popular items to the user before any search terms are entered.

Role required: admin or sp_admin

Because no search has been executed when the widget initializes, the server input variable is undefined. This empty state may cause confusion when a user first interacts with the widget. To solve this issue, give your widget something to display when the input variable is empty. This initial data can guide your users when initially interacting with your widget.

1. From the Widget Editor, open the Quick Order widget.
2. Replace the existing server script with the following script:

   ```javascript
   (function() {
     if (input.keywords != null && input.keywords != '')
       data.items = getCatalogItems(input.keywords);
     else data.items = getPopularItems();

     function getCatalogItems(keywords) {
       var sc = new GlideRecord('sc_cat_item');
       sc.addActiveQuery();
       sc.addQuery('123TEXTQUERY321', keywords);
       sc.addQuery('sys_class_name', 'NOT IN',
           'sc_cat_item_wizard,sc_cat_item_content');
       sc.addQuery('sc_catalogs', '0d08b13c3330100c8b837659bba8fb4');
       sc.setLimit(100);
       sc.orderByDesc('ir_query_score');
       sc.query();
       var results = [];
       while (sc.next()) {
         if (!$sp.canReadRecord(sc))
           continue;

         var item = {};
         $sp.getRecordDisplayValues(item, sc, 'name,price,sys_id');
         item.category = sc.getValue('category');
         results.push(item);
       }
       return results;
     }

     function getPopularItems() {
       var items = [];
       var count = new GlideAggregate('sc_req_item');
       count.addAggregate('COUNT', 'cat_item');
       count.groupBy('cat_item');
   ```

© 2018 ServiceNow. All rights reserved.
count.addQuery('cat_item.sys_class_name', 'NOT IN', 'sc_cat_item_guide,sc_cat_item_wizard,sc_cat_item_content');
count.addQuery('cat_item.sc_catalogs', '0d08b13c3330100c8b837659bba8fb4');
count.orderByAggregate('COUNT', 'cat_item');
count.query();
while (count.next() && items.length < 9) {
    if (!$sp.canReadRecord("sc_cat_item", count.cat_item.sys_id.getDisplayValue()))
        continue; // user does not have permission to see this item
    var item = {};
    item.name = count.cat_item.name.getDisplayValue();
    item.category = count.cat_item.category.toString();
    item.price = count.cat_item.price.getDisplayValue();
    item.sys_id = count.cat_item.sys_id.getDisplayValue();
    items.push(item);
}
return items;
})();

This script introduces a new function getPopularItems() to query the database and return popular items when the input variable is empty.

3. Replace the HTML template with the following script:

```html
<div class="panel panel-primary">
  <div class="panel-heading">Request an item from the catalog</div>
  <div class="panel-body">
    <input class="form-control" type="search" placeholder="Start typing here to search the list of catalog items" ng-model="c.data.keywords" ng-change="c.server.update()" ng-model-options="{debounce: 250}" />
    <h5 ng-if="!c.data.keywords">Showing the most popular items</h5>
    <ul class="list-group result-container">
      <li class="list-group-item" ng-repeat="item in c.data.items">
        <a href="{{item.name}}">{{item.name}}</a><span class="pull-right">{{item.price}}</span>
      </li>
    </ul>
  </div>
  <div class="panel-footer" ng-if="c.data.keywords">
    <ng-pluralize count="c.data.items.length" when="{'0': 'No items found for ', '1': 'One item matching ', 'other': 'Found {} items matching '}">
      {{c.data.keywords}}
    </ng-pluralize>
  </div>
</div>
```

This script provides a template to display the popular items returned from the server script.

4. Refresh your test page preview to view the changes.

The widget displays popular items to the user prior to any search input.
Embed an existing widget

Enable the user to view and purchase Service Catalog items in the Quick Order widget by embedding the SC Catalog Item widget.

Role required: admin or sp_admin

Instead of duplicating code, you can embed widgets to leverage pre-existing functionality. The SC Catalog Item widget is a base system widget that enables the user to view and purchase Service Catalog items.

1. Inspect the SC Catalog Item widget.
   Before embedding the SC Catalog Item widget, inspect the widget to understand what data it needs access to. You may need to update your Quick Order widget client or server script to make sure that the correct data is passed to the embedded widget.
   a) Navigate to <yourInstanceURL>/sp_config?id=widget_edit.
   b) Open the SC Catalog Item widget.
   c) Note that the widget ID is widget-sc-cat-item. You will use this ID to embed the widget model in the client script.
   d) Examine the server script.

   Notice that the data object includes a sys_id property populated by either the input or options objects. If neither input nor options include a sys_id, the $sp.getParameter() method retrieves the sys_id from the request query string.
To populate the input object, you can pass a catalog item sys_id from the Quick Order widget client script.

2. From the Widget Editor, open the Quick Order widget.
3. Replace the Quick Order widget client script with the following script.

```javascript
function($location, spUtil) {
  var c = this;

  c.select = function(item_id) {
    if (c.openItem == item_id) {
      c.openItem = null;
      return;
    }
  }

  renderCatalogItemWidget(item_id);
}
```
function renderCatalogItemWidget(item_id) {
    c.catalogItemWidget = null;
    spUtil.get("widget-sc-cat-item", {sys_id:
        item_id}).then(function(response){
        c.catalogItemWidget = response;
        c.openItem = item_id;
    });
}

This script uses spUtil.get() to retrieve the widget model by ID (widget-sc-cat-item) and define the
{sys_id: item_id} object. This object posts to the server script as input.

4. Replace the HTML template with the following script:

   <div class="panel panel-primary">
       <div class="panel-heading">Request an item from the catalog</div>
       <div class="panel-body">
           <input class="form-control" type="search" placeholder="Start typing
here to search the list of catalog items" ng-model="c.data.keywords" ng-
change="c.server.update()" ng-model-options="{debounce: 250}" />
           <h5 ng-if="!c.data.keywords">Showing the most popular items</h5>
           <ul class="list-group result-container">
               <li class="list-group-item" ng-repeat="item in c.data.items">
                   <a href ng-click="c.select(item.sys_id)">{{item.name}}</a><span
                       class="pull-right">{{item.price}}</span>
                   <div class="catalog-item" ng-if="item.sys_id == c.openItem">
                       <sp-widget ng-if="c.catalogItemWidget"
                           widget="c.catalogItemWidget" />
                   </div>
               </li>
           </ul>
           <div class="panel-footer" ng-if="c.data.keywords">
               <ng-pluralize count="c.data.items.length"
                   when="{'0': 'No items found for ',
                       '1': 'One item matching ',
                       'other': 'Found {} items matching '}">
                   {{c.data.keywords}}
               </ng-pluralize>
           </div>
       </div>
   </div>

This template:
   • Adds on-click behavior using the ng-click directive.
   • Displays the embedded SC Catalog Item widget using the sp-widget directive.

5. Replace the CSS with the following script:

   .result-container {
       margin-top: 10px;
   }
   .catalog-item {
       background-color: #f5f5f5;
       padding: 10px;
       @include border-top-radius($panel-border-radius);
       @include border-bottom-radius($panel-border-radius);
   }

6. Refresh your test page preview to view the changes.

When you select a search result, the item opens in the embedded SC Catalog Item widget.
Create a reusable directive and add it to a widget
Angular Providers are reusable components that can be added to multiple widgets. Using the Widget Angular Providers table, create a directive that shows a category icon next to each result in the Quick Order widget.

Role required: admin or sp_admin

Angular Providers let you build angular directives and services that can be injected into your client script controller. The code in a Provider differs from a typical Angular directive or service because it must be anonymous, without being appended to a specific module.

2. Click New to create a new record.
3. Fill out the form.
   a) Add the type and name.
      • Type: Directive
      • Name: categoryIcon
   b) Add the client script.

```javascript
function() {
  return {
    template: '<span class="fa fa-stack fa-lg"><i class="fa fa-circle fa-stack-2x"></i><i class="fa fa-{{::icon}} fa-stack-1x fa-inverse"></i></span>',
    restrict: 'E',
    replace: true,
    scope: {
      category: '='
    }
  }
}
```
link: function(scope, element) {

var _iconMap = {
"b06546f23731300054b6a3549dbe5dd8": "tablet", /* Tablets */
"15706fc0a0a0aa7007fc21e1ab70c2f": "question", /* Can we help you? */
"d68eb4d637b1300054b6a3549dbe5db2": "mobile-phone", /* Mobiles */
"109cdf8c6112276003b17991a09ad65": "print", /* Office and Print */
"5d643c6a3771300054b6a3549dbe5db0": "print", /* Printers */
"2c0b59874f7b4200086eeed18110c71f": "plug", /* Peripherals */
"280952237b1300054b6a3549dbe5dd4": "desktop" /* Software */
};

scope.icon = _iconMap[scope.category] || "shopping-cart";
}
}

This script associates the sys_id of the Category record with the Service Catalog item. The icon that displays is the icon defined in the Category record in the Service Catalog.
New Widget Angular Provider

Widget Angular Provider

Type
Directive

categoryIcon

Client Script
```javascript
function() {
  return {
    template: '<span class="fa fa-stack fa-1x"><i class="fa fa-circle fa-stack-2x"></i><i class="fa fa-stack-1x fa-inverse"></i></span>',
    restrict: 'E',
    replace: true,
    scope: {
      category: '='
    },
    link: function(scope, element) {
      var _iconMap = {
        'a80467373138085463a3549d8628688': 'tablet', // Tablets /
        '1378624cb209663726c2812907121c46b62a': 'question', // Can we help you? /
        '60e446c3703138085463a3549d862868': 'mobile-phone', // Mobiles /
        '39bece690c12276303617951c89b0d': 'print', // Office and Print /
        '5a035c437138085463a3549d862868': 'print', // Printers /
        '2c8be907487b42e00060ed3b1818719': 'plug', // Peripherals /
        '3b9e9513703138085463a3549d8628688': 'desktop', // Software /
      };
      scope.icon = _iconMap[scope.category] || 'shopping-cart';
    }
  }
}
```

Application
1. Global

Save [M + s]
c) Click Save.

4. Associate the new Angular directive with the Quick Order Widget.
   a) Navigate to `<yourInstanceURL>/sp_config?id=widget_edit`.
   b) Open the Quick Order widget.
   c) Under Related Lists, select Angular Providers.
   d) In the Angular Providers list, click New to associate an existing Angular Provider with the Quick Order widget.
   e) Add the following values to the form.
      - Angular Provider: categoryIcon
      - Widget: Quick Order
   f) Click Save.

5. Add the categoryIcon directive to your Quick Order HTML template.
   a) From the Widget Editor, open the Quick Order widget.
   b) Replace the HTML template with the following script.

```html
<div class="panel panel-primary">
  <div class="panel-heading">Request an item from the catalog</div>
  <div class="panel-body">
    <input class="form-control" type="search" placeholder="Start typing here to search the list of catalog items" ng-model="c.data.keywords" ng-change="c.server.update()" ng-model-options="{debounce: 250}" />
    <h5 ng-if="!c.data.keywords">Showing the most popular items</h5>
    <ul class="list-group result-container">
      <li class="list-group-item" ng-repeat="item in c.data.items">
        <a href ng-click="c.select(item.sys_id)"><category-icon category="item.category" style="margin-right: 10px"></category-icon>{{item.name}}</a><span class="pull-right">{{item.price}}</span>
        <div class="catalog-item" ng-if="item.sys_id == c.openItem">
          <sp-widget ng-if="c.catalogItemWidget" widget="c.catalogItemWidget" />
        </div>
      </li>
    </ul>
    <div class="panel-footer" ng-if="c.data.keywords">
      <ng-pluralize count="c.data.items.length" when="{"0": 'No items found for ',
        '1': 'One item matching ',
        'other': 'Found {} items matching '}"
        >>
      </div>
  </div>
</div>
```

6. Refresh your test page preview to view the changes.
   A category icon displays beside each result.
Widget API reference

The following client and server side APIs are supported in the Service Portal.

Supported client side APIs

These are the supported Service Portal APIs that can be used in a widget client controller. For detailed class and method information, see the API reference on the developer portal.

<table>
<thead>
<tr>
<th>Class</th>
<th>Available methods</th>
</tr>
</thead>
<tbody>
<tr>
<td>spUtil</td>
<td>• addErrorMessage(String message)</td>
</tr>
<tr>
<td></td>
<td>• addInfoMessage(String message)</td>
</tr>
<tr>
<td></td>
<td>• addTrivialMessage(String message)</td>
</tr>
<tr>
<td></td>
<td>• get(String widgetId)</td>
</tr>
<tr>

</table>

Widget properties

Global variable and functions available in widget client and server scripts.

Server script global objects

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>An object containing client-side properties set under c.data. The value is undefined until the client controller calls c.server.update().</td>
</tr>
<tr>
<td>data</td>
<td>An object containing properties set during server-side execution.</td>
</tr>
<tr>
<td>options</td>
<td>An object containing the schema option properties.</td>
</tr>
</tbody>
</table>
Client script global functions

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>this.server.get([Object])</td>
<td>Calls the server and sends custom input. Returns Promise.</td>
</tr>
<tr>
<td>this.server.update()</td>
<td>Calls the server and posts this.data to the server script. Returns Promise.</td>
</tr>
<tr>
<td>this.server.refresh()</td>
<td>Calls the server and automatically replaces the current options and data from the server response. Returns Promise.</td>
</tr>
</tbody>
</table>

A promise represents the eventual result of an asynchronous operation. For more information on promises, see [https://promisesaplus.com/](https://promisesaplus.com/) or [AngularJS documentation](https).

Widget troubleshooting guide

Use the following tools to investigate and resolve unexpected behavior in your custom Service Portal widgets.

Reduce complexity

Deactivate widgets unrelated to the widget you are troubleshooting to isolate parts of the page that may be causing errors or unexpected behavior. Set the active field to false on a widget record to hide the widget on the page, and prevent associated scripts from executing.

Use the browser developer console

All supported desktop browsers have built-in developer tools. Access your browsers developer tools to view console messages and errors thrown by client-side javascript. Many of the logging tools detailed below output information to this console.

Use the widget context menu to access information and options

CTRL+right-click a widget to access configuration options for the widget. There are also options to output the scope and scope data object to the browser console. For more detail on this menu, see [Widget context menu](https).

Use script methods to capture debugging output

Several methods are available to output debugging information within your server and client-side code.

<table>
<thead>
<tr>
<th>Method</th>
<th>Availability</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>console.log()</td>
<td>Server and client</td>
<td>Logs output to the browser developer console.</td>
</tr>
<tr>
<td>Method</td>
<td>Availability</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>--------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>$sp.log()</td>
<td>Server</td>
<td>Logs output to the Service Portal Log Entries [sp_log] table, when the logged in user has the sp_admin or admin role.</td>
</tr>
<tr>
<td>gs.log()</td>
<td>Server</td>
<td>Logs output to the Log [syslog] table.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> gs.log creates records on the syslog table. Excessive use can adversely affect performance.</td>
</tr>
<tr>
<td>gs.warn()</td>
<td>Server</td>
<td>Produces warning level output in the Log [syslog] table.</td>
</tr>
<tr>
<td>gs.error()</td>
<td>Server</td>
<td>Produces error level output in the Log [syslog] table.</td>
</tr>
<tr>
<td>gs.addInfoMessage()</td>
<td>Server</td>
<td>Displays a green information message at the top of the browser window.</td>
</tr>
<tr>
<td>spUtil.addErrorMessage()</td>
<td>Client</td>
<td>Displays a red error message at the top of the browser window.</td>
</tr>
<tr>
<td>spUtil.addInfoMessage()</td>
<td>Client</td>
<td>Displays an Info message within the browser window.</td>
</tr>
<tr>
<td>spUtil.addTriviaMessage()</td>
<td>Client</td>
<td>Displays a message which automatically disappears after a short time.</td>
</tr>
<tr>
<td>debugger</td>
<td>Client</td>
<td>Sets a break point in Chrome and Firefox browsers, allowing you to step through a script line by line in the browsers developer console.</td>
</tr>
<tr>
<td>Method</td>
<td>Availability</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>--------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>{{data</td>
<td>json}}</td>
<td>HTML</td>
</tr>
</tbody>
</table>

**Check for security restrictions**

Often, widget display issues are caused by access rules rather than the widget script. Verify that any records that are not accessible within a widget are accessible using the platform UI. Use the ACL debugger to ensure that your users have the expected access to records used by your widgets. For more detail on the debugger, see [ACL debugging tools](#).

**Create a reference to the widgets scope in the console**

Use reference to a widget to manipulate scope data or manually run the widgets client and server scripts. Use the following steps to create the reference.

1. Right-click the widget and choose Inspect.
2. In dev tools Elements tab, click to highlight the element with attribute widget=widget. You can find it a few elements above the currently inspected element. This element points the $0 scripting tool at the widget.
3. In the Javascript console, run the following code:
   ```javascript
   var scopeRef = angular.element($0).scope();
   ```

   Use the reference to your widget to change data within the console. See the following example. Remember to run AngularJS $apply() on the scope to apply changes to the page.
   ```javascript
   scopeRef.data.prop1 = "Pear";
   scopeRef.$apply();
   ```
   Run any function defined in the widgets client controller from your reference using the syntax below.
   ```javascript
   scopeRef.exampleFunction();
   ```

   Use the refresh command to manually execute the widgets server script.
   ```javascript
   scopeRef.server.refresh();
   ```

**Service Portal search**

Service Portal displays search data within a widget on the search page. To make data searchable from Service Portal, create a search source that fetches data from a single table within your ServiceNow
instance, from multiple ServiceNow tables, or from an external site. Add facets to the search source to enable end users to filter search results.

**Search sources**

A search source is a record that describes the behavior and source of searchable data. A search source defines:

- Where search data is retrieved from.
- Whether search suggestions can populate the search field based on user input.
- How a search entry displays in the search result page.

Search sources have simple and advanced configurations.

**Simple**

Define a table within your ServiceNow instance as a source of searchable data. To learn more, see *Define a search source* on page 2859.

**Advanced**

Define a data fetch script to return data. A data fetch script executes on the server and returns a result array to the search widget. This method is more complex, but offers complete power over how a search is executed. You are not limited to querying single tables within ServiceNow and can define a script that fetches data from multiple tables, or from anywhere on the web. To learn more, review the *Tutorial: set up an external knowledge base search source* on page 2864.

**Note:** Search facets may not behave as expected if integrated into an advanced search source that queries data from a non-ServiceNow site.

**Typeahead settings**

Typeahead returns search results as a user types in the search field. You can configure typeahead settings, or disable the feature entirely, within the search source record.

**Simple**

Define an icon to display beside typeahead results and the target page to display typeahead selections.

**Advanced**

Define a template for the typeahead result. See *Create an advanced typeahead template* on page 2863.

**Search facets**

Enable your end users to filter search results for a more meaningful result set. Facets can return results based on:

- Fields in a table such as Active or Author.
• Query conditions such as [Updated][After][Last week].

**Note:** Only set search facets for indexed fields. Fields that are not indexed may take longer to return results and are not optimized for a fast search experience. Learn more: [Enable text indexing for a table](#).

Search facets render in the Faceted Search widget on the sp_search page. In new instances, search facets are enabled by default. If upgrading from a previous release, enable search facets by activating a record in the Page Route Maps [sp_page_route_map] table. See [Enable search facets](#) on page 2869.

**Simple**

Enable end users to refine search results for a simple search source. You can create facets for a table search source that return results based on field values or query conditions. See [Add facets to a simple search source](#) on page 2870.

**Advanced**

Define facets for advanced search sources using the Facet generation script on the search source record. Use facet APIs to create facets and assign ServiceNow facet items or mapped queries to the facet.

<table>
<thead>
<tr>
<th>API</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>SPScriptedFacetService</code></td>
<td>Creates a single or multi choice facet.</td>
</tr>
<tr>
<td><code>SPScriptedFacet</code></td>
<td>Defines facet items, filters, or mapped queries for the facet.</td>
</tr>
</tbody>
</table>

**Search configurations**

When a simple search source is defined, Service Portal uses the search engine settings configured on your instance. To learn more, see [Search administration](#).

**Performance recommendations**

To avoid performance degradation and to ensure a fast search experience for end users, follow these recommendations.

• Limit search sources when possible to perform only the necessary query. For example, if a search only needs to return active incidents, add a condition to the search source set to [Active] [is] [true]. A search that queries only active incidents is faster than a search that queries all records in the incident table.

• Create facet items and mapped queries with no more than 30 filter items. To verify, test each search source with a variety of keywords as a user with low permissions.

**Note:** Search results in service portal are displayed as text only. HTML tags, images, and formatting do not display in search results.
Define a search source

Configure a basic search source to query data from an instance table, or configure an advanced data fetch script to query data across multiple tables and data sources, or to pull data from anywhere on the web.

1. In the platform UI, navigate to Service Portal Portals and select the portal you want to add search sources to.
2. From the Search Sources related list, click New to add a search source.
3. Define the fields on the Search Source form.

<table>
<thead>
<tr>
<th>Table 1163: Search Source form</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>ID</td>
</tr>
<tr>
<td>Application</td>
</tr>
<tr>
<td>Roles</td>
</tr>
<tr>
<td>Search page template</td>
</tr>
</tbody>
</table>

4. Complete the fields on the Data Source tab.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Is scripted source</td>
<td>Adds an advanced data fetch script. If configuring an instance table as the data source, do not check this option.</td>
</tr>
<tr>
<td>Data fetch script</td>
<td>Script defining the endpoint and API calls to fetch data. This field is only visible when Is scripted source is selected. For an example of a data fetch script, see Tutorial: set up an external knowledge base search source on page 2864.</td>
</tr>
</tbody>
</table>

**Note:** If defining a facet generation script, inject the facets object into the data fetch script and update the script to generate data for each facet item. For an example, see the Knowledge Base and Service Catalog search sources. Search facets may not behave as expected if integrated into an advanced search source that queries data from a non-ServiceNow site.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Facet generation script</td>
<td>Script defining search facets for a scripted search source. Enable your end users to filter search results for a more meaningful result set. This field is only visible when Is scripted source is selected.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If defining a facet generation script, inject the facets object into the data fetch script and update the script to generate data for each facet item. For an example, see the Knowledge Base and Service Catalog search sources. Search facets may not behave as expected if integrated into an advanced search source that queries data from a non-ServiceNow site.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table from the list that you want to draw your results from. You can select any table in the platform. For example, User [sys_user] or Knowledge [kb_knowledge].</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Only indexed tables return search results. Learn more: Enable text indexing for a table.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Filters results based on defined conditions. For example, Active is True.</td>
</tr>
<tr>
<td>Primary display field</td>
<td>Select which field you want to display on the search results page. For example, Name.</td>
</tr>
<tr>
<td>Display fields</td>
<td>Select additional fields to display on the search results page. For example, User ID, Email, and City.</td>
</tr>
<tr>
<td>Paginate results</td>
<td>Paginates search results. True by default.</td>
</tr>
<tr>
<td></td>
<td>If Is scripted source is selected, the value updates to false. To enable pagination for a scripted search source, see Paginate search source results on page 2861.</td>
</tr>
<tr>
<td></td>
<td>Define the maximum number of results per query for the search source in the Search Page widget or Faceted Search widget instance options.</td>
</tr>
</tbody>
</table>

5. Configure Typeahead settings to allow search results to populate the search field based on user input.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable typeahead</td>
<td>Allows typeahead functionality. If you do not want to integrate typeahead into your search source, clear the check box.</td>
</tr>
<tr>
<td>Advanced typeahead config</td>
<td>Optionally add an advanced typeahead script to configure the way search results display. For more information, see Create an advanced typeahead template on page 2863.</td>
</tr>
<tr>
<td>Typeahead glyph</td>
<td>Adds an icon beside each typeahead result.</td>
</tr>
<tr>
<td>Page</td>
<td>Defines a service portal page to display the selected result. For example, if form is configured, a selected typeahead result opens in a form.</td>
</tr>
</tbody>
</table>
6. Click Submit.

To enable end users to refine search results, *Add facets to a simple search source* on page 2870.

### Paginate search source results

Limit the number of results that a search source displays at one time to improve performance. End users can load more results as needed.

**Role required:** admin or sp_admin

If adding pagination to a simple search source, set Paginate results on the search source record to true. However, if adding pagination to an advanced search source, you must also modify the data fetch script to handle multiple pages of results. When a user loads more search results, the search source re-executes the data fetch script.

**Note:** If paginating a search source with advanced facets, do not modify the facet generation script to load facets based on the results from each page. Facets should enable end users to filter results from an entire result set, rather than page-specific results.

1. In the platform UI, navigate to Service Portal Search Sources.
2. Open a search source to add pagination to.
3. Set Paginate results to true.
   
   Enabling this field adds a Load more results button to the search results page. This flag automatically enables pagination for simple search sources.

4. If the search source is advanced, modify the data fetch script to handle multiple search result pages.
   
   Update the data fetch script using one of the following GlideRecord APIs, depending on the scope of the search source.

<table>
<thead>
<tr>
<th>Scope</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global</td>
<td>setLocation() in GlideRecord</td>
</tr>
<tr>
<td>Scoped application</td>
<td>chooseWindow() in GlideRecord</td>
</tr>
</tbody>
</table>
The following is an example data fetch script for a global search source that queries the incident table and paginates results.

// queryLocation is a special value injected into the script, // which holds the query_location property of the last item // in the previously fetched result set
(function(query, queryLocation, count) {
    var results = [];
    var gr = new GlideRecord("incident");
    gr.addQuery("123TEXTQUERY321", query);
    gr.query();
    // Here, we are utilizing queryLocation to implement pagination.
    // In practice, there are many other ways to use the
    // query_location value of the last item in the previous
    // result set to implement pagination. Your implementation
    // will vary by use case.
    gr.setLocation(queryLocation - 1);
    var resultCount = 0;
    while(gr.next() && resultCount < count + 1) {
        results.push({
            label: gr.getDisplayValue(),
            short_description: gr.getValue("short_description"),
            // Here, we are populating the query_location
            // property of each result item. This is how the
            // framework knows what value to pass into the
            // next fetched search result script execution
            query_location: gr.getLocation(),
            primary: gr.getDisplayValue(),
            state: gr.getDisplayValue("state")
        });
        resultCount++;
    }
    if (results.length == 0)
        return results;
    if(results.length > count) {
        results.pop();
    } else {
        // In order to indicate that a result in the result
        // set is the final result (that there are
        // no more results to be fetched), add this property
        // to the final element in your result set.
        results[results.length - 1].isLastResult = true;
    }
    return results;
})(query, queryLocation, count, facets);

For an additional example, see the Knowledge Base search source.

5. Define the maximum number of results per query for the search source in the Search Page widget or Faceted Search widget instance options.

The search page only returns the defined number of results at one time. When a user selects Load more results, the search source re-executes the query or data fetch script.
Create an advanced typeahead template

Configure the way typeahead results display with an advanced template.

1. Complete the required fields in *Define a search source* on page 2859.
2. In the Typeahead tab of the Search Source record, select the Advanced typeahead config check box.
3. In the Typeahead template field, add an HTML template.

   This example uses AngularJS bindings to display service catalog images in the typeahead results.

   ```html
   <i class="ta-img" ng-if="match.model.type== 'sc'" style="background-image:url('{{match.model.picture}}')"></i>
   <i class="ta-img" ng-if="match.model.type== 'sc_guide'" style="background-image:url('{{match.model.picture}}')"></i>
   <i class="ta-icon fa fa-file-text-o" ng-if="match.model.type== 'sc_content' && match.model.content_type == 'kb'"></i>
   ```
4. Click Update.
Typeahead results display beside the image defined in the service catalog record.

![Typeahead results display](image)

## Tutorial: set up an external knowledge base search source

Define an advanced search source to return data from any source on the Internet. To understand the power of search sources, follow this tutorial to set up an external knowledge base search source.

To create an advanced search source, you need an external resource that you can access via REST and basic knowledge of AngularJS.

In this integration, you will:

- Create a data fetch script that uses the ServiceNow Table API to query a knowledge base from another ServiceNow instance.
• Decode the JSON response and define the fields that the search widget expects.
• Update the search sources HTML template to open the search result in the external site.

1. In the platform UI, navigate to Service Portal Portals and select the portal you want to add the search source to.
2. From the Search Sources related list, click New.
3. Create a name and ID for the search source. The ID should be unique, and should not include any spaces or special characters.
4. On the Data Source tab, select the Is scripted source check box.
5. Add content to the data fetch script field.
   a) Define the search function to be executed by the instance.

      This example uses a recordless RESTMessage, but you can modify this example to use a pre-configured Outbound REST web service if needed, or create a more secure authentication profile.

      (function(query) {
        var results = [];
        /* Calculate your results here. */
        var url = "https://myInstance.service-now.com/api/now/table/kb_knowledge?sysparm_query=GOTO123TEXTQUERY321%3D" + encodeURI(query) + "&sysparm_fields=sys_id%2Cnumber%2Cshort_description%2Ccategory%2Ctext";
        var ws = new sn_ws.RESTMessageV2();
        ws.setBasicAuth("search_user", "search");
        ws.setHttpMethod("get");
        ws.setEndpoint(url);
        var jsonOutput = ws.execute();
        return results;
      })(query);

      Note: In the preceding example, sw.setBasicAuth requires a user and password for the remote instance. For more detail, see RESTMessageV2.

   b) Add an if statement to the data fetch script to decode the JSON object being returned, iterate over each result, and set expected fields.

      The final data fetch script:

      (function(query) {
        var results = [];
        /* Calculate your results here. */
        var url = "https://myInstance.service-now.com/api/now/table/kb_knowledge?sysparm_query=GOTO123TEXTQUERY321%3D" + encodeURI(query) + "&sysparm_fields=sys_id%2Cnumber%2Cshort_description%2Ccategory%2Ctext";
        var ws = new sn_ws.RESTMessageV2();
        ws.setBasicAuth("search_user", "search");
        ws.setHttpMethod("get");
        ws.setEndpoint(url);
        var jsonOutput = ws.execute();
        if (jsonOutput) {
          var response = new JSON().decode(jsonOutput.getBody());
          results = response.result;
          results.forEach(function(result) {
            result.url = "https://myInstance.service-now.com/kb_view.do?sysparm_article=" + result.number;
            result.target = "_blank";
            result.primary = result.short_description;
          });
        }
      })(query);
In this example, the following fields are set on the result object:

- **url**: If linking to an external site rather than opening the record in your ServiceNow instance, this defines where the link leads to.
- **target**: The target for the link. Set the target to `/_blank` to open results in a new tab, otherwise leave it blank.
- **primary**: The primary field displayed in the search results.

6. **Update the search page template to open the search results in the external site.**

   `<div>
   <a href="https://myInstance.service-now.com/kb_view.do?sysparm_article//{{item.number}}" target="_blank" class="h4 text-primary m-b-sm block">
   <span ng-bind-html="highlight(item.primary, data.q)"></span>
   </a>
   <span class="text-muted" ng-repeat="f in item.fields | limitTo: 4">
   {{f.label}}: <span ng-bind-html="highlight(f.display_value, data.q)"></span>
   </span>
   </div>

7. **Click Update.**

   Test the external search in your portal. Results display under the name field value defined in step three.
Each search result opens in the external site defined in the search page template.
Example: set up a GitHub search source

Set up an advanced search source that queries data from an external site.

To create an advanced search source, you need an external resource that you can access via REST and basic knowledge of AngularJS.

1. In the platform UI, navigate to Service Portal Portals and select the portal you want to add search sources to.
2. From the Search Sources related list, click New.
3. Create a name and ID for the search source.
   The ID should be unique, and should not include any spaces or special characters.
4. On the Data Source tab, select the Is scripted source check box.
5. Add content to the data fetch script field.

To set up a GitHub integration:

```javascript
(function(query) {
  var results = [];
  /* Calculate your results here. */
  var url = "https://api.github.com/search/repositories?q=" +
  encodeURI(query);
  var ws = new GlideHTTPRequest(url);
  ws.setBasicAuth("YOUR_USERNAME_HERE", "YOUR_PASSWORD_HERE");
  var jsonOutput = ws.get();
  if (jsonOutput) {
    var response = new JSON().decode(jsonOutput.getBody());
    results = response.items;
    results.forEach(function(result) {
      result.url = result.svn_url;
      result.target = "_blank";
      result.primary = result.full_name;
    });
  }
  return results;
})(query);
```

6. Use the Search page template to customize the way the search results display.

   `<div>
   <div class="pull-right">
     <strong>{{item.language}}</strong>
     <a ng-href="{{item.svn_url}}/stargazers" target="_blank" class="m-l-sm"><span class="fa fa-star m-r-xs"></span>{{item.stargazers_count}}</a>
     <a ng-href="{{item.svn_url}}/network" target="_blank" class="m-l-sm"><span class="fa fa-code-fork m-r-xs"></span>{{item.forks}}</a>
   </div>
   <a ng-href="{{item.svn_url}}" target="_blank" class="h4 text-primary m-b-sm block">
     <span ng-bind-html="highlight(item.full_name, data.q)"></span>
   </a>
   <p>{{item.description}}</p>
   <p>Updated <sn-time-ago timestamp="item.updated_at"></sn-time-ago> ago</p>
   </div>`

Enable search facets

In new instances, search facets are enabled by default. If upgrading from a previous release, enable search facets by activating a record in the Page Route Maps [sp_page_route_map] table.

Role required: admin or sp_admin

Search facets render in the Faceted Search widget on the sp_search page. To enable search facets after upgrade, activate the page route map record to route your search results to render in the sp_search page.

1. Navigate to Service Portal Page Route Maps.
2. Locate the Search record in the list.
This record redirects users from the search page to the sp_search page when viewing search results in Service Portal. The sp_search page includes the Faceted Search widget, which supports search facets in both desktop and mobile environments.

3. Set the Active field to true.

When using search in Service Portal, results render in the sp_search page. Add facets to the search source to enable end users to filter search results. To learn more about facets, see Add facets to a simple search source on page 2870.

Add facets to a simple search source

Enable end users to refine search results for a simple search source. You can create facets for a table search source that return results based on field values or query conditions.

Role required: admin or sp_admin

In new instances, search facets are enabled by default. If upgrading from a previous release, enable search facets by activating a record in the Page Route Maps [sp_page_route_map] table. See Enable search facets on page 2869. Create facet items and mapped queries with no more than 30 filter items. To verify, test each search source with a variety of keywords as a user with low permissions.

Note: Only set search facets for indexed fields. Fields that are not indexed may take longer to return results and are not optimized for a fast search experience. Learn more: Enable text indexing for a table.

1. Navigate to Service Portal Search Sources.
2. Open or create a simple search source.
   Simple search sources do not use a data fetch script. Rather, they define a table as the source of searchable data. To learn more about search sources, see Service Portal search on page 2856.
3. Select the Facets related list.
4. Click New.
   The Facet form displays.
5. Complete the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Display name of the facet header.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the search source. This value is read-only.</td>
</tr>
<tr>
<td>Selection type</td>
<td>Type of user selection allowed:</td>
</tr>
<tr>
<td></td>
<td>• Single: Only one filter value can be selected at a time. For</td>
</tr>
<tr>
<td></td>
<td>example, if a facet is created for the Assigned to field, the</td>
</tr>
<tr>
<td></td>
<td>end user can select Fred Luddy or Beth Anglin, but not both at</td>
</tr>
<tr>
<td></td>
<td>the same time. Before filtering for a new value, the user must</td>
</tr>
<tr>
<td></td>
<td>first clear the current value.</td>
</tr>
<tr>
<td></td>
<td>• Multiple: Multiple filter values can be selected at the same</td>
</tr>
<tr>
<td></td>
<td>time. For example, if a facet is created for the Assigned to</td>
</tr>
<tr>
<td></td>
<td>field, the end user can select both Fred Luddy and Beth Anglin.</td>
</tr>
<tr>
<td></td>
<td>Because multi choice results in an OR query, records assigned</td>
</tr>
<tr>
<td></td>
<td>to either Fred Luddy or Beth Anglin display.</td>
</tr>
<tr>
<td>Active</td>
<td>Whether the filter option displays in search results.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Use mapped facet filters</td>
<td>Maps a facet to a query condition, such as [Updated][After] [Last week]. When selected, the Fields and Sort fields are removed from the form. After saving, define filters in the Facet Filters related list.</td>
</tr>
<tr>
<td>Order</td>
<td>Defines the display order when multiple facets are defined. If some facets do not have an order value defined, facets with an order defined display first. Facets without an order defined are displayed alphabetically.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that the query is created for. This value is read-only and defined by the table used in the search source.</td>
</tr>
<tr>
<td>Field</td>
<td>Field that end users can filter search results by. For example, if Active is selected, the user can filter search results by true or false. Only fields of the following types are supported: True/False, Choice, Decimal, Floating Point Number, Integer, IP Address, Long, Reference, String, String (Full UTF-8), and URL.</td>
</tr>
<tr>
<td>Sort</td>
<td>Determines the order in which filter options display.</td>
</tr>
<tr>
<td></td>
<td>• Ascending: Sorts filter options from A to Z when alphabetical, and from lowest to highest when numerical. This is the default option.</td>
</tr>
<tr>
<td></td>
<td>• Descending: Sorts filter options from Z to A when alphabetical, and from highest to lowest when numerical.</td>
</tr>
</tbody>
</table>

6. Save the record.
   If Use mapped facet filters is selected, the Facet Filters related list appears in the facet form.

7. If Use mapped facet filters is selected, define facet filters. Map facet filters map a query condition to a facet label. When the end user selects the label from the facet list, the defined query executes.
   a) In the Facet Filters related list, click New. The Mapped Facet Form appears.
   b) Define the facet filter fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Display name of the facet filter option.</td>
</tr>
<tr>
<td>Order</td>
<td>Defines the display order when multiple facet filters are defined. If some facet filters do not have an order value defined, facets filters with an order defined display first. Facet filters without an order defined are displayed alphabetically.</td>
</tr>
<tr>
<td>Application</td>
<td>The application scope of the search source. This value is read-only.</td>
</tr>
<tr>
<td>Facet</td>
<td>The search facet that uses the mapped query. This value is read-only.</td>
</tr>
</tbody>
</table>
Enable search facets

Search facets allow users to filter search results and display them with relevant properties. Administrators can enable or disable facets for one or more search sources by adding a system property. Once enabled, the search source displays search facets in the Faceted Search widget on the sp_search page. You can enable facets for simple or advanced search sources.

Role required: admin or sp_admin

1. Enter sys_properties.list in the Application Navigator to navigate to the System Properties table.
2. Click New.
   The System Property form opens.
3. In the Name field, enter glide.service_portal.enable_search_facets.
4. In the Value field, enter a comma-separated list of search source Sys IDs to enable facets for. Do not include spaces. For example, c6170ae86721220023c82e08f585efe6,c96eb1686721220023c82e08f585efff.
5. Click Submit.

Facets display when the defined search source is selected in the sp_search page.

Set the default portal search source

If you don't define specific search sources for your portal, the system uses default search sources instead. Administrators can use the glide.service_portal.default_search_sources system property to define default search sources.

To make changes to the default search sources, navigate to the sys_properties list and search for the default search sources property. Copy the sys_ID of any search source you want to add into the Value field of the system property using a comma separated list.

To change the order in which the default search sources show in the Search List, change the order of the IDs in the property.

To remove the default search source behavior, delete the property value or delete the property altogether.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>The table defined in the search facet. This value is read-only.</td>
</tr>
<tr>
<td>Mapped query</td>
<td>A query condition that users can set to filter search results. For example, [Updated][On][Today].</td>
</tr>
</tbody>
</table>
Configure Search Sources available on a page

Use contextual search to limit search results for an instance of the type-ahead search widget.

With contextual search enabled, users only see type-ahead results for specific search sources. For example, searching on the Service Catalog page only shows results from the Service Catalog search source when contextual search is enabled.

1. In the Service Portal Designer (Service Portal Service Portal Configuration Service Portal Designer), find an instance of the type-ahead search widget.

2. Point to the widget and click the edit icon ( ).

   Alternatively, in any preview page containing the type-ahead search widget, for example the Service Catalog homepage, control + right-click to open the widget context menu. Then click Instance Options.

3. In the Contextual Search Sources field, select search sources from the list.

   Search sources listed for contextual search can be limited to just one, several, or all search sources.

Default search sources are defined in the glide.service_portal.default_search_sources property, so even if you do not have search sources configured, type-ahead search widget still shows type-ahead suggestions. For more information on default search sources, see Set the default portal search source on page 2872.
Service Portal announcements

Use announcements to broadcast messages to Service Portal users. Announcements can display in an announcement banner or an announcement widget instance.

Announcements are active on new instances. To activate announcements after upgrade, you can activate the Service Portal Announcements plugin (com.glide.service-portal.announcements).

When creating announcements, you can define the way an announcement displays.

Sort order

Announcements are displayed depending on the order defined in:

- The `glide.service_portal.announcement.default.sort_order` system property. See Service Portal properties on page 2646.
- The Display First field in the announcement record.

If there is a tie between two records set to Display first, the sort order defined in the system property is honored.

Display location

Announcements can display in the following locations:

- Announcement banner
- Announcements widget instance
Email server down
We are aware of the issue and are taking steps to correct it.
To define the announcement display location, define the announcement type in the announcement record.

**Display Style**

Using display styles, you can:

- Create a custom color scheme.
- Change the text alignment.

Announcements that appear in a banner use the display style defined in the Announcement record by default. To use the display style in an instance of the Announcements widget, you can select the Use Display Style instance option.

**User criteria**

If user criteria is set up for the Service Portal, you can define who can and who cannot view an announcement. Through user criteria, you can create announcements only visible to specific users, groups, roles, organizations, and more.

Create an announcement

Announcements display as a banner in a Service Portal or within the announcements widget.

Role required: admin, sp_admin, or announcement_admin

1. Navigate to Service Portal Announcements.
   The Announcements table [announcement] displays all announcements.
2. Click New.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Internal title that does not display in the announcement.</td>
</tr>
<tr>
<td>Active</td>
<td>Whether the announcement is active. Inactive announcements do not display.</td>
</tr>
<tr>
<td>Title</td>
<td>The display title of the announcement.</td>
</tr>
<tr>
<td>From</td>
<td>Date and time the announcement begins to display.</td>
</tr>
<tr>
<td>To</td>
<td>Date and time the announcement ends. If this field is not defined, the announcement continues to display until it is deactivated.</td>
</tr>
<tr>
<td>Summary</td>
<td>The display text of the announcement.</td>
</tr>
<tr>
<td>Display style</td>
<td>Defines the background color, text color, and text alignment of banner announcements. Base system styles include:</td>
</tr>
<tr>
<td></td>
<td>• Normal: Blue background and left-aligned, white text. This is the default style.</td>
</tr>
<tr>
<td></td>
<td>• Urgent: Red background and left-aligned, white text.</td>
</tr>
</tbody>
</table>

Announcements that appear in a banner use the display style defined in the Announcement record by default. To use the display style in an instance of the Announcements widget, you can select the Use Display Style instance option.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Type                | Defines where an announcement displays. By default, announcements display in the following locations:  
  • Banner: Announcement banner above the banner frame in the Service Portal.  
  • Widget: Instance of the announcements widget.  
  
You can create an announcement type to define other widget instances to display an announcement. |
| Glyph               | Glyph to display to the left of the title in banner announcements.                                                                                                                                                                                                                                                                           |
| Glyph alt text      | Alternative text for the glyph icon used with screen readers.                                                                                                                                                                                                                                                                             |
| Public              | Whether the announcement can be viewed before login.                                                                                                                                                                                                                                                                                        |
| Roles               | If Public is not selected, you can define roles that the announcement is visible to. If no roles are selected, the announcement is visible to all roles. If User criteria for Service Portal on page 2882 is set up and Public is not selected, you can define user criteria for the announcement record instead of defining roles. |
| Display first       | If selected, the announcement displays before all other announcements.  
  
If there is a tie between two records set to Display first, the sort order defined in the glide.service_portal.announcement.default.sort_order system property is honored. See Service Portal properties on page 2646. |
| Click target        | Creates a link below the announcement body that opens to a target page or URL.  
  • None: No link is included in the announcement.  
  • Page: Opens a Service Portal page in the current browser tab.  
  • URL in current browser tab: Opens a URL in the current browser tab.  
  • URL in new browser tab: Opens a URL in a new browser tab.  
  
If the Details link text field is blank and a click target is defined, the title of the announcement is the link. |
| Details page        | The page that opens in the current browser tab. Available if the Click target is Page.                                                                                                                                                                                                                                                     |
| Details URL         | The URL that opens in the current or new browser tab. Available if the Click target is URL in current browser tab or URL in new browser tab.                                                                                                                                                                                                 |
| Details link text   | Link text for the page or URL click target. If this field is blank and a click target is defined, the title of the announcement is the link.                                                                                                                                                                                                     |
| Dismiss options     | Determines whether the user can dismiss the announcement. Options include:  
  • User can dismiss - no redisplay  
  • User can dismiss for current session only  
  • User cannot dismiss                                                                                                                                                                                                                                                                                       |
4. Save or submit the record.
5. If User criteria for Service Portal on page 2882 is set up and Public is not selected, you can define user criteria for the announcement record. Announcements only display to users that pass the access criteria.
6. Update the record.

If the Type is Banner, test your announcement by navigating to the portal defined in the Portals field. If the Type is Widget or a custom type, test your announcement by navigating to the page with the associated widget instance.

Create an announcement display style

Define the background color, foreground color, and text alignment of one or more announcements. Announcements that appear in a banner use the display style defined in the Announcement record by default. To use the defined display style in a widget, you can select an instance option.

Role required: admin, sp_admin, or announcement_admin
1. Navigate to Service Portal Announcements.
2. Open an existing announcement or create a new announcement.
3. In the Display style field, click the reference lookup icon to open the referenced table. The Announcement Styles [announcement_style] list view opens.
4. Click New to create a new display style.
5. Complete the form.
6. Click Submit.

Navigate to the Service Portal associated with the announcement record to view the announcement.

Create an announcement type

Announcement types determine where an announcement displays. Announcements include two base system types: banner and widget.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Internal name of the display style.</td>
</tr>
<tr>
<td>Application</td>
<td>The application scope of the announcement. This value is read-only.</td>
</tr>
<tr>
<td>Background color</td>
<td>Color name or HEX value in the format #000000 for the announcement background.</td>
</tr>
<tr>
<td>Foreground color</td>
<td>Color name or HEX value in the format #000000 for the announcement text.</td>
</tr>
<tr>
<td>Alignment</td>
<td>Text alignment. Options include:</td>
</tr>
<tr>
<td></td>
<td>• Left align</td>
</tr>
<tr>
<td></td>
<td>• Center align</td>
</tr>
</tbody>
</table>
Role required: admin, sp_admin, or announcement_admin

Similar to creating a category tag, you can create alternative types to define custom locations. For example, to display an announcement only in a specific widget instance, you can create an announcement type for that widget instance. Any announcements tagged with that type will only display in the desired widget instance.

1. Navigate to System Definition Tables Announcement Consumer Type.
   The Announcement Consumer Type table [announcement_consumer_type] opens.
2. In the Columns section of the form, Click New.
3. Define a Name. The name is used to associate an announcement with a widget instance.
4. Click Save.
5. Add the custom type to an announcement.
   a) Navigate to Service Portal Announcements.
   b) Open an existing announcement or create a new announcement.
   c) In the Type field, select the custom type.
   d) Click Save.

6. If using the type in a widget, define the type as a widget instance option.
   The announcement banner only displays announcements tagged with the Banner type.
   a) Navigate to an instance of the Announcement widget.
   b) Control + right-click the widget instance and select Instance Options.
   c) In the Type field, select the custom announcement type.

The widget instance associated with the type displays any announcements tagged with the same type.

Service Portal security

Control user access to a portal.

Control who accesses your portal and what they can see in the following ways:

- Authentication: Configure login and single sign on for users
- Limit page access by role: Use roles to limit the users who can see a page.
- Public pages: Use the public check box on a page record to make the page publicly accessible.

Note: A number of portal pages that are installed by default are marked public. Filter your list of Service Portal pages for Public [is] true to identify these pages. Setting the Public value to false will prevent these pages from being publicly available.

- User criteria: For a more advanced way of limiting user access, create and apply user criteria to pages, widgets, widgets instances, and search sources.

Single sign-on, logins, and URL redirects

Service Portal uses a combination of system properties and script includes to determine how the system handles URL redirects for users logging in to the portal.

Only users who understand SSO, URL redirects, and the ServiceNow platform should make any changes.
Single sign-on and Service Portal

To use single sign-on with Service Portal, you must enable the Integration - Multiple Provider Single Sign-On Installer plugin (com.snc.integration.sso.multi.installer).

If you are using the system property to automatically redirect to your primary IdP, then Service Portal automatically redirects to that IdP. If you have multiple identity providers, Service Portal shows a link on the login page to Use external login. For more information on SSO and authentication in the platform, see Multiple-Provider single sign-on (SSO).

Require authentication for a Service Portal page

If you want to require authentication for a Service Portal page, ensure that the Public flag on the page record is not selected. For more information, see Create and edit a page using the Service Portal Designer on page 2668. If a user navigates to a non-public page, they are redirected to the login page for the requested portal.

Because every page request is routed through the $sp page, this page must be public. The following values in the Public Pages sys_public table define the page as public:

- Page: $sp
- Active: true

Configure the Service Portal login page

Administrators can configure a login page URL redirect for a portal.

1. In the [sys_properties] table, make sure these properties are set to the following values:

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.entry.page.script</td>
<td>new SPEntryPage().getLoginURL()</td>
<td>Login page determination</td>
</tr>
</tbody>
</table>

2. It is better to leave this alone, but if you do need to customize the actual entry page, from the Script Includes table, search for SPEntryPage.

   **Note:** If you make changes to the script include, it won’t be upgraded with future updates.

3. Edit the script on the SPEntryPage to change the assigned portal to the portal_suffix you want. SPEntryPage uses /sp/ as the portal path to redirect to. Enter your own portal_suffix in place of sp.

   ```javascript
   SPEntryPage.prototype = {
     initialize: function() {
       this.logVariables = false; // for debugging
       this.portal = ""/sp/""; // The URL suffix specified in the sp_portal record
     },
   }
   ```

Redirect to Service Portal after login

Use system properties and script includes to conditionally redirect users to a page after logging in.
Follow these steps to redirect a user to Service Portal after they log in.

1. In the sys_properties table, add the following property:

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.entry.first.page.script</td>
<td>string</td>
<td>new SPEntryPage().getFirstPageURL()</td>
<td>First page after authentication</td>
</tr>
</tbody>
</table>

getFirstPageURL primarily does the following:

- Redirects to login_redirect.do in order to break out of the frameset (if there is one).
- Redirects to Service Portal if the user has no roles, or the full platform for everyone else.

2. Customize the after login behavior by navigating to the SPEntryPage script include.

**Note:** If you make changes to the script include, it won't be upgraded with future updates.

**Note:** If you are using external authentication, ensure that your IdP supports the RelayState URL parameter. This parameter retains the originally requested URL while the user authenticates, and is necessary for redirection after login.

Debug Service Portal URL redirects

Debug the URL redirects for logging in to Service Portal and redirecting to the first page.

To view debug output from SPEntryPage and see the session variables it redirects based on:

1. Make sure the system property glide.entry.first.page.script has the value: new SPEntryPage().getFirstPageURL().
2. From the SPEntryPage script include, set this.logVariables = true.
3. In a separate browser, log in.
4. From the system navigator, view the log output by navigating to System Logs System Log All.

Configure page security by role

Set up pages to be public or filter them by role.

Public pages won’t require a user login; anyone can access them. All other options require user authentication.

To manage your page security:

1. In the Service Portal configuration page (Service Portal Service Portal Configuration), open the Page Editor.
2. In the Select Page list, search for the page you want to apply page security to.
3. Select the highest level node in the tree view.
4. To make a page public, select the Public check box. All users can access pages marked as Public.
5. To limit access to a certain role, add roles in a comma separated list. Users without the role listed can see links to the page if they appear in the portal. Trying to open the page results in a page not found error.

**Note:** If you select Public and add a list of roles, the page is still accessible by any user.
6. To create a draft page that only administrators can see while the page is still in development, select Draft. Users must have the admin role to see any pages in draft. Everyone else sees a page not found error.

Figure 632: Page with limited access by role

User criteria for Service Portal

User criteria enables you to allow access to users based on role, department, group, location, or company. Administrators can control access to pages, widgets, widget instances, announcements, and search sources in a portal by creating and applying user criteria.

User criteria records define conditions that are evaluated against user records. When user criteria is defined, portal records are only visible to users who pass the defined conditions.

User criteria is a platform feature used in Service Portal. Learn more about user criteria in the Now Platform:
- Service Catalog: *Set security for items and categories.*
- Knowledge management: *Select user criteria for a knowledge base* on page 1400.

**Converting role-based permissions to user criteria records**

User criteria in Service Portal replaces role-based permissions. After activating the user criteria for Service Portal plugin, you must *Set the user criteria for Service Portal system property* on page 2886 to true. When the system property is set to true, any existing roles defined for a page, widget, or search source are automatically converted into user criteria records. To disable user criteria and continue using role-based permissions, set the system property to false.

**User criteria checks**

User criteria uses the following checks in Service Portal to verify user access.

![User criteria checks diagram](image)

**Page access user criteria**

The following diagram shows how the system decides whether a user can access a page based on user criteria.
The following diagram shows how the system determines whether a user has access to a particular widget or widget instance.

Widget access user criteria
Activate the user criteria for Service Portal plugin

You can activate the Service Portal User Criteria Support plugin (com.glide.service-portal.user-criteria) if you have the admin role.

Role required: admin

1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
   - If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. If available, select the Load demo data check box.
   - Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
   - You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.
5. Click Activate.

Set the user criteria for Service Portal system property

After activating the Service Portal User Criteria Support plugin, you must set the system property to true.

Role required: admin

Setting the system property activates user criteria for Service Portal. When the system property is set to true, any existing roles defined for a page, widget, or search source are automatically converted into user criteria records. To disable user criteria and continue using role-based permissions, set the system property to false.

1. Navigate to Service Portal Properties.
2. Click the check box to set the following property to true.

Enable use of User Criteria records instead of Roles fields for Service Portal entitlements

Defines permissions for Service Portal widgets, widget instances, search sources and pages

☐ Yes | No

3. Click Save.

Create a user criteria record for Service Portal

Create a user criteria record to apply to items in Service Portal and control user access to pages, widgets, widget instances, and search sources.

You can apply existing user criteria to records in Service Portal through Service Portal configuration (Service Portal Service Portal configuration). You can only create user criteria within the platform UI.

1. In the navigation filter, type Service Portal.
2. Select a page, widget, or widget instance record.

3. In the related list at the bottom of the record, select the Can View or Cannot View tab, then click New. If a user criteria record is already created, you can click Edit to apply user criteria to the page, widget, or widget instance.

User criteria records are stored in the user_criteria table.

4. Complete the fields on the form, as appropriate.

Table 1164: Service Portal User Criteria

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the criteria record.</td>
</tr>
<tr>
<td>Users</td>
<td>User records to match access criteria.</td>
</tr>
<tr>
<td>Groups</td>
<td>Group records to match access criteria.</td>
</tr>
<tr>
<td>Roles</td>
<td>Roles to match access criteria.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Displays or hides the Script field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Script</td>
<td>Defines any additional criteria, and returns true or false. This field is available only if Advanced is selected.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Because scripts are evaluated dynamically, including scripts in user criteria records can decrease performance.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for the user criteria record.</td>
</tr>
<tr>
<td>Active</td>
<td>Activate or deactivates this criteria record.</td>
</tr>
<tr>
<td>Companies</td>
<td>Companies to match access criteria.</td>
</tr>
<tr>
<td>Locations</td>
<td>Locations to match access criteria.</td>
</tr>
<tr>
<td>Departments</td>
<td>Departments to match access criteria.</td>
</tr>
<tr>
<td>Match All</td>
<td>Determines whether all elements from each populated criteria field must match. If selected, only users who match all criteria are given access.</td>
</tr>
<tr>
<td></td>
<td>If cleared, the user must meet one or more of the set criteria to be given access.</td>
</tr>
<tr>
<td></td>
<td>By default, this check box is cleared so that any condition met provides a match.</td>
</tr>
<tr>
<td></td>
<td>For example, consider a user criteria record for the following:</td>
</tr>
<tr>
<td></td>
<td>- Locations A or B</td>
</tr>
<tr>
<td></td>
<td>- Company C or D</td>
</tr>
<tr>
<td></td>
<td>With Match All selected, only users meeting all these conditions are matched. For example, a user with a location A and a company C.</td>
</tr>
<tr>
<td></td>
<td>With Match All cleared, users meeting any of these conditions are matched. For example, a user with a location B.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If you select Match All, ensure that you do not create contradictory conditions that can never be met. For example, if all users in location A work for company G, then the conditions in this example can never be met.</td>
</tr>
</tbody>
</table>

5. Click Submit.
Apply user criteria to a page, widget, or widget instance

Assign user criteria to pages, widgets, or widget instances to limit user access to content in a portal. You can apply several user criteria records to a single portal item.

1. In the Service Portal Configuration page (Service Portal Service Portal Configuration), open the Page Editor.
2. Select a page from the list.
3. Select a page, widget, or widget instance node from the page tree.
4. Under related lists, click Who Can View or Who Cannot View.
5. Click New.
6. Select a criteria from the Can View or Cannot View list.
   Selecting criteria from the Can View or Cannot View list applies user criteria records created in Create a user criteria record for Service Portal on page 2886 to the selected page, widget, or widget instance.

7. Click Save.
Apply user criteria to a search source

Assign user criteria to search sources to limit user access to content in a portal.

Role required: admin

You can add user criteria to custom or default Service Portal search on page 2856.

1. In the Service Portal Configuration page (Service Portal Service Portal Configuration), navigate to Portal Tables Search Source in the header menu.
Service Portal
Create rich, engaging and modern experiences to help your business run.
Select one of the options below to continue.

- **Branding Editor**: Customize your portal's title, logo and theme colors. Preview changes as you make them.
- **Designer**: Create and layout pages with drag-and-drop functionality. Preview pages as you make changes.
- **Page Editor**: Configure the properties of pages, containers and widgets from a map view.
- **Widget Editor**: Create widgets from scratch or customize an existing one. Write HTML, CSS, and JavaScript with real-time preview.
- **Search Source**: Search for content related to the portal.
2. Open the search source record that you would like to modify.
3. Under related lists, click Who Can View Search Sources or Who Cannot View Search Sources.
4. Click New.
5. Select a criteria from the Can View or Cannot View list.
   Selecting criteria from the Can View or Cannot View list applies user criteria records created in Create a user criteria record for Service Portal on page 2886 to the selected search source.

6. Click Save.

Enable e-signature for Service Portal

You can configure e-signature in Service Portal to require re-authentication from approving users.

Role required: admin

2. Navigate to System Definition e-Signature Registry.
3. Add any tables you want to require an e-signature for to the list.
With e-signature enabled, approvers are required to provide a password to approve or reject any requests. Authentication with touch ID works in the mobile app. On the mobile web, approvers are still required to enter a password. For more information on configuring e-signature, see Approval with e-signature on page 2418.

Service Portal SCSS Primer

SCSS is a subset of the Syntactically Awesome StyleSheets (Sass) specification and is an extension of CSS. Every valid CSS style sheet is valid SCSS.

SCSS variables

SCSS variables are a way to store information that you want to reuse throughout your style sheet. You can store things like colors, font stacks, or any CSS value you think you want to reuse. SCSS uses the $ symbol to make something a variable.

SCSS supports the follow data types:

- Numbers (including units)
- Strings (with quotes or without)
- Colors (name, or names)
- Booleans

Variables can also be arguments to or results from one of several available functions or mixins. During translation, the values of the variables are inserted into the output CSS document.

For example:

```scss
$font-stack:    Helvetica, sans-serif;
$primary-color: #333;

body {
  font: 100%$font-stack;
  color: $primary-color;
}
```

For more information on Sass, see the Sass/SCSS reference.

SCSS functions

List of functions for Service Portal SCSS compiler.

**RGB functions**

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rgb($red, $green, $blue)</td>
<td>Creates a Color from red, green, and blue values.</td>
</tr>
<tr>
<td>rgba($red, $green, $blue, $alpha)</td>
<td>Creates a Color from red, green, blue, and alpha values.</td>
</tr>
<tr>
<td>red($color)</td>
<td>Gets the red component of a color.</td>
</tr>
<tr>
<td>green($color)</td>
<td>Gets the green component of a color.</td>
</tr>
<tr>
<td>blue($color)</td>
<td>Gets the blue component of a color.</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>------------------------------------------</td>
</tr>
<tr>
<td>mix($color1, $color2, [$weight])</td>
<td>Mixes two colors together.</td>
</tr>
</tbody>
</table>

### HSL functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>hsl($hue, $saturation, $lightness)</td>
<td>Creates a Color from hue, saturation, and lightness values.</td>
<td>Yes</td>
</tr>
<tr>
<td>hsla($hue, $saturation, $lightness, $alpha)</td>
<td>Creates a Color from hue, saturation, lightness, and alpha values.</td>
<td>Yes</td>
</tr>
<tr>
<td>hue($color)</td>
<td>Gets the hue component of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>saturation($color)</td>
<td>Gets the saturation component of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>lightness($color)</td>
<td>Gets the lightness component of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>adjust-hue($color, $degrees)</td>
<td>Changes the hue of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>lighten($color, $amount)</td>
<td>Makes a color lighter.</td>
<td>Yes</td>
</tr>
<tr>
<td>darken($color, $amount)</td>
<td>Makes a color darker.</td>
<td>Yes</td>
</tr>
<tr>
<td>saturate($color, $amount)</td>
<td>Makes a color more saturated.</td>
<td>Yes</td>
</tr>
<tr>
<td>desaturate($color, $amount)</td>
<td>Makes a color less saturated.</td>
<td>Yes</td>
</tr>
<tr>
<td>grayscale($color)</td>
<td>Converts a color to grayscale.</td>
<td>Yes</td>
</tr>
<tr>
<td>complement($color)</td>
<td>Returns the complement of a color.</td>
<td>No</td>
</tr>
<tr>
<td>invert($color)</td>
<td>Returns the inverse of a color.</td>
<td>No</td>
</tr>
</tbody>
</table>

### Opacity functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>alpha($color)</td>
<td>Gets the alpha component (opacity) of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>opacity($color)</td>
<td>Gets the alpha component (opacity) of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>rgba($color, $alpha)</td>
<td>Changes the alpha component for a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>opacify($color, $amount)</td>
<td>Makes a color more opaque.</td>
<td>No</td>
</tr>
<tr>
<td>fade-in($color, $amount)</td>
<td>Makes a color more opaque.</td>
<td>No</td>
</tr>
</tbody>
</table>
### Other color functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>transparentize($color, $amount)</td>
<td>Makes a color more transparent.</td>
<td>No</td>
</tr>
<tr>
<td>fade-out($color, $amount)</td>
<td>Makes a color more transparent.</td>
<td>No</td>
</tr>
</tbody>
</table>

### String functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>unquote($string)</td>
<td>Removes quotes from a string.</td>
<td>Yes</td>
</tr>
<tr>
<td>quote($string)</td>
<td>Adds quotes to a string.</td>
<td>Yes</td>
</tr>
<tr>
<td>str-length($string)</td>
<td>Returns the number of characters in a string.</td>
<td>No</td>
</tr>
<tr>
<td>str-insert($string, $insert, $index)</td>
<td>Inserts $insert into $string at $index.</td>
<td>No</td>
</tr>
<tr>
<td>str-index($string, $substring)</td>
<td>Returns the index of the first occurrence of $substring in $string.</td>
<td>No</td>
</tr>
<tr>
<td>str-slice($string, $start-at, [$end-at])</td>
<td>Extracts a substring from $string.</td>
<td>No</td>
</tr>
<tr>
<td>to-upper-case($string)</td>
<td>Converts a string to upper case.</td>
<td>No</td>
</tr>
<tr>
<td>to-lower-case($string)</td>
<td>Converts a string to lower case.</td>
<td>No</td>
</tr>
</tbody>
</table>
Number functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>percentage($number)</td>
<td>Converts a unitless number to a percentage.</td>
<td>Yes</td>
</tr>
<tr>
<td>round($number)</td>
<td>Rounds a number to the nearest whole number.</td>
<td>Yes</td>
</tr>
<tr>
<td>ceil($number)</td>
<td>Rounds a number up to the next whole number.</td>
<td>Yes</td>
</tr>
<tr>
<td>floor($number)</td>
<td>Rounds a number down to the previous whole number.</td>
<td>Yes</td>
</tr>
<tr>
<td>abs($number)</td>
<td>Returns the absolute value of a number.</td>
<td>Yes</td>
</tr>
<tr>
<td>min($numbers…)</td>
<td>Finds the minimum of several numbers.</td>
<td>Yes</td>
</tr>
<tr>
<td>max($numbers…)</td>
<td>Finds the maximum of several numbers.</td>
<td>Yes</td>
</tr>
<tr>
<td>random([$limit])</td>
<td>Returns a random number.</td>
<td>No</td>
</tr>
</tbody>
</table>

List functions

Lists in SCSS are immutable. All list functions return a new list rather than updating the existing list in-place.

All list functions work for maps as well, treating them as lists of pairs.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>length($list)</td>
<td>Returns the length of a list.</td>
</tr>
<tr>
<td>nth($list, $n)</td>
<td>Returns a specific item in a list.</td>
</tr>
<tr>
<td>set-nth($list, $n, $value)</td>
<td>Replaces the nth item in a list.</td>
</tr>
<tr>
<td>join($list1, $list2)</td>
<td>Joins two lists into one.</td>
</tr>
<tr>
<td>append($list1, $val)</td>
<td>Appends a single value onto the end of a list.</td>
</tr>
<tr>
<td>zip($lists…)</td>
<td>Combines several lists into a single multidimensional list.</td>
</tr>
<tr>
<td>index($list, $value)</td>
<td>Returns the position of a value within a list.</td>
</tr>
<tr>
<td>list-separator($list)</td>
<td>Returns the separator of a list.</td>
</tr>
</tbody>
</table>

Adding custom functions

Scss @function my-calculation-function($some-number, $another-number){ @return $some-number + $another-number }
SCSS nesting

SCSS lets you nest your CSS selectors in a way that follows the same visual hierarchy of your HTML.

For example:

```css
nav {
  ul {
    margin: 0;
    padding: 0;
    list-style: none;
  }

  li { display: inline-block; }

  a {
    display: block;
    padding: 6px 12px;
    text-decoration: none;
  }
}
```

The ul, li, and a selectors are nested inside the nav selector, which is a great way to organize your CSS and make it more readable. When the widget is rendered, the generated CSS looks something like the following code block:

```css
nav ul {
  margin: 0;
  padding: 0;
  list-style: none;
}

nav li {
  display: inline-block;
}

nav a {
  display: block;
  padding: 6px 12px;
  text-decoration: none;
}
```

For more information on Sass, see the [Sass/SCSS reference](#).

SCSS operators

SCSS has a handful of standard math operators like +, -, *, /, and %.

Use simple math to calculate widths for an aside & article. For example:

```css
.container { width: 100%; }

article[role="main"] {
  float: left;
  width: 600px / 960px * 100%;
}

aside[role="complementary"] {
  float: right;
  width: 300px / 960px * 100%;
}
```

The generated CSS looks like:
For more information on Sass, see the Sass/SCSS reference.

SCSS mixins

A mixin lets you make groups of CSS declarations that you want to reuse throughout your site. You can pass in values to make your mixin more flexible.

The following code block is an example for border-radius.

```scss
@mixin border-radius($radius) {
  -webkit-border-radius: $radius;
  -moz-border-radius: $radius;
  -ms-border-radius: $radius;
  border-radius: $radius;
}

.box { @include border-radius(10px); }
```

The generated CSS looks like:

```css
.box {
  -webkit-border-radius: 10px;
  -moz-border-radius: 10px;
  -ms-border-radius: 10px;
  border-radius: 10px;
}
```

For more information on Sass, see the Sass/SCSS reference.

Subscription Management

With the ServiceNow® Subscription Management application, review and manage how your ServiceNow subscriptions are used on your production instance. Subscriptions are downloaded to production instances only and not to development or QA instances.

Subscription Management setup guide

Because Subscription Management is active for all production instances by default, you do not need to activate a plugin. To set up Subscription Management, you assign the usage_admin role to the users who will administer subscriptions. The admins allocate users to appropriate subscriptions, monitor usage of applications (both by subscribed users and by users who are not subscribed), and update subscription levels as needed.

What to do

Assign the Usage Admins

Before you (the admin user) do anything else, assign the usage_admin role to the persons who will manage subscriptions for your organization.

Admin responsibilities and activities are described in Allocating users to a Per-User subscription on page 2909 and Monitoring how subscriptions are allocated on page 2917.

View the list of your subscription applications

See View your subscription applications and allocation levels on page 2901.

If your organization purchased Per-User subscriptions, the usage_admin allocates users

**Note:** You perform this task only for Per-User subscriptions. Your instance auto-allocates and reports on monthly usage for all other subscription types.

With a Per-User subscription, a specified number of users is entitled to use the application. You perform the following tasks:

- Build user sets.
- Allocate users to appropriate subscriptions.
• Monitor whether you have allocated the right number of users.
• Monitor and manage how users are allocated.

See Allocating users to a Per-User subscription on page 2909.

What to do next

Day-to-day administration: Monitor and manage subscriptions
See Monitoring how subscriptions are allocated on page 2917.

Domain separation in Subscription Management

This is an overview of domain separation in Subscription Management. Domain separation is not supported in this application. For more information, see Application support for domain separation.

Overview

Domain separation is not supported in this application. For more information, see Application support for domain separation.

Subscription Management admin guide

You use the ServiceNow® Subscription Management application to review and manage how purchased subscriptions are used on your production instance. You can monitor usage of subscription applications to update subscription levels and to make informed decisions about subscription purchases.

What is a subscription?

In contrast to companies that sell software licenses, ServiceNow sells subscription services.

• Your organization has purchased a subscription to an application family. The subscription entitles an agreed-upon number of users or resources in your organization to use the applications.
• For Per-User type subscriptions only, you allocate users to the subscription. As a result, the user is subscribed to the family of applications. For other subscription types, the instance auto-allocates users or resources to the subscription.
• For your organization to comply with its service contract, only subscribed users or resources should use a subscription application family.
• The Subscription Management application monitors your purchased subscriptions on production instances only.

How do you use Subscription Management?

The usage_admin can perform the following tasks:

• Receive and view subscriptions that your organization has purchased.
- Monitor and adjust allocation levels.
- Plan for renewing subscriptions.
- Determine which users (by role, by user group, or by some other criterion) should be subscribed to which Per-User subscription applications.
- Build user sets.
- Allocate users and user sets to each of the Per-User subscriptions.
- Manage user sets as users, roles, and groups change over time.

**View your subscription applications and allocation levels**

The Subscriptions page lists the subscriptions that your organization has purchased and indicates how many users or resources are allocated to each subscription.

Role required: usage_admin or admin

The page lists only subscriptions that are currently active (have not expired). To view expired subscriptions as well, set the list filter to All.

1. On your production ServiceNow instance, navigate to Subscription Management Subscriptions.
   - The page attempts to list all subscriptions that your organization has purchased. Some subscriptions do not appear. See *Why a subscription might not appear in the list* on page 2905.
   - A color code indicates the allocation level (the number of resources that are subscribed to the application).
   - Headings on the Subscriptions list are described in *Subscription form* on page 2902.

![Subscriptions page](image)

2. You can click a subscription Name to open the Subscription form, where you can:
   - View or update how users are allocated to a Per-User subscription. See *Subscription form* on page 2902
Subscription form

Use the Subscription form to view the list of applications that are associated with the subscription and to view or update how resources are allocated to a subscription.

In any list of subscriptions, click a subscription Name to open the Subscription form. Some fields do not appear for ServiceNow Store applications.

**Note:** For information on why a subscription is not in the list, see *Why a subscription might not appear in the list* on page 2905.

**Table 1165: Fields on the Subscription form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the subscription.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of subscription: Per-User, Max User, PA Indicator, Capacity, or Unlimited. See <em>Types of subscriptions</em> on page 2905.</td>
</tr>
<tr>
<td>Category</td>
<td>The source of the purchased subscription: ServiceNow or ServiceNow Store.</td>
</tr>
<tr>
<td>Start date / End date</td>
<td>Start and end of the subscription period as agreed in your service contract. This information appears in the General section of the service contract for the subscription.</td>
</tr>
<tr>
<td>Display only</td>
<td>A value of true indicates that user allocation or monitoring is not currently supported for the subscription.</td>
</tr>
<tr>
<td>Cost</td>
<td>Denotes whether the subscription is For-fee or Free. Some ServiceNow Store apps are free. You do not allocate resources to free subscriptions.</td>
</tr>
<tr>
<td>Purchased</td>
<td>Number of users or other resources that can be subscribed.</td>
</tr>
<tr>
<td>Allocated</td>
<td>Number of currently subscribed users or allocated resources for the subscription. The color codes indicate the percentage of the subscription that is used. See <em>Configure the color codes for subscription allocation levels</em> on page 2922.</td>

<tr>
<td>List</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Entitlements</td>
<td>List of entitlements that are included with the subscription. An entitlement is a feature that is part of the application (for example, the Employee Relations or Payroll feature in the HR application). For subscription applications, your organization can buy some entitlements and not buy others. The entitlements that appear in the list are the entitlements that your organization purchased with the subscription application. The Entitlements related list appears only for subscription applications that implement entitlements. Not all applications implement entitlements.</td>
</tr>
</tbody>
</table>

*Why a subscription might not appear in the list*

The Subscriptions list displays the subscriptions that your organization has purchased. There are, however, several types of non-subscription items that do not appear in the list.

*Why does my subscription not appear in the Subscriptions list?*

- You might not see all subscription services that you have purchased because the Subscription Management application does not yet allow management of some subscription services.
- The subscription may have expired. The page lists only subscriptions that are currently active. To view expired subscriptions as well, set the list filter to All.
- Subscription data arrives on production instances only.
- Self-hosted instances do not receive subscription information.
- Subscriptions that are marked as Display only do not currently support resource allocation or monitoring.

*Why is the Subscriptions list empty?*

- The subscription information might not yet have arrived. The data is downloaded daily.

*Types of subscriptions*

The Subscriptions module lists all subscription types that your organization has purchased.

You allocate users only to Per-User subscriptions. Because the instance auto-allocates all other subscription types, no action is required on your part.
### Table 1166: Subscription types in the Subscriptions list

<table>
<thead>
<tr>
<th>Subscription type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Capacity</td>
<td>Your ServiceNow instance auto-allocates resources such as users, devices, software, or nodes to Capacity subscriptions. For example, resources like each CI that Discovery finds or each password reset request.</td>
</tr>
<tr>
<td>Max User</td>
<td>Your organization purchased a subscription for the anticipated maximum number of active ServiceNow users. To monitor overall usage, the instance auto-allocates each active user up to the limit of the Max User subscription.</td>
</tr>
<tr>
<td>PA Indicator</td>
<td>Your organization purchased a subscription for an application family that uses Performance Analytics capabilities (for example, PA for ITSM or PA for Service Management). The PA admin creates indicators on tables that are used by the applications.</td>
</tr>
<tr>
<td>Per-User</td>
<td>Your organization purchased a subscription for the number of fulfiller users for subscription applications and capabilities. By default, the instance can monitor and report on usage of the application by both subscribed users and users who are not subscribed. See Allocating users to a Per-User subscription on page 2909.</td>
</tr>
<tr>
<td>Unlimited</td>
<td>ServiceNow Store apps only. Your instance auto-allocates and tracks active users to an Unlimited subscription. There is no limit to the number of users that can be allocated. An active user is any user in the sys_user table that has a user id and has the Active field set to true.</td>
</tr>
</tbody>
</table>

**View the applications and plugins that are included with a subscription**

You can activate a plugin that is associated with a for-fee subscription only if your organization has purchased the subscription.

**Role required:** usage_admin or admin

1. On your production ServiceNow instance, navigate to Subscription Management Subscriptions. The page lists all active subscriptions for your organization. If a subscription does not appear in the list, contact your ServiceNow account representative to purchase the subscription. Some subscriptions do not appear for other reasons. See Why a subscription might not appear in the list on page 2905.

2. Click a subscription name and then, on the Subscription form, click an application name in the Subscription Applications related list. (A subscription can include multiple applications.) The page lists the plugins that are associated with the application.
View the roles that are associated with the plugin for a subscription application

The Application Roles related list includes all roles that are loaded with the plugin for an application. The roles in the list form a good basis for constructing a user set.

Role required: usage_admin or admin

<table>
<thead>
<tr>
<th>Associated Roles</th>
<th>Go to Application</th>
<th>Requires Subscription</th>
</tr>
</thead>
<tbody>
<tr>
<td>asset</td>
<td>Asset Management</td>
<td>Yes</td>
</tr>
<tr>
<td>category_manager</td>
<td>Asset Management</td>
<td>Yes</td>
</tr>
<tr>
<td>contract_manager</td>
<td>Asset Management</td>
<td>Yes</td>
</tr>
<tr>
<td>financial_mgmt_admin</td>
<td>Asset Management</td>
<td>Yes</td>
</tr>
<tr>
<td>financial_mgmt_user</td>
<td>Asset Management</td>
<td>Unspecified</td>
</tr>
</tbody>
</table>

1. On your production ServiceNow instance, navigate to Subscription Management Subscriptions, and then click a subscription name.
   The Application Roles related list includes all roles that are loaded with the plugin for an application. The fulfiller type roles in the list that are subscription roles form a good basis for constructing a user set.

2. Use the list as a basis for creating a user set.

View Subscription Management history reports

History reports give the usage_admin at-a-glance status and trends on subscription activity for an organization.

Role required: usage_admin or admin

1. Follow the How to instructions in the table.
**Table 1167: History reports**

<table>
<thead>
<tr>
<th>Report</th>
<th>Description</th>
<th>How to</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subscription histories</td>
<td>Concise data on subscription downloads and updates for your organization.</td>
<td>1. Navigate to Subscription Management Subscriptions and then click a subscription Name.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2. On the Subscription form, click the View Subscription History related link.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>3. The Subscription History pop-up lists the operations on subscriptions for this ServiceNow instance. Click an Operation to view details.</td>
</tr>
<tr>
<td>Histories of subscription users</td>
<td>For each Per-User subscription, concise historical data on changes in subscription state for users: when users were subscribed and when they were unsubscribed, excluded, or unexcluded.</td>
<td>1. Navigate to Subscription Management Subscriptions and then click the Name of a Per-User subscription.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2. On the Subscription form, click the View User Subscription History related link.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>3. The User Subscription History pop-up lists the operations on user subscription state for the specified subscription. Click a User State to view details of a change in subscription state for a user.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• User State: Lists the change in the user state: subscribed/unsubscribed and excluded/unexcluded.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Allocation Source: Lists the name of the user set that acted as the source of the user.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Allocation Type: Lists the method for allocating the user to the subscription: user set or individual.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Operation time and Created by: Lists the timestamp of change and the admin who made the change.</td>
</tr>
<tr>
<td>Histories of subscription user sets</td>
<td>Data on when subscription user sets were created, updated, or deleted.</td>
<td>1. Navigate to Subscription Management Subscription User Sets and then click the Name of a user set.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2. On the Subscription User Set page, click the View User Set History related link.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>3. The User Set History pop-up lists the operations on user sets for the specified subscription. Click an Operation to view details.</td>
</tr>
</tbody>
</table>
2.

Allocating users to a Per-User subscription
You use the Subscriptions module to allocate users to all Per-User subscriptions that your organization has purchased.

Example: allocate users to a Per-User subscription
In this example, your organization purchased a subscription for 200 fulfiller users. You, the usage admin, can therefore specify the 200 users—the subscribed users—who have the right to use the application family on your production instance. You can allocate users either individually or by adding user sets to the subscription.

Note: User sets are the preferred automated method for managing the pool of users who are allocated to a subscription. Once you configure and allocate a user set, the system regularly updates the list of members based on the conditions that you specified. You do not need to manage individual users.
Allocating users to a Per-User subscription

1. The subscription admin allocates a mix of user sets and individual users to the 200-user subscription.

2. The 200 users that the admin allocated to the subscription are now subscribed.

User Set 1
- Allocate
- 130 users

User Set 2
- Allocate
- 65 users

5 Individual Users

ServiceNow subscription app

© 2018 ServiceNow. All rights reserved.
Guidelines for allocating users

- You allocate users only to Per-User subscriptions. The instance auto-allocates and reports on monthly usage for all other subscription types.
- When you add a user set to a subscription, the system allocates all users in the user set, up to the purchased subscription limit.
- In the case that adding the users in a user set would exceed the subscription limit, then none of the users in the user set are subscribed. Instead, all users in the user set are set to the Pending state and are listed on the Pending Users related list. Users that are currently subscribed are not affected. See Manage users in the Pending state on page 2916.
- You can unsubscribe any user as needed.
- You can exclude users. Excluded users cannot be allocated to a subscription individually or through a user set. At any time, you can remove a user from the list of excluded users.

Note: If you unsubscribe a user who is a member of a user set that is associated with an auto-synced subscription, the user will be resubscribed in the next synchronization cycle. To remove such a user, exclude the user. See Exclude a user from a subscription on page 2917.

Methods for allocating users

- Define user sets and then add user sets to the subscription
- Allocate individual users to the subscription (as many as are required)

Overview of the procedure for allocating users

1. Allocate users to the subscription using one or both of the following methods:
   - Build one or more user sets and add the user sets to the subscription
   - Allocate individual users

2. After you have allocated users to the subscription, you can add or remove user sets and individual users as needed. In addition, you can exclude individual users as needed.

Subscription user sets

User sets make it easy to specify which users should be allocated to a subscription. You can use roles, user groups, or both roles and groups as the conditions for a user to be a member of a user set (for example, everyone with the fulfiller role in the "IT department" group).

Auto-sync

When you add a user set to a subscription, the system attempts to subscribe all users in the user set. The system updates the members in a user set whenever a user update causes the user to meet or fail to meet the criteria for the user set. For example, if a user loses the "fulfiller user" role, the user is removed from the user set.

To make subscriptions self-maintaining, you can auto-sync a subscription. The system then regularly subscribes or unsubscribes users based on updates to the user sets that are assigned to the subscription. The option is described in Auto-sync a subscription to user set updates on page 2913.
How users are subscribed and unsubscribed

- When you add a user set to a subscription, the system allocates all users in the user set to the subscription, up to the purchased subscription limit.
- You can add a user set to any number of subscriptions.
- Users that are allocated from multiple user sets are subscribed only one time.
- In the case that adding the users would exceed the subscription limit, then none of the users in the user set are subscribed. Instead, all users in the user set are set to the Pending state and are listed in the Pending Users related list.
- When you remove a user set from a subscription, the system attempts to unsubscribe all users in the set. If a user is added from another user set, however, the user is not unsubscribed.
- Users that the usage admin has flagged as excluded are not allocated, even if other members of the user set are allocated. The usage admin can unexclude a user so that the user can be allocated.

Why a user is not subscribed when you add a user set

- The user set is empty (contains no users).
- The user had been excluded from the subscription.
- The user had already been directly allocated
- Another user set added the user (duplicate user)
- A user could not be allocated because adding the user would exceed the subscription limit. In this case, all users in the user set are set to the Pending state. The names of the users are listed in the Pending Users related list.

Why a user is not unsubscribed when you remove a user set

- The user set is empty (contains no users).
- The user was already directly allocated
- The user is added from another user set

Build a subscription user set

You can create a user set using either or both of two methods: Configure a filter (for example, filter by role) that selects particular users from the User [sys_user] table or specify a particular set of user groups from the Group [sys_user_group] table.

Role required: usage_admin or admin

1. Navigate to Subscription Management Subscription User Sets.
2. On the Subscription User Sets page, click New and then enter a unique Name (for example, Fulfiller users in the IT department) and Description for the user set.
3. To specify a user set by filtering users:
   a) In the Source field, select User [sys_user].
   b) Specify the filters that determine which users to extract from the table. The extracted users make up the user set. For example, filter for [role] [is] [itil]. The Conditions setting is a standard ServiceNow condition builder.
Tip: The Application Roles related list on the Subscriptions page includes all roles that are loaded with the plugin for the application. The roles in the list [that are identified as Subscription roles] form a good basis for constructing a user set. See View the roles that are associated with the plugin for a subscription application on page 2907.

c) Click ( ) to view the number of users that the filter generates. Members of the user set appear in the Subscription User Set Members related list.

4. To specify a user set based on user groups that should be included in the set:
   a) In the Source field, select Group [sys_user_group]
   b) Unlock the Groups box and add appropriate groups.
   c) Click ( ) to view the number of users that the filter generates. Members of the user set appear in the Subscription User Set Members related list.

5. When the Subscription User Set Members related list is correct, click Submit or Update. The user set that you created is available to add to any subscription.

Add a user set to a subscription
When you add a user set to a subscription, all users in the user set are allocated to the subscription.

Role required: usage_admin or admin

1. Navigate to Subscription Management Subscriptions.
2. Click the Name of the Per-User subscription to allocate users to.
3. On the User Sets related list, click Edit.
4. The Add User Sets form displays the list of user sets that you can add. Move the desired user sets from the Collection list into the User Sets list and then click Save. The users in the list are allocated to the subscription and the number of subscribed users is updated.

Note: In the case that adding the users would exceed the subscription limit, then none of the users in the user set are subscribed. Instead, all users in the user set are set to the Pending state and are listed in the Pending Users related list. Users that are currently subscribed are not affected. See Manage users in the Pending state on page 2916.

5. You can configure any subscription to check associated user sets for updates regularly and then update the list of subscribed users accordingly. On the Subscription form, select Auto-sync with user sets.

Note: If you do not select the Auto-sync with user sets option, then the user sets that you add to the subscription are never updated and the list of subscribed users does not auto-update over time.

6. On the Subscription form, click Update.

Auto-sync a subscription to user set updates
You can configure any subscription to check user sets regularly to find users who were added or removed. The system regularly subscribes or unsubscribes users based on updates to user sets.

Role required: usage_admin or admin
If the system cannot allocate a user because adding the user would exceed the subscription limit, the user is set to the Pending state and is listed in the Pending Users related list.

1. Navigate to Subscription Management Subscriptions.
2. Click the Name of the Per-User subscription to update.
3. On the Subscription form, select Auto-sync user sets.
4. On the Subscription form, click Sync Now to synchronize and update the list of subscribed users immediately.

Remove a user set from a subscription
When you remove a user set from a subscription, the system attempts to unsubscribe all users in the set. User sets are removed regardless of the Auto-sync with user sets setting.

Role required: usage_admin or admin
1. Navigate to Subscription Management Subscriptions.
2. Click the Name of the Per-User subscription.
3. In the User Sets list, select all user sets to remove.
4. In the Actions on selected rows list, select Remove From Subscription. On the Remove User Set from Subscription pop-up, click Remove.
   All users in the selected user sets are unsubscribed. If users in the user sets are pending, then the users are removed from the Pending Users list.

Delete a subscription user set
You can delete a subscription user set only if no subscriptions use the user set.

Role required: usage_admin or admin

**Note:** Deleting a user set is a permanent action — the user set will no longer exist. In contrast, you can remove a user set from a subscription to unsubscribe all users in the user set — the user set will still exist.

1. Ensure that the user set is not used by any subscription.
2. Navigate to Subscription Management Subscription User Sets and select the user set.
3. Click Delete.

Allocate an individual user from the Subscription form
In addition to adding user sets to a subscription, you can add individual users directly. Users that you allocate directly are subscribed immediately.

Role required: usage_admin or admin

**Note:** A user set, not individual allocation, is the preferred automated method for managing the pool of users who are subscribed to an application. Once you configure and allocate a user set, you do not need to manage individual users.

1. Navigate to Subscription Management Subscriptions.
2. Click the Name of the Per-User subscription to allocate users to.

3. Optional: On the Subscription form, to ensure that you do not exceed the purchased subscription limit, click Limit to purchased.

4. On the Subscribed Users related list, click Edit.

5. The form displays the list of users that you can add. Move the desired users from the Collection list into the Subscribed Users list and then click Save.

   The selected users are allocated to the subscription and the Allocated value is updated. If allocating a user would exceed the subscription limit, the user is not subscribed. Instead, the user is set to the Pending state and is listed in the Pending Users related list. See Manage users in the Pending state on page 2916.

6. Click Update on the Subscription form.

Allocate an individual user from the User Record form

To simplify the process of setting up user capabilities, you can allocate or deallocate an individual user to a subscription while viewing the user data on the User form. Users that you allocate directly are subscribed immediately.

Role required: usage_admin or admin

**Note:** A user set, not individual allocation, is the preferred automated method for managing the pool of users who are subscribed to an application. Once you configure and allocate a user set, you do not need to manage individual users.

1. Navigate to User Administration Users and then click the Name of the user. The User form opens.

2. On the Manage Subscriptions related list, click Edit.
3. The Edit Members slushbucket lists the subscriptions that you can allocate the user to. To allocate the user, move a subscription from the Collection list into the Manage Subscriptions list and then click Save.

The selected users are allocated to the subscription and the Allocated value is updated. If allocating a user would exceed the subscription limit, the user is not subscribed. Instead, the user is set to the Pending state and is listed in the Pending Users related list. See Manage users in the Pending state on page 2916.

To deallocate the user, move a subscription from the Manage Subscriptions list into the Collection list.

4. Click Update on the User form.

The Subscriptions related list is updated to list all subscriptions that the user is allocated to and the applications that the user is subscribed to.

Manage users in the Pending state

Users are set to the Pending state when adding the users would exceed the subscription limit (the Purchased value).

Role required: usage_admin or admin

Users are added to the Pending Users list when you attempt to allocate users in the following situations:

- User sets: If adding the user set exceeds the subscription limit, the user set is not added and all users in the set are set to the Pending state.
- Individual user: If allocating a user directly would exceed the subscription limit, the user is not subscribed and is instead set to the Pending state.

1. Navigate to Subscription Management Subscriptions.
2. Click the Name of the Per-User subscription.
3. In the Pending Users related list, select all users to update.
4. In the Actions on selected rows list, select an action.

<table>
<thead>
<tr>
<th>Action</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allocate selected users</td>
<td>Allocates the users to the subscription and removes the user from the Pending Users list.</td>
</tr>
<tr>
<td></td>
<td>• If the Limit to purchased option is selected and adding the selected users would exceed the subscription limit (the Purchased value), then the action is not allowed.</td>
</tr>
<tr>
<td></td>
<td>• If the Limit to purchased option is not selected and adding the selected users would exceed the subscription limit (the Purchased value), then the system displays a pop-up to notify you.</td>
</tr>
<tr>
<td>Exclude from subscription</td>
<td>Excludes the user and removes the user from the Pending Users list.</td>
</tr>
<tr>
<td></td>
<td>Excluded users cannot be allocated to the selected subscription. The auto-sync process does not add excluded users.</td>
</tr>
<tr>
<td>Delete</td>
<td>Removes the selected users from the Pending Users list and performs no other action.</td>
</tr>
</tbody>
</table>
Unsubscribe a user

When you remove a user from a subscription, the user is unsubscribed.

Role required: usage_admin or admin

1. Navigate to Subscription Management Subscriptions.
2. Click the Name of the Per-User subscription.
3. In the Subscribed Users list, select all users to unsubscribe.
4. In the Actions on selected rows list, select Remove from subscription and then click Remove on the pop-up.

**Note:** If you unsubscribe a user who is a member of a user set that is associated with an auto-synced subscription, the user will be resubscribed in the next synchronization cycle. To remove such a user, exclude the user.

Exclude a user from a subscription

You can exclude users. Excluded users cannot be allocated to a specified subscription. The auto-sync process does not add excluded users.

Role required: usage_admin or admin

1. Navigate to Subscription Management Subscriptions.
2. Click the Name of the Per-User subscription.
3. In the Subscribed Users list, select all users to exclude.
4. In the Actions on selected rows list, select Exclude from subscription and then click Exclude on the pop-up.

Remove a user from the Excluded list

You can unexclude a user so that the user can be allocated to a subscription.

Role required: usage_admin or admin

1. Navigate to Subscription Management Subscriptions.
2. Click the Name of the Per-User subscription.
3. In the Excluded Users related list, select all users to unexclude.
4. In the Actions on selected rows list, select Delete and then click Delete on the pop-up.

The selected users are no longer excluded and are removed from the Excluded Users related list. No other action is taken.

**Note:** The users are not yet allocated to the subscription. You must manually add the users or synchronize the associated update set. On the Subscription form, click Sync Now to synchronize and update the list of subscribed users immediately.

Monitoring how subscriptions are allocated

You use the modules in the Subscription Management application to manage and monitor your purchased subscriptions throughout the subscription life-cycle. ServiceNow notifies usage admins by email when subscriptions are added or updated on your instance.
Subscription life cycle

1. Receive and view subscriptions
2. Allocate users to subscriptions
3. Monitor and adjust subscribed users
4. Plan for renewing subscriptions
5. Review the subscriptions that your organization has purchased

Subscription Management tasks

<table>
<thead>
<tr>

• *View Subscription Management history reports* on page 2907                                                             |
| Review the subscriptions that your organization has purchased | View the list of all types of subscriptions and check allocation levels at a glance.                                                                                                                      | Subscriptions module: *View your subscription applications and allocation levels* on page 2901                          |

**Monitor how resources are allocated to subscriptions**

Use the Subscription Overview module to monitor how users and resources are allocated to subscriptions.

Role required: usage_admin or admin

The system displays one chart for each subscription. You can:

- Monitor how resources (for example, discovered nodes or password reset requests) use Capacity subscriptions.
- Plan and budget for upcoming or future subscription needs.
- Assess whether you have allocated too many fulfiller users to a Per-User subscription. You might deallocate some users or purchase a subscription for more users.
- Assess whether you have allocated too few fulfiller users to a Per-User subscription. You might allocate more users.
- Determine whether users who are not subscribed are accessing a subscription application.

Navigate to Subscription Management Subscription Overview.

The Expired Subscriptions report lists all subscriptions where the service contract term has expired (the end date has passed). You should assess whether to renew any subscription that has expired.
Each Subscription Metrics chart displays the following data for a single subscription (at least one month of data is required):

- **Purchased**: The number of resources purchased for the subscription.
- **Allocated**: The average number of users for the month who have been allocated to the subscription.
- **Non-subscribed users**: The average number of individual users who performed fulfiller actions in the associated applications without being subscribed to the applications. Click a data point to view the application.

In the example, the organization updated the purchased subscription from 15 to 20 users in November 2015. Over the course of April 2016, the usage admin had allocated an average of about 19 users. In addition during the period, one user who was not subscribed performed fulfiller actions in an application associated with the subscription.
Monitor subscription compliance

Use the Compliance Overview module to monitor fulfiller actions by subscribed users and by users who are not subscribed to an application that your organization has purchased. In addition, a chart shows usage for applications where your organization has not yet purchased a subscription.

Role required: usage_admin or admin

Navigate to Subscription Management Compliance Overview to view the following charts:
• The Unique Application Users chart shows the number of individual subscribed users who performed fulfiller actions in the application. Each user is counted one time only, regardless of number of accesses.

• The Unique Out-of-Policy Users chart shows the number of individual users who performed fulfiller actions in the application without being subscribed to the application. Each user is counted one time only, regardless of number of accesses. This chart might alert you to users in the Pending state or users who are accessing the application without being subscribed.

• The Application Use Without a Purchased Subscription chart shows the number of users who performed fulfiller actions in an application even though your organization has not purchased a subscription for the application.

Configure the color codes for subscription allocation levels

On lists, forms, and charts, a configurable color code indicates the percentage of the subscription that has been allocated.

Role required: usage_admin or admin

In the example, the green color code for the Financial Management application and the yellow code for the Fulfiller application indicate that you can allocate additional users. The red code for Facilities Service Automation indicates that you have allocated more users than you have purchased a subscription for.

1. Navigate to Subscription Management Properties.
2. Update the Threshold for color codes [subscription.used.thresh] property setting and then click Save.

Specify a percentage value greater than 0 and less than 100. Default: 90% of the purchased subscription limit.

• Subscription allocation levels below the specified threshold are marked with a green color code.
• Allocation levels between the threshold and 100% are marked yellow.
Survey Management

With the ServiceNow® Survey Management application you can create, send, and collect responses for basic surveys. If installed, you can also use the Survey widget to set up a survey within Service Portal.

Get started with Survey Management

Two versions of the application are supported, Survey Management, which is the latest version, and Legacy Surveys. Survey Management improves the user interface and extends the capabilities of the Legacy Surveys application.

**Note:** Survey Management does not support domain separation.
Configuring surveys

There are many options for advanced configuration in Survey Management:

- Create a survey, add questions, and choose recipients, all in one interface.
- Create conditional questions, which appear only when users answer other questions a certain way.
- Restrict a survey so only specific survey users can take it, and send invitations to those users simultaneously. Alternatively, make the survey a public survey so that any user can take the survey, even users who have not logged in to the ServiceNow system.
- Set a schedule to automatically assign a survey to users and to limit how often the same user can take a survey.
- Customize the look and feel of survey questionnaires.
- Save anonymous survey responses.
- Convert survey responses to numerical scores and view them on scorecards.
- Deactivate a survey for maintenance or to retire it without deleting it.

Note: Because surveys use the same tables and other back-end components as assessments, you may see assessment elements such as table and field names in certain places throughout the survey feature.

Legacy Surveys

Survey administrators can continue to use legacy survey functionality and data, however, it is recommended that you migrate legacy surveys to the Survey Management application. Concurrent use of both survey applications can cause confusion and redundancy.

Survey wizards are not impacted and cannot be migrated.

Note: The Legacy Surveys application is not described in the documentation that you are viewing. It is documented on the ServiceNow wiki.

**Survey Management roles**

The Survey Management application uses the following roles.

No role is required to take assigned survey questionnaires.
Table 1169: Survey Management roles

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
</table>
| Survey administrator     | Create and administer surveys. Survey administrators know what types of surveys are necessary, when to send a survey, and to whom. Survey administrators can use all modules in the Survey application menu. | • survey_reader  
• assessment_admin |
| Survey reader            | View surveys and related information, such as survey responses, survey groups, scorecards, and reports. | none |

Key survey terms

These survey terms are used throughout the documentation to describe survey management functions and capabilities.

Table 1170: Key survey terms

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey definition</td>
<td>Root record on which a survey is built. A survey definition contains information such as the survey name, state, and distribution schedule. Each survey definition has its own categories and questions. Survey definitions are comparable to legacy survey masters.</td>
</tr>
<tr>
<td>Public survey</td>
<td>Any user can take a public survey, even users who have not logged in to the ServiceNow system. For a completed survey, the Assigned to field value is Guest.</td>
</tr>
<tr>
<td>Survey category</td>
<td>Represents a theme for survey questions. Categories contain one or more questions. The system creates one category per survey by default. Additional categories are optional.</td>
</tr>
<tr>
<td>Survey question</td>
<td>A question that appears on a survey questionnaire for the associated survey definition. Survey questions are comparable to legacy survey questions.</td>
</tr>
<tr>
<td>Survey user</td>
<td>User who is authorized to receive invitations for a restricted survey.</td>

<td>Survey instance</td>
<td>Represents one survey questionnaire assigned to one user. Survey instances are comparable to legacy survey instances.</td>
</tr>
<tr>
<td>Trigger condition</td>
<td>Defines a rule that enables the system to send a survey when an action occurs on a table, such as when an incident closes. Trigger conditions are comparable to legacy survey conditions.</td>
</tr>
<tr>
<td>Scorecard</td>
<td>Visual representation of survey responses. Scorecards display a variety of data summaries for one survey definition.</td>
</tr>
</tbody>
</table>

Survey questionnaires

All surveys that are assigned to you appear in your personal assessment and survey queue.

No special role is required to complete a survey but you must be logged in and the survey must be assigned to you. When you submit a survey, the system stores your responses.

Survey notification

If the system is configured to send email, it sends you a notification when a survey is assigned to you. The message contains a link to the survey and instructions for viewing the assessment and survey queue.

Take a survey

Surveys that are assigned to you, and that are not complete, appear in your assessment and survey queue.

Role required: none

Each assessment or survey appears as a card in the queue. The card contains helpful information, including the survey name, state, and due date, and a button to launch the questionnaire. Overdue surveys are clearly marked with a red icon and red due date. You must answer every mandatory question, indicated by a red asterisk, before you can submit the survey. If you start to take a survey but cannot complete it, save your responses and return to it later. When you have answered all the questions and are satisfied with the responses, submit the survey.

1. Navigate to Self-Service My Assessments & Surveys.
   Users with the assessment_admin role, including survey administrators, can display other users’ assessments and surveys in addition to their own. Use the Show all and Show assigned to me related links at the bottom of the queue to show and hide assessments and surveys. Click a card assigned to another user to open the associated metric type or survey definition.

2. Click Take Survey on a survey card to open the questionnaire.
   If there is more than one survey category, you can click the collapse or expand icon to hide or show the questions in the category.

3. Answer each question to the best of your ability.
   If you are unsure of how to respond to a question or if a question does not apply to a particular record, select Not Applicable, if available.
4. Complete one of the following steps.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Save your responses without submitting them</td>
<td>Click Save. You can close the questionnaire and access it later from your queue. <strong>Note:</strong> The system does not save the survey if there are invalid responses, such as a letter in a date field. You must enter valid responses or remove invalid responses before you can save the survey.</td>
</tr>
<tr>
<td>Submit the survey after answering all questions</td>
<td>Click Submit. You cannot return to the questionnaire after submitting. <strong>Note:</strong> If there is an unanswered mandatory question or an invalid response, an error message appears and the problematic questions are temporarily highlighted.</td>
</tr>
</tbody>
</table>

**Domain separation for Survey Management**

This is an overview of domain separation as it pertains to Survey Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

**Overview**

Support: Data only

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

As a survey creator, survey_admin can create surveys in the assigned domain. A Global domain survey_admin can create or edit survey in any domain.

As a survey taker, a user can access the survey record and take the survey based on the domain of the survey record and user. Global domain users can take a survey in any domain.

**How domain separation works in Survey Management**

There are several main areas to consider in how domain separation works in Survey Management.

Survey Management in domain-separated instances

The following domains are available by default after activating the Domain Support-Domain Extensions Installer [com.glide.domain.msp_extensions.installer] plugin. Only ServiceNow employees can activate this plugin.

- Global
- Acme
Access to surveys in domain-separated instances

Based on the domain of the survey record and users, users can access the survey record and take the survey.

Global domain users can access survey records in any domain. Users in any other domain can access records in their domain and Global domain. For example, users in the Acme domain can access records in the Acme domain and the Global domain.

Global domain users can take a survey in any domain. Users in any other domain can take surveys in their domain as well as the Global domain. For example, users in Acme domain can take surveys in the Acme domain and the Global domain.

<table>
<thead>
<tr>
<th>Location of the survey record</th>
<th>Users who can access and take the survey</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Global</td>
</tr>
<tr>
<td>Global</td>
<td>Yes</td>
</tr>
<tr>
<td>Acme</td>
<td>Yes</td>
</tr>
<tr>
<td>Cisco</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Any domain user can assign a survey in that domain to the same domain user or a Global domain user. For example, an Acme domain user can assign a survey to a Global domain user or an Acme domain user. Users from other domains are not visible to the Acme domain user.

Although the Global domain user can view a survey from other domains, this user cannot assign the survey of one domain to a user from a different domain. For example, a Global domain user can assign a survey from the Acme domain to another Global domain user or an Acme domain user, but not to a Cisco domain user.

Note: When a task is closed in a child domain and the assigned survey is either in the child domain or the global domain, the user from the child domain can then take the survey.

Trigger conditions in domain-separated instances

A Global domain user can create a triggered condition for a survey from any domain. The Global domain user can create an incident and trigger the survey by selecting a user from the other domain in the User field under Caller. However, the Global user cannot assign the survey to the user of different domain.

A user can assign a trigger condition to a survey if the user belongs to the Global domain or the Survey domain.

If there is no domain path for a trigger condition, users from any domain can view the trigger condition. For example, in the asmt_condition table that has no column for the domain path, users from the Acme domain can view the trigger condition created by the Cisco domain users.

Survey responses and results

There is a metric result record for each user response to each question on every survey instance. Survey results for each question and category are calculated automatically based on the metric result records.

If you use survey result calculations for results and scorecards, ensure that the positive indicator field for the question is set appropriately, based on the answer options. To have any results, a category must contain scored questions.
Survey responses

Survey responses are stored in the Metric Result [asmt_metric_result] table and display the recipients’ answers to each question in a category. To view general results, navigate to Survey Survey Responses. To view results for a particular criterion, use a filter on the Metric Result [asmt_metric_result] table. For example, to view results based on the assignment group, apply a filter condition for assignment group.

![Survey metric results](image)

Figure 634: Survey metric results
Category results

Category results are stored in the Assessment Category Result [asmt_category_result] table and display the overall ratings for each category based on the weighted value for each scored question. To view these results, navigate to Assessments Results Category results and filter the results using the [Type.Evaluation method] [is] [Survey] condition.

![Survey filter]

Figure 635: Assessment category results

Survey scorecards

A scorecard provides a visual breakdown of survey responses, based on the way questions were answered, by category. To access a scorecard, see View a survey scorecard on page 2451.
View results for all surveys

You can view the survey responses that are stored on the Metric Result [asmt_metric_result] table.

Role required: survey_admin or survey_reader

1. Navigate to Survey Survey Responses.
   Do not confuse this module with Survey Legacy Surveys Survey Responses, which displays legacy survey responses.
   The Type column displays the survey definition each response is associated with.
2. Select a response to view its details.

View the results for a survey

You can view the responses for one survey definition. Survey results are stored on the Metric Result [asmt_metric_result] table.

Role required: survey_admin or survey_reader

1. Navigate to Survey View Surveys
2. Open a survey definition.
3. Under Related Links, click View Responses, which is available only if there are results.
   The results are grouped by metric, which is what questions are called in assessments.
4. Open a metric result to view more detail.
   The metric result contains the user's response and calculated values of interest to advanced survey administrators. Because the Metric Result table is also used by the assessment feature, many field names are not clear in the context of surveys.
## Metric result fields

List of field descriptions for the Metric Result form.

### Table 1171: Metric Result form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment group</td>
<td>Assessment group to which the metric result belongs. An assessment group is a container for survey instances and results generated in a single occurrence. The system generates an assessment group every time at least one survey instance is created. If multiple survey instances are created at once, such as when a survey administrator sends invitations to a list of survey users, they are all stored in the same assessment group.</td>
</tr>
<tr>
<td>Metric</td>
<td>Question that the user answered.</td>
</tr>
<tr>
<td>Data type</td>
<td>Data type of the question the user answered.</td>
</tr>
<tr>
<td>Method</td>
<td>Assessment method. Always Assessment for surveys.</td>
</tr>
<tr>
<td>Updated</td>
<td>Date and time the metric result was last updated.</td>
</tr>
<tr>
<td>Source</td>
<td>Survey definition from which the associated survey instance was generated.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User who completed the survey questionnaire.</td>
</tr>
<tr>
<td>Instance</td>
<td>Survey instance completed by the Assigned to user.</td>
</tr>
<tr>
<td>Actual value</td>
<td>Value obtained from the user response to the question. The actual value is determined by the question data type:</td>
</tr>
<tr>
<td></td>
<td>• Checkbox: The actual value is 0 if the checkbox is cleared and 1 if it is selected.</td>
</tr>
<tr>
<td></td>
<td>• Choice or Likert Scale: The actual value is equal to the Value of the metric definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>• Date, Date/Time, or String: The actual value is -1 to indicate that these data types do not contribute to category result calculations.</td>
</tr>
<tr>
<td></td>
<td>• Template: The actual value is equal to the Value of the template definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>• Yes/No: The actual value is 0 if the response is No and 1 if it is Yes.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Normalized value</td>
<td>Adjusted value that accounts for the Scale definition setting, minimum and maximum values, and other factors. The equation that generates the value and an example calculation appear in Example: calculate the normalized value for a survey metric on page 2450.</td>
</tr>
<tr>
<td>String value</td>
<td>Value that displays the response as it appears on a questionnaire. In some cases this is the same as the Actual value, such as when the question data type is Percentage. The string value is N/A for unanswered questions of certain data types.</td>
</tr>
</tbody>
</table>

**Example: calculate the normalized value for a survey metric**

The normalized value is calculated based on a linear equation and the scale definition of the metric.

**Equation used to calculate the normalized value**

Normalized value = (Input Value - Min value defined in metric) / (Max value defined in metric - Min value defined in metric) * current metric weight / (sum of valid metric weight) * scale_factor

**Note:** The normalized values are directly proportional to the scale definition of the metric. If the scale definition is low, that is, the lower scale values are better, then Normalized value = 1.0 – Normalized value.

**Example**

Calculate the normalized value for the Please rate the competency of the technician metric. The metric has the following values:

<table>
<thead>
<tr>

<tr>
<td>Current metric weight</td>
</tr>
<tr>
<td>Number of responses</td>
</tr>
<tr>
<td>• 4 of type=number</td>
</tr>
<tr>
<td>• 1 of type=yes/no</td>
</tr>
<tr>
<td>• 1 of type=string (invalid data type; value cannot be calculated)</td>
</tr>
<tr>
<td>Valid metric weight of each response</td>
</tr>
</tbody>
</table>
Normalized value = \( \frac{3 - 1}{(6 - 1) * 10}{\frac{10 + 10 + 10 + 10 + 10}{10}} \) = 0.8

Several data types are ignored because the values cannot be calculated. These invalid data types include string, date, and datetime.

For reporting purposes, use the Metric Result [asmt_metric_result] table.

### View a survey scorecard

A survey scorecard provides a visual breakdown of survey responses by category, based on the way questions were answered.

Role required: survey_admin or survey_reader

A scorecard displays charts for survey results, in which category and question responses are analyzed and current ratings are compared with previous ratings. Users can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages for the time range selected. The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed surveys.

1. Navigate to Survey View Surveys.
2. Open a survey definition.
3. Under Related Links, click View Scorecard. The interactive scorecard displays the following filters:
   - **Question Results**: Displays the result of all questions or an individual question.
   - **Category Results**: Displays the results of all questions associated with an individual category or all categories.
   - **Average Ratings**: Displays the result of weighted average rating for each survey question in an individual category or all categories.
   - **History**: Displays the result of all questions in comparison with their history (by calendar year or quarters).
   - **Sentiment Analysis Results**: Displays the results of sentiment analysis for the survey.

   **Note**: The scorecard link is hidden if there are no survey results to report.

### Survey scorecard category results

The Category Results view is a stacked bar chart showing survey results for all questions in an individual category or all categories by respondent count.

Select a category from the list to display the questions from that category in the chart.

This view displays responses that use the following data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No
- Multiple selection
- Image Scale
- Numeric Scale
Note: The Checkbox and Yes/No data types are combined into the Boolean data type in the Survey Designer

Figure 636: Survey category results

To view details about a specific response, point to the colored bar to display the response, the number of responses, and the percentage it represents of all the responses to that question.
Survey scorecard question results

The Question Results filter displays the result of all questions or an individual question using charts or lists. For the String, Attachment, Date, Date/time, Reference, and Ranking data types, the results are displayed in the list view. The results of all other data types are displayed in the pie chart view.

Pie chart

The pie chart shows question results for all data types other than those that are displayed in the list view. See Survey question data types on page 2480.

- Checkbox.
- Boolean.
- Choice.
- Likert Scale.
- Number.
- Percentage.
- Yes/No.
- Image Scale.
- Multiple Selection.
- Template. The question result shows the aggregated net promoter score (NPS) with promoters, detractors, and passives.

Table 1173: Net promoter score categories

<table>
<thead>
<tr>
<th>Question score</th>
<th>NPS category</th>
</tr>
</thead>
<tbody>
<tr>
<td>9 or 10</td>
<td>Promoter</td>
</tr>
<tr>
<td>7 or 8</td>
<td>Passive or Neutral</td>
</tr>
<tr>
<td>0 to 6</td>
<td>Detractor</td>
</tr>
</tbody>
</table>

The result is calculated as:

- %Promoters = Number of promoters / Sample size
- %Detractors = Number of detractors / Sample size
- %Passives = Number of passives / Sample size
- NPS = %Promoters - %Detractors

Note: The Checkbox and Yes/No data types are combined into the Boolean data type in the survey designer.
Service Desk Satisfaction Survey

Survey Scorecard

How courteous and respectful was the technician who responded? (1=poor, 6=excellent)

2 = 2 (14.29%)  3 = 2 (14.29%)  4 = 9 (54.29%)  5 = 1 (7.14%)
Survey scorecard average ratings

The Average Ratings view displays the weighted average rating for each survey question in an individual category or all categories.

Use this view to learn how individual questions affect the overall rating for the category. Select a survey category from the choice list to display the chart for that category.
Service Desk Satisfaction Survey

Average Normalized value
To view the effect of each question's ratings on the entire category's ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question's weighted average.

![Average ratings detail](image)

**Figure 640: Average ratings detail**

**Survey scorecard history**

The History view compares the current ratings for the categories and their questions with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the Diff column indicate the trend of the current survey against the previous survey.

Point to a category to display a line chart that shows the rating trend for that category. Click a category to view the Survey Category form containing the survey questions.
To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The Diff column shows the discrepancy between the current ratings and the previous calendar year’s ratings.
### Service Desk Satisfaction Survey

</tr>
</tbody>
</table>

**Figure 642: Survey scorecard history - 3 years**
4 quarters

Quarterly surveys compare the average rating for each question and category in the current quarter against the average ratings from the previous four quarters. The Diff column shows the discrepancy between the current ratings and the previous quarter's ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the 3rd quarter of 2015, then the previous quarters appear as 2nd [2015], 1st [2015], 4th [2014], and 3rd [2014]. All four of the previous quarters appear, whether or not there was any data for those quarters.
Figure 643: Survey scorecard history - 4 quarters
Export a survey scorecard as an image

You can export a scorecard as an image to use in presentations or other documents.

Role required: admin or survey_admin

1. Click the menu icon (≡) and select Save as PNG or Save as JPEG and wait for the export to complete.

2. Click Download and save the scorecard image to a storage location.
Survey administration

Survey administrators—users with the survey_admin role—create and maintain surveys and configure how they are distributed and published. Surveys on Service Portal are also supported.

Survey administration includes the following procedures.

• Create, customize, and publish surveys.
• Write and maintain survey questions.
• Define trigger conditions for when surveys are sent to users, such as when an incident closes.
• Maintain surveys and survey questions as the organization's needs change.

To set up surveys in Service Portal, you must first install Service Portal and then configure the Survey widget on the page. The base system includes the Survey widget.

Surveys in Service Portal

If Service Portal is installed, you can use the Survey widget to set up surveys, quizzes, assessments, risk assessments, and attestations in Service Portal. Surveys for users on mobile devices are fully supported in Service Portal.

To create an intuitive interface for your users, you can set up surveys in Service Portal on page 2610. You must first install Service Portal and then configure the survey widget on the page. To learn more about configuring a widget, see configure widget instances.
To configure a Survey widget on a page, CTRL + right-click the widget heading and select Instance Options.

**Table 1174: Service Portal: Instance options (properties) for the Survey widget**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max records</td>
<td>Number of surveys to list on the Service Portal homepage. The user can click the View all link to view all items. Default: 5</td>
</tr>
<tr>
<td>Title of the widget</td>
<td>Text that appears in the title bar of the surveys widget. Default: My Surveys</td>
</tr>
</tbody>
</table>
Each survey on the My Surveys page contains a progress bar and a description. The color in the progress bar increases as a survey is completed. In the case of a triggered record, the table title is used for the survey description.

For mobile users, the Pagination setting for Service Portal view survey designer property is set to one question per page by default.
**One Click survey**

A One Click survey has no introduction page in Service Portal. This survey does not have the Submit and Cancel buttons in the desktop and iPad view.

**Note:**
- The One Click Survey field should be selected in the survey definition.
- If the public access is enabled for a One Click survey, a user can submit the survey without having to log in.

A kiosk survey is a One Click survey with only one question of any of the following types:
- Image Scale
- Choice
- Likert Scale
- Numeric Scale
- Yes/No

When you click the answer of the kiosk survey question in Service Portal, the survey is submitted and the end note is displayed on the same page as that of the survey questions.

**Note:**
- A kiosk survey does not have any Submit or Cancel buttons.
- A kiosk survey cannot have a signature, dependent questions, or additional information.

**URI parameters for One Click survey**

Pass these URI parameters through the createAssessment() API to store their values in the asmt_assessment_instance table for both platform view and Service Portal view.

**Table 1175: URI parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_refresh_interval</td>
<td>Refresh time (in seconds) after the survey submission to create another instance. For example, sysparm_refresh_interval=5.</td>
</tr>
<tr>
<td>sysparm_trigger_table</td>
<td>Location that is stored as the Trigger Table field in the asmt_assessment_instance table. For example, sysparm_trigger_table=incident.</td>
</tr>
<tr>
<td>sysparm_trigger_id</td>
<td>Location sysId that is stored as the Trigger ID field in the asmt_assessment_instance table. For example, sysparm_trigger_id=1c741bd70b2322007518478d83673af3.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>sysparm_kiosk</td>
<td>When set to true, both sysparm_trigger_table and sysparm_trigger_id parameters should be specified. This is a mandatory parameter for kiosk requests. For example, sysparm_kiosk=true.</td>
</tr>
</tbody>
</table>

View the overview of all surveys

Use this homepage to view various survey reports such as results by metric type and state. You can refresh, add, delete, and rearrange widgets. All reports on the Survey Overview page have demo data.

Role required: admin or survey_admin

1. Navigate to Survey Overview.
   The following reports are available:

   Table 1176:

<table>
<thead>
<tr>
<th>Report</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Surveys by Metric Type and State</td>
<td>Assessment Instance [asmt_assessment_instance]</td>
</tr>
<tr>

<td>Metric Result [asmt_metric_result]</td>
</tr>
<tr>
<td>Service Desk Survey 'Tech Competence' 60 Days</td>
<td>Metric Result [asmt_metric_result]</td>
</tr>
</tbody>
</table>

2. Click elements within the reports to view the required information.
3. To refresh, edit, or close a widget, point to the widget and select the required option.

Survey designer

Users with the survey_admin role can use the survey designer. The survey designer lets you create survey categories and questions, configure the details, and publish the survey to specific users or groups.

You can assign a survey to individual users or groups who receive all the questions from all the categories. You can also customize each question and make it dependent on the response to another question. The following describes the procedures you follow to create and publish a survey.

- Create survey categories.
- Create questions within each category.
• Configure survey details, such as introductory and closing remarks and time limit.
• Select recipients for the survey.
• Publish the survey to the selected users or groups.

**Note:** The survey designer replaces the survey creator in the Legacy Surveys application. If you are using Internet Explorer version 8 or earlier, the system redirects you to the survey creator.

**Survey designer elements**

The survey designer is accessible from Survey Survey Designer.

The survey designer contains controls, a header bar, and the design canvas.

**Controls**

To create a question, drag the appropriate data type control from the Controls palette and drop it onto the designer canvas.
Figure 644: Controls
The assessment engine provides a built-in result calculation feature that converts responses to scored question data types to a score from 0 through 10.

**Table 1177: Question data types**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Scored</th>
<th>Description</th>

<tr>
<td>Ranking</td>
<td></td>
<td>Question with an order number to be selected for each option. One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.</td>
</tr>
</tbody>
</table>

**Header bar**

The tabs on the header bar display views and a menu of functions. Click a tab to change the view on the canvas:

- Design: Add and configure the properties of categories and questions. This is the default view.
- Configuration: Create introductions and end notes for surveys and select a signature.
- Availability: Select the recipients for each category in the survey.

Point to the menu icon ( ) to select an option. The list of options depends on the currently open survey.

- Save: Save the current survey without changing its state.
- Preview: Display a preview of the survey as it appears to recipients.
- Publish: Distribute the survey to the selected recipients.
- Save and Publish: Save the survey to the Draft state and distribute the survey in one step.
- New Survey: Open a fresh canvas for a new survey.
- Load Survey: View the list of existing surveys.
- Copy Survey: Copy the current survey.

**Design canvas**

New surveys open in the canvas of the Design view. The survey Name field appears above first category in the canvas. A blank question field appears in the category container.
Configure a survey in the survey designer

Configuration settings apply to the entire survey.

Role required: admin or survey_admin

Select Configuration in the survey designer and complete the Survey Designer Configuration form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Select the check box to enable the distribution of this survey to recipients.</td>
</tr>
<tr>
<td>Anonymize responses</td>
<td>Select the check box to collect survey responses anonymously. Recipients are not listed with survey results. When a user submits a survey, the system clears the Assigned to field for the associated survey instance. Also, survey responses for anonymous surveys do not contain Assigned to values.</td>
</tr>
<tr>
<td>Note: The Assigned to field is cleared. However, each response record includes the Created By and Updated By fields that are accessible to users with the survey_admin role.</td>
<td></td>
</tr>
<tr>
<td>Description</td>
<td>Description of this configuration or the survey to which it is attached.</td>
</tr>
<tr>
<td>Introduction</td>
<td>Introductory content to display on surveys. You can add a welcome message or background information about the survey.</td>
</tr>

<td>Enables sentiment analysis for this survey.</td>
</tr>
<tr>
<td>Duration</td>
<td>Amount of time that recipients are given to complete this survey, starting from the time that the survey is generated. The default duration is 14 days.</td>
</tr>
<tr>
<td></td>
<td><em>Note:</em> By default, the system runs the Cancel Expired Assessments script every 30 days to cancel expired survey, assessment, and quiz instances that are in the Work in progress or Ready to take states.</td>
</tr>
</tbody>
</table>

**Survey categories**

Survey categories provide a way to group questions of a similar theme for a given survey.

There must be at least one survey category per survey definition and every survey question must be associated with a category. When you create a survey, the system generates one category, which all the questions belong to.

For simple surveys, one category is usually enough. Consider creating additional categories if you want to accomplish any of the following tasks.

- Separate groups of questions into collapsible sections by category on the survey questionnaire.
- Report on category scores, which are calculated based on responses for all questions within each category.

*Create a category in the survey designer*

A category represents a theme for evaluating a specific element of the survey topic and contains questions pertaining to that theme.

Role required: admin or survey_admin

When you create a survey, the system creates a default category, using the name of the survey. You can use this category, modify it, and create additional categories as needed. To have any results, a category must contain scored questions.

1. Navigate to Survey Survey Designer.
2. Enter the name of the survey in the Name field.
   - The system uses this name as the name of the survey and of the first category.
3. To configure the category, click the gear icon in its title bar and complete the following steps in the Properties dialog box.
   a) Enter a new name and a description for the category.
   b) Enter text in the Details field that introduces or explains the category to recipients.
c) Click the X icon to close the Properties dialog box and save your settings.

4. To add a new category, click the + icon in the title bar of an existing category. The new category appears below the category that you selected to create it. You can click the X icon in a category header to delete a category that you added in error.

Create a survey category in a survey
You can modify an existing survey to add one or more survey categories.

Role required: admin or survey_admin

Only one category is required for each survey, but you can add additional categories as needed.

1. Navigate to Survey View Surveys.
2. Open a survey definition.
3. In the Metric Categories related list, open a category or click New.
   Each survey category is stored as a record on the Metric Category [asmt_metric_category] table with a modified view for survey use.
4. Enter the survey category name and description.
   The category name appears on questionnaires when either of the following is true.
   • There is more than one category for the survey.
   • There is only one category and its name is different from the survey definition name. If you create a survey using the survey creator, the category name is the same as the survey definition name.
5. Right-click the form header and click Save.
   The Assessment Metrics and Users related lists appear.
6. Click Update.

Create a question in the survey designer
You can create multiple questions for each category in the survey designer, but each question can only be associated with one category.

Role required: admin or survey_admin

The data type that you select for each question determines how it can be answered by survey recipients.

1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.
2. To configure the question, click the gear icon in its title bar.
   The Properties dialog box opens.
3. Complete the form.

Table 1178: Question property fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Concise name of the question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as the question on surveys. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Type</td>
<td>Data type selected for this question. See the table in <em>Controls</em> for the available data types.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this question is available on a survey. A question does not appear on surveys that are generated after the question becomes inactive.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box to require users to answer the question. Mandatory questions are denoted by a red field status indicator and must be answered before the survey can be submitted. This field is available when the question does not have a dependency and the question type is not Boolean with a check box option.</td>
</tr>
</tbody>
</table>
| Allow Additional Information | If selected, the Additional Information Label field is enabled. The Additional Information Label field value is displayed as a field on the survey response page to provide additional information for a question.  
  
  **Note:** This is not applicable for the String and Template data types. |
| Boolean option             | Whether a check box or a Yes/No list appears as the option for a Boolean question.                                                        |
| String option              | Setting for the appearance of a string field in a question. This field is available when the question type is String. The string options include the following.  
  • Single line: Single-line text field 40 characters in length that allows strings of any length.  
  • String line wide: Full page width text field that allows a single-line entry of any length.  
  • Multiline: Full page width multiline text field that allows word wrap and returns |
<p>| Min                        | Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

<tr>
<td></td>
<td><strong>Note:</strong> This field is available only for String type questions.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question that is displayed on the survey. Include details that help users understand how to answer the question.</td>
</tr>
</tbody>
</table>
### Field: Choices

**Description:** Options for a question with a data type of Choice or Scale. The system automatically adds text and values that you can edit for each option. You must have at least two options, and each option must have a unique value.

Click the + icon to add an option, or click the X icon to delete an option. By default, the system arranges options in the order established by their values. To change the order, drag and drop the options.

**Note:** Value numbers also contribute to the calculations of survey response scores, which can be used by advanced survey administrators.

---

**4.** To create any special conditions that must be met before the question appears on the survey, click the Dependency tab.

The question must have a data type of Boolean, Choice, Scale, or Template.

**5.** Select a question in the Displayed when field.

The system selects the appropriate operator and displays the possible answers for the selected question.

**6.** Select the answer that satisfies the condition.

You can select more than one answer. Selected answers are indicated by a check mark.

The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.

**7.** Click the X icon to close the question properties dialog box and save your settings.

**8.** To add a question with the same data type as an existing question in the category, click the + icon in the title bar of the existing question.

**9.** Drag and drop questions to change their order within a category or move them between categories.

**10.** To delete a question, click the X icon in its title bar.
Survey question data types

You must choose a data type for each survey question. The data type determines the format of the question and the kind of data that is collected on survey questionnaires.

The following data types are available for surveys:

**Attachment data type**

On questionnaires, users can attach one or more files to a question.

Users click the Manage Attachments icon and select one or more files in the Attachments pop-up window to attach to the question. From this window, users can:

- View a list of the attached files.
- View an attached file in a separate window.
- Rename an attached file.
- Add or delete files

Once a survey has been submitted, attachments cannot be updated or deleted.

Any type of file supported by the platform can be attached to a question. One or more files can be attached a question while taking a survey or completing an assessment.

The assessment administrator can see the attachments associated with an individual question as well as those associated with the survey.

See *Administering Attachments* for more information.

**Boolean data type**

On questionnaires, users select a check box beside a statement or leave it cleared.

If you select Boolean, you must fill in the Scale definition field. Select High if it is best when users select the check box.

**Choice data type**

On questionnaires, users select a value from a list of choices.
If you select Choice, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

**Note:** The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

**Date and Date/Time data types**

The Date and Date/Time data types are similar.

- **Date:** On questionnaires, users select a date.

- **Date/Time:** On questionnaires, users select a date and time.
Likert Scale data type

On questionnaires, users select a multiple choice value from a custom Likert scale. Each answer option is represented by a radio button on the scale. A Likert scale question that evaluates an application’s ease of use might have the answer options Easy, Average, and Difficult.

If you select Likert Scale, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

Note: The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

Number data type

On questionnaires, users enter a number.
If you select Number, you must fill in these additional fields:

- Scale definition: Select High if a larger number is better, such as for a question that measures the number of sales made in a quarter.
- Min and Max: Enter the smallest and largest numbers users can enter. State the range of acceptable answers in the question text.

**Percentage data type**

On questionnaires, users enter a number.

If you select Percentage, you must fill in these additional fields:

- Scale definition: Select High if a larger percentage is better, such as for a question that measures the percentage of work an agent has completed.
- Min and Max: Enter the smallest and largest numbers users can enter. Generally 0 and 100 are appropriate minimum and maximum values. If you choose values other than 0 and 100, it is usually best to state the range of acceptable answers in the question text.

**Reference data type**

On questionnaires, users select a value from a list that is generated from a specified reference table. The response field supports auto-completion.

**Note:** Reference qualifiers are not supported.

For example, a user could select a user name in response to a question if you specify User [sys_user] as the reference table.
String data type

On questionnaires, users enter text. When you select String, the String option field appears. Select one of the following options to determine how the string field appears on questionnaires:

- **Figure 646: Single line**

**Additional comments**

```
Template data type

On questionnaires, users select a value from a predefined series of answer options. To use this data type, a question template must be defined.

If you select Template, you must fill in these additional fields:

- Template: Select a template.
- Scale definition: Select High if the answer option with the largest template definition Value is best.

Yes/No data type

On questionnaires, users select Yes or No from a list.

If you select Yes/No, you must fill in the Scale definition field. Select High if Yes is the best answer.
**Image Scale data type**

On questionnaires, users select an image from a predefined set of images as their response. Image scale questions can also be used in a template for better performance with surveys that have the same type of answer options.

Five emojis, similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Two images can be uploaded, one for selected case and another for unselected case. Larger size images are reduced to 64 x 64 pixels.

The result behavior depends on the presence of uploaded images. If no selected image is uploaded, then the question shows up blank.

<table>
<thead>
<tr>
<th>Selected image</th>
<th>Unselected image</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Unselected image loads. Clicking on the image changes it to the selected image.</td>
</tr>
<tr>
<td>Yes</td>
<td>No</td>
<td>Selected image loads with 50% opacity. Clicking on the image changes the opacity to 100%.</td>
</tr>
<tr>
<td>No</td>
<td>Yes</td>
<td>A blank placeholder box is displayed.</td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>A blank placeholder box is displayed.</td>
</tr>
</tbody>
</table>

**Note:** N/A option is not supported for image scale type question.

**Multiple selection data type**

On questionnaires, users can select multiple check boxes indicating all answers that apply. For instance, a user can be instructed to “Select all that apply” in a multiple selection question.
Ranking data type

On questionnaires, users can select a different order number for each option to rank them. Drag-and-drop functionality is also supported, which allows a user to either fill in the number, or simply drag an option.

One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.

Edit a survey in the survey designer

You can modify surveys using the survey designer.

Role required: admin or survey_admin
You can edit a survey even after it has been distributed, with the following results.

- Added questions are available only on surveys that are distributed after this change.
- Changes to existing questions are immediately available to users before the survey is submitted or during the retake period. This includes changes to the answers, such as additional choices or changes to the data type.
- Deleted questions are also deleted from the distributed surveys in user queues.

**Note:** You can only edit a survey that has the same application scope as that of your current session.

1. Navigate to Survey Survey Designer.
2. Point to the menu icon in the survey header bar, and select Load Survey.
3. Select a survey from the list and modify it as needed.

**Configure category weights for a survey**

You can assign a weight to each category in a survey. The system calculates results from the weight that you configure.

Configure the Survey Category form to display the Weight field.

Role required: admin or survey_admin

Weights are set to a value of 10 by default but can be changed.

1. Navigate to Survey View Surveys and select a survey from the list.
2. In the Survey Definition form, select a category from the Metric Categories related list.
3. Edit the default weight value.
4. Click Update.

**View a survey instance**

A survey instance represents one questionnaire assigned to one user. You view an instance to verify that survey instances were created, to check the state of a survey instance, or to reassign a survey instance.

Role required: admin or survey_admin

1. Navigate to Survey Survey Instances. The following sub-modules are available based on the state of the instances:
   - Ready to take: Displays survey instances that are ready to be taken by the user. By default, these instances are sorted in ascending order by the Number field.
   - In progress: Displays survey instances that are in progress. By default, these instances are sorted in ascending order by the Number field.
   - Completed: Displays survey instances that are complete. By default, these instances are sorted in descending order by the Taken on field.
   - Cancelled: Displays survey instances that are cancelled. By default, these instances are sorted in ascending order by the Number field.
   - All: Displays survey instances in all states. By default, these instances are sorted in ascending order by the Number field.
2. Open a survey instance from the required sub-module. By default, the following fields are displayed in the Survey Instance form for all sub-modules other than Completed.

**Note:**
- When you open an instance in the Completed sub-module, you are redirected to the User's Response page.
- Each survey instance is stored as a record on the Assessment Instance [asmt_assessment_instance] table with a modified view for survey use.

### Table 1179: Survey Instance form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Automatically generated record number.</td>
</tr>
<tr>
<td>Metric type</td>
<td>Survey definition this survey instance was created from. Survey definitions are stored on the Assessment Instance table, and the field label on that table is Metric type.</td>
</tr>
<tr>
<td>Due date</td>
<td>Date by which the survey instance should be completed. The system populates the due date based on the Assessment duration of the associated survey definition, which is set to 14 days by default. The survey due date is not enforced in the base system. If you want to enforce the due date, consider using a workflow or other mechanism to send survey recipients reminders when a survey is overdue.</td>
</tr>
<tr>
<td>State</td>
<td>State of the survey instance.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User this survey instance is assigned to. This field becomes read-only when the state is In progress, Complete, or Canceled.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain associated with the instance.</td>
</tr>
<tr>
<td>Expiration date</td>
<td>Date on which the assigned user can receive a new instance of the same survey definition. The system automatically populates the expiration date based on the Schedule period of the associated survey definition.</td>
</tr>
<tr>
<td>Related Link</td>
<td></td>
</tr>
<tr>
<td>View User's Response</td>
<td>Shows a read-only version of the survey responses completed by the user.</td>
</tr>
</tbody>
</table>

*Note:* By default, the system runs the Cancel Expired Assessments script every 30 days to cancel expired survey, assessment, and quiz instances that are in the Work in progress or Ready to take states.
## Retry Sentiment Analysis

Sends the survey instances for sentiment analysis.

**Note:** This link is available only if any sentiment analysis result is not available for this instance under Survey Question Sentiment Results

## Related List

### Assessment Instance Questions

All instance question records, which store user response values for each question on the survey questionnaire. The following columns are relevant to surveys:

- **Category:** Displays the survey categories the questions belong to.
- **Metric:** Displays the survey questions.

### Survey users and groups

Survey users and survey user groups help survey administrators control who can take a survey.

Survey administrators can restrict a survey so that only specified users can access it unless a survey administrator manually assigns the survey to a different user. Survey user groups provide a way to quickly designate multiple survey users.

### Administering survey users

The list of survey users for a survey is visible on the Survey Definition and Survey Category forms. You can add or remove users from the list of survey users at any point. Note that designating a survey user does not automatically generate a survey instance for that user unless both of the following conditions are true:

- The survey definition Schedule period is set to Daily, Weekly, Monthly, or Yearly. In this case the system assigns a new survey instance to each survey user at the beginning of each schedule period.
- The user has no instances of the survey that are incomplete or that have not yet reached their expiration date.

You can designate survey users from the Survey Designer, the Survey Definition form, or the Survey Category form.

**Note:** If there are trigger conditions for a survey, do not create survey users. Instead, use the Trigger Conditions form to assign users.

### Create a survey user group

Survey user groups are groups that have the Type field set to survey and that display only the information most relevant to surveys. You can assign survey groups or any user group to surveys.

Role required: admin, user_admin, or survey_admin
Though it is possible to designate members of any group as survey users, one reason to create a survey group is to view it conveniently in the survey User Groups module.

1. Navigate to Survey Administration User Groups.
2. Click New.
3. Complete the Group form.
4. Right-click the form header and click Save.
   The Group Members and Groups related lists appear.
5. To add group members, complete the following steps:
   a) In the Group Members related list, click Edit.
   b) Select users from the list on the left and add them to the Group Members List on the right.
   c) Click Save.

Select recipients for a survey in the Survey Designer

You can assign survey users while designing or modifying the survey.
Role required: admin or survey_admin
1. In the Survey Designer, click the Availability tab.
2. Under Accessible by:, select the Specific users option, then select users.
3. If desired, select the Survey groups only check box, then select survey user groups or other groups.
4. Click Save.

Designate a survey user

You can designate one survey user at a time from the Survey Definition form.
Role required: admin or survey_admin
1. Navigate to Survey View Surveys.
2. Open a survey definition.
   There must be at least one category.
3. In the Survey Users related list, click New.
4. Select a User.
5. Click Submit.
   The Survey Definition form reopens.
6. To remove survey users, in the Survey Users related list, select the check box beside the user, and then select Delete from the action list below the list.

Designate or remove multiple survey users at one time

Use the Survey Category form to designate or remove multiple survey users at one time.
Role required: admin or survey_admin
1. Open a survey definition.
2. In the Metric Categories related list, open a category.
   You can choose any category. The system applies survey user changes to all the survey's categories automatically.
3. In the Users related list, click Edit.
4. Use the slushbucket to add or remove survey users.
5. Click Save to return to the survey category. The changes are also reflected in the Survey Users related list on the survey definition.

Allow recipients to retake a survey

You can configure a survey to allow recipients to resubmit their answers as many times as they like, up to the survey's due date.

Configure the Survey Definition form to display the Allow retake field. For more information, see *Configuring the form layout*.

Role required: admin or survey_admin

Results are not calculated for the survey until the configured duration has elapsed. The card in the user's queue remains visible until the due date of the survey, and a button is displayed to allow retakes.

1. Navigate to Surveys View Surveys.
2. Select a survey from the list.
3. Select the Allow retake check box.
4. Click Update.

Copy a survey

Create a copy of a survey with at least one category. All associated questions (type), configurations, categories, metrics, domain separation rules, and role-based categories are copied. Assigned users, category users, instances, and trigger conditions are not copied.

Role required: survey_admin or admin

1. Navigate to Survey View Surveys.
2. Open a survey definition.
3. Perform any of the following steps:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Platform</td>
<td>In the title bar, click Copy.</td>
</tr>
<tr>
<td>From Platform</td>
<td>In the title bar, select Copy from the context menu.</td>
</tr>
<tr>
<td>From survey designer</td>
<td>1. In the title bar, click Survey Designer.</td>
</tr>
<tr>
<td></td>
<td>2. In the Survey Designer title bar, point to the menu icon (🍔) on the header bar and click Copy Survey</td>
</tr>
</tbody>
</table>

Publish a survey

You must publish a survey to enable people to receive and complete survey instances.

Role required: admin or survey_admin

The State field on the Survey Definition form indicates whether the survey is in the Draft or Published state.
**Note:** You cannot return a survey to the Draft state after it has been published. You do have the option to deactivate a survey by clearing the Active check box.

1. Navigate to Survey View Surveys and select a survey to publish.
2. Click Publish.
   When you publish a survey, the system generates survey instances for any associated survey users. You can assign the survey to other users manually.

**Publish a survey in the Survey Designer**

You must save changes to a survey before you can publish it to the specified recipients or groups.

Role required: admin or survey_admin

1. In the Survey Designer, point to the menu and select Load Survey.
2. Select a survey to publish.
3. To preview the survey as a user, point to the menu icon and click Preview.
4. When you are satisfied with the survey, click either Save and Publish or Publish to distribute it.
   When you publish a survey, the system sends email notifications to the recipients and to their managers. The system displays a link to the survey on a card in each recipient's My Assessments & Surveys portal.

**Customize the appearance of a survey**

Assessment and survey administrators can set properties to customize the color of various elements on the questionnaires.

Role required: admin or survey_admin

**Note:**

- For color properties, enter either an HTML color name or hexidecimal (hex) value. For hex values, the # character is required. Values are not case-sensitive.
- For example, all of the following formats are valid: LightGray, lightgray, #D3D3D3. A preview of the color appears next to the field.

Note that the customizations you make apply to all assessments and surveys.

1. Navigate to either of the following modules.
   - Assessments Admin Assessment Properties
   - Survey Administration Properties
2. On the properties page, edit the properties as needed.
   Refer to the screenshot below to see what parts of assessment questionnaires are controlled by the properties.
3. Click Save.
   You may need to clear the browser's cache to see updates.

Assessment and survey properties

You can configure a variety of properties to customize the appearance of assessment and survey questionnaires, require authentication for user signatures, open surveys in the service portal view from emails, and limit the number of items shown in a decision matrix field filter.

Table 1180: Assessment and survey properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
</table>
| sn_portal_surveys.sp_survey.email_redirection | Allow survey link from email to open in service portal view (applies only for surveys) | When Yes is selected, a survey accessed from a link in an email opens in the Service Portal.  
   **Note:** This property applies only to surveys.  
   • Default value: No |
| com.snc.assessment.signature.authentication   | Require authentication for user signature.      | When Yes is selected, this property requires credentials for a full name signature.  
   • Default value: Yes |
| css.assessment.question.header.background.color | Sets the background color of question headers on assessment and survey questionnaires.  
   • Default value: #767676 |
### Survey definitions

A survey definition is the root record upon which a survey is built.

The survey designer generates a survey definition automatically when you save or publish the survey. Survey administrators may want to modify the survey definition to configure additional options for the survey, or to publish the survey when it is ready for distribution.

Survey administrators and survey readers can also send survey invitations directly to users from the survey definition.

### Modify a survey definition

You can configure additional options for a survey definition.

**Role required:** admin or survey_admin

1. Navigate to **Survey View Surveys**.
   Each survey definition is stored as a record on the Assessment Metric Type [asmt_metric_type] table with a modified view for survey use.

2. Open a survey definition. The Response Trend chart with the weekly trend of the survey instance count, and the Survey Summary chart with the overall summary response based on instance states are displayed.

3. Modify the fields on the Survey Definition form, as appropriate.

**Note:** You can only edit a survey that has the same application scope as that of your current session.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the survey, which appears on the questionnaire.</td>
</tr>
<tr>
<td>Description</td>
<td>Helpful information about the survey.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to activate the survey definition. When the Active check box is cleared, new survey instances cannot be generated and users cannot complete existing survey instances. Use the Active check box to deactivate or activate a published survey.</td>
</tr>
</tbody>
</table>
| Anonymize responses   | Check box to ensure that all responses for this survey are stored without the submitting user names. When a user submits a survey, the system clears the Assigned to field for the associated survey instance. Also, survey responses for anonymous surveys do not contain Assigned to values.  
**Note:** The Assigned to field is cleared. However, each response record includes the Created By and Updated By fields that are accessible to users with the survey_admin role. |
<p>| Send notifications    | Check box to send a notification that the survey has been taken.                                                                                   |
| State                 | Status of the survey: Draft or Published.                                                                                                         |
| Allow retake          | Check box that allows users to modify their answers to a completed survey. Users can resubmit a survey as many times as they want until the due date. After that date, the system removes the survey from the user's My Assessments &amp; Surveys page. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Scheduled job       | Scheduled job the system creates for this survey definition when the schedule period is a repeating interval. The system sets the scheduled job to run according to the selected schedule period. If you change the schedule period and save the survey definition:  
  • The system deletes the old scheduled job.  

If you selected a recurring schedule period:  
  • A new scheduled job is created.  

For example, if you change the schedule period from Daily to Weekly and save the record:  
  • The system deletes the daily scheduled job.  
  • Creates a weekly one set to run a week from the current date.  

This field is visible to administrators only if the schedule period is Daily, Weekly, Monthly, or Yearly. |
| Assessment duration | The length of time to complete assigned survey instances, starting from the time the survey instance is generated. The assessment duration sets the Due date for each survey instance. The default duration is 14 days. Configure the form to see this field.  

**Note:** By default, the system runs the Cancel Expired Assessments script every 30 days to cancel expired survey, assessment, and quiz instances that are in the Work in progress or Ready to take states. |
<p>| Send notifications  | Select the check box to send notifications for the survey when it is published. Configure the form to see the field. |
| Other Options       |                                                                                                                                          |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sample Metric</td>
<td>A metric of the current survey that you can include as an image in the email or invitation sent to a survey user. When the survey user clicks the image in the email or while previewing the HTML body, the entire survey is available to be taken. <strong>Note:</strong> You cannot edit or delete a metric that is selected in this field.</td>
</tr>
<tr>
<td>Signature</td>
<td>Acknowledgement by a survey recipient of requirements, admonitions, or policies related to the survey. The signature may require the recipient to select a check box or to type a full signature to verify having read these assertions. You can display assertions without requiring a signature. Select an existing signature from the list or click New to create a new one. The signature form contains these fields: • Name: Descriptive name for this signature. • Signature type: Type of signature required. The selections are Check box, Full name, or Assertion only. If Assertion only is selected, no signature is required to submit the survey. • Assertion: Text you want to display to recipients. By default, a property called Require authentication for user signature (com.snc.assessment.signature_authentication) requires users to authenticate when providing a full name signature.</td>
</tr>
<tr>
<td>Schedule period</td>
<td>Option that determines how often a user can take the same survey and whether the system generates survey instances on a schedule. <strong>Note:</strong> If you use a trigger condition for a survey, ensure the schedule period is set to No Limit. Trigger conditions use a different method to regulate how often users can receive survey instances.</td>

**Note:**
- This related link is available only for survey_admin, assessment_admin and survey_reader with bm_viewer role.
- You must opt in to Benchmarks to view the dashboard. See Enable Benchmarks
- This is applicable only for a published survey.

**Note:**
- This related link is available only for the survey_admin and assessment_admin role. A survey_reader can only view the created improvement initiative records.
- You should activate the Continual Improvement Management plugin (com.sn_cim).
## Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Retry Sentiment Analysis</td>
<td>Checks all survey instances of this survey that do not have sentiment analysis data and sends them for analysis.</td>
</tr>
</tbody>
</table>

### Related Lists

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trigger Condition</td>
<td>Displays all trigger conditions associated with the survey.</td>
</tr>
<tr>
<td>Survey Responses</td>
<td>Displays all responses associated with the survey.</td>
</tr>
<tr>
<td>Metric Categories</td>
<td>All survey categories for this survey.</td>
</tr>
<tr>
<td>Survey Users</td>
<td>All survey users who are authorized to take this survey. If no users are listed, any user can take this survey.</td>
</tr>
<tr>
<td>Assessment Instances</td>
<td>All survey instances for this survey. Configure the form to add this related list to see it.</td>
</tr>
</tbody>
</table>

**Note:** If you add a related list to the form, use list control to omit the New button. The system generates survey instances to produce functional surveys.

<tbody>
<tr>
<td>Improvement Initiatives</td>
<td>Displays improvement initiatives associated with the survey.</td>
</tr>
</tbody>
</table>

**Note:** This related list is available only when there is at least one improvement initiative record.

4. Save the record.

### Schedule periods

The available schedule periods are Only Once, No Limit, Daily, Weekly, Monthly, and Yearly.

The default schedule period is No Limit. When you set the schedule period to anything except Only Once or No Limit, the system creates a corresponding scheduled job. The scheduled job performs the following actions:

- Ensures that a user can take one survey instance of the same survey per schedule period.
- Generates a new survey instance for each survey user at the beginning of the new schedule period, as long as the survey user does not have an incomplete instance of that survey. A survey instance is incomplete if the state is not Complete.

For example, if you set the schedule period to Monthly and someone attempts to send survey invitations twice in the same day, the system generates survey instances for the survey users the first time only. At the beginning of the next schedule period, the system generates another survey instance for each survey user who completed the previous one.
Schedule periods are enforced by the Expiration date field on the survey instance. As long as the survey instance expiration date has not passed, the assigned user cannot receive a new survey instance. When the system generates a survey instance and the schedule period is anything except No Limit, the Expiration date field is automatically set to the appropriate date. For example, if the schedule period is Weekly, the expiration date is a week after the survey instance is generated.

If you change the schedule period, the scheduled job updates automatically to the correct schedule. However, users who have survey instances for the survey cannot receive new survey instances until their existing survey instances expire, regardless of the new schedule period.

Consider the following example: Sal Pindell receives a survey instance when the schedule period is Weekly. The next day, a survey administrator changes the schedule period to No Limit. Sal cannot receive another survey instance until one of the following actions occurs.

- Seven days pass from the time Sal's survey instance was generated.
- A survey administrator deletes Sal's survey instance.

After one of these actions occurs, Sal can receive a new survey instance anytime, as long as he has no incomplete instances of the survey.

Note: If you use a trigger condition for a survey, ensure the schedule period is set to No Limit. Trigger conditions use a different method to regulate how often users can receive survey instances.

Create a survey designer template question

You can create a question that uses choice lists from a template.

Role required: admin or survey_admin

1. Navigate to Survey Survey Designer and load a survey or create a new survey.
2. Drag the Template data type icon into a category container.
3. Click the gear icon in the question title bar to open the template properties dialog box.
4. Select a predefined scale from the list.
Question entry fields appear for that template.

5. Enter one or more questions that are appropriate for the template.
6. Click the arrow to the right of a question to configure its properties. You must provide a name for each question.
7. Click the back arrow to return to the template properties dialog box.
8. Configure the properties for the remaining questions.
9. Click the X icon to close the template properties dialog box and save your settings.

Survey questions

Survey questions appear on survey questionnaires for the associated survey definition.

The survey creator generates questions and answer options automatically. However, it provides only the basic configuration options for questions, such as the question text and the data type. You may want to create additional questions or set advanced configuration options for the questions, including making a question appear conditionally or making a question mandatory. You can also use question templates to define reusable sets of answer options.

Survey questions are available from Survey Questions. The list displays information about each question, including the associated survey definition listed in the Type column, and the data type. Survey administrators can modify these questions.
Create or modify survey questions

You can create and administer survey questions.

Role required: admin or survey_admin

Changes to a survey, such as the addition of questions or the modification of question templates, do not apply immediately to the existing survey instances. However, the changes apply immediately to any new survey instances that are created after the changes are saved.

1. Navigate to Survey View Surveys.
2. Open a survey definition.
3. In the Metric Categories related list, open a category.
4. In the Assessment Metrics related list, open an existing question or click New.
   Each survey question is stored as a record on the Assessment Metric [asmt_metric] table with a modified view for survey use.
5. Complete the Survey Question form.
   The fields that appear depend on the selected Data type.

Table 1182: Survey Question form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the question. When you create a survey, the question name is the same as the text in the Question field.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to use for the question, which appears on survey questionnaires.</td>
</tr>
<tr>
<td>Data type</td>
<td>Data type of the question. The fields for the response depend on the data type.</td>
</tr>
<tr>
<td>Template</td>
<td>Question template to use for the answer options.</td>
</tr>
</tbody>
</table>

**Note:** If another question depends on this question, you cannot change the data type.

**Note:** If another question depends on this question, you cannot change the template.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scale definition</td>
<td>Setting that determines whether smaller or larger numerical values equate to a good score in result calculations. Select Low if smaller numerical values are better, such as for a question that measures the number of incidents for a vendor. Select High if larger numerical values are better, such as for a question that measures user satisfaction on a scale of one to five. This field is visible and required only when certain data types are selected.</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box that determines whether to present the answer options for this question in a random order each time a user opens the survey. Answer preference is sometimes influenced by the order in which answer options appear, which can result in biased results. Randomize answer options to help prevent this bias. This field is visible only if the data type is Choice or Likert Scale. Note: Randomizing answer options may make a question confusing. In general, only randomize answer options that do not follow a logical order.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box that makes the question mandatory (selected) or optional (cleared) on survey questionnaires. Users cannot submit questionnaires until they provide valid responses to all mandatory questions, which are denoted by a red field status indicator. This field is visible only when the Depends on field is empty and the data type is not Checkbox. Questions that depend on other questions and check box questions cannot be mandatory.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box that determines whether to include a Not Applicable answer option for this question on survey questionnaires. User responses of Not Applicable are excluded from results calculations. This field is visible only if the data type is Choice, Likert Scale, Template, or Yes/No.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Allow Additional Information | If selected, the Additional Information Label field is enabled. The Additional Information Label field value is displayed as a field on the survey response page to provide additional information for a question.  
**Note:** This is not applicable for the String and Template data types. |
| Depends on                   | Setting used to make this a conditional question, meaning that it only appears when users answer another question a certain way.  
To make a question depend on another question, select an existing question from the list, which displays Checkbox, Choice, Template, and Yes/No questions of the same category as this question. Then, use the Displayed when field to set the conditions that cause this question to appear on surveys.  
The system prevents the creation of recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A. |
<p>| Displayed when               | Answer options for the selected Depends on question which, when chosen on surveys, display this question. This field is visible and required only when the Depends on field is set. |
| Min                          | Smallest numerical value to be used as an answer option for this question. This field is visible and required only if the data type is Choice, Likert Scale, Number, or Percentage. |
| Max                          | Largest numerical value to be used as an answer option for this question. This field is visible and required only if the data type is Choice, Likert Scale, Number, or Percentage. |
| String option                | Selection that determines what kind of response text box appears for this question on survey questionnaires. This field is visible and required only if the data type is String. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Field</td>
<td>Source table field that appears as a dynamic value for the question in a triggered survey. When this field value is selected, a <code>${param}</code> placeholder is added at the end of the question label.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You can move this placeholder anywhere in the question label.</td>
</tr>
<tr>
<td></td>
<td>When a user takes the survey, the question with dynamic value is included in the survey instance and <code>${param}</code> placeholder is replaced with the source field value.</td>
</tr>
<tr>
<td></td>
<td>If the record table specified in the trigger condition does not match the source table specified for the survey, or if the system fails to get the dynamic value from the source record, the <code>${param}</code> placeholder is not replaced by any value and is displayed as is in the question.</td>
</tr>
<tr>
<td></td>
<td>For example, if the survey is triggered from a PRB record and the survey question is configured with a dynamic value from Incident, the <code>${param}</code> placeholder in the survey question label is not replaced by any dynamic value and is displayed as is.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> When survey questions are translated to other languages by a survey admin, the <code>${param}</code> placeholder should not be translated.</td>
</tr>
<tr>
<td>Allow Sentiment Analysis</td>
<td>Includes this question for the sentiment analysis of a survey.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available only for String type questions.</td>
</tr>
<tr>
<td>Related Lists</td>
<td></td>
</tr>
<tr>
<td>Assessment Metric Definitions</td>
<td>Answer options for this question. This related list is available only if the Data type is Choice or Likert Scale.</td>
</tr>
</tbody>
</table>

6. Save the record.

**Note:**
- Be sure to create answer options if you select the Choice or Likert Scale data type.
• You cannot delete a survey question (metric) with user responses. To delete a survey question with user responses, you should delete the responses, and then delete the survey question.

---

Survey question data types

You must choose a data type for each survey question. The data type determines the format of the question and the kind of data that is collected on survey questionnaires.

The following data types are available for surveys:

**Attachment data type**

On questionnaires, users can attach one or more files to a question.

Users click the Manage Attachments icon and select one or more files in the Attachments pop-up window to attach to the question. From this window, users can:

• View a list of the attached files.
• View an attached file in a separate window.
• Rename an attached file.
• Add or delete files

Once a survey has been submitted, attachments cannot be updated or deleted.

Any type of file supported by the platform can be attached to a question. One or more files can be attached a question while taking a survey or completing an assessment.

The assessment administrator can see the attachments associated with an individual question as well as those associated with the survey.

See *Administering Attachments* for more information.

**Boolean data type**

On questionnaires, users select a check box beside a statement or leave it cleared.

If you select Boolean, you must fill in the Scale definition field. Select High if it is best when users select the check box.

**Choice data type**

On questionnaires, users select a value from a list of choices.
If you select Choice, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

**Note:** The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

### Date and Date/Time data types

The Date and Date/Time data types are similar.

- **Date:** On questionnaires, users select a date.

- **Date/Time:** On questionnaires, users select a date and time.
Likert Scale data type

On questionnaires, users select a multiple choice value from a custom Likert scale. Each answer option is represented by a radio button on the scale. A Likert scale question that evaluates an application’s ease of use might have the answer options Easy, Average, and Difficult.

If you select Likert Scale, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

**Note**: The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

Number data type

On questionnaires, users enter a number.
If you select Number, you must fill in these additional fields:

- **Scale definition**: Select High if a larger number is better, such as for a question that measures the number of sales made in a quarter.
- **Min and Max**: Enter the smallest and largest numbers users can enter. State the range of acceptable answers in the question text.

**Percentage data type**

On questionnaires, users enter a number.

If you select Percentage, you must fill in these additional fields:

- **Scale definition**: Select High if a larger percentage is better, such as for a question that measures the percentage of work an agent has completed.
- **Min and Max**: Enter the smallest and largest numbers users can enter. Generally 0 and 100 are appropriate minimum and maximum values. If you choose values other than 0 and 100, it is usually best to state the range of acceptable answers in the question text.

**Reference data type**

On questionnaires, users select a value from a list that is generated from a specified reference table. The response field supports auto-completion.

**Note**: Reference qualifiers are not supported.

For example, a user could select a user name in response to a question if you specify User [sys_user] as the reference table.
String data type

On questionnaires, users enter text. When you select String, the String option field appears. Select one of the following options to determine how the string field appears on questionnaires:

- Figure 649: Single line
On questionnaires, users select a value from a predefined series of answer options. To use this data type, a question template must be defined.

If you select Template, you must fill in these additional fields:

- Template: Select a template.
- Scale definition: Select High if the answer option with the largest template definition Value is best.

**Yes/No data type**

On questionnaires, users select Yes or No from a list.

If you select Yes/No, you must fill in the Scale definition field. Select High if Yes is the best answer.
Image Scale data type

On questionnaires, users select an image from a predefined set of images as their response. Image scale questions can also be used in a template for better performance with surveys that have the same type of answer options.

Five emojis, similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Two images can be uploaded, one for selected case and another for unselected case. Larger size images are reduced to 64 x 64 pixels.

How satisfied are you with the service provided by IT?

<table>
<thead>
<tr>
<th>Selected image</th>
<th>Unselected image</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Unselected image loads. Clicking on the image changes it to the selected image.</td>
</tr>
<tr>
<td>Yes</td>
<td>No</td>
<td>Selected image loads with 50% opacity. Clicking on the image changes the opacity to 100%.</td>
</tr>
<tr>
<td>No</td>
<td>Yes</td>
<td>A blank placeholder box is displayed.</td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>A blank placeholder box is displayed.</td>
</tr>
</tbody>
</table>

Note: N/A option is not supported for image scale type question.

Multiple selection data type

On questionnaires, users can select multiple check boxes indicating all answers that apply. For instance, a user can be instructed to “Select all that apply” in a multiple selection question.
Equipment Usage Survey

Multiple Selection

What equipments do you use?

- Laptop
- Tablet
- Smart Phone

Ranking data type

On questionnaires, users can select a different order number for each option to rank them. Drag-and-drop functionality is also supported, which allows a user to either fill in the number, or simply drag an option.

1. Please rate following device in order of Importance.

One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.

Survey question template

Question templates define reusable sets of answer options for survey questions.
Question templates define reusable rating scales for answering questions, where each answer option on the scale is a template definition. For example, the template named Satisfaction represents a satisfaction scale and contains the following template definitions: Very Satisfied, Satisfied, Neutral, Dissatisfied, and Very Dissatisfied.

![Template definition]

**Figure 652: Template definition**

Templates are available for survey questions that have Data type set to Template. The following question templates are available in the base system. You can create or update a template as described in *Create a survey question template* on page 2518.

<table>
<thead>
<tr>
<th>Name</th>
<th>Template definitions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amount</td>
<td>None, Few or little, Average amount, Many, Quite a lot</td>
</tr>
<tr>
<td>Complexity</td>
<td>Very Complex, Complex, Moderate, Simple, Very Simple</td>
</tr>
<tr>
<td>Frequency</td>
<td>Never, Seldom, Sometimes, Most of the time, All of the time</td>
</tr>
<tr>
<td>Likert 5</td>
<td>Strongly Disagree, Disagree, Neutral, Agree, Strongly Agree</td>
</tr>
<tr>
<td>Quality</td>
<td>Very Poor, Poor, Average, Good, Very Good</td>
</tr>
<tr>
<td>Satisfaction</td>
<td>Very Dissatisfied, Dissatisfied, Neutral, Satisfied, Very Satisfied</td>
</tr>
<tr>
<td>Size</td>
<td>Very Small, Small, Average, Large, Very Large</td>
</tr>
</tbody>
</table>

*Create a survey question template*

You can create and administer question templates.

**Role required: admin or survey_admin**

Changes to a survey, such as the modification of question templates, apply to existing survey instances immediately. Templates that you create are available for use with both surveys and assessments.

1. Navigate to Survey Templates.
   Each template is stored as a record on the Assessment Metric Template [asmt_template] table.
2. Click New.
3. Enter a Name.
4. Right-click the form header and click Save.
5. In the Assessment Template Definitions related list, click New.
Create a template definition for each answer option you want to appear on a question.

6. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>Enter the text to appear as the answer option.</td>
</tr>
<tr>
<td>Value</td>
<td>Enter a numeric value, greater than or equal to zero, to which the answer option equates. Values are used in results calculations. When you view questions that use templates, answer options appear in order from smallest to largest Value. Each template definition for a given template must have a unique Value.</td>
</tr>
</tbody>
</table>

7. Click Update.

*Update min and max values to match templates*

If you use survey result calculation data, ensure that the Min and Max values for a question that uses a template are equal to the smallest and largest template definition Value.

Role required: admin or survey_admin

When you create a question of the Template data type, the system sets the Min and Max fields based on the template definition values. The fields for existing questions are not updated if you add a new template definition to a template or if you update the Value of an existing template. If the new Value is less than the minimum value or greater than the maximum value of any questions that use the template, update the questions accordingly.

1. Navigate to Survey Questions.
2. Configure the list to show the Min and Max columns.
3. Add the following list filter condition: [Template] [is] [<select the template you updated>].
4. Ensure the Min and Max values match the smallest and largest template definition Value for the selected template.
   If the values do not match, edit the Min and Max values directly from the list.

**Note:** When the data type is Template, a UI policy prevents the editing of Min and Max from the form.

---

Create or modify answer options

You must create answer options, called metric definitions, for survey questions that have Data type set to Choice or Likert Scale.

Role required: admin or survey_admin

Changes to a survey, such as the addition or modification of answer options, apply to existing survey instances immediately.

1. Navigate to Survey Questions.
2. Open a choice or Likert scale survey question.
3. In the Assessment Metric Definitions related list, open a metric definition or click New.
   Each answer option is stored as a record on the Assessment Metric Definition [asmt_metric_definition] table.
4. Complete the Assessment Metric Definition form.

Table 1184: Assessment Metric Definition fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>Text to appear as the answer option.</td>
</tr>
<tr>
<td>Value</td>
<td>Numeric value, greater than or equal to zero, to which the answer option equates. Values determine the order in which answer options appear. See the example below. Values are also used to calculate survey results. Each metric definition for a given question must have a different Value.</td>
</tr>
</tbody>
</table>

5. Click Submit.

On survey questionnaires, the answer options for a question appear in order from smallest to largest Value. For example, consider the survey question How do you feel? with the answer options Good, Neutral, and Bad. The following table shows the answer option order based on the Value.

Table 1185: Answer option order based on value

<table>
<thead>
<tr>
<th>Answer option</th>
<th>Value</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Good</td>
<td>1</td>
<td>First</td>
</tr>
<tr>
<td>Neutral</td>
<td>3</td>
<td>Second</td>
</tr>
<tr>
<td>Bad</td>
<td>5</td>
<td>Third</td>
</tr>
</tbody>
</table>

If you use survey result calculations, ensure the question Scale definition is set appropriately based on the answer options. In the previous example, if you want the answer option Good to earn the highest score, the scale definition should be Low because Good has the smallest value.

Change the order of survey questions

You can easily reorder survey questions at the category level or the question level.

Role required: admin or survey_admin

You can change the order in which the questions in one category appear relative to those in other categories for the same survey definition. If you add a new question manually after you create other questions, you may want to change the order of questions.

When you create questions using the survey creator, the system sets the Order field for the first question to 101, the second to 102, and so on. After you create a new question outside of the survey creator, the Order is set to 100 by default, which means it appears before all questions generated by the survey creator.

1. Navigate to Survey View Surveys and open the appropriate survey definition.
2. In the Metric Categories related list, edit the values in the Order column.
3. To change the order of questions within a category, complete the following steps.
a) Open the Assessment Metrics related list.
b) Edit the values in the Order column.

4. Click Update.

Survey trigger conditions

Trigger conditions specify when to send a particular survey and the persons to send it to.

Survey administrators can use trigger conditions to configure the system to generate a survey instance each time a specified action occurs on a specified table, for example, when an incident or change request closes. The system sends the survey to users that are related to the triggering record, for example, incident callers or change request assignees. You can choose to send a survey every time the condition is met, or you can set a probability for the system to send a survey at random when the condition is met.

Trigger conditions are ideal for sending transactional surveys. Transactional surveys generally measure satisfaction with a recent experience, such as closing an incident or purchasing an item.

Note: Trigger conditions are comparable to survey conditions in legacy surveys. If you migrate a legacy survey that has survey conditions, ensure that the survey conditions are deactivated before you recreate them as trigger conditions.

Configure a trigger condition for a survey

You can configure trigger conditions to specify when to send a particular survey and the persons to send it to.

Role required: admin or survey_admin

1. Navigate to SurveyTrigger Conditions.
2. Click New.

Note: Do not specify particular users for a triggered survey because only the specified users are allowed to take the survey.

3. Complete the form.

Table 1186: Trigger condition fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment</td>
<td>Survey to send.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to run the trigger condition on. You can select only tables in the current application scope. For example, to send a survey whenever an incident closes, select the Incident [incident] table.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| User field         | Field that stores the users you want to send the survey. You can select any field, on the selected table or on a referenced table, that references the User [sys_user] table. Use the tree picker to select a field.  

**Note:** To avoid requiring users to log in to take a survey with a trigger condition, set the survey to Public.                                                                                                                                                                                                 |
| Repeat interval    | Minimum period that must pass before the trigger condition can resend the survey to the same user. For example, assume the repeat interval is set to 30 days. Even if the same user qualifies for multiple surveys from this trigger condition, the system can send only one survey every 30 days.  

**Note:** Ensure that the Schedule period of the selected survey definition is set to No Limit. If the schedule period is set to a different value, it prevents the trigger condition from sending surveys as expected. |
<p>| Application        | [Admin only] Application is set to Global.                                                                                                                                                                                                                                                                                                                      |
| Active             | Check box that determines whether this trigger condition is active (selected).                                                                                                                                                                                                                                                                                 |
| Business rule      | [Admin only] Business rule the system creates to monitor the selected table. When the condition is met, the business rule sends the survey to the correct user. No configuration is necessary for this business rule.                                                                                                                                                                     |
| Trigger randomly   | Check box that determines whether to send the survey to the appropriate user every time the condition is met (cleared) or only a percentage of the time (selected).                                                                                                                                                                                                     |
| Probability (%)    | Approximate probability that the survey is sent each time the condition is met. For example, if the probability is set to 50, the system sends the survey approximately 50% of the time the conditions are met. There are no repeat interval restrictions is assumed. This field is visible and required only when Trigger randomly is selected. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Related Field 1- 4</td>
<td>Field that contains a value you want to store for reporting purposes. You can pick any reference field on the selected table. When the trigger condition generates a survey instance, the system stores the value from the triggering record. Specify up to four fields. For example, select the Incident table, Assigned to and Problem as related fields. The system stores the assigned user and problem associated with the incident as Related record 1 and Related record 2 in the survey instance record. To view the fields, configure the form for any survey instance. <strong>Note:</strong> You cannot use a related field for the ticket number because you cannot select the Number column. You can, however, use the trigger_id column of the table.</td>
</tr>
<tr>
<td>Description</td>
<td>Summary information to identify the trigger condition. <strong>Note:</strong> For a triggered record, the table title is used for the survey description.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition builder that defines the criteria that must be true to send the survey. For example, to send a survey whenever an incident closes, create the condition [State] [is] [Closed].</td>
</tr>
</tbody>
</table>

You can also create a trigger condition directly from the survey creator. If you select Certain users can take this survey, based on conditions in the Survey User Access section, the Trigger Condition form opens automatically when you click Save as Draft or Publish.

Trigger condition example

You can send out auto-triggered surveys when an incident is closed or resolved.

A trigger condition is configured as follows:

- Assessment: Service Desk Satisfaction Survey
- Table: Incident [incident]
- User field: Caller
- Repeat interval: 30 days
- Active: true
- Trigger randomly: false
- Related Field 1: Assigned to
- Related Field 2: Problem
- Condition: [State] [is] [Closed] [or] [State] [is] [Resolved]

Fannie Steese is the caller on incident INC00004305 that is assigned to Boris Catino, a service desk technician. Boris creates PRB010101 based on Fannie’s complaint and closes the incident. The system creates a survey instance assigned to Fannie so she can rate her satisfaction with the incident experience.

Because two related fields were selected as part of the trigger condition, the survey instance stores the following information from the incident:

- User (Related Field 1): Boris Catino
- Problem (Related Field 2): PRB010101
- Task (automatically created): INC00004305

Because the task field is automatically populated, UI-based filtering by dot-walking on incidents (or any task-based table) is supported when creating a report on survey results. For example, you can query all survey instances related to incidents assigned to a group (survey reports on all incidents assigned to networking group, for instance).

Note: Even though the trigger condition is set to be triggered each time that the conditions are met, the Repeat interval setting ensures that Fannie does not receive another survey for another of her incidents closes within 30 days of the first incident.

Survey report example based on task field

One of the most common use cases for Surveys is to send out an auto-triggered survey when an incident, request, or task is closed. Once you get the survey results back, you can filter the results by users and groups related to the ticket, such as Assignment Group, or Assignee.

Filtering the survey results provides more detail on how people and teams are performing based on ticket data. Since this information is automatically captured, you can dot-walk while filtering the data (instead of utilizing a related field on the Survey trigger condition form, as previously required).
To create a report on incident-triggered survey responses by Assignment group, set up the report on the Task Assessment Details by navigating to Reports View/Run and clicking Create a report.

Survey distribution

There are several ways for survey administrators to distribute surveys to users. Surveys are distributed using any of the following methods.

- Send survey invitations to users
- Share a survey URL that opens the survey directly.
- Create a module that opens a survey.

Send survey invitations to users

You can send survey invitations using the Assign Survey or Send Invitations buttons on the Survey Definition form.

Role required: admin or survey_admin

Use the Send Invitations button to immediately assign survey instances to each survey user that is listed in the survey definition. Use the Assign Survey button to assign a survey instance to any one user at a time.

Each of the buttons generates survey instances assigned to the appropriate users. In addition, if the instance is configured to send email, the system generates survey notifications. For either button to be available, the survey definition must meet all of the following conditions.

- Active check box is selected.
• State is Published.
• Survey is associated with at least one question.

Note: You (or a trigger) can send more than one instance of a survey to a user at any time.

1. Navigate to Survey View Surveys.
2. Select an active, published survey.
3. Complete one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assign a survey to users listed in the Survey Users related list</td>
<td>Click Send invitations.</td>
</tr>
<tr>
<td>Assign a survey to any user</td>
<td>Click Assign Survey and select one or more users, and then click OK.</td>
</tr>
</tbody>
</table>

The system creates a survey instance assigned to the user or users, assuming the user is eligible to receive a new survey instance. When you use the Assign Survey button, the selected user is not saved as a survey user.

Survey URLs

You can distribute a survey by giving survey users a survey URL.

Survey administrators can obtain one of the following types of URLs.

• A general URL for a survey, which users can open to take the survey questionnaire. The following process occurs.
  • When someone opens the URL, the system ensures that the person is logged in. It then searches for an instance of the associated survey that is assigned to the logged-in user.
  • If a survey instance is found, the appropriate action occurs based on the State of the survey instance (see table). If there are multiple active survey instances (Ready to take or In progress), the instance with the earliest due date opens.
  • If no survey instance is found, the system creates a new instance for the survey, assigns it to the user, and opens the survey questionnaire.

• A URL for a specific survey instance, which the assigned user can open to take the survey questionnaire. The following process occurs.
  • When someone opens the URL, the system ensures the person is logged in as the user the survey instance is assigned to. Only the assigned user can access the survey questionnaire.
  • The appropriate action occurs, depending on the State of the survey instance (see table).

<table>
<thead>
<tr>
<th>Survey instance state</th>
<th>Action upon opening URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ready to take: User has not saved any responses.</td>
<td>The survey questionnaire appears for the user to begin. The user can save or submit responses.</td>
</tr>
<tr>
<td>In progress: User has saved at least one response.</td>
<td>The survey questionnaire appears for the user to continue. Any previously saved responses are displayed. The user can save or submit responses.</td>
</tr>
</tbody>
</table>
If someone opens a URL for an unpublished or deactivated survey, an error message appears.

**Obtain and distribute a general survey URL**

You can distribute a general survey URL to allow any eligible user to open a survey questionnaire.

Role required: admin or survey_admin

The general URL is available on the Survey Definition form and on the survey creator. You can also email the URL for a public survey that is published.

1. Navigate to Survey View Surveys.
2. Open a survey definition from the Assessment Metric Types list.
3. To view or copy the URL, click the View Survey URL related link.
   This related link is visible only if the survey definition is Active.
4. To distribute the URL to users, paste the copied URL as desired, or click the Email button to send via email.
   The Email button is visible only for a public survey that is published.

When a survey user clicks the general survey URL, the system creates a survey instance for the survey user as long as the user does not have an instance in the Ready to take state. The system is configured by default to send an email notification when a survey instance is generated.

As a result, the survey user receives a second notification in addition to the notification that you sent with the general survey URL. This may confuse the survey user. To avoid this issue, you can deactivate auto-notification.

**Deactivate auto-notification for surveys**

When you send a survey notification with a general survey URL to a survey user, the user may receive a second system-generated notification. To avoid this issue, you can deactivate auto-notification.

Role required: admin or survey_admin

1. Navigate to System Notification Email Notifications.
2. Open the Survey User Invite notification.
3. Configure the form to add the Send to event creator check box to the Who will receive section.
   The Send to event creator check box is selected by default.
4. Clear the Send to event creator check box.
   The system will no longer send auto-notification messages to survey users.

**Obtain a survey instance URL**

You can distribute a survey instance URL to allow the assigned user to open a survey questionnaire.

Role required: admin or survey_admin
The survey instance URL is available on the survey instance record.

1. Navigate to Survey Survey Instances.
2. Open the instance for the survey.
3. To view or copy the URL, click View Instance URL related link.
   The related link is available only when the survey instance State is Ready to take or In progress and the associated survey definition is Active.
4. In the dialog box, select and copy the URL then click OK or Cancel.
5. Distribute the URL to the assigned user.

Test a survey URL
When there are survey users associated with a survey, the survey is restricted so only those users can use the survey URL. You can test the survey URL to ensure it is restricted.

Role required: admin or survey_admin
1. Navigate to Survey View Surveys and open a survey for which you are not a survey user.
2. Under Related Links, click View Survey URL.
3. Copy the URL and click OK or Cancel.
4. Navigate to the URL.
   You see a message that you are not authorized to take the survey.

Create a survey module
You can create a module that opens a survey.

Role required: admin or survey_admin

When a user clicks a survey module, the system performs one of the following actions, depending on the configuration options for the survey and other factors.

• Creates a new survey instance
• Opens an existing survey instance
• Displays an error message.

1. Perform the appropriate action for your version of the UI:
   • UI16: Point to the application menu that contains the module to which you want to add the survey module and click the edit application (pencil) icon.
   • UI15: Right-click the application menu you want to add the module to and select Edit Application Menu
2. In the Modules related list, click New.
3. Complete the following fields.
   • Link type: Assessment
     Do not select Survey, which is used for legacy surveys only.
     • Assessment: Select the survey you want the module to open.
4. Complete and save the form.

Sharing surveys: export and import
You can export a survey and then import it to a different ServiceNow instance.
The system exports a single XML file that contains a survey definition [asmt_metric_type] and the associated records, including the following.

- Assessment Metric Template [asmt_template]
- Assessment Template Definition [asmt_template_definition]
- Metric definitions [asmt_metric_definition] (survey question answer options)
- Scheduled Jobs associated with the Survey [sys_trigger]
- Survey categories [asmt_metric_category]
- Survey questions [asmt_metric]
- Survey users [asmt_m2m_category_user]
- Trigger Condition [asmt_condition]

Export a survey
You can export a survey and then import it to another instance.

Role required: admin, survey_reader, or survey_admin

For information about update sets, see System update sets.

1. Navigate to Survey View Surveys.
2. Right-click the name of a record to show the context menu.
3. Select Export Assessment.
4. If applicable, follow the prompt in your browser to save the XML file.

Import a survey
You can import a survey that has been exported as an XML file. The exported XML file does not contain result data.

Role required: admin or survey_admin

Note: Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see System update sets.

1. Verify that the target instance has assessments enabled.
2. Follow the steps in Import an XML file to import the assessment.

Use update sets for surveys and assessments
Use an update set to capture changes to surveys and assessments.

Role required: admin or survey_admin

When developing surveys and assessments, you can use an update set to capture the changes and move them from a development instance to a production instance. Once an update set is created and marked current, all of the updates to the following tables are recorded in the update set.

The following tables are now update set enabled and also extend the application file:

- Assessment Metric Templates [asmt_template]
- Assessment Template Definitions [asmt_template_definition]
- Assessment Metric Definitions [asmt_metric_definition]: survey question answer options
- Schedule [sys_trigger]: scheduled jobs associated with the survey
- Assessment Metric Categories [asmt_metric_category]: survey categories
- Assessment Metrics [asmt_metric]: survey questions
- Assessment Category Users [asmt_m2m_category_user]: survey users
- Trigger Conditions [asmt_condition]

**Sentiment analysis for surveys**

You can use sentiment analysis to determine whether user responses for a survey are considered positive, negative, or neutral.

Activate the Sentiment Analysis (com.snc.sentiment_analysis) plugin.

For a survey, you can select questions that should be used for analysis. The survey responses of these questions are sent to the thirdparty platforms for analysis through the specified connector configurations.

**Note:** You can only use string type questions for sentiment analysis.

The sentiment analysis results are displayed under **Survey Question Sentiment Results**. The sentiment label is based on the normalized score:

<table>
<thead>
<tr>
<th>Normalized score</th>
<th>Sentiment label</th>
</tr>
</thead>
<tbody>
<tr>
<td>-1 to 0</td>
<td>Negative</td>
</tr>
<tr>
<td>0</td>
<td>Neutral</td>
</tr>
<tr>
<td>0 to 1</td>
<td>Positive</td>
</tr>
</tbody>
</table>

**Configure a sentiment connector**

Specify the service URL and other configuration information for third party APIs that are used for sentiment analysis.

Role required: admin

1. Change the scope of the current session to Sentiment Analysis.
2. Navigate to **Sentiment Analysis Sentiment Connector Configurations**.
3. Add or edit the connector configuration for a third party vendor such as Google, IBMWatson, and MSAzure.

**Note:** By default, placeholders are available for configuring connectors for Google, IBMWatson, and MSAzure.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the sentiment analysis connector configuration.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to activate the connector configuration.</td>
</tr>
<tr>
<td>Credential Alias</td>
<td>Credential alias associated with the connector configuration. It has a reference to the system level table (sys_alias_list).</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Default</td>
<td>Check box to make this as the default connector configuration.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the connector configuration.</td>
</tr>
<tr>
<td>Script</td>
<td>Script to call the Sentiment Analysis API and the normalize the values.</td>
</tr>
</tbody>
</table>

4. Configure the connector credentials
   a) Open the record referred in the Credential Alias field.
   b) Under the Connections tab, select the connection.
   c) In the Connection URL field, enter the value.
   d) Open the record referred in the Credentials field.
   e) Enter the credential information.

   **Note:**
   - You should obtain the connection credentials from the respective third-party vendors.
   - If the credential is an API key, specify its value. If the credential is basic authentication, that is, user name and password, specify the corresponding information.

   f) Select the Active check box and click Update.

5. Select the Active check box for the connector configuration and click Update.

**Sentiment analysis properties**

You can use the sentiment analysis properties to customize the Sentiment Analysis module.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Response time for the outbound call of Sentiment Analysis API (sn_nlp_sentiment.glide.sentiment.transaction.timeout)</td>
<td>Maximum time (milliseconds) expected for executing the outbound call for Sentiment Analysis API before it's timeout.</td>
</tr>
</tbody>
</table>

**Sentiment analysis results**

The sentiment analysis results view contains a bar chart that displays the percentage of positive, negative, and neutral results, along with the instance count for each category.

**Color indicators**

Following are the color indicators in the bar chart:

- Green: Positive
- Red: Negative
- Blue: Neutral
Legacy survey migration

Users with the survey_admin role can migrate legacy survey data to create copies of legacy surveys and their related records in assessment tables. The Survey Management application, which is built on the assessment engine, is available as an alternative to legacy surveys.

The following legacy survey components are migrated:

- Survey masters
- Supported survey questions and question choices
- Survey instances
- Survey responses

Legacy survey conditions are not migrated and must be recreated as trigger conditions.

**Note:**

- The Legacy Surveys and Legacy Administration modules are available on instances upgraded from a previous release but not available for new instances. Customers using legacy survey or survey wizard should plan to migrate to the Survey Management application to create modern and high quality surveys for their users.
- The following legacy survey plugins are inactive by default, and are available upon request:
  - Best Practice - Task Survey Management (ID: com.snc.bestpractice.task_survey)
  - Survey Management (ID: com.glideapp.survey)
  - Assessment Components (ID: com.snc.assessment)
  - Survey Wizard (ID: com.glideapp.survey_wizard)
- Survey wizards cannot be migrated.

Migrate a legacy survey

Migrate a legacy survey and its related records to take advantage of a more powerful feature set.

Role required: admin or survey_admin

To avoid timing out for very large surveys, you can disable the transaction quota. See *Transaction quotas*.

1. Navigate to SurveyLegacy SurveysMasters.
   The list of legacy survey masters appears. By default, the list shows only survey masters that have not been migrated. To show all survey masters, remove the Assessment is empty breadcrumb.

2. Open a survey and click the Migrate to New Survey Management related link or Migrate to New Survey Management in the title bar.
   A dialog box describes what happens when you migrate the survey. Note that certain types of survey questions cannot be migrated.

3. Click OK.
   The system generates records on assessment tables based on the survey master, eligible questions and choices, results, and other related survey components. The original survey components are unaffected.

   System messages may appear at the top of the Survey form to notify you of questions that could not be migrated and to advise you to review migrated Multiple Choice questions.

4. Click the reference icon beside the Assessment field to view the new survey definition.

5. Remove survey users from the assessment survey if you want all users to be able to take it.
When you migrate a survey, any users who have taken it are automatically associated with the assessment survey and become survey users. When there are survey users associated with an assessment survey, only those users can take it.

6. Deactivate any survey conditions associated with the survey by completing the following steps.
   a) Navigate to Survey Legacy Administration Survey Conditions.
   b) In the Active column, ensure the value is false for any survey conditions that reference the migrated survey.

7. Navigate to Survey Administration Trigger Conditions to create new trigger conditions for the migrated survey.

The Migrate to Assessment related link on the legacy survey record becomes unavailable after the migration. However, if you delete the record referenced in the Assessment field, the related link reappears and you can migrate the legacy survey again.

Survey question migration

Before you migrate a legacy survey, understand that some legacy survey questions cannot be migrated due to incompatible question types.

Legacy survey questions are migrated from the Survey Question [survey_question_new] table to the Assessment Metric [asmt_metric] table. In legacy surveys, the Type field on the Survey Question table determines how the question renders on the survey questionnaire. In assessment surveys, the Data type field on the Assessment Metric table serves a similar purpose. Certain legacy survey types are not supported in assessment surveys.

The following table shows the conversion path for each legacy survey question type to an assessment data type, if there is one.

**Table 1191: Survey question migration**

</tr>
</tbody>
</table>

**Migrated components**

When you migrate a survey, the system maps records from survey tables to assessment tables. To create a functional survey on the assessment framework, the system converts survey records to the most logical equivalent assessment survey records. This may mean multiple assessment survey records represent one legacy survey record.

**Table 1192: Migrated components**

<table>
<thead>
<tr>
<th>Survey component</th>
<th>Assessment survey components</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey master [survey_master]</td>
<td>• Survey definition [asmt_metric_type]</td>
</tr>
<tr>

<tr>
<td></td>
<td>• Survey response [asmt_metric_result]</td>
</tr>
<tr>
<td></td>
<td>• Category result [asmt_category_result], for system use only</td>
</tr>
</tbody>
</table>

**Migrated question review**

To maintain accurate result calculations, you may need to make minor adjustments to some of the migrated survey records to ensure results are calculated correctly.

**Note:** The assessment engine provides a built-in result calculation feature that converts each survey response to a score between 0 and 10. The configuration required to maintain accurate...
For each legacy question migrated, the system creates a survey question record on the Assessment Metric [asmt_metric] table. For legacy questions of the Multiple Choice and Select Box types, the system also creates a metric definition record, on the Assessment Metric Definition [asmt_metric_definition] table, for each legacy question choice.

Table 1193: Comparable metric definitions and survey question choices

</tr>
<tr>
<td>Value (can be any string value)</td>
<td>Value (must be a numerical value)</td>
</tr>
<tr>
<td>Order</td>
<td>Value (metric definition with smallest Value is first)</td>
</tr>
</tbody>
</table>

When the system migrates legacy survey question choices, it uses the legacy Order to set each metric definition Value. For the legacy question choice with the smallest Order, the corresponding metric definition Value is set to 1. For the legacy question choice with the next smallest Order, the metric definition Value is 2, and so on.

The Scale definition field on the migrated Survey Question form determines whether smaller or bigger metric definition values equate to a good score in survey result calculations. By default, the scale definition is set to High, meaning bigger values are good. When you migrate a legacy survey, check that the default scale definition makes sense for each question.

For example, the following tables depict a sample migrated question and the metric definitions automatically created for it. Recall that the system uses the order of the legacy survey question choices to set the metric definition value. Excellent has the lowest Order value, so when the system creates a metric definition for this question choice, the Value is set to 1. In this case the default scale definition value, High, does not make sense, as the system will calculate the worst scores for responses of Excellent.

Table 1194: Legacy question: Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Question choice text</th>
<th>Question choice value</th>
<th>Question choice order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>A</td>
<td>100</td>
</tr>
<tr>
<td>Good</td>
<td>B</td>
<td>200</td>
</tr>
<tr>
<td>Fair</td>
<td>C</td>
<td>300</td>
</tr>
<tr>
<td>Poor</td>
<td>D</td>
<td>400</td>
</tr>
</tbody>
</table>

Table 1195: Migrated question: Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Metric definition display</th>
<th>Metric definition value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>1</td>
</tr>
<tr>
<td>Good</td>
<td>2</td>
</tr>
<tr>
<td>Fair</td>
<td>3</td>
</tr>
<tr>
<td>Poor</td>
<td>4</td>
</tr>
</tbody>
</table>
If there are no Order values for the legacy survey question choices, the system sets each corresponding metric definition Value based on the alphanumerical order of the legacy Text value.

**Table 1196: Migrated question: Please rate the overall quality of your service.**

<table>
<thead>
<tr>
<th>Metric definition display</th>
<th>Metric definition value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>

</tr>
<tr>
<td>Good</td>
<td>2</td>
</tr>
<tr>
<td>Fair</td>
<td>3</td>
</tr>
<tr>
<td>Poor</td>
<td>4</td>
</tr>
</tbody>
</table>

You may also need to change the Scale definition setting for other migrated questions. For details, see the scale definition recommendations for each survey question data type.

**Task Communications Management**

Task Communications Management (TCM) provides a framework for defining and managing a communication process for any entity that extends the task table. Task Communications Management helps you to streamline the process by creating designated plans for effective communication during an event.

A communication plan defines:

- who should be informed
- what information needs to be shared and when that information should be delivered
- methods of communication

When you have a predefined communication plan, you can focus on resolving the current issue instead of deciding when to send a communication, what information to share, and who to inform.
How Task Communications Management works

With Task Communications Management, you can predefine a communication plan for an event such as major incident, planned maintenance, and release. Each plan generally involves a series of tasks that define different communication and collaboration activities along with frequency and method of communication. For each task, you must specify the communication channel such as SMS, email, or conference, for contacting the stakeholders. You can also define templates for email and SMS messages.

After defining the task and channel for communication, you need to define the contacts or the target audience to be contacted for each task as well as the responsibility that is expected of them. The contact type can be user, group, or a list of recipients added dynamically.

After a communication plan is defined, the plan gets associated with the appropriate task table based on the conditions defined. Thereafter, the tasks defined in the plan get executed sequentially and stakeholders are contacted as defined in the plan. The communication plan makes communication and collaboration process smoother and brings a quicker resolution of the issue.

Task communications management flow in major incident management

Assume that you want an incident communication plan generated for a high priority major incident.

- An incident manager can pre-define a communication plan and the conditions that drive its attachment. In this case, conditions are: Priority = High and Major Incident state = Accepted. Let us consider that the target audience is technical stakeholders of the incident and the communication plan definition is named Technical Communications.
- The plan definition can have multiple communication task definitions such as:
  - Initiate Technical Communications
  - Technical Status Update
Each communication task definition also specifies the channel of communication and the communication frequency (one time or recurring).

- Initiate Technical Communications uses email as a channel of communication and communication frequency is one time.
- Technical Status Update uses email and SMS as channel of communication and the communication frequency is recurring.

The target audience for the communications is defined as communication contact definitions on the plan definition. In this case, consider Service owners of the affected CIs related to the incident as technical stakeholders.

When an incident meets these conditions, an incident communication plan together with its tasks gets attached to the incident record.

The major incident manager can now effectively carry out the communication without any delay in the resolution of the major incident.

Task Communications Management plugin

- Existing customers, who have activated Incident Management - Major Incident Management plugin (com.snc.incident.mim) or Incident Communications Management plugin (com.snc.iam), the Task Communications Management plugin (com.snc.task_communication_management) is also activated by default.

- The Task Communications Management plugin is activated when you activate the Incident Management - Major Incident Management plugin (com.snc.incident.mim).

Note: With the activation of the Task Communications Management plugin (com.snc.task_communication_management), the Contact Management plugin (com.snc.contact_management) and the Targeted Communications (com.sn_publications) plugin also get activated.

Activate Task Communication Management

The Task Communications Management plugin (com.snc.task_communication_management) is activated when you activate the Incident Communications Management plugin (com.snc.iam) or the Incident Management - Major Incident Management plugin (com.snc.incident.mim). This plugin includes demo data and activates related plugins if they are not already active.

Role required: admin

Task Communications Management activates these related plugins if they are not already active.

Table 1197: Plugins for Task Communications Management

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>

</table>

Installed with Task Communications Management

Several types of components are installed with the Task Communications Management (TCM) plugin.

Tables installed with Task Communications Management

Tables are added with the activation of Task Communications Management. Task Communications Management adds the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Communication Plan Type Lookup</td>
<td>Stores the communication plan types.</td>
</tr>
<tr>
<td>[comm_plan_type_lookup]</td>
<td></td>
</tr>
<tr>
<td>Communication Task Type Lookup</td>
<td>Stores the communication task types.</td>
</tr>
<tr>
<td>[comm_task_type_lookup]</td>
<td></td>
</tr>
<tr>
<td>Communication Plan Definition</td>
<td>The definition table for the communication plan entity.</td>
</tr>
<tr>
<td>[comm_plan_definition]</td>
<td></td>
</tr>
<tr>
<td>Communication Task Definition</td>
<td>The definition table for the communication task entity.</td>
</tr>
<tr>
<td>[comm_task_definition]</td>
<td></td>
</tr>
<tr>
<td>Communication Channel Definition</td>
<td>Master table for channel definitions.</td>
</tr>
<tr>
<td>[comm_channel_definition]</td>
<td></td>
</tr>
<tr>
<td>Communication Channel Definition - Email</td>
<td>Defines email as a channel.</td>
</tr>
<tr>
<td>[comm_channel_def_email]</td>
<td></td>
</tr>
<tr>
<td>Communication Channel Definition - SMS</td>
<td>Defines SMS as a channel.</td>
</tr>
<tr>
<td>[comm_channel_def_sms]</td>
<td></td>
</tr>
<tr>
<td>Communication Channel Definition - Conference</td>
<td>Defines Conference as a channel.</td>
</tr>
<tr>
<td>[comm_channel_def_conference]</td>
<td></td>
</tr>
<tr>
<td>Communication Contact Definition</td>
<td>Defines the contacts for sending out communications. Contacts can be users,</td>
</tr>
<tr>
<td>[comm_contact_definition]</td>
<td>groups, or recipient lists.</td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Communication Channel Configuration [comm_channel_config]</td>
<td>Lists all available channels for an instance.</td>
</tr>
<tr>
<td><strong>Note:</strong> Configuration script for each channel is a script include.</td>
<td></td>
</tr>
<tr>
<td>Communication Plan [comm_plan]</td>
<td>Stores the communication plan that outlines the communication activity during an event.</td>
</tr>
<tr>
<td>Communication Task [comm_task]</td>
<td>Stores the task to be carried out to communicate with the involved contacts.</td>
</tr>
<tr>
<td>Communication Channel - Email [comm_channel_email]</td>
<td>Stores records that indicate email is used as a communication channel for a communication task.</td>
</tr>
<tr>
<td>Communication Channel - SMS [comm_channel_sms]</td>
<td>Stores records that indicate SMS is used as a communication channel for a communication task.</td>
</tr>
<tr>
<td>Communication Channel - Conference [comm_channel_conference]</td>
<td>Stores records that indicate conference is used as a communication channel for a communication task.</td>
</tr>
<tr>
<td>Communication Task Handler [comm_task_handler]</td>
<td>Lists specific handlers for various task types. Example: For incident, CommunicationManagementIncidentHandler.</td>
</tr>
<tr>
<td><strong>Note:</strong> The admin cannot delete this table.</td>
<td></td>
</tr>
</tbody>
</table>

Roles installed with Task Communications Management

Roles are added with the activation of Task Communications Management. Task Communications Management adds the following roles.

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Communication Plan Admin [sn_comm_management.comm_plan_admin]</td>
<td>Provides overall accountability of Task Communications Management. This role has create and edit access to Task Communications Management tables including Communication Plan Definitions and other related records.</td>
</tr>
<tr>
<td><strong>Contains roles</strong></td>
<td>• Notify_admin&lt;br&gt;• Sn_publications_recipients_list_user</td>
</tr>
<tr>
<td>Role title [name]</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Communication Plan Viewer</td>
<td>This role has read access to Task Communications Management tables.</td>
</tr>
<tr>
<td>Communication Plan Manager</td>
<td>This role has create and edit access to Task Communications Management instance tables such as Communication Plans, Communication Tasks. Users with this role can send ad hoc communications.</td>
</tr>
</tbody>
</table>

Business rules installed with Task Communications Management

Business rules are added with the activation of Task Communications Management. Task Communications Management adds the following business rules.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Validate Communication Plan type</td>
<td>Communication Plan Definition [comm_plan_definition]</td>
<td>Validates that a correct communication plan type is associated with a plan definition record.</td>
</tr>
<tr>
<td>Validate Communication Task type</td>
<td>Communication Task Definition [comm_task_definition]</td>
<td>Validates that the source, plan definition, and the communication plan type are in synchronization with each other.</td>
</tr>
<tr>
<td>Validate Source, Plan Definition &amp; Type</td>
<td>Communication Plan [comm_plan]</td>
<td>Validates that the source, plan definition, and the communication plan type are in synchronization with each other. For example, if the source is an incident, then the plan definition and the type that you chose must be defined on the incident table.</td>
</tr>
<tr>
<td>Validate Task Definition, type</td>
<td>Communication Task [comm_task]</td>
<td>Validates that the communication task definition and type fields are in synchronization with the communication task record.</td>
</tr>
<tr>
<td>Attach Communication Plans</td>
<td>Task [task]</td>
<td>This attaches the communication plans on the relevant task record when the condition mentioned in the communication plan definition matches.</td>
</tr>
<tr>
<td>Business rule</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Validate Channel Definition</td>
<td>Communication Channel definition [comm_channel_definition]</td>
<td>This enforces the mutual exclusiveness of Conference as a channel definition.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> If Conference is added as a channel definition, then you cannot add email or SMS as a channel for that communication task definition. A communication task definition can have both email and SMS as channel definitions.</td>
</tr>
<tr>
<td>Validate Channel</td>
<td>Communication Channel [comm_channel]</td>
<td>Validate Channel business rule enforces the mutual exclusiveness of Conference as a channel. For example, if Conference is added as a channel, then you cannot add email or SMS as a channel for that communication task. A communication task can have both email and SMS as channels.</td>
</tr>
<tr>
<td>Conference call allowed</td>
<td>Communication Task [comm_task]</td>
<td>Decides whether conference call initiation should be allowed on the communication task record in its current state.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> If a conference call is already in progress for a communication task, you cannot initiate a new conference call for the same communication task until the previous call ends.</td>
</tr>
<tr>
<td>Sync Conference Call status</td>
<td>Notify Conference Call [notify_conference_call]</td>
<td>This keeps the conference call state and the conference channel state in synchronization.</td>
</tr>
</tbody>
</table>

**UI policies installed with Task Communications Management**

UI policies are added with the activation of Task Communications Management.

Task Communications Management adds the following UI policies.
<table>
<thead>
<tr>
<th>UI policy</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Type is Consumer (active when sn_customerservice plugin is activated)</td>
<td>Communication Contact Definition [comm_contact_definition]</td>
<td>These four UI policies on the Communication Contract Definition table [comm_contact_definition] show respective fields only when you select the related value from the Type choice list.</td>
</tr>
<tr>
<td>• Type is Group</td>
<td>Communication Plan Definition [comm_plan_definition]</td>
<td>Displays the Condition field on the Communication Plan Definition table [comm_plan_definition] only when the Condition based check box is selected.</td>
</tr>
<tr>
<td>• Type is User</td>
<td>Communication Plan [comm_plan]</td>
<td>When you provide the Communication plan definition value, the Communication plan definition and the table field are set as read only on loading.</td>
</tr>
<tr>
<td>• Type is Recipient List</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Script includes installed with Task Communications Management**

Script includes are added with the activation of Task Communications Management.

Task Communications Management adds the following script includes.

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CommunicationManagementBridgeSNC</td>
<td>The main script include that provides implementations for other tasks. If no implementation is found, default handling is done per CommunicationManagementDefaultHandlerSNC.</td>
</tr>
<tr>
<td>CommunicationManagementDefaultHandlerSNC</td>
<td>Default handler for communicationcanagement common tasks. This handler is used if there is no specific script include shipped in comm_task_handler table.</td>
</tr>
<tr>
<td>CommunicationManagementRestHandlerSNC</td>
<td>Includes functionality for creating ad hoc communication plan or tasks, and provides utilities for capturing details in the communication clan.</td>
</tr>
<tr>
<td>CommunicationManagementUtilSNC</td>
<td>Includes functionality for syncing channels and communication tasks and provides utilities for the Task Communication Management flow.</td>
</tr>
<tr>
<td>CommunicationPlanEngineSNC</td>
<td>Includes functionality for associating communication plans with the task record.</td>
</tr>
<tr>
<td>CommunicationManagementChannelConferenceConfigSNC</td>
<td>Provides functionality to fetch configuration details for the conference channel.</td>
</tr>
<tr>
<td>CommunicationManagementChannelEmailConfigSNC</td>
<td>Provides functionality to fetch configuration details for the email channel.</td>
</tr>
</tbody>
</table>
### Working with Task Communications Management

The section covers topics that help you with a variety of technical concepts related to Task Communications Management such as creating communication plan definition, task definition, channel definition, and contact definition.

#### Create communication plan definition

Create a communication plan definition to specify communication task and contact definitions. You can define communication frequency for each task along with communication channels and templates for messaging.

Role required: sn_comm_management.comm_plan_admin or admin

2. On the form, fill in the fields.

<p>| Table 1198: Communication Plan Definition form |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the communication plan.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to which the plan is to be attached when the conditions are met.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of communication plan such as Technical, Internal, External, Customer.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which the communication plans must get associated to the table.</td>
</tr>
<tr>
<td>Condition based</td>
<td>Check box to define whether the plan is attached to a table based on conditions. For example, if you want a communication plan to get attached to an incident of priority = 2, you can mention the condition in the Condition field.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to define whether the plan definition is active.</td>
</tr>
<tr>
<td>Description</td>
<td>Detailed description of the plan definition.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition under which a communication plan gets attached to a table.</td>
</tr>
</tbody>
</table>
3. Click Submit.
   The communication plan is submitted. The communication plan definition contains the following related lists:
   - Communication Task Definitions
   - Communication Contact Definitions

Create communication tasks for the plan.

Create communication task definition

Create a communication task for a communication plan. When a plan gets attached to a table, the tasks related to the plan need to be executed to resolve the issue. You can associate multiple tasks with a communication plan.

You have defined a communication plan.

Role required: sn_comm_management.comm_plan_admin

1. Click the Communication Task Definitions related list and then click New.
2. On the form, fill in the fields.

Table 1199: Communication Task Definition form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the communication task definition.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of task such as internal communication, that is applicable to a particular table or globally.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which the communication tasks appear in the plan. This field indicates which communication task to execute first.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to define whether the task is active or not.</td>
</tr>
<tr>
<td>Description</td>
<td>Detailed description of the task definition.</td>
</tr>
<tr>
<td>Communication frequency</td>
<td>Frequency of the communication task execution. You can send the notification once or the notification can be repeated.</td>
</tr>
<tr>
<td>Duration</td>
<td>Time by which you want to send a notification. For example, if the communication frequency is One time and the Duration is 15 minutes, then the notification is sent only once within 15 minutes. If the Communication frequency is Recurring, then the notification is sent every 15 minutes.</td>
</tr>
</tbody>
</table>

3. Click Update.

Create communication channel definition for the task.
Create communication channel definition

Create a communication channel for each communication task to determine which mode of communication to use for the task when a plan is attached to a table.

You have defined a communication plan.

Role required: sn_comm_management.comm_plan_admin

- There are three modes of communication available: email, SMS, and conference.
- For the incident table, the functionality for SMS and conference appears only if you activate the Notify plugin (com.snc.notify) and the com.snc.iam.notify_number property value is set to the registered notify number. The notify number is registered while configuring the Twilio account.
- Add Channel – Conference is mutually exclusive to Add Channel – SMS and Add Channel – Email. If you add Add Channel – SMS, the Add Channel – Email related link appears but not the Add Channel – Conference related link. Similarly, if you add Add Channel – Email, the Add Channel – SMS related link appears but not the Add Channel – Conference related link.

1. On the Communication Task Definition form, click any one of the following related links based on your requirement:
   - Add Channel – Conference
   - Add Channel – Email
   - Add Channel – SMS

2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Channel – Conference</td>
<td>Communication task definition this channel definition is associated with.</td>
</tr>
</tbody>
</table>
| Email client template   | Lookup icon to select the email client template used to send emails to the targeted audience.  
                         | **Note:** This email template must be defined on the Communication task table. |
| Add Channel – SMS       | Communication task definition this channel definition is associated with.   |
| Notify SMS template     | Lookup icon to select the notify sms template used to send an sms to the targeted audience. 
                         | **Note:** This email template needs to be defined on the Communication task table. |
3. Click Submit.

After creating communication tasks and communication channels for those tasks, create contacts for the communication plan.

Create communication contact definition

Define the recipients of a particular plan to determine the target audience involved in each communication task and the responsibilities the recipients are expected to handle. A notification that is sent for a task is sent to all individuals specified for that task.

You have defined a communication plan.

Role required: sn_comm_management.communication_plan_admin

You can add or remove any particular communication contact manually.

1. Click the Communication Contact Definitions related list and then click New.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Type of contact that you want to involve in the plan. The contact type is assigned dynamically at the time of the table execution.</td>
</tr>
<tr>
<td>Responsibility</td>
<td>Responsibility that the user or group or the individuals in the recipient list are expected to handle.</td>
</tr>
<tr>
<td>User</td>
<td>Name of the user, group, or recipient list to be added to the contact list.</td>
</tr>
</tbody>
</table>

**Note:** Use the recipient list to specify a dynamic criteria for fetching the list of users for a particular communication plan.

3. Click Submit.

Define a recipient list for communication contact

Dynamically define the recipients of a particular communication plan using the recipient list.

You have defined a communication plan.

Role required: sn_comm_management comm_plan_admin

Sometimes, the members you want to include in a plan can only be known dynamically. For example, you might want the support group associated with a particular business service in an incident to be involved in the communication plan. The support group might change depending on the business service that you select. In such a case, a recipient list provides the flexibility to add recipients dynamically.

1. Navigate to Task Communications Management Administration Recipients Lists.
3. On the form, fill in the fields.
Table 1202: Recipients Lists form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the recipient list.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of recipients such as internal users, accounts, contacts.</td>
</tr>
<tr>
<td>State</td>
<td>Role that the user, group, or the individuals in the recipient list plays.</td>
</tr>
</tbody>
</table>

Setup

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Different methods used to define the recipients:</td>
<td></td>
</tr>
<tr>
<td>• Upload File: Upload an Excel file with the recipient information. This list is static.</td>
<td></td>
</tr>
<tr>
<td>• Dynamic Condition: Use scripts or conditions to receive recipient information.</td>
<td></td>
</tr>
</tbody>
</table>

4. Click Submit.

Create communication contacts for the task.

Define plan type

Define the communication plan type and specify whether the plan type is applicable to a particular table or globally. When you create the communication plan type, it is referenced in the communication plan definition.

Role required: sn_comm_management.comm_plan_admin

The value in the Type field helps you filter the plan by its type, generate a report of a particular plan type, or create SLAs for any communication plan.

1. Navigate to Task Communication Management Administration Plan Types, and click New.
2. On the form, fill in the fields.

Table 1203: Communication Plan Type Lookup form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the communication plan type.</td>
</tr>
<tr>
<td>Global</td>
<td>Check box to determine whether the plan type is available for all tables or for a specific table. If the check box is not selected, the Table field appears where you can select the table for which the plan type appears.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the plan type. The plan type is available for all applications or for scoped applications.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to define whether the plan type is active.</td>
</tr>
<tr>
<td>Description</td>
<td>Detailed description of the plan type.</td>
</tr>
</tbody>
</table>

3. Click Submit.
Create a communication plan definition.

Define task type

Define the type of the communication task and specify whether the task is applicable to a particular table or applicable globally.

Role required: sn_comm_management.comm_plan_admin

The value in the Type field helps you filter a task by its type, generate a report of a particular task type, or create SLAs for any communication task.

1. Navigate to Task Communication Management Administration Task Types, and click New.
2. On the form, fill in the fields.

Table 1204: Communication Task Type Lookup form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the communication task type.</td>
</tr>
<tr>
<td>Global</td>
<td>Check box to determine whether the task type is available for all tables or for a specific table. If the check box is not selected, the Table field appears where you can select the table the task type appears for.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the task type. The task type is available for all applications or for scoped applications.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to define whether the task type is active or not.</td>
</tr>
<tr>
<td>Description</td>
<td>Detailed description regarding the type of the task.</td>
</tr>
</tbody>
</table>

3. Click Submit.

Create a communication task definition.

Define contact responsibilities

Define the different contacts or target audience involved in the communication process and the responsibility that those contacts are expected to manage throughout the process. Define the contact responsibility name such as Business Director or Duty Manager, type of the contact such as user, group, or recipient, and the task table the contact is associated to.

Role required: sn_comm_management.comm_plan_admin

1. Navigate to Task Communication Management Administration Contact Responsibilities, and click New.
2. On the form, fill in the fields.

Table 1205: Contact Responsibility form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global</td>
<td>Check box to determine whether the contact responsibility is available for all tables or for a specific table. If the check box is not selected, the Table field appears where you can select the table the contact responsibility appears for.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the contact involved in the communication process.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of contact.</td>
</tr>
<tr>
<td>Table</td>
<td>Table on which contact is activated when a communication plan is attached.</td>
</tr>
</tbody>
</table>

3. Click Submit.

Create communication contacts for the task.

**View communication channel configuration**

You can define different communication channels that are used to contact the target audience in the communication process. By default, the communication channels available are e-mail, SMS, and conference.

Role required: sn_comm_management.comm_plan_admin

An admin only has read access to the Channel Configuration module. If you want to create a new channel configuration, request through the HI Customer Service system.

1. Navigate to Task Communication Management Administration Channel Configuration and click New.
2. On the form, fill in the fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Mode of channel such as e-mail, SMS, conference.</td>
</tr>
<tr>
<td>Configuration script</td>
<td>Lookup icon to select the script that defines the channel configuration.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to define whether the communication channel is active or not.</td>
</tr>
</tbody>
</table>

3. Click Submit.

**Timeline Visualizations**

A timeline visualization is a representation of an organization's activities over time.

Typically, timeline visualizations are useful for quickly assessing the impact of future strategic and operational activities such as change requests and projects. Timeline visualizations come in two varieties: a two-dimensional (2D) view where activities are grouped by month, and a three-dimensional (3D) view where activities are grouped in lanes. Both views are interactive, and the 2D view can be printed.

Timeline administrators, users with the timeline_admin role, can set up visualizations to represent ITSM-related activities, such as incidents, problems, changes, and projects. Timeline administrators or users with the timeline_user role can personalize their timeline visualizations from the Settings pane in the visualization.
The CIO Roadmap timeline visualization shows your organization’s projects grouped by portfolios. Organizational leaders can use the CIO Roadmap to monitor and evaluate the status of current and upcoming projects.

**Note:** Activating timeline visualizations does not activate predefined CIO roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.

**Key terms for timeline visualizations**

- **Lane**: A logical grouping of items on the 3D timeline visualization. For example, one lane might show pending projects while another lane shows open projects.
- **Panel**: A block that represents an item record in a 2D timeline visualization, or a block that represents one or more item records in a 3D timeline visualization.
- **Summary view**: A pop-up window that appears when a user clicks a panel in either the 2D or 3D timeline visualization. The summary view contains additional information about the record. Timeline administrators configure the information that appears in the summary view.
- **Marker**: A bar indicating the start of a month in a 3D timeline visualization.
- **Slider**: A tool used to control the time period seen in a 3D visualization.
- **Slider track**: An alternative view of the panels displayed in both the 2D and 3D timeline visualization.
Activate Timeline Visualization

An administrator can activate the Timeline Visualization plugin (com.snc.timeline_visualization) to access the functionality.

To use the CIO roadmap with timeline visualization, you must activate Project Portfolio Management (com.snc.financial_planning_pmo) plugin.

1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
   - If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. If available, select the Load demo data check box.
   - Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
   - You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.
5. Click Activate.
Installed with Timeline Visualizations

Several components are installed with timeline visualizations.

Tables

Timeline visualization adds the following table.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timeline Visualization [roadmap_page]</td>
<td>Stores all available timeline visualizations.</td>
</tr>
<tr>
<td>Personalize Timeline [roadmap_user_page]</td>
<td>Stores timeline personalization settings for all timeline visualizations.</td>
</tr>
</tbody>
</table>

UI Policies

Timeline visualization adds the following UI policy.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control Timeline Visualization configuration Page to enable/disable certain fields</td>
<td>Timeline Visualization [roadmap_page]</td>
<td>Script that hides fields in the Timeline Visualization form when the form loads.</td>
</tr>
</tbody>
</table>

Script Includes

Timeline visualization adds the following script includes.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Roadmap2DUtil</td>
<td>Timeline Visualization - 2D API to generate data for lanes and panels.</td>
</tr>
<tr>
<td>RoadmapCommonUtil</td>
<td>Timeline visualization common utility to handle generic functions.</td>
</tr>
<tr>
<td>RoadmapConfig</td>
<td>Timeline visualization utility allowing configuration through the Timeline Visualization [roadmap_page] table.</td>
</tr>
<tr>
<td>RoadmapItems</td>
<td>Timeline visualization utility to get lane items.</td>
</tr>
<tr>
<td>RoadmapUtil</td>
<td>API to generate data for lanes and panels.</td>
</tr>
</tbody>
</table>

Client Scripts

Timeline visualization adds the following client scripts.
<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Roadmap Color Choice</td>
<td>Timeline Visualization [roadmap_page]</td>
<td>Sets color values for the color choice fields in the timeline visualization configuration page.</td>
</tr>
<tr>
<td>Roadmap Item Table</td>
<td>Timeline Visualization [roadmap_page]</td>
<td>Allows changing the color fields for the item_color_key whenever there is a change to the panel table.</td>
</tr>
<tr>
<td>Roadmap On Load</td>
<td>Timeline Visualization [roadmap_page]</td>
<td>Loads the personalized version of the roadmap/visualization.</td>
</tr>
<tr>
<td>Roadmap Panel Table Change</td>
<td>Timeline Visualization [roadmap_page]</td>
<td>Allows changing the field name for item_color_key whenever there is a change to the panel/visualization table.</td>
</tr>
</tbody>
</table>

**Business Rules**

Timeline visualization adds the following business rule.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Check only one default</td>
<td>Timeline Visualization [roadmap_page]</td>
<td>Checks if another visualization is already set as default when user sets a new visualization as the default.</td>
</tr>
</tbody>
</table>

**Timeline visualizations roles**

Timeline visualizations provides two roles.

**Table 1207: Roles**

<table>
<thead>
<tr>
<th>Role Title [Name]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timeline administrator [timeline_admin]</td>
<td>Create and edit timeline visualization pages and view timeline visualizations.</td>
</tr>
<tr>
<td>Timeline user [timeline_user]</td>
<td>View timeline visualizations. Timeline user access is also granted to users with the project_manager and project_user roles.</td>
</tr>
</tbody>
</table>

**Create a Timeline Visualization**

Set up timeline visualizations for the organization’s leaders by creating a timeline that provides visual representations of the organization's operational and strategic activities.

Role required: timeline_admin

Additionally, create timeline visualization views to define what data appears in the summary window when a user clicks a panel on the timeline.
**Note:** Activating timeline visualizations doesn’t activate predefined CIO roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.

- Navigate to Timeline Visualization Create New and create a new record.
Figure 654: Timeline visualization configuration form
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for the visualization.</td>
</tr>
<tr>
<td>Panel table</td>
<td>Table that provides the records displayed as lanes and panels in the timeline. Note: The list shows only tables and database views that are in the same scope as the visualization.</td>
</tr>
<tr>
<td>Relationship field</td>
<td>Field on the table that contains values displayed as lane titles. Typically this field is a reference field or a field that contains a limited range of values. Note: The CIO Roadmap timeline visualization is a ServiceNow customized visualization for the Project application that does not use the Relationship field.</td>
</tr>
<tr>
<td>Show slider</td>
<td>Check box that enables (selected) or disables (cleared) displaying the timeline slider that users move to change the dates shown.</td>
</tr>
<tr>
<td>Panel name</td>
<td>Field from the Panel table that contains the values displayed in the panel body.</td>
</tr>
<tr>
<td>Panel date</td>
<td>Field from the Panel table that contains the date values displayed in the panel head in 3D view and in the panel body in 2D view. These dates also determine placement of panels on a lane. Only date and date-time fields are available on the choice list.</td>
</tr>
<tr>
<td>Default</td>
<td>Check box that sets (selected) or removes (cleared) the default status of a visualization when you have more than one defined for a specific table. Applications that include a visualization use the default visualization.</td>
</tr>
<tr>
<td>Max items per lane</td>
<td>Maximum number of items that are displayed in a lane in 3D view. The default value is 500. Note: The field is not visible on the form by default. Configure the form to add this field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Max items per lane 2d</td>
<td>Maximum number of items that are displayed in a lane in 2D view. The default value is 99. <strong>Note:</strong> The field is not visible on the form by default. Configure the form to add this field.</td>
</tr>
</tbody>
</table>

**Table 1209: Timeline visualization configuration filtering and sorting form field descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lane condition</td>
<td>Condition builder used to create filters and apply sorting to values that are used as lanes in 3D view visualizations. For example, if you set [Name] [is not] [IT] as a lane condition for the CIO Roadmap, then IT no longer appears as a lane in the roadmap, nor does it appear as a lane option in the Settings pane. Removing the filter restores the IT lane to the visualization and to lane options in the Settings pane. To order the results, specify sorting based on relevant field names. For example, to order the portfolio names so that they appear in reverse alphabetical order on the CIO Roadmap, set the sort fields to [Name] [z to a].</td>
</tr>
<tr>
<td>Panel condition</td>
<td>Condition builder used to create filters and apply sorting to values that are used as panels in 2D and 3D view visualizations. For example, if you set [State] [is one of] [Pending, Open, Work in Progress] as the panel condition for the CIO Roadmap, only projects that are in one of those states appear on the roadmap.</td>
</tr>
</tbody>
</table>
### Table 1210: Timeline visualization configuration color options form field descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Panel color key</td>
<td>Field from the Panel table that contains values used for color coding the information displayed. The field selected here determines the values that are available in the Label fields on the form.</td>
</tr>
<tr>
<td></td>
<td>The CIO Roadmap uses State, which is a field in the Project table. Panels on the CIO Roadmap are color coded according to the project state, which can be Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Skipped.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.</td>
</tr>
<tr>
<td></td>
<td>Examples of other fields that are suitable for this selection include Priority, Risk, and Approval.</td>
</tr>
<tr>
<td>Label 1</td>
<td>Values to be color coded. The values available are determined by the Panel color key field. For example, the CIO Roadmap is based on the Project table and has the Panel color key set to the State field, which contains the values Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped.</td>
</tr>
<tr>
<td>Label 2</td>
<td>You can set specific colors for up to four values from the selected field. Other values are shown in the Default color.</td>
</tr>
<tr>
<td>Label 3</td>
<td></td>
</tr>
<tr>
<td>Label 4</td>
<td></td>
</tr>
<tr>
<td>Default color</td>
<td>Color applied to values that are not selected for labels. For example, the CIO Roadmap color codes and creates labels for the values Pending, Open, Work in Progress, and Closed Complete. The additional values, Closed Incomplete and Closed Skipped, use the default color.</td>
</tr>
<tr>
<td>Color 1</td>
<td>Colors that correspond to each of the Label field values. For example, if Label 1 is the Pending state, and Color 1 is red, then panels for projects in the pending state are red.</td>
</tr>
<tr>
<td>Color 2</td>
<td></td>
</tr>
<tr>
<td>Color 3</td>
<td></td>
</tr>
<tr>
<td>Color 4</td>
<td></td>
</tr>
</tbody>
</table>
Create a Timeline Visualization view

The timeline visualization view determines which record details appear in the pop-up summary window when a user clicks a panel.

You can create one timeline visualization view per table. For example, if your view shows incident records, you can create a view on the Incident table to show only certain information, such as the incident number, priority, and short description.

If no Timeline Visualization view exists, all panels use the default view that shows all the fields that currently appear on the default view of the form for that table. After you create a Timeline Visualization view for a table, all panels then use that view.

For example, to create a Timeline Visualization view using the Incident form:

1. Navigate to Incident All.
2. Open an incident.
3. Right-click the form header and select Configure Form Layout.
4. Under Form view and section, go to the View name field and select New.
5. Enter timeline visualization in the View name field.
6. Click Ok to create the timeline visualization view.
7. Add fields to or remove items from the timeline visualization view using the Available and Selected columns.
8. Click Save.

Planning Your Timeline Visualization

Before creating a timeline visualization, you should have a clear idea of the information that you want to display.

This planning process helps you identify the required table and fields, and determine filtering and sorting requirements. Since users can personalize the visualization, avoid setting restrictive filters that may prevent users from finding categories that they are accustomed to seeing. You can use the CIO Roadmap as a starting point for creating your own timeline visualizations.

Note: Activating timeline visualizations doesn't activate predefined CIO roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.

Use Timeline Visualization

Timeline Visualization provides a high-level view of an organization's strategic and operational activities over time.

Organizational decision makers can use the information in visualizations for activities such as planning future projects and estimating resource requirements. Users can personalize the information displayed with the visualization Settings pane.

Activating the Timeline Visualization application does not install the CIO Roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap. CIO Roadmap is a timeline visualization that displays an organization's IT projects and portfolios. This following sections use the CIO Roadmap to demonstrate features of timeline visualizations.
Lanes, markers, and panels

Lanes, markers, and panels are the fundamental elements of a timeline visualization. appear in the 3D view only.

**Note:** Lanes and markers are available in the 3D view only. A panel in the 2D view always represents a single record, while panels in 3D view may represent one or more records.

**Lanes**

A lane is a channel in which activities are grouped. A visualization can display up to eight lanes at a time. While viewing a visualization, you can use the Settings pane to show or hide individual lanes.

**Note:** The number of items displayed in a lane depends on the Max items per lane and Max items per lane 2d settings on *Timeline Visualization form.*

**Markers**

Markers are horizontal lines that cross all lanes and identify a transition to the next month.

**Panels**

Panels in both 2D and 3D views are color coded according to values that the administrator selects during the initial setup.

In 2D view, panels are grouped by month and stacked in chronological order, from the earliest date to the latest date. By default, the 2D view opens with the current month displayed on the left side of the visualization. You can print visualizations from the 2D view using the browser's print option. In 3D view, panels are grouped in lanes and ordered by date, from earliest to latest. The date that appears on the panel determines its placement in 2D and 3D view. The date displayed is based on a value the timeline administrator selects during initial setup.

Panels appear in the CIO Roadmap according to the planned completion date for the project. In 3D view, projects with the same planned date of completion are consolidated into a single panel. In 2D view, projects with the same planned date of completion are displayed as individual panels.
Panel headers in the CIO Roadmap are color coded based on project state. However, in 3D view, if a panel represents more than one project, the panel header is colored black. The Settings pane contains a key showing each available project state and the corresponding color.

**Note:** Activating timeline visualizations doesn’t activate predefined CIO roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.

To view additional information about a panel:

- Click a panel for a single record while in 2D or 3D view to open a summary window that contains additional information. Click the heading in the summary window to open the full record.
- Click a panel that represents multiple records to open a list of those records. Click a record number to open the full record.

The timeline administrator can configure the information that appears in summary windows.

**Personalize Timeline Visualizations**

You can configure settings for timeline visualizations like lane and panel conditions, colors, and labels.

**Personalization**

Open the Settings pane and click Configure. Complete the form as appropriate (see table).
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lane conditions</td>
<td>Condition builder used to create filters and apply sorting to values that are used as lanes in 3D view visualizations. For example, if you set [Name] [is not] [IT] as a lane condition for the CIO Roadmap, then IT no longer appears as a lane in the roadmap, nor does it appear as a lane option in the Settings pane. Removing the filter restores the IT lane to the visualization and to lane options in the Settings pane. To order the results, specify sorting based on relevant field names. For example, to order the portfolio names so that they appear in reverse alphabetical order on the CIO Roadmap, set the sort fields to [Name] [z to a].</td>
</tr>
<tr>
<td>Panel conditions</td>
<td>Condition builder used to create filters and apply sorting to values that are used as panels in the visualization. For example, if you set [State] [is one of] [Pending, Open, Work in Progress] as the panel condition for the CIO Roadmap, only projects that are in one of those states appear on the roadmap.</td>
</tr>
<tr>
<td>Panel color key</td>
<td>Field from the Panel table that contains values used for color coding the information displayed. The field selected here determines the values that are available in the Label fields on the form. The CIO Roadmap uses State, which is a field in the Project table. Panels on the CIO Roadmap are color coded according to the project state, which can be Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Skipped. Examples of other fields that are suitable for this selection include Priority, Risk, and Approval.</td>
</tr>
<tr>
<td>Label 1</td>
<td>Values to be color coded. The values available are determined by the Panel color key field. For example, the CIO Roadmap is based on the Project table and has the Panel color key’ set to the State field, which contains the values Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped. You can set specific colors for up to four values from the selected field. Other values are shown in the Default color.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Default color</td>
<td>Color applied to values that are not selected for labels. For example, the CIO Roadmap color codes and creates labels for the values Pending, Open, Work in Progress, and Closed Complete. The additional values, Closed Incomplete and Closed Skipped, use the default color.</td>
</tr>
<tr>
<td>Color 1</td>
<td>Colors that correspond to each of the Label field values. For example, if Label 1 is the Pending state, and Color 1 is red, then panels for projects in the pending state are red.</td>
</tr>
<tr>
<td>Color 2</td>
<td></td>
</tr>
<tr>
<td>Color 3</td>
<td></td>
</tr>
<tr>
<td>Color 4</td>
<td></td>
</tr>
</tbody>
</table>

**Note:**

- Activating timeline visualizations doesn't activate predefined CIO roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.
- If the Max items per lane field is set to more than 1000, you may observe a delay when displaying the timeline data using Internet Explorer (IE) as the browser.

**The Settings pane**

Element names in the Settings pane vary based on the table and fields used to create the visualization.
The Settings pane contains the following elements:

**Table 1212: Settings pane elements**

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key</td>
<td>Identifies the type of information that is color coded on the timeline, such as state or priority. It also lists the color assigned to each possible value, such as pending state and open state.</td>
</tr>
<tr>
<td>Element</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Configure</td>
<td>Allows you to personalize a visualization by creating filters on lane information and panel information, specifying sort order for results, and reassigning panel colors. These changes affect your view of the visualization only.</td>
</tr>
<tr>
<td>View</td>
<td>Allows you to switch between 2D and 3D view.</td>
</tr>
<tr>
<td>View &lt;table&gt; List</td>
<td>Opens a separate browser tab showing the complete record list for the associated table.</td>
</tr>
<tr>
<td>Portfolio</td>
<td>Allows you to click lane names to add or remove them from the visualization. While the visualization is in 2D view, the Settings pane displays a Show all &lt;records&gt; button that allows you to override lane filters applied to the initial setup.</td>
</tr>
</tbody>
</table>

Use the slider and slider track

The slider and slider track are useful for quickly navigating to any point in time on a visualization.

**Note:** Activating timeline visualizations doesn't activate predefined CIO roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.

For the CIO Roadmap, the slider track allows you to quickly view the distribution of projects over time and determine project states. While in 3D view, click and drag the slider to move the timeline forward or backward. In 2D view, click and drag the slider track right or left to move the timeline forward or backward.

The slider track provides an alternative view of panels on a visualization. For the CIO Roadmap, a colored dot in the slider track indicates the presence of one or more projects for a given day. The different dot colors correspond to different project states. This allows you to scan the slider track to identify projects of interest by their color, and then use the slider or slider track to quickly navigate to those projects. For example, if you are interested in projects that are in a pending state, you can use the slider to navigate to the colored dots that represent that state.

**Note:** Dots in the slider track do not correspond one-to-one with panels in a visualization. A dot represents the presence of one or more projects on a given date. In 3D view, if there is more than one project for a given day, all of the projects for that day are combined into a single panel on the roadmap. When the slider track is populated, projects in a multi project panel are analyzed for project state and then represented as appropriately colored dots in the slider track.

Similarly, you can use the slider or slider track in conjunction with the calendar to quickly navigate to any point in time. For example, if you are concerned about resource issues in April 2014 because you see a large cluster of dots during that time, dragging the slider or slider track to those dots brings those projects into view. Click the individual panels to view additional information.

View timeline visualization

You can view timeline visualizations from a project.

1. Navigate to Project Projects All.
2. Scroll to the bottom of the list and click the Timeline Visualization related link.
By default, the CIO Roadmap opens in three-dimensional (3D) view with the current date at the forefront of the timeline. You can use the Settings pane to change between two-dimensional (2D) and 3D view. As soon as you view a timeline visualization, it is considered personalized. After that, you see your personalized view even if the timeline administrator makes changes to the default visualization.

**Note:** Activating timeline visualizations doesn't activate predefined CIO roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.

Timeline administrators can create timeline visualizations on other tables. If you are not sure whether a timeline visualization exists for a certain application, use the application navigator to open the application of your choice, and click All. If a timeline visualization exists for the application's table, a Timeline Visualization related link appears.

### Work with timeline visualizations

There are various tools that allow you to move visualizations backward and forward in time depending on whether you are in 2D or 3D view.

The following options are available for navigating between months.

#### Table 1213: 2D views

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dragging</td>
<td>Hold down the left mouse button and drag the slider track right or left to view other months.</td>
</tr>
<tr>
<td>Left and right arrow keys</td>
<td>Press the left or right arrow keys on the keyboard to move the timeline forward or backward.</td>
</tr>
<tr>
<td>Mouse wheel button</td>
<td>Scroll the wheel to move the timeline forward or backward.</td>
</tr>
<tr>
<td>Right and left navigation arrows</td>
<td>Click the arrows to move from month to month. Arrows do not appear if there are no additional months to view.</td>
</tr>
</tbody>
</table>

The following options are available for navigating stacked panels.

#### Table 1214: Navigating stacked panels

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dragging</td>
<td>Hold down the left mouse button and drag the stack up or down to view other panels.</td>
</tr>
<tr>
<td>Up and down navigation arrows</td>
<td>Click the arrows in a stack to view additional panels for the same month. Arrows do not appear if there are no additional panels to view.</td>
</tr>
</tbody>
</table>

The following options are available for navigating in 3D view.
Virtual Agent

Virtual Agent is a conversational bot platform for providing user assistance through conversations within a messaging interface. Use Virtual Agent to build automated agents (bots) and design bot conversations that help your users quickly obtain information, make decisions, and perform common work tasks.

Watch this eight-minute video for an introduction to the Virtual Agent platform.

The Virtual Agent platform includes the following components:

**Virtual Agent conversational (client) interface**

With Virtual Agent, your users interact with a chatbot or live agent through various messaging services. Your users can use the web-based Virtual Agent interface available for Service Portal and Apple iOS and Google Android environments. They can use the Virtual Agent interface for third-party messaging applications through the ServiceNow integrations for Slack and Microsoft Teams.

**Virtual Agent Designer**

Use Virtual Agent Designer to develop, test, and deploy bot conversations that assist your users with common issues or self-service tasks. Virtual Agent Designer is a graphic tool for building the dialog flows of bot conversations, called topics. A topic defines the dialog exchanged between a virtual agent and user to accomplish a specific goal or resolve an issue.

Predefined topics are available for Customer Service Management, HR Service Delivery, and IT Service Management.

**Live Agent support**

Give users the option to switch to a human agent for assistance during bot conversations. Virtual Agent is integrated with the Live Agent module to offer a seamless transfer from a bot conversation to a live agent. With Live Agent, you specify the agent chat queues to be used, including the chat interactions transferred from a virtual agent to a human agent. Your users can request a live agent transfer at any time during a chatbot conversation. You can also initiate a live agent transfer through custom conversation flows that you build.
Benefits

Implementing a virtual agent to handle common requests and tasks enables your users to get immediate help, day or night. Providing your virtual agent on channels familiar to your users, such as third-party messaging apps, offers a convenient way for them to get work done quickly. A virtual agent can also offer personalized customer experiences by applying and remembering user information during the conversation.

Typical Tier 2 support tasks that can be accomplished with virtual agents include:

- Answering FAQs.
- Providing tutorial ("how to") information.
- Querying or updating records, for example to get status on cases or incidents.
- Gathering data, such as attachments, for the live agent.
- Performing diagnostics.
- Resolving multi-step problems.

Automating these support tasks with a virtual agent frees your support agents to focus on more complex user issues and enables you to scale your support organization accordingly.

Conversational interface

The Virtual Agent conversational interface captures an automated messaging session between the virtual agent and user. The interface uses the Service Portal web widget, which can be configured for custom service portals. The widget is available in the CSM, HR Service Delivery, and ITSM Service Portals.
A simple conversation typically includes the following elements:

- Default welcome message from the bot, followed by the first prompt for the conversation. The initial prompt asks the user to type a question, which includes a keyword to trigger the appropriate conversation or to choose from a list of available topics.
- User response to the first prompt. In this example, the user chooses the topic for opening an IT incident.
• Series of prompts, acknowledgements, and responses exchanged between the bot and user, until the user’s goal is reached or task completed. Different rich controls can be used in bot prompts, for example choice lists with buttons or a carousel of images to select an item.
• Closing message to end the conversation.

Conversation options

The conversational interface offers your users several options to manage the conversation. Users can leave the current conversation and start a new one, or contact support to get a live agent for immediate assistance.
Implementing Virtual Agent

To implement Virtual Agent, complete these initial configuration and setup steps.
Role required: admin or virtual_agent_admin

1. Activate Virtual Agent for your production and non-production instances.

   **Note:** Use your non-production instance to develop and test your Virtual Agent conversations (topics). When your topics run as expected, export the topics to your production instance and publish them to make them available on your Virtual Agent clients.

2. Activate the plugins for predefined Virtual Agent conversations.

3. Set up the Virtual Agent clients.
   a) Add the Service Portal chat widget.
   b) Optional. Load the standalone Virtual Agent web client.
   c) Install the Virtual Agent integration app for Slack and MS Teams.

4. Configure Virtual Agent branding.
   Customize Virtual Agent with your own company logo and avatar. Set the color schemes of UI elements and the support contact information displayed in the client interface.

5. Configure the basic conversation settings and customer support contacts.
   Use the Virtual Agent general settings to define the basic characteristics of a conversation, such as the welcome message and general error message displayed on all Virtual Agent clients.

   Specify the chat queues used by live agents for support.

### Activate Virtual Agent

You can activate the Glide Virtual Agent plugin (com.glide.cs.chatbot) if you have the admin role. This plugin includes activates related plugins if they are not already active.

Role required: admin

You must have a subscription for Virtual Agent before you can activate the Virtual Agent plugin. The Glide Virtual Agent plugin activates these related plugins if they are not already active.

#### Table 1216: Plugins for Glide Virtual Agent

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Virtual Agent Designer</td>
<td>Activates Virtual Agent Designer for building conversation flows.</td>
</tr>

<td>[com.glide.connect.support]</td>
<td>Enables chat in a support queue.</td>
</tr>
</tbody>
</table>

1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
   - If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. If available, select the Load demo data check box.
   - Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
   - You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.
5. Click Activate.

Predefined Virtual Agent topics

Prebuilt bot conversations are available for Customer Service Management, HR Service Delivery, and IT Service Management. These topics are designed to help users with common self-service tasks in each business area, such as creating or updating incidents, or providing answers to frequently asked questions.

Plugins for predefined topics

Admins activate the predefined conversations for Virtual Agent through the following plugins:

- Customer Service Virtual Agent conversations (com.sn_csm.virtualagent)
  For details on the Customer Service topics, see Customer Service Virtual Agent conversations.
- Human Resources Scoped App: Virtual Agent Conversations (com.sn_hr_virtual_agent)
  For details on the HR topics, see HR Virtual Agent conversations.
- ITSM Virtual Agent Conversations (com.snc.itsm.virtualagent)
  For details on the ITSM topics, see ITSM Virtual Agent conversations.

Users with the virtual_agent_admin or admin roles can preview the predefined topics in Virtual Agent Designer and deploy the topics to users by publishing them.

Note: Predefined topics cannot be modified. To create a custom topic from a predefined one, duplicate and modify the topic.

Installed with Virtual Agent

Several types of components are installed with activation of the Glide Virtual Agent [com.glide.cs.chatbot] plugin, including tables and user roles.
Note: To view all other components installed with this plugin, see the Application Files table. For instructions, see Find components installed with an application.

Roles installed

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Virtual Agent Administrator [virtual_agent_admin]</td>
<td>Users who can create and manage topics (bot conversations) using Virtual Agent Designer.</td>
<td>None</td>
</tr>
<tr>
<td>External App Install Admin [external_app_install_admin]</td>
<td>Users who can install external apps such as Slack, Microsoft Teams.</td>
<td>None</td>
</tr>
</tbody>
</table>

Tables installed

Table 1217:

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adapter Configuration [sys_cs_adapter_configuration]</td>
<td>Stores records for default keywords, labels, and message values for third-party messaging applications.</td>
</tr>
<tr>
<td>Adapter Configuration Page [sys_cs_adapter_configuration_page]</td>
<td>Stores adapter configuration for third-party messaging applications. This table is the root table for sys_cs_adapter_configuration_page_slack and sys_cs_adapter_configuration_page_teams.</td>
</tr>
<tr>
<td>Client Adapter [sys_cs_client_adapter]</td>
<td>Stores each adapter state.</td>
</tr>
<tr>
<td>Consumer Channel [sys_cs_consumer_channel]</td>
<td>Stores consumer channel information.</td>
</tr>
<tr>
<td>Consumer Device Context [sys_cs_consumer_device_context]</td>
<td>Stores consumer device context information.</td>
</tr>
<tr>
<td>Conversation [sys_cs_conversation]</td>
<td>Stores a record for each conversation on the instance.</td>
</tr>
<tr>
<td>Conversation Consumer [sys_cs_consumer]</td>
<td>Stores a record representing the user in a conversation, and references the associated sys_user record for that user.</td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Conversation Media [sys_cs_media]</td>
<td>Media attached to conversations are stored in sys_attachment, and associated to this table.</td>
</tr>
<tr>
<td>Conversation Message [sys_cs_message]</td>
<td>Stores a record for each message in a conversation.</td>
</tr>
<tr>
<td>Conversation Server Connect Hand-off [sys_cs_connect_handoff]</td>
<td>Stores mapping of Virtual Agent conversations and Connect/Workspace conversations.</td>
</tr>
<tr>
<td>Conversation Session [sys_cs_session]</td>
<td>Stores a record for each conversation.</td>
</tr>
<tr>
<td>Conversation Task [sys_cs_conversation_task]</td>
<td>Stores a record for each conversation task.</td>
</tr>
<tr>
<td>Conversation Task History [sys_cs_conversation_task_history]</td>
<td>Stores history of conversation task execution.</td>
</tr>
<tr>
<td>Conversation Vendor [sys_cs_vendor]</td>
<td>Stores vendor information.</td>
</tr>
<tr>
<td>CS Consumer Account [sys_cs_consumer_account]</td>
<td>Stores third-party user information.</td>
</tr>
<tr>
<td>Live Agent Support Queue Cache [sys_cs_support_queue_cache]</td>
<td>The database cache used for support queue wait times.</td>
</tr>
<tr>
<td>Published Topic [sys_cb_design_topic]</td>
<td>Stores design topic definitions and references runtime topic.</td>
</tr>
<tr>
<td>Session Binding [sys_cs_session_binding]</td>
<td>Stores session binding and AMB channel information.</td>
</tr>
<tr>
<td>Sys CS Vendor Client Adapter Configuration [sys_cs_vendor_client_adapter_configuration]</td>
<td>Stores adapter configuration for third-party messaging applications.</td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>

<td>Enables phonetic searching on topic searches when set to true.</td>
</tr>
<tr>
<td>com.glide.cs.suggest.enable_spell_check</td>
<td>Enables alternate search spellings on topic searches when set to true.</td>
</tr>
</tbody>
</table>

**Domain separation and Virtual Agent**

This is an overview of domain separation and the Virtual Agent application. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

**Overview**

**Support: Level 1**

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see *Application support for domain separation.*

Domain separation is best for those customers who:

- Need to enforce absolute data segregation between business entities (data separation).
- Customize business process definitions and user interfaces for each domain (delegated administration).
- Maintain some global processes and global reporting in a single instance.
- Separate data between customers or sub-organizations.
- The session scope is set upon session establishment to the domain listed in the user's user record. Users can manually change their session domain scope with the domain picker.
- The record scope uses the domain of the record and is active when viewing the form of any record.

By default, the record scope takes precedence over the session scope so that users in higher-level domains adhere to each record's data and process constraints. However, these users can choose to expand or collapse the domain scope to show or hide data from other domains. For example, a user in the MSP global domain also has visibility into child domains such as the ACME domain. When looking at an incident record from the ACME domain, the user can choose to expand the domain scope to show values from the MSP domain or collapse the domain scope to show only record values that match the record's ACME domain.

**Note:** Users always have access to data from domains that have been explicitly granted to them by domain visibility.

Users with the `domain_expand_scope` user role can select the domain scope from the Toggle Domain Scope UI action on the form. When record scope is in effect, the UI action can be clicked to expand the session scope and display all data available associated with the user's domain and child domain.
**Live Agent setup of Virtual Agent**

The Managed Service Provider (MSP) has one Live Agent setup record in the global domain when the instance is provisioned. The MSP can configure a separate Live Agent setup for each subdomain.

Roles required: admin, ITIL, or virtual_agent_admin

- User in a subdomain logs in and navigates to Collaboration Live Agent Setup.
- When user logs in to each subdomain, a seeded Live Agent setup record is created.

**Prerequisites**

1. User logged in to the subdomain navigates to Connect Queues.
   - Creates queues and assigns queues to the assignment groups.
   - Assigns users to the assignment groups.

2. The admin logged in to the subdomain navigates to Collaboration Live Agent Setup and assigns the default queues and the Live Agent variables to be used by virtual agents.

3. The admin sets up the transfer message and the “No Agents Available” message.

**Branding setup of Virtual Agent**

The MSP has only one global branding setup per domain-separated instance for Virtual Agent web- and portal-based clients. All subdomains share the same branding.

Roles required: admin, ITIL, or virtual_agent_admin
1. The MSP searches for Branding in the Navigator as the global domain. The user logs in as a global user in this domain.

2. The MSP assigns a logo and avatar that is the same for all subdomain Virtual Agent topics. All subdomains share the same branding.

3. The MSP applies the colors that are leveraged by all subdomains.

General settings setup of Virtual Agent

The MSP has only one general settings setup per domain-separated instance for all Virtual Agent clients. All subdomains share the same general settings.

Roles required: admin, ITIL, or virtual_agent_admin

1. The MSP searches for Virtual Agent General Settings in the Navigator as the global domain. The MSP logs in as a global user in this domain.

2. The MSP assigns generic settings to be used by all virtual agents for all subdomains:
   - Welcome message
   - Topic selection message
   - Generic error message
   - Minimum delay before displaying typing animation
   - Minimum delay between bot messages
The MSP either logs in to one of the subdomains and creates and enables topics or allows subdomain admin users to create and deploy their own topics.

Roles required: admin, ITIL, or virtual_agent_admin

To enable Virtual Agent topics, the MSP or admin user completes these steps:

1. The admin user logged in to the subdomain navigates to Collaboration Virtual Agent Designer to enable topics.
   - This can be either a global domain user impersonating a user in a subdomain or an admin user logged in to the subdomain.

2. The admin creates topics and publishes them to the instance.

3. MSP admin only: Admin can also activate either the ITSM, HR, or CSM plugin to enable base system topics for the subdomain.

4. All topics available to clients such as web, service portal, Slack, or MS Teams must be published.

5. The admin assigns roles on a particular subdomain if using roles to control which topics can be run by users.
Virtual Agent setup of messaging apps integration

The domain-separated instance has one setup record for the Slack and MS Teams messaging apps integration.

Roles required: admin, ITIL, or virtual_agent_admin

1. Customers on the subdomain license either Slack or MS Teams independent of the ServiceNow instance.
2. The admin user in the subdomain logs in and navigates to Collaboration Virtual Agent Messaging Apps Integration.
3. The admin runs the installation and sets the appropriate credentials to access the Virtual Agent bot from the third-party client.
Configure the Service Portal widget for Virtual Agent

Add the Virtual Agent Service Portal widget to a Service Portal page to enable your user to run Virtual Agent within your service portal.

Role required: admin or sp_admin

1. Navigate to Service Portal Service Portal Configuration in the navigation bar to open the service portal configuration page.
2. Click Designer to open the Service Portal Designer.
3. Select the service portal page where you want the Virtual Agent widget to appear.
4. Use the Filter Widget text box in the navigator to filter the widget list for term Virtual Agent.
5. Click and drag this widget to the bottom of the page. The widget itself appears empty, however you should see a floating blue Chat Widget at the bottom right of the page.
6. Change the color of the Virtual Agent chat icon using the widget instance parameters.
   a) Click the pencil icon in the upper right corner of the Virtual Agent widget to show the instance parameters for the widget.
b) In the Floating Button Color parameter, enter a new color for the button.

c) Click Save.

7. Set a default topic for Virtual Agent using the widget instance parameters.

a) Click the pencil icon in the upper right corner of the Virtual Agent widget to show the instance parameters for the widget.

b) In the Virtual Agent Client URL Parameters parameter, enter the text `sysparm_topic=sys_id`. Replace `sys_id` with the `sys_id` of the topic you want to use as the default.

c) Click Save.

Load the standalone Virtual Agent web client

You can load the Virtual Agent web client interface into a browser through a Virtual Agent URL link or into a web page using an iFrame.

Role required: admin or virtual_agent_admn

In a browser address bar or in an iFrame, enter this URL with your instance name: https://instance.service-now.com/$sn-va-web-client-app.do

The Virtual Agent client opens in the browser window or iFrame. For example:
Note: Use ?sysparm_skip_load_history=true parameter at the end of the URL to load the interface without the conversation history.

Virtual Agent integration with messaging applications

Enable users to run Virtual Agent bot conversations in third-party messaging applications. Use the ServiceNow Virtual Agent integration app to configure the messaging apps for your instance.
Admin and user setup

Integrating Virtual Agent with third-party messaging apps involves installation and setup tasks that admins and users perform.

Admin setup

Use the Virtual Agent integration app to configure the messaging apps for your instance. As an administrator for your ServiceNow instance and the third-party application (or working with the admin for the third-party messaging app), perform these basic installation steps to set up the Virtual Agent bot.

1. Install the ServiceNow Virtual Agent integration app and associate the app with your instance. For details, see Install Virtual Agent integrations on page 3074.

   **Note:** If you are using Slack Enterprise Grid, install the Virtual Agent bot only in a single workspace. Conversations with the bot must take place within that workspace.

2. If needed, configure the messaging text displayed in the third-party app.

   You can customize the text users see in Virtual Agent conversations by using the Adapter configuration page for third-party messaging apps.

User setup

After admins set up the Virtual Agent bot for Slack or Microsoft Teams, users link their ServiceNow user account to their Slack or Microsoft Teams account. For details, see Link your ServiceNow user account to a messaging application for Virtual Agent conversations on page 3080.

Linking accounts enables users to run Virtual Agent topics that use ServiceNow information and records. If users do not link their ServiceNow account, they can access and run only topics that have the public role.

Conversational interface in messaging integrations

The Virtual Agent interface for third-party messaging apps is similar to the web-based interface. However, there are differences in how certain options and interface controls are displayed in third-party messaging apps:

**Requesting a live agent or starting a new conversation**

Users type the keyword Hi to access options for transferring to a live agent or beginning a new conversation.
Rendering of input controls and bot responses in conversations

Input controls in Virtual Agent Designer, such as Date Time picker, Image picker, and Carousel render differently in bot conversations in messaging applications than in the web-based interface. For example, the Date Time picker control presents buttons for users to elect a date and time. Similarly, certain bot response controls, such as the Image response and Multi-flow Output, also render differently in the third-party messaging apps. For details on these differences, see the descriptions of the Virtual Agent Designer input controls, bot responses, and utilities.

Install Virtual Agent integrations

As an administrator for ServiceNow, install the ServiceNow Virtual Agent integration application and associate the app with your instance.

Install the Virtual Agent integration with Microsoft Teams
Install the Virtual Agent integration for Microsoft Teams on your instance.

Roles required:
- Admin or both virtual_agent_admin and external_app_install_admin
- Administrator for third-party applications

Note: Installing the Virtual Agent integration with Microsoft Teams creates a one-to-one association between the ServiceNow instance you are installing from and the Teams tenant in which the integration runs. Use a separate MS Teams tenant for each instance you plan to install the integration in. If you plan to test with a non-production instance and clone the instance, be sure to run the installation steps again on the clone target, to associate the bot to the new instance. Running the steps again disassociates the integration between the original non-production instance and the Teams tenant.

1. Navigate to Collaboration Messaging Apps Integration.
2. Click the Install button next to Microsoft Teams.
3. A pop-up message appears to confirm redirection to Microsoft Teams to verify your identity. Click OK.
4. Log into Microsoft Teams.
5. In the Now Virtual Agent screen, click Accept to accept the permissions for the app.
6. If the selected workspace has already been assigned to Virtual Agent, you are asked whether you want to proceed to override the previous assignment. Click Override to change the workspace, or Cancel to leave the current assignment in place.
7. After authentication, installation starts in the background. Once installation completes, a message appears confirming the installation.

8. Click the app package link to access the ServiceNow knowledge base article KB0690098, containing the application package for Microsoft Teams. Follow the steps in the article to make this package available for your MS Teams users.
9. After you see this confirmation, check for installation verification. The workspace appears below the Microsoft Teams heading on the Integration page.

Notify your users that the Virtual Agent bot for Microsoft Teams is available for use. Your users must then link their ServiceNow account to the Microsoft Teams account to access non-public Virtual Agent topics (that use ServiceNow records). For details on these steps, see Link your ServiceNow user account to a messaging application for Virtual Agent conversations on page 3080.

Install the Virtual Agent integration with Slack

Install the Virtual Agent integration for Slack and associate the app with your instance. Installing Virtual Agent with Slack creates a one-to-one association between the ServiceNow instance you are installing from and the Slack workspace in which the integration runs.

Roles required:

- Admin or both virtual_agent_admin and external_app_install_admin
- Administrator for third-party applications

Note the following important guidelines:

- If you are using Slack Enterprise Grid, which has multiple workspaces, install the Virtual Agent bot only in a single workspace. Choose the workspace where most of your end users are likely to interact with the bot. For end users, bot conversations must start and end within the same workspace.
- If you are running Enterprise Grid and use a non-production instance for testing, you must use a workspace in a different grid or use a non-grid workspace.
- If you clone the instance, the installation for the original instance will not be cloned. Run the installation steps again on the clone target, following these guidelines.

1. Navigate to Collaboration Messaging Apps Integration.
2. Click the Install button next to Slack.
   A pop-up message appears to confirm redirection to Slack to verify your identity.
3. In the pop-up message, click OK.
4. Log into your Slack workspace.  
   A confirmation message appears to confirm your identity on a workspace.

5. Change the workspace if needed by selecting another workspace using the list in the upper right corner.

6. Click Authorize to authorize the installation.

7. If the selected workspace has already been assigned to Virtual Agent, you are asked to confirm whether you want to proceed to override the previous assignment. Click Override to change the workspace, or Cancel to leave the current assignment in place.
8. A confirmation message appears confirming the installation once it completes. After you see this confirmation, verify the installation. The Slack workspace appears below the Slack heading on the Integration page.

Configure Virtual Agent messaging for messaging apps

Modify messages in the adapter configuration pages for third-party apps to customize the text users see in Virtual Agent conversations.

Role required: admin or virtual_agent_admin

1. Navigate to Collaboration Virtual Agent Messaging Apps Integration.
2. In the Slack or Microsoft Teams section, click the down arrow to show a list of installed teams.

Notify your users that the Virtual Agent bot for Slack is available for use. Your users can then link their ServiceNow account to the Slack account to access non-public Virtual Agent topics (that use ServiceNow records). For details on these steps, see Link your ServiceNow user account to a messaging application for Virtual Agent conversations on page 3080.
3. Click the name of one of the teams to go to the configuration page. The Adapter Configurations list shows a list of keywords, labels, and messages and the default values for each.

4. Double-click an attribute value to change that value.

   **Note:** For Slack integrations only, you can change the bot name and avatar in the Adapter Configuration page. The maximum bot name length is 80 characters.

5. Press Enter or click the green check icon to save your changes.

Link your ServiceNow user account to a messaging application for Virtual Agent conversations

Link your ServiceNow account to a third-party messaging application to access non-public Virtual Agent topics that use ServiceNow records.

Role required: user

1. Open the messaging application.
2. Find your Virtual Agent bot.
3. Start a conversation with your Virtual Agent bot. The bot then presents a link to authenticate.

   ![Figure 658: Example authentication message](image)

4. Click the Connect to ServiceNow link to authenticate. Authentication directs you to your instance. If you are not already logged in to your instance, you are prompted to enter your login credentials.

5. A confirmation message appears, prompting you to Confirm or Deny linkage between your accounts. Click Confirm to allow the account link.
Note: For security reasons, the confirmation prompt expires after five minutes. If you do not respond within five minutes, or if your account is not valid, the account linking process fails. Restart the linking process by typing Hi again to display the authentication link.

6. After confirmation, you are directed to the instance user record. A confirmation message is displayed at the top of the screen.

7. Return to your messaging app and continue your conversation with the Virtual Agent bot.

Unlink your ServiceNow user account from a messaging application for Virtual Agent conversations

If needed, you can unlink your ServiceNow user account from a messaging app used for the Now Virtual Agent.

Role required: user

Unlinking your account from a selected messaging app, such as Slack or MS Teams, deactivates the association between your ServiceNow account and the messaging app. After you unlink your account, you can no longer engage in Virtual Agent conversations that query or change records in the ServiceNow database. But you can still run public Virtual Agent conversations.

1. Navigate to Self-Service My Profile.
2. Click the View Linked Accounts related link.
3. In the Linked Accounts page, check the selection box for the messaging integration to be unlinked.
4. Select Actions on selected rows..., then click Unlink account.
   The link between your ServiceNow account and the Virtual Agent messaging integration becomes inactive.

---

**Note:** Even though you unlinked your account, you can still run public Virtual Agent conversations. To link your account again, repeat Steps 1 through 3 for the associated messaging integration and in the Actions on selected rows..., click Link account.

---

**Configure Virtual Agent branding**

Customize the Virtual Agent bot with your own company logo and avatar. Set the color schemes of the UI elements and customer support contact information displayed in the web-based conversational interface.

*Role required: admin or virtual_agent_admin*

To prepare for configuration of the conversational interface, gather the following information.

- Your company logo and avatar for your virtual agent bot. The images must be a .jpg, .png, .bmp, .gif, .jpeg, .ico, or .svg file format. The images can be high resolution, but the image display is scaled based on the aspect ratio.
- The brand color hex or RGB numbers for your company, typically from your marketing department. Use them to configure the colors for UI items, such as font colors and background colors for chat bubbles or buttons displayed.
Figure 659: Chatbot branding and UI elements

- Contact information for your support organization, such as support call hours, call center support phone number, and support email address.
Each color selection option provides a color picker to select a color. The text box beside the color picker lets you enter the value of the color as any of the following CSS formats.

- Name: predefined color names, such as red, green, blue
- RGB decimal: RGB(102, 153, 204)
- RGB hex: #223344

For information about HTML color names, see [HTML Color Names (W3CSchools)](https://www.w3schools.com/cssref/css_colors.asp).

2. Change any of the branding settings to customize the chatbot and chat interface:

<table>
<thead>
<tr>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Logo in Chat Header [com.glide.cs.branding.va_logo]</td>
<td>Click + next to the ServiceNow logo and upload your logo.</td>
</tr>
<tr>
<td>Label</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Modify the bot avatar</td>
<td>Click bot user profile to change the bot avatar. In the Live Profile form:</td>
</tr>
<tr>
<td>[com.glide.cs.branding.va_profile]</td>
<td>• To upload an avatar image, locate the Photo field, click Update, and choose the image file and click OK. Enter a short description of the avatar in the Live Profile form and click Update.</td>
</tr>
<tr>
<td></td>
<td>• To delete an avatar, locate the Photo field and click Delete.</td>
</tr>
<tr>
<td>Virtual Agent Profile — Live Profile Reference</td>
<td>The reference ID of the bot. Do not change this value.</td>

</table>

3. Enter the contact information for your support center:

**Table 1220: Agent contact properties**

<table>
<thead>
<tr>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Call</td>
<td>Informative text string. For example, a text string that indicates when phone support is available: Call Support (Daily 5 AM to 11 PM)</td>
</tr>
<tr>
<td>[com.glide.cs.branding.support_phone_label]</td>
<td>Leave this value blank to hide the email support option.</td>
</tr>
<tr>
<td>Phone Number</td>
<td>The phone number of your call support organization. The phone number must be a valid number.</td>
</tr>
<tr>
<td>[com.glide.cs.branding.support_phone]</td>
<td></td>
</tr>
</tbody>
</table>
Configure Virtual Agent conversation settings

Use the Virtual Agent general settings to define the basic characteristics of a bot conversation, such as the welcome message and generic error message displayed.

Role required: admin or virtual_agent_admin

Note: If you are using the Virtual Agent messaging integrations, you can also customize messages shown in Slack or Microsoft Teams through the integration configuration pages. For details, see Configure Virtual Agent messaging for messaging apps on page 3079.

1. Navigate to Collaboration Virtual Agent General Settings.
2. Change any of the following bot conversation settings:

<table>
<thead>
<tr>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Welcome message</td>
<td>The text string for the default conversation greeting.</td>
</tr>
<tr>
<td>[com.glide.cs.general.welcome_message]</td>
<td></td>
</tr>
<tr>
<td>Top selection message</td>
<td>The text string that specifies the next selection that the user can make in the conversation.</td>
</tr>
<tr>
<td>[com.glide.cs.general.top_selection_message]</td>
<td></td>
</tr>
<tr>
<td>Generic error message</td>
<td>The text string displayed when an irrecoverable error occurs during a bot conversation.</td>
</tr>
<tr>
<td>[com.glide.cs.general.error_message]</td>
<td></td>
</tr>
<tr>
<td>Minimum delay before displaying typing animation</td>
<td>The delay, in milliseconds (ms), that occurs before showing the animation ellipsis indicating the bot is processing user input.</td>
</tr>
<tr>
<td>[com.glide.cs.general.type_presence_delay]</td>
<td></td>
</tr>
<tr>
<td>Minimum delay between bot messages</td>
<td>The minimum delay, in milliseconds (ms), that occurs between bot responses.</td>
</tr>
<tr>
<td>[com.glide.cs.general.msg_delay]</td>
<td></td>
</tr>
</tbody>
</table>
3. Click Save.

Transferring Virtual Agent conversations to a live agent

Use the Live Agent module to manage live chat support, including the chat queues used when a Virtual Agent conversation is transferred to a live agent.

In new and upgraded instances, the Live Agent plugin (com.glide.cs) is activated by default. This plugin includes related plugins for chat support, such as Connect Support (com.glide.connect.support), which is the default fulfiller user interface.

When bot conversations are transferred to a live agent

Conversations in Virtual Agent are transferred to a live agent in several ways. This transfer happens automatically when an unrecoverable error occurs, but it can also be triggered via a script in a topic, or when manually selected by the user.

**Automatic transfer to a live agent when an error occurs**

When a conversation encounters an error, the conversation automatically transfers to a live agent.

- An unrecoverable error has occurred.
- Please stand by while I connect you to a live agent.
- Routing you to a live agent...

**Note:** If you do not intend to use Live Agent, make sure to remove references to queues in live agent setup, or deactivate your Live Agent queue [chat_queue] records. For details on chat queue setup for Virtual Agent, see Specify Live Agent chat queues on page 3091.

**Automatic transfer to a live agent triggered by a script in a topic**

In situations where you want a support agent to handle the conversation, you can create a script in your topic that uses the vaSystem.connectToAgent() command. This command triggers a transfer to a live agent. This option can be useful for conversations involving negative customer sentiment, high priority requests, or requests outside the scope of your topic process. For example:

```javascript
(function execute() {
```

© 2018 ServiceNow. All rights reserved. 3088
if (vaInputs.urgency == 1 &&
    vaInputs.impact == 3)
    vaSystem.connectToAgent();

This script action control transfers the conversation to a live agent based on the incident impact and urgency indicated by the user.

In the Virtual Agent web-based client, users can choose the Contact Support option to transfer to a live agent.

**Note:** Users running a Virtual Agent messaging integration must type the keyword Hi to access the live agent transfer option. For details, see *Virtual Agent integration with messaging applications* on page 3072.

Next, they select the Contact Live Agent option to transfer the conversation to the live agent.
How bot conversation transfers work

For a user engaged in a bot conversation, the switch to a live agent is a seamless transfer. When a transfer is triggered, either automatically or manually by the user, the conversation is automatically routed to the appropriate chat support queue in Connect Support. For the user, the conversation with the agent continues in the Virtual Agent (client) interface. In Connect Support, the agent accepts the queue with the transferred user to join the conversation and interact with the user.
In Live Agent setup, admins assign the default chat queues (for Customer Service Management, HR Service Delivery, and IT Service Management) or a global queue to which Virtual Agent conversations are automatically routed if default queues are not assigned. These queues, which you define in Connect Support, are stored in the Chat Queues [chat_queue] table.

In Live Agent setup, admins also define the general messages that users see during live agent transfers.

Specify Live Agent chat queues

Specify the Live Agent chat queues used for chat support and the general support messages displayed during a transfer from a bot conversation to a live agent.

Role required: admin or virtual_agent_admin

Define the chat queues using Connect Support. For details, see Administer Connect Support queues on page 510 and Make a Connect Support queue accessible to end users on page 511.
If you are using Virtual Agent, the Virtual Agent Context related list displays below the Live Agent Settings. Use this list to specify the Live Agent variables that can be used in Virtual Agent topic scripts. Use Live Agent variables to pass certain information from the topic to share with the live agent or control how bot conversations are routed to live agents. For details on using Live Agent variables, see Virtual Agent scripts on page 3154.

**Note:** All contexts are accessible via script, but only the queue context can be modified by a script.

1. Navigate to Collaboration Live Agent Setup.
2. Complete the Live Agent Setup form.

### Table 1221:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The live agent setup configuration.</td>
</tr>
<tr>
<td>CSM Queue</td>
<td>The live agent chat queue used for Customer Service Management if not specified through the chat interface or changed by a topic.</td>
</tr>
<tr>
<td>CSM Fulfiller UI</td>
<td>The chat support interface used. The default is Connect Support.</td>
</tr>
<tr>
<td>HR Queue</td>
<td>The live agent chat queue to be used for Human Resources if not specified through the chat interface or changed by a topic.</td>
</tr>
<tr>
<td>HR Fulfiller UI</td>
<td>The chat support interface for HR. The default is Connect Support.</td>
</tr>
<tr>
<td>ITSM Queue</td>
<td>The live agent chat support queue used for IT Service Management if not specified through the chat interface or specified by a topic.</td>
</tr>
<tr>
<td>ITSM Fulfiller UI</td>
<td>The chat support interface for ITSM. The default is Connect Support.</td>
</tr>
<tr>
<td>Global Queue</td>
<td>The queue used if the Virtual Agent does not have context to the queue through the chat interface or topic.</td>
</tr>
<tr>
<td>Global Fulfiller UI</td>
<td>The chat support interface for the platform. The default is Connect Support.</td>
</tr>
<tr>
<td>Transfer Message</td>
<td>The message that users see when they are transferred to a live agent or another queue. For example: &quot;Please stand by while I connect you to a live agent.&quot;</td>
</tr>
</tbody>
</table>

**Note:** You can define only one transfer message, which is displayed for all the queues in your instance.
### Field

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>No Agents Available Message</td>
</tr>
<tr>
<td>Message that users see when a live agent is not available. For example: “There are no agents available at the moment. Please try again later.”</td>
</tr>
</tbody>
</table>

**Note:** You can define only one agent availability message, which is displayed for all the queues in your instance.

3. Click Update.

### Virtual Agent Designer

The Virtual Agent Designer is a graphical tool for creating and managing topics, which are blueprints for conversations between a virtual agent and user. You can design topics that help your users resolve common work issues or guide them through self-service tasks.

### Topic development process

Topic development by an admin or virtual_agent_admin involves these basic steps:

**Identify the use case for an automated conversation**

Determine the use case or goal of your topic, for example solving a user problem or assisting with a self-service task, and the users of that topic.

As you gather key requirements for your topic, identify the information that you need from the user to complete the goal.

**Determine the general structure of the conversation**

Identify the conversation "happy" path, and the alternate paths where the conversation might branch depending on the information supplied by the user. Consider how to handle each branch and whether users loop back to an earlier point in the conversation.

**Build the topic using Virtual Agent Designer**

Follow these steps:

1. **Define the topic properties.**
   - Name the topic and set the keywords for triggering the conversation. You can also specify a condition for running the topic and the roles of users who can run that topic.

2. **Build the conversation flow.**
   - Use the palette of user inputs, bot responses, and utilities to create the conversation flow.
3. **Preview the topic as you build it.** Use the Preview feature to run the topic in its current state.

4. **Publish the topic.** Publishing the topic automatically activates the topic and deploys it to the Virtual Agent client.

---

**Managing topics**

Use the Topics page to manage your topics. You can search, sort, create, and run active topics through this page. The Topics page lists the active (published) and inactive topics (in development) in your instance.

- **Run Active Topics** — Opens a window for running topics in the Virtual Agent web client. Use this feature to test your keywords and verify that your published topics work as intended.
- **Add a Topic** — Opens the Topic Properties page to start the topic creation process and define the topic-level properties. For details, see *Create a Virtual Agent topic* on page 3105.
Defining topic properties

Topic properties identify a topic and how it is accessed, including who can use the topic and any conditions that affect when it is run. These properties include:

**Keywords**

Keywords are words or phrases that users enter to trigger a particular conversation in the client interface.

**Condition**

A JavaScript script that defines the condition for running the topic. The script returns a value of true or false. A returned value of false means that the topic does not appear in the client. If the return value is false, the control is not used.

**Roles**

The roles of users required to run the topic. Assigning the public role to a topic makes the
topic a public topic. Public topics are accessible to unauthenticated users, such as guest users.

**Live Agent variables**

Live Agent variables available to the topic. The selected variables are accessible scripts within the topic to provide dynamic information when transferring a virtual agent conversation to a live agent.

**Topic building with the Virtual Agent Designer page**

Use the Virtual Agent Designer page to build a topic flow using the controls for user inputs, bot responses, and utilities.
1. Palette region

List of controls that you can drag onto the canvas to build a conversation:
- **User Input** — controls used to prompt and capture information from the user in a conversation.
- **Bot Response** — controls for displaying bot responses in a conversation.
- **Utilities** — controls for performing actions within a topic, such as running a script or adding different conversation paths (branches) in a topic.

2. Canvas

Area that graphically displays the conversation flow. As you drag a control onto the canvas, that control becomes a node in the conversation flow.
Includes an associated property sheet that opens in the right pane. Each flow has a Start and End node. The layout of controls on the canvas is organized automatically as controls are added and removed.

3. Property sheet
Properties specific to the selected node on the canvas. Each node has its own set of properties that you can define, which can include scripts that control the behavior or processing performed in the node.

4. Script editor
A script editor for adding or editing JavaScript scripts used in a property. Provides scripting assistance, including a list of valid elements at the insertion point, such as function name, object names, and variable names available for the topic. For more information, see the Syntax editor.

5. Script variables
Section for declaring variables used within the topic (conversation session) to store values outside the control variables, to help with more complex scripting scenarios.

Virtual Agent controls
A Virtual Agent topic consists of a collection of controls within a topic flow. Use these controls to collect, process, and present information to your users. Controls can also read, create, and update records on your instance.

Control types
Controls are separated into categories based on their use.

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bot Response</td>
<td>Bot responses provide controls for displaying bot responses in a conversation.</td>
</tr>
<tr>
<td>Start Segment</td>
<td>This control appears automatically in a topic flow and cannot be added or removed from a conversation. This control can be configured with a greeting response that appears when a conversation begins.</td>
</tr>
<tr>
<td>End Segment</td>
<td>This control appears automatically in a topic flow and cannot be added or removed from a conversation. This control can be configured with a final confirmation message before the end of a conversation. Ensure that all branches of your topic eventually connect to this control</td>
</tr>
<tr>
<td>User Input</td>
<td>User inputs provide controls used to prompt and capture information from the user in a conversation.</td>
</tr>
<tr>
<td>Category</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Utilities</td>
<td>Utilities provide controls used to control actions and logic within a topic, such as running a script or adding different conversation paths (branches) in a topic.</td>
</tr>
</tbody>
</table>

**Condition property**

All controls, except the Decision utility and the Start and End nodes, have a condition property. Use this property to determine whether that control is used in a conversation. A condition property, if used, contains a script that returns a value of true or false. If the return value is false, the control is not used, and the conversation will continue to the next control along that branch of the topic. A control with a blank condition field is always used. Use conditions to make your conversations more dynamic based on context, data, or scripted logic.

In the preceding example, a condition script returns a value of true if the current user is able to create incident records. This condition prevents a utilities control from creating an incident when the user does not have permission to do so.

**Condition**

```javascript
1 (function execute() {
2 var gr = new GlideRecord('incident');
3 return gr.canCreate();
4 })()```

Designing a Virtual Agent topic

Walk through the design of an example topic that enables users to view incidents they submitted. This example highlights various design controls that can be used to build the conversation flow.

**Plan the structure of a conversation**

The first step in implementing a topic is to decide what the topic covers. Consider the intended audience, and what you want the audience to accomplish when using the conversation. For this example, the goal of this topic is to create a flow that enables end users to see the status of incidents they submitted. The topic includes an option for the user to add a comment to the incident.

With this goal in mind, the topic needs the following elements:

- A prompt for the user to select an incident.
- An output showing the status of the incident.
- A prompt to ask if the user wants to leave a comment.
- A utility control to branch the conversation on that answer.
• A prompt for the user to enter a comment.
• A utility control to add the user input as a comment in the incident.

**Build the conversation flow with Virtual Agent controls**

The conversation is going to look similar to the following dialog flow.

---

**Important:** This flow is intended to give you an idea of how the completed flow looks. It is not recommended that you build the entire layout first. Build your topic incrementally, and test your topic frequently. Make sure to consider both functionality and user experience in your testing.

---
Configure controls within the conversation

This example begins with defining the conversation flow in Virtual Agent Designer, after the topic properties have been set. The conversation begins with a Start node and finishes with an End node.

1. In Virtual Agent Designer, add a Reference Choice control to the conversation flow. This control is used to select the incident.
   a. Enter Choose an incident for the Name property. The variable name choose_an_incident is automatically generated for the control.
   b. In the Prompt property, enter the text the user sees before selecting an incident.
   c. In the Acknowledge Message property, enter text the user will see after making a selection. This value can be a static string, for example, Thank you for making a selection. This value can also be a scripted message, as shown here:

      ```javascript
      (function execute() {
        return "Thanks " + gs.getUser().getFirstName() + ", Here's the current status of " + vaInputs.choose_an_incident.number + ",";
      })()
      ```

      In the preceding example, the script uses the first name for the user, and the number of the record entered into this prompt.
   d. Leave the Default Value property blank.
   e. In the Reference Type property, select Record.
   f. In the Table property, select incident.
   g. In the Choice Value Expression property, input the following code:

      ```javascript
      (function execute(table) {
        var options = [];
        var gr = new GlideRecord(table);
        gr.addQuery('active', true);
        gr.addQuery('opened_by', gs.getUser().getID());
        gr.setLimit(10);
        gr.orderByDesc('opened_at');
        gr.query();
        while(gr.next()) {
          options.push({ 'value': gr.getUniqueValue(), 'label': gr.getValue('number') + ' - ' + gr.getValue('short_description') });
        }
        return options;
      })(table)
      ```

      This script queries the incident table for active records opened by the current user, places these records into an array, and returns that array. The script also sets a limit of 10 records, and orders them by the date they were opened. As a result, the user has a choice from the 10 most recent active incidents they have opened.

2. Add a Card control to the flow. This control shows information from the record selected by the Reference Choice in the previous step.
   a. Enter Status Card for the Name property.
   b. In the Reference Type property, select Record.
   c. In the Record property, select Choose an Incident. This choice refers to the Reference Choice control created in the previous step, so the data displayed comes from the record chosen there.
d. In the Fields control, select a field. The choices available are the available fields on the chosen record. In this case, you can see the fields on the incident table. After a field has been selected, click the Add Field option to add additional fields to the card. A delete icon appears to the right of each selected field. Clicking these icons removes the field from the card.

3. Add a Boolean control to the flow. This control is used to prompt the customer with a yes/no question. In this case, the control checks to see if the user wants to leave a comment on the selected incident record.
   a. Enter Leave Comment? for the Name property. The variable name leave_comment_ is automatically generated for the control.
   b. In the Prompt property, enter the text the user sees before the prompt. In this case, ask the user whether they want to leave a comment on the incident.
   c. Optionally, you can enter a value in the Acknowledge Message property. This value appears after the user chooses yes or no.

4. Add a Decision control to the flow. This control branches the conversation into two possible paths. The path the conversation follows depends on the choice the user made in the previous step.
   a. There are no properties on the decision control, however there are properties on the branches below the decision. By default, there is a single branch labeled Always. Click the blue plus icon at the bottom of the decision control. A second branch appears labeled Never.
   b. Click the Always branch of the decision to access the properties for this branch.
   c. Change the name to Leave Comment.
   d. In the condition property, enter the following code.
      
      (function execute() {
          return Vars.leave_comment_.getValue() == 'true';
      })()

      If the value of the leave_comment_ variable is true, this script returns a value of true. This variable is the variable from the Boolean control in the previous step. If the user chose Yes at the prompt, the conversation follows this branch.
   e. Click the Never branch of the decision to access the properties for this branch.
   f. Change the name to No Comment.
   g. In the condition property, enter the following code.
      
      (function execute() {
          return Vars.leave_comment_.getValue() == 'false';
      })()

      If the value of the leave_comment_ variable is false, this script returns a value of false. This variable is the variable from the Boolean control in the previous step. If the user chose No at the prompt, the conversation follows this branch.
   h. One of the two branches you have created points to the End node of the conversation. The second branch should also lead to this node. Click the arrow at the bottom of that branch, and drag it the End node.

5. Add a Text Input control to the Leave Comment branch of the conversation. This control is used to request text input from the user.
   a. Enter Get Comment for the Name property. The variable name get_comment is automatically generated for the control.
b. In the Prompt property, enter the text the user sees before the prompt. In this case, ask the user for the text of the comment.

c. Optionally, you can enter a value in the Acknowledge Message property. This value appears after the user enters a comment.

6. Add an Action control to the conversation below the Get Comment control. This control is used to add the text entered into the previous control as a comment on the selected incident.

a. Enter Save Comment to Incident for the Name property.

b. In the Action Type property, select Update a Record.

c. In the Record property, select Choose an Incident. This choice refers to the Reference Choice control created in the previous step, so the record chosen there is the one that this Action control updates.

d. In the Field property, click Add Field. A pop-up window appears. Fields from the record can be selected and given values in this window.

e. Select the Additional Comments field from the list.
f. Click the button to the right of the field to select a value from one of the controls in this conversation.

g. Click the Get Comment option from the list. This option refers to the value entered by the user in the Text Input control from the previous steps.

h. Click the Save button at the bottom of the pop-up window.

Test the conversation

Use the Preview button to test the flow of the conversation. Preview topics often throughout the design process to find errors or unexpected behavior quickly. For further information on debugging topics, see Debug a Virtual Agent topic on page 3108.

Create a Virtual Agent topic

Use Virtual Agent Designer to create and modify chatbot topics (conversations). Build your topic to meet a specific objective or goal, such as fulfilling a user's request or helping a user complete a task.

Role required: virtual_agent_admin or admin

Topic authors should have a basic knowledge of the ServiceNow platform and application table structures, scripting (JavaScript), HTML, and REST integrations.

Define the flow of user inputs, bot responses, and actions performed in a chatbot conversation. The main steps in topic creation are:

- Define the topic-level properties.
- Build the topic flow with user inputs, bot responses, and utilities. For each control, specify the properties that determine how the control functions in the conversation. Save the topic frequently as you build the flow.
- Preview and test the topic as you build it.
- Save the topic flow.

**Note:** When you create a topic, the topic is in the inactive state until you publish it. Publishing a topic changes the topic state to active and automatically deploys the topic to your Virtual Agent clients.

1. Navigate to Collaboration Virtual Agent Designer, and in the Topics page, click + Add a topic.
   The Topic Properties page displays.
2. Enter the topic properties.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the topic that reflects its business purpose.</td>
</tr>
<tr>
<td>Description</td>
<td>A brief description of the topic.</td>
</tr>
<tr>
<td>Keywords</td>
<td>A list of key phrases or terms that users enter to initiate the conversation with the chatbot. Press Enter after each phrase.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
Condition | Expression logic that uses one or more conditions to control who sees a topic in the Virtual Agent client. If left blank, the expression is true.
Roles | The roles that an end user must have to view and run the topic. If a topic is public (available to users, including guest users, who are not authenticated in ServiceNow), select only the Public role.
Live Agent variables | The Live Agent variables defined in Live Agent setup. Select the variables that provide dynamic context (information from the Virtual Agent chat) transferred from the topic to a Live Agent.

3. Click Save.
4. Click Edit Topic flow.
   The Virtual Agent Designer page opens.
5. To add a user input, bot response, or utility:
   a) Drag the input, bot response, or utility control from the Designer palette and drop it in the canvas. The item becomes a node in the conversation flow.
   b) Complete the properties for the node. For details on each control and the corresponding properties that you define, see User inputs, Bot responses, and Utilities.
   c) Click Save.
   d) To see how the topic runs in the Preview window, click Preview.
      To see details on how each node in the flow is processed, click Show Log in the Preview window. For more information on using the Preview logs, see Debug a Virtual Agent topic on page 3108.
   e) Repeat adding the various controls, previewing, and saving until the conversation flow is complete.

To move a node, click the node and then drag it to the new location and click Save.
6. To delete a user input, bot response, or utility:
   a) Click the X in the upper right corner of the node.
   b) Confirm that you want to delete the node.
   c) Click Save.

**Note:** You cannot delete a node that has a script variable used by subsequent JavaScript expressions in the flow. Also, a decision node can be deleted only when it has one leaf branch.

**Publish** the topic to deploy it to your Virtual Agent clients.

### Publish a Virtual Agent topic

Deploy an inactive topic to the Virtual Agent client.

Role required: admin or virtual_agent_admin

1. Navigate to Collaboration Designer.
2. In the Topics page, select the inactive topic to be published.
3. In the Topic Properties page for the topic, click Publish. 
   The topic state changes to Active.
4. Verify that your keywords for the topic work as expected.
   a) Return to the Topics page and click Run Active Topics.
   b) In the conversation window, test each topic keyword to verify that the corresponding conversation
      opens.
      For example, in the predefined Virtual Agent topics, the bot returns a list of topics that might
      match the keyword entered.

**Duplicate a Virtual Agent topic**

You can copy an existing Virtual Agent topic and edit it to create a new topic.

Role required: virtual_agent_admin or admin

Consider duplicating topics when you want to:

- Use an existing topic, such as a predefined topic, as the basis for a new topic.
- Modify an active topic but want to preserve the original topic for reference purposes or as a backup.

1. Navigate to Collaboration Virtual Agent Designer, and in the Topics page, click the topic to be copied. 
   The Topic Properties page is displayed.
2. Change the topic properties as needed.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the new topic.</td>
</tr>
<tr>
<td>Description</td>
<td>A brief description of the topic.</td>
</tr>
<tr>
<td>Keywords</td>
<td>A list of key phrases or terms that users enter to initiate the conversation with the chatbot.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You may need to change certain keywords depending on the goal or purpose of your new topic.</td>
</tr>
<tr>
<td>Condition</td>
<td>A script that defines the conditions that must be met for running this topic. The regular expression must evaluate to true.</td>
</tr>
<tr>
<td>Roles</td>
<td>The roles that an end user must have to view and run the topic. Select the available roles from the Roles list.</td>
</tr>
<tr>
<td>Live Agent variables</td>
<td>The Live Agent variables defined in Live Agent setup. Select the variables that provide dynamic context (information from the Virtual Agent chat) transferred to a Live Agent.</td>
</tr>
</tbody>
</table>

3. Click Save.
4. Click Edit Topic flow.
   The Virtual Agent Designer canvas is displayed.
5. To add a user input, bot response, or utility:
a) Complete the properties for the node. For details on each control and the corresponding properties that you define, see User inputs, Bot responses, and Utilities.
b) Click Save.
c) To review the topic in the Preview window, click Preview.
   To see details on how each node in the flow is processed, click Show Log in the Preview window. For more information on using the Preview logs, see Debug a Virtual Agent topic on page 3108.
d) Repeat adding the various controls, previewing, and saving until the conversation flow is complete.

6. To delete a user input, bot response, or utility:
   a) Click the X in the upper right corner of the node.
   b) Confirm that you want to delete the node.
   c) Click Save.

Note: You cannot delete a node that has a variable used by subsequent JavaScript expressions in the flow. A decision node can be deleted only when it has one leaf branch.

Publish the topic to deploy it to your Virtual Agent clients.

Delete a Virtual Agent topic

Delete a Virtual Agent topic that is no longer needed.
Role required: admin or virtual_agent_admin
If you want to remove a topic from your Virtual Agent clients but do not want to delete it, consider making the topic inactive instead.

1. If necessary, navigate to Collaboration Virtual Agent Designer to display the Topics page.
2. Select the topic to open the Topic Property page and click Delete.
   The topic is immediately removed from Virtual Agent clients and is no longer listed on the Topics page.

Debug a Virtual Agent topic

Use the following information to investigate and resolve unexpected behavior in your custom Virtual Agent topics.

Duplicate topics when possible

Duplicate a topic to make changes rather than updating a live topic. The unmodified original topic can serve as both a reference and a backup, and allow you to quickly restore the topic. Remember to de-activate the original topic before publishing the duplicate.

Preview your conversations often

Use the Preview button to test a conversation. The preview pop-up shows the conversation as it appears within Service Portal. Elements in your conversation may appear differently in third-party applications such
as Slack and Microsoft Teams. Test your conversations in any third-party applications where you intend to deploy Virtual Agent.

Use the conversation preview logs to view errors and messages logged while previewing a topic. Use the following steps to access the conversation preview logs. Use gs.log, gs.print, and gs.warn statements in your scripts to output information in this log.

1. In Virtual Agent Designer, click Preview to begin previewing a topic.
2. In the topic preview window, click the Show Logs check box.

**Note:** Logging information does not begin to appear in the logs until after the Show Logs check box is selected. Select this option immediately after the topic preview loads to ensure that all logging information is available.
Watch for warnings on controls within your topic

Controls that are missing necessary information show a red icon in the upper left corner of the control. The icon shows a number indicating the number of issues in that control. Point to this icon to see a list of the issues in the control.

Another icon appears in the upper left corner of the designer to indicate the number of issues within the entire topic.

Check for errors when a topic preview does not run
Additional information appears under the Virtual Agent Designer canvas when an error prevents the topic from running. Use the information provided to correct any errors in your conversation.

**Common issues**

<table>
<thead>
<tr>
<th>Issue</th>
<th>Possible resolution</th>
</tr>
</thead>
</table>
| Cannot see module designer under collaboration| • User may not have the virtual_agent_admin role.  
• Virtual Agent plugin may not be activated.                                                                                                      |
| Cannot edit a topic                           | Logged in user must be in the same application scope as topic.                                                                                     |
| Cannot preview topic                         | • Fill in all required fields on the node properties.  
• Your web browser may be configured to block pop-ups. Ensure that your browser is configured to permit pop-ups from your instance. |
| Web client stuck at Connecting....           | • One or more of your topics may be missing. Check the Topics page to ensure that topics are present on the instance and in the active state.  
• Chat workers may be down. Run the following code in Scripts - Background to restart them.  
```javascript
var gw = GlideWorkerThreadManager.get();
gw.init("com.glide.cs.qlue.module.worker.Worker");
``` |
| No response from bot                         | The AMB workers on your instance may be down. Restart AMB workers.                                                                                 |

**Virtual Agent Designer user inputs**

Virtual Agent Designer provides a collection of input controls that can be used to prompt and capture information from the user in a conversation.

**Common input properties**

Each input control has the following common properties:

**Variable for the user response**

Each control stores the user response in a variable that is accessible from other controls within the same topic using the getValue() and...
getDisplayValue() methods. The variable name is based on the name that you assign to the input control. For example, if you assign the name First prompt to an input control, the variable name is first_prompt (lower case, with an underscore character instead of a space). For more information on these methods, see Virtual Agent scripts on page 3154.

**Default value**
An input prompt can have a preset value, which you define. This value can be either a string, or a script that returns a string.

**Confirmation message**
If your input control provides users with a single-choice or default value selection, the selection that the user makes is automatically displayed in the conversation. For example, if you present a boolean prompt, the user's selection (either yes or no) is automatically displayed. This message can be either a text string, or a script that returns a text string.

**Condition script**
You can define a script that contains a condition statement that returns true or false. If the condition evaluates to true, the control is used. For example, you can specify a condition that enables only certain users to see a particular input prompt, while hiding the prompt from other users. If no script is used in the condition, the condition always evaluates to true.

**Text user input**
Use Text input in a Virtual Agent topic to prompt the user for a text string.
### Example text input

#### Table 1224:

<table>
<thead>
<tr>
<th>Response properties</th>
<th>Text input prompt</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### User Input Properties

**String Basic Info**

- **Name**: Test Input
- **Variable Name**: test_input
- **Prompt**: Enter some text

**Acknowledge Message**: Thank you!

**Default Value**: 

**Confirmation Message**: 

**Condition**: 

---

**Figure 662: Web UI text input prompt**

- Virtual Agent: 1:56 PM
- Test User: 1:47 PM

**Figure 663: Slack text input prompt**

- Virtual Agent: 10:59 AM
- Test User: 10:59 AM

Text input properties

Table 1225: Text properties

<table>
<thead>
<tr>
<th>Text property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name that identifies this text node in the topic flow.</td>
</tr>
<tr>
<td>Variable Name</td>
<td>The name of the variable that stores the user response to this prompt. The variable name is automatically created from the Name property.</td>
</tr>
<tr>
<td>Prompt</td>
<td>The prompt or question to the user. The prompt can be either a text string or a script that returns text.</td>
</tr>
<tr>
<td>Acknowledge Message</td>
<td>The message that verifies the user selection. The message can be either a text string or a script that returns text.</td>
</tr>
<tr>
<td>Default Value</td>
<td>The predefined value for the user response to the question or prompt. The value can be either a text string or a script that returns text.</td>
</tr>
<tr>
<td>Confirmation Message</td>
<td>The message that verifies the default or single-choice selection made by the user. The message can be either a text string or a script that returns text.</td>
</tr>
<tr>
<td>Condition</td>
<td>A script that specifies a condition for presenting this prompt in the conversation. The condition must evaluate to true.</td>
</tr>
</tbody>
</table>

Note: Slack users can edit text previously entered in a conversation. However, Virtual Agent does process messages after they were first entered. If a Slack user edits text input, such as a comment to update a case, Virtual Agent does not evaluate the edited update.

Static Choice List

Use the Static Choice List in a Virtual Agent topic to list predefined choices available to the user. A user can select only one item from a choice list.
Example static choice list

Table 1226:

<table>
<thead>
<tr>
<th>Input properties</th>
<th>Static choice list prompt</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>User Input Properties</strong></td>
<td></td>

<tr>
<td>Variable name</td>
<td>The name of the variable that stores the user response to this prompt. The variable name is automatically created from the Name property.</td>
</tr>
<tr>
<td>Prompt</td>
<td>The prompt or question to the user. The prompt can be either a text string or a script that returns text.</td>
</tr>
<tr>
<td>Acknowledge Message</td>
<td>The message that verifies the user selection. The message can be either a text string or a script that returns text.</td>
</tr>
<tr>
<td>Default value</td>
<td>The predefined value for the user response to the question or prompt. The value can be either a text string or a script that returns text.</td>
</tr>
<tr>
<td>Confirmation Message</td>
<td>The message that verifies the default or single-choice selection made by the user. The message can be either a text string or a script that returns text.</td>
</tr>
<tr>
<td>Condition</td>
<td>A script that specifies a condition for presenting this prompt in the conversation. The condition must evaluate to true.</td>
</tr>
<tr>
<td>Choice List Setting</td>
<td>For each choice, enter a Label and a Value. The Label is the text that appears to the user for that choice. The Value is what is stored in the variable when that choice is selected. The Value is stored as a string.</td>
</tr>
</tbody>
</table>

**Note:** Slack has a limit of 30 characters for choice list labels.

## Reference Choice List

Use reference choice lists in a Virtual Agent topic to dynamically create a list of available choices. Create these choices by querying a table or by using a script to dynamically create them.
# Example reference choice list

## Table 1227:

<table>
<thead>
<tr>
<th>Input properties</th>
<th>Reference choice list prompt</th>
</tr>
</thead>
<tbody>
<tr>

- INC0010011 - FINAL TEST!
## Reference Choice List property sheet

<table>
<thead>
<tr>
<th>Reference choice list property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name that identifies this reference choice list node in the topic flow.</td>
</tr>
<tr>
<td>Variable name</td>
<td>The name of the variable that stores the user response to this prompt. The variable name is automatically created from the Name property.</td>
</tr>
<tr>
<td>Prompt</td>
<td>The prompt or question to the user. The prompt can be either a text string or a script that returns text.</td>
</tr>
<tr>
<td>Acknowledge Message</td>
<td>The message that verifies the user selection. The message can be either a text string or a script that returns text.</td>
</tr>
<tr>
<td>Default value</td>
<td>The predefined value for the user response to the question or prompt. The value can be either a text string or a script that returns text.</td>
</tr>
<tr>
<td>Confirmation Message</td>
<td>The message that verifies the default or single-choice selection made by the user. The message can be either a text string or a script that returns text.</td>
</tr>
<tr>
<td>Condition</td>
<td>A script that specifies a condition for presenting this prompt in the conversation. The condition must evaluate to true.</td>
</tr>
</tbody>
</table>

### Choice List Setting

<table>
<thead>
<tr>
<th>Reference Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The type of reference variable to be used. Select one of the following options:</td>
</tr>
<tr>
<td></td>
<td>• Record — returns records from the table selected. The values for these options are GlideRecord objects.</td>
</tr>
<tr>
<td></td>
<td>• Script — The expression that returns an array of options.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Table</th>
<th>If you selected Record as the Reference Type, select the table to be searched.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Choice Value Expression</td>
<td>If you selected Script as the Reference Type, enter a script that defines the enumeration list for the options (choice list) to be displayed. The name value pair is stored as a string object.</td>
</tr>
<tr>
<td>No records response message</td>
<td>The message displayed to the user when the table search does not return any records. The message can be either a text string or a script that returns text.</td>
</tr>
</tbody>
</table>
Example choice value expression

```javascript
(function execute(table) {
    var options = [];
    var gr = new GlideRecord(table);
    gr.addEncodedQuery('active=true');
    gr.setLimit(10);
    gr.query();
    while (gr.next()) {
        options.push({ 'value': gr.getUniqueValue(), 'label':
            gr.getValue('short_description') });
    }
    return options;
})(table)
```

Script in the Choice Value Expression property defines and returns an array of choices. In the preceding example, the script creates an array called options, and adds each record found in a GlideRecord query to this array. Each element in the array is given a value in the value and label keys using data from that GlideRecord. The Table property of the control defines the table used by the script. This example script uses gr.setLimit(10) to limit the number of records returned to 10. Using this method prevents returned records from creating an overly large choice list.

Table 1228:

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>The value for the choice. When a user selects a choice from the control, this value is stored in the variable named in the Variable name property.</td>
</tr>
<tr>
<td>label</td>
<td>The label that appears for this choice in the choice list.</td>
</tr>
</tbody>
</table>

Boolean user input

Use the Boolean user input in a Virtual Agent topic to present a Yes/No prompt to the user.
Example Boolean input element

Table 1229:

<table>
<thead>
<tr>
<th>Input properties</th>
<th>Boolean input prompt</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>User Input Properties</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Boolean Basic Info</strong></td>
<td></td>
</tr>
<tr>
<td>• Name ①</td>
<td>Show Logs [now] Now Support</td>
</tr>
<tr>
<td>Boolean Test</td>
<td>just now</td>
</tr>
<tr>
<td>• Variable Name ①</td>
<td>Choose a response</td>
</tr>
<tr>
<td>boolean_test</td>
<td>Yes</td>
</tr>
<tr>
<td>• Prompt ①</td>
<td>No</td>
</tr>
<tr>
<td>Choose a response</td>
<td></td>
</tr>
<tr>
<td>Acknowledge Message ①</td>
<td>virtualagent 2:18 PM</td>
</tr>
<tr>
<td>Thank you</td>
<td>Choose a response</td>
</tr>
<tr>
<td>Default Value ①</td>
<td>Yes</td>
</tr>
<tr>
<td>Confirmation Message ①</td>
<td></td>
</tr>
<tr>
<td>Condition ①</td>
<td></td>
</tr>
</tbody>
</table>

**Figure 671: Web UI user input prompt**

**Figure 672: Slack user input prompt**

**Figure 673: Microsoft Teams user input prompt**
Boolean property sheet

Boolean controls prompt the user to answer a Yes/No question, and store the response as a string with a value of true or false. Use this value in topic utilities, like the Decision utility, to branch the topic flow based on the answer.

<table>
<thead>
<tr>
<th>Boolean property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name that identifies this Boolean node in the topic flow.</td>
</tr>
<tr>
<td>Variable name</td>
<td>The variable that stores the choice selected by the user. The variable name is automatically created from the Name property.</td>
</tr>
<tr>
<td>Prompt</td>
<td>The prompt or question to the user. The prompt can be either a text string or a script that returns text.</td>
</tr>
<tr>
<td>Acknowledge Message</td>
<td>The message that verifies the user selection. The message can be either a text string or a script that returns text.</td>
</tr>
<tr>
<td>Default Value</td>
<td>The predefined value for the user response to the question or prompt. The value can be either a text string or a script that returns text.</td>
</tr>
<tr>
<td>Confirmation Message</td>
<td>The message that verifies the default or single-choice selection made by the user. The message can be either a text string or a script that returns text.</td>
</tr>
<tr>
<td>Condition</td>
<td>A script that specifies a condition for presenting this prompt in the conversation. The condition must evaluate to true.</td>
</tr>
</tbody>
</table>

Date Time picker

Use the Date Time picker in a Virtual Agent topic to enable the user to select a calendar date, time (hours and minutes), or both.
## Example date and time user input

### Table 1230:

<table>
<thead>
<tr>
<th>Input properties</th>
<th>Date Time Prompt</th>
</tr>
</thead>
</table>

#### User Input Properties

</tbody>
</table>

#### Figure 675: Slack prompt

**Select Time**

- 12:39 PM

**OK**
Date and Time selection for the Slack and Teams interfaces

The Slack and Microsoft Teams interfaces do not natively support a date selection widget. Date and Time selection is instead done with the buttons that are supported in these interfaces.

The Date Time user input prompts the user for a date, showing the current date and time. Click the month, day, year, or time button to modify that value. The time and day fields prompt the user to type in a new value. The month and year fields show a set of buttons with the current and upcoming months or years. Select one of these buttons, or type in a value to set the time or year.
## Date Time property sheet

<table>
<thead>
<tr>
<th>Date Time property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name that identifies this date and time node in the topic flow.</td>
</tr>
<tr>
<td>Variable name</td>
<td>The name of the variable that stores the user response to this prompt. The variable name is automatically created from the Name property.</td>
</tr>
<tr>
<td>Prompt</td>
<td>The prompt or question to the user. The prompt can be either a text string or a script that returns text.</td>
</tr>
<tr>
<td>Acknowledge Message</td>
<td>The message that verifies the user selection. The message can be either a text string or a script that returns text.</td>
</tr>
<tr>
<td>Default Value</td>
<td>The predefined value for the user response to the question or prompt. The value can be either a text string or a script that returns text.</td>
</tr>
<tr>
<td>Confirmation Message</td>
<td>The message that verifies the default or single-choice selection made by the user. The message can be either a text string or a script that returns text.</td>
</tr>
<tr>
<td>Condition</td>
<td>A script that specifies a condition for presenting this prompt in the conversation. The condition must evaluate to true.</td>
</tr>
<tr>
<td>Format</td>
<td>The type of date-time picker to be displayed. Select one of the following formats:</td>
</tr>
<tr>
<td></td>
<td>• DateTime — Shows both a monthly calendar and time picker.</td>
</tr>
<tr>
<td></td>
<td>• Time — Shows only the time picker for the user to select the time (hours and minutes).</td>
</tr>
</tbody>
</table>

### Image Picker

Use the Image Picker in a Virtual Agent topic to prompt a user to upload an image. After the user uploads the image file, the image appears immediately in the Virtual Agent client.
Example image picker

<table>
<thead>
<tr>
<th>Image properties</th>
<th>Image Picker Prompt</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>User Input Properties</strong></td>
<td><strong>Figure 677: Web UI prompt</strong></td>
</tr>
<tr>
<td>Image Basic Info</td>
<td></td>
</tr>
<tr>
<td>* Name</td>
<td>Please upload an image.</td>
</tr>
<tr>
<td></td>
<td><img src="image.jpg" alt="Image" /></td>
</tr>
<tr>
<td>* Variable Name</td>
<td>Please upload an image.</td>
</tr>
<tr>
<td>image_upload_test</td>
<td><img src="image.jpg" alt="Image" /></td>
</tr>
<tr>
<td>* Prompt</td>
<td>Please upload an image.</td>
</tr>
<tr>
<td></td>
<td><img src="image.jpg" alt="Image" /></td>
</tr>
<tr>
<td>Acknowledge Message</td>
<td>Please upload an image.</td>
</tr>
<tr>
<td>Response on complete</td>
<td><img src="image.jpg" alt="Image" /></td>
</tr>
<tr>
<td>Condition</td>
<td>Please upload an image.</td>
</tr>
<tr>
<td><img src="image.jpg" alt="Image" /></td>
<td><img src="image.jpg" alt="Image" /></td>
</tr>
</tbody>
</table>

Figure 678: Slack prompt

![Image](image.jpg)

Figure 679: Microsoft Teams prompt

![Image](image.jpg)

**Image picker properties**

The image that can be uploaded must be a .jpg, .png, .bmp, .gif, .jpeg, or .ico file format. The image can be high resolution, but the image displayed in the Virtual Agent client is scaled based on the aspect ratio. Images scale to fit within the chat window.
### Image picker property

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name that identifies the image picker node in the topic flow.</td>
</tr>
<tr>
<td>Variable name</td>
<td>The name of the variable that stores the user response to this prompt. The variable name is automatically created from the Name property.</td>
</tr>
<tr>
<td>Prompt</td>
<td>The prompt to the user asking them to upload an image. The prompt can be a text string that includes variables or a script that returns text.</td>
</tr>
<tr>
<td>Acknowledge Message</td>
<td>The message that verifies the user selection. The message can be either a text string or a script that returns text.</td>
</tr>
<tr>
<td>Condition</td>
<td>A script that specifies a condition for using the image picker.</td>
</tr>
</tbody>
</table>

#### Using the image picker in different client interfaces

The process to select an image differs based on the Virtual Agent client interface. Use the following steps to select an image in the client interface of your choice.

<table>
<thead>
<tr>
<th>Platform</th>
<th>Steps to select an image</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web UI</td>
<td>1. Click the Click here to upload a file button.</td>
</tr>
<tr>
<td></td>
<td>2. Choose an image file from your local computer.</td>
</tr>
<tr>
<td>Slack</td>
<td>1. Click the Green + icon.</td>
</tr>
<tr>
<td></td>
<td>2. Select Your computer.</td>
</tr>
<tr>
<td></td>
<td>3. Choose an image file from your local computer.</td>
</tr>
<tr>
<td>Microsoft Teams</td>
<td>1. On your local computer, copy an image file.</td>
</tr>
<tr>
<td></td>
<td>2. Paste the image file into the text input field in Teams.</td>
</tr>
</tbody>
</table>

### Carousel user input

Use the Carousel in a Virtual Agent topic to present a prompt and a horizontal series of labeled images. The user can select a single item from the carousel.
Example carousel

Table 1233:

<table>
<thead>
<tr>
<th>Carousel properties</th>
<th>Carousel Prompt</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Here's what I have available.</td>
</tr>
<tr>
<td></td>
<td>&quot;Classic&quot; Cellphone</td>
</tr>
</tbody>
</table>

Figure 680: Web UI prompt

© 2018 ServiceNow. All rights reserved.
### Carousel property sheet

<table>
<thead>
<tr>
<th>Carousel properties</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name that identifies this carousel node in the topic flow.</td>
</tr>
<tr>
<td>Variable name</td>
<td>The name of the variable that stores the selection made by the user. The variable name is automatically created from the Name property.</td>
</tr>
<tr>
<td>Prompt</td>
<td>The prompt to the user. The prompt can be a text string or a script that returns the prompt string.</td>
</tr>
<tr>
<td>Acknowledge Message</td>
<td>The message that verifies the user selection. The message can be either a text string or a script that returns text.</td>
</tr>
<tr>
<td>Default Value</td>
<td>The predefined value for the user response to the question or prompt. The value can be either a text string or a script that returns text. The user is prompted with a Yes/No prompt to accept this value. If the user selects No at this prompt, no value is used.</td>
</tr>
<tr>
<td>Confirmation Message</td>
<td>The message that appears when the carousel has a default value or only a single choice is available. The user is prompted with a Yes/No prompt to accept this value.</td>
</tr>
</tbody>
</table>

Figure 683: Microsoft Teams prompt
Carousel properties | Description
--- | ---
Condition | A script that specifies a condition for presenting this prompt in the conversation. The condition must evaluate to true.
Carousel Item Expression | Use script to create items for selection in your carousel. The script should return an array containing one or more items.
No records response record | The message indicating that no records were found. The message can be either a text string or a script that returns text.

**Example carousel item expression**

```javascript
var options = [];
options.push(
    {
        'Name': 'Item 1,
        'Value': 'item_1',
        'Body': 'https://images.pexels.com/photos/688666/pexels-photo-688666.jpeg'
    });
options.push(
    {
        'Name': 'Item 2,
        'Value': 'item_2',
        'Body': 'https://images.pexels.com/photos/916472/pexels-photo-916472.jpeg'
    });
return options;
```

Script in the Carousel Item Expression property defines and returns an array containing the items that appear in your carousel. The elements of this array must contain Name, Value, and Body keys. In the preceding example, the script creates an array called options, and added two elements, each with the required keys. The images here are hard-coded as an example.

### Table 1234:

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the carousel item. This name is shown below the image on the carousel.</td>
</tr>
<tr>
<td>Value</td>
<td>The value for the item. When a user selects a carousel item, this value is stored in the variable named in the Variable name property.</td>
</tr>
<tr>
<td>Body</td>
<td>The image used in the carousel item. The value is a URL for an image file.</td>
</tr>
</tbody>
</table>

**Virtual Agent Designer bot responses**

Virtual Agent Designer offers various controls for displaying bot responses in a conversation.
Text response

Use Text output in a Virtual Agent topic to display a text bot response.

Example text response

### Table 1235:

<table>
<thead>
<tr>
<th>Response properties</th>
<th>Text output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Response Properties</strong></td>
<td></td>
</tr>
<tr>
<td>Text Output: Basic Info</td>
<td></td>
</tr>
<tr>
<td>* Name ①</td>
<td></td>
</tr>
<tr>
<td>Text Output</td>
<td></td>
</tr>
<tr>
<td>* Response Message ①</td>
<td></td>
</tr>
<tr>
<td>Hello!</td>
<td></td>
</tr>
<tr>
<td>Condition ①</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Figure 684: Web UI Text output

Figure 685: Slack Text output

Figure 686: Microsoft Teams Text output

Text response properties

<table>
<thead>
<tr>
<th>Text response property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name that identifies the text response node in the topic flow.</td>
</tr>
<tr>
<td>Response message</td>
<td>The text response to the user, either a text string or a script that returns a text string. The script can include Glide record variables or script variables.</td>
</tr>
<tr>
<td>Text response property</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Condition</td>
<td>A script that specifies a condition for presenting this response in the conversation. The condition must return a value of true to display the text.</td>
</tr>
</tbody>
</table>

**Example text response script**

```javascript
(function execute() {
   return 'Hello ' + gs.getUser().getFirstName();
})()
```

In the preceding example, the script returns a string that greets the user. In this example, `gs.getUser().getFirstName()` is used to append the current user's first name.

**Image response**

Use Image Output in a Virtual Agent topic to display an image from a URL link. The image aspect ratio determines how the image is sized in the bot chat bubble.

**Example image output**

<table>
<thead>
<tr>
<th>Response properties</th>
<th>Image response output</th>
</tr>
</thead>
</table>
| ![Response Properties](https://images.pexels.com/photos/109371/)
| ![Image Output Test](https://images.pexels.com/photos/109371/)
| ![Image URL Link](https://images.pexels.com/photos/109371/)
| ![Condition](https://images.pexels.com/photos/109371/)

Figure 687: Web UI image response output
<table>
<thead>
<tr>
<th>Response properties</th>
<th>Image response output</th>
</tr>
</thead>
</table>

**Figure 688:** Slack image response output

**Figure 689:** Microsoft Teams image response output

Image response properties

<table>
<thead>
<tr>
<th>Image response property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Required. The name that identifies the Image response node in the topic flow.</td>
</tr>
<tr>
<td>Image URL Link</td>
<td>The URL link to an image file.</td>
</tr>
<tr>
<td>Condition</td>
<td>A script that specifies a condition for presenting this image in the conversation. The condition must return a value of true to display the image.</td>
</tr>
</tbody>
</table>

**Note:** Third-party messaging applications may place restrictions on the maximum size of an image displayed within a conversation. For details on the maximum image size allowed, check the documentation for the messaging application. For example, Microsoft Teams supports a maximum image size of 1024 x 1024 pixels and 1-MB file size for PNG, JPEG, and GIF files (see Microsoft Teams Developer documentation on conversations). Also, sometimes in MS Teams bot conversations, images may not fully render and appear cropped. Scroll up and down in the messaging window to view the image.

Link response

Use the Link output element in a Virtual Agent topic to present a bot response that contains a header prompt and a single URL link to an item. For example, you can provide a link to a website page or to a particular record, such as an incident.
Example link response element

Table 1237:

<table>
<thead>
<tr>
<th>Output properties</th>
<th>Link response output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td><img src="now" alt="Show Logs" /> <strong>Now Support</strong> <img src="more" alt="..." /></td>
</tr>
<tr>
<td>Header</td>
<td>![Here is a link](Click Here)</td>
</tr>
<tr>
<td>Label</td>
<td>![Click Here](Click Here)</td>
</tr>
<tr>
<td>URL</td>
<td>![<a href="https://www.google.com">https://www.google.com</a>](Click Here)</td>
</tr>
</tbody>
</table>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header</td>
</tr>
<tr>
<td>Label</td>
</tr>
<tr>
<td>URL</td>
</tr>
<tr>
<td>Condition</td>
</tr>
</tbody>
</table>

**HTML response**

Use the HTML output control to display static HTML text in the Virtual Agent bot response.

**Example HTML output**

The HTML response shows a static HTML as a chat response. The example shown here includes an image, headings, and paragraph text. The web UI presents this content as HTML. The Slack and Teams UI displays the same content as a .png image. URL links within the HTML are extracted and displayed below the image.
Table 1238:

<table>
<thead>
<tr>
<th>HTM response properties</th>
<th>Card output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Response Properties</strong></td>
<td><strong>Html Basic info</strong></td>
</tr>
<tr>
<td>Name</td>
<td>HTML Use Case Demo</td>

## HTML response properties

<table>
<thead>
<tr>
<th>HTML response property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name that identifies the HTML output node in the topic flow.</td>
</tr>
<tr>
<td>HTML Message</td>
<td>The HTML output to be displayed. Click the Edit icon to open the HTML editor.</td>
</tr>
<tr>
<td>Height (Pixel)</td>
<td>The maximum height of the area for displaying HTML output in third-party messaging applications.</td>
</tr>
<tr>
<td>Width (Pixel)</td>
<td>The maximum width of the bot bubble for displaying HTML output in third-party messaging applications.</td>
</tr>
</tbody>
</table>

**Note:** As shown in the examples, HTML output can vary in third-party messaging applications. Determine an appropriate Height and Width area by previewing the HTML output in the messaging applications you intend to use, then adjusting the height and width values.
Multi-flow Output

Use the Multi-flow Output in a Virtual Agent topic to sequentially display two or more outputs (text, image, link, or HTML). Includes a navigation button that enables the user to move from one output to the next.
Example multi-flow output

Table 1239:

<table>
<thead>
<tr>
<th>Output properties</th>
<th>Multi-flow output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Response Properties</strong></td>
<td><img src="image" alt="Response Example" /></td>

<tr>
<td>----------------------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Add a response             | For each output type, click + Add a Response to specify the output and define the output properties.  
1. In the Add a Response dialog box, select the Type, and specify the associated values:  
   • Text — Enter the text to be displayed in the response.  
   • Image — Enter the Header, Prompt (label for the link), and the URL link to the image.  
   • Link — Enter the Header, Prompt (label for the link), and the URL link.  
   • HTML — Enter the Height and Width, in pixels, to set the dimensions of the HTML block. In the HTML editor, enter the HTML markup to be displayed.  
2. Click Save. |

**Script Output**

Use Script Output in a Virtual Agent topic to run a script that returns a single response or a multi-part response.

**Example script output**

Use the script output response when creating a more complex response that relies on scripted calculations, or requires a multi-part response. Scripted output can include text, image, cards, links, and HTML, to create a versatile response.
### Table 1240:

<table>
<thead>
<tr>
<th>Output properties</th>
<th>Script output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Response Properties</strong></td>
<td><img src="https://via.placeholder.com/150" alt="Image" /></td>
</tr>
<tr>
<td><strong>Script Basic Info</strong></td>
<td><img src="https://via.placeholder.com/150" alt="Image" /></td>
</tr>
<tr>
<td>Name</td>
<td>Test Script Output</td>
</tr>
<tr>
<td>Script Output Type</td>
<td>Single-Part</td>
</tr>
<tr>
<td>Script Response Message</td>
<td>(function execute外形()</td>
</tr>
<tr>
<td>Condition</td>
<td></td>
</tr>
</tbody>
</table>

#### Script output properties

<table>
<thead>
<tr>
<th>Script output properties</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name that identifies the script output node in the topic flow.</td>
</tr>
<tr>
<td>Script Output Type</td>
<td>The type of output returned by the script: single-part or multi-part.</td>
</tr>
<tr>
<td>Script Response Message</td>
<td>The script that generates the selected output type (single or multi-part).</td>
</tr>
<tr>
<td>Condition</td>
<td>A script that specifies a condition for presenting this output in the conversation. The condition must return a value of true to display the output.</td>
</tr>
</tbody>
</table>
Example script

(function execute() {
  var gdt = new GlideDateTime();
  var gt = new GlideTime();
  gdt.addSeconds(7200);
  gt = gdt.getTime();
  var multiOutMsg = new sn_cs.MultiPartOutMsg();
  multiOutMsg.addPlainTextPart('Thank you for submitting an incident.');
  multiOutMsg.addPlainTextPart('You should receive a response from a technician by ' + gt.getByFormat('HH:mm'));
  return multiOutMsg;
})()

In the preceding example, the script calculates the time two hours from the current time and outputs a multi-part message that includes this information.

Card response

Use the Card response in a Virtual Agent topic to display selected information from a record on your instance, such as an incident.

Example card output

The Card response shows content from a record in a compact format designed for readability within the chat window. The record content includes the display field for the table the top of the card followed by any other fields specified by the properties of the bot response.
### Table 1241:

<table>
<thead>
<tr>
<th>Response properties</th>
<th>Card output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td><strong>Inquiry / Help</strong></td>
</tr>
<tr>
<td>Status Card</td>
<td><strong>Number</strong> INC0010003</td>
</tr>
<tr>
<td><strong>Reference Type</strong></td>
<td><strong>Short description</strong> Test Incident</td>
</tr>
<tr>
<td>Record</td>
<td><strong>Assigned to</strong> Support User</td>
</tr>
<tr>
<td><strong>Record</strong></td>
<td><strong>State</strong> In Progress</td>
</tr>
<tr>
<td>Here It Is</td>
<td></td>
</tr>
<tr>
<td><strong>fields</strong></td>
<td></td>
</tr>
<tr>
<td>Number</td>
<td></td>
</tr>
<tr>
<td>Short description</td>
<td></td>
</tr>
<tr>
<td>Assigned to</td>
<td></td>
</tr>
<tr>
<td>State</td>
<td></td>
</tr>
</tbody>
</table>

**Figure 702: Web UI card output**

**Figure 703: Slack card output**
**Card properties**

The contents of the card must come from a single record on your instance. This record can be referenced from variables in the flow, or queried using a script that returns a single Glide record from a selected table. Use the card properties to define which record is used and what fields are displayed from that record.

<table>
<thead>
<tr>
<th>Card property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name that identifies the Card node in the topic flow.</td>
</tr>
</tbody>
</table>
| Reference Type| The reference to a specific record in a table. Choose one of the following options:  
  - Record — Data for the card comes from a record referenced in a variable from another node in the flow, for example, a Choice List or Glide Action.  
  - Script — Data for the card comes from a script that returns a single Glide record from a specified table. |
<table>
<thead>
<tr>
<th>Card property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>When the Reference Type property is set to Record, this property appears as a list. Use this list to select a variable from the current flow that contains a record object. Information from this record is shown in the card. When the Reference Type field is set to script. Use this field to input a script that returns the record. Information from this record is shown in the card.</td>
</tr>
<tr>
<td>Table</td>
<td>If the Reference Type is Script, select the table containing the record.</td>
</tr>
<tr>
<td>fields</td>
<td>The fields from the ServiceNow record to be displayed in the card. Click +Add Field to specify each field.</td>
</tr>
<tr>
<td>Condition</td>
<td>A script that specifies a condition for presenting this card in the conversation. The condition must return a value of true to display the card.</td>
</tr>
</tbody>
</table>

**Example Glide record query**

```javascript
(function execute(table) {
    /* Write a glide record query, and return the glide record. For example:
     *
     * var gr = new GlideRecord(table);
     * gr.addEncodedQuery('active=true^number=INC0010099');
     * gr.query();
     * if(gr.next()) {
     *    return gr;
     *}
     */
}(table))
```

In the preceding example, the script creates a GlideRecord object, populates this object using a query that should return a single result, then returns the object. The Table property defines the table used in this query.

**Virtual Agent Designer Utilities**

Virtual Agent Designer offers various actions for controlling interactions within a topic, such as running a script or adding different conversation paths (branches) in a topic. Utilities are represented as nodes in a conversation flow but do not display anything to the user.

**Lookup utility**

Use the Lookup utility in a Virtual Agent topic to return a ServiceNow record query.
Example Lookup utility

Prompt Properties

- **Name**: Lookup Record
- **Variable Name**: reference_81
- **Condition**: 

Reference Settings

- **Table**: Incident [incident]
- **Script**: 

<table>
<thead>
<tr>
<th>Lookup property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name that identifies the Lookup node in the topic flow.</td>
</tr>
<tr>
<td>Variable Name</td>
<td>The variable that stores the record returned by the script.</td>
</tr>
<tr>
<td>Condition</td>
<td>A script that specifies a condition for executing this lookup. The condition must return a value of true for the lookup to execute.</td>
</tr>
</tbody>
</table>
Example Lookup script

(function execute(table) {
  var gr = new GlideRecord(table);
  gr.addEncodedQuery('active=true');
  gr.setLimit(1);
  gr.query();
  if(gr.next()) {
    return gr;
  }
})(table)

In the preceding example, a table is queried the first active. The table to be queried is defined in the Table property found in the lookup utility control. The setLimit() method ensures that only a single record is returned from the database. If a record is found, it is returned. For more information on GlideRecord queries, see Using GlideRecord to query tables.

Script Action

Use a Script Action in a Virtual Agent topic to run a script.

Example Script action
Script action properties

<table>
<thead>
<tr>
<th>Script action property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name that identifies the Script Action node in the topic flow.</td>
</tr>
<tr>
<td>Action Expression</td>
<td>The script that performs an action.</td>
</tr>
<tr>
<td>Condition</td>
<td>A script that specifies a condition for executing this script action. The condition must return a value of true for the script action to execute.</td>
</tr>
</tbody>
</table>

Example script action

```
(function execute() {
  var list = [];
  if (vaInputs.case_number != "") {
    var gr = new GlideRecord("sn_customerservice_case");
    gr.addQuery("number", "CONTAINS", vaInputs.case_number);
    gr.addQuery("active", "true");
    gr.orderBy("number");
    gr.query();
    while (gr.hasNext()) {
      gr.next();
      list.push(gr.getUniqueValue().toString());
    }
  }
  vaVars.case_list = list;
})()
```

The preceding example performs a search on the sn_customerservice_case table for a specific case number based on the input from another control called case_number. The script then places the results in an array and stores them in the case_list variable, which is accessible by other nodes in the same topic. Because vaVars only supports string, number, and boolean values, the script uses toString() to store these values as strings. The code is contained in an if statement, so it only executes if the case_number variable has a value. This if statement prevents the code from running if user had not entered a number.

Action utility

Use the Action utility in a Virtual Agent topic to create or update a ServiceNow record.
Example action utility

Prompt Properties

- Name  
  Glide Action

- Variable Name  
  glide_action

Condition

Action Setting

- Action Type  
  Create a Record

- Table  
  Incident [incident]

- Field  
  Field  Value
  short_description  Test Incident
  active  true

+ Add Field
**Action properties**

Specify the table for which the record is to be created. To update a record, specify the fields in the record to be modified.

<table>
<thead>
<tr>
<th>Action property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name that identifies the Action node in the topic flow.</td>
</tr>
<tr>
<td>Variable Name</td>
<td>The name of the Glide variable that is automatically created from the Name field.</td>
</tr>
<tr>
<td>Condition</td>
<td>A script that specifies a condition for executing this action. The condition must return a value of true for the action to execute.</td>
</tr>
<tr>
<td>Action Setting</td>
<td></td>
</tr>
<tr>
<td>Action Type</td>
<td>The action to be performed in the instance. Choose one of the following options:</td>
</tr>
<tr>
<td></td>
<td>• Create a Record</td>
</tr>
<tr>
<td></td>
<td>• Update a record</td>
</tr>
<tr>
<td>Table</td>
<td>If the Action Type is Create a Record, select the ServiceNow table for which the record is to be added.</td>
</tr>
<tr>
<td>Record</td>
<td>If the Action Type is Update a Record, select the variable for the GlideRecord. The available variables are referenced from another node in the flow, such as a choice list.</td>
</tr>
<tr>
<td>Action property</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Field</td>
<td>The fields from the table to be operated on:</td>
</tr>
<tr>
<td></td>
<td>1. Click + Add Field to specify the field and field values.</td>
</tr>
<tr>
<td></td>
<td>2. In the Field Values form, enter the value. This value can be added in one of two methods.</td>
</tr>
<tr>
<td></td>
<td>• Enter a static value into the text field.</td>
</tr>
<tr>
<td></td>
<td>• Use a value stored in a variable. Access your available variables by press Control + Space or click the Insert Reference button.</td>
</tr>
<tr>
<td></td>
<td>3. Click Save.</td>
</tr>
<tr>
<td></td>
<td>4. Repeat steps 1 through 3 for each field to be added.</td>
</tr>
</tbody>
</table>

**Decision utility**

Use the Decision utility in a Virtual Agent topic to add two or more branches that represent different paths in a conversation.
In the preceding example, a static choice control prompts the user to select from three available colors, which is stored in a variable. The decision utility control is configured with a branch for each possible selection. Each branch contains a script in the Condition property that returns true when a specific color is selected. In the preceding example, the script returns true when the choice is "Blue."

**Add a decision utility with branches**

1. Drag the Decision utility onto the canvas.
   
   The Decision added to the canvas has a single branch named Always by default.
2. Click the + (plus) sign under the node.
   
   A second branch named Never is added below the Decision node.
3. To add additional branches, click the + (plus) sign.
4. For each branch, specify the branch properties: Name of the branch and Condition for displaying that branch.

**Use scripts to set conditions for branches**

Each branch below a decision node has a condition property. Add a script to this property that returns a value of true or false. A branch that returns a value of true is followed, while a branch returning a value of false is not. When creating these scripts, ensure that only one branch in each decision evaluates to true.
Virtual Agent scripts

Admins and users with the virtual_agent_admin role can use scripts to customize the behavior of Virtual Agent topics.

Virtual Agent scripts run on the server. Scripts can provide context for topics, such as retaining information about a user or a user's input. You can use this information to personalize a conversation, for example to present a scripted greeting or confirmation. Scripts can also specify certain actions to be performed on information obtained during a conversation, such as creating or updating ServiceNow records.

Scripts run in the scope in which a topic is defined. All scope protections apply. If you are developing a conversation for a scoped application, you must use the scoped API. You can use most APIs that run in server scripts.

User input and ServiceNow record variables

In Virtual Agent, the following variables are available for use in scripts that you create for a topic.

User input variables

When you add an input control to a topic, the system automatically creates a variable to store the user input (string object). The syntax is vaInputs.myvar where myvar is the name you assigned to the input node.

For example, a text input prompt with the name First prompt has a system-defined variable called vaInputs.first_prompt. Spaces in the name are replaced with an underscore character and uppercase characters are changed to lower-case.

ServiceNow record variables

If you create a script for a topic that queries a ServiceNow table, the record object (GlideRecord) returned is automatically available for use in the topic. The variable syntax is vaInputs.myvar where myvar is the record object. For details on querying ServiceNow tables to return a record object, see Using GlideRecord to query tables.

Use dot-walking in variables that contain a ServiceNow record to specify a particular field in the table. The syntax is vaInputs.myvar.field. For details on dot walking within a script, see Dot-walking examples.

Accessing user input and ServiceNow record variables

Use vaInputs object, for example vaInputs.myvar == "expected value" to access ServiceNow record variables in scripts. To access values from user inputs that are not records, use vaInputs.myvar.getValue().

The following methods are available.

• vaInputs.myvar == "expected value") evaluates whether myvar matches an expected value.
**Note:** Values for user input variables are assigned using user input controls. These values cannot be changed in your scripts.

- If myvar is a GlideDateTime variable, the date and time value is formatted as a string, for example: 2018-12-11 17:45:23
- By default, the user variable is available and is a reference to the sys_user record for the user.
- valInputs.myvar.getValue(); returns the value.
- valInputs.myvar.getDisplayValue(); If the stored value is not a ServiceNow record, this method returns the display value. For variables that contain ServiceNow records, this method returns the display value, as defined by the display field for that table.

### Choice List Setting

<table>
<thead>
<tr>
<th>Label</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Apple</td>
<td>10</td>
</tr>
<tr>
<td>Orange</td>
<td>20</td>
</tr>
<tr>
<td>Pear</td>
<td>30</td>
</tr>
</tbody>
</table>

This example shows the label and choice values for a user input. In this case myVar.getValue() would return a value of 10, 20, or 30, while myVar.getDisplayValue() would return Apple, Orange, or Pear.

- valInputs.myvar.getDefaultValue(); returns the default value in a confirmation message.
- valInputs.myvar.getDefaultDisplayValue(); returns the display value for the default value in a confirmation message.

### Script variables

You can define script variables for information that is not stored in ServiceNow tables but can be used to share that information elsewhere in a topic. Script variables are similar to workflow scratchpad variables that store primitives such as integers, boolean values, or strings. A string value can be either a static or...
dynamic scripted value. Create these variables using the Script Variables sidebar in the Virtual Agent Designer page.

![Script Variables sidebar](image)

**Figure 705: Script Variables sidebar**

**Note:** Script variables are intended for use by topic authors with advanced scripting skills.

The variable syntax is `vaVars.myvar` where `myvar` is the name you assign to the variable. For example, you can assign a value to the variable using `vaVars.myvar = value;`. Unlike user input variables, script variables can be assigned values in a script.

To define a script variable:

1. In the Virtual Agent Designer page, click the + plus sign for Script Variables.
2. In the Add Script Variable window, define the variable:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable name</td>
<td>Name of the variable. The name is case-sensitive. Spaces in the name are replaced with an underscore character.</td>
</tr>
<tr>
<td>Default value</td>
<td>Either a static value or a script that specifies a dynamic value for this variable.</td>
</tr>
</tbody>
</table>

3. Click Save.
**Live Agent variables**

The following Live Agent variables are available for use in topic scripts:

- application
- queue
- short_description

For example, you can use the queue variable to control the chat queues used in a topic.

The variable syntax is `vaVars.LiveAgent_myvar` where `myvar` is one of the available Live Agent variables specified in Live Agent setup. Access the variable using `vaVars.LiveAgent_myvar = value;`

To use Live Agent variables in topic scripts, enable the Live Agent toggle switch (under Script Variables) in the Virtual Agent Designer page.

**Context variables**

Variables can be used in system parameters within the web client URL. These variables can be used anywhere in the conversation using the `vaContext` object. Use these options to create links to Virtual Agent with predefined variables.

```plaintext
https://<instance>.service-now.com/$sn-va-web-client-app.do?
sysparm_city=London
```

The preceding link contains a parameter, `sysparm_city=London`. In addition to opening a Virtual Agent conversation, using this link creates a variable called `city`, with a value of London. This variable can be accessed in a script using `vaContext.city`.

**vaSystem methods**

Use methods in the `vaSystem` object to attach images to records, access the search string used to find the current topic, or transfer the user to a live agent queue.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
</table>
| `vaSystem.attachToRecord(String mediaId, String tableName, String sysId)` | This method attaches an image to a record. The method uses three parameters:
  - `mediaId`: The path for the image to be attached. Use `getValue()` on an image input variable to use an image entered by the customer. For example, `vaInputs.image_input.getValue()`.
  - `tableName`: A string containing the name of the table.
  - `sysId`: The `sys_id` of the record. |
<p>| <code>vaSystem.getSearchText()</code> | This method returns the search string used to find the current topic. |</p>
<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vaSystem.connectToAgent()</td>
<td>This method ends the current conversation and connects the customer to a live agent queue. For more information on this method, see Transferring Virtual Agent conversations to a live agent on page 3088.</td>
</tr>
</tbody>
</table>

**Virtual Agent localization**

Use the Message [sys_ui_message] table to provide translations for Virtual Agent topics and accommodate users from different countries.

**Using localization for Virtual Agent**

If you use multiple languages on your instance, or plan to do so, use localization methods in your Virtual Agent scripts to ensure that the content can be translated. Localization methods are designed to show the original text when no translation is found. These methods can be applied to your code before translations have been created.

**Use the Message table to store translation text**

The Message [sys_ui_message] table stores translation for informational messages, and is used to store translation for elements in your topic. Predefined topics have already been translated, but you must provide translations for any content you create for your instance. Information on the Message table can be found here: Message table

**Use the gs.getMessage function to access stored translations**

The gs.getMessage method checks the Message table for the translated version of the text in the language selected for the current user.

**Example of localization in a script**

```javascript
(function execute() {
    return 'Hi there ' + vaInputs.first_name;
})()
```

The preceding code provides a greeting that dynamically adds the value of the first_name variable. Here is that same code, rewritten for localization.

```javascript
(function execute() {
    return gs.getMessage('Hi there {0}', [vaInputs.first_name]);
})()
```

The preceding example uses the gs.getMessage method. The text is the same as the previous example, but the format is changed. The number in brackets acts as a placeholder for the variable, which is then listed in an array after the comma. The gs.getMessage method looks for a record on the Message table with a key value matching Hi there {0}, and a language value matching the current language. The method returns the translated version of the text, which is stored in the message field of the record.
Visual Task Boards

Visual Task Boards (VTB) transform the navigation of lists and forms into an interactive graphical experience.

With Visual Task Boards, you can view and update multiple task records, which appear as cards that can be moved between lanes. An activity stream on the board displays recent activity so you can easily track changes to tasks. You can add task cards from any table that extends Task to intuitively and easily track updates and edit records directly from the board. Any user can use task boards, regardless of role, though access control rules (ACLs) may limit which cards each user can see. The Visual Task Board interface provides a graphic-rich environment suited for managing and collaborating on records. For example, a support manager might create a board for her team to track their assigned incidents by state in real time.

This video demonstrates how Visual Task Boards work.

Activate Visual Task Boards

Visual Task Boards are active by default on new instances. For upgraded instances, you can activate the Visual Task Boards plugin [com.glide.ui.vtb] if you have the admin role.

Role required: admin
1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.

If the plugin depends on other plugins, these plugins are listed along with their activation status.
If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).

4. If available, select the Load demo data check box.

Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.

You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.

5. Click Activate.

**Domain separation in Visual Task Boards**

This is an overview of domain separation in the Visual Task Boards application. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

**Overview**

Support: Data only

Domain separation in this application is supported at the Data only level, meaning it supports the data security model of separating visibility of data from one domain to another. To learn more, see Application support for domain separation.

**Installed with Visual Task Boards**

Several types of components are installed with Visual Task Boards.

**Tables installed with Visual Task Boards**

Tables are added with activation of Visual Task Boards.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Board Member [vtb_board_member]</td>
<td>Stores a record for each member of each task board.</td>
</tr>
<tr>
<td>Private Task [vtb_task]</td>
<td>Stores a record for each personal task on each freeform board.</td>
</tr>
<tr>
<td>Visual Task Board [vtb_board]</td>
<td>Stores a record for each task board.</td>
</tr>
<tr>
<td>Visual Task Board Card [vtb_card]</td>
<td>Stores a record for each task card on each task board.</td>
</tr>
</tbody>
</table>
### Table Description

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Visual Task Board Card History [vtb_card_history]</td>
<td>Stores records for certain task card changes, such as lane or assignee changes. Each record indicates the previous value and the new value.</td>
</tr>
<tr>
<td>Visual Task Board Lane [vtb_lane]</td>
<td>Stores a record for each lane on each task board.</td>
</tr>
</tbody>
</table>

### Properties installed with Visual Task Boards

Properties are added with activation of Visual Task Boards.

**Note:** To open the System Property [sys_properties] table, enter `sys_properties.list` in the navigation filter.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vtb.board.upload_limit</td>
<td>Sets the maximum file size in megabytes allowed for each task card attachment.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 10</td>
</tr>
<tr>
<td></td>
<td>• Location: System Property [sys_properties] table</td>
</tr>
</tbody>
</table>

### Script includes installed with Visual Task Boards

Script includes are added with activation of Visual Task Boards.

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VisualTaskBoards</td>
<td>Provides general utilities for Visual Task Boards.</td>
</tr>
<tr>
<td>VTBBoardSecurity</td>
<td>Provides security utilities to control board access.</td>
</tr>
<tr>
<td>VTBGetBoardsByUser</td>
<td>Provides a method that retrieves all the boards a specified user owns or is a member of.</td>
</tr>
<tr>
<td>VTBTaskSecurity</td>
<td>Provides security utilities to control task access.</td>
</tr>
</tbody>
</table>

### Client scripts installed with Visual Task Boards

Client scripts are added with activation of Visual Task Boards.

<table>
<thead>
<tr>
<th>Client script</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Kanban Choice</td>
<td>Visual Task Board [vtb_board]</td>
<td>Adds the -- Kanban Board -- option to the Lane field field. This option indicates that the task board is a flexible board.</td>
</tr>
</tbody>
</table>
## Business rules installed with Visual Task Boards

Business rules are added with activation of Visual Task Boards.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add members to live group</td>
<td>Board Member [vtb_board_member]</td>
<td>If a Connect Chat conversation is created for a task board, this business rule adds the board members as conversation members.</td>
</tr>
<tr>
<td>Remove member from live group</td>
<td>Board Member [vtb_board_member]</td>
<td>If a Connect Chat conversation exists for a task board and a user is removed from the board members, this business rule removes the user from the conversation members.</td>
</tr>
<tr>
<td>Remove member from VTB</td>
<td>Live Group Member [live_group_member]</td>
<td>If a Connect Chat conversation exists for a task board and a user is removed from the conversation members, this business rule removes the user from the task board members.</td>
</tr>
<tr>
<td>Sync board name to Connect</td>
<td>Visual Task Board [vtb_board]</td>
<td>If a Connect Chat conversation exists for a task board and someone updates the board name, this business rule updates the conversation name.</td>
</tr>
<tr>
<td>Sync chat name to VTB board</td>
<td>Live Group Profile [live_group_profile]</td>
<td>If a Connect Chat conversation exists for a task board and someone updates the conversation name, this business rule updates the board name.</td>
</tr>
<tr>
<td>Sync Members With VTB</td>
<td>Live Group Member [live_group_member]</td>
<td>If a Connect Chat conversation exists for a task board and a user is added to the conversation members, this business rule adds the user as a board member.</td>
</tr>
<tr>
<td>Update Board on Card Change</td>
<td>Visual Task Board Card [vtb_card]</td>
<td>Triggers the system to update the task board when changes occur to the cards.</td>
</tr>
<tr>
<td>Update Board on Lane Change</td>
<td>Visual Task Board Lane [vtb_lane]</td>
<td>Triggers the system to update the task board when changes occur to the lanes.</td>
</tr>
<tr>
<td>update board on lane change</td>
<td>Board Member [vtb_board_member]</td>
<td>Triggers the system to update the task board when changes occur to the board members.</td>

<tr>
<td>VTB Previous Additional</td>
<td>Private Task</td>
<td>Triggers the system to send an email notification to users when they are</td>
</tr>
<tr>
<td>Assignees</td>
<td>[vtb_task]</td>
<td>designated as additional assignees for cards.</td>
</tr>
</tbody>
</table>

Notifications installed with Visual Task Boards

Notifications are added with activation of Visual Task Boards.

<table>
<thead>
<tr>
<th>Notification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VTB additional assignee notification</td>
<td>Sends an email notification to users when they</td>
</tr>
<tr>
<td></td>
<td>are designated as additional assignees for tasks.</td>
</tr>
<tr>
<td>VTB assignee notification</td>
<td>Sends an email notification to users when they</td>
</tr>
<tr>
<td></td>
<td>are designated as the primary assignees for</td>
</tr>
<tr>
<td></td>
<td>personal tasks.</td>
</tr>
<tr>
<td>VTB lane change notification</td>
<td>Sends an email notification to a task's assignees</td>
</tr>
<tr>
<td></td>
<td>when the task changes lanes.</td>
</tr>
</tbody>
</table>

Supported browsers for Visual Task Boards

The system supports Visual Task Boards on most modern browsers.

Supported browsers

- The latest public release of Firefox or Firefox ESR
- The latest public release of Chrome
- Safari version 9.1 and later
- Internet Explorer version 11
  - Edge mode is supported.
  - Compatibility mode is not supported.
  - Setting Security Mode to High (via the Internet Options Security tab) is not supported.
  - Internet Explorer 11 is susceptible to memory leaks, which may impact performance, especially in Windows 7.

- Access Visual Task Boards on your mobile device using either a browser or the native mobile app. See *Mobile supported devices* for more information.

Scripting support

Visual task boards do not interact with client scripts. Use a UI policy or a data policy instead.
Visual task board structure

There are different types of task boards for different kinds of task management. All types of boards share the same overall structure.

Table 1244: Board types

<table>
<thead>
<tr>
<th>Board type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Freeform boards</td>
<td>Display any kind of task record, including personal tasks. Members of freeform boards can add and remove task cards and lanes.</td>
</tr>
<tr>
<td>Flexible boards</td>
<td>Display tasks that match the configured filter against a particular table. Members of flexible boards can add task cards, which are removed automatically when the tasks no longer match the filter conditions. Members can define custom lanes, similar to a freeform board.</td>
</tr>
<tr>
<td>Guided boards</td>
<td>Display tasks that match the configured filter against a particular table, like flexible boards. Members of guided boards can add task cards, which are removed automatically when the tasks no longer match the filter conditions. Guided board lanes correspond to field values and cannot be edited in most cases.</td>
</tr>
</tbody>
</table>

The icon beside the board name on the Task Boards page identifies the type of board. Freeform boards appear with a grid of four squares

( )

flexible boards appear with a vertical line beside two squares

( )

guided boards appear with two vertical lines

( )
Figure 706: Task Boards screen

All boards have these elements:
<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quick panel</td>
<td>Displays labels and users associated with the board. Board members can use the quick panel to filter cards or to quickly label or assign tasks. Members can also configure what appears in the quick panel.</td>
</tr>
<tr>
<td>Lanes</td>
<td>Organize cards on a board into vertical groups. These groups often represent the status of the task, such as To Do, Doing, and Done. Each board is composed of one or more lanes. When using a guided board, each lane represents a possible field value. For example, a board on the Incident table can display one lane for each State value such as New, Active, or Resolved. Users can move cards from one lane to another to update the task that card represents.</td>
</tr>
<tr>
<td>Cards</td>
<td>Represent individual tasks. Users can add comments, attachments, and labels to cards and assign users to cards. Each card is tied to a task record; updating one immediately updates the other. For freeform boards, each card represents a personal task. For flexible and guided boards, each card represents a record from the list that board was created from.</td>
</tr>
<tr>
<td>Task board tools</td>
<td>Displays board information, a board members, the board activity stream, and board labels.</td>
</tr>
</tbody>
</table>

Visual Task Board use

Any user can create, view, and edit freeform, flexible, and guided visual task boards, and add users to these boards as members.

You can create a freeform board and add cards from multiple task tables, or create a flexible or guided board from an existing list of records.

Create a freeform board

You can create freeform task boards for tracking any kind of task or project.

Role required: none

2. Next to My Task Boards, click New, or if you have never created a task board before click Create New Visual Task Board.
3. From the Create New Board window, click Freeform.
   A new task board opens with the default freeform lanes, To Do, Doing, and Done.
4. Click the board name and enter a new name.

After the board is created, board members can:

- Add and modify lanes
- Create and modify task cards
- Add and remove members
- Configure the look and feel

Create a data driven board

You can create a flexible or guided task board for any table that extends Task, such as Incident or Change.

Role required: none

2. Next to My Task Boards, click New, or if you have never created a task board before click Create New Visual Task Board.
3. From the Create New Board window, click Data Driven Board.
4. From the Task Table list, select a base table of tasks on which to base your board, for example, an incident table.
5. From the Lane Field list, select the field you want to use for the lane headers. Create a Flexible board with editable lane headers by selecting None.
   The type of board that is created and the lanes that appear on the board depend on which type of column you select. If you select a reference or choice column, the board is a **guided board**. Each lane in a guided board represents one possible value for that column and the cards appear in the appropriate lane. For example, if you create a guided task board for incidents using the State column, the board shows one lane for each incident state, such as New or Closed. If you select a column that is not a reference or choice, the board is a **flexible board** and the board shows the default lanes, To Do, Doing, and Done, with all cards in the To Do lane.
6. Create a filter to show only the records you want to work with.
   For example, you might filter out incidents that are not assigned to you.
   Any card that no longer fits the parameters of the filter is automatically removed from the task board.
7. Click the board name and enter a new name.

**Note:** For guided boards created from choice fields, such as State, the system creates a lane for each possible choice value. For guided boards created from reference fields, the system creates a lane only for each value in use by a task card. Lanes are added as needed if the reference field values change.

After the board is created, board members can:

- Add and modify lanes
- Create and modify task cards
- Add and remove members
- Configure the look and feel

**Delete a task board**

You can delete any task board you own.

Role required: none

Deleting a board does not impact the underlying task records. However, you cannot recover a board after you delete it.

2. Under Boards you own, point to a board and click the delete icon (X).
3. In the confirmation dialog, click Delete.

**Add or modify task board lanes**

Any board member can change the names and add new lanes to accommodate the task workflow you want to track. When you create a freeform or flexible task board, it includes the default lanes To Do, Doing, and Done.

Role required: none

Unlike guided boards, the lanes on a freeform or flexible task board do not match possible field values.

**Note:** You cannot remove lanes from guided boards.

1. Open a task board.
2. Perform any of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create a new lane</td>
<td>1. Scroll past the last lane and click Add Lane.</td>
</tr>
<tr>
<td></td>
<td>2. Enter a title for the lane, then press the Enter key.</td>
</tr>
</tbody>
</table>

The Add Lane option is always available for freeform and flexible boards. It is available for guided boards only if the lanes are based on a reference field, such as Assigned to.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rearrange lanes</td>
<td>Click a lane header and drag the lane to the desired drop zone. To cancel the move, press the Escape key while you drag the lane. You can also change the lane order from the board configuration menu.</td>
</tr>
</tbody>
</table>
| Hide a lane     | 1. Click the lane menu ( الثلاثة ) in a lane header.  
                  2. Select Hide Lane. 
You can restore hidden lanes from the board configuration menu. |
| Delete a lane   | 1. Click the lane menu in a lane header.  
                  2. Select Delete Lane.  
                  3. In the confirmation dialog box, click Delete.  
When you delete a lane on a freeform or flexible board, all the cards in the deleted lane are archived.  
The Delete Lane option is always available for freeform and flexible boards. It is available for guided boards only if the lanes are based on a reference field, and only for lanes that contain no cards. |

**Task cards**

Visual Task Board task cards can represent a personal task or a record on a table. You can add task cards, edit task card details, add labels to cards, and access the underlying task record the card represents, depending on the board type.

**Note:** Each board can display up to 2,000 cards by default. When the number of tasks exceeds the maximum, a warning appears and the system determines which cards to show by most recent update time. Administrators can configure a different maximum card limit for freeform boards and for flexible and guided boards.

**Freeform board tasks**

You can add personal task cards directly to lanes on a freeform board. You can also add other kinds of task cards to a freeform board from a list or form.

*Add a personal task to a freeform board*  
You can add cards directly to a freeform board lane. These cards are called personal tasks and represent records on the Private Task [vtb_task] table.
Role required: none

1. In a lane header, click the lane menu ( ) and select Add Task. Alternatively, click Add Task at the bottom of a lane. A new task card appears in the lane.
2. Enter a short description for the new task card.
3. To save the card, click another area of the board or press Enter.

Add a task to a freeform board from a form
You can add a task card to a freeform board from any table that extends Task. These cards represent records on whichever table you add them from.

Role required: none

You can add cards from multiple task tables, such as Incident or Problem, to the same freeform board.

1. Open a task record, such as an incident.
2. Click the menu icon ( ) or right-click the form header to show the form context menu.
3. Select Add to Visual Task Board. A pop-up window appears with a list of freeform task boards.

4. Click the name of the board you want to add the card to. A confirmation message appears.
5. To view the board, click the board name in the confirmation message. The task appears in the first lane by default.

Add a task to a freeform board from a list
You can add a task card to a freeform board from any table that extends Task. These cards represent records on whichever table you add them from.
Role required: none

You can add cards from multiple task tables, such as Incident or Problem, to the same freeform board.

1. Navigate to a list of task records, such as Incident Open.
2. Perform either of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add one task</td>
<td>Right-click a record and select Add to Visual Task Board</td>
</tr>
<tr>
<td>Add multiple tasks</td>
<td>Select the check box beside each record you want to add and select Add to Visual Task Board from the actions choice list</td>
</tr>
</tbody>
</table>

A pop-up window appears with a list of freeform task boards.

3. Click the name of the board you want to add the card to.
   A confirmation message appears.
4. To view the board, click the board name in the confirmation message.
   The task appears in the first lane by default.

Data driven board tasks

You can add a task to a flexible or guided task board.

*Add a task to a flexible or guided board*

Cards in a flexible or guided board represent records on whichever table the board is associated with.

Role required: none

1. In a lane header, click the lane menu ( الثلاثة ) and select Add Task. Alternatively, click Add Task at the bottom of a lane.
A pop-up window appears with a new record. Fields are populated based on any filter conditions for the board and, for guided boards, the lane you add the card to.

Consider the example of a guided board that shows incidents with the Software category, with a lane for each assignee. If you add a card to the ITIL User lane, the new incident record Category and Assigned to fields are automatically set to Software and ITIL User.

2. Complete the form and click Submit.
   A new task card appears in the lane.

Edit card details

When you click a card on a Visual Task Board, a pop-up window appears with additional details.

Role required: none

You can edit certain values from the card details. Updating these values also updates the underlying task record.
Figure 708: Card details

1. Click a card.
   The details for that card appear in a pop-up window.
2. Alternatively, you can click an entry in the activity stream to view the details for the associated card.
3. From the card details you can:
   • Click the card title to rename the card.
- Modify the short description.
- Add comments or work notes in the activity stream.
- Edit the assignees.
- Click one or more of the available labels to add a label to the card.
- Add or remove file attachments.
- Create a checklist.
- Archive the card (freeform boards only).
- Move the card to a different board (freeform boards only).

Add an attachment to a task card
You can add an attachment to a record within a task board.

Role required: none

Adding an attachment to a task card also adds the attachment to the underlying task record.
Figure 709: Add attachment

1. Click a card.
2. Click the attachment tab

3. Click Add Attachment and select a file to add as an attachment.

Label a task card

Labels help categorize tasks and visually distinguish them on the task board.

*Enable* labels for the board.

Role required: none

You can filter the visible tasks to show only those with certain labels. Labels appear on cards as colored dots.

You can add one or more labels to a task card.

Do one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Add a label to a card from the quick panel | 1. Drag a label from the quick panel directly to a task card.  
2. Drop the label in the drop zone. |
| Add a label to a card from the card details | 1. Open the card details for a task.  
2. Click the details tab (i).  
3. Under Labels, select one or more labels. Point to a label to display its name.  
4. Close the card detail pop-up window. |

You can use configuration options to *rename or disable* labels or to *hide* labels altogether.
Assign a task card to a user

Assignees represent ownership of task cards and the associated records. Each task card can have one primary assignee and multiple additional assignees.

You can filter the visible tasks on a board to show only tasks assigned to a certain user. Assignees appear on cards as avatars.

![Task card assignees](image)

Figure 711: Task card assignees

When a card changes lanes, all the assignees receive an email notification.

For flexible and guided boards, the primary assignee corresponds to the underlying task's Assigned to field. For example, on a board created from the Incident table, if you add Joe Employee as the primary assignee for a card, the associated incident is assigned to Joe. Note that assignment rules on the associated table may restrict who you can make the primary assignee of a card. If you attempt to assign a task card to a user in a way that violates an assignment rule, a notification appears and the assignment does not take place.
**Note:** Assignees are not automatically granted access to the board. Only members can access the board.

Do one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add an assignee from the quick panel</td>
<td>1. Drag a user’s avatar from the quick panel directly to the task card.</td>
</tr>
<tr>
<td></td>
<td>2. Drop the avatar in the Primary or Additional drop zone.</td>
</tr>
<tr>
<td>Add an assignee from the card details</td>
<td>1. Open the card details for a task.</td>
</tr>
<tr>
<td></td>
<td>2. Click the assignees tab (👤).</td>
</tr>
<tr>
<td></td>
<td>3. Click Add Primary Assignee or Add Additional Assignee. The Add Primary Assignee option is not available if there is already a primary assignee.</td>
</tr>
<tr>
<td></td>
<td>4. Select a user.</td>
</tr>
<tr>
<td></td>
<td>5. Close the card detail pop-up window.</td>
</tr>
</tbody>
</table>

The system sends an email notification to inform the new assignee of the change.

**Visual Task Board checklists**

Checklists help you track the progress of tasks on your Visual Task Board.

Checklists are available as a tab in the card details.
Figure 712: Sample checklist

You can add, remove, or rearrange checklist items. You can also save a checklist as a template for future use on other cards. Any user can create or edit a checklist. When the compact card view is disabled, the task card displays a progress bar to show how many items are complete.
You can also use checklists with task records in the standard interface. For more information, see \textit{Checklists}.

\textbf{Create a checklist for a card}

You can create a unique checklist for each Visual Task Board card or create a task from a checklist item.

Role required: none

1. Open the card details for a task.
2. Click the checklist tab (\text{\includegraphics[width=7pt]{checklist}}).
3. Click Add Item.
4. Enter text for the checklist item.
5. Press the Enter key to add the checklist item.
6. Create as many additional checklist items as desired.
7. To delete a checklist item, click the minus (-) icon.
8. To reorder checklist items, click the drag icon (\text{\includegraphics[width=7pt]{drag}}) and drag a checklist item to a different position in the list.
9. To create a task from a checklist item:
   a) Point to a checklist item and click the create task icon (\text{\includegraphics[width=7pt]{create}}).
b) Select the type of task you want to create.
   An administrator can configure which task types are available.
   The new task record appears in a pop-up window. The short description is automatically populated with the checklist item text.

c) Fill in the form with additional detail as necessary.

d) Click Update.

Create checklist template
A template saves time by creating checklist items automatically. You can add, edit, or remove checklist items without impacting the template.

Role required: none

1. Open the card details for a task.
2. Click the checklist tab (✓).
3. Add items to the checklist that you want to save as part of the template.
4. Click the more icon (⋮).
   The more icon does not display unless you have added an item to the checklist, or if you have a pre-existing checklist template.
5. Select Save as Template.
6. In the dialog box, enter a descriptive template name to identify the checklist.
   When a user creates a checklist from a template, all templates are listed in alphabetical order and there is no way to filter which templates appear. To provide a better user experience, consider implementing a naming system for checklist templates. For example, include the name of the table or another identifier to clarify how the checklist should be used.
7. Click Save.

Create a checklist from a checklist template by selecting the template from the more icon.

Delete a checklist from a card
You can remove a checklist from a Visual Task Board card.

Role required: none

1. Open a task card that contains a checklist.
2. Click the checklist tab (✓).
3. Click the more icon (⋮).
4. Select Remove Checklist.
   A confirmation dialog box appears.
5. Click Delete.

Configure which types of tasks can be created from checklist items
A system property controls which types of tasks you can create from a Visual Task Board checklist item.

Role required: admin

You might want to add custom tables or remove tables you do not use.

1. Navigate to sys_properties.list.
2. Locate the glide.ui.create_task_type_option_list property.
3. Edit the Value to add or remove tables.

You can add any table that extends Task [task]. Use the table name, not the label. For example, you would enter change_request, not Change Request. Ensure the tables listed are separated by commas, with no spaces.

The property value populates the task type selection list users choose from when they create a task from a checklist item. Note that users can only see task types for which they have the appropriate access roles.

---

**Archive a card**

Archiving a card is a non-destructive way to remove a card from a freeform board. You can archive cards you are no longer working on to reduce visual clutter.

Role required: none

---

**Note:** You can only archive cards on a freeform board.

- Perform one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Archive one card from the lane view</td>
<td>1. Point to a card and click the X icon that appears in the corner.</td>
</tr>
<tr>
<td></td>
<td>2. In the confirmation dialog, click Archive.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Archive one card from the card details</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Click a card and view the Details tab.</td>
<td></td>
</tr>
<tr>
<td>2. Under Tools, click Archive.</td>
<td></td>
</tr>
<tr>
<td>3. In the confirmation dialog, click Confirm.</td>
<td></td>
</tr>
</tbody>
</table>
### Archive all the cards in a lane

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Archive all the cards in a lane**   | 1. In the lane header, click the more options icon ( ).  
                                           2. Select Archive All Tasks.  
                                           3. In the confirmation dialog, click Archive.                                                                                     |

- To see all archived cards for the current board, from the board navigation panel, open the board information menu ( ) and click View Archived Tasks.
- To restore an archived card, point to it and click Restore.

### Access a task record from a VTB card

You can open the form view of any task card. Viewing a task record on a form allows you to see all fields for that record, including fields that are not visible in the card details.

**Role required:** none

Access a task record using one of the following options.
- Access the record from the task card by clicking the record number on the task card.
- Access the record from the card details by doing the following:
  a) Open the card details for a task.  
  b) Click the record number in the header.

### Move a card to a different lane

You can move a card from one lane to another.

**Role required:** none

When you move a card to a different lane on a guided board, the field on which the lanes are based is updated to reflect the new lane value.

1. Open a Visual Task Board. 
2. Select a card and drag it to a different lane.  
   - To cancel the move, press the Escape key while you drag the card.

**Note:** All mandatory fields on a record must be filled in to move the associated card to a new lane. For example, assume you have a guided board based on the Incident [incident] table, with a lane for each State. The Close code and Close notes fields become mandatory when the State changes to Closed. If you attempt to move an incident card from the New lane to the Closed lane, a pop-up view of the form appears and prompts you to fill in the mandatory fields.

### Move a card to a different board

You can move a card from one freeform board to another.

1. Open the card details.  
2. In the details tab ( ), click Move Card.
3. In the pop-up window that appears, select the board and lane to move the card to. The board selection list displays freeform boards only.

Task board tools

The task board tools area in a Visual Task Board contains several tabs, each represented by an icon. Click an icon to open the tab. Click the same icon again to hide the tab. The tabs you see for each conversation depend on the conversation type and other conditions.

<table>
<thead>
<tr>
<th>Tab icon</th>
<th>Tab name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>📌</td>
<td>Info</td>
<td>Contains the following information about the task board: • Name • Board type • Table name and a link to open the table view (visible on data driven boards only) • Filter conditions (visible on data driven boards only) • Lane field (visible to the board owner, on data driven boards only) • Owner • Number of lanes • Number of cards • URL</td>
</tr>
<tr>
<td>🧑‍ %=</td>
<td>Members</td>
<td>Lists all members and assignees of the board. You can add or remove board members, promote assignees to be members, and filter the board by member or assignee.</td>
</tr>
<tr>
<td>🐠</td>
<td>Labels</td>
<td>Use labels to visually distinguish tasks on the task board. Filter board contents by toggling the label. You need to <strong>enable labels</strong> before being able to use this tab.</td>
</tr>
<tr>

<td>Activity</td>
<td>Displays all of the activity for cards on the board.</td>
</tr>
<tr>
<td>Tab icon</td>
<td>Tab name</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Configuration</td>
<td>Configure the settings for the task board. This setting is only available for the board owner. For more information, see <em>Configure a task board</em> on page 3194</td>
</tr>
</tbody>
</table>

View board information

You can display key information about any task board.

Role required: none
Open a task board.
Click the board information icon (i).

Add a board as a favorite
Add boards you access frequently to the application navigator using the favorite option.
Role required: none
Adding a board as a favorite is only available in UI16.

1. Navigate to Self Service Visual Task Boards.
2. From the board you want to favorite, select the information icon from the board tools. Then select the star.
3. Remove the board as a favorite by clearing the star icon.

View a task board in a list

You can view a task board in the list view using the board information option.

Role required: none

1. Open a task board.

2. From the task board tools, click the board information icon (i).

3. Click View List at the bottom of the information panel.

   The cards from the board open in the list view.

   **Note:** The freeform board list view only shows cards made by the board and no other tasks that might be added manually.

Add or remove a task board member

You can add and remove task board members using the members tab of the activity stream. You can also promote assignees to board members.

Role required: none

Only members of a task board can access the board. Any board member can add or remove other members.

1. On a Visual Task Board, open the task board tools.

2. Click the members tab.

3. Perform one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Add a member</strong></td>
<td></td>
</tr>
<tr>
<td>1. In the Users section, click Add Members.</td>
<td></td>
</tr>
<tr>
<td>2. Enter a user's name or select a user from the drop-down menu.</td>
<td></td>
</tr>
</tbody>
</table>

   | Remove a member             |             |
   | 1. In the Members section, point to a user. |             |
   | 2. Click the dash icon (-). |             |

   | Promote an assignee to a member |             |
   | 1. In the Assignees section, point to a user. |             |
   | 2. Click the upward arrow icon. |             |

   | Promote all assignees to members | In the Assignees section, click Promote All. |
Visual Task Board SLA indicators

SLA (service level agreement) indicators alert board members if any cards on the board have breached SLAs.

When SLA indicators are enabled, a status bar appears on each card that has an associated SLA. If any cards have breached SLAs, an alert appears at the top of the board and a filter option appears in the quick panel. The indicator displays the elapsed percentage of the SLA. If there are multiple SLAs associated with a task card, the indicator displays the status of the SLA with the greatest elapsed percentage.
Figure 7: Visual Task Board with SLA indicators enabled

Any board member can enable SLA indicators from the board configuration menu. The setting applies to the current user only.

**Share a Visual Task Board in a Connect conversation**

You can share a Visual Task Board in a Connect Chat or Connect Support conversation.

Role required: none

1. Navigate to **Self-Service Visual Task Boards**.
2. Drag a task board to a Connect mini window.

   A link to the task board appears in the conversation. The task board is also listed in the conversation tools, which are visible in the Connect workspace. Only conversation members who are members of the board can access it. If you share a task board in a *record conversation*, it appears as a URL in the record activity stream.

**Create a Connect conversation from a Visual Task Board**

Create a Connect Chat conversation from a Visual Task Board to collaborate with board members and keep track of activity as it happens.

Role required: none

When you create a conversation from a task board, all the board members become members of the conversation. The members are synchronized between the task board and the conversation. For example, if you remove a user from the conversation, the system automatically removes the user from the board as well.

1. Navigate to **Self-Service Visual Task Boards**.
2. Open a task board.
3. In the board header, click the connect with board members icon ( ).

   The system automatically opens a record conversation for the board. Each board member becomes a member of the conversation.

**Visual Task Board accessibility**

Several accessibility improvements are included in Visual Task Boards.

**Skip links**

Skip links allow you to tab directly to the main content on a page. When *accessibility mode is enabled*, task boards include a skip link to view tasks as a list. The View tasks as a list skip link switches all the task cards to the table view. For more information on viewing task boards in a list view, see **View a task board in a list** on page 3190.

**View card details**

With accessibility mode enabled, visual indicators appear on task cards that users can tab to in order to open card details. For more information, see **View card details in a task board** on page 3194.
View card details in a task board

With accessibility mode enabled, tab through cards in a task board. Use the card details button to view task card details.

Enable accessibility from the General tab of the system settings menu.

Role required: none

2. Open an existing task board.
3. Tab through the board to get to a task card.
4. Tab through the card until the Open Card Details button appears.

![Card details](image)

Figure 716: Card details

5. Press Enter to open the card.
6. To exit the card, press Escape.

Configure a task board

The board configuration menu provides several options that affect the look and feel of the board.

Role required: none
Task board setting changes are personal unless otherwise stated.

1. From the task board tools, click the menu icon ( ).
2. Click Advanced Settings, then from the Board Color section, select a background color from the palette.
   The background color surrounds the lane area of a board. It also appears as the color for the board on the My Task Boards page. Changes to the background color apply to all users.
3. In the Quick Panel section, toggle quick panel options as necessary.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show Panel</td>
<td>Shows the quick panel is visible. This setting applies to the current user only.</td>
</tr>
<tr>
<td>User Names</td>
<td>When enabled, user names appear by user avatars in the quick panel. This setting applies to the current user only.</td>
</tr>
<tr>
<td>Show Labels</td>
<td>When enabled, labels appear on cards and in the quick panel. This setting applies to all users.</td>
</tr>
<tr>
<td>Label Names</td>
<td>When enabled, the label name appears beside the colored icon for that label in the quick panel. This setting applies to the current user only and is available only when Show Labels is enabled.</td>
</tr>
</tbody>
</table>

When all the options are enabled, a quick panel looks like this:

![Quick panel](image)

4. In the Configure Cards section, toggle card options as necessary.
   Changes to the cards apply to the current user only.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compact Cards</td>
<td>Decreases the lane width and card information and thumbnails do not appear on the card.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Show Card Info</td>
<td>Card information that appears on each card. Card information typically includes details like the task state, date opened, and last user to update it. This setting is available only when Compact Cards is disabled.</td>
</tr>
<tr>
<td>Show Card Attachment</td>
<td>Cards display the first image attached to that card as a thumbnail. This setting is available only when Compact Cards is disabled.</td>
</tr>
<tr>
<td>Show SLAs</td>
<td>SLA status indicators appear on cards and alerts appear when one or more card has a breached SLA. SLA status indicators are hidden when Compact Cards is enabled. This setting is available only when there are SLAs associated with the tasks on the board.</td>
</tr>
</tbody>
</table>

5. Under Advanced Settings, in the Lane Configuration section, show or hide lanes by selecting or clearing the check box for each lane. Rearrange lanes by dragging and dropping them in the list.

Configuring Visual Task Board labels

Labels help categorize tasks and visually distinguish them on the task board. You can disable or rename labels using the labels tab of the activity stream.

Role required: none

You can use up to seven labels per board. Any board member can edit the labels on a board.

1. From the task board tools, click the labels tab.
2. Click the labels tab.
3. Toggle the Show Labels switch to the enabled position if it is not already enabled.
4. To change a label name, click the label text and enter a new value.
5. To disable or enable a specific label, toggle the switch by the label.

When a label is disabled, members cannot add that label to cards on the board. The label is hidden on cards that are already labeled.

Modify the query or lane field for an existing board

For flexible and guided boards, you can edit the board query or lane field. This ability enables you to change the board contents while preserving the member list, board configuration settings, and, if applicable, Connect Chat conversation history.
Inform the board members that you plan to change the board query or lane field. If you or any members have manually sorted cards within a lane, the order may be reset.

Role required: none but you must be the board owner

The board query consists of filter conditions that determine which tasks the board tracks. For example, you might edit the query so the board shows only active incidents, rather than all incidents.

The lane field is the field on the underlying table that defines the lanes. For example, you might change the lane field so the lanes represent incident states, rather than assignees. This change is called a lane field pivot. Lane field pivots also make it possible to convert a flexible board to a guided board or vice versa.

1. Open a task board.
2. Click the board information icon (i) by the board name.
3. Perform one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Edit the board query    | 1. Under Board Filter, click Edit Filter to open the condition builder.  
                            2. Add and remove conditions as needed to edit the query.  
                            3. Click Save. |
| Change the lane field   | 1. Click the Lane Field picker and select a field or the None option.  
                            Guided boards have the Lane Field set to a field, such as State. Flexible boards have the Lane Field set to None. You can change the Lane Field value accordingly to change the board type.  
                            2. In the confirmation dialog, click OK. |

The board reloads to reflect the changes.

Configure the card limit for freeform boards

Freeform boards can display up to 2,000 cards by default. You can change the default card limit by adding a property.

Role required: admin

1. Add a new system property with the following field values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.vtb.freeform_max</td>
</tr>
<tr>
<td>Type</td>
<td>integer</td>
</tr>
</tbody>
</table>

2. Set the Value to the maximum number of cards allowed for each freeform board.
Configure the card limit for flexible and guided boards

Flexible and guided boards can display up to 2,000 cards by default. You can change the default card limit by adding a property.

Role required: admin

1. **Add a new system property** with the following field values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.vtb.board_max</td>
</tr>
<tr>
<td>Type</td>
<td>integer</td>
</tr>
</tbody>
</table>

2. Set the Value to the maximum number of cards allowed for each flexible or guided board.

   *Note: Performance degradation may occur if you set the Value to a number greater than 1,000, especially on tablet devices.*

Configure the task board card view

Configure the fields that appear in a card on a task board.

Role required: admin

1. Navigate to the form you want to configure fields for.
2. Right-click the header and select Configure Form Layout.
3. Under the Form View section, select the VTB view.

   You may need to create a VTB view for the form. For more information, see *Create and delete views.*
4. Select the fields to appear on the card by adding or removing the fields from the Selected column. You can also adjust the order they appear on the form by moving the fields up or down.

Workflow

Workflow provides a drag-and-drop interface for automating multi-step processes across the platform. Each workflow consists of a sequence of activities, such as generating records, notifying users of pending approvals, or running scripts. The graphical Workflow Editor represents workflows visually as a type of flowchart. It shows activities as boxes labeled with information about that activity and transitions from one activity to the next as lines connecting the boxes.

Getting started with workflows

The graphical Workflow Editor provides a drag-and-drop interface for automating multi-step processes across the platform.

Each workflow consists of a sequence of activities, such as generating records, notifying users of pending approvals, or running scripts.

The workflow starts when a triggering event occurs. Common triggers include a record being inserted into a specific table, or a particular field in a table being set to a specified value. For example, you might create a workflow that runs whenever a user requests approval for an item they want to order from the catalog.

When an activity completes, the workflow transitions to next activity. An activity might have several different possible transitions to various activities, depending on the outcome of the activity. Continuing the example above, if the user's request is approved, the activity might transition to an activity that notifies someone to order the item; if the user's request is denied, the activity might transition to notifying the user that their request has been denied.

The graphical Workflow Editor represents workflows visually as a type of flowchart. It shows activities as boxes labelled with information about that activity and transitions from one activity to the next as lines connecting the boxes.

At each step in a workflow:

1. An activity is processed and an action defined by that activity occurs.
2. At the completion of an action by an activity, the workflow checks the activity's conditions.
3. For each matching condition, the workflow follows the transition to the next activity.

When the workflow runs out of activities, the workflow is complete.

Workflow activities

A workflow activity contains instructions that are processed by the workflow.

Activities can include running scripts, manipulating records, waiting for a set period of time, or logging an event. Workflow conditions determine whether or not the activity is performed. Activities can be added, removed, or rearranged. Transitions can be drawn between activities.

This is an activity that triggers a notification:
Figure 717: Sample activity

For more information on available activities and their behaviors, see *Workflow activities* on page 3367.

**Transitions**

After the workflow condition is evaluated, the workflow transition determines which activity is performed when the workflow condition is met.

This is a transition that always leads from the Change Approved script to the Change Task activity:

Figure 718: Sample transition

**Exit conditions**

After a workflow activity is performed, the workflow condition is evaluated to determine which transition is activated.

The condition determines behavior based on a change being approved or rejected:
Workflow example

During workflow editing or while an unpublished workflow is running, only the person who checked out the workflow can view the changes.

After a workflow is published, it is available to other users. The workflow moves through the process as defined in the Workflow Editor. The entire workflow is represented in one screen. For example, this is the Standard Change workflow:
Figure 720: Sample change workflow

Workflow editor

The Workflow Editor is an interface for creating and modifying workflows by arranging and connecting activities to drive processes.

You can manage multiple workflows in the same screen, create custom workflow activities, and use existing activities as data sources. Users with the workflow_creator role can create workflows. Users with the workflow_admin role can create, modify, delete, and publish workflows.

To open the Workflow Editor, navigate to Workflow Workflow Editor. For information about using the editor, see Create a workflow on page 3222.
Welcome screen

The editor opens with the Welcome page, which displays a list of active, published workflows. From this tab, you can open existing workflows, create new workflows, and open help resources related to workflow.
Click to create a new workflow

New

Workflows: Workflow activities and workflows you can use as subflows.
Core: Available workflow activities appropriate for the selected workflow. Contents can include activities provided by the base system and those purchased with orchestration.
Packs: Orchestration activity packs downloaded from the ServiceNow® App Store, organized by vendor and scope. Custom activities and workflows that you scope also appear as packs. Only visible if the orchestration plugin is installed.
Custom: Orchestration custom activities available. Only visible if the orchestration plugin is installed.
Data: Activities in the current workflow that output data. You can use these activities as data sources for other activities. Only visible if the orchestration plugin is installed.

Note: If your workflow welcome page does not look like this example, you may have customized the workflow welcome page before upgrading to London. You can update the workflow welcome page to the latest version by editing the UI pages.

Navigate to System UI UI Pages Workflow Editor welcome. In the UI page record for workflow_editor_welcome, scroll to the Versions related list. Select the row for the version corresponding to the upgrade to London, right-click and select Revert to this version.

Workflow canvas

After you open or create a new workflow, the system displays the workflow canvas. On the canvas you interact with the Workflow Editor through several different elements: the canvas itself, the canvas tabs, the title bar, the palette, and the palette tabs.

The drawing canvas is where you add activities and configure transitions for checked out workflows. Add an activity by dragging it from the palette to the workflow in the canvas. For more information, see Create a workflow on page 3222.

- Canvas tabs: Contains tabs for accessing workflows being edited or created.
- Title bar: Displays the workflow name and status. Provides a menu and controls for configuring, testing, and validating workflows.
- Canvas: Provides the working surface for creating new workflows or editing existing ones.
- Palette tabs: Contains tabs for accessing activities being edited or created.
- Palette: Contains all available workflow activities and existing workflows you can use as subflows. Drag activities and subflows to the canvas to create new workflows or edit existing ones.
The default workflow palette contains workflow activities and existing workflows you can use as subflows. The basic workflow palette contains these tabs:

- **Workflows**: Displays existing workflows and provides controls for creating new ones.
- **Core**: Displays baseline workflow activities available to all systems and Orchestration activities (when Orchestration is activated).
Workflows tab

The Workflows tab lists existing workflows that you can edit or use as subflows in other workflows. Double-click a workflow to open it in the canvas. To add a workflow as a subflow, drag it to another workflow in the canvas. Click the + icon to create a new workflow.

Core tab

The Core tab contains the standard activities available by default to all workflows and any activities purchased with Orchestration, organized by category. Click the arrow icons to expand or collapse the activity lists under each category. To add an activity to a workflow, drag it to the canvas. For more information, see Add an activity to a workflow on page 3456.
Workflow editor title bar

When a workflow is opened in the canvas, the title bar displays the workflow title and the workflow status in italics. Possible states are Checked out by <name> and Published.
Figure 724: Workflow editor title bar

Controls on the right side of the title bar manage the workflow.

- **Workflow Properties**: Opens the current workflow's properties form.
- **Start**: Runs the workflow. This control is only available for workflows running on the Global table that are accessible from all application scopes. To test workflows that are on other tables, insert a record into that table that meets the condition of the workflow.
- **Validate**: Tests the workflow prior to publication. Validation detects potential problems that can prevent the workflow from publishing or cause the workflow to fail. For more information, see *Workflow Validation*.
- **Help**: Opens documentation to help you create the workflow.

**Workflow menu**

Click the menu icon in the title bar for additional options to configure the workflow.
Figure 725: Accessing the workflow menu

These menu options are available:

**Workflow editor keyboard navigation**

The platform includes accessibility features that support [Web Content Accessibility Guidelines (WCAG) 2.0 level A](https://www.w3.org/WAI/standards-guidelines/wcag/) and make the interface accessible to users with disabilities.

These features improve the user experience when accessing platform functions with screen readers and keyboard navigation. In general, you use the following set of standard keyboard navigation functions:

- Press Tab to navigate major groupings in a pre-defined sequence. This usually includes moving between standard interface controls (fields and lists) in a module, or between records within a tab.
  - Press Shift Tab to move backwards in a pre-defined sequence.
- Use arrow keys (left, right, up, down) to navigate between individual elements within a group. This usually includes moving between tabs, or between available selections within a specific control (for example, within a list).
• Press Enter to select a control or tab, or enter text within a control.

The Workflow Editor is constructed in a unique manner. It includes a series of main (left) panel tabs, a series of side (right) panel tabs, and a drawing canvas for workflow creation or editing. As such, it has its own unique set of keyboard accessibility functions and commands.

Welcome page keyboard commands

Use keyboard commands to navigate and operate the Workflow Editor Welcome page.
<table>
<thead>
<tr>
<th>Task or Action</th>
<th>Keyboard Commands</th>
</tr>
</thead>
</table>
| Navigate to main content (left) panel, and select a workflow | 1. After accessing the Workflow Editor from a menu, press Tab. 
   
   **Skip to Main Content**

   appears in the upper left corner.

   2. Press Enter to position the cursor in the first record displayed in the Published tab.

   3. Press Tab to navigate down the listing of workflow records.

   Press Enter to select and open a workflow record in the Workflow drawing canvas. |

| Select a checked out workflow or a help function in main content panel | 1. After accessing the Workflow Editor from a menu, press Tab until the Published tab is highlighted.

   **Note:** Do not select or .

   2. Press the right or left arrow keys to navigate between the Published, Checked Out, or Help tabs.

   3. Press Tab to navigate across the columns and down the listing of checked out workflow records or help selections.

   Press Enter to select and open a checked out workflow record in the Workflow drawing canvas, or open a help selection (work or orchestration videos, documentation, community discussions, knowledge base, or live feed). |

| Create a workflow | 1. After accessing the Workflow Editor from a menu, press Tab until **New Workflow** is highlighted.

   2. Press Enter to open **New Workflow** |
<table>
<thead>
<tr>
<th>Task or Action</th>
<th>Keyboard Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>Jump to Top</td>
<td>After tabbing through the displayed records in a tab in the main panel (for example, within the Published tab), a “Jump to top” button appears at the bottom of the listing. Press Enter to return to the Welcome tab at the top of the Workflow Editor.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| Navigate to page selection controls | 1. After tabbing through the displayed records in a tab in the main panel (for example, within the Published tab), including press Tab to access the page selection controls. Continue to press Tab until you access the desired one.  

2. Press Enter to operate the selected page control. |
<table>
<thead>
<tr>
<th>Task or Action</th>
<th>Keyboard Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>Navigate directly to side (right) panel to open help, create a new workflow, or open an existing one</td>
<td>1. After accessing the Workflow Editor from a menu, press Tab two times. Do not select appears in the upper left corner.</td>
</tr>
<tr>
<td></td>
<td>2. Press Enter to position the cursor in the Workflows tab in the side panel.</td>
</tr>
<tr>
<td></td>
<td>3. To open help, press Tab to navigate to Press Enter to open help, or press Tab to skip.</td>
</tr>
<tr>
<td></td>
<td>4. To create a new workflow, press Tab to navigate to Press Enter to open New Workflow, or press Tab to skip.</td>
</tr>
<tr>
<td></td>
<td>5. To open an existing workflow:</td>
</tr>
<tr>
<td></td>
<td>• As needed, stop at the filter field to filter workflows.</td>
</tr>
<tr>
<td></td>
<td>• Press Tab to navigate down the workflow list.</td>
</tr>
<tr>
<td></td>
<td>• Press Enter to select and open a workflow record in the Workflow drawing canvas,</td>
</tr>
<tr>
<td>Task or Action</td>
<td>Keyboard Commands</td>
</tr>
<tr>
<td>----------------</td>
<td>-------------------</td>
</tr>
<tr>
<td>Add a core activity to a checked out workflow in the Workflow drawing canvas</td>
<td>If a checked out workflow is open in the Workflow drawing canvas, core activity records display in the Core tab. To select a core activity and place it in the checked out workflow:</td>
</tr>
</tbody>
</table>

**Note:** Core activity records only display when a checked out workflow is open in the Workflow drawing canvas. Other tabs display in the side panel only if Orchestration functions are enabled.

1. In the Workflow drawing canvas, press Shift Tab until appears in the upper left corner.
2. Press Enter to position the cursor in the Workflows tab in the side panel.
3. Press the right arrow key to navigate to the Core tab.
4. Press Tab or the down arrow key to navigate down the listing of core activities.
   - To open a core activities folder (for example, Approvals), press the right arrow key.
   - To navigate up the list, press the left or up arrow keys.
5. Press Tab to select a core activity and open the New Activity dialog to specify properties for it.
6. After creating the activity, remember to link it to another activity in the workflow. See Create a connection from a condition on one activity to the next activity that follows in *Workflow drawing canvas keyboard commands* on page 3217.

---

**Workflow drawing canvas keyboard commands**

Use keyboard commands to navigate and operate the Workflow Editor canvas.
### Task or Action
Select Workflow Actions menu command (for example, Validate Workflow or Publish Workflow)

### Keyboard Commands
1. Press Tab until the context menu is highlighted.
2. Press Enter to open the context menu.
3. Use the down arrow key to move to the command, then press Enter to select it.
<table>
<thead>
<tr>
<th>Task or Action</th>
<th>Keyboard Commands</th>
</tr>
</thead>
</table>
| Set general workflow properties             | 1. Press Tab until 

is highlighted.  

2. Press Enter to open Workflow Properties. |

| Navigate from activity box to activity box. | Simply press Tab or use the arrow keys (right, left, up and down) to navigate from activity to activity within the workflow. |

**Note:** Depending on the complexity and number of activity boxes in the workflow, the sequence of navigation is not always predictable. Depending on how you are navigating within the workflow, the navigation sequence is generally (but not always) row-by-row, and focus is usually placed on the nearest activity box.
<table>
<thead>
<tr>
<th>Task or Action</th>
<th>Keyboard Commands</th>
</tr>
</thead>
</table>
| Modify a selected activity.    | 1. Navigate to the activity box, then press Enter to select it and place it in Edit mode. When you select an activity box, it appears as highlighted.  
2. Once in Edit mode, use Tab to move around within the activity box to change or access elements such as:  
   • Activity Properties  
     - Title  
     - Node context menu  
     - Delete Node  
     - Condition Properties  
   • Condition Properties  
     - Condition Properties  
     - Node conditional context menu  
     - Node conditional port options  
   3. Press Enter to select an element, or press Esc to escape an element without making changes. |
| Add a condition to an activity. | 1. Within an activity box, select Always to access Condition Properties.  
2. In Condition Properties, specify the conditions for the activity. |
<table>
<thead>
<tr>
<th>Task or Action</th>
<th>Keyboard Commands</th>
</tr>
</thead>
</table>
| Create a connection from a condition on one activity to the next activity that follows | 1. Within an activity box, select Node conditional context menu.  
2. Select Link to... to create a connection to the next activity box that follows, or select Delete to delete an existing connection.                                                                                                                                                                                                                                        |
| Add a core or custom activity                                                 | 1. Within an activity box, select Node conditional port options.  
2. Select Add Core Activity to access Workflow Activity Definitions to add a new core activity, or select Add Custom Activity to add a custom activity to the workflow.                                                                                                                                                                                                                     |
| Move an activity box                                                          | 1. Press Tab to navigate to the activity box, enter press Enter to select it.  
2. Use the arrow keys to move the activity box. To move the activity box one pixel at a time, press Shift while using the arrow keys.                                                                                                                                                                                                                  |
| Validate a workflow                                                           | 1. Press Tab until ✔️ is highlighted.  
2. Press Enter to validate the workflow.  
You can also select Validate from the Workflow Actions menu.                                                                                                                                                                                                                                                                                            |
| Run a workflow                                                                | 1. Press Tab until ⏯️ is highlighted.  
2. Press Enter to run the workflow.                                                                                                                                                                                                                                                                                                                                                          |

**Note:** If the workflow is tied to a database table, this function is disabled. The workflow runs when the proper table conditions are activated (for example, insertion of a new record into the table).
<table>
<thead>
<tr>
<th>Task or Action</th>
<th>Keyboard Commands</th>
</tr>
</thead>
</table>
| Close workflow drawing canvas | 1. Press Tab until (on the right side of the tab that contains the name of the workflow) appears.  
2. Press Enter to close the canvas. |
| Publish a workflow          | 1. Press Tab until the context menu is highlighted.  
2. Press Enter to open the context menu.  
3. Use the down arrow key to move to the Publish command, then press Enter to select it. |
| Jump to Top                 | After tabbing through the entire workflow, appears at the bottom of the listing. Press Enter to jump to the top of the Workflow drawing canvas. |

**Workflow management**

Create, edit, validate, and publish workflows to automate multi-step processes across the platform. Understand workflow activities and variables and how to use them effectively. Take a deeper look at how workflows are constructed, validated, and used.

**Create a workflow**

Automate a multi-step process by creating a workflow with the Workflow Editor.

- You must have the workflow_admin or workflow_creator role to use the Workflow Editor.
- If you are designing the workflow as part of an update set process, see *Workflow movement with update sets* on page 3337 before creating the workflow.

1. Navigate to Workflow Workflow Editor.  
The Welcome tab of the Workflow Editor opens.  
2. On the Workflows tab in the palette, click New Workflow.
<table>
<thead>
<tr>
<th>Workflow Name</th>
<th>Type</th>
<th>Description</th>

</tbody>
</table>
A simplified version of the New Workflow form opens.

3. Fill in the Name and Table fields

4. [Optional] Add a Description.

5. [Optional] Do one of the following:
   a) If the Conditions UI section is displayed, specify a Condition if needed and edit the fields.
   (The Conditions UI section shows only if the selected table supports conditions for launching workflows. For example, if you select the sc_req_item table, conditions are not applicable and the Conditions UI section is not displayed.)
   b) If the Stages UI section is displayed, check that the State rendering and Stage order fields contain the correct information. (The Stages UI section shows only if the selected table supports stages. For example, if you select the sc_req_item table, the Stages UI section is displayed.)

6. Click Submit.

   The new workflow is created with the Begin and End activities connected by a single transition.

7. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users.
   For more information, see Work on workflows on page 3236.

8. To change advanced settings for the workflow, click the Properties icon ⚙️. If you make changes, click Update.

Workflow properties

In the properties of a workflow, you can configure settings such as its application scope, start conditions, schedule, inputs, stages, and run time metrics. You can also view information such as the workflow author, version, and history.

When you create a new workflow, the following fields are available in the dialog box:

- Name
- Table
- Description
- If condition matches
- Condition

If you click Diagrammer view, in Related Lists, the following UI sections are available in the dialog box:

- General
• Conditions
• Inputs
• Activities
• Application
• Schedule
• Stages
• Estimated Runtime

General

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A name to identify the workflow.</td>
</tr>
<tr>
<td>Table</td>
<td>The table for the workflow to run on. Workflows that run on specific tables can still interact with other tables. Select Global [global] to run the workflow on all tables.</td>
</tr>
<tr>
<td>Checked out</td>
<td>[Read-only] When the workflow was checked out. Automatically set by the Checkout action in the workflow menu.</td>
</tr>
<tr>
<td>Checked out by</td>
<td>[Read-only] The user who has this workflow checked out. This value is automatically set by the Checkout action in the workflow menu.</td>
</tr>
<tr>
<td>Published</td>
<td>[Read-only] Check box to indicate whether the workflow has been published. Automatically set by the Publish action in the workflow menu.</td>
</tr>
<tr>
<td>Description</td>
<td>The purpose of the workflow.</td>
</tr>
</tbody>
</table>

Conditions

Create conditions to trigger the workflow. The Conditions section does not appear if you select a table, such as sc_req_item, that does not require a condition.
### If condition matches

When the condition evaluates to true, the workflow launches an active context:

- **None**: The workflow is not automatically started by the workflow engine. To run this workflow, write a script to start the workflow.
- **Run the Workflow**: The default value. The workflow engine starts the workflow if the information in the Condition field matches a record that is inserting into the table.
- **Run if no other workflows match yet** (deprecated): The workflow only runs if no other workflows are running on the execution thread that started this workflow. Avoid using.
- **Run if no other workflows matched**: The workflow only runs if no other workflows are running on a specific record. For example, there are four workflows inserted into the Incident table, which have a condition such as `short_desc contains test`. A new workflow, which has If condition matches set to Run if no other workflows match yet, only runs if none of the four workflows have started running on the Incident record.

### Condition

A condition builder for specifying workflow conditions that trigger the behavior selected from the If condition matches list.

### Order

Numeric value that determines the order of the workflow, relative to other workflows. Workflows are evaluated in order from the lowest order number to the highest. A workflow runs if it is the first to match conditions.

### Inputs

The Inputs section lists all the activities in the current workflow that input data, the data type, and the default value. The Inputs section is only available after a workflow has been created. To create a variable, click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Displayed column label. Localized depending on user locale.</td>
</tr>
<tr>
<td>Reference</td>
<td>Input field from another table.</td>
</tr>
<tr>
<td>Type</td>
<td>Data type. For example, integer or string.</td>
</tr>
<tr>
<td>Default value</td>
<td>Value used if you do not provide a value.</td>
</tr>
</tbody>
</table>
Activities

The Activities section enables you to set activity pinning and maximum activity count.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activity pinning</td>
<td>List of options that control updates to custom activities at the workflow level. Pinning protects custom activities from being updated automatically when downloaded from the ServiceNow Store. For more information, see Workflow activity pinning on page 3471. The possible options are:</td>
</tr>
<tr>
<td></td>
<td>• Set by activity: Allows all activities in the workflow to use their own pinning settings. This is the default pinning option.</td>
</tr>
<tr>
<td></td>
<td>• Pin all activities: Pins all activities in the workflow to their current version.</td>
</tr>
<tr>
<td></td>
<td>• Unpin all activities: Allows all activities in the workflow to be updated.</td>
</tr>
<tr>
<td>Max activity count</td>
<td>The maximum number of activities performed by the workflow. This value is used to prevent infinite loops and is set to 100 by default. When the stated maximum count is reached, the workflow is canceled. If this field is blank, the maximum count is set to -1, and the workflow is canceled.</td>
</tr>
</tbody>
</table>

Application

The Application section enables you to see application scope and scope restrictions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>[Read-only] Scope of this activity. For more information, see Application Scope.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Scope restrictions for this workflow. Possible settings are:</td>
</tr>
<tr>
<td></td>
<td>• All application scopes: Workflow is accessible to all application scopes.</td>
</tr>
<tr>
<td></td>
<td>• This application scope only: Workflow access is limited to the scope named in the Application field.</td>
</tr>
<tr>
<td></td>
<td>For more information see Workflow scope on page 3319.</td>
</tr>
</tbody>
</table>
### Schedule

Use the Schedule section to create a schedule for this workflow using the schedule builder.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delivery based on</td>
<td>The schedule type for this workflow. Possible types are:</td>
</tr>
<tr>
<td></td>
<td>• User-specified duration: Duration based on a user-specified value. This is the default schedule type.</td>
</tr>
<tr>
<td></td>
<td>• Relative duration: Duration calculated from a preconfigured schedule, such as 8-5 weekdays.</td>
</tr>
<tr>
<td>Expected time</td>
<td>User-defined interval. This field is visible when the schedule type is User-specified duration.</td>
</tr>
<tr>
<td>Schedule</td>
<td>Preconfigured schedule that determines when this workflow runs.</td>
</tr>
<tr>
<td>Timezone</td>
<td>Time zone for this instance.</td>
</tr>
</tbody>
</table>

### Stages

The Stages section appears if you select a table with Type = Workflow.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stage</td>
<td>Displays the workflow stage progress on the selected table. Optionally, select Stage rendering and Stage orderschemes to customize the appearance of the stage field. The default values cover typical scenarios.</td>
</tr>
<tr>
<td>Stage rendering</td>
<td>The renderer to use when displaying stage icons on a form or list view. For more information about renderers, see Workflow stage renderers on page 3289.</td>
</tr>
<tr>
<td>Stage order</td>
<td>The order of workflow stages when you view a workflow field in a list. Select Computed to let the workflow engine compute the stage order from the order of execution in the workflow. Select User Specified to use the Order field from that Workflow stages on page 3273.</td>
</tr>
<tr>
<td>Name</td>
<td>The name of the stage as it appears in workflow fields.</td>
</tr>
<tr>
<td>Duration</td>
<td>Time allocated for the specific stage.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Order</td>
<td>The order of workflow stages when you view a workflow field in a list. Select Computed to let the workflow engine compute the stage order from the order of execution in the workflow. Select User Specified to use the Order field from that Workflow stages on page 3273.</td>
</tr>
<tr>
<td>Value</td>
<td>The value of the stage when it is referenced from elsewhere in the system, such as in a script.</td>
</tr>
</tbody>
</table>

**Estimated Runtime**

The Estimated Runtime section opens the controls for configuring the ERT for the workflow. Core workflows included in the base system are not configured for estimated run time by default. All new workflows are configured with default ERT values automatically. You can edit existing run time estimates or configure new ones for any existing workflow. For details about how estimated run times are configured and calculated, see Workflow run time metrics on page 3354.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requires ERT</td>
<td>Check box to indicate that this workflow requires an estimated runtime configuration. You can use the ERT calculations to determine if workflows are running longer or shorter than expected and to identify errors in workflow processing. By default, new workflows require an ERT.</td>
</tr>
<tr>
<td>Estimated Run Time</td>
<td>The initial estimate for the workflow's run time.</td>
</tr>
<tr>
<td>Number of data points</td>
<td>[Read only] The number of times the system has compared the estimated run time to an actual run time result.</td>
</tr>
<tr>
<td>Outlier Percentage Threshold for ERT</td>
<td>[Required] The percentage deviation from the estimated run time that identifies an outlier workflow run time. The system uses a default value of 20. For more information, see Outlying workflow run times on page 3355.</td>
</tr>
</tbody>
</table>

**Create a workflow from a table**

Automate a multi-step process by creating a workflow from the list view of any table that supports workflows.

- If you are designing the workflow as part of an update set process, see Workflow movement with update sets on page 3337 before creating the workflow.

1. Open a table, such as Incident or Problem, in list view. For example, navigate to Incident > Open.
2. Right-click in the column header and select Configure > Workflows.
The Workflow Versions on that table appear in a list.

3. Click New.
   The Workflow Version opens in New Workflow view. The Table field is filled in with the table you selected in step 1 and is read-only.

4. Enter Name.
5. [Optional] Enter Description.
6. [Optional] Edit conditions fields as necessary.
7. Click Submit.
   The new workflow is added to the Workflow Versions list.
8. Click the workflow Name.
   The new workflow is created with the Begin and End activities connected by a single transition.
9. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users.
   For more information, see Work on workflows on page 3236.

10. [Optional] To change advanced settings for the workflow, click the Properties icon. If you make changes, click Update.

Create a workflow for a new service catalog item

When you create a new service catalog item, you can create a new corresponding workflow at the same time.

- If you are designing the workflow as part of an update set process, see Workflow movement with update sets on page 3337 before creating the workflow.

1. Navigate to Service Catalog Catalog Definitions Maintain Items.
2. At the top of the form, next to Catalog Items, click New.

   The Catalog Item form opens.

3. Add a Name.
4. Next to the Workflow field, click the lookup icon.
5. Next to Workflow at the top, click New.
The Workflow version dialog opens in the New Workflow View. The Table field is set to Requested Item (sc_req_item) and is read-only.

6. Add a Name.
7. [Optional] Add a Description.
8. [Optional] Change the stage information as necessary.
9. Click Submit.
The new workflow is created with the Begin and End activities connected by a single transition.

10. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users.  
   For more information, see Work on workflows on page 3236.
11. To change advanced settings for the workflow, click the Properties icon.
12. Click Update.
   If you close the Workflow Editor, you can see the Catalog Item record. Note that the workflow is added to the Workflow field. The Show Workflow and Information icons appear next to the Workflow field. Hover over the information icon to view a read-only summary of the workflow.

Create a workflow for an SLA Definition

Automate a multi-step process by creating a workflow from an SLA definition.

- If you are designing the workflow as part of an update set process, see Workflow movement with update sets on page 3337 before creating the workflow.

1. Open a list of SLA definitions. For example Facilities > SLA Definitions or Service Level Management > SLA Definitions.
2. At the top of the form, next to SLA Definitions, click New.
3. Select Contract SLA or Service Offering SLA.
   The SLA Definition or Service Offering SLA form opens.
4. Next to the Workflow field, click the lookup icon.
5. Next to Workflow at the top, click New.
The Workflow Version dialog shows in the New Workflow view. The Table field is set to SLA Definition (contract_sla) or Service Offering SLA (service_offering_sla) and is read-only.

6. Enter Name.
7. [Optional] Enter Description
8. [Optional] Edit conditions fields as necessary.
9. Click Submit.
   The new workflow is created with the Begin and End activities connected by a single transition.
10. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users.
   For more information, see Work on workflows on page 3236.

11. [Optional] To change advanced settings for the workflow, click the Properties icon. If you make changes, click Update.

Ending workflows with multiple branches

A workflow is complete when it reaches the End activity, even if there are still active branches of the workflow in progress. To ensure that both branches are completed, add a Join activity to resolve the branches.

For example, the following figure shows a workflow with two branches that execute independently. When Task 1 and Task 2 of Branch B are completed, the workflow is marked complete even if the Branch A tasks are not completed.

Figure 726: Workflow with uncompleted branch

For both branches to complete, add a Join activity to resolve the branches. When one branch reaches the join, the workflow waits for the other branch. When both branches are complete, the workflow reaches the end. The Incomplete condition of the a Join activity is met only if one of the branches cannot be completed.
Work on workflows

To complete a workflow, you add workflow activities, validate the workflow, and publish it.

Add a workflow activity

Activities determine the functionality of the workflow.
Role required: workflow_admin, workflow_creator, or admin
When they are created, all workflows contain Start and End activities.
For more information, see Workflow activities on page 3367.
1. Open a workflow.
2. Check out the workflow.
3. Drag a workflow activity from the Activities menu into the workflow body.
4. Populate the Workflow Activity form that appears.

Validate a workflow

You can manually validate a workflow from the Workflow Editor. You can generate a workflow validation report from the Workflow Version form.
Role required: workflow_admin, workflow_creator, or admin
Running a workflow on a new node automatically attempts to validate the workflow. If validation is successful, the system updates the workflow version record to indicate the workflow has been validated and marks the record as updated by the user who ran the workflow.
1. Open the workflow to validate in the Workflow Editor.
   When the workflow is loaded, the workflow validator icon appears in the toolbar.
2. Click the validator icon to run a series of validation tests on the current workflow version and generate a report.

3. Complete the following steps to generate a workflow validation report from the Workflow Version form:
   a) Navigate to Workflow Administration Workflow Versions, and select a workflow to validate.
   b) Under Related Links, click Validate Workflow.

Publish a workflow

When a workflow is complete, publish the workflow so that it is available to all users.

Before you publish a workflow, validate it to test it for issues that might cause it to fail, such as missing subflows or disconnected transitions. For more information, see Workflow validation on page 3294.

Role required: workflow_admin, workflow_creator, or admin
To publish a workflow:

1. Navigate to Workflow Workflow Editor.
2. Open the workflow that you want to publish.
3. In the title bar, click the menu icon and select Publish.

If you published a new version of workflow, the changes are not applied to running workflow contexts. Any currently running workflow context continues using the workflow version that was available when the workflow started. The next time the workflow runs, it uses the new version.

Determine whether a workflow can run

A workflow can run only if a checked out version is available to the user who has it checked out, and a valid, published version is available for all users with permission to run it.

Role required: workflow_admin, workflow_creator, or admin

1. In the navigation filter, enter wf_workflow.list, and then open one of the workflows.
2. In the Versions related list, check for all of the following conditions:
   a) There is only one workflow version in a state of Checked out and Checked out by.
   b) There is only one version and it is not checked out. This version must be both Active and Published.
      You may need to personalize the list and add the Active column.
   c) If there are multiple versions, only one is Published.

These checks determine the only two conditions under which a workflow can run:

- A checked out version of a workflow is available for the user who has it checked out.
- A valid, published version of a workflow is available for all users who have permission to run the workflow.

Main flows containing subflows that do not meet one of these two conditions are not permitted to execute against a current record transaction. Instead, a critical log entry detailing the subflow state is added to the Workflow Context record. To enable the workflow to execute on the next appropriate transaction, remove the subflow from the main flow or modify the published and active states of the subflow.

Edit a published workflow

You can edit a published workflow after you check it out.

Role required: workflow_admin, workflow_creator, workflow_publisher, or admin

**Note:** You cannot check out or delete workflows that are associated with a read-only application file.

To check out a workflow:

1. Navigate to Workflow Workflow Editor.
2. Open the workflow that you want to edit.
3. In the title bar, click the menu icon and select Checkout.

A new version of the workflow is created and assigned to you.

If you are in a different domain than the published workflow, the new workflow version is created in your domain.
After you finish editing the workflow, validate and publish the workflow to make the new version available to other users.

Copy a workflow between two application scopes

Application scoping protects applications by identifying and restricting access to application files and data. You can copy a workflow created in one application scope (for example, Test) to another (Production) as needed.

Role required: admin

1. On the Home page, click located next to the logged in user name.
2. In the Developer tab, in the Application field, select the application scope (for example, Test) in which you want to operate the ServiceNow platform.
3. Close the System Settings page.
4. Navigate to Workflow Workflow Editor.
5. Create a workflow in the Workflow Editor. For more details, see Create a workflow on page 3222.
6. In the Workflow Editor, click.
7. In the Application tab, Application is set to the current application scope selected in System Settings.
8. In Accessible from, select All application scopes if the workflow is available to all application scopes, or select This application scope only if it is only available to, and accessible in the current application scope only.
   Only those workflows that are accessible from all application scopes can be copied to another application scope.
9. Go back to the Homepage, click.
10. In the Developer tab, in the Application field, select the application scope (for example, Production) to which you want to copy the workflow.
11. Navigate to Workflow Workflow Editor.
12. Refresh the page, then open the same workflow you created.
   An Out of scope workflow, workflow belongs to <scope name> scope message appears, where <scope name> is the application scope in which the workflow was originally created.
13. In the Workflow Editor, click.
14. Select Copy.
   The Workflow Name dialog appears:
a) In Workflow Name, type the new name for the copied workflow.
b) Click OK. The system creates a workflow in the current application scope.

15. In the Workflow Editor, click

16. In the Application tab, Application is set to the current application scope.
17. In Accessible from, select This application scope only if to make the newly copied workflow a private one that cannot be accessed from outside current scope.
18. Click Update.

A new workflow record is created in the selected application scope and marked as private if designated as one in the Workflow Editor.

Workflows used as subflows

A workflow can launch another workflow as an activity.

The parent workflow triggers the subflow and then waits for the subflow to complete before continuing. Run the workflow validation tool prior to publishing to detect missing subflows and other dependency problems, such as those involving update sets.

The Workflows tab in the Workflow Editor contains a list of the workflows available for use as subflows.

Figure 728: Workflows available to use as subflows
Make sure that the selected subflow is active. If the subflow is inactive, the main workflow will hang with a Loading message. If you place an inactive subflow into a workflow, the subflow appears with a red banner, indicating that it cannot run. An active subflow is highlighted in blue when selected.

Figure 729: Workflow with active subflows

**Subflows and the Create Task activity**

If a workflow contains a *Create Task* activity that has executed on the current record, additional task activities in the workflow might not execute as expected.

This can happen when the same subflow containing a Create Task activity runs more than once in a parent flow. When the subflow reruns and attempts to execute the Create Task activity again, the system reopens the first task activity instead and does not create an additional task.

**Note:** An alternative to creating duplicate subflows that use the Create Task activity is to add a *Run Script* activity to the workflow that creates a task with a script.
Figure 730: The same create task activity runs twice in a workflow

In this configuration, the workflow does not run the same subflow containing a Create Task activity more than once. This allows the workflow to create additional tasks.
Pass a variable from a workflow to a subflow

Use this process to pass variables from a parent workflow to a subflow.

Role required: workflow_admin, workflow_creator, or admin

**Note:** You can also use the Return Value activity in the subflow to return values to the parent workflow. Make sure to have a Return Value on every ending transition path.

1. Prepare the subflow to accept variables from the parent workflow by defining the inputs.
2. Include the subflow in the parent workflow and connect the inputs to the parent workflow variables.

**Note:** Subflows on the Requested Item [sc_req_item] table in the Service Catalog cannot accept variables from parent workflows.

**Define inputs for a subflow**

Define the input variables for a workflow to request from parent workflows when it is launched as a subflow.

All inputs are stored in the Variables [var_dictionary] table.

1. In the editor, open and check out the workflow.
2. In the title bar, click the menu icon and select Edit Inputs.
3. In the Workflow Inputs window, click New.
4. Populate the record with the definition of the variable, including the column name, the label that is displayed to the user, and the type of field.
5. Click Submit.

*Invoke a subflow in a workflow*

Use this procedure to add a subflow to a workflow.

1. In the Workflow Editor, open and check out the parent workflow.
2. Drag the subflow from the Workflows tab to the parent workflow.
3. In the New Activity dialog box, define the variables defined by the subflow’s Inputs.

   These fields can accept both static values or variables in the following format:

   ${variable_name}

4. Click Submit.

   The workflow triggers the subflow at the appropriate time and passes the variables as indicated by the Inputs definition.

*Prepare a subflow*

Review the process of preparing a subflow for use in a parent workflow, and for preparing the parent workflow to use a subflow.

1. In the editor, open and check out the workflow that you want to use as a subflow.
2. In the title bar, click the menu icon and select Edit Inputs.

3. In the Workflow Inputs window, click New in the Variables list.
4. Add a new variable depending on the type of values that it is going to store. The following example sets up a string value.

5. Click Submit.

6. Close the Workflows Inputs dialog.

7. Create a Run Script activity on the subflow.
   - Set the value from the parameter to a field on the current form. This is important because the Notification activity can only pull values from the current variable and not from the newly added variable. The following example sets the value in the Description field.

```
current.description = workflow.inputs.bluesubvariable;
```

- Create a new field on the request form but do not display the field. This serves as temporary storage.
8. Create a Notification activity on the subflow. Use ${description} in the subject to return the value from the field.
This is what the subflow would look like:
Prepare a workflow to use a subflow
After you create a subflow, use this procedure to prepare the parent workflow.

1. On the parent workflow, create a variable similar to what you did on the subflow, but name it something different.
   
   In the following example, the variable is named Blue Main Variable.

   ![Variable creation screenshot]

2. Click Submit.

3. Insert a Run Script activity to return the value from a field to the newly created variable.
   
   In this example, the value of the Short Description field is returned and given to the newly created variable.

   ```javascript
   workflow.scratchpad.bluemainvariable = current.short_description;
   ```
4. Click Submit.
5. In the subflow activity, set the Blue Sub Variable to pass the bluemainvariable to the bluesubvariable. 
   \$\{\text{workflow.scratchpad.bluemainvariable}\}

   This is what the main workflow looks like:
Using variables in a workflow

Within workflow there are several different types of variables that are available.

Some variables define, describe, or compose the pieces of the workflow (such as workflow activities). Some variables are available specifically to facilitate the execution of a workflow (such as scratchpad variables). Some variables define, describe, or compose the data records being manipulated by the workflow process (for example, the elements of a Glide Record that are defined in a dictionary.xml file describing a record, such as an incident).

Activity variables

Activity variables are properties specifically associated with a workflow activity.

These are the inputs that appear on the activity definition when a specific activity is dragged onto the workflow canvas. These variables are properties that define, compose or describe the workflow activity, or the work it is designed to perform.

Activity variables are declared in a related list within the Workflow Activity Definition.

To add, view, or modify a variable:

1. Navigate to Workflow Activity Definitions.
2. Select a workflow activity, such as Approval - User.
3. In the Activity Variables section or tab, add, view, or modify the variables. Activity variables are defined using the same fields as Dictionary records.

**Note:** If defining a new activity variable that is dependent on another activity variable, put the prefix "vars." before the name of the parent activity variable. For example, if the child field is dependent on a field named parent, put the value vars.parent in the Dependent field.

To control the visibility of an activity variable on the workflow canvas after the activity has been dragged to the canvas, use a UI policy on the wf_activity table.

To access the variables or assign values to these variables within the workflow activity, use the vars variable of the workflow activity.

```
activity.vars.variable_name = new_variable_value
```

Workflow input variables

Workflow variables are external values that are passed into and referenced by a workflow during its execution.

Workflow variables can be declared externally in a script and passed into a main workflow or they can be declared within a main workflow and passed as inputs to a subflow.

**Note:** There is a specific kind of input variable for any workflow that is declared against the table Requested Item [sc_request_item]. To understand the use of these variables see Workflow catalog variables on page 3254.

Workflow variables are declared in a form available from the Workflow Editor gear menu.

To add, view, or modify a variable:

1. Navigate to Workflow Workflow Editor.
2. Edit and checkout a workflow.
3. Select the Workflow Activities menu and select Edit Inputs.
4. Select an existing variable or click New.

Note the Column name field. Use this value when accessing the variable from a script.

Workflow variables do not appear on the workflow canvas, they are only available for view from the Workflow Activity menu.

The input variables are available to use in scripts. To access an input variable from a script:

```javascript
var input = workflow.variables.variableName // get the workflow variable identified by column name.
```

Assigning values to variables from outside of workflow

After being declared in a workflow, values can be assigned to the variables from where the workflow is kicked off.

The following example demonstrates how a workflow variable's value can be set in a script include, business rule, or UI action:

```javascript
//Declare an instance of workflow.js
var wf = new Workflow() //Get the workflow id
var wfId = wf.getWorkflowFromName( "Workflow Name" ) ;
//Start workflow, passing along name : value pair(s) for mapping to variable
//where input_var_name is the name of the variable declared in gear menu
//and input_var_value is whatever that value should be for this execution of workflow
wf.startFlow(wfId , null , "Workflow Name" , {input_var_name : input_var_value } ) ;
```

Another example that demonstrates a more readable way of passing multiple variables involves declaring an object, adding the names/values to the object, and passing it:

```javascript
//Declare an instance of workflow.js
var wf = new Workflow() //Get the workflow id
var wfId = wf.getWorkflowFromName( "Workflow Name" ) ;
//Start workflow, passing along object containing name/value pairs mapping to inputs expected by the workflow
var vars = { } ;
vars.input_var_name1 = input_var_value1 ;
vars.input_var_name2 = input_var_value2 ;
//add as many variables as your workflow is expecting, then pass the object
wf.startFlow(wfId , null , "Workflow Name" , vars ) ;
```

Assigning Values for Subflow Inputs from inside of a Main Workflow

If a workflow that accepts inputs is called from within another workflow, those input values can be set from the workflow canvas within the UI of the workflow activity. Each input variable declared for a subflow will have a text box input area displayed on the activity. Within these text boxes, the variables can be set with any value either from the scratchpad or from within the current record.

For more information, see Workflows used as subflows on page 3240.

Reading the Value of a Workflow Input Variable

The value of a Workflow input variable is accessible anywhere within the workflow that accepts javascript by dot walking the current workflow object:

```javascript
var readValue = workflow.inputs.variable_name;
```
Workflow scratchpad variables

Store and share string-based variables as name-value pairs between workflow activities. The scratchpad is global to the instance of the running workflow and as such, is available equally to all activities.

Declaration

The scratchpad itself is automatically available to an executing workflow and requires no specific declaration. Variables are declared and stored in the scratchpad simultaneously by referencing it. For example:

```
workflow.scratchpad.variableName = variableValue;
```

Display

View activity scratchpad values from the Workflow Activity History Scratchpad [wf_history_scratchpad] table. Workflow Activity History Scratchpad is also an embedded list in Workflow Activity History records.
Figure 732: Sample Workflow Activity History Scratchpad records
Access and Assignment

Use standard JavaScript object notation to access or assign scratchpad values. For example, use this format to assign a particular scratchpad variable value.

`workflow.scratchpad.variableName = variableValue;`

Use this format to assign a JavaScript variable to a scratchpad variable.

`var myValue = workflow.scratchpad.variableName;`

Current variables

Current is the database GlideRecord that kicked off the workflow, either by association to the table in the Workflow properties table or by being associated with a catalog item.

Declaration

Variables in current are the columns that are defined in the dictionary.xml file that support the database record. There is no way at runtime to add variables to the current record.

Display

Variables of a current record are displayed on the Glide Forms and Lists throughout the applications that use them.

Access and Assignment

To access the variables or assign values to the variables within the workflow activity, get the value from the current record by referencing the Glide Element.

`var myVarValue = current.getElement(nameOfTheField);`

or

`var myVarValue = current.fieldName;`

or

`current.variableName.setValue( "A Variable Value");`

Workflow catalog variables

Workflows that are associated with the Requested Item [sc_req_item] table have a specific type of workflow input.

The inputs into this workflow are essentially question:answer pairings that, when associated with a specific catalog task, become options on the task form. These options are generated by that catalog task activity within a workflow.

Scope

For the purposes of Service Catalog and workflow, a variable’s scope determines its availability to a catalog task activity within a workflow. You can define variables as global or catalog item-specific. When a variable is associated to a catalog item and the workflow generating the catalog task is associated to the catalog item, the variable scope determines which variables are available for mapping within the catalog
task activity in a workflow. If a workflow is associated with Requested Item [sc_request_item], and is not specifically associated with a catalog item, any catalog variable with a blank Cat Item field value is available to all catalog task activities within the workflow.

Declaration

You can declare requested item catalog variables at the catalog item level or at a global level.

You can declare global catalog variables using the Workflow Editor context menu.

Also see, _Global variable declaration option 2_.

1. Navigate to Workflow Workflow Editor .
2. Open and check out a workflow that runs against the Requested Item [sc_req_item] table.
3. Click the menu icon and select Edit Catalog Variables.
4. Click New to create a new variable or select an existing variable.
5. Select the Global check box.
6. Click Submit.

_Global variable declaration option 2_

You can declare global catalog variables using the Service Catalog.

1. Navigate to Service Catalog Item Variables .
2. The list of variables that appears in the workspace has a default filter of Cat Item != <blank>. Change the filter to Cat Item = <blank> and run the query.
   The catalog variables that appear are available to any catalog task that is initiated from within a workflow.
3. Click New to create a new variable.
4. Leave the Cat Item field blank.
5. Select the Global check box.
6. Click Submit.
   Also see, _Global variable declaration option 1_.

_Catalog item specific variable declaration option 1_

You can declare a catalog item-specific variable.

These variables are only available to the catalog item referenced in the Cat Item field on the variable record.

1. Navigate to Service Catalog Catalog Variables Item Variables .
   Note the list of variables that appears in the workspace has a default filter of Cat Item != <blank>.
2. Enter or select a catalog item in the Cat Item reference field.
   Selecting a Cat Item restricts the scope and availability of the catalog variable to that specific catalog item.
3. Click Submit.
   Also see, _Catalog item specific variable declaration option 2_.

_Catalog item specific variable declaration option 2_

You can declare a catalog item-specific variable directly from a catalog item record.

Creating a catalog variable in this way automatically sets the Cat Item reference to the catalog item selected.

1. Navigate to Service Catalog Catalog Definitions Maintain Items .
2. Select or create an a catalog item.
Note the Variables related list. All variables declared using this related list have a Cat Item reference value of the current catalog item.

3. From the Variables related list, click New.
4. Ensure that the Cat Item field correctly references the catalog item previously selected or created.
5. Go to or open the Question section or tab.
6. Add a Question.
7. Add a Name.
   Variable names should not include white space and cannot begin with a number.
8. Click Submit.
   Also see, Catalog item specific variable declaration option 1.

Display

Catalog specific item variables are visible in several places depending on where in the process the variable is viewed.

Declaration can happen and variables can be seen from within the menu, inside both the Maintain Items module and in the Item Variable modules of the Service Catalog.

Within a workflow, the Catalog Specific Item variables are available to the Catalog Task activity in the form of a slushbucket at the bottom of the Catalog Task activity. Item variables that are selected, are the question and answer pairs that will appear on the task that is generated by that instance of Catalog Task when executing that workflow.

If a workflow is associated with a specific catalog item, the association acts as a filter for item variables that appear in the slushbucket of the Catalog Task activity.

The last place the variables are seen is in the task form that is generated by the Catalog Task Item. The variables selected in the slushbucket are the question and answer pairs that appear to the user on the task form.

Access and assignment

The Catalog Item Variables are available and assigned to a specific Catalog Task activity (thereby to a specific task) using the slushbucket entry of a catalog task.

The user working the task enters the values of the variables.

To access the values of a Catalog Item Variable inside a script:

```javascript
var gr = current; // or create and query a new GlideRecord
var itemVariable = gr.variables[variableName]; //access the service catalog variable identified by the variable name.
var itemVariableValue = itemVariable.getValue();
var itemVariableName = itemVariable.getName();
var itemQuestion = itemVariable.getQuestion(); //All GlideappQuestion API are accessible on itemQuestion
```

Workflow events

The system employs two types of events: registered platform events and workflow events.

Registered platform events

Registered events are created in business rules and are used for such tasks as sending email notifications when records are inserted into the database. Workflow events are registered within workflows only and
are not used anywhere else in the platform. Registered platform events can be triggered by a workflow for external use, but cannot be used within a workflow.

Workflow events

Workflow events follow different rules than platform events that are registered using the event registry. Platform events are entered into the Event Registration [sys/event_register] table and are available for platform processes to use. Workflow events are triggered exclusively for the workflow engine and are used only to direct the work of executing workflow contexts. When an event is registered in a workflow, it is attached to a currently executing activity in the registered_events column of the Workflow Executing Activity [wf_executing] table.

Workflow events also can be broadcast to a workflow from any scripting source that has access to the workflow context, such as a script include or a Run Script activity. In this case, the event, such as cancel, is passed to all records in the Workflow Executing [wf_executing] table for a specific context.

Whether by registry or by broadcast, an event is handled by the activity definition associated with the currently executing activity. Each activity definition comes with a set of handlers. For example, most activities come with onExecute, onCancel, and onUpdate event handlers. As an example of a more specific event, the Approval - User activity also comes with onDetermineApprovalState, which is specific to the work of the approval activity.

Multiple parallel events

A single workflow can have multiple event threads running concurrently, such as when a workflow has timers that overlap on separate workflow branches. If any additional thread completes before the first thread, the system stores event information from the additional thread on the Workflow Queued Commands [wf_command] table. After the first thread completes, the system retrieves the information stored by the additional thread and proceeds through the workflow with the event information from each thread.

Workflow events in the base system

Several workflow events are available in the base system.

Table 1250: Workflow events in the base system

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
<th>Purpose</th>
<th>To use</th>
<th>Source</th>
<th>Thread</th>
<th>Listeners</th>
</tr>
</thead>
<tbody>
<tr>
<td>activityComplete</td>
<td>String value used by activity definitions to respond to the onActivityComplete event handler.</td>
<td>Informs records in the Workflow Executing Activity [wf_executing] table about the completion of other activities in the same workflow context.</td>
<td>If the activity is allowed to set the boolean value for wf_executing/notify_termination then set the value to true (activity.notify_termination = true) during the onExecute event.</td>
<td>Workflow Engine, Process Terminations</td>
<td>Current thread, current mutex termination</td>
<td>Join activity</td>

<td>------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------------------------</td>
<td>-------------------------</td>
<td>--------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>execute (specific to Lock)</td>
<td>String value used by the Lock activity to respond to a waiting lock that is ready to make another attempt to obtain a specific lock. This execute is different than the previous execute because it is called on a separate thread, at specified intervals, and is treated as an outside event.</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Informs a Lock activity waiting to execute that the specified wait interval has passed and that it should attempt to get the lock again.</td>
<td>Lock activity schedules a job with a script that uses the workflow script include's fireEvent(wf_executing, 'execute') method.</td>
<td>Lock activity via a scheduled job</td>
<td>Worker thread, private mutex</td>
<td>Lock activity, onExecute event handler</td>
</tr>
<tr>
<td>determineApprovalState</td>
<td>String value used by approval activities to respond to a change in the overall approval status of the current record.</td>
<td>Informs Approval Coordinator about an approval that completed and triggered the timer event.</td>
<td>Approval Coordinator triggers the event during its onExecute</td>
<td>Approval Coordinator, Approval - User, and Approval - Group all have onDetermineApprovalState event handlers. If the state is anything but Requested, the activity is considered finished, and the approval state (Approved, Rejected, Cancelled) is set to the wf_executing.result column.</td>
<td>Current thread, current mutex</td>
<td>ApprovalState event handlers, Approval Coordinator, Approval - User, and Approval - Group all have onDetermineApprovalState event handlers. If the state is anything but Requested, the activity is considered finished, and the approval state (Approved, Rejected, Cancelled) is set to the wf_executing.result column.</td>
</tr>
<tr>

<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
<td>-----------------------------------</td>
<td>---------------------------------</td>
<td>----------------------------------</td>
</tr>
<tr>
<td>cancel (outside current context)</td>
<td>String value used by workflow activities to respond to a request for cancellation.</td>
<td>This event is the same as the cancel event above and handled the same. However, the management of this event is subtly different. This event informs all wf_executing records in a context that the workflow is being canceled. The event is managed via the onCancel event handler of each executing activity definition, but the event is called differently. In particular, the call to cancel from outside an activity definition is blocked by the current mutex. This is a significant difference in that the event does not interrupt a currently executing activity that is still operating within the parameters of the current mutex.</td>
<td>Any script can call cancel on a known executing context via the workflow script include. For example, var w = new Workflow(); w.cancel(context); //where context is a GlideRecord of the context to be canceled.</td>
<td>Any script include, scheduled job, UI action, or other source</td>

*Workflow event-specific functions*

There are several functions that relate specifically to workflow events.
<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Purpose</th>
<th>Use</th>
<th>Thread</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>registerForEvent</td>
<td>Function in the workflow environment that writes events represented as strings to the wf_executing_registered_events field.</td>
<td>The workflow events are just strings. When an activity that has registered for an event executes, a comma delimited set of events is stored with the Workflow Executing Activity [wf_executing] record. When the event is triggered in the workflow context, the wf_executing table looks for all executing records that contain the string that represents the event in the wf_executing_registered_events field.</td>
<td>The global variable workflow that is available to all Workflow Activity [wf_activity] records is the source of the call. For example, from inside a Run Script activity, a designer can write: workflow.registerForEvent('myEventName');</td>
<td>Current thread, current mutex</td>
<td>Global variable workflow</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
<td>Purpose</td>
<td>Use</td>
<td>Thread</td>
<td>Source</td>
</tr>
<tr>
<td>------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
<td>-------------------------</td>
<td>-------------------------------</td>
</tr>
<tr>
<td><code>unRegisterForEvent(eventName)</code></td>
<td>Function in the workflow environment that removes a string value representing an event that has been written to the <code>wf_executing.registered_events</code> field.</td>
<td>The workflow events are just strings that are written to the <code>wf_executing.registered_events</code> field. When an activity unRegisters for an event, the comma delimited set of events stored with the Workflow Executing Activity <code>[wf_executing]</code> record is searched, and if that string is found, it is removed.</td>
<td>The global variable workflow that is available to all Workflow Activity <code>[wf_activity]</code> records is the source of the call. For example, from inside a Run Script activity, a designer can write: <code>workflow.unRegisterForEvent('myEventName');</code></td>
<td>Current thread, current mutex</td>
<td>Global variable workflow</td>
</tr>
<tr>
<td><code>fireEvent(eventName)</code></td>
<td>Function in the workflow environment that examines the contents of the <code>wf_executing.registered_events</code> field, comparing its contents to the <code>eventName</code> passed in.</td>
<td>The workflow events are just strings that are written to the <code>wf_executing.registered_events</code> field. When <code>fireEvent(eventName)</code> is called by a workflow activity, the workflow engine queues up any executing records that contain the string in the registered field.</td>
<td>The global variable workflow that is available to all Workflow Activity <code>[wf_activity]</code> records is the source of the call. For example, from inside a Run Script activity, a designer can write: <code>workflow.fireEvent('myEventName');</code></td>
<td>Current thread, current mutex</td>
<td>Global variable workflow</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
<td>Purpose</td>
<td>Use</td>
<td>Thread</td>
<td>Source</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
<td>---------</td>
<td>-----</td>
<td>--------</td>
<td>--------</td>
</tr>
<tr>
<td>fireEvent(eventRecord, eventName)</td>
<td>Function in the workflow environment that sends an event to a specific Workflow Executing Activity [wf_executing] record. The eventRecord is a GlideRecord of the type wf_executing.</td>
<td>This event call expects an onMyEvent event handler in the activity represented in the event record (Workflow Executing Activity [wf_executing] table). When fireEvent(eventRecord, eventName) is called by a workflow activity, the workflow engine queues up the specific executing record with that event and passes the event into the activity definition for the on&lt;eventName&gt; handler to manage. This event is queued up in its own mutex, so the current queue completes before this event is processed.</td>
<td>The workflow script include contains the call for this. For example, from inside a Run Script activity, a designer can write: var w = new Workflow(); w.fireEvent(executing, eventName);</td>
<td>Current thread, current mutex</td>
<td>Workflow script include</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
<td>Purpose</td>
<td>Use</td>
<td>Thread</td>
<td>Source</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
<td>---------</td>
<td>-----</td>
<td>--------</td>
<td>--------</td>
</tr>
<tr>
<td>fireEvent(\text{eventRecordSysId, eventName})</td>
<td>Function in the workflow environment that sends an event to a specific Workflow Executing Activity [wf_executing] record. The eventRecordSysId is the sys_id of a GlideRecord of the type wf_executing.</td>
<td>This is the same as the fireEvent above, except that it accepts an ID and returns the Workflow Executing Activity [wf_executing] record.</td>
<td>The Workflow script include contains the call for this. For example, from inside a Run Script activity, a designer can write: var w = new Workflow(); w.fireEvent(executing, eventName);</td>
<td>Current thread, current mutex</td>
<td>Workflow script include</td>
</tr>
<tr>
<td>fireEvent(\text{eventRecordSysId, eventName, optionalJSONObject})</td>
<td>Function in the workflow environment that sends an event to a specific Workflow Executing Activity [wf_executing] record. The eventRecordSysId is the sys_id of a GlideRecord of the type wf_executing.</td>
<td>This is the same as the fireEvent above, except that it accepts a JSON object as a third parameter. This object can specify any data expressible as JSON. You can also specify additional functionality when creating a workflow activity.</td>
<td>The Workflow script include contains the call for this. For example, from inside a Run Script activity, a designer can write: var w = new Workflow(); w.fireEvent(executing, eventName, JSONObject);</td>
<td>Current thread, current mutex</td>
<td>Workflow script include</td>
</tr>
<tr>
<td>broadcastEvent(\text{contextId, eventName})</td>
<td>Function in the workflow environment that sends an event to all currently running Workflow Executing Activity [wf_executing] records in a specified context, regardless of their state.</td>
<td>This is the same as the fireEvent above, except that it accepts an ID and returns the Workflow Executing Activity [wf_executing] record.</td>
<td>The Workflow script include contains the call for this. For example, from inside a Run Script activity, a designer can write: var w = new Workflow(); w.broadcastEvent(contextId, eventName);</td>
<td>Current thread, current mutex</td>
<td>Workflow script include</td>
</tr>
<tr>
<td>Function</td>

<tr>
<td>broadcastEvent</td>
<td>Function in the workflow environment that sends an event to all currently</td>
<td>This should not be confused with broadcastEvent above. This event is</td>
<td>This is available only through the global workflow variable of the</td>
<td>Current thread, current mutex</td>
<td>Global variable workflow</td>
</tr>
<tr>
<td>(eventName)</td>
<td>running Workflow Executing Activity [wf_executing] records in the current</td>
<td>only available to current Workflow Executing Activity [wf_executing]</td>
<td>the current context. The following is an example of its use from</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>context, regardless of their state.</td>
<td>records.</td>
<td>within an activity definition's script: workflow.broadcastEvent</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>(eventName)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*Event-specific workflow activities*

The following workflow activities trigger events.
### Table 1253: Event-specific workflow activities

<table>
<thead>
<tr>
<th>Activity Name</th>
<th>Description</th>
<th>Purpose</th>
<th>To Use</th>
<th>Source</th>
<th>Thread</th>
<th>Listeners</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Event</td>
<td>Requires an event from the event registry rather than a workflow event. This activity is located in the Notification category of the workflow tree.</td>
<td>Fires the notification event specified in the Workflow Activity [wf_activity] table.</td>
<td>1. Navigate to System Policy Events Registry 2. Create an event. 3. Navigate to System Policy Templates and create an email template. 4. Navigate to System Policy Email Notifications. 5. Create a new notification that is triggered by the event you created and sends the template you created. 6. On the workflow canvas, drag the Create Event activity onto the canvas and</td>
<td>Event Registry</td>
<td>Triggered in the current thread and handled on the worker thread in notifications. Never processed by a workflow</td>
<td>On the notification thread, outside of workflow</td>
</tr>

<td>------------------------------------------------------------------------</td>
<td>-------------------------------------</td>
<td>--------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Wait for WF Event</td>
<td>Listens for workflow events, as described in the Workflow Events in the Base System table, and only within the current context. This activity is located in the Conditions category of the workflow tree.</td>
<td>Waits for another transition branch of the current context to trigger an event.</td>
<td>Takes an event name as input. When the activity is executed, the specified event name is added to a string array stored in the registered_events column. The values in this column are in a list of all events the activity waits for when it is executing.</td>
<td>The Wait for WF Event activity has a generic onUnhandledEvent that tests the current event against the value that was passed to the events table. If they match, the Wait for WF Event moves the workflow forward.</td>
<td>Triggered in the current thread or from a script include</td>
<td>The onUnhandledEvent of the Wait for WF Event activity</td>
</tr>
</tbody>
</table>

**Workflow stages**

Workflows can indicate workflow progress by updating any field designated as a stage field.

For example, the Incident [incident] table has an Incident state field that indicates progress, but the service catalog uses the Stage field.

To indicate the workflow's progress through the possible stage values, the interface updates the Stage field selected in the workflow properties. Available fields depend on the table used by the workflow. If the field provides a choice list, then the choices are available as stage values for the workflow. If the field is a workflow field, it displays an icon to indicate the workflow's progress, as with the Service Catalog's Stage field.
After stages are added to the workflow, they can be assigned to each workflow activity. If an activity with an assigned stage is encountered when the workflow runs, the workflow engine assigns the stage to the record associated with the workflow context.

For workflows that use the Requested Item [sc_req_item] table, the stage field is automatically set to the Stage field of the table and cannot be changed. The stage state displayed for a workflow running on the Requested Item table is based on the state of the workflow activities.

- If an activity is active, then the stage is shown with the state of In progress.
- If an activity is in the Pending or Completed state, the stage reflects this state.
- If an activity is canceled, Request Cancelled appears in the Stage field. The "Cancelled" label set in the wf_stage table is a reserved word, and does not display in the Stage field.

How stage values are derived

Stage values are derived from various sources in the interface.

- **Note:** An updated method for managing workflow stages as a set is also available. For information about grouping and reusing stages, see *Workflow stage sets* on page 3281.

Stage values are derived from the following sources:

- Choices for Stage column: Choices defined for the column selected as the Stage column for the workflow.
- Default stages for table: Stages defined in the Stage Default [wf_stage_default] table for the table selected.
- Workflow-specific stages: Applied only to the workflow for which they were defined in the Workflow Stage [wf_stage] table.
- Stage values in existing records: Values from the designated Stage column in the table assigned to the workflow are inherited from existing records.

If the stage field for a workflow is the table column named Stage, then the progress of the workflow appears in any list view containing the Stage column.
Stage values shown in the list views are accompanied by the state, based on the workflow activities being executed. If an activity has a stage specified for it, and the activity is currently active in the workflow, then the stage is shown with a state of In progress. Similarly, if the activity is in the Pending or Completed state, the stage reflects this state.

Example

If the workflow table is Request Item [sc_req_item], then the stage field is automatically set to the Stage column of that table and cannot be changed. The following stage values for the request item are displayed in a choice list from the Dictionary Entry [sys_dictionary] table:

- Waiting for Approval
- Fulfillment
- Delivery

In addition, the Request Item table has the following default stages:

- Request Cancelled
- Completed
Note: If an activity is cancelled, Request Cancelled appears in the Stage field. The "Cancelled" label set in the wf_stage table is a reserved word, and does not display in the Stage field.

When you edit available activity stages in the Workflow Editor, the list displays the following stage values:

- Waiting for Approval
- Fulfillment
- Delivery
- Request Cancelled
- Completed

The following diagram depicts the process used to gather stage values from the Request Item table to populate the Stages list in workflow activities.
Note: If you are creating a workflow with a table other than Request Item `[sc_req_item]`, you must select a Stage field in the workflow properties for the workflow to have stages.

Use workflow stages

You can add or modify workflow stages.

Role required: workflow_admin, workflow_creator, or admin

1. Navigate to Workflow Workflow Editor.
2. Create a new workflow by clicking New or open an existing workflow.

3. In the Workflow Properties form, if the table is not the Requested Item [sc_req_item] table, select a field to display stages in the Stage field property.

   Available fields depend on the table selected for the workflow.

4. After assigning a list of stages to the workflow, you can set a stage value in any of the workflow activities that provide a Stage field in their dialog box.

   Setting a stage value in a workflow activity tells the workflow engine to assign that stage to the record associated with the workflow context when the activity is encountered during a run.

   When an activity starts with a specified stage, the platform updates the Stage field with the current value. In workflows run against the Requested Item [sc_req_item] table, the sc_req_item.stage field is defined as a workflow type field.

   When displaying the stages for a workflow on the Requested Item [sc_req_item] table, the stage state is based on the state of the workflow activities. If an activity has a stage specified for it, and the activity is currently active in the workflow, then the stage is shown with an In progress state. Similarly, if the activity is in the Pending or Completed state, the stage reflects this state.

5. To edit the workflow-specific stages for an existing workflow, click the gear icon in the header bar and select Edit Stages. Again, these stage values are combined with the choices, defaults, and existing values.
Workflow stages

To optimize the use of stages, you can assign a stage to multiple activities in a workflow. For example, if your workflow uses the following activities to create tasks:
1. Get approval
2. Order equipment
3. Receive equipment
4. Add equipment to CMDB
5. Set up equipment
6. Install software
7. Configure software
8. Deliver to user

The following stages might be used:
- Approval
- Order
- Configure
- Deliver

A good practice is to assign stages to the activities as follows:

<table>
<thead>
<tr>
<th>Activity</th>
<th>Assigned stage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get approval</td>
<td>Approval</td>
</tr>
<tr>
<td>Order equipment</td>
<td>Order</td>
</tr>
<tr>
<td>Receive equipment</td>
<td>Order</td>
</tr>
<tr>
<td>Add equipment to CMDB</td>
<td>Order</td>
</tr>
<tr>
<td>Set up equipment</td>
<td>Configure</td>
</tr>
<tr>
<td>Install software</td>
<td>Configure</td>
</tr>
<tr>
<td>Configure software</td>
<td>Configure</td>
</tr>
<tr>
<td>Deliver to user</td>
<td>Deliver</td>
</tr>
</tbody>
</table>

When the Order equipment, Receive equipment, or Add equipment to CMDB activity is active, the Stage display shows that the Order stage is In progress.

Add and translate stages

You can add default stages to use for a table, and stages to existing workflow

Add default stages for a table

You can assign a stage set as a default set to any number of tables.

The stages in the assigned stage set pre-fill the workflow version stages when you create a new workflow for the associated table.

1. Navigate to Workflow Default Stages (by table).
2. Click New.
3. Select a stage Set.
   You can create a new set by clicking New, typing a name, and clicking Submit.
4. Select a corresponding Table.
5. Click Submit.
   The stages in the selected stage set are automatically added to any new workflows that use the corresponding table.

Add a stage to an existing workflow
If a stage required for a workflow has not been imported or is not in the stage set assigned to the workflow table, you can add it to the workflow manually.
1. Navigate to Workflow Workflow Editor.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select Edit Stages.
4. In the Workflow Stages list, click New.
5. On the Workflow Stage form, fill in the fields as appropriate.
   Do not use a Name or Value field value that already exists in the base system.

Table 1255: Workflow stage fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the stage as it appears in workflow fields.</td>
</tr>
<tr>
<td>Value</td>
<td>The value of the stage when it is referenced from elsewhere in the system, such as in a script.</td>
</tr>
<tr>
<td>Duration</td>
<td>The default duration for the stage. Currently not used.</td>
</tr>
</tbody>
</table>

6. Click Submit.
7. Publish the workflow.

Add a stage to a workflow activity
After stages are added to a workflow, you can assign them to the workflow activities.
1. Navigate to Workflow Workflow Editor.
2. Open and check out the workflow.
3. Double-click the activity.
4. In the Stage field on the Activity Properties form, find and select the stage to display when the workflow reaches the activity.
5. Click Update.

Translate workflow stages
You can provide translations for workflow stage names so the names appear in the language selected for the instance.

The instance must already have Internationalization support installed.

Language-specific text appears in workflow fields displayed in a list, workflow stage sets, and the Workflow Editor for users with that language selected. Language-specific text does not automatically appear when
displaying stages on a form. To translate stages on a form, add translated text to the workflow field choices.

You can add translated text for any language enabled on the instance. For example, to translate workflow stages into French:

1. Set the interface language to French.
2. Navigate to Workflow Workflow Editor.
3. Open and check out a workflow.
4. In the title bar, click the menu icon and select Edit Stages.
5. Edit the Name field for each stage and enter the text to display to French users.
   Do not change the Value field.
6. Confirm that the workflow stages display the French text.

Alternatively, to translate stages for multiple workflows at once, you can directly edit the Workflow Stages [wf_stage] table. For example, to translate workflow stages from multiple workflows into French:

1. Set the interface language to French.
2. In the application navigation filter, enter wf_stage.list.
3. Edit the Name field for each stage and enter the text to display to French users. Do not change the Value field.

Workflow stage sets

Stage sets are named groups of workflow stages commonly used together. Create a stage set and assign it as a default set to any number of tables. You can import the choice list values of a workflow field as stages for a workflow, and export a stage set to create a new one.

A single stage set usually represents a process, such as the stages required to display the progress of a service catalog request. You can also assign a stage set as the default set for workflows on specific tables.

In an active context, workflow stages provide summary-level feedback about the progress of a workflow. Stage icons display the status of each activity as it is being driven by a workflow. The system updates a Stage field, defined in the workflow properties, to indicate the progress of the workflow through the possible stage values.

Updates to workflow stage values

During an upgrade, the system makes changes to the Value field of records in the Workflow Stage [wf_stage] table.

- All entries are made lowercase.
- All spaces and special characters are replaced with underscores.

These changes support Localization settings and enable workflows to display translated text in the Stage field.

Create a new stage set

You can create a new stage set by creating a stage set record and adding stage set entries manually.

Create a stage set record only when you want additional stages that are not available on the table by default.

1. Navigate to Workflow Stage Sets.
2. Click New.
3. Enter a Name that indicates the purpose of the stage set. For example, you can create a Requested Item stage set to hold the stages commonly used by inventory tracking workflows or service catalog fulfillment workflows.

4. Click Submit.

5. Open the new stage set record.

6. In the Stage Set Entries related list, click New.
   Each stage set entry can be used as the Stage for an activity in a workflow that uses this stage set.

7. Enter a Name that indicates the stage name to appear in workflow fields.

8. Enter a Value to use when referencing the entry, such as in a script.

9. Click Submit.

10. In the Stage Set Entries related list, ensure that each entry has a unique Order value.
    Enter a low value for stages that should appear early in the workflow and a higher value for later stages.

The stage set can be added to a workflow or assigned as the default stage set for workflows that are created for a specific table.

*Use a default stage set*
You can assign a stage set as a default set to any number of tables.
The stages in the assigned stage set pre-fill the workflow version stages when you create a new workflow for the associated table.

1. Navigate to **Workflow Default Stages (by table)**.
2. Click New.
3. Select a Table.
4. Select the Set you want to assign to the selected table.
5. Click Submit.

**Import stages from a choice list**
You can import the choice list values of a workflow field as stages for a workflow.

Create a choice list as follows:

- Add a custom field of Type Workflow to the table.
- Configure the custom field to use a choice list.
- If you are creating a new field, set the Choice List type to Display without --None-- and create the choices for the newly created field.

For more information, see *Create a workflow stage field* on page 3284.

1. Navigate to **Workflow Workflow Editor**.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select Properties.
4. In the Workflow Properties dialog box, click the Stages tab.
5. From the Stage field list, verify that the correct workflow field is selected.
6. In the Related Links section, click Import Stages from Choice List.
7. In the dialog box asking you to confirm that you want to import the choice list, click OK.
8. Click Update.

The stage set can be added to a workflow or assigned as the default set for workflows that are created for a specific table.

**Export a stage set from a workflow**
You can create a new stage set by exporting the stages from an existing workflow as a set, instead of manually adding stage set entries to a stage set record.

1. Navigate to **Workflow Workflow Editor**.
2. Open and check out the workflow containing stages that you want to export as a new stage set.
3. In the title bar, click the menu icon and select Edit Stages to open the Workflow Stages dialog box.
4. In the Related Links section, click Export to Stage Set.
5. Enter a unique Name for the new stage set.
6. Click OK.

The stage set can be added to a workflow or assigned as the default set for workflows that are created for a specific table.

**Add a stage set to a workflow**
You can add any number of stage sets to an existing workflow.

When multiple stage sets have stage set entries with the same Value, the stage appears on the workflow only once.

1. Navigate to **Workflow Workflow Editor**.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select Edit Stages to open the Workflow Stages dialog box.
4. In the Related Links section, click Import from Stage Set.
5. Select the stage set.
6. Click Ok.
7. Import additional stage sets as needed for the workflow.

After you add all necessary stage sets to the workflow, you can add them to the workflow activities. For more information, see *Add a stage to a workflow activity* on page 3280.

**Create a workflow stage field**

Workflows can provide a summary of workflow progress by updating any field of the Workflow type. If the field is a workflow field, it displays an icon to indicate the workflow stage progress.

**Role required:** admin

In a form, the workflow field displays the current stage as a choice list value.

In a list, the workflow field displays stage icons that represent the series of states, stages, phases, or tasks within a workflow. The stage icons are populated using the activity stages from the associated workflow. For more information, see *Workflow stages* on page 3273.

To create a workflow stage field:

1. Navigate to *Workflow Default Stages (by table)*.
2. Right-click near a column header and select *Configure List Layout*.
3. Create a new field in lower right.
4. On the form view of the table used by the workflow, create a field with the Type set to Workflow.
   For detailed steps, see *Add and customize a field in a table*.
5. Click Save.
6. Right-click the field label and select *Configure Dictionary*.
7. Open a dictionary entry.
8. In the Choice List Specification section of the Dictionary Entries form, select Dropdown with --None-- from the Choice list.
9. Click Update.
10. To ensure that the workflow field properly displays stages on the form, define a choice for each workflow stage.
   - To create workflow stages using a choice list that already has choices, you can import the stages from the choice list. A stage is created for each choice defined for the Stage field selected in the workflow properties. For detailed steps about importing a choice list, see *Import stages from a choice list* on page 3283.
   - The Value of each choice must match the Value of the corresponding workflow stage.
   - Do not use spaces in the Value field for either choices or stages. Use underscores in place of spaces.
   - Make the choice list read-only. If a user changes the stage value for a record from the choice list rather than allowing the workflow to control the value, the workflow-driven, legacy, and linear renders may not work as intended. You can also use business rules or events to ensure the workflow progresses accordingly.

   For detailed steps on defining choice lists, see *Define an option for a choice list*.

11. To see workflow stages as icons, add the field to the list layout of the workflow table.

   For detailed steps, see *Configure the list layout*.

After you create or update the workflow field:

- Unless the workflow uses the Requested Item [sc_req_item] table, ensure that the workflow field is selected from the Stage field list in the workflow properties. For detailed steps, see *Select a stage field* on page 3285. If a workflow uses the Requested Item table, the stage field is automatically set to the Stage field of the table and cannot be changed.
- Work through the workflow. Any other updates made to the workflow field, such as updates from business rules or other scripts, can interfere with displaying workflow stages.

*Select a stage field*

A Stage field allows the workflow context to show additional workflow information, such as the stage name and the estimated completion time for an activity.

Ensure that the workflow field you want to use as the stage field is configured to properly display stages. For detailed steps, see *Create a workflow stage field* on page 3284.

Unless the workflow uses the Requested Item [sc_req_item] table, you can specify which field from the workflow table is the stage field. For workflows that use the Requested Item [sc_req_item] table, the stage field is automatically set to the Stage field of the table and cannot be changed.

To add or edit a workflow stage field:

1. Navigate to Workflow > Workflow Editor.
2. Create or check out the workflow.
3. In the title bar, click the menu icon and select Properties.
4. In the Workflow Properties dialog box, click the General tab.
5. In the Table list, verify that the table containing the workflow field is selected.
6. Click the Stages tab.
7. From the Stage field list, select the workflow field.
8. Click Update.

*Display approvers in workflow stage fields*

Enable workflow stage fields to display approvers, change the number of approvers to display, or disable displaying approvers.

Role required: admin
By default, only workflow stage fields that use the Workflow-driven renderer can display a list of approvers. Only these workflow stage renderer types support displaying approvers.

- Linear renderer
- Main flow renderer
- Workflow-driven renderer

1. Navigate to Workflow Administration Properties. The system displays the Workflow Properties page.
2. Set the following properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Number of approvers to show if approvers are displayed for workflow stages. Only valid for supported list v2 renderers. glide.workflow.renderer.show_approver_limit | Sets the maximum number of approvers to display within a workflow stage field. The system displays an ellipsis character when there are more approvers than the display limit allows.  
  - Type: integer  
  - Default value: 5 |
| Show approvers when displaying workflow stages with the Linear renderer. glide.workflow.renderer.linear.show_approval | Enables (true) or disables (false) the Linear renderer to display approvers.  
  - Type: true | false  
  - Default value: false |
| Show approvers when displaying workflow stages with the Main flow renderer. glide.workflow.renderer.mainflow.show_approval | Enables (true) or disables (false) the Main flow renderer to display approvers.  
  - Type: true | false  
  - Default value: false |
| Show approvers when displaying workflow stages with the Workflow-driven renderer. glide.workflow.renderer.workflowdriven.show_approval | Enables (true) or disables (false) the Workflow-driven renderer to display approvers.  
  - Type: true | false  
  - Default value: true |

3. Click Save.
4. Add stages to workflows that have associated workflow stage fields.

   **Note:** If you add stages to a subflow, the parent workflow must also have stages.

5. For each approval activity you want to display approvers, select a Stage value. For example, the sample workflow Service Catalog Item Request has two approval activities. The first Approval - User activity has a Stage value of Dept. Head Approval. The second Approval - User activity has a Stage value of CIO Approval.

The workflow stage field renderers you enabled display approvers up to the approver display limit. For example, a Workflow-driven stage field displays up to five approvers when the workflow reaches an approval stage.
Workflow stage field icons and tooltips
A workflow stage field displays icons to indicate the workflow stage.
Based on the stage renderer selected for the workflow, these icons may display a tooltip with additional information.

Table 1256: Workflow field icons

<table>
<thead>
<tr>
<th>Icon</th>
<th>Workflow stage</th>
</tr>
</thead>
<tbody>
<tr>
<td>◢▶</td>
<td>Current active step</td>
</tr>
<tr>
<td>◐</td>
<td>Approval pending</td>
</tr>
<tr>
<td>◔</td>
<td>Approval rejected</td>
</tr>
<tr>
<td>✔</td>
<td>Complete</td>
</tr>
<tr>
<td>◔</td>
<td>Late (Change/Request) or Canceled (Catalog)</td>
</tr>
<tr>
<td>◐</td>
<td>Skipped (Catalog only)</td>
</tr>
</tbody>
</table>

Stage tooltips
Based on the stage renderer selected for a workflow, workflow stage icons may display tooltips with detailed information about a stage.
<table>
<thead>
<tr>
<th>Renderer</th>
<th>Tooltip behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Legacy</td>
<td>When a user points to a stage, the tooltip displays the name of the stage. In the expanded view, the activity status appears in parentheses next to the stage.</td>
</tr>
<tr>
<td>Renderer</td>
<td>Tooltip behavior</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Other renderers</td>
<td>When a user points to a stage, the tooltip displays the name of the stage. If the stage is a gated approval, the tooltip also shows the name of the approver. In the expanded view, the activity status appears in parentheses next to the stage.</td>
</tr>
</tbody>
</table>

If you do not want the approver’s name included in the tooltip, navigate to System Properties Service Catalog and clear the Show the current pending approver’s name in the stage widget mouseover check box.

![Tooltip Example](image)

Show the current pending approver’s name in the stage widget mouseover

- Yes
- No

**Figure 735: Property for displaying pending approver’s name**

*Workflow stage renderers*

Workflow stage renderers determine how a workflow displays stages in a workflow field.

There are multiple renderers available.
Note: Most workflows should use the workflow-driven renderer. This renderer is used by default for all workflows. Use a different stage renderer only after careful consideration and to satisfy specific requirements for how the stages appear.

**Workflow-driven**

Use the workflow-driven renderer as much as possible. This renderer displays icons for stages using the stage state controlled by the workflow. Icons are displayed in a way that is meaningful for many situations. This renderer can display stages from a main workflow and subflows. The order of the icons is determined by the expected path of the executing workflow. As the workflow progresses, stages on paths that the workflow did not take are removed from the display. Stages from paths other than the expected path are not included unless the workflow follows that path.

The Stage order field on the Stages tab has two options:

- Computed uses the actual workflow path in order
- User-specified uses the order specified in the Order column on the Workflow Stages record

Note: If the workflow context for a request item has been deleted, the stages for that request item can no longer be rendered. This stage history is stored on the workflow context.

**Main flow**

The main flow renderer displays icons for stages defined in the main workflow only. Use this renderer when you do not want to expose the details of the subflows. For example, a single main workflow may run several subflows to handle implementation details. The stages in these subflows do not provide useful information for the user who starts the workflow, but are useful when editing the subflow. In this scenario, using the main flow renderer leads to the best user experience. The stage field displays the high-level process of the workflow without exposing unnecessary details.

The Stage order field on the Stages tab has two options:

- Computed uses the actual workflow path in order
- User-specified uses the order specified in the Order column on the Workflow Stages record

**Linear**

Linear rendering displays all stage icons from the main workflow and all subflows within a single workflow field on a list or form. It displays icons in a linear sequence regardless of the paths the workflow follows as it executes. This renderer uses stages defined in both the main workflow and any subflows that the main flow launches. The icons appear in the user-specified order. Skipped stages do not appear.

Use this renderer when the workflow stages must display in a consistent order and the actual details of how the workflow runs are less important. For example, a workflow may revisit or revert to previous stages based on one or more *Condition Workflow activities* on page 3398. Displaying these loops in the stage field does not provide useful information to the user. In this scenario, using the linear renderer leads to the best user experience. The stage field displays the predefined process, including stages from subflows, in a consistent order.

For example, you can create a service catalog workflow that uses a subflow to complete delivery of the requested item. The following images illustrate the main flow and subflow for ordering corporate-branded supplies.
The linear renderer displays all these stages in one workflow field. The parent workflow specifies the Waiting for approval, Fulfillment, and Completed stages. The subflow specifies the Delivery and Waiting for Task, and Delivery OK stages.

**Progress bar**

The progress bar renderer displays a single progress bar instead of a sequence of stage icons. This renderer is particularly useful when you want to display the general progress of the workflow as a percent. Each stage in the workflow controls an equal percentage of the progress bar. For example, if a workflow has 10 stages, reaching each stage causes the workflow field to display an additional 10% of the progress bar. Stage names do not appear in the progress bar.
The progress bar renderer provides a way to display the status of a workflow that has a large number of stages. Other rendering options may provide a better user experience when rendering fewer than four stages in a single workflow.

The Stage order field on the Stages tab has two options:

- Computed uses the actual workflow path in order
- User-specified uses the order specified in the Order column on the Workflow Stages record

![Stage](image)

Figure 738: Workflow field progress bar

**Legacy**

The legacy renderer displays stages in the same way as releases prior to Dublin. When an instance is upgraded from a release prior to Dublin, all existing workflows are set to use the legacy renderer. Whenever possible, use a different stage renderer instead. If you want your workflow to maintain pre-Dublin behavior, use the Legacy option. The legacy renderer sometimes assigns incorrect data to and/or reports incorrect data from the workflow stage field. If possible, we recommend all workflows use the Workflow-driven renderer.

With the legacy renderer, you can create and reference a custom workflow field icon set by setting the icons attribute to a new script include. For example, to use the WorkflowIconsSCR script include to define which icons to use, add the attribute icons=WorkflowIconsSCR to the Attributes field of the dictionary entry for the workflow field. To use the default icon display behavior, use the attribute icons=WorkflowIconsStages.

The legacy renderer works with all tables except the Requested item [sc_req_item] table. In this case, use the requested item renderer instead.

**Requested item**

The requested item renderer functions the same way as the legacy renderer, but is for use with the Requested item [sc_req_item] table.

Select a stage renderer

In most cases, the default workflow-driven renderer should be used. If you have specific requirements for displaying stages, you can select a different stage renderer.

Consider the following when selecting a stage renderer:

- Use the workflow-driven renderer if possible. This is the default renderer that should be used in most cases.
- Use the legacy renderer only if your instance was upgraded from a release prior to Dublin and you want your workflow to maintain pre-Dublin behavior.

To use linear, main flow, or progress bar rendering, satisfy the following requirements.
## Table 1258: Linear and progress bar renderer requirements

<table>
<thead>
<tr>
<th>Renderer</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linear</td>
<td>• The parent workflow and all subflows must modify the same current record.</td>
</tr>
<tr>
<td></td>
<td>• In the properties for all subflows, the Stage field value for all subflows must match that of the parent workflow.</td>
</tr>
<tr>
<td></td>
<td>• The parent flow and all subflows must contain the same stages. Use a stage set to ensure the parent flow and all subflows have the same stages.</td>
</tr>
<tr>
<td></td>
<td>• On the workflow canvas, each workflow needs only the stages used directly by that workflow. It is not necessary to add stages from subflows to activities on the parent flow, or stages from the parent flow to activities on the subflows.</td>
</tr>
<tr>
<td>Main flow</td>
<td>• The workflow contains subflows.</td>
</tr>
<tr>
<td></td>
<td>• You do not want or need to reveal the details about the subflows.</td>
</tr>
<tr>
<td>Progress bar</td>
<td>• The workflow properties must have a Stage ordering value of User-defined.</td>
</tr>
<tr>
<td></td>
<td>• There must be workflow stages within the workflow.</td>
</tr>
<tr>
<td></td>
<td>• Because stage names do not appear in a workflow field when using the progress bar renderer, you can simplify stage names to represent a percentage of the workflow. For example, if a process has four main steps, name the workflow stages as 25%, 50%, 75%, and 100%. Enter the numerical value of each stage, such as 25, in the Value and Order fields.</td>
</tr>
</tbody>
</table>

To select a stage renderer:

1. Navigate to Workflow Workflow Editor.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select Properties.
4. In the Workflow Properties dialog box, click the Stages tab.
5. From the Stage rendering list, select a stage renderer.
   - If you are using two workflows to update two unique workflow fields on a single record, both workflows must use a non-legacy renderer. You can select a different stage renderer for each workflow but do not select Legacy for either one.
   - If you want to use the linear renderer, make sure you select Linear in the properties for the parent workflow and all subflows.
6. Click Update.

Workflow fields with deleted records

Workflow fields may indicate when a record required by the workflow is deleted.

After a referenced record is deleted, the reference in the primary record is no longer valid. If the stage renderer detects a reference that is no longer valid, the stage field displays a message about the deleted record.

Administrators can restore deleted records. For more information, see Use the Deleted Records module to restore a deleted record.

Figure 739: Workflows with missing records

The image shows a list with two workflows. The top request does not have an associated request item. The bottom request has an associated request item, but the item does not have an associated workflow context.

Workflow validation

Workflow validation examines different characteristics of a workflow to locate issues that might prevent the workflow from being published or cause it to fail. The validation report summarizes the results of each separate workflow validation.

Validation prevents workflows with critical flaws from executing and resulting in an unstable or incomplete state. There are a number of validators in the base system that notify workflow designers of potential problems. For example, multiple End activities, disconnected transitions, incorrect table references, missing subflows, and dependencies affected by update sets. A workflow validation report displays the results from each validator, including a message explaining what was found. The system automatically validates a workflow when you publish it. You can also run validation on a workflow directly from controls in the Workflow Editor.

Highlighting critical errors

The graphical Workflow Editor highlights critical errors when a workflow is loaded. In this example, a subflow is missing and is not available to the parent workflow for the current user. The graphical Workflow Editor indicates the error when the parent workflow loads by highlighting (in red) the activity that calls the
subflow. To correct the error in the parent workflow, click the validate icon in the header bar and inspect the error description in the validation report.

![Workflow Diagram](image)

**Figure 740: Validate missing subflow**

**Validations at publishing**

If you attempt to publish an invalid workflow or a workflow with potential problems, the system displays an error message and blocks the operation, if necessary. When validation error messages appear, click the validate icon in the graphical Workflow Editor to see the error report.

**Validation warning**

A validation warning notifies you that a potential problem exists in a workflow but permits you to publish the workflow. Validation warnings appear when:

- You edit and then attempt to publish a workflow that is included as a subflow in another workflow. The system cannot determine how your changes will affect the parent workflow and alerts you of the relationship.
- A workflow activity uses a different table than the table assigned to the workflow. The system alerts you of the potential conflict.
Validation failure

A validation failure notifies you that a critical error has occurred in the workflow that prevents you from publishing the workflow. An example of a critical error is a missing subflow.

Workflow validation report

Validators display three notification levels: CRITICAL, WARN, and INFO. The designer can publish a workflow that returns WARN or INFO level validation, but not a workflow that returns an overall validation level of CRITICAL.
**Workflow Validation Report**

**Figure 743: Workflow validation report**

**Header summary**

The header of the validation report summarizes the entire validation run against the specified workflow.

- Validate Summary: The overall score reflects the most severe notification level encountered during the validation.
- Total checks performed: The total number of validations run is also broken down to show the number at each notification level.

**Report columns**

The body of the report displays the results of each individual validation check that was performed. The
columns are Type, Level, and Message. You can sort and filter these columns as you would any list.

Table 1259: Workflow termination and external dependencies levels

<table>
<thead>
<tr>
<th>Name</th>
<th>Implication</th>
</tr>
</thead>
<tbody>
<tr>
<td>Info</td>
<td>Provides information about the current workflow version. An example of an information level message is one that names the lowest common table in the workflow. Workflows at this validation level are considered valid and publishable.</td>
</tr>
<tr>
<td>Warning</td>
<td>Alerts the user that the validator detected anomalies in the workflow that might compromise its ability to execute. An example of a warning level message is one that alerts you to a missing activity input transition. Workflows at this validation level are considered valid and publishable.</td>
</tr>
<tr>
<td>Critical</td>
<td>Names a workflow element containing a critical error that prevents the workflow from executing successfully. Examples of this are missing or invalid subflows and missing transitions. Workflows at this validation level cannot be published or run in production.</td>
</tr>
</tbody>
</table>

Message

The validation message provides a detailed description of the results, including table names, update sets, and other specifics.

For the procedure to validate a workflow and generate a validation report, see Validate a workflow on page 3236
Workflow validator

ServiceNow offers several workflow validators for workflow designers to test their workflows. This page lists all available workflow validators. See Workflow validation on page 3294 for information on using workflow validators and the workflow validation report to see the type of information that is returned.

</tr>
</tbody>
</table>

**ValidateTransitionOut**

The ValidateTransitionOut validator finds activity conditions with no exit transitions.

**Validation summary**

- Risk: Activity conditions might not transition to the next activity, which could cause the workflow to hang.
- Severity Level: Warning
- Valid Result: Valid
- Valid Message: All conditions have transitions.
Troubleshooting

Design choices made when creating a workflow on the canvas might legitimately use an activity without an exit condition. In the first example, the Notification and Timer activities both execute at the start of the workflow. The Timer is the entity that decides when the workflow ends. In this situation, executing the Notification, but not transitioning away, keeps the design simple and adds no risk. The validator finds and reports the missing transition from the Notification activity as a Warning that the designer can ignore.

![Workflow Diagram](image)

**Figure 744: Condition with no valid transition**

In the second example, the Notification activity has no exit transition. The designer missed this because of the layout. The transition from the Timer activity passes behind the Notification activity and appears to connect the exit from the Notification activity to the End. In workflows with more than 10 or 15 activities, it might be difficult to see all the transitions clearly. This workflow's designer intended for the Notification activity to transition to the End.
Figure 745: No condition out

This validator directs the designer to the specific activity and condition that does not have an exit transition. The designer then makes the decision whether or not to respond to the warning.

*ValidateTransitionIn*

The ValidateTransitionIn validator finds activities that do not have inbound transitions and cannot execute in the workflow.

**Validation summary**

- **Risk:** Activities that do not have inbound transitions have no means of being executed in the workflow. If other logic builds from these activities, the workflow could hang, with no means of moving forward.
- **Purpose:** Find activities that do not have inbound transitions.
- **Severity Level:** Warning.
- **Valid Result:** Valid.
- **Valid Message:** All activities in this workflow have at least one inbound transition.
- **Invalid Result:** Invalid.
- **Invalid Message:** This workflow contains <activity count> activity conditions without an input transition.
- **Suggested Action:** Either remove the activities to reduce confusion and make the workflow easier to understand or provide the appropriate inbound transition.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** None

**Troubleshooting**

Although the activities detected in this validator do no harm to the execution of the workflow, the designer needs to know that there are activities on the canvas that cannot execute and serve no purpose, particularly in a production system. This error is typically caused by a visual misinterpretation of the drawing.

This example workflow appears to be perfectly valid. Under closer inspection, however, we see that the transition from Set Values does not stop at Approval - User (there is no arrow end). Instead, that transition goes directly to End. As a result, Approval - User cannot execute. Because there is an activity in the workflow based on the approval’s condition routing, it appears that the designer intended for the approval to execute and that a correction is needed.
This validator directs the designer to the specific activity and condition that has no inbound transition. The designer should establish a transition or remove the activity.

**ValidateDanglingTransition**

The ValidateDanglingTransition validator finds and reports any transitions that do not terminate on an activity.

**Note:** These transitions are not drawn on the workflow canvas, but are still present in the database.

**Warning:** This is a critical error that prevents a workflow from running.

**Validation summary**

- Risk: A workflow with dangling transitions will silently hang a workflow with no recovery options.
- Severity Level: Critical
- Valid Result: Valid
- Valid Message: Valid
- Invalid Result: Invalid
- Invalid Message: Invalid
- Suggested Action: Remove or connect the offending transition. Get the source activity name from the validation report details and resolve the issue. Then, run the validation again to test your changes.
- Publishable: No
- Runnable: No
- Related Information: None
Troubleshooting

On rare occasions, the destination of a workflow transition becomes null. The workflow canvas shows no evidence of the transition, but at run time, the workflow hangs when it encounters one of these dangling transitions. If the ValidateDanglingTransition validator reports this condition at publishing time, it blocks the publication action until the issue is resolved. If this condition is detected on a runtime check, the workflow is not allowed to execute against a current record's transaction. Instead, the system adds a critical log entry detailing the activity with the faulted transition to the current record's workflow context. To enable the workflow to execute on the next appropriate transaction, remove the faulted transition from the workflow model.

To find and remove the faulted transition:

1. Make note of the workflow version and activity that contains the faulted transition as indicated in the validator details.
2. Navigate to Workflow Administration Workflow Version.
3. In the list of workflow versions, select the workflow that has the faulted transition.
4. On Workflow Version form, add the workflow activities related list. Click the menu icon, select Configure > Related Lists, move Workflow Activity-->Workflow Version from the Available list to the Selected list, and click Save.
5. In the Workflow Activities related list, select the activity cited in the validator.
6. In the Workflow Activity form, view the Workflow Transitions section or tab and identify the transition in that list that has no value or a null value in the To column.
7. Delete this transition.
8. Return to the workflow version and re-run the validation check.

The Critical warning should disappear. The workflow should execute as expected on the next appropriate transaction.

ValidateSubflows

The ValidateSubflows validator detects any workflows included as subflows that are either inactive, deleted, or not available as a published workflow for the current user.

Any of these conditions cause the workflow to hang when the workflow activity in the main flow is encountered.

**Warning:** This is a critical error that prevents a workflow from running.

Validation summary

- **Risk:** A parent workflow that transitions to a deleted subflow hangs indefinitely, with no recovery options.
- **Severity Level:** Critical
- **Valid Result:** Valid
- **Invalid Result:** Invalid
- **Valid Message:** This workflow contains <count> valid subflows.
- **Invalid Message:** This workflow contains <invalid count> invalid subflow(s) of <total subflow count> total subflows.
- **Suggested Action:** Remove the link in the parent workflow to the questionable subflow, examine the subflow to ensure that it is valid and published, or that it is checked out to the current user. After making the correction to the state of the subflow, run the validation again to test your changes.
• Publishable: No
• Runnable: No
• Related Information: Workflows used as subflows on page 3240

Troubleshooting

When a workflow runs, regardless of whether it is a subflow or a main flow, the script engine determines which version of a workflow should execute, given the current user and workflow conditions. When a workflow is checked out by the same user who is running the workflow, the checked out version is the version that executes. If the user is not the same person who has the workflow checked out, the published version of the workflow executes. If there is no published workflow, no workflow runs.

One scenario addressed by the ValidateSubflows validator is when a workflow:

• Is checked out to User A.
• Is a subflow in a parent workflow being run by User B.
• Has no published alternative to the subflow being run by User B.

When this occurs, the parent workflow runs to the execution of the unpublished subflow and then hangs at that activity, with no means to transition forward. Main flows that encounter this condition in a subflow are not permitted to execute against a current record's transaction. Instead, a critical log entry detailing the subflow's state is added to the current workflow's Workflow Context record. To correct the problem, remove the subflow from the main flow, or publish the subflow so it is available to User B. This allows the workflow to execute on the next appropriate transaction.

Another scenario addressed by the ValidateSubflow validator is when a workflow:

• Is a subflow in a parent workflow being run by any user.
• Has no published alternative to the subflow, because the workflow has been deleted or all versions of the workflow are unpublished or inactive.

Note: You cannot delete a from a list or form workflow that is a subflow. However, you can create one of these unstable conditions with advanced scripting, SQL options, or incomplete update sets that contain main flows, but not the referenced subflows. When troubleshooting a workflow that triggered this validator, consider the history of the subflow while assessing the error condition.

ValidateScriptForCurrentDotUpdate
The ValidateScriptForCurrentDotUpdate validator finds workflow activities with scripts that use the current.update() function.

Calling current.update() causes significant performance delays in transaction processing and might cause an instance to hang.

Validation summary

• Risk: At best, a workflow that uses current.update() in scripts experiences degraded performance. In the worst case, the workflow enters an infinite, recursive loop that crashes the server.
• Severity Level: Warning
• Valid Result: Valid
• Valid Message: The JavaScript in this workflow has no instances of 'current.update()'.
• Invalid Result: Invalid
• Invalid Message: This workflow uses 'current.update()' in <count of current.update references> JavaScript statements.
• Suggested Action: Remove current.update() from the activity scripts cited by this validator. Workflows execute within a transaction, and current is updated, or possibly inserted, at the end of the transaction, as appropriate. There is no need to explicitly update the record during the transaction.

• Publishable: Yes
• Runnable: Yes

Problems with current.update() in workflow scripts

A workflow initiates execution in one of these ways:

• Script Engine: If a workflow is assigned to a specific table, and given a run condition, the workflow runs on INSERT.
• Script: Any business rule, script include, background script, or client script can initiate a workflow using the workflow script include and calling startFlow().

The workflow engine initiates a workflow based on the matched criteria of the current record being inserted. The transaction for current is managed by the script engine and not the workflow. Workflows that progress on the update() of the current record are not invoked via the workflow engine, but as a call from either a client script or business rule. In either case, the script engine is invoked, and the current record is put in memory. Edits and modifications to any current fields are made and are available to other activities and scripts that are executed in the same transaction.

When appropriate, other engines that run in sequence with the workflow engine, such as the business rule engine or field normalization, are invoked against the same current record transaction. Any changes made to current through these scripts and activities modify the record in memory. These changing values are available for reference in any other transactions called from activities and scripts in the same INSERT transaction. When all expected changes are executed, the current record is inserted.

When one of these scripts calls current.update() on a record that has yet to be inserted, the action forces an unnecessary and error-prone database transaction. If a record is not yet in the database, it cannot be updated. Business rules that trigger on update() on a record that is in the process of being inserted can cause a very unstable and potentially infinite looping condition.

Troubleshooting

This validator detects the use of current.update() in any of the editable script fields. Do not call current.update() from within a workflow script. In the event of an INSERT or UPDATE of current, the changes made to current are available to all scripts executing in the same transaction, and the script engine stores all changes in the database. Leave the update of current to the engine. Use the scripts only for setting and referencing the current field values.

ValidateLowestCommonTable

The ValidateLowestCommonTable validator reports the lowest table in the Glide hierarchy that the workflow uses.

For example, the Requested Item [sc_req_item] table is the lowest table in a workflow containing a Catalog Task activity. This information is significant to a designer who wants to change the table against which an existing workflow runs after adding activities to the canvas.

Note: This validator provides information only. It does not indicate an error or warning condition.
Validation summary

- Risk: This validator informs only and has no risk associated with it.
- Severity Level: Data/Information
- Valid Result: Valid
- Valid Message: The lowest common table in this workflow is <table_name>.
- Invalid Result: N/A (informational only)
- Invalid Message: N/A (informational only)
- Suggested Action: None
- Publishable: Yes
- Runnable: Yes
- Related Information: Tables and classes, Workflow activities on page 3367

ValidateTableChange
The ValidateTableChange validator reports any activities in the workflow that are invalid given the table associated with the workflow version.

For example, a workflow version that is associated with the Change Request [change_request] table but has a Catalog Request activity on the canvas is invalid, since the activity is not compatible with the selected table.

Validation summary

- Risk: If the current record at runtime does not originate from the table specified by the lowest common table, the activities for the lowest common table cannot set specific values.
- Severity Level: Warning if the table that is associated with a workflow is higher in the table hierarchy than the lowest common table required for the workflow activities.
- Valid Result: Valid
- Valid Message: All activities are valid for the newly selected table
- Invalid Result: Invalid Activity
- Invalid Message: This workflow contains <count of invalid activities> invalid activities for the newly selected table.
- Suggested Action: Make one of these changes:
  - Change the workflow to not require the activities associated with the lowest table reported.
  - Modify the workflow to use a table that contains the lowest common table in its hierarchy.
  - Ensure that the current record meets the requirements of the at-risk activities.
- Publishable: Yes
- Runnable: Yes
- Related Information: Workflow activities on page 3367

Troubleshooting

Navigate to Workflow Administration Activity Definitions. Note the Table column in the list. Each activity that is not global is associated with a table.

When you select a table in the Workflow Properties form, the activity menu presents only activities that are compatible with the selected table. Associating a table with a workflow activity enables the system to make certain decisions about the activity that affect value comparison, condition routing, or the setting and getting of field values in the current record.
When a workflow is set to the Global [global] table, it is possible that the process executing the workflow ensures that the current record meets the requirements of the activities identified by this validator. In that case, the activity still works as expected. If that assurance cannot be guaranteed by the user process, do not use the activity identified by the validator without assigning a table that meets the requirements of all the activities on the canvas.

This validation check ensures that the table specified by all the activities in a particular workflow is included in the hierarchy of the table selected for the workflow.

**ValidateParentFlow**
The ValidateParentFlow validator reports any workflows that use the workflow as a subflow.

**Validation summary**

- Risk: There is no risk in a workflow being a subflow. This is only a warning that other workflows are at risk from dramatic changes to a subflow.
- Severity Level: Warning
- Valid Result: Valid
- Valid Message: Currently `<workflow version name>` is not a subflow.
- Invalid Result: None
- Warning Message: This workflow version (`<workflow version name>`) is required as a subflow in `<workflow version count>` other workflows.
- Suggested Action: Exercise caution when modifying things like input parameters and return values to assure that parent workflows are not adversely affected.
- Publishable: Yes
- Runnable: Yes
- Related Information: Workflows used as subflows on page 3240

**Troubleshooting**

The system warns the workflow designer at publishing time and during validation that a workflow is a subflow. This warning reminds the designer that changes to the current workflow have the potential to affect workflows cited in the validation report or other workflows already running in production. Regardless of how simple the change to a workflow that is a subflow, thoroughly test all parent flows cited in this validation report before publication.

When a workflow is a subflow, changes that can cause it to become invalid include:

- Changing the data types of input variables. Verify that all parent workflows cited in this validation report can pass the correct value type.
- Adding input variables. Verify that all parent workflows cited in this validation report are able to pass all variable values into the subflow.
- Changing or removing the return value of a workflow. Verify that any changes to the return value of a workflow are compatible with the requirements of all the parent flows.
- Changing the table on which the workflow runs. Verify that the table selection is compatible with all parent flows.

**Note:** To delete a workflow that is a subflow, first remove the dependency by removing the subflow from all parent flows cited in this validation report. After the dependencies are cleared, a user with the proper role can delete the subflow.

**ValidateSingleEnd**
The ValidateSingleEnd validator finds and identifies multiple End activities in a single workflow.
Multiple End activities in a workflow might be intentional and have no affect on the workflow, or might be a mistake that the designer needs to correct.

Validation summary

- Risk: If the execution paths to the End activities are not mutually exclusive, then the first End encountered completes the workflow and cancels all other executing activities.
- Severity Level: Warning
- Valid Result: Valid
- Valid Message: This workflow contains 1 End activity.
- Invalid Result: Invalid Activity
- Invalid Message: This workflow contains <count of ends> End activities.
- Suggested Action: Remove extraneous End activities that are not intended as part of the design.
- Publishable: Yes
- Runnable: Yes
- Related Information: None

Troubleshooting

As soon as an End activity is encountered in the workflow, the workflow completes even if there are other viable execution paths leading to a second End activity that is still executing. Those executing activities are canceled as part of the End activity's clean up actions. Therefore, the results of designing workflows with multiple Ends must be carefully considered.

In the case of large workflows, it is often more intuitive to read the workflow when there are multiple End activities. In the following example, the paths to the two Ends are mutually exclusive execution paths. If this was a large workflow, with many activities between Branch and the second End, the value of the multiple ends becomes apparent. Tracing a No response from User is invalid to a single End behind 33 other activities would be significantly more difficult. There is no risk in this workflow design because there is no reason for other activities to execute if the End after the Notification activity terminates the workflow.
Figure 747: Mutually exclusive execution paths

The next example has multiple End activities in execution paths that are not mutually exclusive. A Yes response from User is valid causes the Set Values activity to finish immediately. By reaching its End activity first, this execution path cancels the Approval for Apps and the DB Task activities, which might not be the desired outcome. If the paths are all expected to complete before End, the activities should come to a Join (as in the previous example) that transitions to a single End.
Figure 748: Mutually inexclusive execution paths

**Note:** To add the second End, right-click to copy the original End activity and paste it onto the canvas. In most cases, a single End is the best and most reliable way to ensure that all activities expected to execute prior to workflow completion, do so successfully.

---

**ValidateUpdateSetDependencies**

The ValidateUpdateSetDependencies validator identifies all the subflows called in the current workflow and determines if any of those subflows are being edited in a different (in progress) update set.

This warning informs the user that this workflow and one or more of its dependencies are being actively modified in a way that will not deploy concurrently to another instance without additional effort.

For information about update sets, see [Create and select an update set](#).

---

**Validation summary**

- **Risk:** If a parent workflow is edited in one update set and its dependent subflow is edited in another, the two workflows might not be compatible when moved to a different instance. Making independent changes, such as to common or expected values, can make the two workflows incompatible.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** There were no Update Set dependency issues found.
- **Invalid Result:** Invalid
• Invalid Message: This workflow has dependent workflows that are in a different update set.
• Suggested Action: Modify and deploy both workflows in the same update set. If you must modify dependencies in separate update sets, use one of these methods:
  • Ensure that all update sets migrate concurrently.
  • Prior to deploying the main flow update set, merge the dependencies into one update set before completing that update set.

• Publishable: Yes
• Runnable: Yes
• Related Information: Workflow movement with update sets on page 3337

Troubleshooting

A workflow is added to an update set only when the workflow is published. This validator issues a warning when either of the following conditions exist:

• A published subflow is in a different update set than the parent workflow and that update set is In progress.
• A subflow is checked out by another user, who is working in a different update set than the current user.

Note: This validator does not look for update sets that have been closed. It looks only at update sets that are In progress or at the update sets of all subflows being used by the current workflow that are checked out to users who are working in a different update set.

Example

Following is an example of an at-risk development scenario in which two users create dependencies between workflows in different update sets.

User A:
1. Sets Update Set A to the current update set.
2. Checks out Workflow A.
3. Changes the return value of the String type in Workflow A to a Reference/User type.
4. Publishes Workflow A, causing an entry into Update Set A.

User B:
1. Sets Update Set B to the current update set.
2. Checks out Workflow B.
3. Includes Workflow A as a subflow.
4. Uses the user reference return value from Workflow A as an approval assignment.
5. Publishes Workflow B, causing an entry into Update Set B.
Risks

- User B moves Update Set B to a different instance that has an older version of Workflow A. The return value is not a user reference, which causes the outcome of Workflow B to be different than it was when tested in development.
- User B moves Update Set B to a new instance that does not have a version of Workflow A. Workflow B experiences a validation failure at runtime and cannot execute. A log entry is added to the workflow log of the current record.

Possible solutions

Solution 1
Migrate the parent workflow and all dependent workflows to a new instance together using the same update set.
1. Set the update set to the one you want to migrate to new instances.
2. Check out and republish the workflows that need to be included.
   • This action forces an entry into the current update set.
3. Complete the update set with all dependencies.
4. Follow standard procedures for migrating update sets to local instances.

Solution 2
Move dependent workflows between update sets.
1. Identify the update set containing the main workflow to be migrated.
2. Navigate to System Update Sets > Local Update Sets.
3. Find and select the update set that contains the dependencies to the main workflow.
4. In the Customer Updates related list, select the workflow version of the subflow you want to move.
5. Select the update set containing the parent workflow in the Update set field.
   • If this field is not on the Customer Update form, configure the form and add the field.
6. Click Update.
   • The base system moves the dependent subflow to the update set selected.
7. Repeat steps 4-6 to add additional dependent subflows to the parent flow update set.

ValidateUpdateSetParentDependencies
The ValidateUpdateSetParentDependencies validator identifies all the workflows that call the current workflow as a subflow and determines if any of those parent workflows are being edited in a different update set that is in progress.

This warning informs the user that this workflow and one or more workflows that depend on this workflow are being actively modified in a way that will not deploy concurrently to another instance without additional effort.
Validation summary

- **Risk:** If a parent workflow is edited in one update set and its dependent subflow is edited in another, the two workflows might not be compatible when moved to a different instance. Making independent changes, such as editing common or expected values, can make the two workflows incompatible.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** There were no Update Set dependency issues found.
- **Invalid Result:** Invalid
- **Invalid Message:** This workflow has dependent workflows that are in a different update set.
- **Suggested Action:** Modify and deploy both workflows in the same update set. If you must modify dependencies in separate update sets, use one of these methods:
  - Ensure that all update sets migrate concurrently.
  - Prior to deploying the main flow update set, merge the dependencies into one update set before setting that update set to complete.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** Workflow movement with update sets on page 3337

Troubleshooting

A workflow is added to an update set only when the workflow is published. This validator issues a warning when either of the following conditions exist:

- A published subflow is in a different update set than the parent workflow and that update set is In progress.
- A subflow is checked out by another user, who is working in a different update set than the current user.

**Note:** This validator does not look for update sets that have been closed. It looks only at update sets that are In progress or at the update sets of all parent workflows that call the current workflow and are checked out to users who are working in a different update set.

Example

Following is an example of an at-risk development scenario in which two users create dependencies between workflows in different update sets.

**User A:**

1. Sets Update Set A to the current update set.
2. Checks out Workflow A.
3. Changes the return value of the String type in Workflow A to a Reference/User type.
4. Publishes Workflow A, causing an entry into Update Set A.

**User B:**

1. Sets Update Set B to the current update set.
2. Checks out Workflow B.
3. Includes Workflow A as a subflow.
4. Uses the user reference return value from Workflow A as an approval assignment.
5. Publishes Workflow B, causing an entry into Update Set B.

**Risks**

- User B moves Update Set B to a different instance that has an older version of Workflow A. The return value is not a user reference, which causes the outcome of Workflow B to be different than it was when tested in development.
- User B moves Update Set B to a new instance that does not have a version of Workflow A. Workflow B experiences a validation failure at runtime and cannot execute. A log entry is added to the workflow log of the current record.

**Possible solutions**

**Solution 1**
Migrate the parent workflow and all dependent workflows to a new instance together using the same update set.
1. Set the update set to the one you want to migrate to new instances.
2. Check out and republish the workflows that need to be included.
   - This action forces an entry into the current update set.
3. Complete the update set with all dependencies.
4. Follow standard procedures for migrating update sets to local instances. For information about update sets, see [System update sets](#).

**Solution 2**
Move dependent workflows between update sets.
1. Identify the update set containing the main workflow to be migrated.
2. Navigate to System Update Sets Local Update Sets.
3. Find and select the update set that contains the dependencies to the main workflow.
4. In the Customer Updates related list, select the workflow version of the subflow you want to move.
5. Select the update set containing the parent workflow in the Update set field.
   - If this field is not on the Customer Update form, configure the form and add the field.
6. Click Update.
   - The base system moves the dependent subflow to the update set selected.
7. Repeat steps 4-6 to add additional dependent subflows to the parent flow update set.

**ValidateInputVarUpdateSetDependencies**
The ValidateInputVarUpdateSetDependencies validator examines update sets to ensure that workflow input variables for a given workflow have not been deleted in different update sets than those currently in progress.
Validation summary

• Risk: Workflows and their input variables are not moved together in a single update set. The deletion of input variables is captured in a different update entry. If these two entries are not in the same update set, the workflow execution can be unstable.
• Purpose: Determine whether input variables that belonged to this workflow were deleted in a different update set.
• Severity Level: Warning
• Valid Result: Valid
• Valid Message: There were no Input Variable Update Set dependency issues found.
• Invalid Result: Invalid
• Invalid Message: There are input variables that have been deleted and logged in a different update set.
• Suggested Action: If the deletion is not intended to be separate from the workflow, ensure that both update sets are committed concurrently to the new instance, or merge both payloads into a single update set.
• Publishable: Yes
• Runnable: Yes
• Related Information: Workflow movement with update sets on page 3337

Troubleshooting

Workflow input variables get individual entries in the Customer Update related list in the current user's update set. This validator reports to the user when workflow input deletions have happened in an update set other than the current user's update set.

Follow the instructions for Input variable removal on page 3340 when the validator issues this warning.

ValidateWorkflowEndStages
The ValidateWorkflowEndStages validator checks that in workflows with stages, the end activity of the workflow has a stage named Complete or Completed.

If the workflow has stages associated with it, but does not have the completed stage on the end activity, then the stage indicator will not show that the workflow completed.

Validation summary

• Risk: The stage indicator will not show the workflow is completed.
• Severity Level: Warning
• Valid Result: Valid
• Valid Message: Workflow end stages are valid.
• Invalid Result: invalid
• Invalid Message: End activity A found with invalid stage "S."
• Suggested Action: If this is not by design, make the appropriate changes.
• Publishable: Yes
• Runnable: Yes
• Related Information: Workflow activities on page 3367
**Troubleshooting**

Check the workflow for an end activity. Ensure that this activity assigns a stage named Complete or Completed.

*ValidateWorkflowStageColumn*

The ValidateWorkflowStageColumn validator detects and reports when the stage field (stage column) for a workflow is not correct or is unusable.

**Validation summary**

- **Risk:** The stage indicators may not display appropriate information.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** Workflow stage values are valid.
- **Invalid Result:** Warning
- **Info Summary:** Stage warnings found.
- **Invalid Messages:**
  - Table T does not have a column named C.
  - Workflow for table T has stages, but no stage column.
  - Table T has a stage column "C," but no stages are set by activities.
  - Workflow on table T has stage column "C" that is not type=workflow.

- **Suggested Action:** If this is not by design, make the appropriate changes.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** Workflow activities on page 3367, Workflow stages

**Troubleshooting**

To check the stage column:

1. Open and check out a workflow.
2. Open the workflow version properties dialog by clicking the menu icon and selecting Properties.
3. View the Stages tab or section.
4. Check that the assigned stage column is actually a column in the table to which the workflow is associated.
5. Check that the column is type=workflow.

Tip: Stage columns should not be choice lists. If they are, the list appears read-only in form views, since changing that column value outside the workflow engine does not ensure safe tracking of stage states.

*ValidateWorkflowStateValues*

The ValidateWorkflowStateValues validator checks a number of stage aspects in workflow activities for correctness.

This validator has multiple possible error messages.
Validation summary

- Risk: The stage indicators may not display appropriate information.
- Severity Level: Warning
- Valid Result: Valid
- Valid Message: Workflow stage values are valid.
- Invalid Result: invalid
- Warning summary: Stage warnings found.
- Invalid Messages:
  - Stage with empty name is not allowed.
  - Stage with empty value is not allowed.
  - Cannot have more than one stage with the same name: x.
  - Cannot have more than one stage with the same value: y
- Suggested Action: If this is not by design, make the appropriate changes.
- Publishable: Yes
- Runnable: Yes
- Related Information: Workflow activities on page 3367

Troubleshooting

Use the following procedure to troubleshoot this validator:

1. Open and check out a workflow.
2. Open the list of stages for the workflow by clicking the menu icon and selecting Edit Stages.
3. Check the names and values.
   Ensure that the names and values are unique and are not empty.
4. If the same stage name or value appears more than once, remove one of the rows. It is then very important to go through the workflow and reassign stages in the activities that used the removed stage.
Workflow stages

You can do many things using the Workflow Editor.

- **Modify core activities** and **exit conditions**.
- **Create custom activities** and reuse the data for other workflows.

Tip: Make a list of which activities assign which stages.

**Workflow concepts**

You can do many things using the Workflow Editor.

- **Modify core activities** and **exit conditions**.
- **Create custom activities** and reuse the data for other workflows.

Tip: Make a list of which activities assign which stages.

**Workflow concepts**

You can do many things using the Workflow Editor.

- **Modify core activities** and **exit conditions**.
- **Create custom activities** and reuse the data for other workflows.

Tip: Make a list of which activities assign which stages.
• Download activity packs from the ServiceNow Store and create packs for upload.
• Edit workflows graphically.
• Define transitions between workflow activities.
• For the table that corresponds to the workflow, customize business rules.
• Summarize workflow progress through stages.
• Validate workflows to identify potential problems.
• Publish workflows for other users.
• Edit multiple tables without needing to directly modify them.

Workflow versions

To prevent users from making changes to a workflow that affect other users of the system, workflows must be checked out before they can be edited.

Only one user can check out a workflow at a time. When a workflow is checked out, changes apply only to the user who has the workflow checked out. Other users can continue to use the published workflow. After the changes are complete, the workflow can be published so that it is available to all users.

Note: Because each workflow has a unique sys_id, different workflows can have the same name. This is typically expected in a domain-separated environment where users in different companies cannot see each other’s workflows because they are in different domains. However, this can lead to confusion in other environments. In general, give each workflow a unique name to prevent workflow designers from making changes to the wrong workflow.

When a new version of an existing workflow is published, the changes are not applied to running workflow contexts. Any currently running workflow context continues using the workflow version that was available when the workflow started. The next time the workflow runs, it uses the updated, published version.

Workflow scope

Workflow application scope determines the access that an application has to the information in a workflow, specifically to the data contained in the activities in that workflow.

When a workflow is created, it inherits the application scope from the gear menu for the logged in user. This scope cannot be changed in the Workflow Editor. When the workflow executes, it runs in this scope and can only be called from a different application if the workflow’s accessibility setting permits access to all scopes (public). Otherwise, the workflow’s application scope is private to the application.

Note: Any script that is created in the Workflow Editor, such as an advanced script in an If activity, runs in the scope of the workflow. All core activities provided in the base system or for Orchestration run in the scope of the workflow.

Custom activities run in their own scope, even if it is different from that of the workflow. The scope of a custom activity can be private or public. Any script that runs inside a custom activity with a scope can only access outside artifacts that are within the scope of that activity or artifacts that are configured to run in any scope. Conversely, an outside artifact can only access the script inside that private activity if the outside artifact is running in the same scope. Activities with public scopes can interact with outside artifacts in any application scope.

You can use private activities as part of a workflow that has a public application scope. These activities are protected from reaching outside of the workflow or from being reached from outside the workflow. For details about setting application scoping for custom activities, see the field description table for the appropriate activity template.
Workflow scope restrictions

There are some restrictions to public and private application scopes.

During runtime, publicly scoped workflows can access other application resources, as long as these resources are set to be accessible to all application scopes. Privately scoped workflows in a private application scope can only access resources private to its scope. Due to scope access boundaries, any privately scoped workflows that make calls out to other scoped resources fail with either an exception or a hung activity while waiting for returned results. This occurs when making calls to these common global resources:

- ECC queues
- Tasks
- Approvals
- Events
- SLA timers
- Timers
- Script includes
- Business rules
- Workflow APIs

As you design workflows, validate the visibility and accessibility of all resources prior to deployment. See Application scope.

For information on how to configure the scope for a workflow, see Workflow properties on page 3224.

Domain separation and Workflow

This is an overview of domain separation and the Workflow application. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

Support: Data only

When domain separation is enabled, workflows and workflow activities inherit the domain of the user who publishes or creates them.

How domain separation works in the Workflow application

While workflows are managed by multiple tables, only the following tables are used for domain separation features:

- Workflow [wf_workflow] and Workflow Version [wf_workflow_version]: used for delegated administration or process separation.
- Workflow Context [wf_context]: used for data separation.
Note: The Workflow Version table \( \text{[wf\_workflow\_version]} \) table does not contain a domain field; Workflow Version records inherit their domain from the parent Workflow record.

The Workflow Editor displays a workflow’s domain in the title bar after the workflow name.

![Workflow editor domain](image)

**Figure 750: Workflow editor domain**

**Workflows and delegated administration**

Delegated administration allows child domains to inherit workflows from higher up the domain hierarchy and to override them with domain-specific versions if necessary.
Workflow records in the Workflow [wf_workflow] and Workflow Version [wf_workflow_version] tables are considered processes. A user in a child domain may check out but not copy a workflow from a parent domain. When a user in a child domain checks out a workflow from a parent domain, the system creates a version of the workflow in that user's domain. This new version is a unique record in the Workflow [wf_workflow] table. After the user publishes this new workflow, other users in the child domain use the
new workflow, which overrides the workflow from the parent domain. The original workflow in the parent domain is no longer visible to users in the child domain.

For example, a managed service provider (MSP) hosts ITSM services for several companies, including ACME and Initech, on a single instance. As administrators, the MSP creates a Change Request - Emergency workflow that applies to all domains because it was created in the TOP domain, which is the highest domain in the domain hierarchy. This workflow overrides the global Change Request - Emergency workflow and specifies that emergency change requests require approval from the CAB approval group. Because of delegated administration, every domain in the hierarchy sees and uses this workflow. Now suppose the ACME domain requires a different approval policy where emergency change requests require approval from the emergency CAB approval group. The MSP creates another version of the Change Request - Emergency workflow in the ACME domain. This workflow overrides the version in the TOP domain and only applies to users in the ACME domain.

Workflow permissions

When a user starts a new workflow, the workflow runs with that user's domain and credentials.

The workflow preserves a user's domain and credentials until an activity causes the workflow to wait, such as an approval activity waiting for approval or rejection. When the stopped workflow resumes, such as when a user approves a request, the workflow uses the credentials of the approving user, but continues to run within the domain of the original user.

Workflows and data separation

Data separation restricts workflow contexts to users who are either in the same domain of the workflow or are members of a parent domain.
Workflow records in the Workflow Contexts [wf_contexts] table are considered data. Data separation restricts workflow contexts to users who are either in the same domain of the workflow or are members of a parent domain. While a user in a parent domain can see running workflows in a child domain, a user
in a child domain cannot see running workflows in a parent domain. If necessary, administrators can use visibility or contains domains to expand who can see domain-specific data.

For example, when an ACME user requests something from the service catalog, a Service Catalog Request workflow context is created in the ACME domain. Similarly, a service catalog request from an Initech user creates a workflow context in the Initech domain. An MSP user in the TOP domain can see both workflow contexts because it is the parent domain for both the ACME and Initech domains. However when an ACME or Initech user logs in, data separation prevents them from seeing each other’s service catalog requests. This is expected behavior because each workflow context contains data specific to that domain, such as the item requested and the request's approval history.

**Workflow engine operation order**

The workflow engine runs in a predefined order relative to business rules and database operations. It caches commonly-used published workflows to improve performance.

The Run after bus. rules run workflow property defines if a workflow is Default or Deferred.

The diagram below shows the workflow engine order of operations and when Default and Deferred flows are executed. For a more general overview of engine operation order, see *Execution order of scripts and engines*. 
**Before** business rules (order <1000)
Do not use current.update() here

Default workflows
Do not use current.update()}

**Before** business rules (order >=1000)
Do not use current.update()}

Database operation (insert, update, delete)
The current record is inserted or updated at the end of the database operation.

**After** business rules (order <1000)
Use current.update() if there is no deferred workflow

Deferred workflows
Do not use current.update()
Workflow caching

The workflow engine caches commonly-used published workflows to improve performance.

Caching significantly reduces the number of database queries per workflow. By default, the engine caches up to 300 unique workflow versions. Caching very large workflows may reduce this number as the cache size cannot exceed the Java Virtual Machine (JVM) heap size.

To change the maximum number of cached workflow versions, navigate to Workflow Administration Properties and modify the value of the The max number of models that will be concurrently held in the LRU cache (glide.workflow.model.cache.max) property. You must restart the instance to apply this change.

Workflow tables

For full flexibility, workflows store information over a number of different tables.

Usually tables containing workflow information are not edited one-by-one. Instead, use the Workflow Editor to edit workflows. The following lists are provided for reference purposes.

Table 1263: Workflow tables

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workflows</td>
<td></td>
</tr>
<tr>
<td>Column Renderer [column_renderer]</td>
<td>A renderer widget for a stage column. Stage renderers are written in Jelly as a UI Macro. The default is Workflow-Driven; it covers most workflow related stage scenarios.</td>
</tr>
<tr>
<td>Version [wf_versionable]</td>
<td>Tracks different versions of element definitions [wf_element_activity].</td>
</tr>
<tr>
<td>Workflow [wf_workflow]</td>
<td>The master records of workflows.</td>
</tr>
<tr>
<td>Workflow Binding [wf_workflow_binding]</td>
<td>History of workflows run and the triggering record. Workflow Binding records prevent the system from running workflows again when the associated Workflow Context record has been deleted.</td>
</tr>
<tr>
<td>Workflow Context [wf_context]</td>
<td>Individual instances of a workflow being used.</td>
</tr>
<tr>
<td>Workflow Execution [wf_workflow_execution]</td>
<td>Synthetic &quot;current&quot; records for workflows that run on Global.</td>
</tr>
<tr>
<td>Workflow Instance [wf_workflow_instance]</td>
<td>Connections of workflows to subflows.</td>
</tr>
<tr>
<td>Workflow Version [wf_workflow_version]</td>
<td>Particular versions of a workflow, either published versions or versions that have been checked out.</td>
</tr>
<tr>
<td>Activities</td>
<td></td>
</tr>
<tr>
<td>Activity Variables [wf_activity_variable]</td>
<td>Variables for activities.</td>
</tr>
<tr>
<td>Workflow Activity [wf_activity]</td>
<td>Activities as they are being used in workflows.</td>
</tr>
<tr>
<td>Workflow Activity Definition [wf_activity_definition]</td>
<td>Definitions of activities that can be used in a workflow.</td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Workflow Executing Activity [wf_executing]</td>
<td>Individual instances of activities being performed in active contexts.</td>
</tr>
<tr>
<td>Workflow components</td>
<td></td>
</tr>
<tr>
<td>Element Provider [wf_element_provider]</td>
<td>Template definitions for custom activities.</td>
</tr>
<tr>
<td>Variable [item_option_new]</td>
<td></td>
</tr>
<tr>
<td>Workflow Condition [wf_condition]</td>
<td>All of the defined conditions in workflows.</td>
</tr>
<tr>
<td>Workflow Queued Command [wf_command]</td>
<td>Temporary internal storage for workflows that are currently executing.</td>
</tr>
<tr>
<td>Workflow SC Variable [wf_variable]</td>
<td>The Service Catalog variables for a workflow.</td>
</tr>
<tr>
<td>Workflow Schedule [wf_workflow_schedule]</td>
<td>Definitions of the times to run specific workflows.</td>
</tr>
<tr>
<td>Workflow Transition [wf_transition]</td>
<td>All of the defined transitions in workflows.</td>
</tr>
<tr>
<td>History</td>
<td></td>
</tr>
<tr>
<td>Workflow Activity History [wf_history]</td>
<td>The history of executed activities.</td>
</tr>
<tr>
<td>Workflow Log Entry [wf_log]</td>
<td>All of the events and history of the workflow.</td>
</tr>
<tr>
<td>Workflow Transition History [wf_transition_history]</td>
<td>The history of executed transitions.</td>
</tr>
<tr>
<td>Stages</td>
<td></td>
</tr>
<tr>
<td>Stage Default [wf_stage_default]</td>
<td>Definitions of default stage fields for tables to use.</td>
</tr>
<tr>
<td>Stage Set [stage_set]</td>
<td>A named set of stages that can be used to populate workflow stages for multiple workflows.</td>
</tr>
<tr>
<td>Stage Set Entry [stage_set_entry]</td>
<td>The stages that belong to a named stage set.</td>
</tr>
<tr>
<td>Stage Set for Table [stage_set_table]</td>
<td>Defines a relationship of a stage set to a table so that the stage set can be used as the default stages when a new workflow is created for the table. This replaces the wf_default_stage table and is the view that shows when you click Default Stages (by table) in the menu.</td>
</tr>
<tr>
<td>Workflow Stage [wf_stage]</td>
<td>Definitions of stages used by workflows.</td>
</tr>
</tbody>
</table>

Workflow administration

Tailor workflows exactly the way you want them.
Workflow roles

Certain roles are required to use workflows.

Table 1264: Workflow roles

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activity creator [activity_creator]</td>
<td>Creates and edits custom workflow activities, reuses custom activity data, and manages activity packs downloaded from the ServiceNow Store.</td>
</tr>
<tr>
<td>Web service administrator [web_service_admin]</td>
<td>Accesses and uses REST and SOAP messages in the Orchestration activity designer on page 1990. Creates and edits custom activities that use the REST web service and SOAP web service templates.</td>
</tr>
<tr>
<td>Workflow administrator [workflow_admin]</td>
<td>Creates, edits, publishes, and deletes graphical workflows.</td>
</tr>
<tr>
<td>Workflow creator [workflow_creator]</td>
<td>Creates new graphical workflows.</td>
</tr>
<tr>
<td>Workflow publisher [workflow_publisher]</td>
<td>Publishes graphical workflows.</td>
</tr>
</tbody>
</table>

Administering workflow contexts

The workflow context performs the activities and transitions defined in the workflow with the new record as current.

Workflow in ServiceNow names a running workflow a Workflow Context. The Workflow Context maintains the state of the overall process in the Workflow Context record. The Workflow Context maintains the state of the individual activities as they execute in a series of related lists. These lists maintain the state of currently executing activities, the result of finished activities, and the execution path the workflow took through the process model.

The Workflow Context canvas provides a visual representation of the execution path the workflow took through the process model. The state of each activity (finished, executing, cancelled, error) is represented using the color palette. The executed paths are represented in the color blue; the non-executed paths are represented in grey. Active and historic workflow contexts, as well as the activities within them, can be viewed using the Live Workflows section of the Workflow application menu.

Viewing a workflow context

Workflow contexts can be found in two places:

- From the Workflow Context related link on the form of the task being powered by the workflow.
- By navigating to Workflow All Contexts and selecting an active context.
Displaying workflow progress

Two related links on the Workflow Context form allow you to view the progress of a workflow in different formats.

- Show Timeline displays the workflow context as a timeline.
- Show Workflow displays the workflow context in the graphical Workflow Editor.

Graphical interface

To view the workflow context in the graphical Workflow Editor interface, click the Show Workflow link from either the workflow context record or the current record.
Figure 754: Show workflow

In the top right hand corner are two controls:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Refresh button" /></td>
<td>Refreshes the workflow context.</td>
</tr>
<tr>
<td><img src="image" alt="Color key icon" /></td>
<td>Displays a key of the colors used in the workflow to denote the state of activities and transitions:</td>
</tr>
</tbody>
</table>
Execution order

View tooltip text in the workflow context graphical view to see the execution order of individual activities.

In Workflow Live Workflows Active Contexts or All Contexts, Open the context you want to examine. Click Show Workflow, and point to a finished or executing activity. The tooltip shows error data, execution time, and the order in which the activity executed in the workflow. Use this data to help troubleshoot activities in an error state.
Cancel a workflow

Canceling a workflow stops the workflow from executing and sets the workflow context State to Canceled. To cancel an executing workflow, you can use the cancelContext(context) script. You can define an on Cancel script to clean up unresolved workflow activities.

Canceling a workflow attempts to stop the workflow gracefully by injecting a cancel command into the workflow engine.

To cancel an active workflow:

1. Navigate to Workflow Active Contexts.
2. Select a workflow context record.
3. Select the Cancel related link. A confirmation window appears.

4. Click OK. The Wait for Cancel window appears. The workflow engine attempts to cancel the workflow gracefully.

If the workflow does not respond to the cancel command, the Force Cancel window appears.
5. Click Force cancel to interrupt the thread the workflow is actively executing or click Continue waiting to continue waiting for the workflow to cancel gracefully.

**Warning:** Whenever possible, allow a workflow to cancel gracefully. Forcing a workflow to cancel can leave related workflows and scripts in an unresolved state. You can use an on-cancel script to clean up unresolved artifacts from a cancelled workflow.

---

**Cancel a workflow with the cancelContext(context) script**

To cancel an executing workflow, you can use the cancelContext(context) script. This script can be useful in cases where a workflow must be canceled in response to an event or where a user must manually cancel a workflow.

For more information, see the [API reference](#).

**Define an on-cancel script**

Canceling a workflow can leave records or scripts in an unresolved state. For example, canceling a service catalog workflow may leave catalog items in the requesting user's cart. An administrator can specify an On-cancel script that runs when the workflow transitions to the Canceled state. This script can notify users, log information, or resolve the state of any scripts run within a workflow activity. The sys_id of the workflow context is available in this script using the context_sys_id variable.

To define this script:

1. Navigate to Workflow Workflow Versions.
2. Select a workflow version that you have checked out. Workflow versions that are not checked out are not editable.
3. Edit the On-cancel script field.
   You may need to configure the form to add this field.
4. Click Update.

   This example script adds a comment to a Requested Item [sc_req_item] record indicating the workflow for that request has been canceled.

   ```javascript
   var grContext = new GlideRecord("wf_context");
   grContext.get(context_sys_id);
   var grReq = new GlideRecord("sc_req_item");
   ```
// The current record may not exist, make sure it exists before modifying it.
if (grReq.get(grContext.id)) {
    grReq.comments = "The workflow processing this item was Canceled. Contact your system administrator for further information."
    grReq.update();
}

Scheduling a workflow

In addition to being run based on conditions, workflows can also be scheduled to perform at a particular time, similar to a scheduled job.

Scheduled workflows do not have a defined current record and do not run on specific records within a table. Due to this behavior, certain activities that depend on a current record, such as Create Task or Catalog Task are unavailable on scheduled workflows. If your workflow requires one of these activities, consider using a scheduled job that inserts a record to start the workflow instead of using a scheduled workflow.

To schedule a workflow, navigate to Workflow Scheduled Workflows and click New. Populate the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the scheduled workflow.</td>
</tr>
<tr>
<td>Workflow</td>
<td>Select an existing published workflow to be triggered at the specified date, time, or interval.</td>
</tr>
<tr>
<td>Active</td>
<td>If selected, the scheduled workflow will be triggered at the appropriate time.</td>
</tr>
<tr>
<td>Application</td>
<td>Specifies the type of application, such as Global.</td>
</tr>
<tr>
<td>Run</td>
<td>A choice list to determine when the workflow should be triggered. Options are:</td>
</tr>
<tr>
<td></td>
<td>• Daily: At a particular hour every day.</td>
</tr>
<tr>
<td></td>
<td>• Weekly: On a particular day of the week.</td>
</tr>
<tr>
<td></td>
<td>• Monthly: On a particular day of the month</td>
</tr>
<tr>
<td></td>
<td>• Periodically: After every set duration.</td>
</tr>
<tr>
<td></td>
<td>• Once: At one specific date and time.</td>
</tr>
<tr>
<td>Time</td>
<td>For daily/weekly/monthly scheduled workflows, the time of day to run the workflow.</td>
</tr>
<tr>
<td>Day</td>
<td>For weekly scheduled workflow, the day of the week to run the workflow. For monthly scheduled workflows, the day of the month to run the workflow.</td>
</tr>
<tr>
<td>Repeat Interval</td>
<td>For periodical workflows, the interval between workflows, beginning from the Starting date and time.</td>
</tr>
</tbody>
</table>
Workflow movement with update sets

The system tracks workflows in update sets differently than other records because workflow information is stored across multiple tables.

Changes made to a workflow version are not added to the update set until the workflow is published, at which point the entire workflow is added into the update set. Update sets store workflows as a single Workflow [wf_workflow] record and only retain the latest version with the update type of Workflow.

For information about update sets, see System update sets.

Workflow update set migration use case - simple

Create a new workflow with no dependencies and then migrate the workflow in an update set.

1. User A selects Update Set A.
2. User A creates a new workflow called Workflow A.
3. User A publishes Workflow A.
   A customer update set record is added to Update Set A containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.
4. User A completes Update Set A and migrates it to the production instance.
5. Update Set A commits successfully.
6. Workflow A works as expected.

Workflow update set migration use case - subflow dependency (success)

Successfully edit and migrate an existing workflow and its dependent subflow.

1. User A selects Update Set B.
2. User A checks out Workflow A.
3. User A adds a subflow called Workflow B to Workflow A.
   Assume that Workflow B was previously published and migrated to the production instance.
4. User A publishes Workflow A.
   A customer update set record is added to Update Set B containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.
5. User A completes Update Set B and migrates it to the production instance.
6. Update Set B commits successfully.
7. Workflow A works as expected with Workflow B as a subflow.
Workflow update set migration use case - subflow dependency (failure)

Edit and migrate an existing workflow from a test instance to a production instance that fails to run on the production instance because of a missing dependent subflow.

1. User A selects Update Set C.
2. User A checks out Workflow A.
3. User A adds a subflow called Workflow B to Workflow A.
   
   Assume that Workflow B was previously published, but has not been migrated to the production instance.
4. User A publishes Workflow A.

   A customer update set record is added to Update Set C containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.

   Notably absent from Update Set C is the subflow called Workflow B. Workflow B was published before User A selected Update Set C.
5. User A completes Update Set C and migrates it to the production instance.
6. Update Set C commits with warnings.
7. Workflow A is invoked on the production instance with the following results:

   Workflow A fails the runtime validation check and is prevented from running on the production system. The system adds to the workflow context a workflow log entry detailing the cause of the failure, notably the absence of a dependent workflow.

   To learn more about the validation checks on workflow dependencies and update sets see ValidateUpdateSetDependencies on page 3310.

Workflow update set migration use case - subflow dependency (risk)

Multiple users migrate a workflow from a test instance to a production instance without proper coordination. This use case can succeed, but only when each user understands the dependencies and properly migrates the dependent parts of the workflow to the new instance.

This example does not represent an update set failure, although update sets are most often blamed in this use case. Validation increases the visibility of workflow dependencies across multiple update sets and provides designers with better information. In most cases, the warnings do not prevent an action, but only identify risk. The designer is responsible for taking action on advice given in the validation checks.

1. User A selects Update Set C.
2. User A checks out Workflow A.
3. User A adds a subflow called Workflow B that returns a User ID.

   Note: Assume that Workflow B was previously published and migrated to the production instance.
4. User A uses the return value of Workflow B to generate approvals.
5. User B selects Update Set D.
6. User B checks out Workflow B (the subflow in Workflow A).
7. User B modifies the return value of the workflow by changing it from a User ID to a String Message.
8. User A publishes Workflow A.
9. User A cancels publishing and validates Workflow A.

10. User A is warned that Workflow B was modified by a user in a different update set.

11. User A ignores this warning and publishes Workflow A.

Note: A customer update set record is added to Update Set C containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.

12. User A completes Update Set C and migrates it to the production instance.

13. Workflow A is invoked on the production instance and runs successfully using the older version of Workflow B already on the system.

14. User B publishes Workflow B.

Note: User B is not warned of the Update Set C dependency, because the update set is no longer In progress. However, User B is informed via a dialog box that there are warnings associated with the workflow version and is instructed to validate Workflow B. If User B cancels publication and validates the workflow, User B is warned that there are workflows that use Workflow B as a subflow. Knowing the return value was changed, User B should test those workflows as well. See ValidateUpdateSetDependencies on page 3310 to understand the parameters of update set warnings.

15. User B finally publishes Workflow B.

Note: A customer update set record is added to Update Set D containing an XML payload, including the published Workflow B and all activity dependencies.

16. User B completes Update Set D and migrates it to the production instance.

17. Update Set D commits without warnings.

18. Workflow A is invoked on the production instance and fails to run successfully, because the return value of Workflow B no longer generates a User ID.

Input variable movement

You can add input variables to existing workflows and add them to update sets.

When you submit the new variables, an entry is made into the current update set that reflects the addition of a variable to the Variables [var_dictionary] table. Unlike the workflow version that only writes to the update set when the workflow is published, the variables write individual update entries into the currently selected update set immediately upon submission.

Input variable movement use case - two input variables

An existing workflow already contains two input variables.

1. User A checks out the workflow.

2. User A adds two input variables.

   ServiceNow adds to the current update set one customer update record for each new variable.
The current workflow now has 4 input variables: the two that were present prior to check out and the two new ones.

3. User A publishes the workflow.

There are now three related customer update records: two for new variables, and one for the published workflow. The XML payload of the new workflow version now includes all input variable database entries. So while the two original input variables do not have individual customer update records, all four variables are migrated to the local instance with the payload of the newly published workflow version.

4. Verify variables included in a specific workflow.

5. User A completes the update set.

6. Adding Input Variables - Success

User A migrates and commits the update set to a local instance where the original workflow version had previously been committed.

- The two existing input variables are already present because of the earlier version.
- The system adds the two new input variables when the user commits the update set.
- The system preserves the two legacy input variables on the instance receiving the update set. The update set does not overwrite these variables.
- The new published workflow version uses all four variables.
- The user tests the new workflow version and it runs as expected.

Verify variables included in a specific workflow
You can verify the variables that are included in a specific workflow.

1. Navigate to System Update Sets Local Update Sets.
2. Select the active update set.
3. Select the customer update entry for the workflow.
4. View the XML Payload.
5. Search for the name of one of the columns or search for var_dictionary.

There is one var_dictionary entry for each input variable.

Input variable removal

Deleting workflow input variables, like insert and update actions, creates a customer update record in a user’s current update set.

These deletions migrate to a new instance with the update set, regardless of whether the workflow that owns the input variables is published in the same update set. Plan carefully and use caution when editing a workflow and selecting update sets.

Input variable removal risk
An existing workflow already contains two input variables.

1. The workflow was migrated to a production instance with the two variables.
2. On a development instance, User A selects Update Set A and checks out the workflow.
3. User A removes one input variable and all references to it in the workflow.

   The system enters into Update Set A one customer update record reflecting the deletion of the input variable. No record is added for the new workflow version which no longer depends on the input. This does not happen until the workflow is published.

4. User A continues working on other features in Update Set A that need to be moved to production.
5. User A completes Update Set A and migrates it to the production instance without publishing the workflow.

The update set entry that deletes the workflow input variable now applies to the production instance. The prior version of the workflow is running on this instance and still references the missing variable.

**Input variable removal solution**

When editing workflows, particularly when deleting input variables, be sure to use a single update set for all variable editing and workflow publishing.

If necessary, merge the update set into a more general set targeted for deployment after the workflow is published. For information about update sets, see [System update sets](#).

---

**Note:** If a workflow version is already running on a production system and input variables are deleted from a newer version, those deletions could affect transactions already running against the earlier version. Use extreme caution when deleting workflow input variables and plan the migration carefully.

---

**Input variable removal prevention**

Prior to publishing a workflow version, the system validates the workflow model to assist the designer in planning for deployment.

This validation warns of critical errors that can prevent a workflow from running successfully, but also warns of dependencies and conflicts in update sets. See [ValidateUpdateSetDependencies](#) on page 3310 for more details.

---

**Avoiding duplicate workflows**

Update sets manage the published state of all versions of a workflow prior to committing the workflow version on a local instance.

The last version of a workflow committed as an Insert or Update using an update set becomes the currently published version, regardless of the publishing sequence for the workflow versions.

**Commit a workflow in an update set**

Follow the steps in this page to commit a workflow in an update set.

1. Workflow A - Version 1 is created and published in Update Set A.
2. Update Set A is completed and migrated to a local instance.
3. When the update set is committed, the system sets all prior versions of Workflow A to published = false.

   In the first migration, there are no prior versions.
4. Workflow A - Version 1 becomes the only published version of the workflow.

**Update set migration example**

It is not possible to have multiple published versions as a result of update set commits. However, this does not eliminate risk, and care should be taken when migrating update sets.

Consider this example:

1. Workflow A - Version 1 is migrated and committed to the production instance.
2. Update Set B is created.
3. Update Set C is created.
4. Workflow A - Version 2 is published in Update Set B.

   A customer update record is added to Update Set B with the Version 2 payload.

   A customer update record is added to Update Set B with the Version 1 workflow left unpublished.
5. Update Set B is completed.
6. Workflow A - Version 3 is published in Update Set C.
   A customer update record is added to Update Set C with the Version 3 payload.
   A customer update record is added to Update Set C with the Version 2 workflow left unpublished.
7. Update Set C is completed.
8. Update Set C is migrated and committed to the production instance.
   Workflow A - Version 1 is set to unpublished.
   Workflow A - Version 2 update is skipped since Update Set B, which contains Version 2, was never migrated.
   Workflow A - Version 3 is committed and becomes the only published version of the workflow.

**Update set migration risk**
Update Set B is migrated and committed to the production instance.

1. Workflow A - Version 3 is set to unpublished.
3. Workflow A - Version 2 is committed and becomes the only published version of the workflow.
   The workflow has gone back a version, perhaps unintentionally. The regressed version becomes the currently published version.

**Workflow timelines**

The system provides a timeline view of history activities associated with a workflow context.

Timelines display a linear calendar of activities, such as tasks and approvals, defined by their start and end dates. Each activity on the timeline is represented by a span, which is displayed as a horizontal, colored bar. Each span has a label and a tooltip that contains additional information about the activity. The left pane displays all the activities in the context (or contexts) in an expandable hierarchy. You can change the timeline's perspective for a more granular view of the data.

**Note:** Workflow timelines reflect context history only and are not real-time gauges of workflow activity.

**Use a timeline**

By default, the timeline displays all activities and transitions requested when first opened.

Collapse any part of the hierarchy in the activity pane and the timeline adjusts automatically. Date/time and duration controls enable you to scale the timeline to view all the elements at once. To display a timeline, click a UI action within a Workflow Context record.

1. Navigate to Workflow Live Workflows Active Contexts.
2. Select a context.
3. In Related Links, click Show Timeline to display the timeline for the entire context.
   The timeline opens with all activities expanded and the view set to Max, which displays the entire timeline at the width of the pane. The title of the timeline is in the form Workflow context: <context name>, Requested Item: <requested item number>.
4. Use the Range Selectors at the top of the timeline to change the perspective.

The increments go from one day to one year. To limit the timeline to an increment between the start date of the first span and the end date of the last span, click Max.

5. Use the starting and ending calendar fields to select the timeline perspective.

These fields control the same perspective as the slider at the bottom of the timeline.

6. Use the pink slider at the bottom of the timeline to change the perspective.
1. Move the slider from right to left to view all the spans on a long timeline.

2. Adjust the end points of the slider to make arbitrary changes to the magnification.

   A narrow slider zooms in on the spans and provides a more detailed view of complex timelines. A wide slider pulls the view out and makes more of the timeline visible on the screen.

7. To focus the timeline view on selected activities, expand or collapse the activity tree.

   Spans not visible in the activity tree are not shown in the timeline pane.

8. Hover over an activity span to display a tooltip with information about the activity.

   This action highlights the activity in the activity pane.
9. Hover over the transition between two activities to highlight the activity and the predecessor activity in the activity pane.

10. Double-click a span to display a history record for that activity.

History records shows information such as the State and the starting and ending times.
Timeline for a selected activity

You can display a partial workflow timeline.

1. Navigate to Workflow Live Workflows Active Contexts.
2. Open a Workflow Context record.
3. On the Workflow Activity History related list, select one or more individual activities.
4. Click Show Timeline from the action menu.
   The resulting view is a snapshot of the timeline, showing only the selected activities and their transitions, if any.
5. Collapse the tree to confine the view even further.
6. To view a timeline displaying activities from different contexts:
   You might use this feature to display a subflow’s context with the parent workflow context.
   1. Navigate to Workflow Live Workflows History.
   2. Select individual history items from the list.
   3. Select the Show Timeline option from the actions menu.
      
      History items are arranged in a hierarchy in the activities pane under their contexts. The timeline title is Multiple Contexts. The timeline draws only the activities and relationships of the history items selected.

View subflows in a workflow timeline

In a workflow timeline, subflow spans appear as a different color than the activities of the main workflow.
Workflow error handling

The personalized JavaScript that users create in workflow activity variables is vulnerable to run-time syntax errors. Available error information is available in a tooltip when you point to a workflow activity in an error state.

In the base system, workflow activities do not provide condition routing on the error state. As a result, the workflow progresses based on the state of the current record. For example, a workflow contains an Approval - User activity that uses an advanced script to add additional approvers. A syntax error in the script results in no approvers being added. Because a state of no approvers is a valid return, even without the syntax error, the approval activity is skipped and the workflow progresses along a positive path. However, this might not be a valid response for the workflow designer who does not want the workflow to progress along the positive path without approvers.

Workflow error handling detects and logs syntax errors and provides a state that the workflow designer can use to add error conditions to the workflow. Use error handling to locate syntax errors in advanced script fields for these workflow activities:

- Approval - User
- Approval - Group
- Catalog Task
- Create Task
- If
- Run Script
Available error information

This table shows which activities support error exits.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Workflow log</th>
<th>Red error indicator</th>
<th>Activity state</th>
<th>Activity result</th>
<th>Fault description</th>
<th>Reroute on error</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval - User</td>

</tbody>
</table>

Workflow error tracking features

Error handling provides visual cues within the workflow, such as error descriptions for activities in pop-ups, and detailed log records.

Banners

Look for an activity with a red banner, indicating that a syntax error has occurred in a script field. All activities that provide error handling, with the exception of Catalog Task and Create Task, display a red banner for this error.

Tooltips

Point to the activity displaying a red banner to view information about the error. A tooltip shows the State and Result of the activity and provides a brief Fault Description (except for task activities). Note that this approval continued as skipped despite the error given in the fault description. See Workflow error handling on page 3348 for the information available to each activity.
**Execution order**

Tooltip text in the Workflow Context graphical view displays the execution order of individual activities, which assists in troubleshooting.

To view the order in which a workflow activity was executed:

1. Navigate to Workflow Live Workflows Active Contexts or All Contexts.
2. Open the context you want to examine.
3. Click Show Workflow.
4. Hover the cursor over a finished or executing activity.

   A tooltip appears showing error data, execution time, and the order in which that activity executed in the workflow. You can use this data to help troubleshoot activities in an error state.
Workflow log

View the log in the Workflow Context form for more information about the syntax error in the activity. Since task activities do not display a red banner when a syntax error has occurred, you must view the log if you suspect the workflow has not run properly. Examine the error description in the log, and then inspect the script in the activity named in the log.

To view the activity by name, navigate to Workflow Administration Properties and enable the Log workflow debug messages property.

Figure 757: Activity execution order
In this example, an SSH activity named File Read specifies an invalid MID Server.

<table>
<thead>
<tr>
<th>Activity name</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCOPE Debug</td>
<td>EXIT SCOPE: Moving from scope ssh_pack to rhino.global</td>
</tr>
<tr>
<td>ENGINE Debug</td>
<td>running File Read(c7d607d44822205f2a8111c73: event=execute)</td>
</tr>
<tr>
<td>ACTIVITY Error</td>
<td>The MID Server (arcdemo_mid) is not valid</td>
</tr>
<tr>
<td>ACTIVITY Error</td>
<td>File Read(674077a46822205f2a8111c73: event=execute): MID Server arcdemo_mid is not valid</td>
</tr>
<tr>
<td>ENGINE Debug</td>
<td>completed File Read(674077a46822205f2a8111c73: event=execute)</td>
</tr>
<tr>
<td>SCOPE Debug</td>
<td>ENTER SCOPE: Moving from scope Global to ssh_pack</td>
</tr>
</tbody>
</table>

**Figure 758: Error handling log**

If the credentials used by an activity in the workflow fail, and the activity cannot authenticate on the target, a message describing the failure appears in the Workflow Log related list. The message displays the target IP address and the credential details.
Create an error condition exit

An administrator can reroute the workflow when a script error occurs by creating an error condition exit for specific activities within the workflow. This allows the workflow to process script errors in a predictable way and not create undesirable results.

1. Open and check out a workflow.
2. Right-click in the top portion of the activity for which you want to create an error exit.
3. Select Add condition from the context menu.
4. Add a condition exit with the following values:
   - Name: Error
   - Condition: activity.state=='faulted'
5. Click Submit.
The Error exit appears on the activity.

6. Connect the Error exit to another activity for handling the error state, such as Notification or Log Message.

Reconfigure an approval condition

Approval activities react differently to script errors than the other activities.
Approval activity script errors can prevent an approval from being processed successfully. This, in turn, can cause the approval to complete as Skipped, which can appear to be an Approved state. To prevent this from happening, reconfigure the Approved exit as follows:

1. Open an approval workflow and make sure it is checked out.
2. On an approval activity, double-click the Approved exit.
3. Add the following script to the Condition field:

```
&& activity.state != 'faulted'
```

This prevents the activity from continuing down the normal path in an error state and ensures that Skipped or Approved is the desired state.
4. Click Update.

Workflow run time metrics

You can enable the collection of workflow run time metrics to determine whether workflows are performing as expected or consuming additional resources.

Outlying run times for a workflow are identified by comparing actual run times to an outlier range calculated with the outlier threshold and estimated run time defined in the workflow properties.

You can monitor the results of these metrics on the Workflow Operations Dashboard and custom homepages with workflow gauges.
Enable workflow run time metrics

Provide an estimated run time that can be compared to actual workflow run times.

For baseline workflows, you must also manually enable the collection of run time metrics. The system automatically enables the collection of run time metrics for new workflows.

To collect run time metrics for a workflow:

1. Navigate to Workflow Workflow Editor.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select Properties.
4. In the Workflow Properties dialog box, click the Estimated Runtime tab.
5. To enable the collection of run time metrics, check that the Requires ERT option is selected.
6. Open a configuration from the Estimated Run Time column.
7. In Estimated Run Time, enter an initial estimate for the workflow's run time.
   The system compares this initial estimate to actual run time results to create outlier reports. The system can automatically update this field in certain circumstances. Workflow designers can also manually update this field.
8. In the Outlier Percentage Threshold for ERT field, enter the percentage deviation from the estimated run time that identifies an outlier workflow run time.
   The system uses a default value of 20.
9. Click Update.

Outlying workflow run times

Workflow run times are identified as outliers when they are longer or shorter than the outlier range that is computed for the workflow.

The outlier range is automatically computed with the Estimated Run Time and Outlier Percentage Threshold for ERT values in the workflow properties. These values are used in the following formulas.

<table>
<thead>
<tr>
<th>Value computed</th>
<th>Computation used</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outlier Value</td>
<td>Estimated Run Time * (Outlier Percentage Threshold for ERT / 100)</td>
<td>10 seconds * (20 / 100) = 2 seconds</td>
</tr>
<tr>
<td></td>
<td></td>
<td>10 seconds * 0.2 = 2 seconds</td>
</tr>
<tr>
<td>Outlier Range</td>
<td>(Estimated Run Time - Outlier Value) to (Estimated Run Time + Outlier Value)</td>
<td>(10 seconds - 2 seconds) to (10 seconds + 2 seconds) = 8 to 12 seconds</td>
</tr>
</tbody>
</table>

When a workflow runs within the outlier range, its estimated run time is automatically updated.

If a workflow has an outlying run time, it appears in any outlier workflow gauges on the Workflow Operations Dashboard and custom home pages.

Workflow estimated run time updates

When a workflow runs within the outlier range, its estimated run time is automatically updated.

The estimated run time is updated with the cumulative moving average of the latest run time value in relation to previous run times. The computed value is rounded to the nearest second and stored as a GlideDateTime.
For example:

<table>
<thead>
<tr>
<th>Data point</th>
<th>Latest value</th>
<th>Cumulative running average (CRA)</th>
<th>CRA after rounding to the nearest second</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>10 seconds</td>
<td>10 seconds</td>
<td>10 seconds</td>
</tr>
<tr>
<td>2</td>
<td>12 seconds</td>
<td>11 seconds</td>
<td>11 seconds</td>
</tr>
<tr>
<td>3</td>
<td>9 seconds</td>
<td>10.333 seconds</td>
<td>10 seconds</td>
</tr>
</tbody>
</table>

**Note:** Because the system rounds to the nearest second, the calculation is less precise with short durations.

You can also manually update the estimated run time in the workflow properties.

**Workflow pause utility**

Workflow Pause Utility provides functionality you can use to pause or resume all workflow contexts, a subset of qualified workflow contexts, or individual workflow contexts. You designate the data and time of day at which the paused workflows should resume, and can manually resume individual workflows as needed.

Once activated, the Workflow Pause Utility plugin (com.glideapp.workflow.pause) updates several tables when you pause or resume workflows. Each table stores specific data related to each paused or resumed workflow.

- **wf_pause_request**
  Records every workflow pause request. The system automatically updates and inserts records in this table whenever you pause workflow contexts. It tracks user-specified resume time, whether the pause request is still active, and the total number of workflow activities that paused or resumed.

- **wf_pause_status**
  Records the status of each workflow context you pause. When you pause workflow contexts, the plugin waits until the current executing activity finishes, and pauses it before the next activity starts. It tracks the specific activity on which the workflow context was paused and whether it has resumed. If the workflow is paused, it tracks the time at which it is scheduled to resume.

- **wf_pause_group_request**
  Pauses the specific set of workflow contexts you designate using filtering in Group Pause Requests. You can manually pause all currently active workflows by clicking the Pause All check box.

- **wf_pause_snapshot**
  Before pausing and after resuming a workflow, the table records a snapshot of the current state of the workflow context. The table also records the state of the currently executing activity on the paused workflow context.

**Use examples**
When you take down an instance for maintenance, you can pause all or selected active workflow contexts, and then resume them after you complete the maintenance.

You have an integration workflow context that hits an internal service that is down for maintenance. You can pause all instances of that workflow context from progressing to the next activity, allowing time for the internal service to be restored. Then, the paused workflow contexts can be resumed.

Activate workflow pause utility

You can activate the Workflow Pause Utility plugin (com.glideapp.workflow.pause) if you have the admin role. This plugin may include demo data and activates related plugins if they are not already active.

Role required: Workflow_admin or workflow_publisher, workflow_creator

1. Navigate to System Definition Plugins .
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
   - If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. If available, select the Load demo data check box.
   - Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
   - You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.
5. Click Activate.

Pause and resume individual workflows

To pause individual workflow contexts, specify the date and time of day at which the workflow context should resume. When a workflow context is paused, the system saves basic information about the pause request, such as the resume date and time, in the wf_pause_request table. A workflow context automatically resumes at a specified date and time of day, but paused workflow context can be manually resumed as needed.

Role required: Workflow_admin or workflow_publisher, workflow_creator

Install and activate the Workflow Pause Utility plugin.

1. Navigate to Workflow Live Workflows Active Contexts .
2. Select the individual workflow context you are pausing.
   - Workflow Context appears.
3. In Related Links, click Pause.
   - A Workflow Pause Inputs dialog appears.
4. In the Workflow Pause Inputs dialog:
a) Click to select the date, and enter the time of day (in hours, minutes, and seconds) at which the workflow should resume. You can select the current date or future date, but you must enter a time of day in the future.

For example, to pause the workflow context at 13:30:00 (1:30 pm), select the date from the calendar, and then enter 13, 30, and 00 into the respective Time: fields.

b) Click when finished.

c) The selected date and time of day appear in the Resume At field.

d) Click OK to return to Workflow Contexts.

The selected workflow is now paused. Use Workflow pause request to monitor its status.

5. Paused workflows resume on the date and time of day specified in the Resume At field. To manually resume a currently paused workflow context:

   a) Navigate to Workflow Live Workflows Active Contexts.
   b) Select the individual workflow context you are pausing.

   Workflow Context appears.

   c) In Related Links, click Resume.

Pause and resume all or multiple workflows

Use Workflow Pause Group Requests to pause, or resume, groups of workflows, or all active workflows. If pausing a group of workflows, use filtering functions to select the workflows. If pausing all active workflows, select the Pause All check box to indicate that all currently active workflows should be paused.

Role required: Workflow_admin or workflow_publisher, workflow_creator

Install and activate the Workflow Pause Utility plugin.

1. Navigate to Workflow Operations Group Pause Requests.

   Workflow Pause Group Requests appears and displays existing workflow pause group requests.

2. Click New.

   Workflow Pause Group Request appears, and assigns a workflow pause group request ID.

3. To pause all active workflows, select Pause All, then click Update. To pause a filtered group of active workflow contexts, skip this step.

   All currently active workflow contexts in the instance are paused until you resume them. Use Workflow pause request to monitor their status.

4. To pause a filtered group of active workflow contexts, use the Filter field, specify the conditions for the search, then click Update.

   Workflow Pause Group Requests appears, and displays the results of the workflow group search. It assigns a workflow pause group request ID and indicates if the group is active (true = paused) or inactive (not yet paused).

5. To update, resume or delete a specific workflow pause group request, select it.

   Workflow Pause Group Request appears, and displays the selected workflow pause group request.
6. If the selected workflow pause group request is active (paused), and you do not want to pause it, click Do Not Pause Incoming Workflows. If the selected workflow pause group request is inactive (not yet paused), click Pause to pause it.

7. For the paused workflow group request, use the Resume At field to specify the date and time of day at which the paused workflow contexts should resume.
   a) Click
      ![Date Selection]
      to select the date, and enter the time of day (in hours, minutes, and seconds) at which the workflow contexts should resume. You can select the current date or future date, but you must enter a time of day in the future.
      For example, to pause the workflow context group at 13:30:00 (1:30 pm), select the date from the calendar, and then enter 13, 30, and 00 into the respective Time: fields.
   b) Click
      ![Date Selection]
      when finished.
   c) The selected date and time of day appear in the Resume At field.
   d) Click OK to return to Workflow Pause Group Request.

8. Click Submit.

9. Paused workflow contexts automatically resume on the date and time of day specified in the Resume At field. To manually resume currently paused workflow contexts:
   a) Navigate to Workflow Pause Group Requests.
   b) Select the workflow pause group request to resume.
      Workflow Pause Group Request appears.
   c) Click Resume, and then click Update.

10. Workflow Group Pause Request also contains the following information fields.

    | Field                          | Description                                                                 |
    |--------------------------------|-----------------------------------------------------------------------------|
    | Active                         | Indicates if workflow group is paused.                                      |
    | Completed Resume Activity Count| Number of resumed workflow context activities that are completed.           |
    | Filter                         | Standard filtering fields used to specify the conditions for selection of a group of workflow contexts. |
    | Log                            | Activity work notes generated by the group pause request.                   |
    | Not Transitioned Workflow Count| Number of workflow contexts that were not transitioned when the group pause request was placed. When a group pause request is placed, the affected workflow contexts are paused before start of the next activity. |
Monitor workflow pause requests

You can monitor the status of workflow pause requests using Workflow Pause Request.

Role required: Workflow_admin or workflow_publisher, workflow_creator

You must install and activate the Workflow Pause Utility plugin.

   Workflow Pause Requests appears and displays existing workflow pause requests.

2. Select the workflow pause request.
   Workflow Pause Request appears, and displays the selected workflow pause request.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Req Number</td>
<td>Unique assigned pause request number.</td>
</tr>
<tr>
<td>Completed Resume Activity Count</td>
<td>Number of workflow context activities resumed after the pause completed.</td>
</tr>
<tr>
<td>Pause Active</td>
<td>Selected indicates the workflow context is currently paused. Cleared indicates it is not.</td>
</tr>
<tr>
<td>Transitioned During Pause</td>
<td>Number of workflow contexts that transitioned when the pause request was placed. When a pause request is placed, the affected workflow contexts are paused before start of the next activity.</td>
</tr>
<tr>
<td>Workflow Context</td>
<td>Reference number for the paused workflow context.</td>
</tr>
<tr>
<td>Log</td>
<td>Activity work notes generated by the group pause request.</td>

<td>Group Pause Request</td>
<td>Reference number for the associated group pause request, if any. Appears only if pause request was the result of a group pause request.</td>
</tr>
<tr>
<td>Is Workflow Complete</td>
<td>Selected indicates the workflow context is complete. Cleared indicates it is not.</td>
</tr>
<tr>
<td>Is Workflow Stuck</td>
<td>Selected indicates the workflow context is stuck. Cleared indicates it is not.</td>
</tr>
<tr>
<td>State</td>
<td>Current state of the workflow context - Paused or Resumed.</td>
</tr>
<tr>
<td>Stuck Activities Count</td>
<td>The number of workflow context activities that are stuck.</td>
</tr>
<tr>
<td>Stuck Act Count To be subtracted for Pause Percentage</td>
<td>Writer to whom the documentation request is assigned.</td>
</tr>
</tbody>
</table>

**Encrypted workflow scratchpad**

The Encrypted Workflow Scratchpad plugin (com.snc.encrypted.scratchpad) provides encrypted scratchpad support for workflow context and workflow executing activities.

The platform supports encryption on most fields, and workflows can execute on tables with encrypted fields. Encrypted data is typically stored in the workflow scratch pad for workflows that execute using encrypted fields and must access this data after processing an approval, timer, or create task activity.

Data in the workflow scratchpad is not encrypted by default. The Workflow engine supports scratchpad encryption and executing activity records only when the Encrypted Workflow Scratchpad plugin is activated. Once activated, data stored in the wf_context and wf_executing scratchpads is protected by a private workflow engine encryption context, and is prevented from being stored in plain text.

**Activate encrypted workflow scratchpad**

Activate the Encrypted Workflow Scratchpad plugin (com.snc.encrypted.scratchpad) if you have an admin role.
Role required: admin

The Encrypted Workflow Scratchpad plugin must be activated via a customer support request. You should activate and thoroughly test the plugin in a non-production instance. Only after you satisfied with the results should you activate it in a production instance.

When activating it in a production instance, you should pick a low transactional volume time to do so. Prior to its activation, first activate the Workflow Pause Utility (com.glideapp.workflow.pause), and then pause all active workflows. Refer to Workflow pause utility on page 3356. After activating the Encrypted Workflow Scratchpad plugin, resume all paused workflows.

Encrypted Workflow Scratchpad activates these related plugins if they are not already active.

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Encryption Support</td>
<td>Allows text fields and attached files to be encrypted.</td>
</tr>
</tbody>
</table>

1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
   - If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. If available, select the Load demo data check box.
   - Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
   - You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.
5. Click Activate.

Once you install and activate the plugin, resume all paused workflows. Refer to Pause and resume all or multiple workflows on page 3358.

Troubleshoot workflows

Troubleshooting tools for workflows enable administrators to isolate execution paths, compare contexts, and track incomplete activities.

The workflow timeline provides a visual representation of the workflow, including transitions and the elapsed time for each activity. A troubleshooting tool for highlighting execution paths helps users perform forensics on a workflow. The highlighting feature can group multiple execution paths in various colors and can isolate rollback processing. Use the workflow highlighter to isolate incomplete tasks and approvals. You can also enable a workflow performance timing feature to troubleshoot slow workflows.
Execution path troubleshooting in timelines

Use the controls in a workflow timeline to isolate specific execution paths or compare multiple execution paths over time.

Timelines show how the activities in the workflow progressed in relation to one another over time. Isolate execution paths and follow transition lines between subflows and the main flow. Processing times provide a view of the workflow that you cannot get from the workflow diagram. Tooltips give precise information about each activity, such as duration.

![Workflow timeline troubleshooting](image)

Figure 760: Workflow timeline troubleshooting

Execution history table

Highlight execution paths and rollbacks to locate activities that may have been left in an unresolved state. Rollbacks, cancels, and deletions during the execution of a workflow can prevent some activities from fully completing. Use highlighting in the execution history table to determine which activities in the workflow were left in an unresolved state.

1. Run the workflow.
2. Navigate to Workflow All Contexts.
3. Select a context to troubleshoot.
4. In the Workflow Context form, select the Workflow Activity History related list.
5. Right-click an activity and select Workflow Debug Toggle Execution Path Highlighting from the context menu.
All activities in that execution path are highlighted in a color selected by the platform. The debug path shows all activities that completed successfully during the workflow.

6. Right-click a rollback activity and select Workflow Debug Toggle Rollback Highlighting from the context menu.

The platform highlights the rollback path (restarted activities) in a different color. Each color represents a group of activities that were part of the same rollback execution. The highlighting includes the activity that initiated the rollback. If you right-click an activity that was not part of a rollback, no rows are highlighted.

Note: The rollback activity itself appears in both execution path and rollback highlighting.
7. To remove highlighting, right-click in the list and select an option to clear execution path or rollback highlighting. You can clear individual rollback paths or all rollback highlighting.

Use the Workflow Operations Dashboard

On the Workflow Operations Dashboard, view and add widgets to help you monitor workflows. Review the performance of workflows and determine which workflows must be improved.

Role required: workflow_admin

The different levels of access are:
- View: View the dashboard and refresh report widgets.
- Customize: Refresh, add, delete, and rearrange widgets.

On the Workflow Operations Dashboard, you can click widget elements to view the records they represent. You can also add new report widgets that are not displayed by default.

The default reports on the dashboard include:
- Workflow contexts providing run time metrics
- Active workflows started during a specified time period
- Workflows run between yesterday and today
• Workflows by state for the current month
• Aged workflow contexts for the past month

2.

To find and add more widgets, click the Add Content icon ( ) in the upper left corner of the dashboard.

If a workflow consistently appears as an outlier and there is no error causing the run time values, you can use its historical run time values to calculate a new estimated run time value. Then update the estimated run time in the workflow properties.

Workflow gauges

Multiple gauges are available to help you review the performance of workflows. You can add these gauges to the Workflow Operations Dashboard or custom homepages.

Table 1270: Workflow gauges

<table>
<thead>
<tr>
<th>Content</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ERT Dashboard Controls</td>
<td></td>
</tr>
<tr>
<td>Outlier Finished Workflows for ERT (Percentage Outlier)</td>
<td>Identifies workflows that finished, but did not finish within estimated runtime (ERT) values. Enter an outlier percentage to see workflows that ran outside the specified runtime range.</td>
</tr>
<tr>
<td>Outlier Long Running Workflows for ERT (Percentage Outlier)</td>
<td>Displays workflows running longer than the configured runtime threshold.</td>
</tr>
<tr>
<td>Workflow Dashboard</td>
<td></td>
</tr>
<tr>
<td>Workflows Without Current Record</td>
<td>Displays workflow contexts that do not have an associated current record.</td>
</tr>
<tr>
<td>Gauges  Workflow Context</td>
<td></td>
</tr>
<tr>
<td>Number of Active Workflows Started Hourly Over Time (Yesterday)</td>
<td>Displays the total number of running workflows per hour over a given time period. By default, it displays the number of workflows that ran per hour over the previous day (yesterday).</td>
</tr>
<tr>
<td>Outlier Finished Workflows Not Cumulated to ERT</td>
<td>Displays workflow contexts that are finished outside the estimated runtime outlier value and not cumulated to estimated run time value.</td>
</tr>
<tr>
<td>Running Workflow Context</td>
<td>Displays the total number of running workflows.</td>
</tr>
<tr>
<td>Successfully Finished Workflows Cumulated to ERT</td>
<td>Displays the total number of successfully completed workflows whose running duration is cumulated to the estimated run time value.</td>
</tr>
<tr>
<td>Workflows by State (This Month)</td>
<td>Displays the total number of workflows run in a month grouped by the current state.</td>
</tr>
<tr>
<td>Aged Workflow Contexts (Running Since Last Month)</td>
<td>Displays the total number of workflow contexts running for a given period of time by workflow name. By default, it displays the total number of workflow contexts running over the last month.</td>
</tr>
</tbody>
</table>
Workflow performance timing

The workflow engine can generate detailed performance timing data that is useful for troubleshooting slow workflows.

An administrator must enable this functionality.

When workflow performance timing is enabled, the workflow engine tracks key performance data, including various execution speed metrics. The Workflow Timing [wf_workflow_timing] table stores the data, with a record for each workflow context. The workflow timing record is updated when the workflow engine completes the workflow, waits for an activity to complete, or otherwise exits the workflow execution.

Workflow estimated run time properties

Administrators can enable the collection of workflow run time metrics by setting Estimated Run Time (ERT) properties.

Administrators can use ERT metrics to determine if workflows are running longer or shorter than expected and to identify errors in workflow processing. The system displays run time metrics on the Workflow Operations Dashboard.

Enable workflow performance timing

Workflow performance timing is disabled by default. You can create a system property to enable it.

Role required: admin

  Add a system property with the following specifications.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.workflow.show_timing</td>
</tr>
<tr>
<td>Type</td>
<td>true</td>
</tr>
<tr>
<td>Value</td>
<td>true</td>
</tr>
</tbody>
</table>

Workflow activities

Workflow activity properties reference

Each activity performs a different task, such as running a script, sending notifications, or requesting approvals. Activities can succeed or fail, which can result in actions performed by other activities.

For information about configuring different types of activities, click an activity name in the list below or see Workflow activities reference on page 3368.

Core activities provided in the base system

- Approval and rollback workflow activities on page 3373
• **Condition Workflow activities** on page 3398
• **Notification workflow activity** on page 3415
• **Notify workflow activities**
• **Subflow activities**
• **Task workflow activities** on page 3423
• **Timer workflow activities** on page 3416
• **Utility workflow activities** on page 3432

### Activities provided with Orchestration

The following activities are included with Orchestration.

- Active Directory activity pack
- Orchestration activities
- PowerShell activities
- Puppet activities

### Templates provided for creating custom activities

If Orchestration is active on your system, users with the proper roles can create custom activities using the ServiceNow *Orchestration activity designer* on page 1990. For information about the templates Orchestration provides for creating custom activities that you can upload to the ServiceNow Store, see *Orchestration custom activity templates* on page 2027.

### Workflow activities reference

Workflow activity reference, organized by category.

Each activity performs a different task, such as running a script, sending notifications, or requesting approvals.

### Approval and rollback activities

Approval and rollback activities generate and manage approvals. Not all workflows can include approval activities. For more information, read *Approval and rollback workflow activities* on page 3373.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Approval Action workflow activity</strong> on page 3373</td>
<td>The Approval Action activity performs an approval action on the current task.</td>
</tr>
<tr>
<td><strong>Approval Coordinator workflow activity</strong> on page 3374</td>
<td>The Approval Coordinator activity creates an approval whose outcome depends on the outcome of one or more child activities, including one or more Approval - User, Approval - Group, and/or Manual Approval activities.</td>
</tr>
<tr>
<td><strong>Approval - Group workflow activity</strong> on page 3377</td>
<td>The Approval - Group activity creates approval records for each member of a specified group.</td>
</tr>
<tr>
<td>Activity</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Approval - User workflow activity on page 3384</td>
<td>The Approval - User activity creates one or more individual user approvals.</td>
</tr>
<tr>
<td>Generate workflow activity on page 3389</td>
<td>The Generate activity immediately creates task or approval records from any task or approval activities placed after the Generate activity in the workflow path. These pre-generated tasks and approvals start when the task and approval activities are reached during flow execution. This allows a task to have a set of associated pre-generated sequential tasks or approvals, but still require them to be completed in order.</td>
</tr>
<tr>
<td>Manual Approvals workflow activity on page 3392</td>
<td>The Manual Approvals activity watches and manages any approvals that users add manually outside of the workflow process. This activity only selects approvals that are in the Not requested state.</td>
</tr>
<tr>
<td>Rollback To workflow activity on page 3394</td>
<td>The Rollback To activity transitions directly to the activity specified by the outgoing transition line arrow.</td>
</tr>
</tbody>
</table>

### Condition activities

Condition activities provide conditional branching and logical operation functionality for workflows.

Table 1272: Condition activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If workflow activity on page 3398</td>
<td>The If activity checks a condition or script to determine if a Yes or No transition should be taken.</td>
</tr>
<tr>
<td>Switch workflow activity on page 3399</td>
<td>The Switch activity checks if the value of a passed field or variable is equivalent to one of several case values.</td>
</tr>
<tr>
<td>Wait for condition workflow activity on page 3403</td>
<td>The Wait for condition activity causes the workflow to wait at this activity until the current record matches the specified condition.</td>
</tr>
<tr>
<td>Wait for WF Event workflow activity on page 3404</td>
<td>The Wait for WF Event activity causes the workflow to wait at this activity until the specified event is fired.</td>
</tr>
</tbody>
</table>

### Notify activities

Notify workflow activities manage calls and SMS messages in Notify.

Table 1273: Notify activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Forward call workflow activity on page 892</td>
<td>The Forward Call activity forwards a Notify call to an E.164-compliant phone number.</td>
</tr>
<tr>
<td>Input workflow activity on page 893</td>
<td>The Input activity creates a phone menu by presenting a list of options on a Notify call.</td>
</tr>
<tr>
<td>Activity</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Hangup workflow activity on page 894</td>
<td>The Hangup activity disconnects an active Notify phone call.</td>
</tr>
<tr>
<td>Play workflow activity on page 895</td>
<td>The Play activity plays a sound file on a Notify call.</td>
</tr>
<tr>
<td>Record workflow activity on page 895</td>
<td>The Record workflow activity records audio from a user on a Notify call.</td>
</tr>
<tr>
<td>Reject workflow on page 896</td>
<td>The Reject workflow activity rejects an incoming Notify call.</td>
</tr>
<tr>
<td>Say workflow activity on page 896</td>
<td>The say workflow activity allows you to play a message, using text to speech, on a Notify call.</td>
</tr>
<tr>
<td>Forward to notify client workflow activity on page 897</td>
<td>The forward to notify client workflow activity connects a phone call to a Notify WebRTC client.</td>
</tr>
<tr>
<td>Call workflow activity on page 890</td>
<td>The Call activity makes outbound phone calls using a Notify workflow.</td>
</tr>
<tr>
<td>Join conference call workflow activity on page 888</td>
<td>The Join Conference Call activity connects an incoming or outgoing call to a Notify conference call.</td>
</tr>
<tr>
<td>Send SMS workflow activity on page 891</td>
<td>The send SMS workflow activity to send short text messages using Notify to users' phones.</td>
</tr>
<tr>
<td>Queue workflow activity on page 898</td>
<td>The Queue activity places an active Notify call in a queue.</td>
</tr>
</tbody>
</table>

**Notification activities**

Notification workflow activities notify users of events that occur during the workflow.

**Table 1274: Notification activities**

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Event workflow activity on page 3415</td>
<td>The Create Event activity adds an event to the event queue, but does not immediately fire the event.</td>
</tr>
<tr>
<td>Notification workflow activity on page 3415</td>
<td>The Notification activity sends an email or SMS message to specified users or groups.</td>
</tr>
</tbody>
</table>

**Timer activities**

Timer activities pause workflows for set periods of time.
Table 1275: Timer activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SLA Percentage Timer workflow activity on page 3416</td>
<td>The SLA Percentage Timer activity pauses the workflow for a duration equal to a percentage of an SLA.</td>
</tr>
<tr>
<td>Timer workflow activity on page 3417</td>
<td>The Timer activity pauses the workflow for a specified period of time.</td>
</tr>
</tbody>
</table>

Task activities

Task activities create and modify workflow tasks.

Table 1276: Task activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Worknote workflow activity on page 3423</td>
<td>The Add Worknote activity adds text to the Worknotes field of the current incident record.</td>
</tr>
<tr>
<td>Attachment Note workflow activity on page 3423</td>
<td>The Attachment Note activity adds an attachment to the current record.</td>
</tr>
<tr>
<td>Catalog Task workflow activity on page 3424</td>
<td>The Catalog Task activity creates a service catalog task record.</td>
</tr>
<tr>
<td>Create Task workflow activity on page 3428</td>
<td>The Create Task activity generates a record on any of the tables that extend Task [task].</td>
</tr>
</tbody>
</table>

Utility activities

Utility activities provide controls over the path of the workflow, and other useful tools.

Table 1277: Utility activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Branch workflow activity on page 3432</td>
<td>The Branch activity splits the workflow into multiple transition paths from a single activity.</td>
</tr>
<tr>
<td>Join workflow activity on page 3432</td>
<td>The Join activity unites multiple execution paths into one transition.</td>
</tr>
<tr>
<td>Lock workflow activity on page 3433</td>
<td>The Lock activity prevents other instances of this workflow from continuing past this activity until the lock is released.</td>
</tr>
<tr>
<td>Log Message workflow activity on page 3436</td>
<td>The Log Message activity writes a message to the workflow log.</td>
</tr>
<tr>
<td>Log Trace Message workflow activity on page 3436</td>
<td>The Log Trace Message activity writes a trace message to the workflow log.</td>
</tr>
<tr>
<td>Activity</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><em>REST Message legacy workflow activity</em> on page 3436</td>
<td>The legacy REST Message activity enables an administrator to override the REST endpoint or supply the variables configured in the REST Message module.</td>
</tr>
<tr>
<td><em>Return Value workflow activity</em> on page 3438</td>
<td>The Return Value activity returns a value to a parent workflow, when run from a subflow.</td>
</tr>
<tr>
<td><em>Run Script workflow activity</em> on page 3438</td>
<td>The Run Script activity runs the specified script in the scope of the workflow version.</td>
</tr>
<tr>
<td><em>Set Values workflow activity</em> on page 3438</td>
<td>The Set Values activity sets values on the current record when the workflow quiesces or ends.</td>
</tr>
<tr>
<td><em>SOAP Message legacy workflow activity</em> on page 3439</td>
<td>The legacy SOAP Message activity uses SOAP messages defined in the System Web Services plugin and can call the messages using a MID Server.</td>
</tr>
<tr>
<td><em>Turnstile workflow activity</em> on page 3440</td>
<td>The Turnstile activity limits how many times a workflow can pass through the same point.</td>
</tr>
<tr>
<td><em>Unlock workflow activity</em> on page 3442</td>
<td>The Unlock activity releases a lock that was previously placed by the Lock activity.</td>
</tr>
</tbody>
</table>

### Subflow activities

Subflow activities run and manage workflows from a parent workflow.

**Table 1278: Subflow activities**

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>Parallel Flow Launcher workflow activity</em> on page 3442</td>
<td>The Parallel Flow Launcher activity launches multiple subflows in parallel.</td>
</tr>
</tbody>
</table>

### Activities provided with Orchestration

The following activities are included with Orchestration.

- Active Directory activity pack
- Orchestration activities
- PowerShell activities
- Puppet activities

### Templates provided for creating custom activities

If Orchestration is active on your system, users with the proper roles can create custom activities using the ServiceNow Orchestration activity designer on page 1990. For information about the templates Orchestration provides for creating custom activities that you can upload to the ServiceNow Store, see Orchestration custom activity templates on page 2027
Approval and rollback workflow activities

Approval and rollback activities generate and manage approvals.

Approval and rollback activities are not available in some workflows.

- With two exceptions, approval and rollback activities are only available when the workflow runs on a table that extends Task. The exceptions are the Approval - User and Approval Action activities, which are available globally.
- Approval and rollback activities are available only if approval engines are turned off for the table on which the workflow runs. If approval engines are enabled for the table, approval activities appear greyed out and cannot be selected. To learn more about how workflow and approval engines interact, read Approval workflow activities and approval engines on page 3464.

Approval Action workflow activity

The Approval Action activity performs an approval action on the current task.

Use this activity to mark the current task record as approved or rejected.

**Note:** When an Approval Action activity is used to mark a task approved, the activity marks all pending approvals as No Longer Required. This activity behaves differently from Set Values or Run Script when used to set the Approval field's value.

Results

The result value of the activity is the final approval disposition selected by the approver. The result value can be Approved or Rejected. A workflow designer can assign a result value using the activity.result variable from within a script field of the activity.

Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>The action to perform on the task. Options are:</td>
</tr>
<tr>
<td></td>
<td>• Mark task approved</td>
</tr>
<tr>
<td></td>
<td>• Mark task rejected</td>
</tr>
<tr>
<td></td>
<td>• Mark task requested</td>
</tr>
<tr>
<td></td>
<td>• Disregard pending approvals: the system sets approval records to no longer required and marks the activity as approved.</td>
</tr>
</tbody>
</table>

Conditions

The conditions determine which transition runs after this activity.
Table 1280: Approval Action activity conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Always</td>
<td>The event or condition that causes the approval to move to the next workflow step.</td>
</tr>
<tr>
<td>Error</td>
<td>The event or condition that generates an error.</td>
</tr>
<tr>
<td>Skipped</td>
<td>The event or condition that allows a skipped approval.</td>
</tr>
</tbody>
</table>

**States**

The activity state tells the workflow engine what to do with the activity.

Table 1281: Approval Action activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the execute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Approval Coordinator workflow activity**

The Approval Coordinator activity creates an approval whose outcome depends on the outcome of one or more child activities, including one or more Approval - User, Approval - Group, and/or Manual Approval activities.

**Note:** This activity is only available when the workflow runs on a table that extends Task.

To create an Approval Coordinator activity, first drag the activity onto the workflow canvas, causing the activity form to display. On the activity form, fill in the appropriate fields, then click Submit.

After you click Submit, the activity appears on the workflow canvas. From there, specify the child activities by clicking the links that appear on the body of the activity.

When the Approval Coordinator activity completes, all pending approvals that were created by any of the Approval Coordinator approval activities are immediately set to No Longer Required. If a single user is called as an approver twice by the same workflow, such as when a single user is both a product approver and an executive approver, any approvals for that user after the first are skipped.
Results

The result value of the Approval Coordinator activity depends on the approval actions taken by the approvers and the approval conditions specified in the Wait for field. Possible result values are:

- Approved
- Rejected
- Deleted
- Cancelled

Input variables

Input variables determine the initial behavior of the activity.

Table 1282: Approval Coordinator activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Wait for | Indicate what to wait for to indicate that the approval activity is approved or rejected. Options are:  
  - Any child activity to be approved: Any child activity (User, Group, or Manual Approval) that completes with a result of approved causes the Approval Coordinator activity to complete with a result of approved.  
  - All child activities to be approved: All child activities of the Approval Coordinator activity must complete with a result of approved to cause the Approval Coordinator activity to complete with a result of approved.  
  - The first approval or rejection from any child activity: The first child activity that completes with a result of approved or rejected causes the Approval Coordinator activity to complete with the same result.  
  - Condition based on script: Call a script to determine how to manage an approval or rejection. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>When a rejection occurs</td>
<td>Specify what the coordinator should do when it sees a rejection from any one of the child activities. Options are:                                                                avery complete the Approval Coordinator activity with a result of rejected. Wait for other responses before deciding: Wait until we get other responses from other child activities before making an approval or rejection decision. This allows users to change their minds until a decision is made. In addition, if Wait for is set to Any child activity to approve then a single child activity completion with a result of approved will cause the Approval Coordinator activity to complete with a result of approved even if other child activities have completed with a result of rejected.</td>
</tr>
<tr>
<td>Approval script</td>
<td>If the Wait for variable is set to Condition based on script this script is called to determine how to handle an approval or rejection. The script needs to set the variable answer to approved or rejected to indicate the overall approval status for this approval. When called, the following variable is available to the script: counts.total = total number of child approval activities that are part of this approval counts.approved = # of child approval activities that approved so far counts.rejected = # of child approval activities that rejected so far counts.requested = # of child approval activities that are pending approval</td>
</tr>
<tr>
<td>Conditions</td>
<td>The conditions determine which transition runs after this activity.</td>
</tr>
<tr>
<td><strong>Table 1283: Approval Coordinator activity conditions</strong></td>
<td></td>
</tr>
<tr>
<td>Condition</td>
<td>Description</td>
</tr>
<tr>
<td>Approved</td>
<td>The users from the groups have approved the request based on the Wait for rules.</td>
</tr>
<tr>
<td>Condition</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Rejected</td>
<td>The users from the groups have rejected the request based on the Wait for rules.</td>
</tr>
</tbody>
</table>

**States**

The activity state tells the workflow engine what to do with the activity.

**Table 1284: Approval Coordinator activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the execute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Approval - Group workflow activity**

The Approval - Group activity creates approval records for each member of a specified group.

**Note:** This activity is only available when the workflow runs on a table that extends Task.

The group approval is approved or rejected based on the user approvals, according to the logic specified in the Wait For field.

**Results**

The workflow designer can assign a result value using activity.result from within a script field of the activity. By default, the result value is the final approval disposition. This disposition depends on the approval actions take by the approvers and the approval conditions specified in the Wait for or When Anyone Rejects fields. Possible result values are:

- Approved
- Rejected
- Deleted
- Cancelled

**Input variables**

Input variables determine the initial behavior of the activity.
### Table 1285: Approval - Group activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval - Group When</td>
<td>Specify when this activity generates a group approval record.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions which, if met, cause the group approval to be generated. If the conditions are not met, the approval is skipped.</td>
</tr>
<tr>
<td>Approval - Group Approvers</td>
<td>Specify the groups whose approval will be requested.</td>
</tr>
<tr>
<td>Groups</td>
<td>The groups whose approval will be requested. To edit this field, click the lock icon. To select specific groups by name, use the lookup list. To select groups from field values on the current record at runtime, click the tree icon. Each member of the group will be assigned an individual approval record. If no group is selected, the activity automatically sets the approval to Approved.</td>
</tr>
<tr>
<td>Approval - Group Condition</td>
<td>Specify how the activity decides to approve or reject the group approval, based on the responses from individual members of the group.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Wait for</td>
<td>A choice between different approval logics to determine which individual approvals or rejections result in approval or rejection of the activity's approval. Options are:</td>
</tr>
<tr>
<td></td>
<td>• An approval from each group: Any user from each group can approve and the first approval from each group causes the activity to complete with a result of approved (see below for how a rejection is handled).</td>
</tr>
<tr>
<td></td>
<td>• An approval from any group: Any user from any group can approve and the first approval from any group causes the activity to complete with a result of approved.</td>
</tr>
<tr>
<td></td>
<td>• An approval from everyone from all groups: All users from all groups must approve to cause the activity to complete with a result of approved (see below for how a rejection is handled).</td>
</tr>
<tr>
<td></td>
<td>• First response from each group: The first approval or rejection from any user in each group is used to indicate the state of the group approval (see below for how a rejection is handled).</td>
</tr>
<tr>
<td></td>
<td>Indicate what happens when any user rejects their approval request. Options are:</td>
</tr>
<tr>
<td></td>
<td>• Reject the approval: Immediately complete the activity with a result of rejected.</td>
</tr>
<tr>
<td></td>
<td>• First response from any group: The first approval or rejection from any user in any group causes the activity to complete with a result of approved or rejected.</td>
</tr>
<tr>
<td></td>
<td>• Condition based on script: Each time a user approves or rejects, the Approval script is called to determine if the activity should complete.</td>
</tr>
<tr>
<td><strong>Field</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>---</td>
<td>---</td>
</tr>
<tr>
<td>Approval script</td>
<td>If the Wait for variable is set to Condition based on script this script is called to determine how to handle an approval or rejection. The script needs to set the variable answer to approved or rejected to indicate the overall status for this approval. This script is responsible for setting the approval state for each group that is part of this approval activity before returning the overall approval state for all of the groups. When called, the following variables are available to the script for all the groups that are part of this approval activity:</td>
</tr>
<tr>
<td></td>
<td><code>counts.total</code> = total number of groups that are part of this approval</td>
</tr>
<tr>
<td></td>
<td><code>counts.approved</code> = # of groups that approved so far</td>
</tr>
<tr>
<td></td>
<td><code>counts.rejected</code> = # of groups that rejected so far</td>
</tr>
<tr>
<td></td>
<td><code>counts.requested</code> = # of groups that are pending approval</td>
</tr>
<tr>
<td></td>
<td><code>counts.not_requested</code> = # of groups that are not pending approval</td>
</tr>
<tr>
<td></td>
<td><code>counts.not_required</code> = # of groups that approval is not required</td>
</tr>
<tr>
<td></td>
<td>And for each group:</td>
</tr>
<tr>
<td></td>
<td><code>groups[group_id].total</code> = total number of users that are part of this group's approval</td>
</tr>
<tr>
<td></td>
<td><code>groups[group_id].approved</code> = # of users that approved so far</td>
</tr>
<tr>
<td></td>
<td><code>groups[group_id].rejected</code> = # of users that rejected so far</td>
</tr>
<tr>
<td></td>
<td><code>groups[group_id].requested</code> = # of users that are pending approval</td>
</tr>
<tr>
<td></td>
<td><code>groups[group_id].not_requested</code> = # of users that are not pending approval</td>
</tr>
<tr>
<td></td>
<td><code>groups[group_id].not_required</code> = # of users that approval is not required</td>
</tr>
<tr>
<td></td>
<td><code>groups[group_id].approvalIDs[state]</code> = array of user ids that are at the specified approval state</td>
</tr>
<tr>
<td></td>
<td>Note: Iterate the groups using:</td>
</tr>
<tr>
<td></td>
<td>`for (var id in groups) {</td>

<tr>
<td></td>
<td>var group = groups[id];`</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| When anyone rejects | A choice between different approval logics to determine which individual rejections result in rejection of the activity's approval. Options are:  
  • Reject the approval: Immediately complete the activity with a result of rejected.  
  • Wait for other responses before deciding: Wait until we get other responses before making an approval or rejection decision. This allows users to change their mind until a decision is made. |
| Approval - Group Schedule | Specify how workflow calculates the approval record's expected start date and due date. Once you've made a selection for 'Due date based on', and 'Schedule based on', the appropriate fields will display. |
| Due date based on | Select how workflow determines the task's duration, due date, and schedule.  
  • A user specified duration: The duration is based on a user specified value.  
  • A relative duration: The duration is calculated from a relative duration (such as End of Next Business Day).  
  • A date/time or duration field: The duration is based on the value of a field on the current record.  
  • Script: The duration is returned by a script. |
<p>| Duration | The specific number of days and hours. |
| Only appears when Due date based on is set to A user specified duration |  |
| Relative duration | The general number and length of business days. |
| Only appears when Due date based on is set to A relative duration |  |
| Due date field | The date/time or duration field. |
| Only appears when Due date based on is set to A date/time or duration field |  |
| Due date script | The script that sets 'answer' to the number of seconds for the duration. |
| Only appears when Due date based on is set to Script |  |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Schedule based on             | The basic schedule the timer uses to count working hours. If a schedule is specified, the duration will only be considered for times that are specified on the schedule. For example, if the duration is 2 hours and the workflow begins at 4:00pm on a schedule that is 8am - 5pm, then it ends at 9:00am the next day. The options are:  
  • This workflow's schedule: The schedule uses workflow context date, time, and an optional Time zone based on value.  
  • A specific schedule: The schedule uses a pre-defined Schedule and an optional Time zone based on value.  
  • A schedule field: The schedule uses a value from a table and an optional Time zone based on value. |
| Schedule                      | The predefined Schedule from a list.                                                                                                                                                                  |
| Schedule field                | A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog.                                           |
| Time zone based on            | The time zone for calculating the duration. The time zone may be based on:  
  • No time zone: Default. Workflow uses the GMT time zone.  
  • A specific time zone: A specific Time zone that you choose from a choice list.  
  • A time zone field: A Time zone field to track time duration from a field on the form.                                                   |
| Time zone                     | Select the time zone you want from the choice list.                                                                                                                                                 |
| Time zone field               | A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog.                                           |

**Approval - Advanced**

If desired, write a script for determining additional users to request approvals from.

<tr>
<td>Advanced</td>
<td>Select this check box to write a script for determining additional users to request approvals from. Use the Additional groups script to customize group approvals.</td>
</tr>
</tbody>
</table>
| Additional groups script| If the Advanced check box is selected, this script is called to determine any additional group approvals to be created. The script needs to set the variable answer to a comma-separated list of group ids or an array of group ids to add as approver groups. For example:  

```javascript
answer = [];  
answer.push('id1');  
answer.push('id2');
```

---

### Conditions

The following conditions determine which transition runs after this activity.

**Table 1286: Approval - Group activity conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approved</td>
<td>The users from the groups have approved the request based on the Wait for rules.</td>
</tr>
<tr>
<td>Rejected</td>
<td>The users from the groups have rejected the request based on the Wait for rules.</td>
</tr>
<tr>
<td>Error</td>
<td>The event or condition that generates an error.</td>
</tr>
<tr>
<td>Skipped</td>
<td>The event or condition that allows a skipped approval.</td>
</tr>
</tbody>
</table>

---

### States

The activity state tells the workflow engine what to do with the activity.

**Table 1287: Approval - Group activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the execute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>State</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Approval - User workflow activity**
The Approval - User activity creates one or more individual user approvals.

**Results**
The result value is the final approval disposition. This disposition depends on the approval actions take by the approvers and the approval conditions specified in the Wait for or When Anyone Rejects fields. Possible result values are:

- Approved
- Rejected
- Deleted
- Cancelled

**Input variables**

**Table 1288: Approval - User activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval - User When</td>
<td>Specify when this activity generates a user approval record.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions which, if met, cause the individual approval to be generated. If the conditions are not met, the approval is skipped.</td>
</tr>
<tr>
<td>Approval - User Approvers</td>
<td>Specify the users whose approval will be requested.</td>
</tr>
<tr>
<td>Users</td>
<td>The users for the approval. Use the tree icon to select user reference fields from the current record to create approvals, such as ${assigned_to}. If no user is selected, the activity automatically sets the approval to Approved.</td>
</tr>
</tbody>
</table>

**Note:** Workflow only manages approval records generated by the Approval User activity. After starting the workflow, newly added approvals do not affect the workflow context.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Groups</td>
<td>Groups whose members should also receive approvals. Note that this is different than the Approval - Group activity, which creates a group approval in addition to the individual approvals. The tree icon can be used to select group reference fields from the current record to create approvals, such as ${assignment_group}.</td>
</tr>
</tbody>
</table>

**Approval - User Condition**
Specify how the activity decides to approve or reject the approval, based on the responses from individual approvers.

**Wait for**
A choice between different approval logics to determine which individual approvals result in approval of the activity's approval. Options are:
- Anyone to approve: Any user can approve and the first approval causes the activity to complete with a result of approved.
- Everyone to approve: All users must approve (see below for how a rejection is handled).
- First response from anyone: The first approval or rejection from any user causes the activity to complete.
- Condition based on script: Each time a user approves or rejects, the Approval script is called to determine if the activity should complete.

**When anyone rejects**
A choice between different approval logics to determine which individual rejections result in rejection of the activity's approval. Options are:
- Reject the approval: Immediately complete the activity with a result of rejected.
- Wait for other responses before deciding: Wait until we get other responses before making an approval or rejection decision. This allows users to change their mind until a decision is made.

**Note:** Note that if Wait for is set to Anyone to approve then a single approval will cause the activity to complete with a result of approved even if one or more users reject.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval Column</td>
<td>A string field for the name of the approval field on the table the workflow is running on. The default value is approval, which is the field on the Task table.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Use the field's name, not its label.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If using any custom approval column fields and approval column journals, use Set Value activities in the workflow to set the custom Approval column fields.</td>
</tr>
<tr>
<td>Approval Journal Column</td>
<td></td>
</tr>
<tr>
<td>Approval Script</td>
<td>If the Wait for variable is set to Condition based on script this script is called to determine how to handle an approval or rejection. The script needs to set the variable answer to approved or rejected to indicate the approval status for this approval. When called, the following information is available: counts.total = total number of users that are part of this approval counts.approved = # of users that approved so far counts.rejected = # of users that rejected so far counts.requested = # of users that are pending approval counts.not_requested = # of users that are not pending approval counts.not_required = # of users that approval is not required</td>
</tr>
<tr>
<td>Approval - User Schedule</td>
<td>Specify how workflow calculates the approval record's expected start date and due date. Once you've made a selection for 'Due date based on', and 'Schedule based on', the appropriate fields will display.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Due date based on</td>
<td>Select how workflow determines the task's duration, due date, and schedule.</td>
</tr>
<tr>
<td></td>
<td>• A user specified duration: The duration is based on a user specified value.</td>
</tr>
<tr>
<td></td>
<td>• A relative duration: The duration is calculated from a relative duration (such as End of Next Business Day).</td>
</tr>
<tr>
<td></td>
<td>• A date/time or duration field: The duration is based on the value of a field on the current record.</td>
</tr>
<tr>
<td></td>
<td>• Script: The duration is returned by a script.</td>
</tr>
<tr>
<td>Duration</td>
<td>Only appears when Due date based on is set to A user specified duration</td>
</tr>
<tr>
<td></td>
<td>The specific number of days and hours.</td>

<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Generate workflow activity**

The Generate activity immediately creates task or approval records from any task or approval activities placed after the Generate activity in the workflow path. These pre-generated tasks and approvals start when the task and approval activities are reached during flow execution. This allows a task to have a set of associated pre-generated sequential tasks or approvals, but still require them to be completed in order.

**Note:** This activity is only available when the workflow runs on a table that extends Task.

By default, the workflow does not create any tasks or approvals until it reaches them in the workflow. The Generate activity follows all transitions through the workflow to each activity. For each activity:

- If it is a task activity, creates the task and sets:
  - The State to Pending
  - The Expected Start Date
  - The Due Date

- If it is an approval activity, creates the approvals and sets:
• The approval State to Not Requested
• The Expected Start Date
• The Due Date

Expected start dates and due dates are calculated based on the Expected Duration of all of the tasks and approvals between the Generate activity and the activity being updated. In the case of a branched path (between a Branch and Join activity), the longer duration will be used for any post-branch activities.

The Generate activity can be used more than once, and any tasks or approvals will be refreshed with updated information. This is useful in situations where the list of approvers or other important information is still editable while the workflow is in process and it may be necessary to update or correct the generated approvals or tasks.

To exclude a set of activities from the Generate activity, select the Skip during generate check box on any condition and its transitions will not be followed during the generate process. By default, the following conditions have the Skip during generate check box selected:

• Rejected (for any of the approval activities)
• No condition of If activity
• Continue condition of Turnstile activity
• Incomplete condition of Join activity

**Input variables**

Input variables determine the initial behavior of the activity.

**Table 1291: Generate activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generate approvals</td>
<td>If selected, approvals are created when running the Generate activity. If cleared, the approvals are used to compute their estimated duration, but no approvals are created.</td>
</tr>
<tr>
<td>Generate tasks</td>
<td>If selected, tasks are created when running the Generate activity. If cleared, the tasks are used to compute their estimated duration, but no tasks are created.</td>
</tr>
</tbody>
</table>

**States**

The activity state tells the workflow engine what to do with the activity.

**Table 1292: Generate activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The activity is executing.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>State</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
</tbody>
</table>

Example

![Diagram of Generate workflow]

Figure 761: Generate workflow

In this example, the following approvals are generated:

- Approval-2
- Approval-3

Approval-4 is skipped since the Rejected condition of Approval-3 has Skip during generate selected.

Here is an example of using the Generate activity that describes the expected start and due dates:
Figure 762: Generate workflow start and due date

In this example, if the Generate activity is run on Jan 1, 2016, the following expected start dates and due dates would be set for the generated tasks.

<table>
<thead>
<tr>
<th>Task</th>
<th>Expected Start Date</th>
<th>Reason</th>
<th>Due Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task 2 (1 day)</td>
<td>Jan. 2, 2016</td>
<td>Task 1 is 1 day</td>
<td>Jan. 3, 2016</td>
</tr>
<tr>
<td>Task 4 (1 day)</td>
<td>Jan. 3, 2016</td>
<td>Task 3 is 2 days</td>
<td>Jan. 4, 2016</td>
</tr>
<tr>
<td>Task 5 (1 day)</td>
<td>Jan. 4, 2016</td>
<td>Task 4 ends the latest before the Join</td>
<td>Jan. 5, 2016</td>
</tr>
</tbody>
</table>

Notice that Task 5 starts on Jan. 4, 2016 since the longest path (based on due dates) to the Join is Task 3/Task 4.

Manual Approvals workflow activity

The Manual Approvals activity watches and manages any approvals that users add manually outside of the workflow process. This activity only selects approvals that are in the Not requested state.

**Note:** This activity is only available when the workflow runs on a table that extends Task.

If there are no pending manual approvals when this activity executes, the activity immediately completes with a result of approved. This activity does not create approval records. Use this activity to pause the workflow when a user adds a manual approval to a record with an associated workflow, and it is in the Not requested state. The workflow waits for the approval to be closed before proceeding.

Results

The workflow designer can assign a result value using activity.result from within a script field of the activity. By default, the result value of the activity is the final approval disposition determined by the approval actions take by the approvers. Possible result values are:

- Approved
- Rejected
Input variables

Input variables determine the initial behavior of the activity.

Table 1293: Manual Approvals activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait for</td>
<td>Indicate what to wait for to indicate that the approval activity is approved or rejected. Options are:</td>
</tr>
<tr>
<td></td>
<td>• Any manual user or group approval: Any user can approve and the first approval causes the activity to complete with a result of approved.</td>
</tr>
<tr>
<td></td>
<td>• All manual user or group approvals: All users must approve (see below for how a rejection is handled).</td>
</tr>
<tr>
<td></td>
<td>• The first response from any manual approval: The first approval or rejection from any user causes the activity to complete.</td>
</tr>
<tr>
<td>When anyone rejects</td>
<td>Indicate what happens when any user rejects their approval request. Options are:</td>
</tr>
<tr>
<td></td>
<td>• Reject the approval: Immediately complete the activity with a result of rejected.</td>
</tr>
<tr>
<td></td>
<td>• Wait for other responses before deciding: Wait until we get other responses before making an approval or rejection decision. This allows users to change their mind until a decision is made.</td>
</tr>
</tbody>
</table>

In addition, if Wait for is set to Anyone to approve then a single approval will cause the activity to complete with a result of approved even if one or more users reject.

Conditions

The conditions determine which transition runs after this activity.
Table 1294: Manual Approvals activity conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approved</td>
<td>The users from the groups have approved the request based on the Wait for rules.</td>
</tr>
<tr>
<td>Rejected</td>
<td>The users from the groups have rejected the request based on the Wait for rules.</td>
</tr>
</tbody>
</table>

**States**

The activity state tells the workflow engine what to do with the activity.

Table 1295: Manual Approvals activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the execute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

*Rollback To workflow activity*

The Rollback To activity transitions directly to the activity specified by the outgoing transition line arrow.

**Note:** This activity is only available when the workflow runs on a table that extends Task.

Rollback To determines which activities to reset based on the actual workflow sequence (transition line attachments) of activities between itself and the transitioned to activity, not the execution order. Rollback To then marks all the approvals that have transitioned between the rollback and the transitioned to activity as Not Yet Requested and the tasks as either Open or Pending.

Use the Rollback To activity for all workflows in which multiple rollbacks are required. Rollback To has no variables.

**Conditions**

The conditions determine which transition runs after this activity.
Table 1296: Rollback To activity conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Always</td>
<td>The event or condition that causes the approval to revert to the previous workflow step.</td>
</tr>
<tr>
<td>Error</td>
<td>The event or condition that generates an error.</td>
</tr>
<tr>
<td>Skipped</td>
<td>The event or condition that allows a skipped approval.</td>
</tr>
</tbody>
</table>

**States**

The activity state tells the workflow engine what to do with the activity.

Table 1297: Rollback To activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the execute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Rollback To behavior

The Rollback To activity transitions directly to the activity specified by the transition line arrow.

Use the Rollback To activity for all workflows that use multiple or nested rollbacks. Rollback To resets the targeted task (the direct transition) to Open. All tasks that have executed between the Rollback To activity and the targeted task (rolled back task) are set to Pending.

(0) Begin
(1) Log Message
(2) Task 1
(3) Task 3
(4) Task 2
(5) Timer
(6) Approval 1
(7) Roll back to first task
(8) Task 1
(9) Task 2
(10) Approval 1
(11) Log approval
(12) Join
(14) Send email
(15) End

Figure 763: Rollback to workflow

Transition history

The state of (3) Task 3 does not change, since this activity does not directly transition from the rollback target activity. To see what activities were rolled back, select the Workflow Transition History related list and look at the Rolled back column.

The Rollback To activity (7) updates the following activities:
(8) Task 1: reset to Open
(9) Task 2: reset to Pending
(10) Approval 1: reset to Not Yet Requested

Figure 764: Rollback To workflow transition

Rollback To activity

When conditions in a workflow trigger a Rollback To activity, the workflow moves processing backward to a specified activity in the workflow and resets certain activities that have already executed back to their original state. This is useful when handling an unexpected failure or as part of a programmed logical flow.

When an activity is reset during a workflow rollback, the following happens:

- Approvals are reset to Not Requested.
- Tasks are reset to either Open or Pending. A rollback workflow path cannot create new tasks.

Activities that perform external system operations, such as deleting a file or sending an email, are not rolled back. Only approval and task activity states are reset.
A workflow can contain a single rollback, multiple rollbacks, or nested rollbacks in more complex workflows. The Rollback To activity resets activities based on the actual workflow sequence (transition line attachments) of activities between itself and the transitioned to activity, rather than using the execution order to determine where processing should restart.

**Condition Workflow activities**

Condition activities provide conditional branching and logical operation functionality for workflows.

*If workflow activity*

The If activity checks a condition or script to determine if a Yes or No transition should be taken.

If the workflow creator specifies both the Condition and the Advanced script, both must evaluate successfully for activity to take the Yes transition.

**Results**

The workflow designer can assign a result value using activity.result from within the Script field on the activity record. By default, the result value of the activity is the final result of the condition or script specified. Possible result values are:

- Yes
- No

**Input variables**

The following variables determine the behavior of the activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>If specified and the current record matches the condition, the Yes transition is taken.</td>
</tr>
<tr>
<td>Advanced and Script</td>
<td>To specify a script, select the Advanced check box. You may then enter a script that is evaluated. If your script sets the variable answer to yes, then the Yes transition is taken. Otherwise, the No transition is taken.</td>
</tr>
</tbody>
</table>

**Conditions**

The following conditions determine which transition comes after the activity.

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Taken when the condition, if specified, matches and the Advanced script, if specified, returns yes.</td>
</tr>
<tr>
<td>Condition</td>
<td>Taken when either the condition does not match or the Advanced script, if specified, returns no.</td>
</tr>
<tr>
<td>-----------</td>
<td>-----------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>

**States**

The activity state tells the workflow engine what to do with the activity.

**Table 1300: If activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the onExecute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

*Switch workflow activity*

The Switch activity checks if the value of a passed field or variable is equivalent to one of several case values.

The switch activity behavior is similar to a switch statement in Java.

When creating a switch activity, select a Variable or Field to check against activity conditions for a matching field value. When the value passed in this variable or field matches the value defined in the Condition field of the activity condition, the workflow progresses through that activity condition.

**Results**

The variable or field selected in the Variable or Field activity variable determines the possible result values.

**Input variables**

The following variables determine the behavior of the activity.

**Table 1301: Switch activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select Variable or Field as the type of value to check against available conditions. This selection sets the label and available options for the other field.</td>
</tr>
</tbody>
</table>
### Field

<table>
<thead>
<tr>
<th>Variable or Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable or Field</td>
<td>Select the source of the value compared against the switch activity conditions. The field label and available options depend on the Type selection.</td>
</tr>
<tr>
<td>Variable: select any service catalog variable.</td>
<td></td>
</tr>
<tr>
<td>Field: select any field from the Table defined in the workflow properties.</td>
<td></td>
</tr>
</tbody>
</table>

### States

The activity state tells the workflow engine what to do with the activity.

#### Table 1302: Switch activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the onExecute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

### Example

You can create a switch activity that sets different field values on an incident based on the Assignment group of the incident record.
Figure 765: Switch activity example

The Field selected is the incident Assigned to field.
Figure 766: Switch activity Field

If the value of the Assigned to field of the workflow-triggering incident is Service Desk or Field Services, the workflow populates values on the incident record before continuing. If the Assigned to value is Hardware, the workflow continues without populating any field values.

Condition type (Standard, Else, or Error) is used. For more information, see *Manage workflow activity conditions* on page 3461.
**Figure 767: Hardware group condition**

*Wait for condition workflow activity*

The Wait for condition activity causes the workflow to wait at this activity until the current record matches the specified condition.

The workflow evaluates the Wait for condition activity each time the current record is updated. Use this activity to pause a workflow indefinitely until a particular criteria is met by a record update. To pause a workflow for a timed duration see *Timer workflow activities* on page 3416.

For workflow to consider the condition met, all conditions specified – whether in the builder or in a script – must be true.
**Note:** A Wait for condition activity should only be used to wait for an external event such as a record update, and not one from a workflow setting a value. If you have a workflow setting a value and want to wait for that same field to be seen as 'changed,' try inserting a one-second timer.

**Results**

The workflow designer can assign a result value using activity.result from within a script field of the activity. The activity transitions when the result value is true.

**Input variables**

The following variables determine the behavior of the activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>The workflow is paused at this activity until this condition matches the current record.</td>
</tr>
<tr>
<td>Condition script</td>
<td>If specified, the workflow is paused at this activity until this script sets the answer variable to true.</td>
</tr>
</tbody>
</table>

**States**

The activity state tells the workflow engine what to do with the activity.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the onExecute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

*Wait for WF Event workflow activity*

The Wait for WF Event activity causes the workflow to wait at this activity until the specified event is fired.

Use this activity to wait for another activity to fire an event. Events from other activities are fired in a script using the workflow.fireEvent('eventName') API call.
Results

The workflow designer can assign a result value using `activity.result` from within a script field of the activity. This activity transitions when the specified event fires.

Input variables

The following variables determine the behavior of the activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait for Event</td>
<td>An event name to trigger the workflow.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the <code>onExecute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Notify workflow activities

Notify workflow activities manage calls and SMS messages in Notify.

All Notify workflows that manage a phone call must run on the `notify_call` table. Call-related Notify activities can be added only to workflows where the `Table` field value is `Notify Call [notify_call]`.

You can identify if an outbound call was answered by a human or by an answering machine from within a Notify workflow by evaluating the `current.is_human` variable, such as with an `If` workflow activity. This variable is set by the telephony provider when an outbound call is answered. This variable is always true for inbound calls.

**Note:** Do not add a Timer activity between multiple Notify activities that interact with active phone calls.
Important: When creating a Notify workflow, set the workflow If condition matches field to -- None --. Notify controls which workflow to run based on the configured number groups.

Forward call workflow activity
The Forward Call activity forwards a Notify call to an E.164-compliant phone number.

If the person receiving a forwarded call hangs up, the forward call activity completes and transitions to the next activity. Any further Notify activities in the workflow run for the caller only.

Input variables

Input variables determine the initial behavior of the activity.

Table 1307: Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Phone number to call</td>
<td>Enter the phone number to forward the call to.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait for the call to be answered before hanging up.</td>
</tr>
<tr>
<td>Record</td>
<td>Select this check box to record the conversation.</td>
</tr>
</tbody>
</table>

Conditions

The conditions determine which transition comes after this activity. The forward call activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the phone number to call is invalid.

Input workflow activity
The Input activity creates a phone menu by presenting a list of options on a Notify call.

Input Variables

Input variables determine the initial behavior of the activity.

Table 1308: Input Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of digits</td>
<td>Specify the maximum number of digits the caller can enter. A caller can enter fewer digits than the maximum and press the Finish key to complete the entry.</td>
</tr>
<tr>
<td>Finish key</td>
<td>Specify the key a caller can press on their phone when finished selecting a menu option.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Specify the amount of time to wait before closing the menu automatically when the caller does not select a menu option.</td>
</tr>
<tr>
<td>Variable</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to build the phone menu, instead of using the activity conditions.</td>
</tr>
</tbody>
</table>
| Script   | Define the script to build the phone menu. The script must specify an answer variable as a JavaScript object with the following format:  
```javascript
answer = {
  1: {
    "say": "https://some_url.com/options/one.mp3",
    "myCustomData": "some data here"
  },
  2: {
    "say": "type 2 to speak to a representative",
    "language": "en-US",
    "myCustomData": "some more data here"
  }
};
```

The script may specify either a text-to-speech string and language code or the URL of a prerecorded message for each entry. You can also add optional attributes to store related information, such as `myCustomData` in the example above.

**Conditions**

The conditions determine the transition that comes after this activity.

The input activity does not specify any conditions by default. You must define conditions to build the phone menu. Each condition is one option on the phone menu. Notify reads the text from each condition Name to the caller, up to 100 characters per condition.

You can specify a language for each condition by prefixing the message with the language code, in the format `xx-XX:<Message>`. For example, add `fr-CA:` for Canadian French. Available languages are stored on the Notify Language `[notify_language]` table.

The condition that the activity transitions through depends on the digits entered by the caller. Set the condition `Condition` value to `parseInt(workflow.scratchpad.digits) == <expected digits>`.

You can add an error condition to this activity. The activity transitions through the error condition if the advanced script returns an invalid value, or if the text to say for a condition is empty.

**Scratchpad Entries**

The activity uses the workflow scratchpad to write persistent values.
Table 1309: Values written to scratchpad

<table>
<thead>
<tr>
<th>Entry</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workflow.scratchpad.digits</td>
<td>The digits entered by the caller, as a string.</td>
</tr>
</tbody>
</table>
| workflow.scratchpad.menu<activity name>  | The entire answer variable, if using the advanced script option. You can access this menu from other activities after this activity successfully executes. For example, if the activity name is choices, you can access values from the menu using:  
  ```javascript
  var previousActivity = "choices";
  var choicesMenu = workflow.scratchpad.menu[previousActivity];
  var menuItem = choicesMenu[workflow.scratchpad.digits];
  // Selects the menu item based on the caller's input.
  var selectedValue = menuItem.myCustomData; //get the custom data for the selected menu item.
  ``` |

**Hangup workflow activity**

The Hangup activity disconnects an active Notify phone call.

You can use the hangup activity to disconnect only calls that have been answered. Use the reject activity to disconnect calls that have not been answered.

**Play workflow activity**

The Play activity plays a sound file on a Notify call.

**Input Variables**

Input variables determine the initial behavior of the activity.

Table 1310: Input Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>Enter the URL of a sound file to play. If the URL is inaccessible, or if the audio file mime type is not supported by the telephony provider, the play activity is skipped.</td>
</tr>
<tr>
<td>Loop</td>
<td>Enter the number of times the sound file should play.</td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition comes after this activity. The play activity does not specify any conditions by default.
You can create an error condition to handle errors with the sound file. The activity transitions through the error condition if the specified sound file is not available, or has an unsupported mime type. Supported mime types are listed on the Notify Audio MIME Types [notify_mime_type] table.

Record workflow activity
The Record workflow activity records audio from a user on a Notify call.

Input Variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max duration (in seconds)</td>
<td>Enter the maximum duration, in seconds, allowed for a recording.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait before ending a recording automatically when the caller is silent.</td>
</tr>
<tr>
<td>Finish Key</td>
<td>Specify the key a caller can press on their phone to end the recording.</td>
</tr>
</tbody>
</table>

Scratchpad Entries

The activity uses the workflow scratchpad to store persistent values.

The record activity adds the recording variable to the workflow scratchpad. This variable stores metadata about the recording, such as URI, ID, and duration. You can access the following values from this variable.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>recording.recordingDuration</td>
<td>The duration of the recording, in seconds.</td>
</tr>
<tr>
<td>recording.from_number</td>
<td>The caller's phone number, including country code.</td>
</tr>
<tr>
<td>recording.notify_number</td>
<td>The Notify phone number used to respond to the call, including country code.</td>
</tr>
<tr>
<td>recording.recordingID</td>
<td>The ID used by the telephony provider to identify the recording.</td>
</tr>
<tr>
<td>recording.recordingURL</td>
<td>The URL from the telephony provider to access the recording.</td>
</tr>
</tbody>
</table>

Reject workflow
The Reject workflow activity rejects an incoming Notify call.

You can use the reject activity to disconnect only calls that have not yet been answered. Use the hang up activity to disconnect calls that have been answered.
Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reason</td>
<td>Select a reason for rejecting the call, such as busy.</td>
</tr>
</tbody>
</table>

Say workflow activity
The say workflow activity allows you to play a message, using text to speech, on a Notify call.

Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text to say</td>
<td>Specify the text to read.</td>
</tr>
<tr>
<td>Language</td>
<td>Select the language and locale to use when reading text.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to define the language and message, instead of using the Text to say and Language values.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script to set what text is read on the call. The script must return a string that defines the language and the text to read. For example, to play an English-language message, return <code>{language: 'en-US', text: 'Text to read'}</code>.</td>
</tr>
</tbody>
</table>

Forward to notify client workflow activity
The forward to notify client workflow activity connects a phone call to a Notify WebRTC client.

Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>Select the user to connect the call to.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to determine which client to connect to, instead of using the User variable.</td>
</tr>
<tr>
<td>Variable</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script that controls which client to connect to. This script should return a GlideRecord for a single User [sys_user] record.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait for the call to be connected before hanging up.</td>
</tr>
<tr>
<td>Record</td>
<td>Select this check box to record the call.</td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition comes after this activity. The Forward to Notify Client activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if there is an issue with the Notify client.

*Call workflow activity*

The Call activity makes outbound phone calls using a Notify workflow.

**Input variables**

Input variables determine the initial behavior of the activity.

**Table 1316: Input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notify Number</td>
<td>The Notify phone number to make the call from. When you initiate a call, the outgoing call workflow for the number group associated with this number runs.</td>
</tr>
<tr>
<td>Phone number to call</td>
<td>The E.164-compliant phone number to call.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to determine number to call, and the Notify number to call from instead of using the Phone number to call and Notify Number variables.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script that controls which number to call. This script should return a string listing the Notify number sys_id, as well as the phone number to call, such as {notify_number: 'sys_id', phone_number: '+316...'}</td>
</tr>
</tbody>
</table>
You can add an error condition to this activity. The activity transitions through the error condition if the call could not be set up due to invalid data returned by the advanced script.

Join conference call workflow activity
The Join Conference Call activity connects an incoming or outgoing call to a Notify conference call.

Notify includes the workflows Notify: (Re)join Conference Call and Notify: Join Conference Call Via SMS to demonstrate how to use the join conference call activity to connect inbound and outbound calls, and inbound SMS messages to a conference call.

Input variables
Input variables determine the initial behavior of the activity.

Table 1317: Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advanced</td>
<td>Select this check box to display advanced configuration options.</td>
</tr>
<tr>
<td>Script</td>
<td>Specify advanced configuration options using JavaScript, such as if the new participant should be muted upon joining the conference call. You can access values from the workflow scratchpad.</td>
</tr>
</tbody>
</table>

Conditions
The conditions determine which transition comes after this activity. The join conference call activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the conference_call scratchpad variable is not set.

Scratchpad entries
The activity uses the workflow scratchpad to read persistent values.
Table 1318: Values read from scratchpad

<table>
<thead>
<tr>
<th>Scratchpad variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>workflow.scratchpad.conference_call</code></td>
<td>A GlideRecord for a single conference call record. A call processed by this activity is added to this conference call. If this value is not specified, the join conference call activity will log an error.</td>
</tr>
<tr>
<td></td>
<td>When initiating an outgoing call workflow using the Notify API call(String notifyPhoneNumber, String toPhoneNumber, GlideRecord conferenceCall) method, this scratchpad value is set automatically to the conference call GlideRecord. For incoming call workflows, or workflows initiated using a different mechanism, you must explicitly set this scratchpad value.</td>
</tr>
</tbody>
</table>

Enable the hangupOnStar attribute

System administrators can enable the hangupOnStar attribute and use it in the Join Conference Call workflow activity. When hangupOnStar is enabled (set to true), participants in a conference call can press the * button to disconnect from the call. Control is returned to the workflow, which can be used to trigger customer-defined actions.

To enable the hangupOnStar attribute:

1. Navigate to Workflow Administration Workflow Versions.
2. Open the Notify: (Re)join Conference Call workflow.
3. Click the Show Workflow related link.
4. To modify the workflow, click the WorkFlow Actions icon and click Checkout.
5. Open the Join Conference Call workflow activity.
6. Enable the Advanced check box to display the Script field.
7. Set the hangupOnStar attribute to true. The default setting is false.
8. Click Update.
9. Click the WorkFlow Actions icon and click Publish to save the changes.

Send SMS workflow activity
The send SMS workflow activity to send short text messages using Notify to users' phones.

Input variables

Input variables determine the initial behavior of the activity.
### Table 1319: Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From</td>
<td>Select the Notify phone number to use to send the SMS message.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use JavaScript to determine which numbers to send the message to, and the Notify number to use to send the message.</td>
</tr>
<tr>
<td>To</td>
<td>Select any number of users to send the message to. The user record must have an E.164-compliant phone number or notification device configured for SMS messages.</td>
</tr>
<tr>
<td>To (groups)</td>
<td>Select any number of groups to send the message to. All members of that group with an E.164-compliant phone number or SMS notification device receive the message.</td>
</tr>
<tr>
<td>Message</td>
<td>Enter the message to send. You can add field values from the current record by using the Select variables box. You can also add values from the workflow scratchpad. If a field and a scratchpad variable have the same name, the field value is used. Because you can use variables in this message, it is not possible to determine the length of the message at design time. If the activity sends a message that is longer than supported by the telephony provider, the message is truncated and the instance logs a warning.</td>
</tr>
<tr>
<td>To (script)</td>
<td>Enter a script to determine which numbers to send the message to, and the Notify number to use to send the message. The script should return a JavaScript object with the format `{notify_number: '...sys_id...', users: [...], groups: [...], numbers: [...]} Specify the users or groups to send the message to as an array of sys_id values. Specify other numbers as an array of E.164-compliant phone numbers. This field appears only if Advanced is selected.</td>
</tr>
</tbody>
</table>

### Conditions

The conditions determine which transition comes after this activity. This activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the Notify number used to make the call is not configured correctly or unable to send SMS messages, or if an error occurs while sending the SMS.
Queue workflow activity
The Queue activity places an active Notify call in a queue.

Add the Queue activity to a workflow on the Notify Call [notify_call] table to put the current call on hold. This activity does not specify any input variables.

The queue that the call is added to is given a random ID.

Workflow notification activities
Notification workflow activities notify users of events that occur during the workflow.

Create Event workflow activity
The Create Event activity adds an event to the event queue, but does not immediately fire the event.

The event processor typically processes the event within one minute. This activity triggers any business rules or email notifications that would normally be triggered by the event.

Results
Finished: the activity added the event to the event queue.

Input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event name</td>
<td>The name of the event to create. From the Event Name lookup list, select the event to add to the queue. If the event requires parameters, specify them in the Parameter script field.</td>
</tr>
<tr>
<td>Parameter 1</td>
<td>The first parameter of the event.</td>
</tr>
<tr>
<td>Parameter 2</td>
<td>The second event parameter.</td>
</tr>
</tbody>
</table>

Note: If this parameter is a string value, it must be within quotes (" ").

Notification workflow activity
The Notification activity sends an email or SMS message to specified users or groups.
Input variables

Table 1321: Notification activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Addressees</td>
<td></td>
</tr>
<tr>
<td>To</td>
<td>The users who will be recipients of the email.</td>
</tr>
<tr>
<td>To (groups)</td>
<td>The members of the groups that will be recipients of the email.</td>
</tr>
<tr>
<td>Advanced</td>
<td>If selected, the script in the To (script) field is called to specify additional recipients of the email.</td>
</tr>
<tr>
<td>To (script)</td>
<td>If Advanced is selected, this script is called and should set the variable answer to a comma-separated list of user or group sys_ids that you want to add as recipients of the email.</td>
</tr>
</tbody>
</table>

Message

<table>
<thead>
<tr>
<th>Subject</th>
<th>The subject line of the email.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message</td>
<td>The email body that is sent.</td>
</tr>
</tbody>
</table>

  To include the value of a field in the message body, place the cursor at the point in the text where you want the field's value inserted. Then click the + icon next to Fields and select the field you want.

States

The activity state tells the workflow engine what to do with the activity.

Table 1322: Notification activity states

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the run function of the activity.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
</tbody>
</table>

Timer workflow activities

Timer activities pause workflows for set periods of time.

SLA Percentage Timer workflow activity

The SLA Percentage Timer activity pauses the workflow for a duration equal to a percentage of an SLA.
A workflow must run on the Task SLA table to use this activity.

**Results**

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete</td>
<td>The activity successfully reached the specified duration</td>
</tr>
<tr>
<td>Cancelled</td>
<td>The activity or workflow was canceled before the timer reached the specified duration</td>
</tr>
</tbody>
</table>

**Input variables**

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Percentage</td>
<td>The duration to pause the workflow for, as a percentage of the current SLA</td>
</tr>
</tbody>
</table>

**States**

The activity state tells the workflow engine what to do with the activity.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The activity is in this state very briefly while initializing, after which it immediately changes to Waiting.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine waits until the SLA reaches the specified percentage. The engine then transitions the workflow to the next activity.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Timer workflow activity**

The Timer activity pauses the workflow for a specified period of time.
This duration can be an absolute time value or a relative value based on a defined schedule. It is best to adjust the Duration so the workflow can progress in a timely manner. To pause a workflow indefinitely until a condition is met, see wait for condition.

Results

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete</td>
<td>The activity successfully reached the specified duration.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>The activity or workflow was canceled before the timer reached the specified duration.</td>
</tr>
</tbody>
</table>

Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer Information</td>
<td>How the timer duration is computed. The options are:</td>
</tr>
<tr>
<td>Timer based on</td>
<td>• A user specified duration: The duration is based on the Duration fields, such as days and hours.</td>
</tr>
<tr>
<td></td>
<td>• A relative duration: The duration is based on the Relative duration (such as End of Next Business Day) and Wait fields.</td>
</tr>
<tr>
<td></td>
<td>• A date/time or duration field: The duration is based on the Field value and the Wait field.</td>
</tr>
<tr>
<td></td>
<td>• Script: The duration is based on a script that returns the number of seconds.</td>
</tr>
<tr>
<td>Duration</td>
<td>The specific number of days and hours to wait before proceeding to the next activity in the workflow.</td>
</tr>
<tr>
<td>Appears only when Timer based on is A user specified duration.</td>
<td></td>
</tr>
<tr>
<td>Relative duration</td>
<td>The general number and length of business days to wait before progressing to the next workflow activity.</td>

<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Wait  | An additional timer adjustment when Timer based on is A relative duration or A date/time or duration field. The options are:  
- The full duration: No modification of the calculated duration.  
- A % of the duration: The duration is adjusted by multiplying the number of seconds by the (Percentage / 100).  
- Some time before: The duration is shortened by the Time before days and hours.  
- Some time after: The duration is lengthened by the Time after days and hours. |
<p>| Percentage | The Wait percentage value when Timer based on is A relative duration or A date/time or duration field. |
| Time before | The modifier time value when Wait is Some time before. |
| Time after | The modifier time value when Wait is Some time after. |
| Field | The date/time or duration field that contains the elapsed wait-time before moving to the next workflow activity. |
| Script | The script that sets 'answer' to the number of seconds for the duration. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Schedule based on                         | The basic schedule the timer uses to count working hours. If a schedule is specified, the duration will only be considered for times that are specified on the schedule. For example, if the duration is 2 hours and the workflow begins at 4:00pm on a schedule that is 8am - 5pm, then it ends at 9:00am the next day. The options are:  
  • This workflow's schedule: The schedule uses workflow context date, time, and an optional time zone based on value.  
  • A specific schedule: The schedule uses a pre-defined Schedule and an optional Time zone based on value.  
  • A schedule field: The schedule uses a value from a table and an optional Time zone based on value. |
| Schedule                                   | The pre-defined Schedule from a list.                                                                                                      |
| Schedule field                             | A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog. |
| Timer Time Zone                            |                                                                                                                                            |
| Time zone based on                         | The time zone for calculating the duration. The time zone may be based on:  
  • No time zone: Default. Workflow uses the GMT time zone.  
  • A specific time zone: A predefined Time zone.  
  • A time zone field: A Time zone field to track time duration from a field on the form. |
| Time zone                                  | The predefined time zone.                                                                                                                   |
| Time zone field                            | A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog. |

**States**

The activity state tells the workflow engine what to do with the activity.
### Table 1328: Timer activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The Timer activity is in this state very briefly while initializing, after which it immediately changes to Waiting.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine waits until the timer reaches the specified duration. The engine then transitions the workflow to the next activity.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Example**

You can use a Timer activity to pause the workflow until the end of the business day.
Figure 768: Timer example

In this example, the script evaluates the time between the now variable and the eod variable. The eod variable is defined, in 24 hour time, as 4:00 PM. The script then sets the answer variable to the difference between these variables, in seconds, and logs a message.

// get now and calc end of day (4:00pm)

var now = new Date();

var eod = new Date();
eod.setHours(16);
eod.setMinutes(0);
eod.setSeconds(0);

answer = (eod.getTime() - now.getTime()) / 1000;

workflow.debug('Timer will fire @: ' + eod + ' (' + (answer/60) + ' minutes from now');
Task workflow activities

Task activities create and modify workflow tasks. Task activities are only available when the workflow runs on a table that extends Task.

Add Worknote workflow activity
The Add Worknote activity adds text to the Worknotes field of the current incident record. A workflow must run on the Incident table to use this activity.

Input variables

Table 1329: Add Worknote activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Work Note</td>
<td>The text to add to the incident record.</td>
</tr>
</tbody>
</table>

Attachment Note workflow activity
The Attachment Note activity adds an attachment to the current record.

Note: This activity is only available when the workflow runs on a table that extends Task.

This activity allows the use of irregular HTML tags to reference attachments, specifically the [code] tag. Entries in a journal field that use irregular HTML do not work if the glide.ui.allow_deep_html_validation property is true. This property is set to false by default.

Results

• Finished: the activity added the attachment to the record.

Input variables

The following variables determine the behavior of the activity.

Table 1330: Attachment Note activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>General</td>
<td>When this activity runs, it makes a note on the current record that a file has been attached. Specify the field on the current record in which you want this note to appear. The options are:</td>
</tr>
<tr>
<td>Field</td>
<td>• none (defaults to Work Notes)</td>
</tr>
<tr>
<td></td>
<td>• Additional Comments</td>
</tr>
<tr>
<td></td>
<td>• Work notes</td>
</tr>
</tbody>
</table>

Attachment note information
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attachment Name</td>
<td>When this activity runs, it creates a .txt file with the name you specify in this field.</td>
</tr>
<tr>
<td>Attachment Data</td>
<td>The content of the .txt file attachment. It can be in plain text or use variables to extract specific data from a table.</td>
</tr>
</tbody>
</table>

**Catalog Task workflow activity**

The Catalog Task activity creates a service catalog task record.

**Note:** This activity is only available when the workflow runs on a table that extends Task.

A user must complete the catalog task. This activity is available only for workflows running on the Catalog Request Item `[sc_req_item]` table.

**Results**

You can assign a result value using `activity.result` from within a script field of the activity. The final State value of the catalog task record determines the result value for the Create Task activity. Possible result values are:

- Closed complete
- Closed incomplete
- Closed skipped
- Deleted
- Cancelled

**Input fields**

The values you enter in the following fields determine the behavior of the activity.

**Table 1331: Catalog task activity information**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task Table</td>
<td>The table on which this activity runs. In most cases, leave set to the default value: <code>[sc_req_item]</code>.</td>
</tr>
<tr>
<td>Priority</td>
<td>The value you want assigned to the Priority field for the new task.</td>
</tr>
<tr>
<td>Wait for completion</td>
<td>If selected, the workflow activity waits for the task to complete before continuing. If cleared, the task is created but the workflow proceeds.</td>
</tr>
</tbody>
</table>

**Catalog Task Record Settings**

The following fields specify the field values that this activity sets for the catalog task it creates.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task value from</td>
<td>Specify how you want to populate fields on the new task.</td>
</tr>
<tr>
<td></td>
<td>• Fields: a predefined set of fields including Fulfillment group, Assigned to, Short description and Instructions.</td>
</tr>
<tr>
<td></td>
<td>• Template: an existing template for the selected task table.</td>
</tr>
<tr>
<td></td>
<td>• Values: values that you specify using a Set Values widget.</td>
</tr>
<tr>
<td></td>
<td>After you select a value for Task value from, additional fields specific to that value appear on the form.</td>
</tr>
<tr>
<td>Fulfillment group</td>
<td>Only appears when Task value from is set to Fields</td>
</tr>
<tr>
<td>Assigned to</td>
<td>Only appears when Task value from is set to Fields</td>
</tr>
<tr>
<td>Short description</td>
<td>Only appears when Task value from is set to Fields</td>
</tr>
<tr>
<td>Instructions</td>
<td>Only appears when Task value from is set to Fields</td>
</tr>
<tr>
<td>Template</td>
<td>Only appears when Task value from is set to Template.</td>
</tr>
<tr>
<td>SetValues</td>
<td>Only appears when Task value from is set to Values.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Check Advanced if you want to use a script to assign values on the catalog task. When you check Advanced, a text box appears where you can enter your script.</td>
</tr>
</tbody>
</table>
### Advanced Script

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advanced Script</td>
<td>Only appears when the Advanced field is checked. Set additional values for the task in this script. This script is run after the task values are set using the Fields, Template or Values you have specified. Use the variable task when setting additional values, for example: task.short_description = current.short_description;</td>
</tr>
</tbody>
</table>

### Catalog Task Variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variables on Task Form</td>
<td>Specify optional catalog variables to include on the Catalog task form. The variables you select here will be displayed in a field called Variable Editor. If you select no variables here, the Variable Editor field in the Catalog Task form will not be visible.</td>
</tr>
</tbody>
</table>

### Catalog Task Schedule

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Due date based on</td>
<td>Select how workflow determines the task's duration, due date, and schedule. • A user specified duration: The duration is based on a user specified value. • A relative duration: The duration is calculated from a relative duration (such as End of Next Business Day). • A date/time or duration field: The duration is based on the value of a field on the current record. • Script: The duration is returned by a script.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Duration</td>
<td>Only appears when Due date based on is set to A user specified duration The specific number of days and hours.</td>
</tr>
<tr>
<td>Relative duration</td>
<td>Only appears when Due date based on is set to A relative duration The general number and length of business days.</td>
</tr>
<tr>
<td>Due date field</td>
<td>Only appears when Due date based on is set to A date/time or duration field The date/time or duration field.</td>
</tr>
<tr>
<td>Due date script</td>
<td>Only appears when Due date based on is set to Script The script that sets 'answer' to the number of seconds for the duration.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Schedule based on             | The basic schedule the timer uses to count working hours. If a schedule is specified, the duration will only be considered for times that are specified on the schedule. For example, if the duration is 2 hours and the workflow begins at 4:00pm on a schedule that is 8am - 5pm, then it ends at 9:00am the next day. The options are:  
  • This workflow's schedule: The schedule uses workflow context date, time, and an optional Time zone based on value.  
  • A specific schedule: The schedule uses a pre-defined Schedule and an optional Time zone based on value.  
  • A schedule field: The schedule uses a value from a table and an optional Time zone based on value. |
| Schedule                      | The predefined Schedule from a list.                                                                                                           |
| Schedule field                | A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog. |
| Time zone based on            | The time zone for calculating the duration. The time zone may be based on:  
  • No time zone: Default. Workflow uses the GMT time zone.  
  • A specific time zone: A specific Time zone that you choose from a choice list.  
  • A time zone field: A Time zone field to track time duration from a field on the form. |
| Time zone                     | Select the time zone you want from the choice list.                                                                                           |
| Time zone field               | A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog. |

**States**

The activity state tells the workflow engine what to do with the activity.
Table 1332: Catalog Task activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the onExecute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Create Task workflow activity

The Create Task activity generates a record on any of the tables that extend Task [task].

**Note:** This activity is only available when the workflow runs on a table that extends Task.

If the Wait for completion check box is selected, the workflow context waits for a user action on the task, such as Complete or Incomplete, and then progresses based on the user action.

Results

You can assign a result value using activity.result from within a script field of the activity. By default, the final State value of the task record determines the result value for the Create Task activity. Possible result values are:

- Closed complete
- Closed incomplete
- Closed skipped
- Deleted
- Cancelled

Input variables

The following variables determine the behavior of the activity.

Table 1333: Create Task activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Task Activity Settings</td>
<td>The following fields specify the behavior of the Create Task Activity.</td>

| Time zone field               | A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog. |

**States**

The activity state tells the workflow engine what to do with the activity.
Table 1334: Create Task activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the onExecute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Utility workflow activities

Utility activities provide controls over the path of the workflow, and other useful tools.

*Branch workflow activity*

The Branch activity splits the workflow into multiple transition paths from a single activity.

To add a transition path, drag the Branch activity onto the canvas. When the Branch activity properties form displays, click Submit to add the activity to the canvas. Once the activity is on the canvas, right click in the activity body, then click Add Condition.

All transitions from this activity execute concurrently. This activity provides a single Always condition. You can draw any number of transitions from this condition. Using this activity is equivalent to drawing multiple transitions from a single condition of another activity.

Branching can affect the behavior of rollback activities. See *Rollback To activity* on page 3466 for more information.

*Join workflow activity*

The Join activity unites multiple execution paths into one transition.

Use this activity to cause a workflow to wait for all activities in multiple paths to finish before continuing. If multiple concurrent workflow paths meet without a Join activity, any subsequent activities execute twice.

To add Join to the canvas, click Submit. On the canvas, connect incoming transitions from each activity you want to act as a predecessor to the Join activity. Then connect outgoing transitions to the two exit conditions: Complete and Incomplete.

Results

Provide an Incomplete transition out of a Join whenever it is possible for any predecessor activities to follow a transition path that does not lead to the Join activity.

Table 1335: Join activity results

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete</td>
<td>Join exits along the Complete path when the system has determined that all predecessor activities have completed and transitioned to the Join.</td>
</tr>
<tr>
<td>Result</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Incomplete</td>
<td>Join exits along the Incomplete path when the system determines that at least one predecessor activity completed but transitioned along a path that bypassed the Join activity.</td>
</tr>
</tbody>
</table>

**Lock workflow activity**

The Lock activity prevents other instances of this workflow from continuing past this activity until the lock is released.

Several instances of the same workflow may run concurrently. For example, if a workflow is triggered when a record is added to a particular table and multiple records are added one after the other, that workflow will be triggered multiple times: once by each record insertion. In such cases, you can use the lock activity to ensure that this instance of the workflow has completely finished one or more activities before any other instance of the workflow can proceed.

A workflow can explicitly release a lock with the Unlock activity. The lock may also be released when the Max duration is reached.

When an instance of the workflow reaches the Lock activity, it attempts to obtain a lock using the key specified in the lock activity. If another instance has already obtained the lock and has not yet released it, this lock attempt fails. The instance continues trying to obtain the lock until Max attempts has been reached.

**Note:**

We recommend placing a one-second timer activity before the lock activity. This helps prevent a rare condition in which the lock activity may not be able to distinguish one workflow instance from another. This condition can occur because the entity owning the lock is not the specific workflow instance, but rather the code-execution thread in which that instance is running. In most cases, each workflow instance runs on a different thread, but adding a timer activity ensures that this is the case.
Figure 769: Example of Lock Activity Preceded by Timer Activity

Since a Lock activity can only temporarily prevent processing of other workflow instances, do not add activities that cause the workflow to wait between a Lock and Unlock activity block. This may cause the
Unlock activity to be unable to acquire the lock to release it and instead take 60 seconds to complete. Restricted wait activities include:

- Approval activities
- Task activities
- Timer activities
- Wait for condition activity
- Wait for WF Event activity

Results

Table 1336: Lock activity results

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The activity successfully obtained a lock. This instance of the workflow can proceed past this point, but other instances cannot until the lock is released.</td>
</tr>
<tr>
<td>Failure</td>
<td>After attempting to obtain the lock Max attempts times, the activity could not obtain the lock.</td>
</tr>
</tbody>
</table>

Input variables

Input variables determine the initial behavior of the activity.

Table 1337: Lock activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key</td>
<td>A unique mutex key. The Unlock activity activity uses this key to release the lock.</td>
</tr>
<tr>
<td>Duration</td>
<td>The maximum time the lock persists. The lock is released after it reaches this duration. Releasing a lock this way is equivalent to running the Unlock activity.</td>
</tr>
<tr>
<td>Max. duration</td>
<td>Specify how the activity behaves if the lock attempt is denied. If the final lock attempt fails, the activity state will be set to 'timeout' and the activity result will be set to 'failed'.</td>
</tr>
<tr>
<td>Lock attempts</td>
<td>Specify the maximum number of times the activity may attempt to obtain the lock.</td>
</tr>
<tr>
<td>Delay between attempts</td>
<td>The amount of time required after a failed lock attempt before another lock attempt is allowed.</td>
</tr>
</tbody>
</table>
States

The activity state tells the workflow engine what to do with the activity.

Table 1338: Lock activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Waiting</td>
<td>The workflow engine is waiting to obtain a lock.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity successfully obtained the lock.</td>
</tr>
<tr>
<td>Timeout</td>
<td>The activity could not obtain a lock within the number of attempts specified by the Max. attempts input variable.</td>
</tr>
</tbody>
</table>

Log Message workflow activity

The Log Message activity writes a message to the workflow log.

Use this activity to add entries to the workflow's log for debugging or tracing purposes.

Input variables

Input variables determine the initial behavior of the activity.

Table 1339: Log Message activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message</td>
<td>The message to log. This variable can be a string or a JavaScript expression that evaluates to a string.</td>
</tr>
</tbody>
</table>

Log Trace Message workflow activity

The Log Trace Message activity writes a trace message to the workflow log.

The trace message includes the activity name, the event that invoked the workflow, and the table of the current record. There are no variables or conditions. To log other data, use the Log Message workflow activity on page 3436 activity.

REST Message legacy workflow activity

The legacy REST Message activity enables an administrator to override the REST endpoint or supply the variables configured in the REST Message module.

This activity is deprecated in the London release and no longer shows up in the Workflow canvas for new workflow development. New workflows should use the Orchestration REST Activity templates instead.

Existing workflows using it will continue to work as designed. To edit this activity in an existing workflow, you must re-activate the activity.

The REST Message activity executes a dead link REST function (POST, PUT, GET, or DELETE) on an endpoint using values defined in the function record.

Note: If you want to use a MID Server to send the REST message, the MID Server must be accessible by the instance and configured to use SSH.
### Input variables

**Table 1340: REST Message activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rest Message</td>
<td>Name of the REST message to run. This is a reference field to the REST Message [sys_rest_message] table (System Web Services Outbound REST Message).</td>
</tr>
<tr>
<td>REST Message Function</td>
<td>Function to call that is defined in a REST message function. This is a reference field to the HTTP Method [sys_rest_message_fn] table (System Web Services Outbound REST Message). Available functions are put, post, get, or delete. You can edit functions in the HTTP Methods related list in each REST Message record.</td>
</tr>
<tr>
<td>REST Endpoint</td>
<td>REST endpoint to use instead of the Endpoint defined in the HTTP Method record. Leave this field blank to use the defined endpoint in the REST Message Function record.</td>
</tr>
<tr>
<td>Rest Message Variables</td>
<td>Values to use for variables defined in the HTTP Method record. Use the following format for the string: name1=value1, name2=value2, ... For example, use name=${nameValue}, id=${idValue} where name and id are function variables. If either the variable name or value contains a comma or equal sign, escape those characters with a backslash.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>Check this box if you want to use a MID Server to send the REST message. A MID Server might be necessary to reach an endpoint within a firewall or a subnet that is not visible from the instance. If this check box is selected, but no MID Server is defined in the MID Server field, the workflow automatically attempts to find a MID Server based on IP range and the REST capability.</td>
</tr>
<tr>
<td>MID Server</td>
<td>Name of the MID Server to use. This field is available when Use MID Server is selected. The workflow ignores this parameter if the use_midserver parameter is disabled.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Rest Message Script</td>
<td>The script to execute after the request has been made and a response has been received. You can access the full response body from the activity.output variable.</td>
</tr>
<tr>
<td>Sensor Script</td>
<td>The script to execute after the request has been made and a response has been received. You can access the full response body from the activity.output variable.</td>
</tr>
</tbody>
</table>

**Return Value workflow activity**

The Return Value activity returns a value to a parent workflow, when run from a subflow.

This activity has no variables or conditions. For more information, see *Workflows used as subflows* on page 3240.

Use this activity within a subflow to store data that the parent flow can access. The Return Value activity adds the data from the subflow's value variable to the parent workflow's scratchpad.

**Scratchpad entries**

The activity uses the workflow scratchpad to read and write persistent values.

**Table 1341: Return Value activity scratchpad entries**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>The activity writes the value from the subflow value variable to the parent scratchpad. The parent workflow activity that runs the subflow includes a Map return value to variable that defines where the parent workflow stores the returned data. This data can be scalar, a stringifiable JavaScript object, or an expression that evaluates to a stringifiable JavaScript object.</td>
</tr>
</tbody>
</table>

**Run Script workflow activity**

The Run Script activity runs the specified script in the scope of the workflow version.

**Note:** All changes to current are automatically updated. There is no need to call current.update()

**Input variables**

Input variables determine the initial behavior of the activity.

**Table 1342: Run Script activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Script</td>
<td>Script to execute.</td>
</tr>
</tbody>
</table>

**Set Values workflow activity**

The Set Values activity sets values on the current record when the workflow quiesces or ends.
**Input Fields**

The values you enter in the following fields determine the behavior of the activity.

**Table 1343: Set Values Activity Input Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set these values</td>
<td>From the list on the left, select the field on the current record whose value you want to set when the workflow quiesces or ends. In the user-input field to the right, select or enter the value to which you want that field set.</td>
</tr>
</tbody>
</table>

*Note*: Avoid setting the same fields from different Set Value activities. The workflow only sets the value specified by the last Set Values activity run before quiescing or ending.

*Note*: Using the Set Values activity to set the Approval field on a task does not cancel pending approvals. To approve a task in a workflow, use the **Approval Action** activity instead.

**SOAP Message legacy workflow activity**

The legacy SOAP Message activity uses SOAP messages defined in the System Web Services plugin and can call the messages using a MID Server.

This activity is deprecated in the London release and no longer shows up in the Workflow canvas for new workflow development. New workflows should use the **Orchestration** SOAP Activity templates instead.

Existing workflows using it will continue to work as designed. To edit this activity in an existing workflow, you must **re-activate the activity**.

**Input variables**

**Table 1344: SOAP Message activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAP Message</td>
<td>soap_message</td>
<td>The SOAP Message defined under the System Web Services plugin's Outbound SOAP Message [sys_soap_message] table. ( System Web Services Outbound SOAP Message )</td>
</tr>
<tr>
<td>SOAP Message Function</td>
<td>soap_message_function</td>
<td>The function to call that is defined in the SOAP Message. Functions are listed in the SOAP Message Functions related list in each SOAP Message record.</td>
</tr>
<tr>
<td>Field</td>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>--------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SOAP Endpoint</td>
<td>soap_endpoint</td>
<td>Endpoint to use instead of the SOAP endpoint value in the SOAP Message Function record. Leave this field blank to use the defined endpoint in the SOAP Message Function record.</td>
</tr>
<tr>
<td>Variables</td>
<td>variables</td>
<td>Variables to substitute into the SOAP Envelope defined in the SOAP Message Function record. Use this format for the string: name1=value1, name2=value2, . . . If either the name or value contains a comma or equal sign, escape these characters with a backslash.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>use_midserver</td>
<td>Check box for using a MID Server to send the SOAP message. A MID Server might be necessary to reach an endpoint within a firewall or a sub-network that is not visible from the instance. If this check box is selected (true), but no MID Server is defined in the MID Server field, Workflow automatically attempts to find a MID Server.</td>
</tr>
<tr>
<td>MID Server</td>
<td>midserver</td>
<td>Name of the MID Server to use. This field appears when you select the Use MID Server check box. The workflow ignores this parameter if the use_midserver parameter is disabled.</td>
</tr>
<tr>
<td>Sensor Script</td>
<td>sensor_script</td>
<td>The script to execute after the request has been made and a response has been received. You can access the full XML response body from the activity.output object.</td>
</tr>
</tbody>
</table>

*Turnstile workflow activity*

The Turnstile activity limits how many times a workflow can pass through the same point.

Use this activity to prevent infinite loops. This activity is useful alongside the *Rollback To workflow activity* on page 3394 activity.
Results

You can assign a result value using the activity.result variable from within a script field of the activity. By default, the activity script evaluates if the activity should continue to iterate or stop.

Table 1345: Turnstile activity results

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Continue</td>
<td>The Allowed iterations value is greater than the number of times the workflow accessed this activity.</td>
</tr>
<tr>
<td>Cancel</td>
<td>The workflow accessed this activity more times than the Allowed iterations value.</td>
</tr>
</tbody>
</table>

Input variables

Input variables determine the initial behavior of the activity.

Table 1346: Turnstile activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allowed iterations</td>
<td>Number of times the workflow can pass through this activity before the turnstile ends the loop.</td>
</tr>
</tbody>
</table>

Conditions

The conditions determine which transition comes after this activity.

Table 1347: Turnstile activity conditions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Continue</td>
<td>If the workflow has returned to this point an amount of times less than the allowed iteration.</td>
</tr>
<tr>
<td>Cancel</td>
<td>If the workflow has returned to this point an amount of times more than the allowed iteration.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.
Table 1348: Turnstile activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the onExecute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is triggered.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Unlock workflow activity

The Unlock activity releases a lock that was previously placed by the Lock activity.

To release a lock, specify the same lock key that was specified in the Lock activity. If the Lock activity had a Duration specified, and that duration has already passed, the lock will already be released.

Input variables

Input variables determine the initial behavior of the activity.

Table 1349: Unlock activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lock key</td>
<td>The Mutex key that releases the lock. This key must match the key specified by a Lock activity. For more information, see Lock activity.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.

Table 1350: Unlock activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Finished</td>
<td>The activity successfully released the lock.</td>
</tr>
</tbody>
</table>

Subflow activities in workflow

Subflow activities run and manage workflows from a parent workflow.

The Parallel Flow Launcher subflow activity is available.

Parallel Flow Launcher workflow activity

The Parallel Flow Launcher activity launches multiple subflows in parallel.
Workflows running in parallel execute simultaneously and may complete in any order. The activity can launch a single subflow or multiple subflows as needed. You can manage the input values and values returned for each subflow.

**Note:** The Parallel Flow Launcher activity waits until all subflows are completed before proceeding. If any subflow does not finish, the activity waits indefinitely.

**Note:** Do not launch a large number of subflows with the Parallel Flow Launcher activity. If overused, this activity can overburden the instance. For launching very large numbers of subflows, consider putting the Parallel Flow Launcher inside a loop controlled by a turnstile or other conditional activity and having it do batches of no more than 500 at a time.

### Activity variables

Activity variables determine the initial behavior of the activity.

#### Table 1351: Parallel Flow Launcher activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parallel Flow Launcher configuration</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>A unique name for the activity.</td>
</tr>
<tr>
<td>Stage</td>
<td>The stage to display when the workflow reaches the activity.</td>
</tr>
<tr>
<td>Inputs</td>
<td>Inputs to the subflows to run. Specify an array of name: value pairs for each input defined in the workflow being launched. The name and data type of each input variable entered must match those used by the subflow that this activity launches. For a detailed example, see <a href="#">Parallel Flow Launcher Example</a>.</td>
</tr>
<tr>
<td>Parallel Flow Launcher selection</td>
<td></td>
</tr>
<tr>
<td>Workflow</td>
<td>The workflow to run.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Check Advanced, to enter a script that uses a WorkflowCoordinator object to manage the subflows. When you check Advanced, a text box appears where you can enter a script that specifies a unique workflow for each set of input variables. See <a href="#">WorkflowCoordinator object</a> on page 3445 for more information.</td>
</tr>
<tr>
<td>Parallel Flow Launcher iteration</td>
<td></td>
</tr>
<tr>
<td>Count</td>
<td>If not specified by an input set, Count determines the number of subflows executed in parallel from this activity. If the Advanced option is not selected, ensure that this field is populated with a valid number.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Max flows</td>
<td>The maximum number of workflows this activity can launch. If this value is a positive integer, it overrides the max parameter used in the WorkflowCoordinator constructor.</td>
</tr>
<tr>
<td>Max simultaneous</td>
<td>The maximum number of parallel workflows this activity can run at one time. If this value is a positive integer, it overrides the poolsize parameter used in the WorkflowCoordinator constructor.</td>
</tr>
</tbody>
</table>

**Parallel Flow Launcher Process**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process flow complete</td>
<td>To specify a script that runs after each subflow completes, check Process flow complete. If you check this field, a text box labelled Flow complete appears, where you can enter the script to run.</td>
</tr>
<tr>
<td>Flow complete</td>
<td>The script that runs each time a subflow finishes. This field is available when the Process flow complete option is selected.</td>
</tr>
</tbody>
</table>

The same script functions and variables available in other workflow scripts, such as those in the Run Script activity, are available here. For more information, see Completed subflow values in scripts on page 3446.

The variable "flow" is available to this script. It is an object that contains the following information about the flow that is finishing:

- flow.output (String): The value that the subflow returns to the parent if it executed a Return Value activity before ending.
- flow.index (Number): The zero-relative index of the subflow that finished.
- flow.contextId (String): The sys_id of the workflow context for the completed subflow.
- flow.inputs (Object): The inputs that were passed to the subflow when its context was created and started.
- flow.status (String): The final state of the context. This corresponds to the state column in the subflow context record, which has possible values of executing, finished, cancelled, or faulted. (Since the flow is completed, it cannot be executing at this point.)
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Process finished    | To specify a script that runs after all subflows have finished, check Process finished. If you check this field, a text box labelled Finished Script appears where you can enter the script to run. The ‘coordinator’ variable is made available to this script and is an object that allows access to any of the finished subflows using the getFlow(index) method. For example:  
for (var i = 0; i < coordinator.getNumFlows(); i++)  
writeFlowResultsToTable( i, coordinator.getFlow(i) ); |
| Finished script     | The script that runs after all subflows launched by the activity are complete. You can use variables that contain completed flow information in this script. 

The ‘coordinator’ variable is made available to this script and is an object that allows access to any of the finished subflows using the getFlow(index) method. For example:  
for (var i = 0; i < coordinator.getNumFlows(); i++)  
writeFlowResultsToTable( i, coordinator.getFlow(i) );  
This field is available when Process finished is selected. |

**States**

The activity state tells the workflow engine what to do with the activity. To view an activity’s state, point to the activity. A pop-up window shows the State and Result of the activity. If the activity is in an error state, the pop-up window provides a brief Fault Description.

**Table 1352: Parallel Flow Launcher activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Waiting</td>
<td>The activity is waiting for all subflows to finish. All subflows have started and some may have finished.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity successfully completed all of the subflows.</td>
</tr>
<tr>
<td>Error</td>
<td>The activity encountered an error.</td>
</tr>
</tbody>
</table>

**WorkflowCoordinator object**

A WorkflowCoordinator object specifies which subflows to run and the input variables to pass to those subflows.

© 2018 ServiceNow. All rights reserved.
When using a WorkflowCoordinator object, you can create a Parallel Flow Launcher activity that launches multiple subflows. When using the activity without a WorkflowCoordinator object, you can only launch a single subflow multiple times. Use one of the following methods to specify a WorkflowCoordinator object for the activity when the Advanced activity input variable is selected.

- Reference a workflow scratchpad variable that contains an existing WorkflowCoordinator object. To save a WorkflowCoordinator object to the scratchpad, call the save(variableName) function on the WorkflowCoordinator object. You can reference the object using the value passed in the variableName parameter. For example, you can create a WorkflowCoordinator object in a Run Script activity, save the object using <object>.save('coord'), and then call this object by entering coord in the Workflow activity variable of a subsequent Parallel Flow Launcher activity.
- Define the WorkflowCoordinator within the Workflow activity variable. Add the javascript: identifier at the beginning of the script. The Parallel Flow Launcher example on page 3447 shows how to use a WorkflowCoordinator object in this way.
- Create a factory class to define the WorkflowCoordinator object. The system does not provide a factory class for WorkflowCoordinator by default.

Completed subflow values in scripts
The Parallel Flow Launcher activity exposes additional variables you can use in scripts.

Table 1353: Additional variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>coordinator</td>
<td>The WorkflowCoordinator used when running the subflows. You can use this variable in the Finished script to perform any final operations. Additionally, you can use the WorkflowCoordinator in a later workflow activity by passing the activity name or sys_id to the WorkflowCoordinator.load('&lt;Activity&gt;') function. For example, to load the WorkflowCoordinator object from a Parallel Flow Launcher activity called Launch Subflows, enter var coord = WorkflowCoordinator.load('Launch Subflows'); in a later activity.</td>
</tr>
<tr>
<td>Variable</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>flow</td>
<td>The subflow launched by the activity that completed most recently. You can use this variable in the Flow complete script to perform any post-processing operations on each subflow. To get a complete subflow from a coordinator object, use <code>var flow = coord.getFlow(I);</code> where <code>I</code> is the numeric index of the subflow based on the order it was launched. These values are available from the completed subflow:</td>
</tr>
<tr>
<td></td>
<td>• index: the numerical index of this subflow based on the order it was launched</td>
</tr>
<tr>
<td></td>
<td>• workflow: the sys_id or name, depending on which you passed to the WorkflowCoordinator constructor, of the workflow used for this subflow</td>
</tr>
<tr>
<td></td>
<td>• inputs: any input values provided to the launched subflow</td>
</tr>
<tr>
<td></td>
<td>• status: status of the subflow context</td>
</tr>
<tr>
<td></td>
<td>• output: the value returned by the subflow</td>
</tr>
<tr>
<td></td>
<td>• contextId: the sys_id of the workflow context for the subflow</td>
</tr>
</tbody>
</table>

Parallel Flow Launcher example

This example shows how to use the Parallel Flow Launcher activity with an array of input values and with a WorkflowCoordinator object.

Sample workflow

This example shows a SQL-based web server with four application nodes. A single subflow runs to provision the database, and multiple parallel subflows each configure an application node. Finally, a separate set of parallel subflows configures the nodes to use a load balancer and sets up the server DNS.

![Diagram of sample workflow](image)

Figure 770: Parallel flow launcher business case
Provision the application nodes

The first Parallel Flow Launcher activity launches the Provision Node subflow four times. The activity passes a unique IP address to each subflow from an array in the Inputs variable. The scripts defined in the Flow complete and Finished script variables write log messages regarding the status of the subflows.
Activity Properties: Parallel Flow Launcher

Name: Provision application nodes

Stage:

Inputs:

- [u_host: '192.168.0.10'],
- [u_host: '192.168.0.20'],
- [u_host: '192.168.0.30'],

Advanced:

Workflow: Provision Node

Count:

Max flows: 25

Max simultaneous: 5

Process flow complete:

Flow complete:

```javascript
// To access the flow that completed, use the 'flow' variable.

var flowOutput = flow.output;

workflow.debug("Provision Node Finished. Context: \" + flow.contextId);
```

Process finished:

Finished script:

```javascript
// To access the set of completed workflows use the 'coordinator' variable.

var flowResult = coordinator.getFlow(1).output;

workflow.debug("All Nodes Provisioned");
```
Add nodes to the load balancer

The second Parallel Flow Launcher activity uses WorkflowCoordinator objects to specify which subflows to run. The coordinator variable stores the completed flow information from the previous Provision Nodes activity. The script then retrieves the IP address and port for each node that was provisioned. The coord2 WorkflowCoordinator object runs the Add Node to Load Balancer subflow once for each node, using the retrieved IP address and port information as input variables. Finally, the coord2 WorkflowCoordinator object runs the SetupDNS subflow once to configure the load balancer.

```
javascript:
var coordinator = WorkflowCoordinator.load("Provision Nodes");
var coord2 = new WorkflowCoordinator(
  workflow: 'Add Node to Load Balancer'
);
for (var i = 0; i < coordinator.getNumFlows(); i++) {
  var ip = coordinator.getInput(i).ip;
  var port = coordinator.getOutput(i);
  coord2.add(
    ip: ip,
    port: port
  );
}
var loadBalancerIP = "10.0.20.10";
coord2.add( {ip: loadBalancerIP, hostname: 'www.snow1.net', 'SetupDNS'});
coord2;
```

Figure 772: Specifying which subflows to run

Workflows used as subflows
A workflow can launch another workflow as an activity.

The parent workflow triggers the subflow and then waits for the subflow to complete before continuing. Run the workflow validation tool prior to publishing to detect missing subflows and other dependency problems, such as those involving update sets.

The Workflows tab in the Workflow Editor contains a list of the workflows available for use as subflows.
Figure 773: Workflows available to use as subflows

Make sure that the selected subflow is active. If the subflow is inactive, the main workflow will hang with a Loading message. If you place an inactive subflow into a workflow, the subflow appears with a red banner, indicating that it cannot run. An active subflow is highlighted in blue when selected.
Figure 774: Workflow with active subflows

**Subflows and the Create Task activity**

If a workflow contains a *Create Task* activity that has executed on the current record, additional task activities in the workflow might not execute as expected.

This can happen when the same subflow containing a Create Task activity runs more than once in a parent flow. When the subflow reruns and attempts to execute the Create Task activity again, the system reopens the first task activity instead and does not create an additional task.

**Note:** An alternative to creating duplicate subflows that use the Create Task activity is to add a *Run Script* activity to the workflow that creates a task with a script.
Figure 775: The same create task activity runs twice in a workflow

In this configuration, the workflow does not run the same subflow containing a Create Task activity more than once. This allows the workflow to create additional tasks.
Figure 776: Running different subflows containing the Create Task activity

View workflow activity descriptions

Tooltips are available for workflow activities to help you understand how to use each activity.

1. To view an activity description in the Workflow Editor, point to the icon for the activity in the palette.
2. To modify activity descriptions, navigate to Workflow Administration Activity Definitions and edit the Description field.

**Note:** To view more information about an activity, double-click the activity on the canvas and then click the help icon in the title bar of the Activity Properties window.

**Elements in workflow activity definitions**

Each activity can specify a number of elements that control the behavior of the activity or are controlled by the activity.

Not all activities specify all possible elements. See *Workflow activities* on page 3367 for links to the activities provided by default. Each activity description includes a detailed explanation of the specific elements offered by that activity.
Table 1354: Workflow activity elements

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Results</td>
<td>The possible activity.results value. The activity result usually determines which condition the activity transitions through.</td>
</tr>
<tr>
<td>Scratchpad entries</td>
<td>Scratchpad variables the activity depends on to run, or variables the activity writes to the scratchpad.</td>
</tr>
<tr>
<td>Input variables</td>
<td>Values that control the behavior of the activity. Fields to set these values appear on the Activity Properties form when a new activity is added to a workflow. See Activity variables on page 3250 for more information.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Determines which transition the activity follows after completing. See Manage workflow activity conditions on page 3461 for more information.</td>
</tr>
<tr>
<td>States</td>
<td>Determines how the workflow handles the record being executed.</td>
</tr>
</tbody>
</table>

Add an activity to a workflow

Available activities are displayed in the Core, Packs, and Custom tabs in the Workflow Editor palette.

1. In the Workflow Editor, check out a workflow.
2. To add a workflow activity, drag it from the Core, Packs, or Custom tab to the canvas and drop it on a transition line in the workflow body.

   The transition turns blue when it is connected to the new activity. The designer adds the activity to the flow at that point and displays the property form for the new activity.

   If an activity is greyed out, approval engines are enabled for the table on which the workflow runs. To use the activity, turn approval engines off for the table.
3. Create any additional conditions needed for the activity and ensure that all exits are connected.
4. Run the workflow validation tool prior to publishing to detect missing or disconnected transitions that can cause a workflow to hang.

**Note:** All activity descriptions have a Table value. If this value is Global, the activity is available for use with any workflow regardless of the table selected in the workflow properties. Activities that identify a specific table appear in the palette only if the table configured for the workflow matches or extends the table identified in the activity.
Duplicate a workflow activity

You can duplicate an activity used in a workflow, including all the configured properties.

1. Right-click the activity and select Copy Activity from the context menu.
   The system automatically duplicates the activity, but does not create transitions.
2. Double-click the copy and configure the properties appropriately.
3. Drag the activity to a location in the workflow.
4. Add transitions.
Manage transitions between workflow activities

Transitions define the processing path of the workflow, depending on conditions defined in each activity. All conditions in an activity must have a transition and all transitions must have a connection to another activity or to the End activity.

**Note:**

Run the *workflow validation* tool prior to publishing to detect missing or disconnected transitions that could cause a workflow to hang.

1. Add transitions to the workflow using either of these methods:
   - Drag and drop an activity directly onto a transition line to connect it to the adjacent activities. The transition line turns blue when the connection is made. The system updates the transitions automatically to reflect the new sequence.
• Drag the activity to an open area in the canvas and create the transitions manually. Click the yellow square on the right side of the activity condition and drag a connector to the next task.
2. You can draw multiple transitions from the same activity condition if the activity executes concurrently.
3. To remove a transition, click to highlight it, and then press Delete.

Custom activity transitions

Controls on the Approval - User activity enable an administrator to add additional workflow transitions to the activity other than the default transitions of Approved or Rejected.

Transitions defined using this method do not become a permanent feature of the Approval - User activity. After a new transition is configured, that transition must be applied manually to subsequent instances of the activity, where desired.

Manage workflow activity conditions

Activities contain default conditions that determine which transitions are followed.

For example, the Approval - User activity has two conditions, Approved and Rejected.

![Figure 779: Example of activity conditions](image)
You can use a JavaScript condition check to create custom conditions on Core workflow activities. (Custom activities do not support this feature.)

1. Right-click the activity and select Add Condition from the context menu.
2. In the New Workflow Condition dialog box, fill in the fields as appropriate (see table).

### Table 1355: New Workflow Conditions form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The label that is displayed on the workflow.</td>
</tr>
<tr>
<td>Activity</td>
<td>Name of the activity for which this condition is submitted. This value is populated automatically by the system.</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of this condition.</td>
</tr>
<tr>
<td>Condition</td>
<td>A JavaScript condition check. The following variables are available:</td>
</tr>
<tr>
<td></td>
<td>• current: Current record that the workflow is running against.</td>
</tr>
<tr>
<td></td>
<td>• activity.result: Result value set by the activity upon completion.</td>
</tr>
<tr>
<td></td>
<td>• activity: Workflow Executing Activity (wf_executing) record. Used for advanced condition checks.</td>
</tr>
<tr>
<td></td>
<td>• activity.vars: Variables associated with the Workflow Executing Activity record. Used for advanced condition checks.</td>
</tr>
<tr>
<td>Skip during generate</td>
<td>If selected, the Generate activity does not follow this transition to generate approvals or tasks.</td>
</tr>
</tbody>
</table>

3. Click Submit.
4. To change the order in which conditions appear on the workflow activity, right-click the activity and select Reorder Conditions.

A dialog box appears, with a list of the available conditions.
5. Drag the conditions to a new position in the list.
6. Click OK.

Activity result value

The result value specified by an activity controls the condition through which the activity transitions.

Use the result value as part of the Condition field in the activity. For example, if the Condition field of an Approval - User activity contains activity.result == 'rejected', the activity transitions through that condition when a rejection is received from the approver. Result values are set in the Script field of the activity definition.

Edit the workflow activity properties form

Customize which workflow variables appear on an activity properties form and how the variables are arranged on the form.

1. Navigate to Workflow > Administration > Activity Definitions.
2. Scroll to the activity that you want to work with and click the activity name.
3. On the Workflow Activity Definition form, click the Edit Variables Layout related link.
4. On the Form Design page for the Activity Properties form, add and remove activity variables.
   The activity variables appear as separate items that you can rearrange on the form.
   For more details on using the form design interface, see *Using the form designer*. 
Using workflow approval activities and rolling back workflows

When you work with approvals, you need to understand how approval activities interact with approval engines, how to correct a skipped approval workflow activity, and how rollbacks work.

Approval workflow activities and approval engines

Approvals can be managed by approval activities or approval engines, but not both. Approval activities can be used if approval engines are not turned on for the table associated with the workflow.

Approvals can be managed by approval activities or approval engines, but not both. Trying to use both can cause a range of issues. Approval activites are not available (greyed out) in the palette if approval engines are used on the specified table. If you hover over a greyed out approval activity in the palette, a comment with more information is provided. For more information about approvals and approval engines, see Approvals on page 2404.

Figure 781: Unavailable approval activities

To turn approval engines off for the table, navigate to the System Properties > Approval Engines and change the setting for the table to Turn engines off.
Figure 782: Turn off approval engines

Correct a skipped workflow approval activity

While a workflow is in an active context, an approval activity can skip to the next activity.
An approval activity might skip for the following reasons:

- The approval user or group is missing or invalid (for example, sys_id).
- The approval user or group became inactive after the approval record was created.
- The activity is a dot-walked field, such as current.opened_by.department.manager, and it has a missing or invalid approval user or group.
- The business rule on the table that is associated with the workflow is invalid.

To correct a missed approval activity:

1. Navigate to Workflow Live Workflows All Contexts.
2. Click the date and time in the Started column for the workflow that is incorrectly processing approval activities.
3. In Related Links, click Show Workflow.
4. Review the portion of the workflow that executed, and then do one or more of the following:
   - Verify that after approval, the workflow progressed to the next activity. If a workflow failed to progress, check the business rules. For more information, see Debugging business rules.
   - Point to each processed approval activity to find activities where the State is Finished and Result is Skipped.
5. Navigate to Workflow Workflow Editor and open the workflow.
6. Double-click the skipped approval activity.
7. Click Users or Groups.
8. Assign an active user or group for the approval activity. For more information, see Workflow error handling on page 3348.

Rollback To activity

When conditions in a workflow trigger a Rollback To activity, the workflow moves processing backward to a specified activity in the workflow and resets certain activities that have already executed back to their original state. This is useful when handling an unexpected failure or as part of a programmed logical flow.

When an activity is reset during a workflow rollback, the following happens:

- Approvals are reset to Not Requested.
- Tasks are reset to either Open or Pending. A rollback workflow path cannot create new tasks.

Activities that perform external system operations, such as deleting a file or sending an email, are not rolled back. Only approval and task activity states are reset.

A workflow can contain a single rollback, multiple rollbacks, or nested rollbacks in more complex workflows. The Rollback To activity resets activities based on the actual workflow sequence (transition line attachments) of activities between itself and the transitioned to activity, rather than using the execution order to determine where processing should restart.

Rollback To behavior

The Rollback To activity transitions directly to the activity specified by the transition line arrow.

Use the Rollback To activity for all workflows that use multiple or nested rollbacks. Rollback To resets the targeted task (the direct transition) to Open. All tasks that have executed between the Rollback To activity and the targeted task (rolled back task) are set to Pending.

(11) Log approval
(12) Join
(14) Send email
(15) End
Figure 783: Rollback to workflow

Transition history

The state of (3) Task 3 does not change, since this activity does not directly transition from the rollback target activity. To see what activities were rolled back, select the Workflow Transition History related list and look at the Rolled back column.

The Rollback To activity (7) updates the following activities:

(8) Task 1: reset to Open
(9) Task 2: reset to Pending
(10) Approval 1: reset to Not Yet Requested
Using variables in Notify workflow activities

Certain Notify workflow activities support variable substitution for reading text to callers.

Certain Notify workflow activities allow you to use variables, such as those from the workflow scratchpad, to determine the activity behavior. Each activity supports a maximum of 20 variables. The following activities allow variable substitution:

Table 1356:

<table>
<thead>
<tr>
<th>Activity</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Say</td>
<td>Supports variable substitution in the Text field only.</td>
</tr>
</tbody>
</table>
### Scratchpad variables

You can call variables from the workflow scratchpad or the activity scratchpad using the syntax `${variable_name}`. You do not need to include either `workflow.scratchpad` or `activity.scratchpad` before the variable name. For example, to use the variable `activity.scratchpad.langCode = 'en-US'`, call `${langCode}` within the activity. If the scratchpad does not contain the specified variable, the variable evaluates to an empty value.

You can get values from objects on the scratchpad using the format `${object.value}`. For example, you can get the name of a user object, such as `workflow.scratchpad.user = {name:'john.smith'}` by calling `${user.name}`.

#### The digit variable

The Input activity exposes the `${digit}` variable. Use this variable in each condition presented by the activity. The number read to the user is determined automatically by each condition. The caller can press that number to cause the activity to transition through that condition.

#### Use multiple timer activities in one workflow

Workflow timer activities store data independently of each other in an activity-specific scratchpad. Previously, all timer activities in a workflow accessed a single, shared scratchpad, which could lead to conflicts when adding multiple timer activities to one workflow.

Timer scratchpads entries hold these values:

- `workflow.scratchpad.endTime`
- `workflow.scratchpad.realStartTime`
- `workflow.scratchpad.retroactiveSecsLeft`

#### Publish a custom workflow activity

When a user creates a custom activity and saves or submits it, that activity appears in the Custom and Packs tabs of the designer palette, but is only visible to the user who created it.

When configuration is complete, the user clicks Publish, which makes the activity accessible to other users on the instance with the `workflow_admin` or `activity_creator` role. Published activities are available for upload to the ServiceNow Store, can be added to workflows, and can be edited by any user with the proper roles.

To edit a published activity, click Checkout. When an activity is checked out by a user, only that user can modify it. The fields of a checked out activity are read-only for all other users. When the checked out
activity has been modified successfully, the user publishes it again. The system adds a new version of this activity to the Custom tab in the Workflow Editor palette.

**Note:** Activities you create and publish are only visible in the Packs tab if they were created in the current application scope.

---

**Locked versions**

Problems can arise if an activity version is checked out by a user and not checked back in, for example, when the user is sick or leaves the company. An activity in this state cannot be checked out for update.

A user with the admin role can return a locked activity to a published state. The administrator opens the locked activity from the Custom tab of the Workflow Editor, selects the checked-out version, and selects Force Checkout, and then Publish.

**Workflow activity pinning**

Workflow administrators can *pin* a custom activity to prevent the system from automatically updating that activity when a new version is downloaded from the ServiceNow Store.

You can pin or unpin individual activities or set pinning within workflow properties that controls the versions used for all the activities in that workflow. This can result in two workflows using different versions of the same activity.

**Note:** Activity pinning and unpinning applies to the custom activities downloaded from the ServiceNow Store only, and does not apply to newly published activity definitions made locally on your instance. To make use of these locally updated custom activities, you must check out your workflow and manually add the activities.

Workflow activities overview 3368

Workflow Activities

- multiple timer activities in one workflow 3470
- Notify 888, 3405
- SLA Percentage Timer 3416
- Timer 3417
- timer activities 3416

Workflow activity

- Forward to notify client 897, 3410
- queue 898, 3415
- Send SMS 891, 3413

Workflow activity

- Call 890, 3411
- Forward call 892, 3406
- Hang up 894, 3408
- Join conference call 888, 3412
- Reject call 896, 3409
- Say 896, 3410

Workflow Activity

Input 893, 3406

Play 895, 3408
Record 895, 3409

Workflow Administration

- error 3354
- errors 3348, 3353
- workflow timelines 3342, 3342, 3346, 3347

Workflow Concepts

- data separation 3323
- delegated administration 3321
- domain separation 3320
- restrictions 3320
- workflow caching 3327
- workflow engine operation order 3325
- workflow permissions 3323
- workflow scope 3319
- workflow tables 3327
- workflow versions 3319
- workflows 3320, 3321, 3323

Workflow Editor 3202

Workflow Error Handling

- approval condition 3354

Workflow Events 3256, 3257, 3264, 3266, 3271

Workflow Field 3284, 3285, 3287, 3287, 3289, 3294

Workflow icons 3287

workflow movement with update sets

- avoiding duplicate workflows 3341
- commit a workflow in an update set 3341
- input variable movement 3339, 3339, 3340
- input variable removal 3340, 3340, 3341, 3341
- update set migration 3341, 3342
- workflow update set migration 3337, 3337, 3338, 3338

Workflow run

- determine 3238
- workflow run time metrics 3367

Workflow stage icons 3287

workflow stage sets

- add a stage set 3283
- create a stage set 3281
- export a stage set 3283
- import a choice list 3283
- use default 3279, 3282

Workflow Stages 3273, 3277, 3279, 3280, 3280, 3280

Workflow validation 3236, 3294

Workflow Validator

- validate subflows 3303
- ValidateDanglingTransition 3302
- ValidateInputVarUpdateSetDependencies 3314
- ValidateLowestCommonTable 3305
- ValidateParentFlow 3307
- ValidateScriptForCurrentDotUpdate 3304
- ValidateSingleEnd 3307
- ValidateTableChange 3306
- validateTransitionIn 3301
- ValidateTransitionOut 3299
- ValidateUpdateSetDependencies 3310
- ValidateUpdateSetParentDependencies 3312
- ValidateWorkflowEndStages 3315
- ValidateWorkflowStageColumn 3316
- ValidateWorkflowStateValues 3316

workflows

- add activities 3236
- cancel with a script 3335
cancelContext(context) methods 3335
check out 3238
create 3222, 3229, 3231, 3233
edit 3238
ending with multiple branches 3235
error tracking for 3349
invoking subflows in 3244
palette 3206
passing variables to a subflow 3243
prepare for adding subflow 3248
preparing a subflow for 3244
publish 3237
selecting activities for 3206
subflow inputs 3243
subflows in 3240, 3450
