ParameterValue - toString()
Converts the POST or URL parameter value to a string.

<table>
<thead>
<tr>
<th>Table 396: Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Table 397: Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>String</td>
</tr>
</tbody>
</table>

ParameterValue - getAsJsonContent()
Returns the request as an iterable object of type JsonNode.
This method is available only in an Edge Encryption rule if the request body is a valid JSON payload. If you are not sure what format the request body includes, check the contentType field on the request object.
Once the request is returned as a JsonNode object, you can use the JSON APIs on page 1185 to iterate over the object and encrypt fields.

<table>
<thead>
<tr>
<th>Table 398: Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Table 399: Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>JsonNode</td>
</tr>
</tbody>
</table>

ParameterValue - getAsXmlContent()
Returns the request content as an iterable object of type XMLContent.
This method is available only in an Edge Encryption rule. This method assumes that the request body is a valid XML payload. You can check the contentType to make sure.
Once the request is returned as an XMLContent object, you can use the XML APIs on page 1179 to iterate over the object and encrypt fields.
Table 400: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 401: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLContent</td>
<td>The request as an iterable object of type XMLContent.</td>
</tr>
</tbody>
</table>

ParameterValue - encodedQueryFor(String tableName)

Specifies that the value of the element is an encoded query on the specified table.

Calling this function on a parameter tells the proxy that the value of the parameter is an *encoded query* for the specified table. The proxy parses the encoded query and encrypts the fields in the encoded query that must be encrypted.

Table 402: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table that you expect the query to run on.</td>
</tr>
</tbody>
</table>

Table 403: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

ParameterValue - valueFor(String tableName, String fieldName)

Specifies that the value of the element maps to the specified field in the specified table.

Calling this method on an element value tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then checks if the field must be encrypted.

Table 404: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table name.</td>
</tr>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The field name.</td>
</tr>
</tbody>
</table>

Table 405: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
XML APIs
XML APIs can be used after calling getAsXmlContent() on either the request object or a ParameterValue property.

When using XML APIs to write your encryption rule, you can follow a general format:

1. Call getAsXmlContent() on the request object or ParameterValue property. This returns an iterable object of the XMLContent underlying class.
2. Call getIterator() or getIterator(String xPath) on the XMLContent object. This returns an XMLElementIterator object that can be used to iterate over XML elements.
3. Call the hasNext() method on the XMLElementIterator object to determine whether another element is available.
4. Call next() on the XMLElementIterator object to return the next XML element. You cannot call next() without first calling hasNext().
5. Call valueFor(String tableName, String fieldName) on the XML element. This method tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then checks if the field must be encrypted.

**Note:** To determine if you want to call valueFor(String tableName, String fieldName) on an XML element, you can use the getName() method to return the name of the element.

Mapping to a known table-field on the instance

In this example, the XML payload will be processed on the instance to insert records in the incident table. The description field will populate short_description on the incident.

```xml
<data>
  <record>
    <name>'Test Record 1'</name>
    <description>'Test Record 1 Description'</description>
    <tag>critical</tag>
  </record>
  <record>
    <name>'Test Record 2'</name>
    <description>'Test Record 2 Description'</description>
    <tag>security</tag>
  </record>
</data>
```

The following encryption rule action can apply:

```javascript
function sampleXmlAction1() {
  var xmlContent = request.getAsXmlContent();
  // This loop iterates over all description tags that match the given path
  var xmlElementIterator = xmlContent.getIterator('data/record/description');
  while (xmlElementIterator.hasNext()) {
    var xmlElement = xmlElementIterator.next();
    xmlElement.valueFor('incident', 'short_description');
  }
}
```

This action iterates through the description tags and asks the proxy server to encrypt the values and insert them into incident.short_description on the instance.
**Mapping to an unknown table-field on the instance**

In this example, the rule iterates over the record tags, but does not know what tags to expect within the record tag. The only known is that the tags within the record tags match the names of the columns specified in the table URL parameter.

The rule also specifies that, if the table is incident, then the data in the description tag should be encrypted and stored in the short_description field on the instance.

```javascript
function sampleXmlAction2() {
    var xmlContent = request.getAsXmlContent();
    var tableName = request.urlParam.table;
    // This first iterator will iterate over all record elements
    var xmlElementIterator = xmlContent.getIterator('data/record');
    while (xmlElementIterator.hasNext()) {
        encryptFieldsInRecord(xmlElementIterator.next());
    }
}
function encryptFieldsInRecord(xmlElement) {
    // Then, iterate over all tags representing fields in the table
    var fieldIterator = xmlElement.getIteratorOverAllChildren();
    while (fieldIterator.hasNext()) {
        var field = fieldIterator.next();
        var fieldName = childElement.getName();
        // if table is incident, then description is encrypted for the
        short_description field
        if (tableName == 'incident' && fieldName == 'description') {
            field.valueFor(tableName, 'short_description');
        } else {
            // if table is not incident, ask the proxy to check if the given
            field is encrypted for the given table
            field.valueFor(tableName, fieldName);
        }
    }
}
```

In the encryptFieldsInRecord() function, the valueFor() method is called on a table and a field that are dynamically assigned based on the request. Even though the table and field names can change, the rule asks the proxy to check whether the field in the table must be encrypted based on the encryption configurations defined.

If the field is not configured for encryption, or if the tag does not match a field in the table, the proxy skips that tag. If the tag matches a field marked for encryption, then the Edge Encryption proxy server encrypts the value.

**Using an encoded query**

In this example, all tags have the filter attribute, which indicates whether the tag contains an encoded query.

```xml
<data>
  <record>
    <name filter="false">'Test Record 1'</name>
    <description filter="false">'Test Record 1 Description'</description>
    <query filter="true">category=1^name=edge</query>
  </record>
</data>
```
function sampleXmlAction3() {
  var xmlContent = request.getAsXmlContent();
  var tableName = request.urlParam.table; // This first iterator will iterate over all record elements
  var xmlElementIterator = xmlContent.getIterator('data/record');
  while (xmlElementIterator.hasNext()) {
    encryptFieldsInRecord(xmlElementIterator.next());
  }
}

function encryptFieldsInRecord(xmlElement) {
  // this time we want to iterate over all tags representing fields in the table
  var fieldIterator = xmlElement.getIteratorOverAllChildren();
  while (fieldIterator.hasNext()) {
    var field = fieldIterator.next();
    var fieldname = field.getName(); // let's look at the filter attribute, if true, then encrypt as encoded query
    if (field.getAttributeValue('filter') == 'true') {
      field.encodedQueryFor(tableName);
    } else {
      // if it is false then check if the field should be encrypted
      field.valueFor(tableName, fieldname);
    }
  }
}

If the filter attribute value is true, the rule asks the proxy server to encrypt the values in the encoded query. If false, the rule asks the proxy to check whether the field should be encrypted.

XMLContent
A global object that provides methods to iterate over the XML content.

You can access an XMLContent object by calling getAsXmlContent() on a request object.

You access XML data in a POST or URL parameter by calling request.postParams.<parameter name>.getAsXmlContent() or request.urlParams.<parameter name>.getAsXmlContent().

XMLContent - getIterator()
Returns an XMLElementIterator object for the XML content.

Table 406: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Table 407: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElementIterator</td>
<td>An object that can be used to iterate over elements in the XMLContent object.</td>
</tr>
</tbody>
</table>

XMLContent - getIterator(String xPath)

Returns an XMLElementIterator object for the XML content based on the specified parameter.

Table 408: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xPath</td>
<td>String</td>
<td>An xPath-like expression that specifies where in the XMLContent object to start.</td>
</tr>
</tbody>
</table>

Table 409: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElementIterator</td>
<td>An object that can be used to iterate over elements in the XMLContent object.</td>
</tr>
</tbody>
</table>

XMLElementIterator

Provides methods for iterating over XML elements.

You get an XMLElementIterator object by calling the getIterator() method of the XMLContent class.

XMLElementIterator - hasNext()

Determines if there is another element available.

Table 410: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

Table 411: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if another element is available.</td>
</tr>
</tbody>
</table>

XMLElementIterator - next()

Returns the next element in the iterator.

You cannot call next() without first calling hasNext().
Table 412: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 413: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElement</td>
<td>The next XML element.</td>
</tr>
</tbody>
</table>

XMLElement

Provides methods for iterating through XML elements and mapping values to fields in a table.

You get an XMLElement object by calling the next() method of an XMLElementIterator object.

XMLElement - getIterator(String xPath)

Returns an XMLElementIterator object for the XML element based on the specified parameter.

Table 414: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xPath</td>
<td>String</td>
<td>An xPath-like expression that specifies where in the XMLElement object to start.</td>
</tr>
</tbody>
</table>

Table 415: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElementIterator</td>
<td>An object that can be used to iterate over elements in the XMLElement object.</td>
</tr>
</tbody>
</table>

XMLElement - getIteratorOverAllChildren()

Returns an XMLElementIterator object that includes all sub-elements for the XML element based on the specified parameter.

Table 416: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 417: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElementIterator</td>
<td>An object that can be used to iterate over elements in the XMLElement object.</td>
</tr>
</tbody>
</table>
XMLElement - `valueFor(String tableName, String fieldName)`
Specifies that the value of the element maps to the specified field in the specified table.

Calling this method on an element value tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then checks if the field must be encrypted. If the table and field names are unknown, you can call the `valueFor()` method on a table and a field that are dynamically assigned based on the request.

<table>
<thead>
<tr>
<th>Table 418: Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>tableName</td>
</tr>
<tr>
<td>fieldName</td>
</tr>
</tbody>
</table>

XMLElement - `encodedQueryFor(String tableName)`
Specifies that the value of the element is an encoded query for the specified table.

Calling this function on an element tells the proxy that the value of the element is an *encoded query* for the specified table. The proxy parses the encoded query and encrypts the fields in the encoded query that must be encrypted.

<table>
<thead>
<tr>
<th>Table 420: Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>tableName</td>
</tr>
</tbody>
</table>

XMLElement - `getName()`
Returns the element name.

<table>
<thead>
<tr>
<th>Table 422: Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>
Table 423: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The element name.</td>
</tr>
</tbody>
</table>

XMLElement - getAttributeValue(String attribute)

Returns the value of the specified attribute.

Table 424: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute</td>
<td>String</td>
<td>Attribute name.</td>
</tr>
</tbody>
</table>

Table 425: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The attribute value.</td>
</tr>
</tbody>
</table>

**JSON APIs**

JSON APIs can be used after calling getAsJsonContent() on either the request object or a ParameterValue property.

When using JSON APIs to write your encryption rule, you can follow a general format:

1. Call getAsJsonContent() on the request object. This returns an iterable object of the JsonNode underlying class.
2. Call getIterator() or getIterator(String xPath) on the JsonNode object. This returns a JsonNodeIterator object that can be used to iterate over nodes in the JSON object.
3. Call the hasNext() method on the JsonNodeIterator object to determine whether another element is available.
4. Call next() on the JsonNodeIterator object to return the next JSON element. You cannot call next() without first calling hasNext().
5. Call valueFor(String tableName, String fieldName) on the JSON element. This method tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then checks whether the field must be encrypted.

**Note:** To determine if you want to call valueFor(String tableName, String fieldName) on a JSON element, you can use the getName() method to return the name of the element.

**Mapping to a known table-field on the instance**

In this example, the JSON payload is processed on the instance to insert records in the incident table. The description field populates short_description on the incident.

```json
{
    data: {
        records: [
            {
```
The following rule can apply:

```javascript
function sampleJsonAction1() {
  var jsonContent = request.getAsJsonContent();
  // This loop iterates over all description elements in the records array
  var jsonNodeIterator = jsonContent.getIterator('/data/records/description');
  while (jsonNodeIterator.hasNext()) {
    var jsonNode = jsonNodeIterator.next();
    jsonNode.valueFor('incident', 'short_description');
  }
}
```

This action iterates through the description nodes and asks the proxy server to encrypt the values and insert them into incident.short_description on the instance.

**Note:** This rule finds all description nodes within the JSON payload. If there is only one occurrence of a node to encrypt, the rule still uses the XPath and iterator structure. However, it iterates only once in the loop.

---

**Mapping to an unknown table-field on the instance**

In this example, the rule iterates over records, but is not sure what nodes to expect. The only known is that for each object within records, the nodes match the names of the columns specified in the table URL parameter.

The rule also specifies that, if the table is incident, then the data in the description node should be encrypted and stored in the short_description field on the instance.

```javascript
function sampleJsonAction2() {
  var jsonContent = request.getAsJsonContent();
  var tableName = request.urlParam.table;
  // This first iterator will iterate over all record elements
  var jsonNodeIterator = jsonContent.getIterator('data/records');
  while (jsonNodeIterator.hasNext()) {
    encryptFieldsInRecord(jsonNodeIterator.next());
  }
}
```

```javascript
function encryptFieldsInRecord(jsonNode) {
  // this time we want to iterate over all nodes
  var fieldIterator = jsonNode.iterator();
  while (fieldIterator.hasNext()) {
    var field = fieldIterator.next();
    var fieldname = childElement.getName();
    if (fieldName == 'description') {
      field.valueFor(tableName, 'short_description');
    } else {
    }
  }
}
```
In the encryptFieldsInRecord() function, the valueFor() method is called on a table and a field that are dynamically assigned based on the request. Even though the table and field names can change, the rule asks the proxy to check whether the field in the table must be encrypted based on the encryption configurations defined.

If the field is not configured for encryption, or if the node name does not match a field in the table, the proxy skips that node. If the node name matches a field marked for encryption, then the proxy encrypts the value.

**Using an encoded query**

```javascript
function sampleJsonAction3() {
    var jsonContent = request.getAsJsonContent();
    var tableName = request.urlParam.table;
    // This first iterator will iterate over all record elements
    var jsonNodeIterator = jsonContent.getIterator('data');
    while (jsonNodeIterator.hasNext()) {
        var jsonNode = jsonNodeIterator.next();
        if (jsonNode.getName() == 'records')
            encryptRecords(jsonNodeIterator.next());
        else if (jsonNode.getName() == 'query')
            jsonNode.encodedQueryFor(tableName);
    }
}

function encryptRecords(jsonNode) {
    // we iterate over all fields in the node
    var recordIterator = jsonNode.iterator();
    while (recordIterator.hasNext()) {
        encryptFieldsInRecord(recordIterator.next());
    }
}

function encryptFieldsInRecord(jsonNode) {
    // this time we want to iterate over all nodes
    var fieldIterator = jsonNode.iterator();
    while (fieldIterator.hasNext()) {
        var field = fieldIterator.next();
        var fieldName = childElement.getName();
        field.valueFor(tableName, fieldName);
    }
}
```

In this example, the rule iterates over data. As it finds records, it performs the same logic as in the second example, iterating over fields in each node. When it finds the query node, it calls encodedQueryFor() to encrypt values that should be encrypted in the query.

**JsonNode**

A global object that provides methods to iterate over the JSON content.

You can access a JsonNode object by calling `getAsJsonContent()` on a request object.

You access JSON content from a POST or URL parameter by calling `request.postParms.<parameter name>.getAsJsonContent()` or `request.urlParms.<parameter name>.getAsJsonContent()`.

**JsonNode - getIterator(String xPath)**

Returns a JsonNodeIterator object for the JSON content.

This method can only be used on the root node, but can be used to traverse deep into the JSON object. Subsequent traversals must use the iterator() method.
### Table 426: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xPath</td>
<td>String</td>
<td>An xPath expression.</td>
</tr>
</tbody>
</table>

### Table 427: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNodeIterator</td>
<td>An object that can iterate over nodes in the JSON object.</td>
</tr>
</tbody>
</table>

JsonNode - iterator()

- Returns a JsonNodeIterator object that iterates over all child nodes of the current node.

### Table 428: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Table 429: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNodeIterator</td>
<td>An object that can iterate over nodes in the JSON object.</td>
</tr>
</tbody>
</table>

JsonNode - getAsString()

- Returns the current node value as a string.

### Table 430: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Table 431: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The current node value.</td>
</tr>
</tbody>
</table>

JsonNode - getAsString(String propertyName)

- Returns the string value of the specified property.
Table 432: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>propertyName</td>
<td>String</td>
<td>Name of the property.</td>
</tr>
</tbody>
</table>

Table 433: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The property value.</td>
</tr>
</tbody>
</table>

JsonNode - getName()  
Returns the name of the current JSON node.

Table 434: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 435: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Name of the current JSON node.</td>
</tr>
</tbody>
</table>

JsonNode - valueFor(String tableName, String fieldName)  
Specifies that the JSON property maps to the specified field in the specified table.

Calling this method on a JSON property tells the proxy that the value for this property maps to the specified field in the specified table. The proxy then decides if the field must be encrypted. If the table and field names are unknown, you can call the valueFor() method on a table and a field that are dynamically assigned based on the request.

Table 436: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table name.</td>
</tr>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The field name.</td>
</tr>
</tbody>
</table>

Table 437: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

JsonNode - encodedQueryFor(String tableName)  
Specifies that the value of the JSON property is an encoded query for the specified table.
Calling this function on a JSON node tells the proxy that the value is an *encoded query* for the specified table. The proxy parses the encoded query and encrypts the values for fields in the encoded query that must be encrypted.

**Table 438: Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table that you expect the query to run on.</td>
</tr>
</tbody>
</table>

**Table 439: Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

JsonNodeIterator

You get a JsonNodeIterator object by calling the getIterator() or iterator() methods of the JsonNode class.

JsonNodeIterator - hasNext()

Determines if there is another property available.

**Table 440: Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Table 441: Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if another property is available.</td>
</tr>
</tbody>
</table>

JsonNodeIterator - next()

Returns the next property in the iterator.

You cannot call next() without first calling hasNext().

**Table 442: Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Table 443: Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNode</td>
<td>The next JsonNode.</td>
</tr>
</tbody>
</table>
print(String message)
Prints a message to the wrapper log file: <proxy server directory>/logs/wrapper_<date>.log.
This method is available only in an Edge Encryption rule action script.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>The message to be written to the wrapper log file.</td>
</tr>
</tbody>
</table>

Table 445: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

Prohibited keywords
The Edge Encryption proxy validates encryption rule scripts before saving the rule. Many JavaScript keywords are not allowed in encryption rule scripts.

Table 446: Prohibited keywords

<table>
<thead>
<tr>
<th>Keyword</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DIR</strong></td>
</tr>

Edge Encryption dictionary attributes

You can add Edge Encryption dictionary attributes to tables and fields.

To set a Edge Encryption dictionary attribute to true, you must enter attribute=true in the Attributes field. To add a dictionary attribute to a record, see Dictionary attributes.

Table 447: Edge Encryption dictionary attributes

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Target element</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edge Encryption Excluded [edge_encryption_excluded]</td>
<td>true/false</td>
<td>field or table</td>
<td>When set to true, the field or table cannot be encrypted.</td>
<td>False</td>
</tr>
<tr>
<td>Name</td>
<td>Value</td>
<td>Target element</td>
<td>Description</td>
<td>Default value</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>----------------</td>
<td>----------------</td>
<td>----------------------------------------------------------------------------</td>
<td>--------------------------------</td>
</tr>
<tr>
<td>Edge Encryption Enabled</td>
<td>true/false</td>
<td>field</td>
<td>When set to true, the field is eligible for encryption through an encryption configuration. Because this attribute is used by the system and cannot be modified, it is not always displayed to the user.</td>
<td>True for String fields</td>
</tr>
</tbody>
</table>

**Note:**
This attribute does not indicate that a field is encrypted, nor does it trigger any encryption logic on the field. Rather, the attribute determines the possibility of the field being encrypted by a user.
<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Target element</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edge Encryption Clear Text Allowed</td>
<td>true/false</td>
<td>field</td>
<td>When set to true, allows server-side scripts to append non-encrypted data to an encrypted string within the field for user actions performed through the proxy server, or any server-side automated scripts, such as scheduled jobs.</td>
<td>False</td>
</tr>
</tbody>
</table>

## Domain separation in Edge Encryption

Edge Encryption provides the ability to encrypt data from within the customer’s environment through the use of specific configurations, rules, and keys defined on the Edge Encryption proxy. The Edge Encryption proxy is not domain aware and cannot support domain-specific settings. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

### Overview

Support: Data only

Domain separation in this application is supported at the Data only level, meaning it supports the data security model of separating visibility of data from one domain to another. To learn more, see Application support for domain separation.

### How domain separation works in Edge Encryption

Edge Encryption can be used where domain-specific keys, configurations, and rules are not required.

### Data integration with Edge Encryption

To integrate third-party data with an instance using Edge Encryption, you must route the data through the Edge Encryption proxy server using supported integrations. Supported integrations use base system encryption rules that map data in each payload to fields in a table.
upload data to fields marked for encryption

Edge Encryption does not support importing data from or exporting data to Excel, CSV, XML, or other file types to or from fields with encryption configurations defined.

**ODBC driver**

Encrypt requests and query data through the Edge Encryption proxy server using the ODBC driver.

Learn more: [Edge Encryption ODBC driver integration](#) on page 1195

**MID Server**

You can configure the MID Server to route data through an Edge Encryption proxy server. However, some restrictions apply.

Learn more: [Edge Encryption MID Server integration](#) on page 1199

**REST/SOAP web services**

Use REST/SOAP web services to update or retrieve record data through the Edge Encryption proxy server.

Learn more: [Web services](#)

**JSONv2 web service**

Use JSONv2 web service APIs to update or retrieve record data through the Edge Encryption proxy server. Base system encryption rules support data retrieval and data modification APIs.

- To insert a single record using the data modification API, use the insert() or insertMultiple() methods.
- To insert multiple records using the data modification API, use the insertMultiple() method.

Learn more: [JSONv2 Web Service](#)

To encrypt data from custom third-party integrations not listed above, create custom encryption rules. See [Define a custom encryption rule](#) on page 1168.

**Upload attachments to records marked for encryption**

Attachments can be uploaded to tables with attachment encryption configured using REST and SOAP web services.

**Edge Encryption ODBC driver integration**

Configure your ODBC driver to query data encrypted by Edge Encryption. The Edge Encryption proxy server encrypts ODBC driver requests to the ServiceNow instance when Edge Encryption is integrated with the ODBC driver.

Encrypted responses from the instance are decrypted through the Edge Encryption proxy server before passing to the ODBC driver in your network.
For a successful integration, the ODBC driver must trust the Edge Encryption proxy server certificate. If the Edge Encryption proxy server certificate is signed by a Certificate Authority trusted by the ODBC driver, the Edge Encryption proxy server is automatically trusted. However, if a Certificate Authority trusted by the ODBC driver has not signed the Edge Encryption proxy server certificate, you must import the self-signed certificate to the ODBC truststore.
Import a self-signed certificate to the ODBC truststore

If a Certificate Authority trusted by the ODBC driver has not signed the Edge Encryption proxy server certificate, you must import a self-signed certificate to the ODBC truststore. You can export the certificate from the Edge Encryption proxy server and import it into the ODBC truststore.

To determine whether a Certificate Authority trusted by the ODBC driver has signed the Edge Encryption proxy server certificate, run the following command in the keystore directory in the proxy home directory to view a list of Certificate Authorities trusted by the ODBC driver:

```
keytool -keystore "<ODBC directory>\ip\Java\jre\lib\security\cacerts" -list
```

1. Change to the keystore directory in the proxy home directory.
2. Check the keystore for the self-signed certificate.
   a) To check the keystore for the certificate, you can run the following command to list all the items in the keystore.
      ```
      keytool -list -keystore keystore.jceks -storetype jceks -v
      ```
   b) Locate the key alias in the list of items.
3. Using the key alias, export the certificate to a .cer file.
   ```
   keytool -export -alias <key alias> -keystore keystore.jceks -storetype jceks -rfc -file <file name>.cer
   ```
4. Change to your ODBC truststore directory: ODBC\ip\Java\jre\lib\security\cacerts.
5. Import the certificate to your ODBC truststore.
   ```
   keytool -keystore cacerts -importcert -alias $<key alias> -file <file name>.cer
   ```

Set the ODBC driver properties

Set the ODBC driver properties to route requests through the Edge Encryption proxy server.

1. In Windows, navigate to Start Programs ServiceNow ODBC Management Console.
2. Expand the console tree root to: ServiceNow ODBC Manager\Manager\<installation location>\Services\ServiceNow_ODBC\Data Source Settings\ServiceNow\IP Parameters.
3. Double-click the DataSourceIPProperties attribute.
4. Change the Value to the URL of your Edge Encryption proxy server, such as https://<IP address>:\<port>
5. Click OK.

The ODBC driver is now configured to route requests to the instance through the Edge Encryption proxy server.

**Edge Encryption MID Server integration**

Configure the MID Server to route data through an Edge Encryption proxy server.

When integrated with the MID Server, the Edge Encryption proxy server acts as the MID Server's endpoint. The Edge Encryption proxy server then encrypts and decrypts data passing between the ServiceNow instance and the MID Server.

**Limitations when integrating with the MID Server**

When MID Server data is configured to pass through the Edge Encryption proxy server, the following limitations apply:

- Encryption of ECC Queue fields is not supported.
- Encrypted data cannot be used with Discovery or Service Mapping.

**Point the MID Server to the Edge Encryption proxy server**

To pass data from the MID Server through the Edge Encryption proxy server, update the MID Server configuration file to point the MID Server to the Edge Encryption proxy server.

When configuring the MID Server to pass through the Edge Encryption proxy server, you cannot use the web proxy properties in the MID Server configuration file to route traffic through the Edge Encryption proxy server to your instance. Instead, you must set the Edge Encryption proxy server as the MID Server's endpoint.

1. Navigate to your local MID Server directory and open the config.xml file.
2. Find the element `<parameter name="url" value="https://YOUR_INSTANCE.service-now.com" />` and change the value property to the URL of your Edge Encryption proxy server. For example, `http://hostname.mycompany.com:8081`.
   This step directs the MID Server to pass traffic to the Edge Encryption proxy server instead of the instance. The Edge Encryption proxy server in turn encrypts any necessary fields and passes the payload to the instance.
3. Save and close the file.
4. If running, restart the MID Server.

**Edge Encryption diagnostics and performance**

Monitor Edge Encryption proxy server performance trends and drill into errors generated by the Edge Encryption proxy server.

**Edge proxy performance**

View key Edge Encryption proxy server performance trends using the Edge Proxy graph set on the ServiceNow Performance homepage. Monitored trends include:

- Maximum and average response times between the client, proxy server, and instance.
- CPU, disk space, and memory usage of the host machine.
• Maximum and average network latency between the proxy server and the ServiceNow instance.

**Note:** Edge Encryption proxy servers with duplicate names do not report performance trends.
Edge Processing (Max and Average)

Maximum and average time in milliseconds to process a request. These data points are general trends over time.
• Total Time: Time for the proxy server to receive a request from a client and send a response. This data point is the sum of the subsequent data points.
• Proxy Response: Time for the proxy server to process a response from the instance.
• Proxy-Instance Round Trip: Time for the proxy server to send a request to the instance and receive a response. Includes network latency between the proxy server and the instance and time spent by the instance to process the request.
• Rules: Time for the proxy server to evaluate a request using defined encryption rules.
• Proxy Request: Time for the proxy server to process a client request and forward it to the instance.

Edge Proxy Performance (Max and Average)  
Maximum and average percentage of resources used on the host machine.
• CPU Usage
• Memory Usage
• Disk Usage

Edge Proxy Latency  
Maximum and average network latency in milliseconds at a given point in time. Latency is determined by round-trip time for a proxy server to send a simple ping to the instance and receive a response.

Proxy Error Reports  
Navigate to Edge Encryption Configuration Diagnostics and Troubleshooting Proxy Error Reports to view all proxy server errors collected over the past seven days.
Errors are collected over a one-minute period. Each minute, an error report is generated. The vertical axis displays the number of error reports over the last seven days that include each error. For example, even if the DEFAULT_ERROR_CODE error is thrown multiple times over a one-minute report period, the DEFAULT_ERROR_CODE bar will only reach one on the Number of Error Reports axis.

From this view, you can:

- Click each proxy error code bar to see the report on a single error for each proxy server. From this view, you can click the bar again to view the error text in the Edge Encryption Proxy Stat table [edge_encryption_stat]. Follow links in the error text to see more information and possible remediation steps.
- Click Other to see page two of the error report.

**Note:** If you have more than one proxy server with the same name, a single DUPLICATE_PROXY_NAME error appears in the Proxy Error Report. No other errors are reported for proxy servers with duplicate names. If you encounter this error, make sure that all proxy servers have unique names.

**Additional monitoring resources**

The instance tracks all encryption proxies. Each Edge Encryption proxy server registers when it starts up. The instance is notified when:

- A new Edge Encryption proxy server starts up.
- An Edge Encryption proxy server is intentionally shut down.

If an Edge Encryption proxy server attempts to register with an instance that does not have Edge Encryption installed, the proxy does not start.
All encryption configuration files are audited. Deleted records are audited on all encryption configuration files. Audit records are put in the sys_audit table. To view the history of a specific configuration record, view the record, and click History List in the menu. The Mass Encryption Job is not audited.

Use the following additional resources to monitor your proxy servers.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Invalid Insert Attempts</td>
<td>List of attempts to save the following data to encrypted fields: invalid_insert_log.</td>
</tr>
<tr>
<td>Job Failures</td>
<td>A list of jobs that did not execute successfully.</td>
</tr>
<tr>
<td>System logs</td>
<td>The instance periodically checks for messages from each registered proxy server. If a proxy server has not sent a message in the required time frame, an error is logged. The log message contains information about the encryption proxy and the last time the proxy pinged the instance. If the instance determines that none of the encryption proxies are online, it logs a message. These messages are added to the system log.</td>
</tr>
</tbody>
</table>

Disable or reduce Edge Proxy statistic collection

Prevent the Edge Encryption proxy server from sending Edge Proxy Graph Set statistics to the ServiceNow Performance homepage, or reduce the frequency of statistic collection.

Role required: admin or security_admin

By adding properties in the edgeencryption.properties configuration file, you can:

- Disable the Edge Proxy graph set.
- Change the interval during which statistics are collected by the Edge Encryption proxy server. By default, statistics are collected every 30 seconds.

1. In your proxy server installation directory, open the edgeencryption.properties configuration file located in the <installation directory>/conf/ folder.
2. Add one of the following properties.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| edgeencryption.stat.collection.enabled | Enables the collection of statistics used by the Edge Encryption proxy server performance dashboard.  
• Default value: true  
Add this property and set the value to false to disable the collection of statistics used by the Edge Encryption proxy server performance dashboard. After adding proxy server performance properties, you must restart the proxy server for the change to take effect. |
| edgeencryption.stat.collection.interval | Interval length in seconds during which the Edge Encryption proxy server collects statistics. The value cannot be less than 30 seconds.  
• Default value: 30  
After adding proxy server performance properties, you must restart the proxy server for the change to take effect. |

3. Restart the proxy server.

Flow Designer

Flow Designer is a Now Platform feature that enables rich process automation capabilities in a consolidated design environment. It enables process owners to use natural language to automate approvals, tasks, notifications, and record operations without having to code.

You can expand the Flow Designer solution to integrate with external instances and third-party applications with a separate subscription to IntegrationHub on page 1327.

Benefits

Flow Designer provides process owners and developers these benefits.

• Consolidates multiple Now Platform automation capabilities into a single environment so process owners and developers can build and visualize business processes from a single interface.
• Consolidates configuration and runtime information into a single environment so process owners and developers can create, operate, and troubleshoot flows from a single interface.
• Provides natural-language-descriptions of flow logic to help non-technical users understand triggers, actions, inputs, and outputs.
• Promotes process automation by enabling subject matter experts to develop and share reusable actions with flow designers.
• Reduces upgrade costs, with upgrade-safe Now Platform® logic replacing complex custom script.
• Reduces development costs by providing a library of reusable actions.
• Allows extending Flow Designer content by subscribing to IntegrationHub or installing spokes.

Interactions with existing automation processes

While learning Flow Designer, make sure that you understand how existing Now Platform automation processes such as business rules and workflows change records to avoid creating conflicting logic. See the Architecture Overview on page 1208 to understand how Flow Designer works within the Now Platform. If you are replacing an existing automation process, you may need to deactivate it before replacing it with Flow Designer flows and actions.

Flow Designer content

Flow Designer consists of the following content types.

**Flows**

A **flow** is an automated process consisting of a sequence of actions and a trigger. Flows automate business logic for a particular application or process. For example, the VTB Sample Flow creates and assigns a VTB card whenever a priority 1 incident is created. Flows require some familiarity with the Now Platform tables and fields the application or process uses. Process analysts can create flows using available actions or copy an existing flow to use it as a template. You can add application-specific flows by activating the associated spoke.

**Subflow**

A **subflow** is an automated process consisting of a sequence of reusable actions and specific data inputs that allow it to be started from a flow, subflow, or script. Subflows automate generic business logic that can be applied to multiple applications or processes. For example, you could create a subflow to notify users of record changes. Subflows require some familiarity with the Now Platform tables and fields the application or process uses. Process analysts can create subflows using available actions or use an existing flow as a template.

**Actions**

An **action** is a reusable operation that enables process analysts to automate Now Platform features without having to write code. For example, the Create Record action allows process analysts to generate records in a particular table with particular values when certain conditions occur. Core actions like Create Record require some familiarity with Now Platform tables and fields. Action designers can create application-specific actions to preset configuration details. For example, creating a Create Incident Task action ensures that the process analyst uses the correct table and field configuration each time the action is used.
add application-specific actions by activating the associated spoke.

Core actions
A core action is a ServiceNow-provided action available to any flow that cannot be viewed or edited from the Action Designer design environment. For example, the Ask for Approval action is a core action that allows process analysts to use Now Platform approvals. Flow Designer provides a set of core actions to automate Now Platform processes. You can add application-specific core actions by activating the associated spoke.

Action steps
An action step or step is a single reusable operation within an action. For example, the Create Record step allows action designers to specify the table and field values to use during record creation. Action steps require subject matter expertise with application tables, fields, and business logic. Application developers or IT generalists add action steps to actions from the Action Designer design environment. Flow Designer provides a set of core action steps to automate Now Platform processes. You can add application-specific action steps by activating the associated spoke.

Spokes
A spoke is a scoped application containing Flow Designer content dedicated to a particular application or record type. For example, the ITSM Spoke contains actions for managing Task records such as the Create Task action. Spokes are activated when their parent application is activated. For example, the ITSM Spoke is activated when the Incident, Problem, and Change applications are activated. Creating a spoke requires familiarity with application development as developers must add Flow Designer content to a scoped application. See Spokes on page 1310 for a list of available spokes.

Consolidated design and operation environment
The design environment consists of these components.

Landing page
Access or create flows, actions, or flow executions.

Flow Designer
Create and edit flows by defining a trigger and adding actions. Test flows to see if they complete successfully and to review the runtime values they generate. Activate flows to make them available for execution on your instance and to preserve their current actions, inputs, and sequence as a snapshot separate from further configuration changes.

Action Designer
Create and edit actions by defining inputs and adding action steps. Copy actions to use existing
actions as templates. Publish actions to activate them, which makes them available to activated flows and to preserve their current action steps, variables, and sequence as a snapshot separate from further configuration changes.

**Flow execution details**

View runtime information about a flow directly from the design environment such as the current state, actions run, and values produced. Open related records from embedded Now Platform editors or in a new tab.

**Operations dashboard**

Identify and troubleshoot potential issues by reviewing flow executions, the event queue, and the operations dashboard.

**User access and security considerations**

Administrators can grant users access to Flow Designer by assigning delegated development permissions or directly assigning a user role.

**Granting access by assigning delegated development permissions**

Administrators can grant users access to Flow Designer by creating an application and assigning users as developers with the Flow Designer delegated development permission. Delegated development allows administrators to control whether flow designers can access features normally restricted to admin users such as assigning user roles, creating access controls, or creating scripts. See [Developer and deployment permissions](#).

**Granting access by assigning user roles**

Administrators can also grant access to Flow Designer by directly assigning users the flow_designer user role, which includes the role to view flow execution details.

**Warning:** Directly granting a user the flow_designer role is equivalent to giving the user the admin role, because Flow Designer runs as the System user, which has access to all tables and all database operations.

**Architecture Overview**

Understand how Flow Designer works within the Now Platform to activate, trigger, and process flows and actions.

A flow consists of a trigger and one or more actions. The trigger specifies when to start the flow, which can be record-based, schedule-based, or application-based. Record-based triggers run a flow after a record has been created, updated, or deleted. The flow can use the triggering record as input for actions. Schedule-based triggers run a flow at the specified date and time. The flow can use the execution time as input for actions. Application triggers are added when the associated application is activated. For example, the MetricBase trigger is present when the MetricBase application is active.
Flow processing

Flow processing occurs in this sequence.

1. When the flow trigger conditions occur, the system creates an entry in the event queue to start the flow.
2. The scheduler processes the event and starts the flow in the background.
3. The system builds a process plan from the flow.
4. The system runs the process plan using the record that triggered the flow.
5. The system stores the execution details in a context record.

1. Process Flow Triggers
2. Process Events in the Queue
3. Build Process Plan
4. Run Process Plan

1. Process flow triggers

Each time trigger conditions are met, Flow Designer creates an event entry. The system processes triggers after database operations. To learn more, see Execution order of scripts and engines. Typically, business rules and workflows that run synchronously run before a triggered flow.

2. Process events in the queue

Each flow event contains a reference to the flow to start and a reference to either the triggering record or the execution time. The system processes these events using Standard event processing where a scheduler periodically works through the current items in the event queue in the order in which they were added. Depending on what other events are in the queue, the system may not immediately start a flow. Flow designers should expect some lag time between when the trigger conditions occur and when the flow actually starts.
3. Build the process plan

When Flow Designer pulls an event from the queue, it builds a process plan to actually run the flow. A process plan contains all the information necessary to execute a flow such as the sequence of published actions or subflows, the input values for each subflow or action, the action steps to run for each action, and the data provided by the trigger or subflow output.

Flow Designer uses a just-in-time compilation scheme to ensure that process plans contain the latest changes to flows, subflows, and actions. If no changes are detected, Flow Designer uses a cached copy of the process plan. Otherwise, it builds a new process plan.

By automatically checking for updated flows, subflows, and actions with process plans, Flow Designer enables you to apply changes from update sets and upgrades without having to edit current flows. If you move published actions to a target instance, every flow that uses the published action will automatically update the next time it is executed.

**Warning:** If changing subflows or actions used in activated flows, do not change the inputs and outputs used in the subflow or action. Changing inputs and outputs may cause errors when the activated flow is next triggered because it has not been configured to use the new inputs and outputs. Any currently running flows are unaffected by changes to inputs or outputs as the flow uses the compiled subflows and actions from the process plan.

4. Run the process plan

Flow Designer runs the process plan as the System user within the flow application scope.

When running a flow with a record-based trigger, Flow Designer stores the triggering record in memory as an instance that is represented in the interface as a data pill.

The instance contains the record values from when the flow started, which may be different than the current record stored in the database. For example, suppose that creating an incident record triggers a flow. Any changes a user makes to the incident record after the flow has started do not update the triggering record unless an action specifically looks up the current record value.

5. Store flow execution details

Flow Designer stores flow execution details in a flow context record, which contains this information.

- Flow outcome state
- Flow runtime duration
- Flow log messages
- Flow configuration and runtime values

Each time a flow runs, Flow Designer adds an entry to the Flow Executions list. Each entry has its own context record and matching execution details page.

A flow can have one of these outcome states.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete</td>
<td>The flow completed successfully.</td>
</tr>
<tr>
<td>In Progress</td>
<td>The flow is running. By default, a transaction quota rule prevents flows from running longer than an hour.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The flow is waiting for another event to occur. For example, a user must update a task or approval, or a record must reach a specific state. When in the waiting state, the flow is quiesced and serialized into a context record.</td>
</tr>
<tr>
<td>Canceled</td>
<td>The flow was canceled by a user.</td>
</tr>
<tr>
<td>Error</td>
<td>The flow encountered an error and has stopped running. For example, an action is missing an input value, or a quota transaction rule has stopped the flow.</td>
</tr>
</tbody>
</table>

Flow, subflow, and action life cycle

Flow Designer uses the flow or action status to describe the current state of configuration changes.

Flow and subflow status and activation state

The Status field indicates whether there is a process plan associated with the flow or subflow.

<table>
<thead>
<tr>
<th>Flow status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>Indicates that there are unsaved changes to a flow or subflow. Modified flows or subflows have not been saved.</td>
</tr>
<tr>
<td>Flow status</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Draft</td>
<td>Indicates that there are saved changes to a flow or subflow, which have not been stored in a process plan. Draft flows have been saved but not activated. Draft subflows have been saved but not published.</td>
</tr>
<tr>
<td>Published</td>
<td>Indicates that there is a stored process plan for the flow or subflow. Published flows have either been activated or deactivated.</td>
</tr>
</tbody>
</table>

The Active field indicates whether the system runs a flow or subflow.

<table>
<thead>
<tr>
<th>Active</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>True</td>
<td>Indicates that the flow or subflow is active and runs when triggered or called. The flow has been activated or the subflow has been published. Active flows run when the trigger conditions are met or when called. Active subflows run when called.</td>
</tr>
<tr>
<td>False</td>
<td>Indicates that the flow is inactive and does not run when triggered or called. An inactive flow has either never been activated or has been deactivated. An inactive subflow has never been published.</td>
</tr>
</tbody>
</table>

When working with flows, you can:
- Save a flow: Creates a draft of the flow.
- Activate a flow: Enables the flow trigger and transform the flow into a process plan.
- Deactivate a flow: Disables the flow trigger and prevents new flow executions. Currently running flows continue to run.

When working with subflows, you can:
- Save a subflow: Creates a draft of the subflow. If the subflow is modified after being published, the subflow moves into a draft state. Any active flows that use the subflow only run the published action.
- Publish a subflow: Enables you to activate a flow containing the subflow. Publishing adds the subflow to the list of available subflows in a flow.
Action status

The Action Designer interface does not display the configuration status of actions. To view action status, navigate to the Action Types table [sys_hub_action_type_definition] and display the Draft state field.

<table>
<thead>
<tr>
<th>Action Draft status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Draft</td>
<td>Indicates that there are changes to an action that have not been published. Draft actions are only available to flows when the Show draft actions option is enabled. You cannot activate a flow containing draft actions.</td>
</tr>
<tr>
<td>Published</td>
<td>Indicates that the action has been published. Published actions are available to all flows and allow flows to be activated.</td>
</tr>
</tbody>
</table>

When working with actions, you can:

- Save an action: Creates a draft of the action that is only available to flows when Show draft actions is enabled. If the action is modified after being published, the action moves into a draft state. Any active flows that use the action only run the published action.
- Publish an action: Enables you to activate a flow containing the action. Publishing adds the action to the list of available actions in a flow. Only actions in a published state run during flow execution.
Application development

When designing an action or a flow, use these design considerations as a guide.

Use standard Now Platform application development capabilities to create, manage, protect, and deploy Flow Designer content. Flow and action designers typically perform these application development tasks.

- Create a custom application to store flows and actions.
- Set application permissions to share or restrict access to application data.
- Grant application developers access to Flow Designer.
- Publish custom applications to the application repository to deploy flows and actions on other instances.

Security

Control access to Flow Designer processes and records.

- Administrators can grant users access to Flow Designer by creating an application and assigning users as developers with the Flow Designer delegated development permission. Delegated development allows administrators to control whether flow designers can access features normally restricted to admin users such as assigning user roles, creating access controls, or creating scripts. See Developer and deployment permissions.
- Administrators can also grant access to Flow Designer by directly assigning users the flow_designer user role, which includes the role to view flow execution details.

**Warning:** Directly granting a user the flow_designer role is equivalent to giving the user the admin role, because Flow Designer runs as the System user, which has access to all tables and all database operations.

- Flow and action designers can use standard Application access settings to manage how their content interacts with other applications.

Action limit

By default, flows can have no more than 50 actions. To change the default behavior, increase the value of the sn_flow_designer.max_actions system property. However, consider the performance impact that a large flow may have on your instance.

Trigger options for record updates

Flow designers can specify how often a flow can update a particular record with the Run Trigger option. Use the Once option when you want a flow to run only once. The first time a record is updated, the flow
runs, but any further record updates do not trigger the flow. Use the Always option when you want the flow to run every time a record is updated and there is not already an active flow running for it. For example, you might set a flow that assigns an incident record to run only once, and set a flow that notifies the incident watch list to always run. The Run Trigger field is only available for these trigger types.

- Created or Updated
- Updated

**Direct recursion prevention and indirect recursion limit**

To prevent instance outages and consumption of system resources, Flow Designer ignores any request to start a flow that is the result of direct recursion. Direct recursion occurs under these conditions.

- An action calls the same flow that it is part of. For example, a script step makes an API call to a flow.
- An action or subflow produces a result matching the flow trigger. For example, a flow that runs when an incident record is updated contains an update record action that updates an incident record.

Flow Designer also limits the number of times a flow can be started from indirect recursion. Indirect recursion occurs under these conditions.

- The same flow is called multiple times in a chain of subflow calls. For example, if subflow A calls subflow B, and subflow B calls subflow A, then calling either subflow produces indirect recursion.
- The same flow is triggered multiple times in a chain of subflows. For example, suppose that there are two flows triggered by record creation. Suppose that creating record A triggers flow A and also creates record B. Furthermore, creating record B triggers flow B and creates record A. Creating either record type produces indirect recursion.

By default, the system stops triggering flow runs after the run count reaches the indirect recursion limit of three runs. Administrators can change the limit by setting the system property `com.glide.hub.flow_engine.indirect_recursion_limit` to an integer value equal to or greater than one. The system ignores any property value less than one and instead uses a limit of one. Consider the performance impact that increasing the indirect recursion limit may have on your instance.

**Note:** By default, a transaction quota rule prevents flows from running longer than an hour.

**Data pill population**

Each time you add an action to a flow, Flow Designer adds a data pill to store its results. The data pill name indicates its sequence in the flow and its data type. Flow designers use action result data pills to provide input for other flows, actions, or subflows. Flow designers can use the sequence value in the data pill name to ensure that they select the correct data pill as an input value. When a flow runs an action, it generates the data pill runtime value, which remains the same for the duration of the flow. For example, a data pill for [Trigger->Incident record] always contains the incident record values from when the flow started.

Flow Designer populates data pill values as soon as the data becomes available regardless of where the data pill is located in the flow sequence. For example, suppose that you have a flow triggered by the creation of an incident record with the following actions.

1. Update [Incident] Record that adds a text string to [Trigger->Incident Record->Short description].
2. Log the value of [Trigger->Incident Record->Short description].
3. Log the value of [1->Incident Record->Short description].
Action-1 and Action-2 both use the data pill [Trigger->Incident Record->Short description]. Since the trigger record is available as soon as the flow starts, these values are set before running these actions.

Flow and action testing

Testing a flow bypasses the trigger conditions and immediately runs it. Testing a flow with a record-based trigger requires selecting a specific record to act as the trigger. Flow designers should generate appropriate sample records prior to testing.

During the design phase, you can test an inactive flow and unpublished actions by setting Show draft actions on the flow. If testing with draft actions, use these guidelines.

- Design flows and actions on a non-production instance. Only deploy active, working flows to your production instance.
- Leave Show draft actions set to true until your draft is in a final state. Once final, publish each action, set Show draft actions to false, and activate the flow.

**Warning:** Disabling Show draft actions before publishing your actions removes all draft actions from your flow.

- Any change you make to an active flow or published action causes it to return to a draft state. If the flow is triggered, the system only runs the activated flow and published actions, and the flow execution details only display what was run. When there is a draft of an active flow, the trigger and actions listed in the flow execution details may be different than those listed in the draft flow.

Domain separation in Flow Designer

Flow Designer is not domain separated and does not support manually adding a domain field. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

Domain separation is not supported in this application. For more information, see Application support for domain separation.

Getting started with flows

Create a sample flow with a trigger and base system actions that requires an approval.

Role required: admin

**Note:** While Flow Designer is designed to use the flow_designer and delegated_developer roles in most scenarios, this tutorial uses the admin role to illustrate functionality without requiring additional roles to set up records and approve requests.

The ITSM application is required to access the Task table.

A flow can include these components:

- Trigger: An activity that initiates the flow, such as a record created in a specified table or a scheduled job.
• Conditions: Statements that determine when or how an action runs. For example, run an action only if a field is over a certain value.
• Actions: Operations executed by the system, such as a field value updated, approval requested, or a value logged.

To understand basic flows, create an expense approval flow. This flow:

1. Runs when an Expenses record is created.
2. Uses the total amount to determine which action to run.
3. Approves the request if it is under the specified dollar amount.
4. Requires manager approval if it is over a specified dollar amount. Another approver can be manually added.

1. Create a custom application for the flow. Creating flows and actions within an application enables you to publish flows and actions to an application repository and deploy them on other instances. While this example does not use delegated development, you can optionally delegate action and flow designer development by assigning developers to the application.
   a) Navigate to System Applications Studio.
   b) Create a custom application called Expenses Getting Started.

2. In Studio, create an Expenses table.
   a) Click Create Application File.
   b) Under Data Model, select Table and click Create.
      A Table form opens.
   c) Complete the form with the following values.
      • Label: Expenses
      • Extends table: Task
   d) Save the form.
   e) Add three additional columns to the table.

<table>
<thead>
<tr>
<th>Column label</th>
<th>Type</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amount</td>
<td>Floating point number</td>
<td>None</td>
</tr>
<tr>
<td>Destination</td>
<td>String</td>
<td>None</td>
</tr>
<tr>
<td>Requested for</td>
<td>Reference</td>
<td>User [sys_user]</td>
</tr>
</tbody>
</table>

3. Add four records to the Expenses table to use in Flow Designer tests. When you test your flow in later steps, you can specify which record is used as the trigger, enabling you to test specific record values.
   a) On the Expenses table record, click the Show list related link.
   b) Click New.
   c) Configure the form to add the Amount, Destination, and Requested for fields, and the Approvers related list.
   d) Complete the Destination and Requested for fields. In the Amount field, add a value under 100.00.
Make sure that the user in the Requested for field in the test record has a manager assigned in the system. If the user in the test record does not have a manager, configure the User form to add the Manager field, and assign a manager to the user.

e) Submit the form.
f) Add another record to the table with an amount under 100.00.
g) Add two more records to the table with a value over 100.00 in the Amount field.

4. In Studio, create a new flow.
a) Click Create Application File.
b) Under Flow Designer, select Flow and click Create.
c) Select the Flow option, click Next.
d) In the Flow Name field, enter Expense Approval.
e) Click Submit.
An Expense Approval flow is created in the Expenses Getting Started scope.

5. Create a trigger that runs the flow when a record is created in the Expenses table.
   • Trigger: Created
   • Table: Expenses [x_expenses_getting_expenses]

   ![Trigger Configuration]

6. Add an if condition to the flow.
a) Select Flow Logic If.
b) In the right-hand pane, expand the Trigger - Record Created category and the [Expenses Record] pill. Drag-and-drop the [Amount] pill into Condition 1. A data pill represents the value of a record or a field at a particular stage in your flow. Dragging the [Amount] data pill from the trigger populates the condition with the value of the field in the triggering record.
c) Set Condition 1 to [Trigger->Expenses Record->Amount] [less than] [100.00].
7. Underneath action 1, click + to add an action that runs when the If condition is met.

8. Create an Update Record action that approves the request.
   - Action: Update Record
   - Record: Expand the Trigger - Record Created category and drag the [Expenses Record] data pill from the right-hand pane.
   - Table: Set to Expenses [x_expenses_getting_expenses].
   - Fields:
     - Approval: Approved
     - Work notes: Auto-approved. Amount less than $100.00
9. Add an else condition to the flow.
   a) Select Flow Logic Else.

10. Underneath action 2, click + to add an Ask for Approval action that runs when the Else condition is met.
   a) Complete the fields in the Ask for Approval step.
      • Action: Ask for Approval
      • Record: Expand the [Trigger - Record Created] category and drag the [Expenses Record] data pill from the right-hand pane.
      • Table: Set to Expenses [x_expenses_getting_expenses].
      • Approval Field: Set to Approval.
      • Journal Field: Set to Approval history.
b) Define the rules in the Ask for Approval step.

- [Approve] when [Anyone approves] from the field [Trigger->Expenses Record->Requested for->Manager], [OR]
- [Anyone approves] from the [Manual User(s)] list. Select to allow a manual approver to process an approval or rejection. A manual approver is a user manually added to the Approvers related list who can then approve the request. For example, you can manually add a subject matter expert to a task to approve the request. To learn more about adding manual approvers, see Generate approvals using the approvers related list on page 2422.

Select Add another OR rule set to define rejection rules. When defining approvals, make sure to include rejection rules to avoid creating flows that remain in a waiting state if there are no matching approval rules.

- [Reject] when [Anyone rejects] from the field [Trigger->Expenses Record->Requested for->Manager], [OR]
- [Anyone rejects] from the [Manual User(s)] list.
c) Define a due date to automatically approve, cancel, or reject an approval if the request is not
approved or denied by the designated time. Adding a due date ensures that the flow does not
remain in a waiting state.

- [Approve] if pending by [Relative date] [1][Days] from [Trigger->Expenses Record->Created].
- Days schedule [8-5 weekdays excluding holidays].

This due date automatically approves all requests that have not been approved or denied within
one day from when the request was created.

11. Click Save.
12. Test the flow using a record with an amount below the designated limit.
   a) From the flow, click Test.
      The Test flow modal appears.
   b) In the Record field, select a record you created in earlier steps that has value in the Amount field
      under the 100.00 limit. This field is a reference to the table defined in the trigger.

      **Note:** Testing a flow bypasses the trigger conditions and immediately runs it. To test a
      flow with a record-based trigger, you must select a specific record to act as the trigger.

c) Select Run Test.
d) After the flow executes, click Flow has been executed. To view the flow, click here.
The Execution Details open.

Because the amount is less than 100.00, the first condition is met and the request is approved.

13. Navigate back to the flow and run the test again using a record with an amount over the designated amount.

14. After the flow executes, open the flow Execution Details.
   Because the amount is over the designated limit, the request must be approved. Until a manager or a manual approver approves the request, the state is Waiting.
15. Approve the request. In an active flow, a user from the Approvers list would approve or reject the request. However, because the flow is being tested, an admin can approve the flow.

   a) Navigate to the test record.
      The associated manager appears in the Approvers related list with Requested in the State field. Alternatively, you can edit the list to add manual approvers.
   
   b) Change the value of the State field in the Approvers related list to Approved.
   
   c) Navigate back to the flow Execution Details and refresh the browser.
      Because the request is approved, the flow completes.
Transform the Ask for Approval action into a reusable action using Action Designer. Actions enable flow designers to add complex actions to multiple flows with minimal configuration. See Getting started with actions on page 1225.

Getting started with actions

Transform the Ask for Approval action into a reusable action that always requires manager approval.

Role required: admin

Note: While Action Designer is designed to use the action_designer and delegated_developer roles in most scenarios, this tutorial uses the admin role to illustrate functionality without requiring additional roles to set up records and approve requests.

Complete the steps in Getting started with flows on page 1216. This tutorial replaces the Ask for Approval action in the Expense Approval flow.

Actions are made up of:

- Inputs: Data variables used in your action.
• Steps: Operations on the inputs or results from a prior step that generate data that can be used in later steps.
• Outputs: Data variables that represent the results of the action. These results are available to other actions in a flow.

Unlike the core Ask for Approval action where flow designers must manually configure the approval rules, this custom action always uses the same approval rules when added to a flow. You might create a reusable action if your flow designers often use an action with the same configuration. For example, if your flow designers always use the request manager approval and due date options, this action automatically uses them and therefore requires less flow configuration.

1. Open the Expenses Getting Started application in Studio.
   Alternatively, you can navigate to Flow Designer and select New Action to access Action Designer in the platform. In the Action Properties, select your scoped application in the Application field.

2. Create an action.
   a) Click Create Application File.
   b) Under Flow Designer, select Action and click Create.
   c) In the Name field, enter Ask for Manager Approval.
   d) In the Description field, enter Approve or reject a request based on manager approval or rejection. Allow manual approvers to be added.
   e) Click Submit.
   An Ask for Manager Approval action is created in the Expenses Getting Started scope.

3. Define the inputs in the Ask for Manager Approval action.
   a) Select + Create Input and add the following values.
      • Name: Request
      • Type: Reference
      • Reference Table: Expenses [x_expenses_getting_expenses]
This input enables you to reference any field or record from the Expenses table. Use the data pills on the right-hand side to add the record or its fields to action steps.

4. Add an Ask for Approval step.
   a) Click the + underneath Inputs in the Action Outline.
   b) Select Ask for Approval.
   c) Complete the fields in the Ask for Approval step.
      • Record: Under the Input Variables category, drag the [Request] data pill from the right-hand pane.
      • Table: Set to Expenses [x_expenses_getting_expenses].
      • Approval Field: Set to Approval.
      • Journal Field: Set to Approval history.

   d) Define rules in the Ask for Approval step. You can use the data pill picker, or drag the data pills from the right-hand pane to select the data you need.
      • [Approve] when [Anyone approves] from the field [action->Request->Requested for->Manager], [OR]
      • [Anyone approves] from the field [Manual User(s)].

   Select Add another OR rule set to define rejection rules:
      • [Reject] when [Anyone rejects] from the field [action->Request->Requested for->Manager], [OR]
      • [Anyone rejects] from the field [Manual User(s)].
e) Define a due date in the Ask for Approval step.
   - [Approve] if pending by [Relative date] 1 [Days] from [action->Request->Created].
   - Days schedule [8-5 weekdays excluding holidays].

   This due date automatically approves all requests that have not been approved or denied within one day from when the request was created.

5. Define the outputs in the Ask for Manager Approval action. Adding an output makes data available to a flow. For example, this action outputs the approval state of the record.
   a) Select + Create Outputs and add the following values.
      - Name: Approval state
- Value: In the right-hand pane, expand the Ask for Approval step category and drag the [Approval State] data pill.

![Ask for Manager Approval Action](image)

b) Click Save.

6. Add a custom icon for your application that displays in Flow Designer. All actions in the application scope use the custom icon.
   a) In Studio, navigate to File Settings. The application settings open.
   b) In the Logo field, select Click to add....
   c) Upload an icon to use with your reusable actions.

7. Test the reusable action within your flow.
   a) Return to the Expense Approval flow.
   b) Remove the 2.1 Ask for Approval action from the flow. This action will be replaced by the reusable Ask for Manager Approval action.
   c) Set Show draft actions to true.
   d) Add the Ask for Manager Approval action to your flow.
   e) In the right-hand pane, expand the Trigger - Record Created category and drag the [Expenses Record] data pill into the Request [Expenses] field.
8. Click Save.
9. Test the flow using a record with an amount below the designated limit.
   a) From the flow, click Test. The Test flow modal appears.
b) In the Record field, select a record you created in earlier steps that has value in the Amount field under the 100.00 limit. Verify that you have not already run tests using this record.

c) Select Run Test.

d) After the flow executes, click Flow has been executed. To view the flow, click here. The Execution Details open.

Because the amount is less than 100.00, the first condition is met and the request is approved. The Else condition is not evaluated.

<table>
<thead>
<tr>
<th>Execution Details</th>
<th>Expense Approval</th>
</tr>
</thead>
</table>

Show Action Details

FLOW STATISTICS

TRIGGER

[Expenses] Created

Open Current Record

Open Flow Logs

ACTIONS

1. If ( Trigger → Expenses Record → Amount less than 100.00 ) then

1.1 Update Record

2. Else

2.1 Ask for Manager Approval

10. Test a record with an amount over the designated limit. Verify that you have not already run a test on the test record.

Because the amount is over the designated limit, the second condition is evaluated.
11. Approve the request.
   a) Navigate to the test record and change the value of the State field in the Approvers related list to Approved.
   b) Navigate back to the flow execution details and refresh the browser. Because the request is approved, the flow completes.
12. Navigate to the Ask for Manager Approval action and click Publish. Publishing an action enables you to activate any flow that uses it.

13. Navigate to the flow and set Show draft actions to false.

14. Click Activate. Activating a flow sets it to run every time the trigger conditions are met.

The Expense Approval flow runs every time a record is created in the Expenses table. Now that the flow is activated and working as expected, you can publish it to the application repository and deploy it to other instances.

Flow Designer landing page

Access or create flows, actions, or flow executions.

**Flows**

The Flows screen contains all the flows that your installation of Flow Designer can use. Selecting a flow opens the flow in a new tab. You can see the scope the flow was created in, the internal name of the flow, whether the flow is published or in draft status, whether the flow is active, and update information.
Subflows
The Subflows screen contains all the subflows that your installation of Flow Designer can use. Selecting a subflow opens the subflow in a new tab. You can see the scope the subflow was created in, the internal name of the subflow, whether the subflow is published or in draft status, whether the subflow is active, and update information.

Actions
The Actions screen contains all the actions that your installation of Flow Designer can use. Selecting an action opens the action in a new tab. You can see the scope the action was created in, where the action is accessible from, whether the action is active, and update information.

Flow Executions
The Flow Executions screen shows a history of flow runs, including the current state and duration of the run.

Help
The Help landing page contains links to Flow Designer Guided Tour, Documentation, Videos, and Community Discussion.

+ New
You can create a new flow or action by selecting an action from the list.

Flow Designer roles
Grant users one or more Flow Designer roles to enable them to create flows, create actions, or see flow execution details.

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
<th>Contains Roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>flow_designer</td>

**Flows**

Automate processes with a sequence of reusable actions such as manage records, ask for approvals, create tasks, and send notifications. Define trigger conditions to start a flow and variables to pass information between actions.

All flows consist of properties, a trigger, a sequence of actions, and the data collected or created.

**Flow properties**

The flow properties specify the flow name, application, description, and status. Flow designers can update the flow name and description at any time, but can only set the application during flow creation. The flow status is set when you save or activate a flow.

**Triggers**

The trigger specifies the conditions that start the flow. When the trigger condition is true, the system starts the flow.

Flow Designer supports record-based, schedule-based, and application-based trigger types. For detailed descriptions of trigger types, see Flow trigger types on page 1239.

**Actions**

Within Actions, flow designers can add actions, flow logic, subflows, or other flows.

Each action is a set of reusable business logic that produces a specific outcome when provided with its input values. Flow designers configure actions by specifying where they go in a flow sequence and by selecting the data they use as input values. As a flow runs, actions earlier in the sequence generate outcomes or output values that become available as data to actions later in the flow.

By default, the system provides a collection of core actions that can be added to any flow. Core actions cannot be viewed or edited from the Action Designer interface. Some applications include spokes which add application-specific flows and actions. Spoke actions are typically read-only but can be copied and customized. Developers may also create their custom actions from the Action Designer interface.
Flow data

Flows store any data gathered or generated as variables in the Data pane. Each variable has its own pill that Flow designers can use to drag-and-drop the variable value to an action input or output. Flow Designer generates the pill name based on the contents and its data type. The system specifies the variable data type next to the pill.

Figure 279: Example flow data

Flow logic

Flows may contain flow logic to specify conditional or repeated actions. The system provides these flow logic options.
### Table 449: Available flow logic

<table>
<thead>
<tr>
<th>Flow logic</th>
<th>Description</th>
</tr>
</thead>
</table>
| For Each   | Applies actions to each record in a list of records. Flow designers must specify the list of records from the flow data.  
  
  **Note:** Add a For Each flow logic block inside of another to repeat an action over a series of records. However, avoid nested For Each loops that process many records. Nested loops may cause the flow to run until stopped by the flow transaction quota rule, which prevents flows from running longer than an hour. For more information about transaction quotas, see *Transaction quotas.* |
| If         | Applies actions when a list of conditions is met. Flow designers can use flow data to specify the conditions. |

**Testing flows**

After adding a trigger and one or more actions, flow designers can test a flow. Testing a flow sets the trigger conditions to true and runs all actions. For flows that have record-based triggers, flow designers may specify an existing test record to use as input. Flow designers should always test flows on non-production instances containing relevant demonstration data since testing a flow creates or changes records on the instance.

**Flow execution details**

The system generates flow execution records, log messages, and reports for each flow run. The flow context is a related record containing the current state and runtime values of the flow. The system generates a context record each time a flow is run.

**Roles**

To access Flows, a user must have the flow_designer or admin roles.

**Flow trigger types**

The trigger specifies the conditions that start the flow. When the trigger condition is true, the system starts the flow.
Record triggers

<table>
<thead>
<tr>
<th>Trigger</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created</td>
<td>Starts a flow when a record is created in a specific table.</td>
</tr>
<tr>
<td>Updated</td>
<td>Starts a flow when a record is updated in a specific table. Requires selecting whether to always run the trigger or to only run it once.</td>
</tr>
<tr>
<td>Created or Updated</td>
<td>Starts a flow when a record is either created or updated in a specific table. Requires selecting whether to always run the trigger or to only run it once.</td>
</tr>
</tbody>
</table>

**Note:** Flows including approval actions should only run the trigger once.

Scheduled triggers

**Note:** Because flows are processed asynchronously, a flow with a scheduled trigger may not run at the exact time its trigger conditions were met. For example, if a scheduled flow is triggered during core business hours, the system may have to process other events in the queue before it can run the scheduled flow.

<table>
<thead>
<tr>
<th>Trigger</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Daily</td>
<td>Starts a flow at a specific time every day.</td>
</tr>
<tr>
<td>Weekly</td>
<td>Starts a flow at a specific time every week.</td>
</tr>
<tr>
<td>Monthly</td>
<td>Starts a flow at a specific time every month.</td>
</tr>
<tr>
<td>Run Once</td>
<td>Starts a flow once at a specific time but does not repeat. If you select a past date or time, the system schedules the flow to run as soon as possible.</td>
</tr>
<tr>
<td>Repeat</td>
<td>Starts a flow at regular intervals you define.</td>
</tr>
</tbody>
</table>

Application triggers

<table>
<thead>
<tr>
<th>Trigger</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MetricBase</td>
<td>Starts a flow when a MetricBase trigger is met. Requires the MetricBase application. For more information, see [Create a flow with a MetricBase trigger](page 1243).</td>
</tr>
<tr>
<td>Service Catalog</td>
<td>Starts a flow from a Service Catalog item request. For more information, see [Create a flow with a Service Catalog trigger](page 1244).</td>
</tr>
</tbody>
</table>
Create a flow

Automate a process to run one or more actions when a trigger condition occurs.

- Role required: flow_designer or admin
- Create a custom application to store Flow Designer content.

Flow designers should know the application table structure and be aware of any existing business logic associated with the target tables of a flow or subflow. Be sure to disable any conflicting business rules or workflows before creating a flow or subflow.

Creating a custom application to contain your Flow Designer content allows you to deploy it using the application repository or the ServiceNow Store.

1. Navigate to Flow Designer Designer .
3. Fill in the following properties.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Create a name for your flow. The system computes the internal name of the flow from the name.</td>
</tr>
<tr>
<td>Application</td>
<td>Select the application scope to create your flow in. Global is the default.</td>
</tr>
<tr>
<td>Description</td>
<td>Add a description of your flow.</td>
</tr>
<tr>
<td>Protection</td>
<td>Select whether the flow is read-only. You can only select a value when you create the flow in an application scope you own.</td>
</tr>
</tbody>
</table>

The system displays the flow designer page.

4. Add a trigger.
   a) Click Click to add a trigger. The system displays the trigger choice list.
   b) Select the type of trigger.
      For more information on trigger types, see Flow trigger types on page 1239. The system displays a set of fields depending on the type of trigger you selected.
      a) Fill in the fields to specify the trigger. For a record-based trigger, for example, fill in the table and conditions.
      b) Click Done.

5. Add actions, flows, subflows, or flow logic.
   a) Under Actions, click + and select an option.
Option | Description
--- | ---
Action | Select the desired action. Flow Designer includes a set of Actions on page 1255 available to flows and subflows. Alternatively, an action designer can create additional actions to add to flows. The IntegrationHub on page 1327 and spoke plugins install additional actions.

To add draft actions, set Show draft actions to true from the More Actions menu.

Flow Logic | Select an option to specify conditional or repeated operations.

Subflow | Select a published subflow and define input values. In addition to adding a subflow as a flow action, you can enable the Show triggered flows option from the More Actions menu to select an activated flow and define the required inputs. Running a triggered flow ignores its trigger conditions and runs all actions.

To change the order of an action in a flow, drag-and-drop the handle on the left side of the action.

The system displays a set of fields depending on the option selected.

b) Fill in the fields to configure the action, flow, or subflow.
c) Click Done.
d) Repeat adding actions until complete.

6. Click Save.

Flow Designer saves a draft of the flow, trigger, and actions.

Test the flow until it is ready to be activated.

**Note:** The system only triggers active flows.

### Request Flow Designer support for the Service Catalog

To activate this feature, request the Flow Designer support for the Service Catalog plugin (com.glideapp.servicecatalog.flow_designer) through the HI Customer Service system. This plugin activates related plugins if they are not already active.

Role required: none

1. In the HI Service Portal, click Service Requests Activate Plugin.

2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
</tbody>
</table>
Specify the date and time you would like this plugin to be enabled

Date and time must be at least 2 business days from the current time.

**Note:** Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.

Reason/Comments

Provide any information that would be helpful for the ServiceNow personnel activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows.

3. Click Submit.

**Create a flow with a MetricBase trigger**

Start a flow when a MetricBase trigger is met. MetricBase triggers track time series data and can monitor when a threshold is reached, when a trend is detected, or when a system stops reporting data.

Role required: flow_designer or admin

MetricBase triggers are not available on the base system. The MetricBase application requires a separate subscription and must be activated by ServiceNow personnel.

1. Navigate to Flow Designer Designer.
2. Click + New New Flow.
3. Define the flow properties.
   
   For more information, see *Create a flow* on page 1241.

4. In the Trigger section, add a trigger and select MetricBase.

5. Complete the trigger fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MetricBase Trigger</td>
<td>Select or create a MetricBase trigger record to start the flow. For types of MetricBase triggers, see <em>MetricBase triggers</em> on page 1567.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only table that contains the metric.</td>
</tr>
<tr>
<td>Condition</td>
<td>Click Add filters to set field-based conditions that determine when the flow runs.</td>
</tr>
<tr>
<td>Condition Script</td>
<td>Define a script in the Additional MetricBase Trigger Filtering and Moderation table to prevent duplicate metric events from re-triggering a flow. For example, if a metric hovers at a defined trigger threshold, create a script that defines whether to run the flow once when the metric is met, or every time the triggering threshold is exceeded.</td>
</tr>
</tbody>
</table>

6. Add actions, subflows, and flow logic to the flow.
7. Test the flow. Once behaving as desired, activate the flow.
For more information, see Test a flow on page 1253 and Activate a flow on page 1252.

The MetricBase application monitors time series data on the Now Platform. When the selected trigger is met, the flow runs.

**Create a flow with a Service Catalog trigger**

Start a flow when a Service Catalog item is requested to automate the fulfillment process. To activate this feature, request the Flow Designer support for the Service Catalog plugin (com.glideapp.servicecatalog.flow_designer) through the HI Customer Service system. This plugin activates related plugins if they are not already active.

Role required: flow_designer or admin

Unlike a record trigger which runs on all records in a table, the Service Catalog trigger runs on all catalog item requests for a specific item when the catalog item is configured to run a specific flow. For example, you can define a flow that runs every time there is a request for a tablet. The requested item becomes the flow trigger record.

1. If not already created, create the catalog item to associate with the flow.
   a) Navigate to Service Catalog Definition Maintain Items.
      The Catalog Items [sc_cat_item] table opens.
   b) Click New.
   c) Complete the fields.
      For a detailed description of catalog item fields, see Create or edit a catalog item.
   d) Configure the form to add the Flow field.
      If you plan to add stages to the flow, verify that there is not an existing workflow associated with the item that also has stages. Clear the values of the Workflow and Execution Plan fields to prevent conflicting stages from reporting to the requested item stage field.

2. Create the flow to associate with the catalog item. When triggered, this flow processes the catalog item request.
   a) Navigate to Flow Designer Designer.
   b) Click + New New Flow.
   c) Define the flow properties.
      For more information, see Create a flow on page 1241.
   d) In the Trigger section, add a trigger and select Service Catalog.
   e) Create flow-specific catalog variables available only to flow actions. See Create flow Service Catalog variables on page 1245.
   f) Add actions, subflows, and flow logic to the flow.
      Some actions enable you to manage catalog items. For example, the Create Catalog Task action generates a task for the requested item, and the Get Catalog Variables action enables you to access catalog variables as data pills in the flow. See Create Catalog Task action on page 1259 and Get Catalog Variables action on page 1263.
   g) Add stages to the flow to report progress to the requester.
      See Flow Designer stages on page 1271.
   h) Test the flow. Once behaving as desired, activate the flow.
      For more information, see Test a flow on page 1253 and Activate a flow on page 1252.
3. Add the flow to the Flow field of the catalog item you created.
   a) Navigate to the catalog item.
   b) In the Flow field, select the flow you created.

   **Note:** The Flow field only displays flows with a Service Catalog trigger.

   c) Click Update.

When the catalog item is requested, the associated flow triggers and runs the actions.

**Create flow Service Catalog variables**

Create Service Catalog variables that are only available to a specific Service Catalog-triggered-flow. Flow-specific variables are available to catalog tasks and actions in the flow.

Role required: flow_designer or admin

To activate this feature, request the Flow Designer support for the Service Catalog plugin (com.glideapp.servicecatalog.flow_designer) through the HI Customer Service system. This plugin activates related plugins if they are not already active.

Flow Service Catalog variables display in the Catalog Variables field of the Create Catalog Task and Get Catalog Variables actions. They display in the Flow:variablename format and are only available to the flow in which they are defined.

For more information about Service Catalog actions, see *Create Catalog Task action* on page 1259 and *Get Catalog Variables action* on page 1263.

1. Open or create a flow with a Service Catalog trigger.
2. Click ![Flow icon] and select Manage flow catalog variables. The Flow catalog variables table opens.
3. Click New to add a new variable available to the flow.
4. Complete the form.

**Table 450: Variable form**

<table>
<thead>
<tr>
<th>Field</th>

<td>If selected, the variable is visible only when the item is added to an order guide.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If an order guide has too many items and variables, consider clearing this check box on as many items as possible, to improve loading performance on order guides.</td>
</tr>
<tr>
<td>Visible on Summaries</td>
<td>If selected, the variable is visible on any variable summarizer of the catalog item. In Service Portal, the variable is visible in the RITM ticket view and the Approval page.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Access the variable in the flow by adding a Create Catalog Task or Get Catalog Variables action.

**Activate a flow**

Activate a flow to make it available to other users.

Role required: flow_designer or admin

When you save a flow, you can test it, but no other users on the instance can see or run it. To make the flow available to other users, activate it.

1. Navigate to Flow Designer. 
2. Double click the row for the flow you want to display it on the flow designer page. 
3. Click Activate.

**Edit a flow**

Edit an existing flow.

Role required: flow_designer or admin

1. If necessary, navigate to Flow Designer, then double click the row for the flow you want to edit. The system displays the flow designer page.
2. Take the appropriate actions to edit the flow.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Change the flow name or description</strong></td>
<td>Click Edit Properties, enter the values you want into the appropriate fields, then click Update.</td>
</tr>
<tr>
<td><strong>Note:</strong> You cannot change the scope of an automationHub flow after you have saved it.</td>
<td></td>
</tr>
<tr>
<td><strong>To edit the trigger</strong></td>
<td>Click the trigger description, fill in the fields as desired, then click Done</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>To edit an existing action</strong></td>
<td>Click the action description, fill in the fields as desired, then click Done</td>
</tr>
<tr>
<td><strong>To add a new action</strong></td>
<td>Click the plus icon in the ACTION section then proceed as you would for adding an action to a new flow.</td>
</tr>
</tbody>
</table>

3. To save your changes, click Save.

**Delete a flow**
Delete a flow that you no longer need.
Role required: flow_designer or admin
You can only delete records that are in the same application scope as the current session.

1. If necessary, navigate to Flow Designer to display the flow designer page.
2. Check the selection box for the row corresponding to the flow you want to delete.
3. Click Actions on selected rows . . . , then click Delete.

**Test a flow**
Before activating a flow so other users can access it, test to make certain it works the way you expect.
Role required: flow_designer or admin. Save the flow.

1. If necessary, navigate to Flow Designer , then double click the row for the flow you want to test.
2. Click Test.
   The system displays the Test flow dialog. The contents of the Test flow dialog depend on the type of trigger: Data or Schedule. If the trigger is a Data trigger, the dialog asks for a record to use for the test.
3. If the trigger is a Data trigger, select a record to use for the test.
   When you test a flow, the system does not execute the trigger. In other words, for a trigger that fires when a record is added to a particular data, the test does not create a new record. It behaves as if a record was created. By selecting a record on the Test flow dialog, you are asking the system to act as if that record was just created.

**Allow flow designers to dynamically set field values**
Enable flow designers to dynamically set field values when adding the subflow or action to a flow. For example, allow flow designers to set the priority and short description of a Create Task action.
A dynamic field can only be created in a subflow action or action step that creates or updates a record, such as Create Catalog Task, Create Task, Create Record, and Update Record.
Role required: admin or action_designer
When creating or updating a record in a subflow action or action step, you can set static or dynamic values. A static value is the same every time a flow runs. A dynamic value allows a flow designer to change it
every time a flow runs. For example, setting the Urgency to the static value 1 - High generates an urgent catalog task every time the flow runs.

1. Open an action in Action Designer or a subflow in Flow Designer that you want to create a dynamic value for.
2. Create an input.
   a) In the Label field, enter a label to help flow designers understand the purpose of the field. This is the label for the field when the flow designer adds the subflow or action to a flow. For example, enter Select fields.
   b) In the Type field, select Template Value. Select the table containing the record you will create or update. For example, if you are adding a Create Catalog Task action in a subflow, set the Type to Template Value.Requested Item [sc_req_item].

3. Add an action step or action that will use the template value.
   The action step or action must create or update a record. For example, add a Create Task action to a subflow that will create an incident task.
4. Drag the Template Value data pill into the Field Values or Fields field.
5. Add static values in addition to the dynamic field by selecting + Add Field Value.

**Note:** Avoid setting static values that you want flow designers to set from the dynamic field. The flow always uses the static value from the subflow or action step over a value entered from a dynamic field. You can use static values to enforce business policies that you do not want flow designers to change.

When the subflow or action is added to a flow, a flow designer can set field values for the record being created or updated.
View activated flows for a table

View flows with record-based triggers that run on a specific table.

Role required: flow_designer or admin
1. Navigate to a table.
2. Right-click the form header and select Configure Flow Designer Flows.
   The Flows table opens and displays all flows that have been activated to run on the specified table.

Actions

Actions can be added to any flow, enabling process analysts to automate Now Platform features without having to write code.

An action is a reusable operation that enables process analysts to automate Now Platform features without having to write code. For example, the Create Record action allows process analysts to generate records in a particular table with particular values when certain conditions occur. Core actions like Create Record require some familiarity with Now Platform tables and fields. Action designers can create application-specific actions to pre-set configuration details. For example, creating a Create Incident Task action ensures that the process analyst uses the correct table and field configuration each time the action is used. You can add application-specific actions by activating the associated spoke.

In Flow Designer, a process analyst adds actions to a flow and defines the configuration options.

Core actions

A core action is a ServiceNow-provided action available to any flow that cannot be viewed or edited from the Action Designer design environment. For example, the Ask for Approval action is a core action that allows process analysts to use Now Platform approvals. Flow Designer provides a set of core actions to automate Now Platform processes. You can add application-specific core actions by activating the associated spoke.

Custom actions

Using a core action enables the process analyst to configure the desired behavior within the flow. To create an action with a pre-set configuration, or to define custom configuration options, a subject matter expert can create a custom action in Action Designer on page 1283.
**Action limit**

By default, flows can have no more than 50 actions. To change the default behavior, increase the value of the `sn_flow_designer.max_actions` system property. However, consider the performance impact that a large flow may have on your instance.

**Ask for Approval action**

Request approval for a record with an approval field. You can configure a rule set for an approval, rejection, or cancellation. If a due date is added to an approval, the approval is automatically approved, rejected, or canceled if the approvers have not responded by the designated time.

*Approvals on page 2404* is a platform feature that enables users or groups to approve or reject a task.

**Roles and availability**

- Available as a Flow Designer core action. Process analysts use the `flow_designer` role to add an action to a flow and define configuration details.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Select a record under the data panel and drag the record pill into the Record field. If selecting a table with an approval field already configured, the Approval field is set to the correct field.</td>
</tr>
<tr>
<td>Table</td>
<td>Set to the table name associated with the record.</td>
</tr>
<tr>
<td>Approval field</td>
<td>Select a field from the designated table to use for approval.</td>
</tr>
<tr>
<td>Journal field</td>
<td>Select a field from the designated table to use for journal.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Rules  | Define the approval and rejection rules. Approval rules determine which users can approve or reject requests, and what happens after approval or rejection. Approval or rejection rules include:  
- Anyone approves  
- All users approve  
- All responded and anyone approves  
- % of users approve  
- # of users approve  

In the field beside the approval rule, add the desired approvers. To add approvers:  
- Select individual users or groups.  
- Drag-and-drop or select a field from a record.  

Select ✍️ to allow a manual approver to process an approval or rejection. A manual approver is a user manually added to the Approvers related list who can then approve the request. For example, you can manually add a subject matter expert to a task to approve the request. To learn more about adding manual approvers, see Generate approvals using the approvers related list on page 2422.  

Define rejection rules by adding another OR rule set. When defining approvals, include rejection rules that run when there are no matching approvals. Such rejection rules prevent the flow from remaining in a waiting state. For example, if an approval can be approved by anyone, create a time-based rejection rule in case no one approves it. |
| Due Date | Define a due date to ensure that the flow does not remain in a waiting state if the request is not approved or denied.  
- None: The approval is not dependent on a specific date.  
- Approve: Automatically approve the step if an action is still pending by the specified date.  
- Reject: Automatically reject the step if an action is still pending by the specified date.  
- Cancel: Automatically cancel the step if an action is still pending by the specified date. |
Example

**TRIGGER**

[Incident] Created or Updated

**ACTION**

1. **Ask For Approval**

- **Action**: Ask For Approval
- **Record**: Trigger ➞ Incident Record
- **Table**: Incident [incident]
- **Approval Field**: Approval
- **Journal Field**: Approval history
- **Rules**
  - **Approve**: When: Anyone approves
  - **Reject**: When: Anyone rejects

- **Due Date**: Approve if pending by Relative date 1 Day From Trigger
- **Days schedule**: 8-5 weekdays
Create Catalog Task action

Creates a record in the Catalog Task [sc_task] table associated to a requested item in the Requested Items [sc_req_item] table. Adds the catalog task record as data to be used in the flow.

Roles and availability

- Available as a Flow Designer core action. Process analysts use the flow_designer role to add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Name</td>
<td>The Catalog Task [sc_task] table where the catalog task is created. This value is read only.</td>
</tr>
<tr>
<td>Requested Item [Requested Item]</td>
<td>The requested item record from the Requested Items [sc_req_item] table that this catalog task fulfills.</td>
</tr>
<tr>
<td>Short Description</td>
<td>Short description for the catalog task.</td>
</tr>
<tr>
<td>Fields [Catalog Task]</td>
<td>To add the action to a flow, set fields in the catalog task record to the desired value. For example, to set the Urgency, select Urgency and set the desired value. If adding the action to a subflow, you can allow flow designers to dynamically set field values.</td>
</tr>
<tr>
<td>Wait</td>
<td>Pauses the flow until this task completes and is no longer active (active=false). Alternatively, you can add a wait condition by dragging-and-dropping a true/false field from the data panel into the Wait field. The flow only waits for the task to complete when this field is true.</td>
</tr>
<tr>
<td>Template Catalog Item [Catalog Item]</td>
<td>Select an item from the Catalog Items [sc_cat_item] table to populate the Catalog Variables slushbucket with the associated variables.</td>
</tr>
<tr>
<td>Catalog Variables</td>
<td>Select catalog variables to show on the catalog task form to provide more information or allow the fulfiller to modify the variables. You can define flow-specific variables that display in the Available column. To define flow-specific variables, see Create flow Service Catalog variables on page 1245.</td>
</tr>
</tbody>
</table>
## Example

**TRIGGER**

**[Service Catalog]**

**ACTIONS**

<table>
<thead>
<tr>
<th>Action</th>
<th>Create Catalog Task</th>
</tr>
</thead>
<tbody>

[Delete] [Cancel] [Done]
Create Record action

Creates a record on any table. You can dynamically add and configure fields for the record.

Roles and availability

• Available as a Flow Designer core action. Process analysts use the flow_designer role to add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Field Values</td>
<td>Set the values of fields in the record to be created. For example, to set the short description to a certain value, select Short description and set the desired value. If adding the action to a subflow, you can Allow flow designers to dynamically set field values on page 1253.</td>
</tr>
</tbody>
</table>

Create Task action

Create a task on any ServiceNow task table. After you choose the task table, you can dynamically select the fields to configure the action. Defining the Parent field associates the task to a parent record.

Roles and availability

• Available as a Flow Designer core action. Process analysts use the flow_designer role to add an action to a flow and define configuration details.
## Fields

| Field Values           | Set the values of fields in the task to be created. For example, to set the short description to a certain value, select Short description and set the desired value. To associate the task with a parent record, define the Parent field. |
|                       | If adding the action to a subflow, you can **Allow flow designers to dynamically set field values** on page 1253. |
Delete Record action

Deletes a record on any table.

**Roles and availability**

- Available as a Flow Designer core action. Process analysts use the flow_designer role to add an action to a flow and define configuration details.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>The record to be deleted. Drag-and-drop a record data pill or use the data pill picker to select a record.</td>
</tr>
</tbody>
</table>

Get Catalog Variables action

Access Service Catalog variables as data pills in a flow.

**Roles and availability**

- Available as a Flow Designer core action. Process analysts use the flow_designer role to add an action to a flow and define configuration details.

**Fields**

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requested Item [Requested Item]</td>
<td>The requested item from the Requested Items [sc_req_item] table.</td>
</tr>
<tr>
<td>Template Catalog Item [Catalog Item]</td>
<td>Select an item from the Catalog Items [sc_cat_item] table to populate the Catalog Variables slushbucket with the associated variables.</td>
</tr>
</tbody>
</table>
Log action
Logs a message in the Flow Designer log table.

Roles and availability

- Available as a Flow Designer core action. Process analysts use the flow_designer role to add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log level</td>
<td>Level of importance of the log message.</td>
</tr>
<tr>
<td></td>
<td>• Error</td>
</tr>
<tr>
<td></td>
<td>• Warn</td>
</tr>
<tr>
<td></td>
<td>• Info</td>
</tr>
<tr>
<td>Log message</td>
<td>Message to display in the log. Enter text or drag-and-drop data pills into the field.</td>
</tr>
</tbody>
</table>

Look Up Record action
Look up a record from any table based on defined conditions.

Roles and availability

- Available as a Flow Designer core action. Process analysts use the flow_designer role to add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Conditions</td>
<td>Conditions to be met by the returned record.</td>
</tr>
<tr>
<td></td>
<td>When building a condition that looks up the value of a reference field, use a data pill that explicitly provides the Sys ID value. Ensure the condition has the format [reference field][is][Reference type data pill-&gt;Sys ID]. For example, both the Change and Incident tables contain a reference field to the User table. To look up change records where the requester is the caller from an incident record, create the condition [Requested by][is][Trigger-&gt;incident record-&gt;Caller-&gt;Sys ID].</td>
</tr>
<tr>
<td>If multiple records are found</td>
<td>Determines what is returned if more than one record matches the defined conditions.</td>
</tr>
<tr>
<td></td>
<td>• Return only the first record</td>
</tr>
<tr>
<td></td>
<td>• Fail the step</td>
</tr>
</tbody>
</table>
Look Up Records action

Look up multiple records on any table using defined conditions.
Roles and availability

- Available as a Flow Designer core action. Process analysts use the flow_designer role to add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Conditions to be met by the returned records.</td>
</tr>
<tr>
<td></td>
<td>When building a condition that looks up the value of a reference field, use a data pill that explicitly provides the Sys ID value. Ensure the condition has the format [reference field][is][Reference type data pill-&gt;Sys ID]. For example, both the Change and Incident tables contain a reference field to the User table. To look up change records where the requester is the caller from an incident record, create the condition [Requested by][is][Trigger-&gt;incident record-&gt;Caller-&gt;Sys ID].</td>
</tr>
<tr>
<td>Max Results</td>
<td>Maximum number of results returned.</td>
</tr>
</tbody>
</table>
Send Email action

Send an email to specified users or groups as an action in a flow.
Roles and availability

- Available as a Flow Designer core action. Process analysts use the flow_designer role to add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>To</td>
<td>The main recipients of the email. Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field, such as a User record. For example, if your action involves an incident record and you want to send an email to the group assigned to the incident, drag the [Assignment group] data pill from the data panel.</td>
</tr>
<tr>
<td>CC</td>
<td>Additional recipients copied on this email. Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field.</td>
</tr>
<tr>
<td>BCC</td>
<td>Additional recipients of this email, who are visible only to the sender (blind copied). Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field.</td>
</tr>
<tr>
<td>Subject</td>
<td>Subject of the email. You can enter text or drag-and-drop data pills into the field.</td>
</tr>
<tr>
<td>Body</td>
<td>The content of the message body. You can enter text or drag-and-drop data pills into the field.</td>
</tr>
</tbody>
</table>

**Note:** Flow Designer does not support the `${URI}` parameter for creating a link to a record in the email message body. Instead, consider inserting the information from the record in the email body using data pills, or create a notification step.

Testing the email action

To verify that the email was generated when testing the action, review the email record in the Email [sys_email] table. The Headers field indicates whether the email was successfully generated. For example:

```
X-ServiceNow-Source:FlowDesigner-9ad2747b0b710300f4eb8bf637673a1e
Message-ID:<193756824.0.1508534586438@[10.0.66.70]>
X-ServiceNow-Generated:true
```

Update Record action

Update an existing record in a table. You can dynamically add and configure fields for the record.
Roles and availability

- Available as a Flow Designer core action. Process analysts use the flow_designer role to add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>The record to be updated. Drag-and-drop a record data pill or use the data pill picker to select a record.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only. Set to the table associated with the record.</td>
</tr>
<tr>
<td>Field Values</td>
<td>Set the values of fields in the record to be updated. For example, to set the short description to a certain value, select Short description and set the desired value. If adding the action to a subflow, you can Allow flow designers to dynamically set field values on page 1253.</td>
</tr>
</tbody>
</table>

Wait For Condition action

Pause the flow until the record value conditions are met.

Roles and availability

- Available as a Flow Designer core action. Process analysts use the flow_designer role to add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Drag-and-drop an input record or a record from a previous step.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only. Set to the table associated with the record.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Select the record values necessary to resume running the flow. For example, if the condition is [State][is][Closed], the flow pauses until the condition is met. Once met, the flow moves on to the next step or action.</td>
</tr>
</tbody>
</table>
Flow Designer stages

Communicate the current stage of a request or flow with an end user.

When configuring stages in Flow Designer, you can:
London    ServiceNow    Now Platform  Capabilities

- Create any number of stages.
- Change stage labels and names.
- Set the estimated duration for a stage.
- Import a copy of a pre-defined stage set from the Stage Sets table. To learn more about stage sets, see Workflow stage sets on page 3281. Any changes made to the copy do not affect the original stage set record.

While stages can be added to a flow with a scheduled trigger, the stages are never displayed to an end user because there is no associated record for the stage field. Only use stages in flows with record and Service Catalog triggers. Stages are not supported on subflows.

View the stages of a flow in the flow execution details.

**Displaying stages in a stage field**

A stage field is a field of type Workflow that displays the stages of a flow to a user. For example, the Service Catalog uses a Stage field to indicate progress of a request as it is processed by an associated flow or workflow.

Stage fields display:
- Stages from flows with record or Service Catalog triggers.
- Stages from the associated flow. If the associated flow calls another flow, stages set on the child flow do not display.
- Stages from flows that have started.

State icons in stage fields cannot be modified. Limit the number of stages and the length of each stage name to represent each stage in a stage field without causing text and icons to wrap onto multiple lines.

**Note:** Only add one stage field per table. If there is more than one stage field, the system only displays stages from the first stage field defined in the table dictionary entry.
Stage field and trigger types

Associating a flow to a stage field depends on the flow trigger type.

<table>
<thead>
<tr>
<th>Flow trigger type</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>For a stage field to report stages on a record-based flow, a stage field must be present on the same table as the triggering record. When a flow has stages, Flow Designer communicates the status of each stage back to the triggering table and displays the current stage state as an icon. If more than one stage field exists on the table, only the first stage field defined in the table's dictionary definition is used.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Avoid creating stages for multiple flows that trigger from the same table. A stage field only displays the stages of the final flow to run. Add different conditions to each flow to ensure that the stages of one flow do not overwrite another flow.</td>
</tr>
<tr>
<td>Service Catalog</td>
<td>If using the Service Catalog trigger, the flow must be associated with the Service Catalog item through the Flow field. Remove any workflows associated with the item by clearing the Workflow and Execution Plan fields. The Stage field displays the current stage state on any list view of the Requested Items [sc_req_item] table.</td>
</tr>
</tbody>
</table>

Stage states

During flow execution, each stage can be in one of five states.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pending</td>
<td>This stage has not yet started.</td>
</tr>
<tr>
<td>In progress</td>
<td>This stage is executing.</td>
</tr>
<tr>
<td>Skipped</td>
<td>This stage was skipped and did not run. Typically, this state is reached when a conditional flow logic block is not executed.</td>
</tr>
<tr>
<td>Complete</td>
<td>This stage is complete.</td>
</tr>
<tr>
<td>State</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Error</td>
<td>This stage has reached an error condition.</td>
</tr>
</tbody>
</table>

When designing a flow, you can manually set the flow to report an Error state. To set an Error state:

- The flow must have at least one stage defined.
- The Error can only be set within a stage. When an Error condition is reached, the current stage is set to Error.
- The Error can only be set within a conditional flow logic block.

While setting the Error state does not affect flow execution, it communicates to the user that the state of the current stage is Error. For example, if an approval is not approved within the required limit you may want to communicate an error to the user.

Each stage can have its own custom state labels. For example, suppose that you have a flow with two stages. Stage 1 could have the Pending state with the label Waiting, and Stage 2 could have a Pending state with a label of Not yet started. Flow Designer provides options to generate either the default states or approval states.

**Configure stages and add them to a flow**

Configure when stages display to a user, define stage state labels, and add stages to a flow within Flow Designer.

While stages can be added to a flow with a scheduled trigger, the stages are never displayed to an end user because there is no associated record for the stage field. Only use stages in flows with record and Service Catalog triggers.

Role required: flow_designer or admin

1. If not already present, create a stage field on the table that triggers the flow. A stage field is a field of type Workflow that displays the stages of a flow to a user. The Service Catalog Requested Items [sc_req_item] table has a stage field by default.

   For a stage field to report stages on a record-based flow, a stage field must be present on the same table as the triggering record.

   To add a field to a table, see Add and customize a field in a table.

2. If adding stages to a flow with a Service Catalog trigger, select the flow in the Flow field of the Service Catalog Item [sc_cat_item] table.

   If using the Service Catalog trigger, the flow must be associated with the Service Catalog item through the Flow field. Remove any workflows associated with the item by clearing the Workflow and Execution Plan fields. This enables a request for a catalog item to initiate a flow specific to that catalog item.

3. Open the flow in Flow Designer.

4. Create and configure stages in the More Actions menu. Alternatively, you can create stages within the flow itself.

   a) Click and select Stages.

      The Flow Stages / State menu opens.

   b) Click New Stage to add a new stage and configure the stage options.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Display name for the stage. Must be unique.</td>
</tr>
<tr>
<td>Value</td>
<td>Internal name for the stage. Must be unique.</td>
</tr>
<tr>
<td>Duration</td>
<td>Estimated duration displayed to the user.</td>
</tr>
<tr>
<td>Always Show</td>
<td>If selected, the stage always displays in the stage field, even if the stage is set within a flow logic block that might not execute.</td>
</tr>
</tbody>
</table>

c) Select a stage set to import from the Stage Sets table. To learn more about stage sets, see *Workflow stage sets* on page 3281. Any changes made to the copy do not affect the original stage set record.

5. Point to a location in the flow and click Add a Stage. Select a stage or click + to add a new stage inline.
   Stages can be applied at the beginning of any Flow Designer action or flow logic block, or within an If block. Stages are not supported within a For Each flow logic block.

TRIGGER

[Service Catalog]

ACTIONS

1. Get Catalog Variables from Apple iPhone 6s

6. Set a stage to the Error state within a conditional flow logic block.
   a) Point to a location and select Set "Error" State.
      To set a stage to the Error stage:
      • The flow must have at least one stage defined.
      • The Error can only be set within a stage. When an Error condition is reached, the current stage is set to Error.
      • The Error can only be set within a conditional flow logic block.
When the flow reaches the indicated point, the currently executing stage is set to Error in the stage field.

In a flow with a record-based trigger, Flow Designer communicates the status of each stage back to the triggering table and displays the current stage state as an icon. In a flow with a Service Catalog trigger, the Stage field displays the current stage state on any list view of the Requested Items [sc_req_item] table.

Subflows

Define a sequence of reusable actions that can be started from a flow, subflow, or script. Define inputs and outputs to pass data to and from the subflow.

All subflows consist of properties, one or more inputs, one or more outputs, a sequence of actions, and the data collected or created. Unlike flows, subflows:

- Do not have a trigger and are instead started from a parent flow, subflow, or script by a method call.
- Include inputs to specify data available to the subflow when it starts.
- Include outputs to specify data available to the parent flow after the subflow ends.

Using subflows, process analysts can:

- Create a set of reusable operations for use in multiple flows.
- Add flow logic in addition to actions.

Subflow properties

The subflow properties specify the subflow name, application, category, description, in-flow annotation, and status. Flow designers can update the subflow name, category, description, and in-flow annotation at any time, but can only set the application during subflow creation. The subflow status is set when you save or publish a subflow.
**Subflow inputs**

Subflow inputs specify the data available to the subflow when it starts. Each input you define for a subflow becomes a configuration option in the Flow Designer interface. To use the subflow in a flow, flow designers must define a value for each mandatory input. The more inputs a subflow has, the more data flow designers must define and the more familiar they must be with the underlying data model to use the subflow effectively.

Inputs provide advanced options based on their data type. All inputs have advanced options to add a hint or provide a default value. Use advanced options to guide flow designers through adding and configuring a subflow to a flow. For example, create a choice input to provide flow designers with a pre-defined list of configuration options to choose from. For more information about the configuration options available to particular data types, see *field types*.

**Subflow outputs**

Subflow outputs specify the data available to the parent flow after the subflow completes. Subflow outputs are defined as variables with a name and data type. Subflow designers assign values to an output using the Assign Subflow Output flow logic. Output values can be based on the subflow logic conditions, action results, or a manually set value. For example, an output may have one value when a condition is met and another value when a condition is not met. During runtime, the value of the output is determined by the condition that is met.

Consider the following example of a subflow with two conditions that both result in a value for a single output variable. The value of the variable depends on which condition is met during runtime.

<table>
<thead>
<tr>
<th>Outputs</th>
<th>[Manager ID] [String]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Actions</td>
<td></td>
</tr>
<tr>
<td>• 1 Look Up [User] Record where (Created on Today)</td>
<td></td>
</tr>
<tr>
<td>• 2 If ([1-&gt;User Record-&gt;Title] contains Manager) then</td>
<td></td>
</tr>
<tr>
<td>• 2.1 Assign Subflow Outputs [Manager ID] to [1-&gt;User Record-&gt;User ID]</td>
<td></td>
</tr>
<tr>
<td>• 3 Else</td>
<td></td>
</tr>
<tr>
<td>• 3.1 Assign Subflow Outputs [Manager ID] to [1-&gt;User Record-&gt;Manager-&gt;User ID]</td>
<td></td>
</tr>
</tbody>
</table>

In this case, if the user’s title contains "Manager" then the user ID is assigned as output. Otherwise, the subflow looks up the user’s manager and assigns the user ID of the manager as output.

Flow Designer allows you to define a value for the same variable multiple times. However, if a variable is given two or more possible values without conditional logic, only the last value defined in the subflow is applied to the output at runtime.

<table>
<thead>
<tr>
<th>Outputs</th>
<th>[Manager ID] [String]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Actions</td>
<td></td>
</tr>
<tr>
<td>• 1 Look Up [User] Record where (Created on Today)</td>
<td></td>
</tr>
<tr>
<td>• 2 Assign Subflow Outputs [Manager ID] to [1-&gt;User Record-&gt;User ID]</td>
<td></td>
</tr>
</tbody>
</table>
In this example, action three overwrites the value of action two and [1->User Record->Manager->User ID] is applied to the [Manager ID] output at runtime because it was the last value defined. Typically, subflows should only include multiple values for one variable if conditional flow logic is used.

**Actions**

Within Actions, flow designers can add actions, flow logic, flows, or other subflows.

An action is a reusable operation that enables process analysts to automate Now Platform features without having to write code. For example, the Create Record action allows process analysts to generate records in a particular table with particular values when certain conditions occur. Core actions like Create Record require some familiarity with Now Platform tables and fields. Action designers can create application-specific actions to pre-set configuration details. For example, creating a Create Incident Task action ensures that the process analyst uses the correct table and field configuration each time the action is used. You can add application-specific actions by activating the associated spoke.

**Flow logic**

Subflows can contain flow logic to specify conditional or repeated actions, or to assign output variables to subflow data. The system provides these flow logic options.

### Table 451: Available flow logic

<table>
<thead>
<tr>
<th>Flow logic</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>For Each</td>
<td>Applies actions to each record in a list of records. Flow designers must specify the list of records from the subflow data. <strong>Note:</strong> Add a For Each flow logic block inside of another to repeat an action over a series of records. However, avoid nested For Each loops that process many records. Nested loops may cause the flow to run until stopped by the flow transaction quota rule, which prevents flows from running longer than an hour. For more information about transaction quotas, see Transaction quotas.</td>
</tr>
<tr>
<td>If</td>
<td>Applies actions when a list of conditions is met. Flow designers can specify the conditions with subflow data. Once an If condition is added, you can add an Else or Else If flow logic option to define behavior when conditions are not met.</td>
</tr>
<tr>
<td>Assign Subflow Outputs</td>
<td>Assigns an output variable to subflow data. Only outputs defined in Inputs &amp; Outputs can be assigned a value. Assigning outputs enables you to assign a different output variable for each logical path in the subflow.</td>
</tr>
</tbody>
</table>

**Testing subflows**

You can test a subflow alone, or when added to a flow. When testing a subflow alone, you must define the inputs that the subflow uses in its actions. Because a subflow does not have a trigger, testing a subflow runs the actions using the defined input values.
Note: Flow designers should always test flows and subflows on sub-production instances containing relevant demonstration data since testing a subflow creates or changes records on the instance.

Roles

To access subflows, a user must have the flow_designer or admin role.

Create a subflow

Create a reusable sequence of actions that can be added to multiple flows.

- Role required: flow_designer or admin
- Create a custom application to store Flow Designer content.

Flow designers should know the application table structure and be aware of any existing business logic associated with the target tables of a flow or subflow. Be sure to disable any conflicting business rules or workflows before creating a flow or subflow.

Creating a custom application to contain your Flow Designer content allows you to deploy it using the application repository or the ServiceNow Store.

1. Navigate to Flow Designer Designer.
2. Click + New New Subflow.
   The Subflow properties dialog displays.
3. Fill in the following properties:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the subflow.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope to create the subflow in.</td>
</tr>
<tr>
<td>Category</td>
<td>Logical group for subflow.</td>
</tr>
<tr>
<td>Protection</td>
<td>Select whether the subflow is read-only. You can only select a value when</td>
</tr>
<tr>
<td></td>
<td>you create the subflow in an application scope you own. The default value</td>
</tr>
<tr>
<td></td>
<td>is None.</td>
</tr>
<tr>
<td>In-Flow Annotation</td>
<td>Help text that appears under the subflow title in Flow Designer to help</td>
</tr>
<tr>
<td></td>
<td>flow designers understand what the subflow does when used in a flow.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the subflow.</td>
</tr>
</tbody>
</table>

4. Create subflow inputs to specify the data available to the subflow when it starts.
   Each input you define for a subflow becomes a configuration option in the Flow Designer interface.
   To use the subflow in a flow, flow designers must define a value for each mandatory input. The more inputs a subflow has, the more data flow designers must define and the more familiar they must be with the underlying data model to use the subflow effectively.
   a) Click + to open the Inputs & Outputs pane.
   b) Click + to add a new input.
   c) Define the name and type for the input.
   d) To make the input a mandatory configuration option, select the Mandatory flag.
e) Click to view the advanced options and define values. Inputs provide advanced options based on their data type. All inputs have advanced options to add a hint or provide a default value. Use advanced options to guide flow designers through adding and configuring a subflow to a flow. For example, create a choice input to provide flow designers with a pre-defined list of configuration options to choose from. For more information about the configuration options available to particular data types, see field types.

5. Create subflow outputs by defining the names and data types.
Subflow outputs specify the data available to the parent flow after the subflow completes.
   a) Click + to add a new output.
   b) Define the name and the data type.
      Output values are assigned in later steps.

| Inputs | | |
| Name | Type | Mandatory |
| Incident | Reference.Incident | |

| Outputs | | |
| Name | Type |
| Caller name | String |
| Incident short description | String |

6. Add actions, flows, subflows, or flow logic.
   a) Under Actions, click + and select an option.
Option | Description
--- | ---
Action | Select the desired action. Flow Designer includes a set of *Actions* on page 1255 available to flows and subflows. Alternatively, an action designer can create additional actions to add to flows. The *IntegrationHub* on page 1327 and *spoke* plugins install additional actions.

To add draft actions, set Show draft actions to true from the More Actions menu.

Flow Logic | Select an option to specify conditional or repeated operations.

Subflow | Select a published subflow and define input values. In addition to adding a subflow as a flow action, you can enable the Show triggered flows option from the More Actions menu to select an activated flow and define the required inputs. Running a triggered flow ignores its trigger conditions and runs all actions.

To change the order of an action in a flow, drag-and-drop the handle on the left side of the action. The system displays a set of fields depending on the option selected.

b) Fill in the fields to configure the action, flow, or subflow.

c) Click Done.

d) Repeat adding actions until complete.

7. **Assign subflow outputs to a value.**

You can assign a subflow output to multiple values, enabling you to create conditional outputs based on flow logic.

a) Under Actions, click + and select Flow Logic.

b) Click Assign Subflow Outputs.

c) In the Name field, select an output you created in the Inputs & Outputs section. You can only assign values to outputs that have already been given a name and data type.

d) In the Data field, enter a value or select a data pill from the data panel.

e) Click Done.
Test the subflow, and publish it when it is ready to be added to a flow or called from a script.

**Test a subflow**

You can test a subflow alone, or when added to a flow. When testing a subflow alone, you must define the inputs that the subflow uses in its actions. Because a subflow does not have a trigger, testing a subflow runs the actions using the defined input values. Unless updated, subsequent tests use the same inputs defined in the initial test run.

Role required: flow_designer or admin

*Create a subflow* on page 1279 and save it. Flow Designer only tests saved subflows.

Flow designers should always test flows and subflows on sub-production instances containing relevant demonstration data since testing a subflow creates or changes records on the instance.

1. Navigate to Flow Designer Designer.
2. Click the subflows tab and open a saved subflow.
3. Click Test. The Test Subflow dialog opens.
4. Define input values for the subflow to use in its actions. The values defined are remembered on future test runs.
5. Click Run Test.
6. After the flow executes, click Subflow has been executed. To view the subflow, click here. The Execution Details open.

Once the subflow behaves as desired, you can *publish the subflow* and add it to a flow.

**Publish a subflow**

Publish a subflow to make it available to other users and to add it to activated flows.

Role required: flow_designer or admin

*Create a subflow* on page 1279, *test the subflow*, and verify that it is working as expected.

1. Navigate to Flow Designer Designer.
2. Click the subflows tab and open a tested subflow.
3. Click Publish.

The subflow can be added to activated flows. If you update the subflow after it is published, you must click Publish again to see the changes when the parent flow is run. After publishing changes, all parent flows that use the subflow are automatically updated to use the current version.

**Action Designer**

Automate a task with a sequence of related steps such as lookup a record, create a record, and log details about the record creation. Actions separate complexity from the Flow Designer environment, enabling flow designers to add actions to multiple flows with minimal configuration.

Using Action Designer, subject matter experts can:
- Create application-specific actions with pre-set configuration details, enabling process analysts to easily add actions to a flow with little configuration.
- Create scripted actions that appear code-less when added to a flow.
- Build integrations using IntegrationHub.

**Custom actions**

Unlike core actions where flow designers must manually configure flow logic, custom actions always use the same configuration when added to a flow. If your flow designers often use an action with the same configuration, you might create a reusable action.

A reusable action includes these components.

**Inputs**

Inputs are data variables used in your action. For example, if an action step creates a record in the incident table, your input might be a reference to the incident table. Once added as an input, the table and its fields are available to steps and outputs in the flow.

Each input you define for an action becomes a configuration option in the Flow Designer interface. To use the action in a flow, flow designers must define a value for each mandatory input. The more inputs an action has, the more data flow designers must define and the more familiar they must be with the underlying data model to use the action effectively.

Inputs provide advanced options based on their data type. All inputs have advanced options to add a hint or provide a default value. Use advanced options to guide flow designers through adding and configuring an action to a flow. For example, create a choice input to provide flow designers with a pre-defined list of configuration options to choose from. For more information about the configuration options available to particular data types, see field types.

**Action steps**

An action step or step is a single reusable operation within an action. For example, the Create Record
step allows action designers to specify the table and field values to use during record creation. Action steps require subject matter expertise with application tables, fields, and business logic. Application developers or IT generalists add action steps to actions from the Action Designer design environment. Flow Designer provides a set of core action steps to automate Now Platform processes. You can add application-specific action steps by activating the associated spoke.

**Outputs**

*Outputs* are data variables that represent the results of the action. These results are available to other actions in a flow.

### Action Designer environment

Subject matter experts build custom actions in Action Designer.

Create and edit actions by defining inputs and adding action steps. Copy actions to use existing actions as templates. Publish actions to activate them, which makes them available to activated flows and to preserve their current action steps, variables, and sequence as a snapshot separate from further configuration changes.

### Roles

To create custom actions, a user must have the action_designer or admin roles.

### Action input and output data types

You can define input variables for your Flow Designer actions. Input variables and data used in action steps can be defined as output variables.

Action inputs are data variables with a name and data type. You must associate some data types with a reference table, which makes the record and fields available to the action steps. Available data types include:

- Audio
- Choice
• Color
• Condition String
• Conditions – Reference table required
• Currency
• Data Structure
• Date
• Date/Time
• Document ID – Reference table required
• Due Date
• Duration
• Encrypted Text
• Field Name
• Floating Point Number
• HTML
• IP Address (Validated IPV4, IPV6)
• Icon
• Image
• Integer
• Journal
• Journal Input
• Journal List
• List
• Long
• Name-Value Pairs
• Password (1 Way Encrypted)
• Password (2 Way Encrypted)
• Percent Complete
• Phone Number (E164)
• Price
• Records – Reference table required
• Reference – Reference table required
• Script
• Script (Plain)
• String
• String (Full UTF-8)
• Table Name
• Template Value – Reference table required
• Time
• Translated HTML
• Translated Text
• True/False
• URL
• Video
• Wiki
• Workflow

Create an action
Create a reusable component to automate one or more steps of a process.
• Create a custom application to store Flow Designer content.
• Role required: action_designer or admin

Action designers should know the application table structure and be aware of any existing business logic associated with the target tables of an action. Be sure to disable any conflicting business rules or workflows before creating an action.

Creating a custom application to contain your Flow Designer content enables you to deploy it using the application repository or the ServiceNow Store.

1. Navigate to Flow Designer Designer.
2. Click the Actions tab and select New Action.
3. Fill in the Action Properties and click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of action.</td>
</tr>
<tr>
<td>Accessible From</td>
<td>Accessible from all application scoped or only within the specified application scope.</td>
</tr>
<tr>
<td>Category</td>
<td>Defined category within the application scope for an action.</td>
</tr>
<tr>
<td>Protection</td>
<td>Select whether the action is read-only. You can only select a value when you create the action in an application scope you own. The default value is None.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the action.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the action.</td>
</tr>
<tr>
<td>In-Flow Annotation</td>
<td>Help text that appears under the action title in Flow Designer to help flow designers understand what the action does when used in a flow.</td>
</tr>
</tbody>
</table>

An empty action opens.

4. Define action inputs to make data available to the action steps and outputs.
   a) Select + Create Input and complete the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the input. This value is used as the name of the data pill in the right-hand pane.</td>
</tr>
<tr>
<td>Type</td>
<td>Data type of the input. For supported data types, see Action input and output data types on page 1284.</td>
</tr>
<tr>
<td>Reference Table</td>
<td>Reference table for the data type. Only required for the following data types:</td>
</tr>
<tr>
<td></td>
<td>• Conditions</td>
</tr>
<tr>
<td></td>
<td>• Document ID</td>
</tr>
<tr>
<td></td>
<td>• Records</td>
</tr>
<tr>
<td></td>
<td>• Reference</td>
</tr>
<tr>
<td></td>
<td>• Template Value</td>
</tr>
</tbody>
</table>
Inputs are represented as data pills in the right-hand pane. You can add inputs to steps and outputs in the flow by dragging and dropping data pills.

5. Add an action step to perform an operation on the action inputs.
   a) Click the + underneath Inputs in the Action Outline.
   b) Select the step you would like to perform.
   c) Complete the fields in the step.

6. Add action outputs to make data available to a flow.
   a) Select + Create Outputs and complete the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the output. This value is the name of the data pill in the right-hand pane when the action is added to a flow.</td>
</tr>
<tr>
<td>Value</td>
<td>Data used previously in the action either in a step or input. Adding a variable to the output makes the value available to the flow.</td>
</tr>
</tbody>
</table>

7. Click Save.
   Action Designer saves a draft of the action.

Test the action by adding it to a flow that has Show draft actions set to true. To add the action to a published flow, or a flow that has Show draft actions set to false, you must first click Publish.

**Note:** By default, the system only runs published actions.

### Ask for Approval step

Request approval for a record with an approval field. You can configure a rule set for an approval, rejection, or cancellation. If a due date is added to an approval, the approval is automatically approved, rejected, or canceled if the approvers have not responded by the designated time.

*Approvals* on page 2404 is a platform feature that enables users or groups to approve or reject a task.
Roles and availability

- Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Select a record under the data panell and drag the record pill into the Record field. If selecting a table with an approval field already configured, the Approval field is set to the correct field.</td>
</tr>
<tr>
<td>Table</td>
<td>Set to the table name associated with the record.</td>
</tr>
<tr>
<td>Approval field</td>
<td>Select a field from the designated table to use for approval.</td>
</tr>
<tr>
<td>Journal field</td>
<td>Select a field from the designated table to use for journal.</td>
</tr>
<tr>
<td>Rules</td>
<td>Define the approval and rejection rules. Approval rules determine which users can approve or reject requests, and what happens after approval or rejection. Approval or rejection rules include:</td>
</tr>
<tr>
<td></td>
<td>• Anyone approves</td>
</tr>
<tr>
<td></td>
<td>• All users approve</td>
</tr>
<tr>
<td></td>
<td>• All responded and anyone approves</td>
</tr>
<tr>
<td></td>
<td>• % of users approve</td>
</tr>
<tr>
<td></td>
<td>• # of users approve</td>
</tr>
</tbody>
</table>

In the field beside the approval rule, add the desired approvers. To add approvers:

- Select individual users or groups.
- Drag-and-drop or select a field from a record.

Select to allow a manual approver to process an approval or rejection. A manual approver is a user manually added to the Approvers related list who can then approve the request. For example, you can manually add a subject matter expert to a task to approve the request. To learn more about adding manual approvers, see Generate approvals using the approvers related list on page 2422.

Define rejection rules by adding another OR rule set. When defining approvals, include rejection rules that run when there are no matching approvals. Such rejection rules prevent the flow from remaining in a waiting state. For example, if an approval can be approved by anyone, create a time-based rejection rule in case no one approves it.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Due Date</td>
<td>Define a due date to ensure that the flow does not remain in a waiting state if the request is not approved or denied.</td>
</tr>
<tr>
<td></td>
<td>- None: The approval is not dependent on a specific date.</td>
</tr>
<tr>
<td></td>
<td>- Approve: Automatically approve the step if an action is still pending by the specified date.</td>
</tr>
<tr>
<td></td>
<td>- Reject: Automatically reject the step if an action is still pending by the specified date.</td>
</tr>
<tr>
<td></td>
<td>- Cancel: Automatically cancel the step if an action is still pending by the specified date.</td>
</tr>
</tbody>
</table>

**Example**

### Create Record step

Creates a record on any table. You can dynamically add and configure fields for the record.
Roles and availability

• Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Field Values</td>
<td>Set static or dynamic values of fields in the record. For example, to set the short description to a static value, select Short description and set the desired value. To add dynamic values, see Allow flow designers to dynamically set field values on page 1253.</td>
</tr>
</tbody>
</table>

Create Task step

Create a task on any ServiceNow task table. After you choose the task table, you can dynamically select the fields to configure the action. Defining the Parent field associates the task to a parent record.

Roles and availability

• Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.
## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a task table.</td>

<td>• Standard Change Proposal [std_change_proposal]</td>
</tr>
<tr>
<td></td>
<td>• Ticket [ticket]</td>
</tr>
</tbody>
</table>

### Field Values

Set static or dynamic values of fields in the record. For example, to set the short description to a static value, select Short description and set the desired value.

To add dynamic values, see [Allow flow designers to dynamically set field values](#) on page 1253.

To associate the task with a parent record, define the Parent field.
### London 

### ServiceNow 

### Now Platform Capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait</td>
<td>Waits to complete the step until the task completes and is no longer active (active=false). Alternatively, you can add a wait condition by dragging-and-dropping a true/false field from the data panel into the Wait field. The flow only waits for the task to complete when the condition field is true.</td>
</tr>
</tbody>
</table>

**Delete Record step**

Deletes a record on any table.

**Roles and availability**

- Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>The record to be deleted. Drag-and-drop a record data pill or use the data pill picker to select a record.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only. Set to the table associated with the record.</td>
</tr>
</tbody>
</table>

**Log step**

Logs a message in the Flow Designer log table.

**Roles and availability**

- Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log level</td>
<td>Level of importance of the log message.</td>
</tr>
<tr>
<td></td>
<td>• Error</td>
</tr>
<tr>
<td></td>
<td>• Warn</td>
</tr>
<tr>
<td></td>
<td>• Info</td>
</tr>
</tbody>
</table>
### Look Up Record step

Look up a record from any table based on defined conditions.

### Roles and availability

- Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log message</td>
<td>Message to display in the log. Enter text or drag-and-drop data pills into the field.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Set static or dynamic conditions to filter records. To define a static condition applied each time the action runs, define the conditions with the condition builder. To enable flow designers to dynamically apply conditions, define an input of type Conditions and drag-and-drop the input data pill into the Conditions field. When building a condition that looks up the value of a reference field, use a data pill that explicitly provides the Sys ID value. Ensure the condition has the format [reference field][is][Reference type data pill-&gt;Sys ID]. For example, both the Change and Incident tables contain a reference field to the User table. To look up change records where the requester is the caller from an incident record, create the condition [Requested by][is][action-&gt;incident-&gt;Caller-&gt;Sys ID] where incident is an input variable for an incident record.</td>
</tr>
<tr>
<td>If multiple records are found</td>
<td>Determines what is returned if more than one record matches the defined conditions.</td>
</tr>
<tr>
<td></td>
<td>• Return only the first record</td>
</tr>
<tr>
<td></td>
<td>• Fail the step</td>
</tr>
</tbody>
</table>
Example

1. Look Up Record step

![Table selection and condition setup]

Look Up Records step

Look up multiple records on any table using defined conditions.

Roles and availability

- Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
</tbody>
</table>
### Conditions

Set static or dynamic conditions to filter records. To define a static condition applied each time the action runs, define the conditions with the condition builder. To enable flow designers to dynamically apply conditions, define an input of type Conditions and drag-and-drop the input data pill into the Conditions field.

When building a condition that looks up the value of a reference field, use a data pill that explicitly provides the Sys ID value. Ensure the condition has the format `[reference field][is][Reference type data pill->Sys ID]`. For example, both the Change and Incident tables contain a reference field to the User table. To look up change records where the requester is the caller from an incident record, create the condition `[Requested by][is][action->incident->Caller->Sys ID]` where incident is an input variable for an incident record.

### Max Results

Maximum number of results returned.

---

**Example**

### 1. Look Up Records step

<table>
<thead>
<tr>
<th>Table</th>
<th>Incident [incident]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conditions</td>
<td>All of these conditions must be met</td>
</tr>
<tr>
<td>Assigned to</td>
<td>is Bow Ruggeri</td>
</tr>
<tr>
<td>State</td>
<td>is New</td>
</tr>
<tr>
<td>Max Results</td>
<td>1000</td>
</tr>
</tbody>
</table>

**Notification step**

Trigger a notification as a step within an action by selecting a record (such as an incident, change request, problem, or user record) to trigger a notification and defining the associated notification.

*Notifications* on page 596 is a platform feature. Before triggering a notification as an action step in Flow Designer, ensure that the notification is set up for use in the platform.

- When you *create or update the notification*, set the Send when field in the When to send tab of the Notification form to Triggered.
- Verify that your users have an active primary email channel and that all their notifications are active.
Roles and availability

- Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Drag-and-drop an input record or a record from a previous step. This is the record that will trigger a notification. Some notifications are not associated with a specific record or table, such as the Passwords Require Updating notification. If configuring such a notification, leave this field blank.</td>
</tr>
<tr>
<td>Table name</td>
<td>Read-only. Set to the table of the triggering record.</td>
</tr>
<tr>
<td>Notification</td>
<td>Select the notification to be triggered. The notifications that can be selected are associated with the table of the specified record. If no record was selected, you can select a notification that does not have an associated record or table. To create notifications, see Create an email notification.</td>
</tr>
</tbody>
</table>

Example

1. Notification step

PowerShell step

Run PowerShell scripts on remote machines from your ServiceNow instance through a MID Server.

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications. ServiceNow supports PowerShell 2.0 and above. PowerShell 3.0 does not support Windows 2003 Server.

Note: PowerShell step is not available on the base system and requires a separate IntegrationHub subscription. After the IntegrationHub plugin is activated, the step is visible under Integrations.
### Roles and availability

- Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Type of connection to use.</td>
</tr>
<tr>
<td></td>
<td>- Define Connection Inline: Define connection information within the action step.</td>
</tr>
<tr>
<td></td>
<td>- Use Connection Alias: Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you do not have to update your custom action.</td>
</tr>
<tr>
<td></td>
<td>To learn more about connections and credentials, see credentials, connections, and aliases.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Specify the Connection &amp; Credential alias record the system uses to run the action step. Requires a flow designer or admin to create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you do not have to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is only visible when the Connection is Use Connection Alias.</td>
</tr>
<tr>
<td>Credential Alias</td>
<td>Specify the credential alias the system uses to run the action step. Requires a flow designer or admin to create or select an associated Credential record. Using an alias eliminates the need to configure multiple credentials when using an action in multiple environments. Likewise, if the credential information changes, you do not have to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is only visible when the Connection is Define Connection Inline.</td>
</tr>
<tr>
<td>Host</td>
<td>Specify the fully-qualified domain name of the target host where the system runs the action step. For example, host.domain.com.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is only visible when the Connection is Define Connection Inline.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Port</td>
<td>Specify the communications port on which the target host listens for connections. For example, 5985. Leave blank to use the default port. <strong>Note:</strong> This field is only visible when the Connection is Define Connection Inline.</td>
</tr>
<tr>
<td>MID Application</td>
<td>Specify the application the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected application. <strong>Note:</strong> This field is only visible when the Connection is Define Connection Inline.</td>
</tr>
<tr>
<td>Capabilities</td>
<td>Specify the capabilities the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected capabilities. <strong>Note:</strong> This field is only visible when the Connection is Define Connection Inline.</td>
</tr>
<tr>
<td>Remoting Type</td>
<td>The location where the PowerShell script runs such as the MID or a remote server.</td>
</tr>
<tr>
<td></td>
<td>• Explicit Remoting (Most Common): Establish a connection with and run the script on a remote server.</td>
</tr>
<tr>
<td></td>
<td>• Implicit Remoting (Advanced): Run a script on a MID Server while importing necessary modules from a remote server. If selected, define the Remote name prefix and Modules to import fields. For optimal performance, only import modules necessary to the step. If blank, all available modules are imported from the server.</td>
</tr>
<tr>
<td></td>
<td>• Run on a MID Server or have your script establish a remote session: Run a script directly on a MID Server, or define remoting specifications within the script. This value is the default. <strong>Note:</strong> To invoke a function in a PowerShell script command or PowerShell script file, the command must define the function param block if the function has input parameters. This requirement applies to explicit and implicit remoting. For additional information on param block, see Microsoft's documentation on Windows Powershell parameters at <a href="https://technet.microsoft.com/">https://technet.microsoft.com/</a>.</td>
</tr>
<tr>
<td>Remote name prefix</td>
<td>The file path, excluding file names, to the modules to load from the remote server. <strong>Note:</strong> This field is only visible when the Remoting Type is Implicit Remoting (Advanced).</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>

<td>Modules to import</td>
<td>The comma-separated list of modules to import from the remote server at the defined file path.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>This field is only visible when the Remoting Type is Explicit Remoting (Most Common) or Implicit Remoting (Advanced).</td>
</tr>
<tr>
<td>Script type</td>
<td>The type of script to run on the PowerShell host.</td>
</tr>
<tr>
<td>• Inline script</td>
<td>Enter the script to run in the Command field of the step.</td>
</tr>
<tr>
<td>• MID Server Script File</td>
<td>Select the PowerShell script to run from the MID Server Script Files [ecc_agent_script_file] table. This is the default value and separates scripting logic from the action, enabling you to update the script without having to modify and redeploy the action.</td>
</tr>
<tr>
<td>MID Server Script</td>
<td>Pre-defined PowerShell script from the MID Server Script Files table [ecc_agent_script_file].</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>This field is only available if the Script type is MID Server Script File.</td>
</tr>
<tr>
<td>Script path</td>
<td>Read-only path to the selected MID Server script.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>This field is only visible when the Script type is MID Server Script File.</td>
</tr>
<tr>
<td>Input variables</td>
<td>The optional name-value pairs that represent the values of PowerShell script variables. You can use action inputs and data from other steps within the PowerShell script. Define the following fields for each variable:</td>
</tr>
<tr>
<td>• Name: The name of the script variable to pass a value to. The name cannot match a reserved or prohibited PowerShell variable. Some variable names are reserved for internal processing and should not be used as input variables. See Reserved variables in PowerShell scripting variables.</td>
<td></td>
</tr>
<tr>
<td>• Type: The type of PowerShell variable. Select plain text, encrypted, or boolean. If encrypted is selected, the value appears in plain text in this field and is only encrypted when it passes to the ECC Queue.</td>
<td></td>
</tr>
<tr>
<td>• Value: The value to map to the variable. Manually enter a value, or drag a data pill into the field.</td>
<td></td>
</tr>
<tr>
<td>Command</td>
<td>The inline PowerShell script to run on the target host.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>This field is only visible when the Script type is Inline script.</td>
</tr>
</tbody>
</table>
PowerShell scripting variables

To access input variables from the Command field, you must call them using special syntax. The syntax you use depends on the value of a system property. If the Remoting Type is Run on a MID Server or have your script establish a remote session, some reserved variables are available in addition to input variables.

Input variable syntax

By default, prefix variable names with a $ character. For example, if an input variable is named message, use $message to access the variable in script.

If the mid.powershell.command.script.parameter_passing parameter is set to false, prefix the variable name with $env:SNC_. For example, if an input variable is named message, use $env:SNC_message to access the variable in script. To learn more about the mid.powershell.command.script.parameter_passing parameter, see MID Server parameters on page 1648.

Reserved variables

When the Remoting Type is Run on a MID Server or have your script establish a remote session, the following variables are available for use in script. Reserved variables cannot be used as custom input variable names.

<table>
<thead>
<tr>
<th>Reserved variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$computer</td>
<td>Host IP address defined in the Connection alias record.</td>
</tr>
<tr>
<td>$cred</td>
<td>Credential object that contains the credentials defined in the connection record. Use this variable with any PowerShell cmdlet that supports the credential parameter. For example, New-PSSession -credential $cred.</td>
</tr>
<tr>
<td>$log_info</td>
<td>If the mid.property.powershell.log_info property is set to true, adds logging information to a PowerShell script.</td>
</tr>
</tbody>
</table>

The following variable names are reserved for internal processing and should not be used as input variables.

- script
- useCred
- isMid
- isDiscovery
REST step

Send an outbound REST web service request to an external system.

**Note:** REST step is not available on the base system and requires a separate IntegrationHub subscription. After the IntegrationHub plugin is activated, the step is visible under Integrations.

*Outbound REST web service* is a platform feature that allows you to retrieve, create, update, or delete data on a web services server that supports the REST architecture.

**Roles and availability**

- Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>The type of connection to use.</td>
</tr>
<tr>
<td></td>
<td>• Define Connection Inline: Define connection information within the action step.</td>
</tr>
<tr>
<td></td>
<td>• Use Connection Alias: Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you do not have to update your custom action.</td>
</tr>
</tbody>
</table>

To learn more about connections and credentials, see credentials, connections, and aliases.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Connection Alias | Specify the Connection & Credential alias record the system uses to run the action step. Requires a flow designer or admin to create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you do not have to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases.  

**Note:** This field is only visible when the Connection is Use Connection Alias.                                                                                                                                                                                                                                                                                                                                                     |
| Credential Alias | Specify the credential alias the system uses to run the action step. Requires a flow designer or admin to create or select an associated Credential record. Using an alias eliminates the need to configure multiple credentials when using an action in multiple environments. Likewise, if the credential information changes, you do not have to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases.  

**Note:** This field is only visible when the Connection is Define Connection Inline.                                                                                                                                                                                                                                                                                                                                                     |
| Use MID | The option to use a MID Server to run the REST step. Select this option to display the MID Application and Capabilities fields.                                                                                                                                                                                                                                                                                                                                                     |
| Base URL | The base URL for the REST request. If Use Connection Alias is selected, this field is read-only and displays the base URL associated with alias. If Define Connection Inline is selected, enter a base URL for the connection.                                                                                                                                                                                                                                                                                                                                                     |
| MID Application | Specify the capabilities the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected capabilities.  

**Note:** This field is only visible when Use MID is enabled.                                                                                                                                                                                                                                                                                                                                                     |
| Capabilities | Specify the capabilities the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected capabilities.  

**Note:** This field is only visible when Use MID is enabled.                                                                                                                                                                                                                                                                                                                                                     |
| Resource Path | Specify the path for the resource.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| HTTP Method | Specify the HTTP method to process the request.  

- GET  
- POST  
- PUT  
- PATCH  
- DELETE

</tbody>
</table>
### Field Table

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Save As Attachment</td>
<td>Specify whether to save the response as a record in the Attachment [sys_attachment] table.</td>
</tr>
<tr>
<td>Attachment File Name</td>
<td>Specify the name of the attachment created by the REST response. For example, rest-response.txt.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only visible when Save Response As Attachment is enabled.</td>
</tr>
<tr>
<td>Attachment File Record</td>
<td>Specify the target record to which the attachment is associated. Must be a data pill of type Record. For example, a specific incident record.</td>
</tr>
<tr>
<td></td>
<td>You can look up this record in a prior step or define it as an input variable. The flow execution details display the Sys ID of the associated record.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only visible when Save Response As Attachment is enabled.</td>
</tr>
</tbody>
</table>

### REST Response

By default, the system limits the size of REST responses that are not saved as attachments to 5 MB. Direct REST responses that exceed this limit generate an error. To support larger response sizes, either save the response as an attachment or increase the response size limit with the `glide.pf.rest.response_payload_max_size` system property. This system property supports a maximum value of 10 MB.

### Script step

Add custom JavaScript to execute within a reusable action. While most core actions and steps fit common use cases, you can build a Script step to execute behavior not satisfied by the core steps.

**Note**: The IntegrationHub plugin further enhances the Script step to enable you to create integrations with external systems.

### Roles and availability

- Available as an Action Designer action step. Subject matter experts use the `action_designer` role to create a custom action with one or more action steps.

### Fields

The JavaScript step includes separate input and output variables that enable you to map JavaScript data to Flow Designer data. By defining input and output variables within the step, you can define what Flow Designer data is available within your script, and which scripting variables are available to other steps in your action.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required Runtime</td>
<td>The runtime environment required to support the script. Choices include:</td>
</tr>
<tr>
<td></td>
<td>• Instance: The action step runs the script from instance. Select this option when the script needs access to the ServiceNow API or instance data. This is the default value.</td>
</tr>
<tr>
<td></td>
<td>• MID: The action step runs the script from the MID Server. Select this option when the script needs access to MID Server script files and APIs. Selecting this option displays the Select MID Server Using field.</td>
</tr>
<tr>
<td></td>
<td>• Vanilla (Core JavaScript): The action step runs the script from either the instance or MID Server. Select this option when the script only needs the core JavaScript APIs and not the ServiceNow API or instance data.</td>
</tr>
<tr>
<td></td>
<td>The runtime you select determines the JavaScript objects and methods displayed in the Context-sensitive help.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>This field is only visible when IntegrationHub is activated.</td>
</tr>
<tr>
<td>Select MID Server Using</td>
<td>Specify the MID Server selection process to use. Choices include:</td>
</tr>
<tr>
<td></td>
<td>• Any MID. The system runs the action step from any available MID Server.</td>
</tr>
<tr>
<td></td>
<td>• Use Connection Alias. The system runs the action using the connection alias you specify. Selecting this option displays the Connection Alias field.</td>
</tr>
<tr>
<td></td>
<td>• Use Inline Selection. The system runs the action using the connection details you specify in the action. Selecting this option displays the Host, MID Application, and Capabilities fields.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>This field is only visible when IntegrationHub is activated, and you select MID from Required Runtime.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Specify the Connection &amp; Credential alias record the system uses to run the action step. Requires a flow designer or admin to create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you do not have to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. Only aliases of connection type Basic are supported.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>This field is only visible when IntegrationHub is activated, and you select Use Connection Alias from Select MID Server Using.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Host</td>
<td>The fully-qualified domain name of the MID Server where the system runs the action step. For example, mid-server.domain.com.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is only visible when IntegrationHub is activated, and you select Use Inline Selection from Select MID Server Using.</td>
</tr>
<tr>
<td>MID Application</td>
<td>Specify the application the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected application.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is only visible when IntegrationHub is activated, and you select Use Inline Selection from Select MID Server Using.</td>
</tr>
<tr>
<td>Capabilities</td>
<td>Specify the capabilities the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected capabilities.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is only visible when IntegrationHub is activated, and you select Use Inline Selection from Select MID Server Using.</td>
</tr>
<tr>
<td>Input variables</td>
<td>Name-value pairs that represent data from the action, enabling you to use action inputs and data from other steps within a script.</td>
</tr>
<tr>
<td>Script</td>
<td>Script that executes within the action. To access input and output variables in your script, use the global objects inputs and outputs. For example, inputs.myVariable.</td>
</tr>
<tr>
<td></td>
<td>Scripts in Flow Designer execute either on the instance or from a MID Server.</td>
</tr>
<tr>
<td></td>
<td>For available classes and methods, see the JavaScript API Context-sensitive help or the JavaScript API reference.</td>
</tr>
<tr>
<td>Output variables</td>
<td>Map JavaScript output to Flow Designer data pills. Define output variables when you want other steps in the action to use the script output.</td>
</tr>
</tbody>
</table>

**Example**

This example builds a JSON payload that can be easily updated or changed and added to a subsequent REST step.

**Note:** REST step is not available on the base system and requires a separate IntegrationHub subscription.
By creating an output variable that represents the payload, you can drag the [Payload] data pill into the REST step Body field.

**Send Email step**

Send an email to specified users or groups as an action in a flow.

**Roles and availability**

- Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.
Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>To</td>
<td>The main recipients of the email. Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field, such as a User record. For example, if your action involves an incident record and you want to send an email to the group assigned to the incident, drag the [Assignment group] data pill from the data panel.</td>
</tr>
<tr>
<td>CC</td>
<td>Additional recipients copied on this email. Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field.</td>
</tr>
<tr>
<td>BCC</td>
<td>Additional recipients of this email, who are visible only to the sender (blind copied). Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field.</td>
</tr>
<tr>
<td>Subject</td>
<td>Subject of the email. You can enter text or drag-and-drop data pills into the field.</td>
</tr>
<tr>
<td>Body</td>
<td>The content of the message body. You can enter text or drag-and-drop data pills into the field.</td>
</tr>
</tbody>
</table>

Note: Flow Designer does not support the ${URI} parameter for creating a link to a record in the email message body. Instead, consider inserting the information from the record in the email body using data pills, or create a notification step.

Testing the email step

To verify that the email was generated when testing the action, review the email record in the Email [sys_email] table. The Headers field indicates whether the email was successfully generated. For example:

```
X-ServiceNow-Source:FlowDesigner-9ad2747b0b710300f4eb8bf637673a1e
Message-ID:<193756824.0.1508534586438@[10.0.66.70]>
X-ServiceNow-Generated:true
```

Update Record step

Update an existing record in a table. You can dynamically add and configure fields for the record, or use a template to set field values.
Roles and availability

• Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>The record to be updated. Drag-and-drop a record data pill or use the data pill picker to select a record.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only. Set to the table associated with the record.</td>
</tr>
<tr>
<td>Field Values</td>
<td>Set static or dynamic values of fields in the record. For example, to set the short description to a static value, select Short description and set the desired value. To add dynamic values, see Allow flow designers to dynamically set field values on page 1253.</td>
</tr>
</tbody>
</table>

Wait For Condition step

Pause the flow until the record value conditions are met.

Roles and availability

• Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Drag-and-drop an input record or a record from a previous step.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only. Set to the table associated with the record.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Conditions that the flow waits for. For example, if the condition is [State][is][Closed], the flow pauses until the condition is met. Once met, the flow moves on to the next step or action. Set static or dynamic conditions to filter records. To define a static condition applied each time the action runs, define the conditions with the condition builder. To enable flow designers to dynamically apply conditions, define an input of type Conditions and drag-and-drop the input data pill into the Conditions field.</td>
</tr>
</tbody>
</table>
Example

1. Wait For Condition step

<table>
<thead>
<tr>
<th>Record</th>
<th>action » incident x</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Incident [incident]</td>
</tr>
<tr>
<td>Conditions</td>
<td>All of these conditions must be met</td>
</tr>
<tr>
<td>State</td>
<td>is</td>
</tr>
</tbody>
</table>

Spokes

Add application-specific content to Flow Designer by installing spokes.

A *spoke* is a scoped application containing Flow Designer content dedicated to a particular application or record type. For example, the ITSM Spoke contains actions for managing Task records such as the Create Task action. Spokes are activated when their parent application is activated. For example, the ITSM Spoke is activated when the Incident, Problem, and Change applications are activated. Creating a spoke requires familiarity with application development as developers must add Flow Designer content to a scoped application.

**Table 452: Default spokes available**

<table>
<thead>
<tr>
<th>Spoke</th>
<th>Description</th>
<th>Plugin</th>
<th>Included with</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Benchmarks Spoke</strong> on page 1312</td>
<td>Provides read-only actions for the read-only Benchmark Recommendation Evaluator flow.</td>
<td>[com.sn_bm_client.spoke]</td>
<td><strong>Benchmarks</strong> application.</td>
</tr>
<tr>
<td><strong>Connect spoke</strong> on page 1312</td>
<td>Provides actions to automate the creation of conversations, to add users to a conversation, and to send messages to a conversation. These actions work with Connect API version 3 and later.</td>
<td>[com.glide.connect_v3plus.core.ah]</td>
<td><strong>Now Platform</strong></td>
</tr>
<tr>
<td>Spoke</td>

<tr>
<td><strong>ServiceNow eBonding spoke</strong> on page 1353</td>
<td>The ServiceNow eBonding Spoke provides some common integration design patterns through a common use case of synchronizing incidents across ServiceNow instances.</td>
<td>[com.glide.sn.ebonding.ah]</td>
</tr>
<tr>
<td><strong>REST step</strong> on page 1301</td>
<td>Enables the REST action step in Flow Designer.</td>
<td>[com.glide.hub.action_step.rest]</td>
</tr>
<tr>
<td><strong>Slack speak</strong> on page 1355</td>
<td>The Slack Speak provides actions that facilitate sending messages about incidents and problems to a channel.</td>
<td>[com.sn.slack.ah]</td>
</tr>
</tbody>
</table>

**Benchmarks Spoke**

Provides read-only actions for the read-only Benchmark Recommendation Evaluator flow.

The Benchmarks Spoke is designed for the Recommendations feature of the *Benchmarks* application.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Action Inputs</th>
<th>Action Outputs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Recommendation Activity Records</td>
<td>Create or update recommendation activity records.</td>
<td>• Recommendation</td>
<td>N/A</td>
</tr>
<tr>
<td>Delete Recommendation Evaluations</td>
<td>Delete recommendation evaluations for the specified month.</td>
<td>• Activity record</td>
<td>N/A</td>
</tr>
<tr>
<td>Evaluate Recommendation Condition</td>
<td>Evaluate the conditions and script specified for the recommendation.</td>
<td>• Record count</td>
<td>• Result, Score</td>
</tr>
<tr>
<td></td>
<td>• Threshold</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Direction</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Recommendation</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Activity record</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Connect spoke**

Provides actions to automate the creation of conversations, to add users to a conversation, and to send messages to a conversation. These actions work with Connect API version 3 and later.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Group Users to Task Conversation</td>
<td>Create a task conversation, and add all users of a group to it.</td>
</tr>
<tr>
<td>Add User to Task Conversation</td>
<td>Create a task conversation, and add a user to it.</td>
</tr>
<tr>
<td>Send Message to Task Conversation</td>
<td>Send a message to all users of a task conversation.</td>
</tr>
</tbody>
</table>
Customer Service Spoke

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get Case</td>
<td>Retrieve a case record using the case number. If multiple records are found, only the first record is returned.</td>
</tr>
<tr>
<td>Create Case</td>
<td>Create a case using one or more attributes. This action mimics the structure of the Case table (sn_customerservice_case) and exposes the fields present on the Case table.</td>
</tr>
<tr>
<td>Create Quick Case</td>
<td>Create a case using the customer, description, channel, priority, and category attributes.</td>
</tr>
<tr>
<td>Create Task on Case</td>
<td>Create a case task and optionally associate it with a case.</td>
</tr>
<tr>
<td>Update Case</td>
<td>Update a case by providing the case reference and the fields that you want to update.</td>
</tr>
<tr>
<td>Assign Case</td>
<td>Assign a case using matching rules. To use this action, you must first define the matching rules that match cases with resources (assignment groups, agents).</td>
</tr>
<tr>
<td>Escalate Case</td>
<td>Request case escalation. This action does not automatically approve escalation. Approval is based on the selected escalation template.</td>
</tr>
<tr>
<td>Escalate Account</td>
<td>Request account escalation. This action does not automatically approve escalation. Approval is based on the selected escalation template.</td>
</tr>
<tr>
<td>Add Work Note to Task</td>
<td>Add a work note to a task or to task extended objects (for example, a case or case task).</td>
</tr>
<tr>
<td>Add Comment to Task</td>
<td>Add a comment to a task or to task extended objects (for example, a case or case task).</td>
</tr>
</tbody>
</table>

Field Service Spoke

Provides actions for flow designers to use when creating Field Service Management business processes.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get Work Order</td>
<td>Retrieve a work order record using the work order number. If multiple records are found, only the first record is returned.</td>
</tr>
<tr>
<td>Create Work Order</td>
<td>Create a work order and optionally associate it with a case.</td>
</tr>
<tr>
<td>Update Work Order</td>
<td>Update a work order by providing the work order reference and the fields that you want to update.</td>
</tr>
<tr>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Get Work Order Task</td>
<td>Retrieve a work order task record using the work order task number. If multiple records are found, only the first record is returned.</td>
</tr>
<tr>
<td>Create Work Order Task</td>
<td>Create a work order task and optionally associate it with a work order.</td>
</tr>
<tr>
<td>Update Work Order Task</td>
<td>Update a work order task by providing the work order task reference and the fields that you want to update.</td>
</tr>
<tr>
<td>Add Work Note to Task</td>
<td>Add a work note to a task or to task extended objects (for example, a work order or work order task).</td>
</tr>
</tbody>
</table>

**ITSM spoke**

Provides flow and actions associated with ITSM. Requires the ITSM application suite.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Comment</td>
<td>Adds a comment to a task record.</td>
</tr>
<tr>
<td>Add Worknote</td>
<td>Adds a work note to a task record.</td>
</tr>
<tr>
<td>Assign Incident to CI Support Group</td>
<td>Updates an incident record to assign it to the CI Support Group.</td>
</tr>
<tr>
<td>Create Catalog Task on Request</td>
<td>Creates a Catalog Task record from a Request record.</td>
</tr>
<tr>
<td>Create Catalog Task on Request Item</td>
<td>Creates a Catalog Task record from a Request Item record.</td>
</tr>
<tr>
<td>Create Change Task on Change Request</td>
<td>Creates a Change Task record from a Change Request record.</td>
</tr>
<tr>
<td>Create Emergency Change Request</td>
<td>Creates a Change Request record of type Emergency.</td>
</tr>
<tr>
<td>Create Emergency Request from Incident</td>
<td>Creates a Change Request record of type Emergency from an Incident record.</td>
</tr>
<tr>
<td>Create Incident</td>
<td>Creates an Incident record.</td>
</tr>
<tr>
<td>Create Incident Task on Incident</td>
<td>Creates an Incident Task record from an Incident record.</td>
</tr>
<tr>
<td>Create Normal Change Request from Incident</td>
<td>Creates a Change Request record of type Normal from an Incident record.</td>
</tr>
<tr>
<td>Create Problem from Incident</td>
<td>Creates a Problem record from an Incident record.</td>
</tr>
<tr>
<td>Create Request</td>
<td>Creates a Request record.</td>
</tr>
<tr>
<td>Create Standard Change Request</td>
<td>Creates a Change Request record of type Standard.</td>
</tr>
<tr>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Create Task  
[Core Action] | Creates a child task record for a Task table record. For example, creates an Incident Task record for an Incident record. |
| Create Standard Change Request from Incident | Creates a Change Request record of type Standard from an Incident record. |
| Update Assignee | Updates the Assigned to field of a Task table record. |
| Update Assignment Group | Updates the Assignment Group field of a Task table record. |

**Security Operations spoke**

**Security Incident Response flow templates**

The Security Incident Response flow templates are created using the *Flow Designer* on page 1205.

*Note:* Each of the flows is triggered when the Category in a security incident is set or changed.

<table>
<thead>
<tr>
<th>Template</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Security Incident Confidential Data Exposure flow template</td>
<td>Perform a series of tasks designed to handle the exposure of sensitive data.</td>
</tr>
<tr>
<td>Security Incident Denial of Service flow template</td>
<td>Perform a series of tasks designed to handle Denial of Service (DOS) attacks.</td>
</tr>
<tr>
<td>Security Incident Lost Equipment flow template</td>
<td>Perform a series of tasks designed to handle lost equipment.</td>
</tr>
<tr>
<td>Security Incident Malicious Software flow template</td>
<td>Perform a series of tasks designed to handle malicious software on your network.</td>
</tr>
<tr>
<td>Security Incident Phishing flow template</td>
<td>Perform a series of tasks designed to handle spear phishing emails on your network.</td>
</tr>
<tr>
<td>Security Incident Policy Violation flow template</td>
<td>Perform a series of tasks designed to handle security policy violations.</td>
</tr>
<tr>
<td>Security Incident Reconnaissance flow template</td>
<td>Perform a series of tasks designed to handle reconnaissance on your network.</td>
</tr>
<tr>
<td>Security Incident Rogue Server or Service flow template</td>
<td>Perform a series of tasks designed to handle activity from rogue servers or services affecting your network.</td>
</tr>
<tr>
<td>Security Incident Spam flow template</td>
<td>Perform a series of tasks designed to handle email spam on your network.</td>
</tr>
<tr>
<td>Security Incident Unauthorized Access flow template</td>
<td>Perform a series of tasks designed to handle unauthorized access to your network.</td>
</tr>
<tr>
<td>Template</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Security Incident Web/BBS Defacement flow template</td>
<td>Perform a series of tasks designed to handle vandalism directed against one of your BBS or web sites.</td>
</tr>
</tbody>
</table>

**Visual Task Board (VTB) Spoke**

Provides VTB actions for flow designers to manage the boards, lanes, cards, board members, and assignees.

### Table 453: Board Management Actions

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Action Inputs</th>
<th>Action Outputs</th>
</tr>
</thead>
</table>
| Create Freeform VTB Action    | Creates a Freeform VTB for any task type. The default lanes are: Todo, Doing, and Done. These lanes can be modified with actions: Add Lane, Rename Lane, Reorder Lane, and Delete Lane | • Name  
• Board Owner  
• Default view  
• Label visibility  
• Picker visibility  
• Background color | • Board record |
| Create Flexible VTB Action    | Creates a Flexible VTB bound to a single Task table. The default lanes are: Todo, Doing, and Done. These lanes can be modified with actions: Add Lane, Rename Lane, Reorder Lane, and Delete Lane | • Name  
• Task table  
• Filter  
• Board Owner  
• Default view  
• Label visibility  
• Picker visibility  
• Background color | • Board record |
| Create Guided VTB Action      | Creates a data-driven VTB bound to a single Task table along with the fields the lanes are derived. | • Name  
• Task table  
• Land field  
• Filter  
• Board Owner  
• Default view  
• Label visibility  
• Picker visibility  
• Background color | • Board record |
| Add VTB Member Action         | Add a user to a VTB. Only members of the VTB can access the board, Any VTB member can add other members. | • Board record  
• User record | N/A |
<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Action Inputs</th>
<th>Action Outputs</th>
</tr>
</thead>
</table>
| Remove VTB Member      | Remove a user from a VTB. Only members of a VTB can access the board. Any VTB member can remove other members. | • Board record  
• User record                               | N/A                                                        |

Table 454: Lane Management Actions

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Action Steps</th>
<th>State</th>
</tr>
</thead>
</table>
| Add VTB lane      | Add a lane to a Freeform or Flexible VTB. This action does not apply to Guided boards, which are constrained to fixed lanes based on fields configured.                                                           | • Board record  
• Lane name                                                                 | VTB lane record   |
| Rename VTB Lane   | Rename an existing lane on a Freeform or Flexible VTB.                                                                                                                                                       | • Lane record  
• New lane name                                                               | N/A              |
| Reorder VTB Lane  | Reorder lanes on any VTB.                                                                                                                                                                                     | • Lane record  
• New lane name                                                               | N/A              |
| Delete VTB Lane   | Delete an existing lane from a Freeform or Flexible VTB.                                                                                                                                                     | • Lane record                                                               | N/A              |

Table 455: Card Management Actions

<table>
<thead>
<tr>
<th>Flow/Action</th>
<th>Description</th>
<th>Action Steps</th>
<th>State</th>
</tr>
</thead>
</table>
| Create VTB Card      | Create a VTB card on a Freeform board for a task.                                                                                             | • Lane record  
• Task record                                                             | Card record     |
| Assign VTB Card      | Assign a user to a VTB card.                                                                                                                   | • Card record  
• User record                                                             | N/A              |
<table>
<thead>
<tr>
<th>Flow/Action</th>
<th>Description</th>
<th>Action Steps</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move VTB Card</td>
<td>Move a VTB card from one lane to another lane.</td>
<td>• Card record&lt;br&gt;• Lane record</td>
<td>N/A</td>
</tr>
<tr>
<td></td>
<td>Note: For Flexible boards, use the Update Record action to change the state of the underlying task. For Guided boards, this action changes the field on the task associated with that card.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Remove Assignee from VTB Card</td>
<td>Remove an assignee from a card.</td>
<td>• Card record</td>
<td>N/A</td>
</tr>
</tbody>
</table>

**Flow execution details**

View runtime information about a flow directly from the design environment such as the current state, actions run, and values produced. Open related records from embedded Now Platform editors or in a new tab.

Each time a flow runs, the system stores information about the configuration and runtime values produced, which process analysts can view from the Flow Designer design environment Flow Executions tab. Select a flow execution to open its associated execution details page.

To disable the flow execution details, add the com.snc.process_flow.reporting.enabled system property to the System Properties [sys_properties] table and set the value to false. If disabled, details are not saved for actions in the flow. However, the flow context record and related log messages are available. If a flow runs while the property is false, execution details are never available for the flow, even if the property value changes. If a flow runs while the property is true, execution details are always available for the flow, even if the property value changes.
### Figure 280: Sample execution details of the VTB Sample Flow

Each execution details page displays:
• Calling source
• Flow state
• Related record options
• Flow Statistics

**Calling source**

The calling source lists what started a flow or subflow.

<table>
<thead>
<tr>
<th>Source</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flow Designer Test</td>
<td>The flow started because a user selected the Test option from the Flow Designer interface. The flow trigger conditions were ignored.</td>
</tr>
<tr>
<td>CRUD Trigger</td>
<td>The flow started when the record-based trigger conditions were met.</td>
</tr>
<tr>
<td>Scheduled Trigger</td>
<td>The flow started when the schedule-based trigger conditions were met.</td>
</tr>
<tr>
<td>Metric Trigger</td>
<td>The flow started when the MetricBase trigger conditions of a MetricBase application on page 1565 were met.</td>
</tr>
<tr>
<td>Service Catalog Trigger</td>
<td>The flow started when a Service Catalog item was requested.</td>
</tr>
<tr>
<td>Script</td>
<td>The flow started from an API method call in a script, such as a business rule.</td>
</tr>
<tr>
<td>Background Script</td>
<td>The flow started from an API method call in the Scripts - Background module.</td>
</tr>
</tbody>
</table>

**Flow state**

All active flows are in one of these states.

**Completed**  
The flow successfully ran all actions. The flow statistics display configuration and run-time details for each action.

**Waiting**  
The flow paused on an action that is waiting for some condition to be met before continuing. The flow statistics display configuration and run-time details for completed actions and configuration details for any actions waiting for a condition to be met. Flows in the Waiting state display a Cancel Flow UI action in the header.

**Error**  
The flow stopped with an error. The flow statistics display configuration and run-time details for completed actions and configuration details for the action that produced the error. Flows in the Error state display a Go to error UI action in the header.
### Related record options

From the Execution details page, you can access records related to the current flow.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Refresh Flow Data</td>
<td>Use this option to update flow runtime data.</td>
</tr>
<tr>
<td>Open Flow</td>
<td>Use this option to make configuration changes and publish a new instance of the flow. Changing the flow configuration does not change any currently active flow.</td>
</tr>
<tr>
<td>Open Context Record</td>
<td>Use this option to view the flow state, run duration, and related log entries from a standard form view. This option opens the context record in a new tab.</td>
</tr>
<tr>
<td>Open Flow Logs</td>
<td>Use this link to view detailed log information about each action. This link opens the log entries list in a new tab.</td>
</tr>
<tr>
<td>Open Current Record</td>
<td>For flows that have a record-based trigger, use this link to view the triggering record in a pop-up window.</td>
</tr>
<tr>
<td>Open Action</td>
<td>Use this link to make configuration changes and publish a new instance of the action. Changing the action configuration does not change any currently active flow. This link is unavailable for ServiceNow-provided core actions.</td>
</tr>
</tbody>
</table>

### Flow statistics

Use flow statistics to see configuration details and run-time values for each flow component. Clicking a trigger or action expands the row and displays configuration and run-time details about it.
The following types of execution details are available.

**Integration Metadata**  
Use Integration Metadata to view transaction data such as connection and credential used, target host, and payload size. Integration Metadata only displays for integration steps and requires a separate IntegrationHub subscription. For more information, see Integration steps on page 1357.

**Configuration Details**  
Use the list of input variables to identify any configuration errors with the action. Each variable has its own row displaying its name, data type, configuration settings, and run-time value. The configuration settings display dynamic values as pills. The run-time values display generated records as a link.

**Output Data**  
Use the list of output variables to identify any configuration errors with the action.

**Logs**  
Use the log entries to identify potential processing or performance issues. Each log entry has its own row displaying the creation date, log level, and log message. If the action does not generate any logs, the statistics displays the string No Logs.

**Steps**  
Use the list of steps to identify any configuration errors with the action. Each step has its own row displaying the variable name, data type, configuration settings, and run-time value. Core actions do not display steps because users cannot change their configuration.

Change the com.snc.process_flow.reporting.serialized.val_size_limit system property to truncate runtime values in the flow execution details step configuration. To learn more, see Flow Designer system properties on page 1235.

**Run duration**  
Use the run duration to identify potential processing or performance issues. Each action and step displays the duration in milliseconds. System quota rules prevent any action from running longer than a minute.

**Embedded text viewer**

Flow Designer displays large text-based configuration and runtime output records such as email output, XML payloads, or script steps using an embedded text viewer. The embedded text viewer can format text as HTML, plain text, or color-coded JavaScript. For script steps, the text viewer highlights code lines containing errors.
(function execute(inputs, outputs) {
    var vtbLane = new GlideRecord('vtb_lane');
    vtbLane.addQuery('board', inputs.vtbBoard.sys_id);
    vtbLane.query();
    vtbLane.next();

    var vtbCard = new GlideRecord('vtb_card');
    vtbCard.task = inputs.task.sys_id;
    vtbCard.board = inputs.vtbBoard.sys_id;
    vtbCard.lane = vtbLane.sys_id;
    vtbCard.insert();

    outputs.vtbCard = vtbCard;
})(inputs, outputs);
**Viewing results for each item in flow logic**

Flow Designer displays a selector control to view the configuration and run-time results for each item processed by flow logic. Select a record number to see its configuration and run-time details.

Flow administration modules

Identify and troubleshoot potential issues by reviewing flow executions, the event queue, and the operations dashboard.

Flow Designer provides administrators and flow operators these modules to manage flows.

**Today's Executions**
Displays a list of flow context records for flows run today. Use this information to identify flows run today.

**Active flows**
Displays a list of flow context records for running flows where the State is Waiting. Use this information to identify flows that are waiting for a trigger or condition to continue.

**Event Queue**
Displays a filtered list of event records where the Queue is flow_engine and the State is Ready. Use this information to identify flows that are waiting on event processing.

**Operations Dashboard**
Displays a responsive dashboard containing a count of flows run and the average flow runtime. View statistics for today or over the last 30 days. Use this information to determine the health and performance of flow execution.

**Usage Overview**
Displays transaction counts between your instance and third-party systems. The Usage Overview is not available on the base system and requires a separate IntegrationHub subscription.

IntegrationHub

Automate integration tasks using ServiceNow-built components for Flow Designer, or develop custom integrations. Requires a separate subscription.

Capabilities

IntegrationHub enables execution of third-party APIs as a part of a flow when a specific event occurs in ServiceNow. These integrations, referred to as spokes, are easy to configure and enable you to quickly add powerful actions without the need to write a script. For example, you can post a message and incident details in a Slack channel when a high priority incident is created.

IntegrationHub provides the following functionality:

**Spokes for base system integrations**
Using IntegrationHub actions in Flow Designer, you can:

- Post messages and ServiceNow incident, problem, and change record details to HipChat, Slack, or Microsoft Teams communications channels.
Create custom integrations

Build custom integrations with Action Designer using a REST step on page 1301 or a Script step on page 1304.

Automate the administration of servers and applications in your network

Use custom actions to delegate Flow Designer processes to a MID Server on page 1579 in your network. For example, actions that use the PowerShell step on page 1296 or REST step on page 1301.

IntegrationHub takes advantage of aliases to manage connection information and credentials when integrating with external systems. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. IntegrationHub only requires an alias, which then resolves to use the correct credentials and connection information during runtime. Learn more about Introduction to credentials, connections, and aliases on page 1010.

Benefits

IntegrationHub provides process owners and developers these benefits.

- Consolidates multiple Now Platform automation capabilities into a single environment so process owners and developers can build and visualize business processes and integrations from a single interface.
- Extends Flow Designer content to integrate business processes with external systems.
- Promotes business process automation by enabling subject matter experts to develop and share spokes with flow designers.
- Provides natural-language-descriptions of integration logic to help non-technical users understand triggers, actions, inputs, and outputs.

Development process

When developing a custom integration, develop all actions for the integration within a scoped application. When deployed to a target instance, these actions are grouped as a spoke in Flow Designer. Brand the spoke by adding a custom icon to the application record. To learn more about application development, see Applications.

When developing spokes, flow and action designers typically perform these application development tasks.

1. Create a scoped application on a development instance to build spokes.
2. Publish a test version of the scoped application to the application repository.
3. Deploy the scoped application to a test instance from the application repository.
4. Test the scoped application on the test instance.
5. When working as expected, publish the scoped application in one of the following ways.
   • Publish to the application repository for deployment on production instances.
   • Publish to the ServiceNow Store as an application that customers can request for their environments.
- Publish to ServiceNow Share to provide content to other customers in the ServiceNow community.

Review Flow Designer design considerations in the *Architecture Overview* on page 1208.

**Request IntegrationHub**

Flow Designer is a Now Platform feature that enables you to automate processes within a single ServiceNow instance. Use base system actions or Action Designer steps to manipulate records, send emails, trigger notifications, and expose scripts as code-less components. Create integrations with external systems by requesting IntegrationHub. IntegrationHub enables base system components in Action Designer, such as the Script step, to call external systems using integration APIs and activates protocol steps like REST.

Role required: none

The ServiceNow IntegrationHub Installer plugin (com.glide.hub.integrations) requires a separate subscription and must be activated by ServiceNow personnel. This plugin includes demo data and activates related plugins if they are not already active.

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>

</tr>
</tbody>
</table>
To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and sub-production instances, generally within a few days.

If you do not have an account manager, decide to delay activation after purchase, or want to evaluate the product on a sub-production instance without charge, follow these steps.

1. In the HI Service Portal, click Service Requests Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.

| Reason/Comments | Provide any information that would be helpful for the ServiceNow personnel activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows. |

3. Click Submit.

**IntegrationHub available spokes**

Review the integration-specific flows and actions available to each spoke.

### HipChat spoke

The HipChat spoke provides actions which post messages and ServiceNow incident, problem, and change record details to a HipChat conversation.

### HipChat actions

The HipChat spoke is an available integration through IntegrationHub. You can specify the following HipChat actions within a flow:

**Table 457:**

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Post a Message</td>
<td>Send a message to a HipChat room. Specify the Room Notification URL, Auth Token, and Message to send.</td>
</tr>
<tr>
<td>Post Change Details</td>
<td>Send details about a ServiceNow change record to a HipChat room. Specify the Room Notification URL, Auth Token, and Change record to send.</td>
</tr>
<tr>
<td>Post Incident Details</td>
<td>Send details about a ServiceNow incident record to a HipChat room. Specify the Room Notification URL, Auth Token, and Incident record to send.</td>
</tr>
<tr>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Post Problem Details</td>
<td>Send details about a ServiceNow problem record to a HipChat room. Specify the Room Notification URL, Auth Token, and Problem record to send.</td>
</tr>
</tbody>
</table>

HipChat Inputs

The following inputs are common to the HipChat actions:

Table 458:

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Required] Room Notification URL</td>
<td>The HipChat notification REST API URL. Example: <a href="https://api.hipchat.com/v2/%7Broom">https://api.hipchat.com/v2/{room</a> name}/ah-test/notification</td>
</tr>
<tr>
<td>[Required] Auth Token</td>
<td>You need an access token to send notifications. Refer to the HipChat API access token guide for details.</td>
</tr>
<tr>
<td>[Optional] Additional Message</td>
<td>Add a message to the record details.</td>
</tr>
<tr>
<td>[Optional] Override Default Field</td>
<td>You can provide a comma-separated list of field names to send instead of the default fields. Default fields are Short Description, Category, State, Priority, and Assignment Group.</td>
</tr>
</tbody>
</table>

Example

You can add a HipChat Post Incident Details action to a flow which identifies high priority incidents and who they are assigned to.

![Flow Diagram]
Microsoft AD spoke

Create, delete, and manage objects in Microsoft Active Directory, such as users, groups, and computers. The AD spoke is an available integration through IntegrationHub. You can specify the following AD actions within a flow.

This spoke uses the AD Connection & Credential Alias record. To use these actions, you must create a Connection record and a Credential record and associate them with the AD Connection & Credential Alias record. To learn more about connections and credentials, see Introduction to credentials, connections, and aliases on page 1010.

To use these actions, your instance must have a MID Server set up and configured to use PowerShell. For more information about running actions on the MID Server, see Integration steps on page 1357. For information about the MID Server, see MID Server on page 1579.

Create Computer

Creates a Computer Account in Active Directory (AD).

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Computer Name</td>
<td>Name of the computer associated with the Computer Account. Must be unique in AD.</td>
</tr>
<tr>
<td>Description</td>
<td>Additional information about the Computer Account.</td>
</tr>
<tr>
<td>Organizational Unit</td>
<td>Organizational Unit (OU) the Computer Account will be created in.</td>
</tr>
<tr>
<td>Display Name</td>
<td>User-friendly name assigned to a computer.</td>
</tr>
<tr>
<td>DNS Host Name</td>
<td>Fully qualified domain name associated with the computer.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

Delete Computer

Deletes a computer from Active Directory (AD).

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Computer Name</td>
<td>Name of the computer to be deleted. If the computer does not exist in Active Directory, the Status output is set to Error.</td>
</tr>
</tbody>
</table>
### Disable Computer

Disables a computer account in Active Directory (AD).

**Table 463: Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Computer Name</td>
<td>Name of the computer to be disabled. If the computer does not exist in Active Directory, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

**Table 464: Outputs**

<table>
<thead>

</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

### Enable Computer

Enables a computer account in Active Directory (AD).

**Table 465: Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Computer Name</td>
<td>Name of the computer to be enabled. If the computer does not exist in Active Directory, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

**Table 466: Outputs**

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

### Get Computer OU

Gets the Organizational Unit (OU) of a Computer Account.
Table 467: Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Computer Name</td>
<td>Name of the computer to retrieve the OU for. If the computer does not exist in Active Directory, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

Table 468: Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>

<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in AD occurs.</td>
</tr>
<tr>
<td>Organizational Unit</td>
<td>OU associated with the Computer Name passed as input. Populated only when the query is successful.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Is Computer Enabled**

Checks the status of the specified computer account in Active Directory (AD).

Table 469: Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Computer Name</td>
<td>Name of the computer to check the status of. If the computer does not exist in Active Directory, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

Table 470: Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
<tr>
<td>Answer</td>
<td>True if the account is enabled; otherwise false.</td>
</tr>
</tbody>
</table>

**Move Computer to OU**

Changes the Organizational Unit (OU) of a Computer Account in Active Directory (AD).

Table 471: Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Computer Name</td>
<td>Computer to change the OU for. If the computer does not exist in Active Directory, the Status output is set to Error.</td>
</tr>
<tr>
<td>Input</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Organizational Unit</td>
<td>New OU to set for the computer. The OU input should be set to the Distinguished Name associated with the OU, not the Relative Distinguished Name (RDN). For example, OU=InnerMost,OU=Nested Parent,DC=corp,DC=ServiceNowADDomain,DC=com. If the OU does not exist in AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

**Table 472: Outputs**

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Add User to Group**

Adds an existing user to a group in Active Directory (AD).

**Table 473: Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Name</td>
<td>Name of the group to add the user to. If the specified Group Name does not exist in AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>User Name</td>
<td>Name of the user to add to the group. If the specified User Name does not exist in AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

**Table 474: Outputs**

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Create Group**

Creates a group in Active Directory (AD).

**Table 475: Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Name</td>
<td>Name of the group to create.</td>
</tr>
<tr>
<td>Description</td>
<td>Additional information about the group you are creating.</td>
</tr>
</tbody>
</table>
Organizational Unit

Organizational Unit (OU) the group will be created in. Use a relative path. For example, if the full OU path is OU=InnerMost,OU=Nested Parent,DC=corp,DC=ServiceNowADDomain,DC=com, the relative path is OU=InnerMost,OU=Nested Parent.

Group Type

Type of group in AD. Group types include:
- Global distribution group
- Domain local distribution group
- Universal distribution group
- Global security group
- Domain local security group
- Universal security group

Table 476: Outputs

<table>
<thead>

<tr>
<td>Answer</td>
<td>True if the account is enabled; otherwise false.</td>
</tr>
</tbody>
</table>

Unlock AD Account

Unlocks a user account in Active Directory (AD).

Table 495: Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Name</td>
<td>Name of the user to unlock the account for. If the specified User Name does not exist in AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>
Table 496: Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Update User Home Location**

Updates the Home Directory for a User in Active Directory (AD).

Table 497: Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Name</td>
<td>Name of the user to update the home directory for. If the specified User Name does not exist in AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>Home Directory</td>
<td>New directory location for the user.</td>
</tr>
</tbody>
</table>

Table 498: Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Create AD Object**

Creates an object of any type supported in Active Directory (AD).

Table 499: Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object Name</td>
<td>Name of the object to create. If the specified object exists in AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>Object Data</td>
<td>JSON object of attributes to apply to the object. If an unsupported attribute is included, the action fails and the Status output is set to Error. For example,{&quot;description&quot; : &quot;This group organizes all IT super admins&quot;}.</td>
</tr>
<tr>
<td>Organizational Unit</td>
<td>OU path to create the object in. Use a relative path. For example, if the full OU path is OU=InnerMost,OU=Nested Parent,DC=corp,DC=ServiceNowADDomain,DC=com, the relative path is OU=InnerMost,OU=Nested Parent.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of object to create. For example, Group, Computer, or User.</td>
</tr>
</tbody>
</table>
Table 500: Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Delete AD Object**

Deletes an object of any type from Active Directory (AD).

Table 501: Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object Name</td>
<td>Name of the object to delete. If the specified object does not exist in AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of object to delete. For example, Group, Computer, or User.</td>
</tr>
</tbody>
</table>

Table 502: Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Update AD Object OU**

Changes the Organizational Unit (OU) of an object in Active Directory (AD).

Table 503: Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object Name</td>
<td>Name of the object to change the OU for. If the specified object does not exist in AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>Organizational Unit</td>
<td>New OU to set for the object. Use the Distinguished Name associated with the OU, not the Relative Distinguished Name (RDN). For example, OU=InnerMost,OU=Nested Parent,DC=corp,DC=ServiceNowADDomain,DC=com.</td>
</tr>
</tbody>
</table>

Table 504: Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in AD occurs.</td>
</tr>
<tr>
<td>Output</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Update AD Object Expiration**

Update the account expiration date of an object in Active Directory (AD).

**Table 505: Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object Name</td>
<td>Name of the object to update expiration for. If the specified object does not exist in AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>Expiry Date</td>
<td>New expiration date to associate with the user account.</td>
</tr>
</tbody>
</table>

**Table 506: Outputs**

<table>
<thead>
<tr>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Microsoft Azure AD spoke**

Manage users, security groups, and office groups. Apply licenses and provision users in Office 365.

The Azure AD spoke is an available integration through IntegrationHub.

This spoke uses the Azure AD Connection & Credential Alias record. To use these actions, you must create a Connection record and a Credential record and associate them with the Azure AD Connection & Credential Alias record. To learn more about connections and credentials, see *Introduction to credentials, connections, and aliases* on page 1010.

These actions use REST calls, which can run on an instance or MID Server. To determine when to run REST from the instance or a MID Server, see the design considerations in *Integration steps* on page 1357. To learn more about the MID Server, see *MID Server* on page 1579.

**Add Owner To Group**

Adds an owner to an existing group in Azure AD.

**Table 507: Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>ID of the group to add an owner to. If the Group ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>Input</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>User ID</td>
<td>ID of the user to make owner of the group. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

Table 508: Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

Add User To Group

Adds an existing user to a group in Azure AD.

Table 509: Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>ID of the group to add a user to. If the Group ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>User ID</td>
<td>ID of the user to add to the group. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

</tr>
</tbody>
</table>

Create Office 365 Group

Creates an Office 365 Group in Azure AD.

Table 511: Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Name</td>
<td>Name to display in the address book for the group.</td>
</tr>
<tr>
<td>Group Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
<tr>
<td>Email Enable Distribution List</td>
<td>Group email address or distribution list associated with the group. By default set to true.</td>
</tr>
<tr>
<td>Description</td>
<td>Additional information about the group in Azure AD.</td>
</tr>
</tbody>
</table>
Table 512: Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Group ID</td>
<td>ID of group created in Azure AD. Only populated if Status is Success.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

Create Security Group

Create a Security Group in Azure AD.

Table 513: Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Name</td>
<td>Name to display in the address book for the group.</td>
</tr>
<tr>
<td>Group Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
<tr>
<td>Description</td>
<td>Additional information about the group in Azure AD.</td>
</tr>
</tbody>
</table>

Table 514: Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Group ID</td>
<td>ID of group created in Azure AD. Only populated if Status is Success.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

Look Up Group ID

Returns the first Group ID found based on provided search criteria.

Table 515: Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Mail ID</td>
<td>Group email address or distribution list associated with the group.</td>
</tr>
<tr>
<td>Display Name</td>
<td>Name to display in the address book for the group.</td>
</tr>
<tr>
<td>Group Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
</tbody>
</table>
Table 516: Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Group ID</td>
<td>First group found with matching criteria in Azure AD.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Look Up Group Membership**

Retrieves a list of groups for the given user as a JSON string.

Table 517: Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the users to retrieve the group for. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

Table 518: Outputs

<table>
<thead>
<tr>

<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
<tr>
<td>Groups List</td>
<td>List of groups in JSON format. For example, [{Group ID1, Group Name1}, {Group ID2, Group Name2}]. If the user is not part of any group, an empty string is returned.</td>
</tr>
<tr>
<td>Number of Groups Found</td>
<td>Total number of groups the user is a member of.</td>
</tr>
</tbody>
</table>

**Remove Owner From Group**

Removes the owner from a group in Azure AD.

Table 519: Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>ID of the group to remove the owner from. If the Group ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>User ID</td>
<td>ID of the user to remove as owner of the group. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>
### Remove User From Group

Removes an existing user from a group in Azure AD.

**Table 521: Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>ID of the group to remove the user from. If the Group ID does not exist in Azure AD, the Status output is set to Error.</td>

<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

### Assign User License

Assigns a license to an existing user in Azure AD and defines access to Office 365 services. For example, if the license includes access to Microsoft Exchange, the user is provisioned a mailbox and login rights.

**Table 523: Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the user to assign a license to. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>SKU ID</td>
<td>Licensing plan for your organization using the syntax <code>&lt;CompanyName&gt;:&lt;LicensingPlan&gt;</code>. If the SKU ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

**Table 524: Outputs**

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Output</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Remove User License**

Removes a license from a user in Azure AD.

**Table 525: Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the user to remove the license from. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>SKU ID</td>
<td>Licensing plan for your organization using the syntax <code>&lt;CompanyName&gt;:&lt;LicensingPlan&gt;</code>. If the SKU ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

**Table 526: Outputs**

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Delete User**

Deletes a user from Azure AD.

**Table 527: Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the user to delete. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

**Table 528: Outputs**

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Disable User**

Disables a user in Azure AD.
### Table 529: Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the user to disable. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

### Table 530: Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

### Enable User

Enables a user in Azure AD.

### Table 531: Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the user to enable. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

### Table 532: Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

### Look Up User ID

Returns the first User ID found based on the provided search criteria.

### Table 533: Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>First Name</td>
<td>First name of the user.</td>
</tr>
<tr>
<td>Last Name</td>
<td>Last name of the user.</td>
</tr>
<tr>
<td>Display Name</td>
<td>Name displayed in the address book for the user.</td>
</tr>
<tr>
<td>User Login ID</td>
<td>Login User ID is same as User Principal Name (UPN). For example, <a href="mailto:johndoe@snc.com">johndoe@snc.com</a>.</td>
</tr>
<tr>
<td>Input</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
</tbody>
</table>

**Table 534: Outputs**

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>User ID</td>
<td>First user found with matching criteria in Azure AD.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Update User**

Updates user properties in Azure AD with the provided details.

**Note:** Azure AD does not allow updating values to null. Null or empty values are discarded in Azure AD when passed as input.

**Table 535: Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Name</td>
<td>Name to display in the address book for the user.</td>
</tr>
<tr>
<td>Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
<tr>
<td>User Login ID</td>
<td>Login User ID is same as User Principal Name (UPN). For example, <a href="mailto:johndoe@snc.com">johndoe@snc.com</a>. This field is mandatory.</td>
</tr>
<tr>
<td>First Name</td>
<td>First name of the user.</td>
</tr>
<tr>
<td>Last Name</td>
<td>Last name of the user.</td>
</tr>
<tr>
<td>City</td>
<td>City of the user.</td>
</tr>
<tr>
<td>Country</td>
<td>Country of the user.</td>
</tr>
<tr>
<td>Department</td>
<td>Name of the department the user belongs to.</td>
</tr>
<tr>
<td>Mobile</td>
<td>Mobile phone number for the user.</td>
</tr>
<tr>
<td>Job Title</td>
<td>User job title.</td>
</tr>
<tr>
<td>Physical Delivery</td>
<td>Office location of the user.</td>
</tr>
<tr>
<td>Office Name</td>
<td></td>
</tr>
<tr>
<td>Postal Code</td>
<td>Postal code for the user.</td>
</tr>
<tr>
<td>Preferred Language</td>
<td>Preferred language for the user.</td>
</tr>
<tr>
<td>State</td>
<td>State for the user.</td>
</tr>
<tr>
<td>Street Address</td>
<td>Street address for the user.</td>
</tr>
</tbody>
</table>
**Input** | **Description**
---|---
Telephone Number | Telephone number for the user.
Usage Location | Some Microsoft services are not available in all locations. This property must be defined for the user in Azure AD before a license can be assigned to them.

**Table 536: Outputs**

| Output | Description |
---|---|
Status | Set to Success if the request succeeds or Error if a failure in Azure AD occurs. |
Error Message | Reason for the error. Populated only when an error occurs. |

**Microsoft Teams spoke**

The Microsoft Teams spoke provides actions which post messages and ServiceNow incident, problem, and change record details to Microsoft Teams channels.

**Microsoft Teams actions**

The Microsoft Teams spoke is an available integration through IntegrationHub. You can specify the following Microsoft Teams actions within a flow:

**Table 537:**

| Action | Description |
---|---|
Post a Message | Send a message to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL, Title, and Message to send. |
Post Change Details | Send details about a ServiceNow change record to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL and Change record to send. |
Post Incident Details | Send details about a ServiceNow incident record to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL and Incident record to send. |
Post Problem Details | Send details about a ServiceNow problem record to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL and Problem record to send. |

**Microsoft Teams Inputs**

The following inputs are common to the Microsoft Teams actions:
**Table 538:**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>[Required] Webhook URL</strong></td>
<td>The Microsoft Teams webhook for sending a message. Set up the webhook before configuring this action. Refer to the custom incoming webhook for Microsoft Teams documentation.</td>
</tr>
<tr>
<td><strong>[Optional] Title</strong></td>
<td>Title of the message.</td>
</tr>
<tr>
<td><strong>[Optional] Additional Message</strong></td>
<td>Add a message before the record details.</td>
</tr>
<tr>
<td><strong>[Optional] Override Default Fields</strong></td>
<td>You can provide a comma-separated list of field names to send instead of the default fields. Default fields are Short Description, Category, State, Priority, and Assignment Group.</td>
</tr>
<tr>
<td><strong>[Optional] Theme Color (Hex)</strong></td>
<td>Hex code value of color to highlight the message.</td>
</tr>
</tbody>
</table>

**Example**

You can add a Microsoft Teams Post Incident Details action to a flow which identifies newly created high priority incidents and a specified theme color.

![Flow diagram](image)

**ServiceNow eBonding spoke**

The ServiceNow eBonding spoke demonstrates some common integration design patterns through a common use case of synchronizing incidents across ServiceNow instances.
Base system eBonding actions

If you have multiple production instances in your environment, you might have a need to synchronize data across these instances. For example, one instance might manage internal applications (your source system) and another manages external customer facing applications (your target system). A common use case is an incident which initially opens on the source system, but it requires a correlated incident to be created and tracked on the target instance. The ServiceNow eBonding integration contains the following OOB actions to assist in creating the synchronization:

**Create Remote Incident action**

This action uses the source system incident details to create a new incident on the target instance. It passes the source incident number as the Correlation ID on the target system. It takes the target system incident number and updates the Correlation ID of the source system.

**Lookup Remote Incident action**

This action takes the remote incident number as input and retrieves more details about that incident, such as: short description, description, priority, etc.

**Update Remote Incident action**

This action uses the source incident details to update the remote incident with details from source instance. Look up of remote incident is performed using Correlation ID in source instance’s incident.

Credential and Connection information for eBonding

When building actions, you must decouple the connection and credential information from the action so there is a seamless transition from distinct production environments. This also makes it easier to share content and create content through the ServiceNow store.

As part of eBonding example, you can associate an OOB connection alias (sn_ebonding_ah.ServiceNow). Create an HTTP connection record and associate it with this alias. For credentials, ServiceNow web services supports a multitude of authentication mechanisms. Create a BasicAuth credential to start with, however, that login ID must have permissions to create, read, and update an incident on your remote system. An example HTTP connection:
Additional eBonding Script

The Payloadbuilder script is included with this example. It builds a payload by reading a set of fields from an incident table used in the REST steps for these actions.

Slack spoke

The Slack spoke provides actions which post messages and ServiceNow incident, problem, and change record details to Slack channels.

Slack actions

The Slack spoke is an available integration through IntegrationHub. You can specify the following Slack actions within a flow:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Post a Message</td>
<td>Send a message to a Slack channel using an Incoming Webhook. Specify the Webhook URL and Message to send.</td>
</tr>
<tr>
<td>Post Change Details</td>
<td>Send details about a ServiceNow change record to a Slack channel using a Webhook Connector. Specify the Webhook URL and Change record to send.</td>
</tr>
<tr>
<td>Post Incident Details</td>
<td>Send details about a ServiceNow incident record to a Slack channel using a Webhook Connector. Specify the Webhook URL and Incident record to send.</td>
</tr>
<tr>
<td>Post Problem Details</td>
<td>Send details about a ServiceNow problem record to a Slack channel using a Webhook Connector. Specify the Webhook URL and Problem record to send.</td>
</tr>
</tbody>
</table>

Slack Inputs

The following inputs are common to the Slack actions:

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Required] Webhook URL</td>
<td>The Slack webhook for sending a message. Set up the webhook before configuring this action. Refer to the custom incoming webhook for Slack documentation.</td>
</tr>
<tr>
<td>[Optional] Additional Message</td>
<td>Add a message before the record details.</td>
</tr>
<tr>
<td>Input</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>[Optional] Channel</td>
<td>Specify the Slack channel to post information.</td>
</tr>
<tr>
<td>Username</td>
<td>Specify a username to include in your post.</td>
</tr>
<tr>
<td>[Optional] Override Default Field</td>
<td>You can provide a comma-separated list of field names to send instead of the default fields. Default fields are Short Description, Category, State, Priority, and Assignment Group.</td>
</tr>
<tr>
<td>[Optional] Icon</td>
<td>Add an icon to the communication.</td>
</tr>
</tbody>
</table>

**Note:** If you do not specify a Username, Channel, or Icon, it will post the message using the defaults as configured in your webhook. If you specify them here, they will override those defaults.

**Example**

You can add a Slack Post Incident Details action to a flow which identifies newly created high priority incidents, a username, and a specific slack channel.
Integration steps

Enable custom actions to integrate with external systems by activating IntegrationHub, which adds integration steps to the Action Designer interface.

Integration steps can run on the instance or a MID Server. A MID Server is required to communicate with or move data between a ServiceNow instance and external applications, data sources, and services in your network.

Steps that perform operations on record data run on the instance, while steps that integrate with systems in your network run on a MID Server. If a step requires a MID Server to run, the instance delegates flow processing to the appropriate MID Server by sending the process plan in a REST call. The MID Server executes the action or step in the process plan and returns results. View log messages and execution status from the instance or the MID Server.
Available integration steps

These integration steps are available from *Action Designer* on page 1283.

<table>

Connection attributes

Define connection-specific variables that you can use in IntegrationHub integration steps. When using an integration step, you must establish a connection with an external system. Use a Connection & Credential alias instead of defining the connection inline. An alias enables you to update the connection details once without having to reconfigure every action. Any action step that uses an alias inherits the attributes associated with it. Flow Designer displays attributes as data pills that you can drag into your action step. For example, you can create a page size attribute that becomes a REST step query parameter. For more information about connection attributes, see *Create connection attributes* on page 1013.

MID Server connection aliases

Action designers can set MID Server selection attributes using a connection record associated with an alias and associate the alias with an integration step. When the flow runs, the system uses the attributes to determine which MID Server runs the step. Learn more about connection and credential aliases.

MID Server selection

Flow designers should avoid shifting the execution environment between MID Servers when a flow runs. Either configure your MID Servers to perform operations on multiple endpoints, or provide multiple capabilities to the MID Servers in your network. You may need a user with the connection_admin role to update the connection records associated with an action, or a network administrator to update the MID Server network configuration. To learn more about how a MID Server is selected during runtime, see *MID Server selection* on page 1630.

Design considerations

Design integration steps using the following guidelines.

- Avoid shifting the execution environment between the instance and the MID Server multiple times. Where possible, group similar action steps. For example, group core steps that perform record operations and integration steps that run on the MID Server.
- When creating a spoke that uses an integration step, include a Connection and Credential alias record with the appropriate connection type. Before anyone can use the spoke, a user with the connection_admin role must associate the alias record to a connection record that supports the
connection type. If defining the connection inline, use inputs to enable the process analyst to define the connection information when adding the action to a flow.

- The MID Server does not have access to all the values in a GlideRecord object, it only has access to the sys_id reference. Inputs of type Reference do not work on a MID Server. Instead, create action inputs that contain the necessary GlideRecord values.

**Roles**

To create integration steps, a user must have the action_designer or admin roles.

**REST step**

Send an outbound REST web service request to an external system.

**Note:** REST step is not available on the base system and requires a separate IntegrationHub subscription. After the IntegrationHub plugin is activated, the step is visible under Integrations.

*Outbound REST web service* is a platform feature that allows you to retrieve, create, update, or delete data on a web services server that supports the REST architecture.

**Roles and availability**

- Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.

**Fields**

<table>
<thead>

<td>Specify the HTTP method to process the request. &lt;br&gt;• GET  &lt;br&gt;• POST &lt;br&gt;• PUT  &lt;br&gt;• PATCH  &lt;br&gt;• DELETE</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Query Parameters</td>
<td>Specify the name-value pairs to pass to the REST endpoint. You can create these parameters manually, or drag input variables into the parameter fields, and then assign a value.</td>
</tr>
<tr>
<td>Headers</td>
<td>Specify the headers to send with the request. You can create headers manually, or drag input variables into the parameter fields, and then assign a value.</td>
</tr>
</tbody>
</table>
| Request Type          | Specify the format of the request. Options include.  
• Text: A request in JSON, XML, or other text format.  
• Binary: A request in a binary file format.  
• Multipart: A request consisting of multiple content types.  
• Form URL-Encoded: A request in a URL-encoded query.  

**Note:** This field is only editable when the HTTP Method is POST, PUT, PATCH, or DELETE.  

| Request Body [Text]   | Enter the body of the request in JSON or XML format. The flow execution details display the response body as either a link to the embedded text viewer or the Sys ID of the attachment record containing the response.  

**Note:** This field is only editable when the Request Type is Text. |
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Attachment</td>
<td>Specify the Attachment record containing the request. You can look up this record in a prior step or define it as an input variable.</td>
</tr>
</tbody>
</table>
| Name, Type, Value     | Specify the content of a multiple part request. For each request part, specify its name, content type, and value. The name can be any valid string and the type can be any valid type. The value must match the content type.  
For attachments, specify:  
• Type: attachment  
• Value: The Sys ID of the Attachment record containing the content. You can look up this record in a prior step or define it as an input variable.  

**Note:** These fields are only visible when the Request Type is Binary.  

**Note:** These fields are only visible when the Request Type is Multipart. |
| Name, Value           | Specify the content of a form URL-encoded request. Specify each part of the URL-encoded request with a name-value pair.  

**Note:** These fields are only visible when the Request Type is Form URL-Encoded. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Save As Attachment</td>
<td>Specify whether to save the response as a record in the Attachment [sys_attachment] table.</td>
</tr>
<tr>
<td>Attachment File Name</td>
<td>Specify the name of the attachment created by the REST response. For example, rest-response.txt.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is only visible when Save Response As Attachment is enabled.</td>
</tr>
<tr>
<td>Attachment File Record</td>
<td>Specify the target record to which the attachment is associated. Must be a data pill of type Record. For example, a specific incident record. You can look up this record in a prior step or define it as an input variable. The flow execution details display the Sys ID of the associated record.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is only visible when Save Response As Attachment is enabled.</td>
</tr>
</tbody>
</table>

**REST Response**

By default, the system limits the size of REST responses that are not saved as attachments to 5 MB. Direct REST responses that exceed this limit generate an error. To support larger response sizes, either save the response as an attachment or increase the response size limit with the glide.pf.rest.response_payload_max_size system property. This system property supports a maximum value of 10 MB.

**PowerShell step**

Run PowerShell scripts on remote machines from your ServiceNow instance through a MID Server.

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications. ServiceNow supports PowerShell 2.0 and above. PowerShell 3.0 does not support Windows 2003 Server.

**Note:** PowerShell step is not available on the base system and requires a separate IntegrationHub subscription. After the IntegrationHub plugin is activated, the step is visible under Integrations.

**Roles and availability**

- Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.
### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Connection** | Type of connection to use.  
  - Define Connection Inline: Define connection information within the action step.  
  - Use Connection Alias: Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you do not have to update your custom action.  
  To learn more about connections and credentials, see credentials, connections, and aliases. |
| **Connection Alias** | Specify the Connection & Credential alias record the system uses to run the action step. Requires a flow designer or admin to create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you do not have to update your custom action.  
  To learn more about connections and credentials, see credentials, connections, and aliases.  
  **Note:** This field is only visible when the Connection is Use Connection Alias. |
| **Credential Alias** | Specify the credential alias the system uses to run the action step. Requires a flow designer or admin to create or select an associated Credential record. Using an alias eliminates the need to configure multiple credentials when using an action in multiple environments. Likewise, if the credential information changes, you do not have to update your custom action.  
  To learn more about connections and credentials, see credentials, connections, and aliases.  
  **Note:** This field is only visible when the Connection is Define Connection Inline. |
| **Host**       | Specify the fully-qualified domain name of the target host where the system runs the action step. For example, host.domain.com.  
  **Note:** This field is only visible when the Connection is Define Connection Inline. |
| **Port**       | Specify the communications port on which the target host listens for connections. For example, 5985. Leave blank to use the default port.  
  **Note:** This field is only visible when the Connection is Define Connection Inline. |
<table>

<td>The optional name-value pairs that represent the values of PowerShell script variables. You can use action inputs and data from other steps</td>
</tr>
<tr>
<td></td>
<td>within the PowerShell script. Define the following fields for each variable:</td>
</tr>
<tr>
<td></td>
<td>• Name: The name of the script variable to pass a value to. The name cannot match a reserved or prohibited PowerShell variable. Some variable</td>
</tr>
<tr>
<td></td>
<td>names are reserved for internal processing and should not be used as input variables. See Reserved variables in PowerShell scripting variables.</td>
</tr>
<tr>
<td></td>
<td>• Type: The type of PowerShell variable. Select plain text, encrypted, or boolean. If encrypted is selected, the value appears in plain text in</td>
</tr>
<tr>
<td></td>
<td>this field and is only encrypted when it passes to the ECC Queue.</td>
</tr>
<tr>
<td></td>
<td>• Value: The value to map to the variable. Manually enter a value, or drag a data pill into the field.</td>
</tr>
<tr>
<td>Command</td>
<td>The inline PowerShell script to run on the target host.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is only visible when the Script type is Inline script.</td>
</tr>
</tbody>
</table>

**PowerShell scripting variables**

To access input variables from the Command field, you must call them using special syntax. The syntax you use depends on the value of a system property. If the Remoting Type is Run on a MID Server or have your script establish a remote session, some reserved variables are available in addition to input variables.

**Input variable syntax**

By default, prefix variable names with a $ character. For example, if an input variable is named message, use $message to access the variable in script.
If the `mid.powershell.command.script.parameter_passing` parameter is set to false, prefix the variable name with `env:SNC_`. For example, if an input variable is named `message`, use `env:SNC_message` to access the variable in script. To learn more about the `mid.powershell.command.script.parameter_passing` parameter, see *MID Server parameters* on page 1648.

### Reserved variables

When the Remoting Type is Run on a MID Server or have your script establish a remote session, the following variables are available for use in script. Reserved variables cannot be used as custom input variable names.

<table>
<thead>
<tr>
<th>Reserved variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>$computer</code></td>
<td>Host IP address defined in the Connection alias record.</td>
</tr>
<tr>
<td><code>$cred</code></td>
<td>Credential object that contains the credentials defined in the connection record. Use this variable with any PowerShell cmdlet that supports the credential parameter. For example, <code>New-PSSession -credential $cred</code>.</td>
</tr>
<tr>
<td><code>$log_info</code></td>
<td>If the <code>mid.property.powershell.log_info</code> property is set to true, adds logging information to a PowerShell script.</td>
</tr>
</tbody>
</table>

The following variable names are reserved for internal processing and should not be used as input variables.

- script
- useCred
- isMid
- isDiscovery
- debug
- user
- password
- executingScriptDirectory
- midScriptDirectory
- hresult
Interaction Management

Interactions are a centralized location for all communication channels in the platform. Each interaction represents a request for assistance through a given channel, for example, a call or a chat. Use interactions to route to queues for assignment or assign them to agents directly. Associate related records with an interaction to track additional work being done as a result of the interaction.

The platform offers several forms of queuing and communication management, but each system is tightly coupled to the specific area. Interactions offer an alternative, flexible, and more extensible option so that each product area can use the same framework.

Interactions are categorized into interaction queues, which determine how each interaction is assigned. Queues also contain configuration information such as the schedule for the queue, automated responses, and average wait time. Users are assigned interactions if they are members of the assignment group associated with the interaction queue.

Activate the interaction management system

An administrator can activate the Interaction Logging, Routing, and Queueing plugin [com.glide.interaction] to access the functionality.

Interactions

Role required: admin

1. Navigate to System Definition Plugins.
3. Review the plugin details then click the Activate/Repair related link.
4. In the activate plugin window, click Activate.

The interaction plugin includes the following roles.

Components installed with Interaction Management

Several types of components are installed with activation of the Interaction Logging, Routing, and Queueing plugin, including tables and user roles.

Note: To view all other components installed with this plugin, see the Application Files table. For instructions, see Find components installed with an application.

Roles installed

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interaction Administrator</td>
<td>Configure interactions for users.</td>
<td>• interaction_agent</td>
</tr>
<tr>
<td>[interaction_admin]</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Interaction Agent</td>
<td>Create and edit interactions. Transfer interactions to different agents or queues.</td>
<td></td>
</tr>
<tr>
<td>[interaction_agent]</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Tables installed

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interaction [interaction]</td>
<td>Table for all interaction records.</td>
</tr>
<tr>
<td>Interaction Queue [interaction_queue]</td>
<td>List of available queues that an interaction can be associated with.</td>
</tr>
<tr>
<td>Interaction Connector [interaction_connector]</td>
<td>List of connectors or channels that an interaction can be assigned to.</td>
</tr>
<tr>
<td>Interaction Agent Status [interaction_agent_status]</td>
<td>Status of all agents assigned to a queue. The status options included available, away, or offline.</td>
</tr>
<tr>
<td>Interaction Agent Transfer [interaction_agent_transfer]</td>
<td>List of interactions that are in the process of being transferred from one agent to another.</td>
</tr>
<tr>
<td>Interaction Queue Transfer [interaction_queue_transfer]</td>
<td>List of interactions that are in the process of being transferred from one queue to another.</td>
</tr>
<tr>
<td>Interaction JSON blob [interaction_json_blob]</td>
<td>List of records that store context information for each interaction.</td>
</tr>
<tr>
<td>Interaction related record [interaction_related_record]</td>
<td>List of related records that have been associated with an interaction.</td>
</tr>
</tbody>
</table>

### Interaction configuration overview

Configure the behavior of an interaction by determining the routine behavior for each state that the interaction goes through during the life cycle.

### Interaction framework

Configure each of the following interaction components to determine the behavior and life cycle.

- Lists: Configure the interaction list view. You can also extend the interaction table.
- Forms: Configure the form view to tailor interactions for each application.
- UI actions: Advance the interaction through the interaction life cycle. You can also amend supplied interaction behavior, like creating a case or attaching a file, by copying an existing base system UI action and making changes.
- Connectors: Tap in to the interaction life cycle. Determine the routine behavior for an interaction at each point in the life cycle. Define the channel where communication takes place, for example, chat or phone.
- Queues: Determine how interactions get routed.
Interaction states

States determine the behavior for interactions. For each state of the interaction life cycle, you determine which routine actions to perform. For example, the On Created state would have a script that creates an interaction and then adds the end user as the ‘opened for’. The script then sends a message to the end user to let them know that the interaction has been opened.

Interactions advance through the state life cycle using UI actions. Business rules transition interactions from state to state. Business rules also evaluate routing and assignment rules.

Table 541: States

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
<th>Connector Hook</th>
</tr>
</thead>
<tbody>
<tr>
<td>New</td>
<td>An interaction is inserted into the interaction table</td>
<td>On Created</td>

<tr>
<td>Queued</td>
<td>The Queue field is filled or changed on a record that was in a New state</td>
<td>On Queued</td>
</tr>
<tr>
<td>Waiting For Agent</td>
<td>The interaction is in an auto-assignment queue that has no agents with available capacity.</td>
<td>N/A</td>
</tr>
<tr>
<td>Pending Accept</td>
<td>A receiving agent has been identified, but the agent has not yet accepted the interaction.</td>
<td>N/A</td>
</tr>
<tr>
<td>Work In Progress</td>
<td>An agent accepts an unassigned interaction</td>
<td>On Assigned</td>
</tr>
<tr>
<td>Closed Complete</td>
<td>The agent or consumer intentionally closes the interaction</td>
<td>On Closed</td>
</tr>
<tr>
<td>Closed Abandoned</td>
<td>The interaction is closed because the consumer disconnects or is unresponsive</td>
<td>On Abandoned</td>
</tr>
<tr>
<td>Error</td>
<td>Something unexpected happened that IMS could not recover from</td>
<td>On Error</td>
</tr>
</tbody>
</table>
Configure interaction queues

Interaction queues define a category that interactions can be grouped for assignment. Queues also define the default messages, schedule and escalation path.

Role required: interaction_admin

1. Navigate to Interaction Queues.
2. Click New or open an existing queue from the list.
3. Complete following fields in the Interaction Queue form as needed.

Table 542: Interaction Queue form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Whether the queue is active</td>
</tr>
<tr>
<td>Assignment group</td>
<td>User group that contains the support staff for the queue. Any user in the group can view the queue in the chat window and accept chats. No other users can access the queue. This field must be populated.</td>
</tr>
<tr>
<td>Average wait time</td>
<td>Average time it takes for an agent to accept a chat in the queue. This value is automatically calculated. Do not manually edit.</td>
</tr>
<tr>
<td>Confirm problem</td>
<td>Message that users see to acknowledge that their chat was submitted.</td>
</tr>
<tr>
<td>Escalate to</td>
<td>Different queue to which an agent can escalate a chat. For example, there is a queue for high priority support chats. When a queue is defined in this field, agents can access the Escalate option in conversations.</td>
</tr>
<tr>
<td>Initial agent response</td>
<td>Message that users see when an agent accepts their chat. For example, Thank you for contacting support. We are looking into your question now and will be with you shortly.</td>
</tr>
<tr>
<td>Not available</td>
<td>Message that users see when they attempt to start a chat outside the defined queue Schedule. You can use HTML to format the message and include links or media.</td>
</tr>
<tr>
<td>Question</td>
<td>Initial phrase that users see when they start a new chat in the queue. For example, How can I help you?</td>
</tr>
<tr>
<td>Queued interactions</td>
<td>The number of unopened interactions waiting in the queue. This value is automatically calculated. Do not manually edit. If you want to limit the duration to just an hour, minute, or second field, add the dictionary attribute max_unit=&lt;unit&gt;. For more information on limiting the duration by a unit of measure, see .</td>
</tr>
<tr>
<td>Schedule</td>
<td>Schedule that defines when the queue is available. Leave the field blank to make the queue available all the time. Users cannot start a new conversation in the queue outside the schedule hours.</td>
</tr>
</tbody>
</table>

4. Click Submit.
Configure interaction connectors

Connectors provide a framework for connecting an interaction to a communication channel. Configure how an interaction behaves depending on the channel it is associated with using interaction connectors.

Connector hooks are included to help define the interaction lifecycle. You can declare what should happen at each point during the interaction lifecycle using these hooks.

Role required: interaction_admin

1. Navigate to Interaction Configuration Connectors.
2. Click New or open an existing connector to change the configuration.
3. In the Name field, type the name of the connector. Name the connector by channel type, for example, Chat or Phone.
4. In the Description field, type a description for the connector.
5. For each of the following connector hooks for the interaction life cycle, write a script to determine how the interaction behaves. Use the GlideRecord API or the Connect API to configure the script.
   - On assigned
   - On close
   - On created
   - On queued
   - On transferred
   - On abandoned

For each state of the interaction life cycle, you can create a script to perform routine actions. For example, the on created state would have a script that creates an interaction, adds the end user as the opened for, and sends a messages to the end user to let them know that the interaction has been opened.

Interaction routing

Use matching rules to identify interactions that meet certain conditions.

You can dynamically add an interaction to a queue by assigning to manually, or you can set up matching rules to determine how an interaction should be routed. Extend or replace to the default routing rules to tailor the routing behavior for different applications or requirements.

The Run Queue Matching Rule business rule kicks On Queued matching for any interactions that are created without a queue. Routing can be bypassed if a queue is specified at creation time, if the interaction is assigned to a fulfiller at creation time, or if the interaction is created with a state beyond Queued.

Create one or more matching rules that establish specific conditions that an interaction must meet before it can be routed to an agent. Then use an assignment rule to route those cases to agents based on product knowledge and availability. You can also invoke the MarchingRuleProcessor API to execute the matching rules and return a list of users (sys_ids).

Matching rules are based on two defined sets of conditions, one that identifies specific case attributes and another that identifies the agent resources best suited to handle cases with these attributes. Matching rules are created using the Matching Rule form.

For more information on creating matching rules for interactions, see Create a matching rule.

Interaction context and channel metadata

Context and channel metadata are document ID fields included as part of interactions. Both types of records store information about the interaction.
Context

Context for an interaction tracks the information for an interaction, such as the initial question, asset tagging, or device location. Context records are stored on the interaction_json_blob table by default, however you can use any table to store a context record.

Channel metadata

Channel metadata contains the information needed to interact with the channel on which communication is happening on, for example, the chat or phone channels. Channel metadata can be free-form JSON or a reference to another record.

Configure close interaction schedule

Interactions that are work in progress for longer than seven days are automatically moved to Closed Abandoned. Use the glide.interaction.auto_close.age to configure the length of time interactions can be in a work in progress state.

Use the following property to make sure any orphaned interactions are closed after a period of time.
Role required: admin
1. In the navigation filter, type sys_properties.list.
2. Search for the glide.interaction.auto_close.age system property.
3. In the value field, change the value to the number in days an interaction can be in the work in progress state before being moved to closed abandoned.

Create an interaction

Most interaction creation takes place in other applications, interactions are merely a method of controlling channels. However, if needed you can create an interaction from the Interaction application.
Role required: interaction_agent
1. Navigate to Interaction All.
2. Click New.
3. In the Channel field, enter the way the interaction began. For example, chat, phone, or walk-up.
4. In the Opened for field, type the name of the user starting the interaction.
5. In the Queue field, enter the name of the queue that most suits the user's query.
6. Include any additional information in the short description and the work notes fields.

View any incidents opened by the same user by clicking the Use the Incidents by Same Caller related list.

Transfer an interaction

Transferring an interaction mostly occurs in other applications, however you can use the Interaction application to transfer an interaction to a queue or to another agent.
To transfer an interaction to another agent, the interaction needs to be assigned to you.
Role required: interaction_agent
1. Navigate to Interaction Assigned to Me.
2. Open an interaction you want to transfer.
3. In the interaction header, click Transfer to Agent or Transfer to Queue.

Transferring an interaction to another queue creates a new interaction for that queue and closes out the existing interaction. When you transfer an interaction to another agent, the agent must accept the interaction before the transaction can be completed.

**Associate a record with an interaction**

As an agent, you might need to create a record on another table to work on an interaction. You can associate the record with the interaction.

Role required: interaction_agent

1. Navigate to Interaction Assigned to me.
2. Open the interaction you want to associate with another record.
3. In the form header, click Associate Record.
4. In the ID of related record field, click the search icon.
5. From the Document Table list, select the table you want to associate a record from.
6. From the Document field, click the search icon.
7. Select an existing record from the list, or click New to create a record.
8. Click OK.
9. Click Submit.

The associated record appears in the Related Tasks related list for the interaction.

**Knowledge Management**

The ServiceNow® Knowledge Management (KM) application enables the sharing of information in knowledge bases. These knowledge bases contain articles that provide users with information such as self-help, troubleshooting, and task resolution.

Knowledge Management has significantly changed with Knowledge v3, which is enabled by default for all instances starting with the Fuji release.

Knowledge Management supports processes for creating, categorizing, reviewing, and approving articles. Users can search and browse articles as well as provide feedback.

To support multiple groups, knowledge bases can be assigned to individual managers. Separate workflows can be used for publishing and retiring articles, and separate access controls can be used to control reading and contributing.

Knowledge Management setup guide for admins

Before users in your organization can start creating knowledge bases and knowledge articles, you must set up Knowledge Management. Work with stakeholders to define requirements for setting up Knowledge Management effectively to meet the needs of users. For this task, you must be an administrator with the admin role.

Requirements

Role required
admin

Before you begin

Meet with the following stakeholders

<table>
<thead>
<tr>
<th>Stakeholder</th>
<th>Responsibilities</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge manager</td>
<td>Defines and oversees the knowledge management processes for day-to-day operations related to content publishing and usage.</td>
</tr>
<tr>
<td>Knowledge admin</td>
<td>Configures advanced settings for specific Knowledge Management features</td>
</tr>
</tbody>
</table>
With stakeholders, determine the following requirements

- Who are the consumers of the content in the knowledge bases?
- Who are the writers, editors, and managers for the knowledge base articles?
- What are the required workflows to publish and retire articles?
- What are the unique behaviors required for your knowledge management implementation? For example, should attachments appear in search results?
- Do knowledge articles need to be translated into other languages?

What to do

Assign knowledge roles to users and groups
Determine which Knowledge Management roles on page 1379 are appropriate for each user, and then assign those roles.

Create custom Knowledge workflows
If the default knowledge workflows for publishing and retiring knowledge articles are not appropriate for knowledge bases, create custom workflows for those knowledge bases.

Configure Knowledge properties
If the default knowledge properties do not fulfill the requirements of users, reconfigure the properties as necessary.
Activate support for other languages besides English

If languages other than English must be supported, activate the Knowledge Management Internationalization plugins.

Coordinate with knowledge managers for knowledge base setup

Let knowledge managers and administrators know that they can start configuring their knowledge bases. For details, refer them to the Knowledge base setup guide for knowledge admins and managers on page 1377.

Next steps

Depending on any other requirements for the knowledge bases, you may be asked to help with additional tasks, such as configuring knowledge homepages.

Knowledge base setup guide for knowledge admins and managers

After basic Knowledge Management setup is completed, you can set up a knowledge base for users to create and publish knowledge articles.

Multiple knowledge bases can be created for different groups within your organization to share information within and between those groups.

Administrators create knowledge bases, and assign them to individual managers responsible for controlling the behavior and organization scheme of each knowledge base.

Each knowledge base contains knowledge articles that provide information for users, such as policy, release notes, or instructions for a task. Each knowledge base can also use a separate workflow for publishing and retiring articles.

Requirements

Role required

knowledge_administrator, knowledge_manager, or admin

Before you begin

Determine the following requirements for each knowledge base that you want to set up:

- Who are the knowledge base managers that are responsible for approving articles?
- Who are the users and contributors for that knowledge base? Access for these users is defined through user criteria.
- What are the categories to be used to classify articles? Will users be able to create categories?
- Will users of the knowledge base be able to create new content?
- Will Social Q&A be leveraged for this knowledge base?
What to do

Set up the knowledge base

1. Create the knowledge base.
2. Set up which users can read, create, or edit knowledge articles by selecting user criteria for the knowledge base.
3. Define the approval process for articles using workflows.
4. Define the knowledge categories that are needed for organizing articles in the knowledge base.
5. If you want to enable users to ask and answer questions in the knowledge base, activate Social Q&A on page 1388.
6. If you want a custom knowledge homepage, ask your ServiceNow administrator to create it.

Next steps

Let users in your organization know that they can start creating and searching articles in the knowledge base. For details, refer users to the Knowledge Management guide for users on page 1460.

If you have the knowledge_manager role, there are many other tasks that you can perform to maintain the knowledge base. You can pin articles so they are featured prominently in the search results and on homepages. You can also assign other users as managers of a knowledge base. For details, see Knowledge manager on page 1399.

Activate the Knowledge Management Advanced plugin

Activate the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) to enable advanced features for Knowledge Management.

Role required: admin

The Knowledge Management Advanced plugin includes feature code and demo data.

The Knowledge Management Advanced Installer plugin (com.snc.knowledge_advanced.installer) is used to activate the Knowledge Management Advanced plugin.

**Note:** The Knowledge Management Advanced plugin is not automatically activated with the Knowledge Management v3 application.

This plugin performs two validation steps prior to activation.

- Determines if there are any active Knowledge Management v2 knowledge bases.
- Determines if there is a unique database index on the Number field. If a unique constraint has been added to the Number field, the plugin activation fails. Follow the instructions listed in KB0634959 to perform corrective steps to resolve the issue.

You need access to HI to be able to view KB articles.
The Knowledge Management Advanced plugin activates the following features:

- Article Versioning
  Customers must migrate to Knowledge Management v3 completely to use article versioning.
- Article Subscriptions
  The Knowledge Management Advanced plugin activates the Subscriptions and Activity Feed Framework plugin (com.snc.activity_subscriptions).
- Article Quality Index
- Article Templates
- In-Context Article Creation
- External Content Integration
  Activating the Knowledge Management - External Content Integration plugin automatically activates the Knowledge Management Advanced Installer plugin.
- Knowledge User Criteria Diagnostics
- Actionable Knowledge Feedback

Demo data is included as part of the Knowledge Management Advanced plugin. If the validation step performed by the Knowledge Management Advanced Installer plugin completes successfully, the Knowledge Management Advanced plug in is activated automatically. However, the demo data is not included in this activation. To load the demo data, go to the Knowledge Management Advanced plugin page, click the Load Demo Data Only related link, and then click OK.

1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   If the plugin depends on other plugins, these plugins are listed along with their activation status.
   If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. If available, select the Load demo data check box.
   Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
   You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.
5. Click Activate.

Knowledge Management roles

Certain roles are required to use Knowledge Management functionality.

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any role</td>
<td>All users with at least one ServiceNow role can create and edit knowledge articles. Some knowledge bases may limit this to only certain users.</td>
</tr>
<tr>
<td>Role</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>knowledge</td>
<td>Users with the knowledge role can contribute to the default knowledge base and access the Knowledge application menu.</td>
</tr>
<tr>
<td>knowledge_manager</td>
<td>Knowledge managers perform administrative functions for knowledge bases they manage such as defining categories, pinning important articles, and approving changes to articles. Users selected as managers of a knowledge base receive this role automatically.</td>
</tr>
<tr>
<td>knowledge_admin</td>
<td>Knowledge administrators can create new knowledge bases and manage all knowledge bases.</td>
</tr>
<tr>
<td>knowledge_coach</td>
<td>Knowledge coaches perform AQI surveys on articles and can write, edit and review knowledge management articles.</td>
</tr>
<tr>
<td>knowledge_domain_expert</td>
<td>Knowledge domain experts perform AQI surveys on articles and can write, edit and review knowledge management articles.</td>
</tr>
<tr>
<td>admin</td>
<td>Administrators can configure knowledge workflows, set knowledge properties, and manage knowledge forms and homepages.</td>
</tr>
</tbody>
</table>

Administrators assign these roles to the users and groups who maintain the knowledge content.

### Knowledge homepage

The Knowledge homepage displays knowledge articles and social Q&A questions organized by knowledge base and category, as well as featured content and popular articles.

To view the default knowledge homepage, navigate to Self-Service Knowledge.

**Note:**

The knowledge homepage is not compatible with Internet Explorer 9 or earlier. Using one of these browsers will cause you to be redirected to the legacy knowledge portal.

The Knowledge V3 home page is not customizable. Use the Knowledge Management Service Portal for an easily configurable user experience.
If you access knowledge from a service management application, the knowledge homepage for the associate application opens.

From the homepage, you can import a Word document to a knowledge base using the Import Articles button. You can also create a new article using the Create An Article button, or ask a question using the Post a Question button.

- Import a Word document
- Create an article
- Ask a question
Note: You must have user criteria "Can contribute" permission for at least one active knowledge base, otherwise these buttons do not appear. See Knowledge Management v3 migration on page 1444 and Knowledge manager on page 1399.

You can select a knowledge base to browse articles and questions within that knowledge base. You can view only knowledge bases you can access.

Articles and questions are organized by category or by tag. Categories are listed alphabetically. While browsing, you can filter content by type to view only knowledge articles, only social Q&A questions, or only unanswered questions. You can sort content by most recent update or by number of views.

An administrator can configure the knowledge homepage to display the number of articles and questions within each category. This count includes articles and questions from subcategories. To display the article and question count, set the knowledge homepage property Display or hide the count of articles and questions in the category and child categories (glide.knowman.show_number_on_categories) to true.

Knowledge search

You can search for knowledge articles and social Q&A questions from the knowledge homepage using the search bar at the top of the page.
Search results include only articles and questions you are authorized to read. The search results count does not take into consideration any security rules set for the articles; therefore, the number of articles you could access may be lower than the count displayed in the search results page. Documents that are attached to articles are also listed in the search results (for those articles to which you have access).

**Note:** To change how the attachments are displayed in the search results, set the How to display attachments in Knowledge Search Results glide.knowman.search.attachment property. Attachments can be displayed with a snippet, link only, or not at all.

To use wildcards in your search, using the application navigator, navigate to Contextual Search Search Contexts Knowledge Base Search and enable wildcard search.

You can sort knowledge content by relevancy, most recent update, or number of views.

You can filter results using the check boxes that appear. Filtering options appear depending on the search text.

### Table 544: Filtering options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select if you want to view knowledge articles, social Q&amp;A questions, or both. This option is only available if Social Q&amp;A is enabled.</td>
</tr>
<tr>
<td>Knowledge Bases</td>
<td>Select a knowledge base to search. You can select only knowledge bases you can access. If you do not select a specific knowledge base, search results include articles and questions from all knowledge bases that you can access. You can also select a knowledge base from the choice list in the search bar. For pinned articles, only those in the selected knowledge base in the corresponding language appear.</td>
</tr>
<tr>
<td>Categories</td>
<td>Select one or more knowledge categories. Categories are listed alphabetically.</td>
</tr>
<tr>
<td>Authors</td>
<td>Select one or more authors.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Language</td>
<td>The multi-language search feature is available when more than one supported language is enabled.</td>
</tr>
</tbody>
</table>

1. To enable multi-languages, activate the I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) or activate one of the internationalization plugins for the language you require.

   **Note:** Activating internationalization plugins for any of the available languages automatically activates the I18N: Knowledge Management Internationalization Plugin v2 plugin.

2. To display search results in all available languages simultaneously, enable the glide.knowman.enable_multi_language_search property.

   a. Navigate to Knowledge Administration Properties Knowledge Search Properties Enable multi language search and select the Yes check box.

   b. Enter sys_properties.list in the filter navigator, search for the property to configure, and in the Value field, enter true.

   **Note:** By default, the glide.knowman.enable_multi_language_search property is not enabled. Search results are displayed based on the language you select in the language filter on the Search page.

---

**Domain separation and Knowledge Management**

This is an overview of domain separation and Knowledge Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

**Overview**

Support: Level 2
Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

Domain separation works differently at different access levels of an application. In Knowledge Management, data, requester and fulfills access to knowledge bases are domain separated.

**How domain separation works in Knowledge Management**

In Knowledge Management the following rules apply:

Data: At the data level of domain separation, data visibility is separated from one domain to another. Knowledge bases, user criteria, articles, categories, article feedback, article versions, article templates, and external sources are domain separated in the base system.

Requester: Requester activities are supported within tenant domains. Users can search; view; comment; and rate articles of their domain, any child domain, and global domains, provided that feedback is enabled and the knowledge base settings grant them read access to articles.

- Users in the global domain can access articles in all the domains if read access is granted at knowledge base and/or article level.
- Users in the parent domain can access articles in that domain, global, and all of its child domains if read access is granted at knowledge base and/or article level.
- Users in the child domain can access articles in that domain and the global domain if read access is granted at knowledge base and/or article level.

Fulfiller: The application can be used by the Fulfiller within the tenant domains as a tenant domain-owned application. Users are allowed to author articles in knowledge bases of their domain, any child domain, and the global domain if the knowledge base has user criteria set up to grant contribute access.

- Articles are automatically saved to the user’s current domain when the article is created.

See Select user criteria for a knowledge base on page 1400 to learn how to control which users create, read, write, and retire knowledge articles within a knowledge base.

See Select user criteria for an article on page 1408 to learn how to control read access to users at the article level.

**Use cases**

This image demonstrates a basic domain hierarchy that is available in the base system.
## Requester use cases

<table>
<thead>
<tr>
<th>User domain</th>
<th>Knowledge base domain</th>
<th>Read user criteria domain</th>
<th>Article domain domain</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global</td>
<td>Global</td>
<td>Global</td>
<td>Global</td>
<td>Can view, comment, rate articles.</td>
</tr>
<tr>
<td>Parent domain (TOP)</td>
<td>Global</td>
<td>Parent domain (TOP)</td>

<td>Global</td>
<td></td>
</tr>
</tbody>
</table>

**Known Issues**

- Knowledge Searches [ts_query_kb], Views [kb_use], and Uses [kb_use] are not domain separated.
- The following AQI tables are not domain separated:
  - AQI Checklist [kb_quality_checklist]
  - Checklist Question [kb_checklist_question]
  - Article Checklist Summary [kb_article_checklist_summary]
  - Article Checklist Answer [kb_article_checklist_answer]
- Comment provided by a user on an article is stored in article’s domain instead of user domain.
Social Q&A

If Social Q&A is activated for a knowledge base, you can ask questions and respond to questions from other users. You can also vote on helpful questions and answers.

Social Q&A extends the Knowledge application. All questions and answers are associated with a knowledge base. Social Q&A uses Knowledge access controls, search, and the knowledge homepage.

Social Q&A is available on mobile devices using the mobile knowledge interface. You can perform all Social Q&A functions on mobile, such as asking and answering questions.

Note: Social Q&A is not compatible with Internet Explorer 9 or earlier. Navigating to a Social Q&A page using one of these browsers will cause a browser support warning to appear.

Enable social Q&A for a knowledge base

As a knowledge manager, you can enable social Q&A for a knowledge base you manage.

Role required: knowledge_manager

You can set the limit for the number of times users can post questions, answers, and comments, or subscribe to the questions using the Knowledge Social Q&A properties section.

All Social Q&A questions and answers are associated with a knowledge base. The Enable social questions and answers check box on the Knowledge Base form controls if users can view and ask questions.

Social Q&A uses user criteria from the knowledge base to determine which users have access to questions. A user must meet the criteria defined in the knowledge base Can Read related list to view or contribute to Social Q&A questions, answers, and comments associated with that knowledge base.

Note: The Can Contribute related list does not control the ability to contribute to Social Q&A. Users that meet the Can Read criteria for a knowledge base can also contribute questions, answers, and comments.

1. Navigate to Knowledge Knowledge Bases.
2. Select a knowledge base you manage.
3. Select the Enable social questions and answers check box.
   This check box only appears if the Social Q&A plugin has been activated.
4. Click Update.

You can disable Q&A for a knowledge base by clearing the Enable social questions and answers check box. Disabling Q&A does not delete existing questions and answers associated with this knowledge base, but prevents users from browsing or searching for those questions and answers.

Social Q&A questions

Social Q&A organizes information by question.

You can browse and search for questions from the Knowledge homepage (Self-Service Knowledge). Questions appear along with knowledge articles organized by knowledge base, category, and tags.

Click on a question to view the question details, as well as responses and comments. You can add responses and comments, vote on existing responses, share questions, and edit your own questions and answers from the question details. Click on a picture profile to view the user's profile.
Ask a social Q&A question

As a Social Q&A user, you can ask questions that other users can respond to.

Roles required: None

1. Navigate to Self-Service Knowledge.
2. Click Post a Question.
3. Enter a value for the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Enter the question you have.</td>
</tr>
<tr>
<td>Question details</td>
<td>Enter additional details about the question that may help other users provide an answer.</td>
</tr>
<tr>
<td>Knowledge base</td>
<td>Select the knowledge base this question relates to. You can select only knowledge bases configured to allow Q&amp;A.</td>
</tr>
<tr>
<td>Category</td>
<td>Select the knowledge category this question relates to. You can select only categories within the selected knowledge base. Questions without a category appear on the knowledge homepage in the (empty) category.</td>
</tr>
<tr>
<td>Tags</td>
<td>Enter one or more tags that describe the question.</td>
</tr>
</tbody>
</table>

4. Click Post Question.

To accept the answer, click the Accept link from within the answer. The accepted answer moves to the top of the list of answers. You can unaccept an answer by clicking Unaccept.

**Note:** You must be the owner of the question or the knowledge manager to accept an answer.

Answer a question

As a user, you can answer a question another user has asked. The owner of the question or the knowledge manager can then accept the answer.

Roles required: None

As a knowledge manager or the owner of a question, you can accept an answer as the correct answer. That answer then appears above other answers for the question.

1. Navigate to Self-Service Knowledge.
2. Select a question.
3. Enter an answer in the Your answer field.
4. Click Submit.
Comment on a question or answer

You can comment on a question or an answer to provide additional information relevant to that question or answer.

Roles required: None

1. Navigate to Self-Service Knowledge.
2. Select a question.
3. Within the question or answer you want to comment on, click the Comment link.
4. Enter the comment text. Comments have a maximum length of 140 characters.
5. Click Post comment or press the Enter key.

Edit a question, answer, or comment

You can edit questions, answers, and comments you submit, or in knowledge bases you manage.

Role required: None

1. Navigate to Self-Service Knowledge.
2. Select a question.
3. Within the question, answer, or comment you want to edit, click Edit.
4. Edit the details as needed.
5. When editing a question, click Advanced to make changes to the question record.
6. Click Update.
   Click Undo to discard the changes and close the editor.

Vote on a question or answer

As a Social Q&A user you can vote on a question or answer to promote it.

Role required: None

Vote up questions that you want users to answer, and answers that you believe accurately resolve questions. Alternatively, vote down questions that you do not find useful, or answers that you believe are incorrect. You can vote for each question or answer only once, but you can change your vote.

Answers with a higher score appear above answers with a lower score when viewing a question. A pinned answer appears above other answers regardless of votes.

Note: You cannot vote for your own questions or answers.

1. Navigate to Self-Service Knowledge.
2. Select a question.
3. Click the up or down arrow next to the question or answer you want to vote on. The score for that question or answer changes depending on your vote.

You can change your vote by clicking the other arrow.

Subscribe to a question

You are automatically subscribed to any question you ask, so you receive notifications when another user votes on, comments on, or answers the question. If you want to receive notifications for a question asked by another user, you can manually subscribe to the question.
Role required: None

You automatically subscribe to any question you ask.

1. Navigate to Self-Service Knowledge.
2. Select a question.
3. Click the subscribe icon.

If you want later to stop receiving notifications about this question, click the unsubscribe icon.

Delete a question, answer, or comment

You can delete questions, answers, or comments that you submitted.

You can delete only questions, answers, and comments you submitted. Knowledge managers can delete any question, answer, or comment within knowledge bases they manage.

Role required: None

1. Navigate to Self-Service Knowledge.
2. Select a question or answer.
3. Within the question, answer, or comment you want to delete, click the Delete link.

Deleting a question also deletes all answers and comments associated with that question. Deleting an answer also deletes all comments associated with that answer.

Share a question

You can generate a URL directly to a question and related answers.

Role required: None

1. Navigate to Self-Service Knowledge.
2. Select the question that you want to share.
3. Click Share.

Some browsers do not allow adding content directly to the clipboard. You may need to manually copy the URL from the popup that appears.

Distribute the URL to share the question.

Social Q&A internationalization support

The Social Q&A questions and answers are automatically associated with the language that is set for the interface.

You can only browse and search for questions in the language currently set for the interface. For example, if a Social Q&A user has set French as the interface language, any questions that the user asks is associated with the French language. All Social Q&A users who want to view those questions must have their interface language set to French.

**Note:** For Social Q&A internationalization to take effect, you must clear the platform cache and browser cache after selecting the desired language.
Social Q&A search

Users can search for specific questions from the knowledge homepage.

Social Q&A uses knowledge search to provide search results. Searching knowledge returns questions that contain the search terms in the question title or the question details, or in the accepted answer.

By default, knowledge search results include both knowledge articles and questions. You can filter results using knowledge search controls, such as filtering by knowledge base or author.

Social Q&A results also appear with knowledge articles when using global search.

Social Q&A uses the Contextual Search feature to generate search results. Questions appear in Contextual Search results, such as when creating an incident. The Social QA Question Search Context and Social QA Question Searcher records define the Social Q&A search. To ensure Social Q&A search functions as intended, do not modify these records.

Social Q&A tags

Tags organize questions and provide information about the question subject matter.

Social Q&A shares available tags with other applications allowing you to organize records consistently across the instance. Tags are stored on the Tags [label] table.

You can view a list of tags and filter by tag from the knowledge homepage. Clicking on a tag displays a list of knowledge articles and questions with that tag.

Only users who can edit a question can edit the associated tags. By default, only the question owner and knowledge managers can add or remove tags on questions.

Knowledge feedback

You can view and contribute to feedback on knowledge articles.

Feedback options

Enable or disable the feedback options using the Knowledge article view properties.

You can submit feedback for knowledge articles in these ways:

- Flag an article as incorrect or inappropriate.
- Provide a rating value for the article.
- Mark an article as helpful or not helpful.
- View comments, add a new comment, or reply to existing comments.

Users can view comments directly on the article. Knowledge managers can view the other types of feedback by navigating to Knowledge Feedback.

Administrators and knowledge managers can disable some feedback options using fields on the Knowledge Base form. Administrators can configure feedback options using properties.

Flagging articles

You can flag an article for incorrect or inappropriate content. Click Flag Article in the article header to open a new window, allowing you to enter suggested changes.

The glide.knowman.use_live_feed property controls the display of knowledge article comments.
• If enabled, the system uses live feed to manage and display feedback on knowledge articles. Flagged comments do not appear on the Article View page. Users with the admin, knowledge_admin, and knowledge_manager roles can access flagged articles by navigating to Knowledge Articles All Flagged. Users with the knowledge role can access their flagged articles by navigating to Knowledge Articles My Flagged.

• If disabled, the author of the article and users with the admin, knowledge_admin, and knowledge_manager roles can see all flagged comments. Other users can see only their own flagged comments.

**Note:** You cannot disable flagging for an article until you have disabled the flagging for all feedback comments for that article.

Flagged comments are stored in the Knowledge Feedback (kb_feedback) table but not the Live Feed Messages (live_message) table.

**Rating articles**

The five stars below the article title allow you to indicate the article's effectiveness on a scale of 1 to 5.

**Marking articles**

The question Helpful? at the bottom of the article allows you to indicate the usefulness of the article with a simple Yes or No answer.

**Comments**

Knowledge comments at the bottom of the article use live feed to enable a conversation around a knowledge article. For example, you can post replies to comments, add attachments, or Like comments.

**Request a knowledge base**

If existing knowledge bases do not fit your needs, you can request a new knowledge base through the service catalog. If the request is approved, you are added as the owner of the new knowledge base.

Role required: none

If no knowledge base exists that fit your needs, all users can request a new knowledge base.

1. Navigate to Self-Service Service Catalog.
2. Select Can We Help You?.
3. Select the Request Knowledge Base catalog item.
4. Enter the reason you want the knowledge base, and a name for the knowledge base.
5. Click Submit.

You are notified when the request is approved or rejected. If the request is approved, you are added as the owner of the new knowledge base. You can then assign managers and manage articles in the new knowledge base.

Knowledge bases created through this request process are inactive by default, so you must activate the knowledge base to make it available for users.
Create a knowledge article

Knowledge contributors can create and edit knowledge articles within a knowledge base to share information across your organization.

Users with at least one role can create and edit knowledge. These users are known as knowledge contributors. Users without any role can read articles and submit feedback, but cannot create or edit articles.

Some knowledge bases may allow only certain users to contribute. For example, a member of the IT department can create knowledge articles in the IT knowledge base, such as desktop support information or articles describing company IT processes.

1. Navigate to Self-Service Knowledge.
2. Click Create An Article.

![Create an Article]

**Note:** You must have user criteria "Can contribute" permission for at least one active knowledge base, otherwise the Create An Article button does not appear. See Knowledge Management v3 migration on page 1444 and Knowledge manager on page 1399.

3. Select an article template.

**Note:** To view an article template, you must activate the article templates feature and enable the desired templates. For more information, see Knowledge article templates.

4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Base</td>
<td>The knowledge base selected for this article.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> An article can only be associated with one knowledge base.</td>
</tr>
<tr>
<td>Category</td>
<td>The category for this article. Select a Knowledge Base before you can select a category. Articles without a category appear on the knowledge homepage in the (empty) category.</td>
</tr>
<tr>
<td>Published</td>
<td>The date this knowledge article was published. This value is set when the article is published.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Valid to</td>
<td>The date this knowledge article expires. Articles do not appear in search results after the valid to date, or if the valid to date is empty.</td>
</tr>
<tr>
<td>Article type</td>
<td>The type of article, either HTML or wiki. <strong>Note:</strong> This field is only visible in the standard template.</td>
</tr>
<tr>
<td>Workflow</td>
<td>[Read-Only] The publication state of the article, such as Draft or Published. When inserting a new article from an existing article, the state of the new article is reset to Draft.</td>
</tr>
<tr>
<td>Source</td>
<td>The task this knowledge article was created in response to, if any. This field is set automatically when you create the knowledge article from a task record.</td>
</tr>
<tr>
<td>Attachment link</td>
<td>Check box for downloading an attached file automatically when a user accesses the article, instead of opening the article view. Add one or more attachments to the article to use this option. <strong>Note:</strong> You may attach multiple files, but most web browsers permit users to download only the first one. To ensure download of all the files, bundle them into an archive, such as with WinZip, and attach the archive.</td>
</tr>
<tr>
<td>Display attachments</td>
<td>Check box for displaying attachments to users viewing this knowledge article. Attachments appear below the article text. Add one or more attachments to the article to use this option.</td>

<td>The title of the article. This title appears when browsing and searching knowledge, and at the top of the article.</td>
</tr>
<tr>
<td>Text</td>
<td>Content for the article. Use the <strong>HTML editor</strong> to create content. A preview of the content appears when browsing and searching knowledge.</td>
</tr>
</tbody>
</table>

5. Click Submit to create the article.

After saving the article record, you can add tags to further organize the article.

Any additional steps required to publish the article, such as approvals, depend on the publishing workflow for the knowledge base.
Select a knowledge article category

Knowledge articles within a knowledge base are grouped by category. These groups can help you define the knowledge base taxonomy, and can help users find articles within that knowledge base.

As a knowledge contributor, when editing a knowledge article you can select categories using the Category picker, and add or edit categories if enabled for the knowledge base.

1. Click the reference lookup icon beside the Category field.

2. Select an existing category, or click the add category icon (+) to add a new category.
   After you select a category, you can click the pen icon to rename that category. Press the enter key or click outside the selected category to save the change.
   
   **Note:** Clicking Cancel while selecting a category cancels selecting a new category, but does not revert any changes you make to the categories such as renaming or adding new categories.

3. Fill in the fields on the form, as appropriate.
4. Select or add a subcategory.
5. Click OK.

Move a knowledge article

You can move articles between knowledge bases.

1. Edit a knowledge article.
2. Change the Knowledge Base field value.
   After moving an article, the Apply Default Values dialog box prompts you to populate certain fields in the article with default values from the new knowledge base. If the new knowledge base has no default values, the dialog box does not appear.
3. Click OK to overwrite fields with the default values, or Cancel to leave all fields unchanged.
   A knowledge manager can define default values for articles in knowledge bases you manage using the Set default knowledge field values field on the Knowledge Base form.
4. Click Update.

Retire a knowledge article

Retired knowledge articles are not available to users except for administrators and knowledge administrators who can view them.

A knowledge article has an associated retirement workflow, similar to the publishing workflow. This allows administrators to configure these workflows, defining an approval and review process for retiring knowledge if appropriate.

When editing an article, click Retire to launch the retirement workflow associated with that article.

Retired knowledge articles cannot be searched for by external users or customers. To reuse a retired article, create a new article with the same content, which is published once approved.

Create knowledge from an incident or problem

To create knowledge from an incident or problem, select the Knowledge check box on the incident or problem form and close the incident or problem record.

For detailed information on creating knowledge from an incident, refer to Create a knowledge article from an incident

The short description from the incident or problem becomes the knowledge article title. Articles created this way are added to the knowledge base specified in the property glide.knowman.task_kb.

Depending on the value of the glide.knowman.submission.workflow property, knowledge created from an incident or problem may require additional approval. When this property is true, a submission record is created instead of a knowledge article. A user with the knowledge role must approve the submission to create a knowledge article.

Approving a submission creates a new knowledge article using the submission content.

1. Navigate to Knowledge Open Submissions.
2. Select a submission record.
3. Review the submission to ensure the content and settings are correct.
4. Click Create Article.
   A new draft knowledge article is created. Articles created this way are added to the knowledge base specified in the property glide.knowman.task_kb.

You can edit the new knowledge article before publishing it, such as to select a category.

Import a Word document to a knowledge base

Import a Microsoft Word document to create a new knowledge article.

Role required: None. You must have user criteria "Can contribute" permission for at least one active knowledge base. If you cannot contribute, the Import Articles button does not appear.

Note: An administrator can control the visibility of the Import Articles button by setting the other knowledge property Hide the 'Import' functionality (button and drag-n-drop) for all users (glide.knowman.import.hide_import_functionality) to true.

Importing documents to knowledge is available only from a computer browser. You cannot import documents from a mobile device.

You can import Microsoft Word .doc and .docx files.
Note: The file extension must be lowercase.

When you import a document, text content from the document is used to create the knowledge article. The articles support all editing functions supported by the TinyMCE editor. All HTML supported by the TinyMCE editor such as tables, lists, and links, as well as styling such as bold and italics, are preserved. Images from the document are added as attachments to the knowledge article and embedded in the article body.

Note:

You can import multiple files at a time. Closing the browser or navigating away cancels any in-progress uploads but does not delete articles created from completed imports.

You cannot import documents to knowledge from mobile devices.

The following styles and elements are preserved when importing a .doc or .docx file into a knowledge base. Styles and elements not included in this list may not be preserved when importing a document.

- Titles
- Headings
- Images
- Links
- Bold text
- Italic text
- Underlined text
- Ordered and unordered lists
- Tables

Note: Only default heading settings are supported. Custom heading styles are imported using the default settings for those styles. Table styling and borders are not supported.

1. Navigate to Self-Service Knowledge.
2. Perform one of the following actions.
   - Click Import Articles and select one or more document files.
   - Drag one or more document files onto the knowledge homepage.
3. Select the Knowledge base to add the new article to.
   You can select only knowledge bases you can contribute to.
4. Select a Category from within that knowledge base.

   Note: Use the category picker to add a category. The picker does not differentiate between different category levels. You can select a category or sub category and add it to the Category field.

5. Select the Publish check box to start the publishing workflow for each imported article immediately after the import finishes.

   This check box applies only when importing to v3 knowledge bases and only if the Show publish checkbox on the knowledge import pop-up property is set to Yes on the Knowledge Management properties form. You cannot automatically publish articles imported to v2 knowledge bases.

   Knowledge v2 articles go into Draft state. Knowledge v3 articles go into Review or Published state, depending on the workflow attached to the knowledge base (Approval Publish or Instant Publish).

6. Click Import.
A new article is created in the selected knowledge base and category using the content from the uploaded document. If you uploaded multiple documents, one article is created for each. If you use knowledge internationalization, the language of the new article is set to the currently selected system language.

After the upload completes, a popup window appears displaying the number and short description of the newly-created articles. Click an article to view the full record.

If any errors occur during the upload, a popup window appears to display the error.

Create a knowledge article from a customer service case

Reuse information from a customer service case by creating knowledge articles from cases.

Your administrator must enable creation of articles from customer service cases.

Role required: sn_customerservice_agent or knowledge

1. Navigate to Customer Service Cases All.
2. Select a case from which you want to create a knowledge article.
3. Click Create Knowledge.
   The relevant fields are automatically copied from the case to the record that opens.
4. In the Knowledge base field, enter the name of the knowledge base in which you want this article to display.
5. Click Submit.

Knowledge manager

Having multiple knowledge bases allows an organization to spread management responsibilities across multiple users, known as knowledge managers.

As a knowledge manager, you can assign other managers, define category structures, configure which users can read and contribute articles, move and pin articles, and modify most fields on the Knowledge Base form. You can also approve the publishing or retiring of knowledge articles in those knowledge bases. You can enable Social Q&A for your knowledge bases if the Social Q&A application is active.

The primary manager of a knowledge base is the owner of that knowledge base. Each knowledge base must have one owner. There may be any number of additional managers for each knowledge base. All managers of a knowledge base, including the owner, automatically receive the knowledge_manager role.

Pin a knowledge article

You can pin a knowledge article to appear in the Featured content section of the knowledge homepage and at the top of knowledge search results page.

Role required: knowledge_manager, knowledge_admin, or admin

Pinning associates an article to specific keywords. You can search a keyword in the knowledge service portal or search results page to display articles in the Featured content section or at the top of the knowledge search results list.

- To display articles in the Featured content section, add a default keyword in the glide.knowman.default_keyword property Value field and add the same keyword to all articles you want to display in that section.
• To display articles at the top of the knowledge search results list, add a list of keywords to each article you want to display at the top of the list.

1. Navigate to Knowledge Knowledge Bases.
2. Select a knowledge base.
3. In the Featured content related list, click New.
4. In the Knowledge field, search for and select the desired article.
5. In the Keywords field, click the lock/unlock toggle icon.
6. Click the lookup icon to open the Knowledge keywords list.

Note: Each keyword must be a single word and cannot contain spaces.

7. Select the keyword to add for this article.
   • Add the default keyword to display this article in the Featured content section during search.
   • Add all related keywords for the article to display it at the top of the knowledge search results page during search.

Note: You can create knowledge keywords, if it does not already exist in the list, and then add it to the article.

8. Click the lock/unlock toggle icon to add the keywords to the article.
9. Click Submit.

Create a user criteria record in Knowledge Management

You can create or modify a user criteria record in Knowledge Management. User criteria is used to control what users, groups, roles, companies, locations, and/or departments can access knowledge bases and articles.

Role required: user_criteria_admin

1. Navigate to Knowledge Administration User Criteria.
2. Click New or open a record.
3. Fill out the fields on the form as required.
   For field descriptions, refer to Create a user criteria record in Service Catalog
   
   Note: Including scripts in user criteria records can decrease performance, because scripts are evaluated dynamically.

4. Click Submit.

Select user criteria for a knowledge base

You can specify user criteria to control which users can create, read, write, and retire knowledge articles within a knowledge base.

Role required: knowledge_manager, knowledge_admin, or admin

User criteria refers to knowledge base records that determine the users who can read or contribute to a knowledge base. User criteria definitions:

- canRead users who can read all knowledge base articles
cantRead  users who cannot read, create, or modify articles in the knowledge base

canContribute  users who can read, create, and modify articles in the knowledge base

cantContribute  users who cannot create or modify articles in the knowledge base

Set user criteria for a knowledge base without explicit roles

If a knowledge base has no user criteria defined, all users can read its articles. Any user having at least one role can create and edit articles, unless they are members of the cantContribute user criteria. If a knowledge base has canRead user criteria, but no canContribute user criteria, all users with at least one role can access and modify the knowledge base.

Set user criteria for a knowledge base with explicit roles

If you create a new knowledge base with the Explicit Roles plugin active, only users with snc_internal role can access the knowledge base. To make all existing knowledge bases that do not have the canRead or canContribute user criteria accessible only to users with the snc_internal role, activate and run the Fix unsecured knowledge bases fix script.

This video demonstrates how to control Knowledge Management access through user criteria.

1. Navigate to Knowledge Knowledge Bases.
2. Select a knowledge base you manage.
3. Access one of these related lists, and then select or create user criteria records.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>

4. User A - > Read

**Note:** In the tables of rules, an implicit last rule is: All Users - > Denied Create, Read.
Select user criteria for an article

You can specify user criteria for an article to control which users can read the article.

If an article has no user criteria selected, the article is available to all users who have access to that knowledge base (based on the user criteria for the knowledge base). Knowledge base user criteria restrictions override article-level user criteria. For example, a knowledge base that is configured to restrict user access overrides any access granted at the article level.

On the article level, if Can read user criteria is defined, only those users specified can read the article. If an article has Cannot read user criteria defined, those users specified are denied reading the article. Cannot read user criteria overrides Can read user criteria for articles.

1. Navigate to Self-Service My Knowledge Articles .
2. Select an article.
3. Select the desired user criteria for the Can Read and Cannot Read fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can Read</td>
<td>Users who meet one of these criteria can read the article.</td>
</tr>
<tr>
<td>Cannot Read</td>
<td>Users who meet one of these criteria are denied reading the article (regardless of the Can Read setting for the user).</td>
</tr>
</tbody>
</table>

**Note:** If the Can Read and Cannot Read fields are not visible, add the fields to the form by configuring the form layout (click the form context menu icon and select Configure Form Layout ).
KB Level Contribute Access?

</tr>
<tr>
<td>Yes</td>
<td>User</td>
<td>User</td>
</tr>
</tbody>
</table>

**Note:** When article-level read access is assigned to an article, only the user who belongs to that particular user criteria can read the article. Other users are restricted.

**Define a knowledge article category**

Each knowledge base has a hierarchy of categories that organizes the articles.

You must have CanContribute access to the knowledge base or have a knowledge_admin or admin role.

A category can be a top-level category or a child category. The parent of a child category can be a top-level category or another child category. By making a category the child of another child category you can create a category structure with any number of levels.

You can create and edit categories separately for each knowledge base.

1. Navigate to Knowledge Knowledge Bases.
2. Select a knowledge base you manage.
3. Choose an option.

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create a top-level category.</td>
<td>Navigate to the Knowledge Categories related list and click New.</td>
</tr>
<tr>
<td>Create a child category.</td>
<td>Expand an existing category and click New within the expanded section.</td>
</tr>
</tbody>
</table>
4. Enter a Label for the category. The label appears as the name of the category.
5. Enter a Value you can use when referencing the category in scripts.
6. Click Submit.

In addition to using categories defined by a knowledge manager, knowledge contributors can add and edit categories when editing an article.

**Assign a knowledge base manager**

You can assign users as managers of a knowledge base.
Role required: knowledge_admin, or admin

1. Navigate to Knowledge Knowledge Bases.
2. Select a knowledge base you manage.
3. In the Managers field, click the unlock icon.
4. Add one or more users.
5. Click Update.

After you save the knowledge base record, users selected as managers automatically receive the knowledge_manager role if they do not have it already.

You can remove a knowledge base manager by removing that user from the Managers field. If the user is not a manager of any other knowledge base, the knowledge_manager role is removed from that user.

User criteria diagnosis for Knowledge Management

Manage user access to a knowledge base or an article using user criteria diagnostics. Understand what access users have to a knowledge base or an article and determine which user criteria define those permissions.

User access to a knowledge base or an article could be restricted based on:

- Domain separation
- Access control list (ACL) rules
- Knowledge work flows
- User criteria set for a knowledge base or an article

This feature only takes into consideration user access to knowledge bases and articles based on user criteria.

Activating user criteria diagnostics

The user criteria diagnostics feature is activated with Knowledge Management v3 (com.snc.knowledge3) plugin.

Diagnose user access to a knowledge base

Identify which users have access to a knowledge base and what enables that access.

Role required: knowledge_manager, knowledge_admin, or admin

1. Access the User Criteria Diagnostics landing page using one of these options:

<table>
<thead>
<tr>
<th>To access</th>
<th>Navigate to</th>
</tr>
</thead>
<tbody>
<tr>
<td>Using the application navigator</td>
<td>Knowledge Administration User Criteria Diagnostics</td>
</tr>
</tbody>
</table>
2. To access

To access
Navigate to

<table>
<thead>
<tr>
<th>From a knowledge base</th>
<th>1. Knowledge Administration Knowledge Bases</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>2. Select the knowledge base to diagnose user access.</td>
</tr>
<tr>
<td></td>
<td>3. In the Related Links section, click Run User Criteria Diagnostics.</td>
</tr>
</tbody>
</table>

The User Criteria Diagnostics landing page appears with the Select knowledge base field pre-populated.

2. To diagnose user access:

   a) In the Select user field, select a user.

   b) From the Select record type choice list, select Knowledge base.

   c) In the Select knowledge base field, select a knowledge base.

   Every time you select a different user, record type, or knowledge base, the page refreshes and displays data for the selected user.

   d) Click Diagnose.

   The page displays these details:

   - A warning message indicating that access restrictions based on domain separation, ACL rules, or knowledge work flows override the permissions defined by user criteria.
   - Which user criteria provides read or read and contribute access for this user to the knowledge base and what type of user criteria definition enables this access.
   - Whether a role that the user has (knowledge_manager, knowledge_admin, or owner of the knowledge base) enables this access.
   - For a user with no access to this knowledge base, which user criteria may be modified to grant the access.

The following image shows an example of a diagnosis where the user Alene Reback does not have access to the IT knowledge base.

Alena can get access to the knowledge base if:

- Alena is added to one of the existing user criteria defined in the knowledge base.
- Alena is added to a new user criteria that is defined and added to the knowledge base.

Click the IT knowledge base link and provide the access by adding Alena to a user criteria for this knowledge base.
User Criteria Diagnostics

Select user: Alene Rabeck
Select record type: Knowledge Base
Select knowledge base: IT

No Access

Alene Rabeck does not have access to knowledge base (IT).

⚠ If ACLs were applied to this Knowledge Base, the ACLs will override the permissions defined by user criteria.

How to Provide Access

To provide access to knowledge base (IT), add Alene Rabeck to one or more of the following user criteria.

<table>
<thead>
<tr>
<th>User Criteria</th>
<th>Access Type</th>
<th>Set on</th>
</tr>
</thead>
<tbody>
<tr>
<td>The ACME North America IT Department</td>
<td>Can Contribute</td>
<td>Knowledge Base</td>
</tr>
<tr>
<td>All ACME North America employees</td>
<td>Can Read</td>
<td>Knowledge Base</td>
</tr>
<tr>
<td>All ACME Corporation employees</td>
<td>Can Read</td>
<td>Knowledge Base</td>
</tr>
</tbody>
</table>

Diagnose user access to an article

Identify which users have access to an article and what enables that access.

Role required: knowledge_manager, knowledge_admin, or admin

1. Access the User Criteria Diagnostics landing page using one of these options:

<table>
<thead>
<tr>
<th>To access</th>
<th>Navigate to</th>
</tr>
</thead>
<tbody>
<tr>
<td>Using the application navigator</td>
<td>Knowledge Administration User Criteria Diagnostics.</td>
</tr>
</tbody>
</table>

From an article

1. Knowledge Administration Knowledge Bases.
2. Select the knowledge base that has the article to diagnose for user access.
3. In the Knowledge related list, select the article.
4. In the Related Links section, click Run User Criteria Diagnostics.

The User Criteria Diagnostics landing page appears with the Select article field pre-populated.

2. To diagnose user access:

   a) In the Select user field, select a user.
   b) From the Select record type choice list, select Article.
   c) In the Select article field, select an article.
      Every time you select a different user, record type, or knowledge base, the page refreshes and displays data for the selected user.
   d) Click Diagnose.
      The page displays these details:
      
      • A warning message indicating that access restrictions based on domain separation, ACL rules, or knowledge work flows override the permissions defined by user criteria.
      • Which user criteria provides read or read and contribute access for this user to the article and what type of user criteria definition enables this access.
      • Whether a role of the user has (knowledge_manager, knowledge_admin, or owner of the knowledge base) enables this access.
      • For a user with no access to this article, which user criteria may be modified to grant the access.

The following image shows an example of a diagnosis where the user Adela Cervantsz has read access to the KB article, KB0000001 v5.0, in the IT knowledge base because Adela belongs to one of the Can Read user criteria defined in the knowledge base.
User Criteria Diagnostics

- Select user: Adela Cervantsz
- Select record type: Article
- Select article: KB0000001 v1.0

Read Access

No user criteria is configured at article level. Adela Cervantsz has Read access to article KB0000001 in knowledge base IT, because the user has Read access to the knowledge base.

⚠ If ACLs were applied to this Article, the ACLs will override the permissions defined by user criteria.
⚠ The article's publication status may also impact the user's access to it. If diagnostic results conflict with the user's access, please check the publication status of the article.

Knowledge administration

As an administrator, you are responsible for setting up knowledge bases, configuring knowledge workflows, and customizing knowledge homepages. Most day-to-day management functions are performed by knowledge managers.

The following podcast offers additional information on using the Knowledge Base Application.

Create a knowledge base

Create a knowledge base to provide a self-service platform for users to store, share, and manage content. Configure knowledge bases into product or service categories and manage user access based on permissions. Customize workflows for publishing and retiring articles in the knowledge base.

Understand the requirements for setting up a knowledge base.

Role required: knowledge_admin or admin

1. Navigate to Knowledge Administration Knowledge bases.
2. In the Knowledge Bases list, click New.
3. On the form, fill in the following fields as appropriate:

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Unique name for the knowledge base.</td>
</tr>
<tr>
<td>Icon</td>
<td>An image that provides a visual reference to describe the knowledge base. This image is displayed next to all articles from this knowledge base in the article search results page.</td>
</tr>
<tr>
<td>Disable commenting</td>
<td>Check box to disable commenting. If selected, users cannot comment on articles in the knowledge base.</td>
</tr>
<tr>
<td>Disable suggesting</td>
<td>Check box to disable edit suggestions. If selected, users cannot suggest edits to articles in the knowledge base.</td>
</tr>
<tr>
<td>Disable category editing</td>
<td>Check box to disable editing of knowledge categories. If selected, only knowledge managers can add or edit knowledge categories for the knowledge base.</td>
</tr>
<tr>
<td>Checklist</td>
<td>Checklist to evaluate the quality of articles in the knowledge base.</td>
</tr>
<tr>
<td>Owner</td>
<td>The user responsible for the knowledge base. A knowledge base owner can assign other roles to the knowledge base.</td>
</tr>
<tr>
<td>Manager</td>
<td>Users who perform administrative functions on the knowledge base.</td>
</tr>
<tr>
<td>Title</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Publish workflow</td>
<td>The workflow for publishing the articles in the knowledge base.</td>
</tr>
<tr>
<td></td>
<td>• Knowledge - Instant Publish: publishes articles in the knowledge base without requiring an approval.</td>
</tr>
<tr>
<td></td>
<td>• Knowledge - Approval Publish: requests approval from the manager of the knowledge base before moving the articles to the published state.</td>
</tr>
<tr>
<td>Retire workflow</td>
<td>The workflow for retiring the articles in the knowledge base.</td>
</tr>
<tr>
<td></td>
<td>• Knowledge - Instant Retire: retires articles in the knowledge base without requiring an approval.</td>
</tr>
<tr>
<td></td>
<td>• Knowledge - Approval Retire: requests approval from the manager of the knowledge base before moving the articles to the retired state.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to make the knowledge base visible to all users.</td>
</tr>
<tr>
<td>Enable social questions and answers</td>
<td>Check box to enable social Q&amp;A for articles in the knowledge base.</td>
</tr>
<tr>
<td>Description</td>
<td>A short description to describe the knowledge base.</td>
</tr>
<tr>
<td>Set default knowledge field values</td>
<td>Default configuration settings for the knowledge base.</td>
</tr>
<tr>
<td>Related products</td>
<td>List of products related to the knowledge base content.</td>
</tr>
</tbody>
</table>

4. Right-click the form header and click Save.
5. In the related list section, view or configure the following items related to the knowledge base:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge</td>
<td>List of knowledge articles stored in this knowledge base.</td>
</tr>
<tr>
<td>Questions</td>
<td>List of Social Q&amp;A questions stored in this knowledge base.</td>
</tr>
<tr>
<td>Can Read</td>
<td>The Can Read user criteria list for this knowledge base.</td>
</tr>
<tr>
<td>Can Contribute</td>
<td>The Can Contribute user criteria list for this knowledge base.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Featured Content</td>
<td>List of knowledge articles that appear in the homepage Featured Content section based on the corresponding keyword search set for each article.</td>
</tr>
<tr>
<td>Knowledge Categories</td>
<td>List of knowledge categories associated with this knowledge base.</td>
</tr>
</tbody>
</table>

6. Click Submit.

Knowledge workflows

The publishing and retirement processes for a knowledge article are controlled by workflows defined for the knowledge base that the article belongs to.

You can assign different workflows to each knowledge base.

You can use one of the default workflows, or create your own workflows to define custom publishing and retirement processes for different types of knowledge.

For the workflows that require approval, you can configure which users can approve or reject by editing the getApprovers() function in the KBWorkflow script include.

**Table 549: Default knowledge workflows**

<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge - Approval Publish</td>
<td>Requests approval from a manager of the knowledge base before moving the article to the published state. The workflow is canceled and the article remains in the draft state if any manager rejects the request.</td>
</tr>
<tr>
<td>Knowledge - Approval Retire</td>
<td>Requests approval from a manager of the knowledge base before moving the article to the retired state. The workflow is canceled and the article remains in the published state if any manager rejects the request.</td>
</tr>
<tr>
<td>Knowledge - Instant Publish</td>
<td>Immediately publishes a draft article without requiring an approval.</td>
</tr>
<tr>
<td>Knowledge - Instant Retire</td>
<td>Immediately retires a published article without requiring an approval.</td>
</tr>
<tr>
<td>Knowledge - Publish Knowledge</td>
<td>A subflow that moves the knowledge article to the published state. You can use this subflow when defining your own workflow.</td>
</tr>
<tr>
<td>Knowledge - Retire Knowledge</td>
<td>A subflow that moves the knowledge article to the retired state. You can use this subflow when defining your own workflow.</td>
</tr>
</tbody>
</table>

**Note:** Retired knowledge articles cannot be searched for by external users or customers. To reuse a retired article, create a new article with the same content, which is published once approved.
Knowledge properties

As an administrator, you can configure the look and functionality of many knowledge base features with knowledge properties.

You can access knowledge properties by navigating to Knowledge Administration Properties.

Knowledge portal properties

Knowledge portal properties control the look and functionality of the legacy portal page. This portal page lists recent knowledge articles and their publishing dates, organized by topic.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of columns on Knowledge portal pages. (glide.knowman.columns)</td>
<td>Set the number of columns for arranging topics on the knowledge portal.</td>
</tr>
<tr>
<td>Maximum number of articles per content block on the home page (glide.knowman.content_block_limit)</td>
<td>Enter the maximum number of articles to display in the Most Useful and Most Viewed sections of the knowledge homepage.</td>
</tr>
<tr>
<td>Omit empty Knowledge topics and categories. (glide.knowman.show_only_populated)</td>
<td>Select the Yes check box to display topic sections only if there are articles for the topic. Clear the check box to show all topic sections, even those with no assigned articles.</td>
</tr>
</tbody>
</table>

**Note:** This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages.

**Note:** This property applies only to the default knowledge base and the legacy knowledge portal. Knowledge v3 articles do not specify a topic. Therefore, this property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show Knowledge section descriptions.</td>
<td>Select the Yes check box to display topic descriptions in the knowledge portal. To enter these descriptions: 1. Edit an existing knowledge article. 2. Right-click the Topic field label and choose Show Choice List. 3. Open the record for the topic name and enter the description into the Hint field. Clear the check box to omit section descriptions from the knowledge portal.</td>
</tr>
<tr>
<td>Number of Knowledge Base items to preview in a section.</td>
<td>Set the maximum number of articles per topic for the knowledge portal. The specific articles shown depends on the Knowledge section sort field property setting. Note: This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages.</td>
</tr>
<tr>
<td>Knowledge section sort field.</td>
<td>Select the default order for articles within each topic section on the knowledge portal.  • Published: uses the date published.  • View count: uses the number of times articles have been viewed during the period specified in the Number of days used when summing article views property.  • Alphabetically: uses the first letter of the article title (Short description field). Note: This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages.</td>
</tr>
<tr>
<td>Knowledge Base section sort direction.</td>
<td>Select the order, ascending or descending, in which articles are listed within each topic section on the knowledge portal. The value used for sorting is set in the Knowledge section sort field property. Note: This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Show unpublished articles in Knowledge Base portal and topic lists.</td>
<td>Select the Yes check box to allow users to see unpublished articles in the knowledge portal and knowledge search results. Use the subsequent List of roles... properties to designate which users can see articles in various unpublished states. If this is not selected, users with appropriate roles can access unpublished articles through other modules of the Knowledge Base application.</td>
</tr>
<tr>
<td>List of roles (comma separated) that can see articles in the Review workflow state in the Knowledge portal and Topic list.</td>
<td>Enter role names exactly as they appear in User Administration Roles. If Show unpublished articles in Knowledge Base portal and topic lists is selected, users with these roles see articles in the Review workflow state in the knowledge portal, in the topic list that appears when they click a topic title on the portal, and in knowledge search results.</td>
</tr>
<tr>
<td>List of roles (comma separated) that can see articles in the Draft workflow state in the Knowledge portal and Topic list.</td>
<td>Enter role names exactly as they appear in User Administration Roles. If Show unpublished articles in Knowledge Base portal and topic lists is selected, users with these roles see articles in the Draft workflow state in the knowledge portal, in the topic list that appears when they click a topic title on the portal, and in knowledge search results.</td>
</tr>
<tr>
<td>Define roles that can view articles in other/custom workflow states. Do not include Draft and Review states, as they are already defined in other properties.</td>
<td>Enter role names exactly as they appear in User Administration Roles. If Show unpublished articles in Knowledge Base portal and topic lists is selected, define the custom field and role as workflow state: [roles];. The users with these roles see articles in the custom workflow state on the knowledge portal.</td>
</tr>
<tr>
<td>The number of articles that are asynchronously loaded when scrolling down in the new search results page.</td>
<td>Enter the number of articles to be displayed during a search.</td>
</tr>
<tr>
<td>Show only Knowledge topic titles on portal page (no article links).</td>
<td>Select the Yes check box to omit all article titles from the knowledge portal and show only the topic names. Users can click the topic title to see the list of related articles.</td>
</tr>
</tbody>
</table>

**Note:** This property applies only to Knowledge v3 pages. This property is not supported on Knowledge v2 pages.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of days (integer, default 30) used when summing article views. Views older than this are not considered when sorting articles based on view count. 0 means consider all views. (glide.knowman.view_age.days)</td>
<td>Enter a number of days to consider when calculating view count. This is used only when the Knowledge section sort field property is set to View count. The view_count field in the knowledge record will be updated periodically to reflect the view count based on this property. Enter 0 to have ServiceNow consider all views, regardless of date.</td>
</tr>
<tr>
<td>Automatically place cursor in Knowledge portal search box. (glide.knowman.portal_search_focus)</td>
<td>Select the Yes check box to have ServiceNow place the cursor in the search field when a user opens the knowledge portal. Clear the check box to have users click in the search field before entering a search term.</td>
</tr>
</tbody>
</table>

**Note:** This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages.

Knowledge search properties

Knowledge search properties give you control over the search options available to users and the presentation of search results.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Knowledge search result order. (glide.knowman.order.search)           | Select the order for displaying search results:  
  - Number of Views: orders search results based on the Number of days used when summing article views property.  
  - Relevancy: orders search results based on content that is similar to the search term.  
  - Last Modified: orders search results based on modification date.                                                                                      |
| Search method used when searching Knowledge from a task or directly in the Knowledge Base. (glide.knowman.search.operator) | Select the search approach to use when the search term includes multiple words.  
  - OR query: returns articles that contain at least one word from the search term.  
  - AND then OR query: first searches for articles that include all words in the search term (an AND query). If no matches are found, an OR query is performed. |
<p>| Show author in knowledge search results. (glide.knowman.search.show_author) | Select this check box to include the author of each article in knowledge search results. If the article versioning feature is enabled, articles with a version number less than or equal to 1.0 display Authored by &lt;name&gt; and articles with a version number greater than 1.0 display Revised by &lt;name&gt;. |</p>
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show last modified date and time in knowledge search results. (glide.knowman.search.show_last_modified)</td>
<td>Select this check box to include the date and time each article was last edited in knowledge search results.</td>
</tr>
<tr>
<td>Show publish date in knowledge search results. (glide.knowman.search.show_published)</td>
<td>Select this check box to include the date each article was published in knowledge search results.</td>
</tr>
<tr>
<td>Show category in knowledge search results. (glide.knowman.search.show_category)</td>
<td>Select this check box to include the category breadcrumbs of each article in knowledge search results.</td>
</tr>
<tr>
<td>Show number of views in knowledge search results. (glide.knowman.search.show_view_count)</td>
<td>Select this check box to include the number of times each article was viewed in knowledge search results.</td>
</tr>
</tbody>
</table>
| How to display attachments in Knowledge Search Results. (glide.knowman.search.attachment) | Select the behavior of how the attachments are shown in the search results:  
  - Do not show attachment  
  - Show only link for attachment  
  - Show attachment with text snippet (default)  
  
  For best performance, select Do not show attachment, or Show only link for attachment. |
| Show relevancy in knowledge search results. (glide.knowman.search.show_relevancy) | Select this check box to show how relevant each search result is based on the search string.  
  Relevancy value is only shown when knowledge search result order property is set to Relevancy. |
| Enable instant search results for knowledge. (glide.knowman.search.instant_results) | Select this check box to enable instant search for search results. The default is No. |
| Show Knowledge Base name in Knowledge search results. (glide.knowman.search.show_knowledgebase) | Select this check box to display the knowledge base to which the knowledge base article belongs. For example, IT. |
| Show average rating from knowledge search results. (glide.knowman.search.show_rating) | Select this check box to display the average star ratings for knowledge base articles. |
| Show article number in knowledge search results. (glide.knowman.search.show_article_number) | Select this check box to display the article number for each article in the search result.  
  If the article versioning feature is enabled, the article number and the version number are displayed for each article in the search result. |

**Note:** This property does not apply to contextual search results.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Specify default language for searching articles. (glide.knowman.search.default_language) | Set the property to the desired default language for searching articles.  
  - String  
  - Default value: user-specified  
  - Location: System Properties  
  **Note:** If the glide.knowman.enable_multi_language_search (property is set to True, then the multi-language search capability overrides the default language search capability. |
| Enable multi-language search. (glide.knowman.enable_multi_language_search) | Set the property to True to enable search for multiple languages simultaneously.  
  - Type: true | false  
  - Default value: false  
  - Location: System Properties  
  **Note:** If this property is set to True, it overrides the setting for the glide.knowman.search.default_language property. |
| Maximum character limit for meta description used for SEO. (glide.knowman.seo.pages.meta_description.length) | Set the maximum number of characters used as meta description for SEO.  
  - Type: integer  
  - Default value: 100  
  - Location: System Properties  
  When you change the character limit, the meta description with the updated limit is only applied to articles published after the change was made. To apply the change to all existing published articles, run the Populate Meta Description on KB Articles fix script. |

**Knowledge article view properties**

Article view properties give you control over the meta data and rating options that appear with articles. They also enable you to grant access to individual feedback options based on user role.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show tasks to which an article has been recently attached. (glide.knowman.recent_tasks.display)</td>
<td>Select the Yes check box to have article view include a list of tasks associated with the article. Knowledge articles can be attached to a task by clicking the Attach to Task button after searching from a form.</td>

Other knowledge properties

Additional knowledge properties let you control general knowledge management features.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>When attaching an article to an incident, copy the content into this field. (glide.knowman.attach.fields)</td>
<td>When a user searches knowledge from a task form (such as an incident, problem, or change) and clicks the Attach to Task button for an article, the system copies the article number and content into the field specified here. You can specify a separate field for each table you want to attach articles to as a comma-separated list. Use dot walking to copy the article content into related records. If a specified field does not exist, that field is ignored.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Knowledge Management logo to display if running out of the ServiceNow frames. (glide.knowman.frameless_logo)</td>
<td>Click the reference lookup tool (Figure 288: Icon Reference Lookup) and choose an image file to be displayed on knowledge pages that are used outside of the ServiceNow application frames. For example, the logo image selected here appears if you create a Content Management System site that includes knowledge pages. You can also enter the Name of an image stored in the database to use that image. <strong>Note:</strong> This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages.</td>
</tr>
<tr>
<td>Hide the 'Import' functionality (button and drag-n-drop) for all users. (glide.knowman.import.hide_import_functionality)</td>
<td>Select Yes to hide the Import Articles button. If you have not yet migrated to Knowledge v3 and are using legacy Knowledge v2, you can configure the visibility of the Import Articles button to prevent users from importing articles to knowledge bases.</td>
</tr>
<tr>
<td>Show publish check box on the knowledge import pop-up. (glide.knowman.import.show_publish_checkbox)</td>
<td>Select No to remove the Publish check box on the knowledge import form so that an article cannot be published as part of the import process. Default is yes.</td>
</tr>
<tr>
<td>Use submission workflow. (glide.knowman.submission.workflow)</td>
<td>Select the Yes check box to use the knowledge submission workflow instead of the standard knowledge workflow. If this option is selected, each time a user creates knowledge from an incident or problem, the content is placed into a submission record instead of a draft article. Transforming knowledge submissions into articles follows a specific workflow.</td>
</tr>
<tr>
<td>The sys_id of the knowledge base when creating knowledge from task records. (glide.knowman.task_kb)</td>
<td>Enter the sys_id of the knowledge base to put new knowledge articles created from tasks in.</td>
</tr>
<tr>

<td>Select this check box if users must have ACL-based permission to view text fields on the Knowledge [kb_knowledge] table to read article previews in knowledge search results.</td>
</tr>
</tbody>
</table>

**Knowledge Social Q&A properties**

You can set the limit for the number of times users can ask, answer, or subscribe to Social Q&A questions, or comment on the questions and answers using the Social Q&A system properties.
**Note:** To open the System Properties [sys_properties] table, enter sys_properties.list in the navigation filter.

**Note:** If the Value field for any of the Social Q&A properties is left blank, then a rate limit does not apply for that particular property.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum number of Social Q&amp;A questions that can be posted per user per</td>
<td>Enter the maximum number of times a user can post Social Q&amp;A questions per day.</td>

**Article versioning properties**

The knowledge administrator can set configuration properties that enable users to edit specific fields on published articles without creating new versions.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable article versioning feature. (glide.knowman.versioning.enabled)</td>
<td>Select the Yes check box to enable the article versioning feature.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
</tbody>
</table>
### Property
Enable minor edits to a published article without creating a new version.

(glide.knowman.versioning.enable_minor_edits)

**Description**
Select the Yes check box to enable minor edits to published articles without creating a new version.

- **Type:** true | false
- **Default value:** false
- **Location:** Knowledge Administration Properties

**Note:** This feature is available for the following users: the knowledge administrator, the knowledge base manager, and the knowledge base owner.

### Property
A comma-separated list of fields that can be edited on published articles without creating a new version.

(glide.knowman.versioning.minor_edit_fields)

**Description**
Enter the fields in a comma-separated list that can be edited on published articles without creating a new version.

- **Type:** string
- **Default value:** valid_to
- **Location:** Knowledge Administration Properties

---

### Knowledge subscription properties

The knowledge administrator can set configuration properties that enable users to subscribe to knowledge bases and knowledge articles.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Enable subscribe feature for KM  (glide.knowman.enable_km_subscription) | Select the Yes check box to enable the Knowledge subscription feature.

Create a custom knowledge homepage

As a system administrator, you can create a module allowing users to open a knowledge homepage for a specific knowledge base or category.

Role required: admin

1. Right-click the application label in the application navigator and select Edit Application.
2. In the Modules related list click New.
3. Enter a Title for the module.
4. In the Link type field, select URL (from Arguments).
5. In the Arguments field, append one or more of the following values to $knowledge.do#/search?.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_kb=&lt;knowledge base sys_id&gt;</td>
<td>Enter the sys_id of a knowledge base to show knowledge articles from that knowledge base by default.</td>
</tr>
<tr>
<td></td>
<td>If the specified knowledge base does not exist, the default knowledge homepage appears when accessing the custom homepage module.</td>
</tr>
<tr>
<td>sysparm_category=&lt;knowledge category sys_id&gt;</td>
<td>Enter the sys_id of a knowledge category to show knowledge articles from that category by default.</td>
</tr>
<tr>
<td></td>
<td>If the specified category does not exist, the default category for the selected knowledge base appears when accessing the custom homepage module.</td>
</tr>
<tr>
<td>sysparm_order=&lt;view_count, last_modified, or relevancy&gt;</td>
<td>Enter the default sort order for articles to appear in.</td>
</tr>
</tbody>
</table>

Note: The category passed in this parameter must belong to the knowledge base passed in the sysparm_kb parameter.

To create a homepage for a Facilities knowledge base with a sys_id of d582764047022100158b949b6c9a7145 and sorting by last modified date, enter $knowledge.do#/search?
sysparm_kb=d582764047022100158b949b6c9a7145&sysparm_order=last_modified in the Arguments field on the Module form.

I18N - Knowledge internationalization

Organizations with knowledge users who speak multiple languages can activate the optional knowledge internationalization features.

Activating internationalization plugins for any of the available languages automatically activates the I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2).

When active, knowledge internationalization enables the knowledge management team to create language-specific knowledge articles and keep translations of the same article related to each other so they are easy to manage. Users can view and search within their own language while still being able to view articles in other languages when necessary.

**Note:**

To set the default language for searching articles to a language different from the logged in language of the user, specify the desired language in the glide.knowman.search.default_language system property. For example, if you are logged in using the French language and would like the default language for searched articles to be English, specify English in the system property. You can then switch to French from within the UI to see French articles. If no language is specified in the system property, articles default to the logged in language of the user.

Refer to Knowledge search on page 1382 for information on performing a search on all available languages simultaneously.

Social Q&A does not use language-specific questions and answers. All questions and answers appear in the language they were created in. For example, a question in English is not translated when the current user's selected language is French.

Activate the knowledge management internationalization plugin

To enable translation of knowledge articles, you must activate multiple plugins.

- I18N:Knowledge Management Internationalization v2 plugin
- Internationalization plugins for each appropriate language

**Activate a plugin**

**Installed Components**

Activating the Knowledge Management Internationalization plugin installs these components:

- A relationship named Translated Versions that creates a related list on the Knowledge form showing other articles that have the same parent article.
- A business rule named knowledge query that automatically filters the knowledge portal and search results based on the user's selected language.
- A UI macro named kb_languages.
- Two fields, named Language and Parent, in the Knowledge [kb_knowledge] table and the Knowledge form.
Knowledge Form Changes

Activating knowledge management internationalization adds these fields to the Knowledge form.

- **Language**: select the language for the article.
- **Parent**: enter the number of the article that represents the base language. This setting keeps translations of the same article related to each other. Consider choosing the same language consistently for the parent article.

Additionally, the Translated Versions related list is automatically added to the Knowledge form after you save an article.

Create a translation for a knowledge article

Create a translation for an article from the Translated Versions related list on the knowledge article record. Before creating a translation, activate the internationalization plugin for the desired language which, in turn, activates the I18N: Knowledge Management Internationalization Plugin v2 (com.glideapp.knowledge.i18n2).

1. Open the knowledge article record.
2. In the Translated Versions related list, click New.
3. Select the desired language for the translation in the Language field.
4. Provide a description in the Short Description field.
5. Click Submit.

The translation is created and added to the Translated Versions related list.

Duplicate knowledge article numbers

Importing knowledge articles into an instance can create articles with duplicate numbers.

The Knowledge Number field is auto-generated and is incremented every time you create a new article in an instance. The initial value for the Number field is 10,000. To customize this number:

1. Navigate to System Definition Number Maintenance.
2. Search for Knowledge in the Table column.
3. Click the Controls related list tab.
4. Enter a new Number and click Update.

Importing knowledge articles from another instance or as part of the demo data for another application may introduce an article with a number that is already in use. Because the Knowledge Number field is not uniquely indexed, the import completes without error.

With duplicate knowledge article numbers present, links to article view pages that use the knowledge number can behave inconsistently. For example, if there are two articles with the same Knowledge number KB0000033, the following link may open either of these two articles randomly: kb_view.do?sysparm_article=KB0000033. This can happen in Knowledge search results where clicking on a result opens a different article instead of the article displayed in the search results.
Avoiding duplicate Knowledge article numbers

To avoid inserting Knowledge articles with duplicate numbers into a production environment:

- Do not import demo data articles in production environment.
- Verify the numbers of the articles to be inserted to make sure they are not already in use.
- Create a before insert business rule on the Knowledge table (kb_knowledge) to ensure the new number is not already in use.

You can also update the initial value for the Knowledge Number field so that newly created articles do not conflict with existing articles.

1. Navigate to System Definition Number Maintenance.
2. Search for Knowledge in the Table column.
3. Click the Knowledge link to open the Knowledge table form.
4. Click the Controls related list tab.
5. In the Number field, update the count to a number greater than the largest value already in the system.
6. Click Update.

Enable search on all knowledge bases

Configure the knowledge base search source in the service portal to perform a search on all knowledge bases.

Role required: admin

By default, the knowledge base search source in the service portal is set to search only a single knowledge base, which by default is set to the IT knowledge base.

1. Navigate to Service Portal Portals Service Portal.
2. Clear the entry in the Knowledge base field.
3. Click Update.
4. In the Search Source related list, select Knowledge Base.
5. In the Data Source tab, go to the Data fetch script field and delete or comment out line 7.
```javascript
(function(query) {
  var results = [];
  // Here goes the logic. Compute results however you want!
  var kb = new GlideRecord('kb_knowledge');
  kb.addQuery('workflow_state', 'published');
  kb.addQuery('valid_to', '>=', (new GlideDate()).getLocalDate().getValue());
  kb.addQuery('kb_knowledge_base', sp.getValue('kb_knowledge_base'));
  kb.query();
  data.article_count = kb.getRowCount();

  var kbCount = 0;
  while (kb.next() && kbCount < data.limit) {
    // Does user have permission to see this item?
    if (!sp.canReadRecord('kb_knowledge', kb.getUniqueValue()))
      continue;

    var article = {};
    $sp.getRecordDisplayValues(article, kb,
      'sys_id, number, short_description, published, text');
    article.publishedUTC = kb.getValue('published');
    article.type = "kb";
    if (article.text)
      article.text = ";
    article.text = $sp.stripHTML(article.text) + "";
```

© 2018 ServiceNow. All rights reserved.
6. Click Update.
   When you perform a keyword search in the service portal, the knowledge base search source
   performs the search on all knowledge bases.

Enable creating an article from a customer service case

You can enable authors to reuse information in a case by copying case details into an article template. Use
the pre-defined customer service source case table to article template target table configuration or create
custom configurations between the two tables to copy information from a case to an article.

- The Knowledge Management Advanced plugin must be active.
- The KCS for Customer Services Management property must be enabled
- The pre-defined KCS article template or a newly created article template must be active.

Note: You can do one of the following to create an article from a case:

- Use the pre-defined Case KCS Article mapping as is or modify the field mappings between the case
  source table and article template target table.
- Create a new article template target table and map it to the case source table and customize the
  field mappings between them. For information on creating article templates, refer to Create an article
  template.
- Knowledge users use the Create Knowledge button in a case form to create an article from a case and
  must have "can contribute" permission for at least one active knowledge base to create an article from a
  case. For information on user permissions, see Knowledge Management roles.

Role required: sn_customerservice.customer_admin or admin

The pre-defined Case KCS Article mapping is stored in the CSM Table Map [csm_table_map] table. This configuration has the sn_customerservice_case source case table configured to the kb_template_kcs_article target article template table with the four field mappings pre-configured between the tables. You can customize the existing field mappings or map additional fields between the tables.

1. In the application filter navigator, type csm_table_map.list.
2. Click Case KCS Article.
3. From the Target Table list, use the pre-defined KCS article template table or select the newly created
   article template table.
4. Map each customer service case field that must be used to create knowledge articles.
   a) In the Basic Field Mapping related list, click New.
      To map fields, fill in the following fields:

```plaintext
Table 554: Customer service case table to article template target table field mapping

<table>
<thead>
<tr>
<th>Field</th>
<th>Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Field</td>
<td>Select the field in the source case table that contains the information to be copied to the field in the article template target table.</td>
</tr>
</tbody>
</table>
```
b) Click Submit.

c) To map fields using advanced scripts, select the Advanced Field Mapping check box and then map the fields between the source and the target table using advanced scripts in the Advanced Field Mapping tab.

**Note:**
If the same source or target field is configured in both the basic and advanced field mappings, the advanced field mapping overrides the basic field mapping.

If the fields configured in the basic and advanced field mapping are different, the field configurations in the advanced field mapping are appended to the field configurations in the basic field mapping.

d) To customize when and how the Create Knowledge button is displayed, use the condition builder in the Condition tab or select Use Advanced Condition check box and configure using advanced scripts.

**Note:** If you change the target table in the Case KCS Article mapping, also update the scripts with the configuration changes for display of this button.

5. Click Update.

**Use knowledge on mobile devices**

All users can access knowledge from mobile devices to search for and view knowledge articles and social Q&A questions.

**Browse knowledge on mobile devices**

You can browse knowledge bases using a mobile device.

Navigate to SELF-SERVICE Knowledge Base.
<table>
<thead>
<tr>
<th>Knowledge Base</th>
</tr>
</thead>
<tbody>
<tr>
<td>Topics</td>
</tr>
<tr>
<td>General</td>

</tr>
<tr>
<td>Policies</td>
</tr>
<tr>
<td>FAQ</td>
</tr>
<tr>
<td>News</td>
</tr>
</tbody>
</table>

**Figure 289: Mobile Knowledge View**

Browse Knowledge by tapping on a category and browsing articles or subcategories.
Figure 290: Mobile Knowledge Categories

**Note:** Select the desired category and click the close icon (×) for the selected category to reflect in the search results.

View knowledge articles and questions on mobile devices

You can read knowledge content using a mobile device.

Tap a title to view the article or question.
Note: You cannot edit or add comments to knowledge articles on the mobile interface. If using *Social Q&A* on page 1388, you can perform all functions such as adding and editing questions, answers, and comments through the mobile interface.

Figure 291: Mobile Knowledge Article View

Search knowledge on mobile devices

Find a specific article or question by searching on a particular term.
Knowledge management has significantly changed with the introduction of knowledge v3 starting with the Fuji release.

Knowledge v3 has several key differences from knowledge v2, the version of knowledge management that was available until Eureka release. The knowledge v3 plugin is activated by default starting with the Fuji release.

The following podcast provides more information on what is new in Knowledge Management v3.

When upgrading from Eureka or earlier versions, if you intend to use the new features available in knowledge v3, you have to migrate legacy knowledge content and any customizations you have made to the Knowledge Base applications.

The following video provides more information on how to migrate from Knowledge Management v2 to v3.
### Table 555: Key differences

<table>
<thead>
<tr>
<th>Legacy Knowledge</th>
<th>Knowledge v3</th>
</tr>
</thead>
<tbody>
<tr>
<td>One knowledge base.</td>
<td>Multiple knowledge bases.</td>
</tr>
<tr>
<td>A single lifecycle workflow shared by all articles.</td>
<td>Separate, customizable workflows available for each knowledge base.</td>
</tr>
<tr>
<td>Two-level organizational structure with Topic and Category. A single organizational taxonomy shared by all articles.</td>
<td>Category structure with any number of levels. Each knowledge base has a unique category taxonomy.</td>
</tr>
<tr>
<td>Permissions defined per article using roles and ACLs.</td>
<td>Permissions defined per knowledge base or article using user criteria.</td>
</tr>
</tbody>
</table>

### Knowledge Management v3 migration process

When you upgrade from Eureka or earlier, consider a multi-step migration process. This process ensures you can access existing knowledge content and allows you to fully migrate at your own pace.

Review automatic changes before upgrading. These changes are applied immediately when upgrading and may impact existing functionality.

1. Migrate knowledge functionality to use your customized functionality with the knowledge v3 enhancements.
2. Migrate knowledge content to use the knowledge v3 enhancements with your existing knowledge articles.

### After migration to Knowledge v3

These items are relevant to getting the full range of new functionality after you migrate.

- You must configure knowledge access controls based on user criteria to ensure that users can access existing knowledge content. Since access control in knowledge v3 is intended to be based on user criteria alone, users may be unable to access v2 or v3 knowledge articles, or have restricted access, with preexisting ACLs.
- If the home page was customized in knowledge v2, custom layout and links are not saved in knowledge v3.
- Images added using the Image field in a knowledge article form do not display in the Knowledge v3 or Knowledge Service Portal pages. The article search results page displays the knowledge base icon next to all articles from the knowledge base.

### Automatic changes after KMv3 migration

Upgrading to Knowledge v3 automatically changes knowledge functionality including the knowledge user interface and security model.

### Default knowledge base

When you upgrade from Eureka or earlier, a default knowledge base is created, titled Knowledge, that contains all knowledge articles from the previous version.

After the upgrade, you can add and edit articles in this knowledge base.
Articles in the default knowledge base continue to use legacy functionality, such as role-based access controls. Any customizations you made to knowledge functionality before the upgrade are preserved in the default knowledge base.

**Knowledge search changes**

By default, the legacy knowledge portal uses knowledge v3 search with limited filtering options. You can filter results only by knowledge base. Search results include only those articles the current user can view based on user criteria. ACLs do not restrict search results.

**Knowledge security changes**

Knowledge v3 manages access to articles with user criteria rather than roles and ACLs. Existing ACLs on the Knowledge [kb_knowledge] table are preserved, but with the following changes.

- A version of 3 indicates that a knowledge base uses the knowledge v3 functionality.
- A version of 2 indicates that a knowledge base uses legacy functionality.

New ACLs introduced by knowledge v3, such as field-level controls, apply to all knowledge bases.

When you upgrade from Eureka or earlier, any custom ACLs you implemented for the Knowledge table still apply to any knowledge records in the default knowledge base. Knowledge v3 updates ACLs that exist before upgrade so they only apply to Knowledge [kb_knowledge] records where this field value is 2.

**Note:** These changes affect the default knowledge base. Even if you are not using the new knowledge functionality, the legacy knowledge behavior may change if you have made customizations to ACLs on the Knowledge [kb_knowledge] table. Ensure you configure knowledge access controls after upgrading to prevent unexpected behavior.

Because Knowledge v3 introduces ACLs for the Knowledge [kb_knowledge] table, if you do not have high security enabled, you may notice differences in default behavior. See [KB0549970](#) for information about configuring Knowledge v3 without high security.

**Knowledge article view changes**

The Knowledge application uses the kb_view UI page to display knowledge articles.

**UI page**

The following changes apply automatically when you upgrade from Eureka or earlier:

- The existing kb_view page is renamed to kb_view_customer. The kb_view_customer page is used to display articles in the default knowledge base, preserving the legacy user experience.
- A new kb_view page is used. This is becomes the primary page used to display articles that are not in the default knowledge base.

You should review all customizations introduced around the legacy kb_view UI page.

- URLs should not be updated as the new kb_view page redirects to the correct page depending on the article.
- Customizations made to the kb_view UI page are automatically copied to the kb_view_customer page on upgrade.
- Other customizations that affect kb_view may need to be copied or modified to apply to kb_view_customer. For example, an ACL defined for kb_view may need to be duplicated to provide security coverage for kb_view_customer.
Feedback

Legacy feedback functionality is retained for knowledge articles displayed in the legacy article view. Users can continue to use the feedback options to view, add, and reply to comments on these legacy articles. Legacy comments are retained in the Knowledge Feedback [kb_feedback] table.

To retain the legacy comment functionality with new knowledge articles, set the Use Live Feed for Knowledge feedback property (glide.knowman.use_live_feed) to false. This property is set to false by default.

Knowledge portal changes

While the legacy knowledge portal, kb_home, has not changed in Knowledge v3, we strongly recommend that you consider moving to the new Knowledge v3 home page, $knowledge.do.

UI page

You can search articles from the knowledge portal and filter search results by knowledge base, and by language if the instance uses knowledge management internationalization. This portal also appears for users on older browsers, such as Internet Explorer 9, instead of the knowledge homepage.

Navigation add-ons are available in the legacy knowledge portal. Navigation add-ons of the Link type appear in the top-right of the portal. To add navigation add-ons of the Search type, you must customize the kb_home UI page.

Search

By default, the legacy knowledge portal uses knowledge v3 search with limited filtering options. You can filter results only by knowledge base. Search results include only those articles the current user can view.

Access a knowledge base or search engine

You can add new search engines to the advanced search function or add links at the top of knowledge pages.

Role required: admin

This feature lets you configure access to a knowledge base, either public or private, or to a public search engine.

1. Navigate to Knowledge Administration Navigation Add-ons.
2. Click New.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the search engine name or link text.</td>
</tr>
<tr>
<td>Type</td>
<td>Select Search or Link.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number to indicate the sequence of this search option or link.</td>
</tr>
<tr>
<td>URL</td>
<td>For a link, enter the URL. Leave blank for a search engine.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Script</td>
<td>For a search engine, enter a script that opens the search engine's results page for the search text. Leave blank for a link.</td>
</tr>
</tbody>
</table>

4. Click Submit.

Knowledge submissions

Knowledge submissions created from tasks continue to work in knowledge v3 with minor changes.

By default, the Topic and Category fields no longer appear on the Submission form due to the knowledge v3 category changes.

The property glide.knowman.submission.workflow no longer appears on the knowledge properties UI page. To enable knowledge submissions, set this property to true on the System Properties [sys_properties] table.

See creating knowledge from incidents and problems for instructions on using knowledge submission in knowledge v3.

Migrating Knowledge access controls

Access to knowledge articles is controlled based on the user criteria for the knowledge base.

**Important:** If you do not migrate existing knowledge ACLs to user criteria, users may be unable to access knowledge articles, or may be able to access restricted articles.

User criteria records, rather than ACLs, control basic create, read, update, and delete operations for knowledge articles as well as which search results appear. This may lead to unexpected behavior if your configuration depends on ACLs to control access.

To ensure users are able to access the correct knowledge articles, migrate any ACL-based security settings to user criteria. This process may include creating additional knowledge bases and moving existing content to these knowledge bases, depending on your security model. For a detailed explanation and migration examples, refer to *KB0550924 Understanding User Criteria and ACLs in Knowledge v3*.

This video demonstrates how to manage article-level access controls during migration from Knowledge Management v2 to v3.

Knowledge functionality migration

You can migrate knowledge functionality to use your customized functionality with the knowledge v3 enhancements.

Replaced knowledge modules

When you are ready to migrate to knowledge v3, you can activate the v3 modules and deactivate the legacy modules.

Use the tables below to identify which knowledge v3 modules to activate and which legacy modules to deactivate. When activating a knowledge v3 module, deactivate the knowledge v2 module with the same name to ensure users access the correct module.

You can use the *enablev3anddisablev2menus.txt* backup script to enable knowledge v3 menus and disable knowledge v2 menus.
### Table 557: Knowledge v3 modules

**Knowledge article publish and retire workflows**

With knowledge v3, article state is controlled by workflows.

In the legacy knowledge base, article state was controlled by UI actions. UI actions from previous versions are available only in the default knowledge base.

To preserve your article publishing and retirement process in new knowledge bases, create workflows that follow these processes. To create these workflows, copy the default workflow that best matches your process and modify that copy. After creating workflows that use your article publishing and retirement processes, use these workflows as the Publish workflow and Retire workflow for the new knowledge bases.

**Knowledge article category structure**

With knowledge v3, all knowledge articles are organized by category and subcategory within knowledge bases.

The default knowledge base uses the legacy category structure; knowledge articles are organized by topics and categories.

Before you migrate articles, create a category structure for these articles in the destination knowledge bases. This structure can reproduce your legacy topic and category structure or can be extended to take advantage of the knowledge v3 category functionality.

**Knowledge content migration**

To use the new functionality available in knowledge v3 with legacy articles, you must migrate these articles out of the default knowledge base.

To migrate knowledge content, move articles out of the default knowledge base by changing the Knowledge Base value for each article. The state of the article remains unchanged when moving articles. After selecting a new knowledge base, assign a category to each article using the category structure defined in the new knowledge base.

After you migrate a knowledge article, the legacy feedback functionality is automatically replaced with the new knowledge feedback mechanisms. Legacy feedback is copied to the Live Feed Message [live_message] table to ensure previously submitted feedback is available for knowledge v3 articles.

**Out-of-the-box Knowledge Management Performance Analytics Solutions**

Performance Analytics Solutions contain preconfigured best practice dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.
**Note:** You can activate Performance Analytics solutions and in-form analytics on instances that have not licensed Performance Analytics to evaluate the functionality. However, to start collecting data you must license Performance Analytics.

**Performance Analytics Solutions**

Use the Performance Analytics widgets on the dashboard to visualize data over time, analyze your business processes, and identify areas of improvement. With solutions, you can get value from Performance Analytics for your application with minimal setup.

**Note:** Solutions include some dashboards that are inactive by default. You can activate these dashboards to make them visible to end users according to your business needs.

To enable the solution for Knowledge Management, an admin can navigate to Performance Analytics Guided Setup. Click Get Started then scroll to the section for Knowledge Management. The guided setup takes you through the entire setup and configuration process.

**Article versioning**

Use the Knowledge Management article versioning feature to create and maintain multiple versions of a knowledge article.

Knowledge contributors can create a new version of a knowledge article from an existing published version. This existing version can be either the latest published version or an older outdated version. All changes are stored in the new version of the article and the information in the existing article remains the same.

Activate the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) to use the knowledge subscription feature.

If you import published knowledge articles from a ServiceNow instance that does not support article versioning, you must run the Initialize Versions on Articles fix script to enable article checkout and editing.

With the article versioning feature, knowledge users can:

- Check out the latest version of a published article and create a new version.
- Select a previously published (outdated) version of an article and make it current.
- Recall an article that is being reviewed.
- Retire the latest published version of an article.

There are two types of article revisions: major and minor. Minor revisions include updates to an article that has not yet been published. Major revisions include updates to an article that has been published and is available to customers. To track the different revisions, the article versioning feature introduces version numbering.

With the article versioning feature, the knowledge article number also includes the version number. All references to knowledge articles use this number format. For example, KB0010003 v2.0.

**Manually update customized files**

If you have customized any of the files that are updated as part of the Knowledge Management Advanced Installer plugin, these files are skipped during plugin activation and must be updated manually.

Manually update your customization to include the article versioning-related changes.
• Add the Version field to the Knowledge form layout and the Knowledge list view, if it is not already present.
• Add the outdated choice to the Workflow choice list field on the Knowledge form, if it is not already present. Keep the value as outdated because of dependencies that article versioning functionalities have on this choice.
• Update the Knowledge My Flagged and Self-Service My Knowledge Articles modules to include the following condition in the Filter field, if these modules do not already reflect this change: Revised by is (dynamic) me.

If you have customized any of the Knowledge Management Overview dashboard reports, these files are also skipped during plugin activation and must be updated manually.

**Article versioning changes**

Article versioning introduces new actions that allow knowledge users to create and revise versions of existing articles. It also introduces new fields and related lists to the Knowledge form, new columns to the Knowledge list, and updates to Knowledge dashboard reports.

**New user actions**

As part of creating article versions, users can:
• Check out a published article and create a new version by clicking Checkout on the Knowledge form.
• Recall an article that is being reviewed by clicking Recall on the Knowledge form.
• Select a previously published article in the Outdated state and make it the current published version by clicking Make this current in the Knowledge form header.

---

**Note:** To edit a published article without having to create a new version, make sure the glide.knowman.versioning.enable_minor_edits property is enabled.

**Changes to the Knowledge list**

The article versioning feature adds the following to the Knowledge list:
• The Version column displays the article version number. The Knowledge list displays multiple versions of an article.
• The Workflow column includes the new Outdated state.

**Changes to the Knowledge form**

The article versioning feature adds the following to the Knowledge form:
• The Version field displays the article version number.
• The Display number field displays a combination of the article number and the version number. For example, KB0010004 v1.02. All references to a knowledge article use this display number.
• The Base Version field displays the knowledge article number and version on which the current article is based.
• The Revised By field displays the name of the user who checked out a published article and created a new version.
• The Article Versions related list displays a list of all versions for an article. From this list, you can:
• Click the Version to view a specific version of an article.
• Click the View Article related link to see the article page view.

**Note:** If necessary, configure the form to display the fields and the related list.

**Changes to Knowledge modules**

The article versioning feature introduces the following Knowledge module changes:

• **My Knowledge Articles**
  • For a knowledge user, this module includes records for the articles authored by the user as well as records for each article revised by the user.
  • For a knowledge reviser, this module includes records for the articles published by the user as well as records for each article revised by the user.

• **My Flagged**
  • For a knowledge user, this module includes records for each revision made to articles authored by the user.
  • For a knowledge reviser, this module includes records for each article revised by the user.

**Note:** Users that have customized these modules do not see these changes.

**Changes to Knowledge Management dashboard reports**

The Knowledge Management Overview dashboard reports have been updated to include article versioning-related changes when the Knowledge Management Advanced plugin is activated.

• Articles Flagged in the Last 30 Days
• Articles Marked Not Useful in the Last 30 Days
• Articles Used per Month
• Knowledge use
• Knowledge view
• Knowledge updated in past 30 days
• Knowledge flagged in past 30 days
• Knowledge by Workflow state
• Knowledge created by Author
• Knowledge created in past 30 days
• New Knowledge Articles Created in the Last 30 Days
• Knowledge Ratings for past 30 days

**Versioning information available in the Knowledge Management Service Portal**

Knowledge search results show the article number and the version number for each article.

**Note:**
To display the article version number next to the article number in the search results, enable the glide.knowman.search.show_article_number property in the Knowledge Search Properties section of the Knowledge Management Properties page.

If you are accessing an article from the base system or knowledge service portals using the URL to a KB article, you must also include the article version number in the URL. For example, to access the KB0000005 knowledge article, instead of using the https://<instance name>/sp?id=kb_article&sys_id=KB0000005 as the URL, you must use https://<instance name>/sp?id=kb_article&sys_id=KB0000005%20V1.0 to view the article.

The article view page shows a version history section for articles that have been updated. This section includes the version numbers, date updated, and the name of the author or reviser.

- Click Latest version or the version number and current state to expand the version history section.
- Click the version number to open that particular version of the article.
- When viewing an outdated article, a message informs the user that a newer updated version is available. The message includes a link to the latest version.

Feedback on article versions

With the article versioning feature, users can view and contribute to feedback on the current versions of knowledge articles.

For more information about feedback options, see Knowledge feedback.

<table>
<thead>
<tr>
<th>Feedback option</th>
<th>How this option works with article versioning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rating an article</td>
<td>The average rating for an article is carried over to the checked out version. The average rating calculation updates and displays on the current version of the article.</td>
</tr>
<tr>
<td>Marking an article as helpful</td>
<td>The helpfulness percentage of a previous version of an article is also considered for a new version when displayed in the helpfulness column on the homepage.</td>
</tr>
<tr>
<td>Comments</td>
<td>The Comments section at the bottom of an article displays comments from previous versions unless Live Feed is enabled. Live Feed only shows comments for the current version.</td>
</tr>
<tr>
<td>Flagging an article</td>
<td>Checking out an article or setting a previous version to the current version resets the flagged value to false.</td>
</tr>
<tr>
<td>View count</td>
<td>The view count is carried over to the checked out article. Any view of a version of an article increments the view count of all subsequent versions. Views to a newer version of an article do not affect the view count of previous versions.</td>
</tr>
<tr>
<td>Use count</td>
<td>The use count is carried over to the checked out article. Any view of a version of an article increments the use count of all subsequent versions. Views to a newer version of an article do not affect the use count of previous versions.</td>
</tr>
</tbody>
</table>
Knowledge article version numbers

Knowledge article version numbers follow a specific pattern. Increments to the version number depend on the revision type.

Article version numbers follow this pattern: <major release number.minor release number>

The type of revision being made to an article determines the increment. A minor revision increments the version number by 0.01. A major revision, such as publishing an article, increments the version to the next whole number, for example, from version 2.02 to 3.0.

The following example illustrates the life cycle of a versioned article and the changes to the version number.

<table>
<thead>
<tr>
<th>User action</th>
<th>Article state</th>
<th>Version number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge author creates a new article</td>
<td>Draft</td>
<td>0.01</td>
</tr>
<tr>
<td>Knowledge author makes a change and updates the article.</td>
<td>Draft</td>
<td>0.01</td>
</tr>
<tr>
<td>Knowledge author submits the article for review.</td>
<td>Review</td>
<td>0.02</td>
</tr>
<tr>
<td>Knowledge author recalls the article to make another change.</td>
<td>Draft</td>
<td>0.03</td>
</tr>
<tr>
<td>Knowledge article submits the article for review</td>
<td>Review</td>
<td>0.04</td>
</tr>
<tr>
<td>Approver rejects the article and requests a change.</td>
<td>Draft</td>
<td>0.05</td>
</tr>
<tr>
<td>Knowledge author makes the change and submits the article for review.</td>
<td>Review</td>
<td>0.06</td>
</tr>
<tr>
<td>Approver approves the article</td>
<td>Published</td>
<td>1.0</td>
</tr>
<tr>
<td>Knowledge author checks out the published article.</td>
<td>Draft</td>
<td>1.01</td>
</tr>
<tr>
<td>Knowledge author submits the article for review.</td>
<td>Review</td>
<td>1.02</td>
</tr>
<tr>
<td>Approver approves the article</td>
<td>Published</td>
<td>2.0</td>
</tr>
<tr>
<td>When the version 2.0 article is published, the state of the version 1.0 article changes to Outdated.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Any change to the state of an article results in a version increment, except to and from the Pending retirement, Retired, and Outdated states.

Knowledge article version information

Users can view version information for a knowledge article from the Knowledge view page.
The knowledge article number and the version number appear at the top of the article, just below the title. Clicking the version number expands the version history section, which includes a list of the available article versions. User roles determine what is included in this list:

- Users with read access to a knowledge base can see the latest published version and previous major versions.
- Users with read and contribute access to a knowledge base can see the latest published version, previous major versions, and any draft or review versions.

You can view any of the previous versions of an article by clicking the version number in the list. When you view a previous version, a message at the top of the article indicates that an updated version is available.

At the bottom of a knowledge article, you can see additional information about an article, including the name of the author or revisor and the date that the article was last modified.

**Knowledge article states**

A versioned knowledge article can be in one of several states as it progresses through the creation cycle.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Draft</td>
<td>The article is in the process of being created.</td>
</tr>
<tr>
<td>Review</td>
<td>The draft version of the article is sent to reviewers to approve or reject.</td>
</tr>
<tr>
<td>Published</td>
<td>The article is approved and published. When the state of an article changes to Published, the state of any previous published versions of that article changes to Outdated.</td>
</tr>
<tr>
<td>Pending retirement</td>
<td>The published article is selected for retirement, pending approval.</td>
</tr>
<tr>
<td>Retired</td>
<td>The published article is retired. Retired knowledge articles cannot be searched for by external users or customers. To reuse a retired article, create a new article with the same content, which is published once approved.</td>
</tr>
<tr>
<td>Outdated</td>
<td>A more recent version of the article has been published. End users can read published articles as well as the outdated versions.</td>
</tr>
</tbody>
</table>

**Article versioning properties**

The knowledge administrator can set configuration properties that enable users to edit specific fields on published articles without creating new versions.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable article versioning feature. (glide.knowman.versioning.enabled)</td>
<td>Select the Yes check box to enable the article versioning feature.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td></td>
<td>• Location: Knowledge Administration Properties</td>
</tr>
<tr>
<td>Enable minor edits to a published article without creating a new version.</td>
<td>Select the Yes check box to enable minor edits to published articles without creating a new version.</td>
</tr>
<tr>

<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: false</td>
</tr>
<tr>
<td></td>
<td>• Location: Knowledge Administration Properties</td>
</tr>
<tr>
<td>Note:</td>
<td>This feature is available for the following users: the knowledge administrator, the knowledge base manager, and the knowledge base owner.</td>
</tr>
<tr>
<td>A comma-separated list of fields that can be edited on published articles without creating a new version. (glide.knowman.versioning.minor_edit_fields)</td>
<td>Enter the fields in a comma-separated list that can be edited on published articles without creating a new version.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: valid_to</td>
</tr>
<tr>
<td></td>
<td>• Location: Knowledge Administration Properties</td>
</tr>
</tbody>
</table>

### Check out a published article and create a new version

Create a new version of a knowledge article by checking out the latest published version.

Users with canContribute permissions, including the knowledge owner, knowledge manager, and knowledge administrator, can check out a published article unless there is already a checked out version. If a version has been checked out, the Checkout button does not appear on the Knowledge form header.

When you check out an article, attachments from the article’s base version are copied into the new article version and relative paths to these attachments are also updated.

**Note:** For article versions that were created in the previous releases, the relative paths to the attachments may not be updated. To update them, activate and run the Fix attachment links on article versions fix script.

1. Navigate to Knowledge Articles Published.
2. Select the desired article from the list.
3. Click Checkout in the Knowledge form header.
   The system creates a new version of the knowledge article and displays a message to the user. The article number for the new version remains the same, the version number is increased by 0.01, and
the state changes to Draft. The new version of the article is added to the Knowledge list and to the Article Versions related list on the Knowledge form.

Approve an article that is being reviewed

Approve an article that is being reviewed and create a new published version.

When an article is in the Review state, only those users who are included in the Approvals related list can modify the article.

1. Navigate to Knowledge Articles Unpublished.
2. Open an article in the Review state and review the text.
3. In the Approvals related list, click Requested in the State column to display the Approval form for the article.
4. Click Approve.
   The system displays the Knowledge form. The version number of the article increments to the next whole number (for example, from 2.02 to 3.0) and the state changes to Published. The new published version of the article is added to the Knowledge list and to the Article Versions related list on the Knowledge form.

Revert an outdated article to the current state

Use an outdated version of an article to create a new version.

Roles required: knowledge base owner, knowledge_manager, knowledge_admin

This action is available for earlier published version that have a state of Outdated and only when there is no checked out version. If a version has been checked out, the Make this current button does not appear on the Knowledge form header.

1. Navigate to Knowledge Articles All.
2. Open an article in the Outdated state.
3. Click Make this current in the Knowledge form header.
   The system displays the Knowledge form. The version number increments to the latest version number plus 0.01 and the state changes to Draft. For example, if the latest published version of an article is 3.0 and you select the outdated 1.0 version to become the current version, the version number increments to 3.01.

Recall an article that is being reviewed

Recall an article that is being reviewed to make additional changes.

When a revised article is in the Review state, only the corresponding versions reviser can recall the article to make additional changes. When a newly created article is in the Review state, only the author can recall the article. Recalling an article in the Review state results in a minor version increment.

1. Navigate to Knowledge Articles All.
2. Open an article in the Review state.
3. Click Recall in the Knowledge form header.
   The system returns the state of the article to Draft, increments the version number by 0.01, and displays a message to the user.
View all versions of an article

View a list of all available versions for a selected knowledge article and then view the selected version in a new tab.

The list of all available versions for a selected knowledge article is displayed in the Article Versions related list on the Knowledge form. Users with read access can see major versions. Users with contribute access can see major and minor versions.

1. Navigate to Knowledge Articles All.
2. Open the desired article.
3. Click the Article Versions tab to display the related list.
4. Click Version to display the desired article version in a new tab.
5. If desired, click the View Version related link to see the article view page.

Compare two versions of an article

Select and compare two versions of a knowledge article.

Role required: knowledge_manager, knowledge_admin

1. Navigate to a knowledge article with multiple versions.
2. In the Article Versions related list, select two versions of the article to compare.
3. In the Actions choice list below the list, select Compare.
   The Compare Versions page opens in a new tab and lists the fields for the selected articles in a side-by-side format. Differences between the two articles are highlighted.
4. When you are finished comparing the two versions, click Done to return to the Knowledge form.

Retire a versioned article

You can retire the latest published version of a knowledge article. Retiring a knowledge article does not create a new version. It simply marks the article as Retired.

This action is available only when there is no checked out version. If a version has been checked out, the Retire button does not appear on the Knowledge form header.

**Note:** For the Knowledge - Approval Retire workflow, this happens only when the retire request is approved.

In addition to the knowledge administrator and the knowledge manager, the following users can retire a versioned article:

- knowledge owner
- author of the versioned knowledge article
- reviser of the versioned knowledge article

Users can still access outdated articles that have been attached to incidents by navigating to the article view page with the sys_id of the article. Outdated articles include a message that an updated article is available.

If versioning is disabled, only the latest version of the article is shown in search results and list views.
Retired knowledge articles cannot be searched for by external users or customers. To reuse a retired article, create a new article with the same content, which is published once approved.

1. Navigate to Knowledge Articles Published.
2. Open the desired article.
3. Click Retire in the Knowledge form header.
   The system returns to the Knowledge list. The state of the article changes to Pending retirement and the state of previously published versions change to Outdated.

   **Note:** You cannot check out or edit a retired article.

### Disable the article versioning feature

Users with the system administrator role can disable the article versioning feature by setting a property.

**Role required:** admin

The Enable article versioning feature property controls the article versioning feature. Setting this property to false disables the article versioning feature. Once disabled:

- The Version field is removed from the Knowledge form. The Version column remains on the Knowledge list and can be removed manually.
- The Article Versions related list is removed from the Knowledge form.
- The Recall, Checkout, and Make this current buttons are removed from the Knowledge form.
- Outdated articles are removed from Knowledge list views.
- The version history does not appear on the article view page.

Articles continue to be versioned in the background. Minor versions are incremented until an article is published and then the version number is increased to the next major version.

Users can still access outdated articles that have been attached to incidents. Outdated articles include a message that an updated article is available.

1. Navigate to Knowledge Administration Properties.
2. Locate the Enable article versioning feature property in the Article Versioning Properties section.
3. Click the check box to disable the property.
4. Click Save.

### Knowledge Management guide for users

After knowledge bases are set up, you can start searching and creating articles. If Social Q&A was activated for the knowledge base, you can also submit answers or answer questions for other users.

#### Requirements

**Role required**

None. All users can read, create, and edit knowledge articles in a knowledge base, unless the knowledge manager has restricted access to it.

If you need these permissions, contact the knowledge manager for the knowledge base.
## What to do

### Create knowledge articles
If you have the required permissions for a knowledge base, you can create articles for it. You can create articles from the **Self-Service application menu** or by importing Word documents.
You can also create knowledge articles from **incidents and problems**.

### Search for knowledge articles
From the **Knowledge homepage**, you can select a knowledge base to **search for articles and answers**.
You can view only the knowledge bases to which you have access.
You can also search knowledge from within an **incident**.
Access to knowledge using **your mobile device** is supported.

### Ask and answer questions
If **Social Q&A** on page 1388 was activated for a knowledge base, you can ask and answer questions. You can also browse and vote on answers.

## Next steps
After articles are created, you can perform the following tasks to make sure that articles are organized in the right knowledge bases and retired when appropriate. If existing knowledge bases do not fit your needs, you can request a new knowledge base.

- [Move a knowledge article](page 1396)
- [Retire a knowledge article](page 1397)
- [Request a knowledge base](page 1393)

## Knowledge Management Service Portal
The Knowledge Management Service Portal enables users to perform the same operations that are available with the Knowledge Management V3 plugin. From the portal, users can view knowledge bases and articles, search for information, sort and filter search results, and provide feedback.

System administrators can customize portal pages and configure widgets for searching, sorting, and filtering knowledge base information.

To use the Knowledge Management Service Portal:

1. **Activate the Knowledge Management - Service Portal plugin** (com.snc.knowledge_serviceportal).
2. Configure the **Knowledge Management Service Portal properties**, including the property that directs users to the Knowledge Management Service Portal homepage.
Customizing the Knowledge Management Service Portal

The Knowledge Management Service Portal is comprised of three pages and multiple widgets. Users with the system administrator role can customize the pages and widgets as desired.

- To customize this portal, navigate to Service Portal Portals and click Knowledge Portal. See Service Portal for more information about creating a custom interface.
- To configure widget instance options and customize the search, sort, and filter features, see Knowledge Management Service Portal widgets.

Section 508 compliance features

Users can view and interact with the Knowledge Management Service Portal article view page using Section 508 compliance features. See Set up Section 508 compliance features for more information.

Activate the Knowledge Management Service Portal plugin

You can activate the Knowledge Management - Service Portal plugin (com.snc.knowledge_serviceportal) if you have the admin role.

Role required: admin

This plugin requires the following plugins:

- Knowledge Management V3 (com.snc.knowledge3)
- Service Portal for Enterprise Service Management (com.glide.service-portal.esm)

1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
   - If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. If available, select the Load demo data check box.
   - Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
   - You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.
5. Click Activate.

**Features not yet supported on Knowledge Management Service Portal**

The following features are not yet supported on the Knowledge Management Service Portal:

- Article import on the Search results page
- Hierarchical categories on the Article view page
- Live Feed support for Social Q&A on the Article view page
- Tags added in Social Q&A are not honored in search results

The `glide.knowman.portal.enable_redirect` property is not honored for the following use cases:

- Contextual search in the Incident form
Knowledge Management Service Portal properties

The knowledge administrator can set configuration properties that determine how information is displayed on the Knowledge portal.

The following system properties are set to direct users to the Knowledge Management Service Portal homepage, and to specify the URL suffix for the homepage.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sn_km_portal.glide.knowman.serviceportal.enable_redirect</td>
<td>Directs users to the desired Knowledge homepage.</td>
</tr>
<tr>
<td></td>
<td>• Set to true to direct users to the Knowledge Management Service Portal homepage.</td>
</tr>
<tr>
<td></td>
<td>• Set to false to direct users to the Knowledge Management v3 homepage.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This property is not honored for the following use cases:</td>
</tr>
<tr>
<td></td>
<td>• Contextual search in the Incident form</td>
</tr>
<tr>
<td></td>
<td>• Connect</td>
</tr>
<tr>
<td>sn_km_portal.glide.knowman.serviceportal.portal_url</td>
<td>The URL suffix for the Knowledge Management Service Portal. The default is kb.</td>
</tr>
</tbody>
</table>

The Knowledge Management Service Portal supports the Knowledge Management V3 properties. Configuring widget instance options on the portal pages can override these properties.

Knowledge Management Service Portal pages

The Knowledge Management Service Portal includes a homepage, a search results page, and an article view page.

**Homepage**

The Knowledge Management Service Portal landing page. This page includes a search bar, knowledge bases, and lists of knowledge articles.

- Users can search for information, explore knowledge bases, and view featured articles.
- Administrators can customize the page layout, add knowledge bases, and add article collections (for example, a list of the most viewed articles).

**Search results page**

This page displays a list of search results and includes several options for sorting and filtering the information.
• Users can sort and filter search results in multiple ways.
• Administrators can customize the page layout, configure the sort and filter widgets to use any field on the Knowledge (kb_knowledge) table, and also configure the filter widgets to use custom queries.

**Article view page**

This page displays the selected knowledge article or social Q&A item.

• Users can view articles and provide comments and ratings. If enabled, users can subscribe to articles, view article versions, and create incidents for articles that are rated as not helpful. Users can also view and edit questions and provide comments or answers.
• Administrators can customize the page layout and enable or disable user actions, such as creating an incident for an article. Administrators can also activate the plugins to enable article versioning and article subscriptions.

**Knowledge Management Service Portal homepage**

The Knowledge Management Service Portal homepage displays knowledge articles and social Q&A items organized by knowledge base and category, as well as featured content and popular articles.

To view the Knowledge Management Service Portal homepage, navigate to one of the following:

• Self Service Knowledge
• Knowledge Homepage

**Note:** To use the Knowledge Management Service Portal, activate the Knowledge Management - Service Portal plugin (com.snc.knowledge_serviceportal) and enable the glide.knowman.serviceportal.enable_redirect property.
The Knowledge Management Service Portal homepage includes the following:

**Header**

The header contains a search bar and counters that display the number of available knowledge bases and the total number of knowledge articles and social Q&A items.

**Knowledge bases**

Each knowledge base is represented by a tile that includes the knowledge base icon and name. Icons and counters below the knowledge base name display the number and type of items stored in the knowledge base, such as articles and questions. By default, tiles are ordered alphabetically by knowledge base name.

**List collections**

Lists of articles, including featured, most useful, and most viewed articles. By default, these lists display articles by the article Short description and include information such as the author name, number of views, and average rating.

**Note:** The Knowledge Management Service Portal homepage is mobile responsive.

### Using the homepage

From the Knowledge Management Service Portal homepage, you can do the following.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Search for information</td>
<td>Use the search bar to search knowledge bases and social Q&amp;A.</td>
</tr>
<tr>
<td>View knowledge bases</td>
<td>Knowledge bases available to the user are arranged in alphabetical order.</td>
</tr>
<tr>
<td>View articles</td>
<td>Select articles from the article collection lists.</td>
</tr>
<tr>
<td>Ask a question</td>
<td>This action is available to logged in users with the knowledge role. Click Ask a Question, which opens a question page. Fill in the Question and Question details fields, and click Post question to post the question.</td>
</tr>
<tr>
<td>Create an article</td>
<td>This action is available to logged in users with the knowledge role. Click the Overflow icon (*** ) and select Create Article, which opens a new Knowledge record with an assigned number. Fill in the fields and click Submit to return to the Knowledge Management Service Portal.</td>
</tr>
<tr>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Subscribe to a knowledge base</td>
<td>This action is available to logged in users; availability is based on knowledge subscriptions user roles. Click Subscribe at the top of a knowledge base tile to subscribe to that knowledge base. Unsubscribe by clicking Unsubscribe. See Knowledge subscriptions for more information.</td>
</tr>
</tbody>
</table>

Knowledge Management Service Portal search results page

The Knowledge Management Service Portal search results page displays a list of search results as well as options for sorting and filtering the items in the list.
Deleted Email Recovery
Forum > Outlook > Outlook 2016
Deleted Email Recovery:
Every email deleted from your OWA mailbox goes through the following process:
The email is moved to your Deleted Items folder. If you purge or remove items from the Deleted Items folder, the email is moved to the De:**
Ron Kettling < 0 Views < 8d ago > *""""""""""

What is Spam?
Forum > Outlook
Spam is a term used to describe unsolicited email messages. Spam is often used to refer to email messages that contain unsolicited commercial email (UCE) or unsolicited bulk email (UBE).
Ron Kettling < 1 View < 8d ago > *""""""""""

How to Deal with Spam
Forum > Outlook
When you receive a spam message, you can delete it or filter it. You can also mark it as spam or flag it.
Ron Kettling < 3 Views < 3y ago > *""""""""""

What are phishing scams and how can I avoid them?
Forum > Outlook
Phishing scams are typically fraudulent emails that contain links to websites that look legitimate but are actually designed to steal sensitive information. Here are some tips to avoid phishing scams:
Ron Kettling < 0 Views < 8d ago > *""""""""""

Create an Email Signature
Forum > Outlook 2016
To create a personalized email signature, open a new message. In the Message tab, click the Include group, click Signature, and then click Signatures. In the E-mail Signature tab, click New, and then type or paste your signature text. Click OK to save the signature.
Ron Kettling < 0 Views < 3y ago > *""""""""""
The Knowledge Management Service Portal search results page includes:

**Search results list**

The search results list includes knowledge articles, pinned articles, and social Q&A items. For knowledge articles, the search results include articles in which the short description, text content, or attached file content includes the search term. For social Q&A items, search results include answered and unanswered questions, and questions with accepted answers. The following information displays for each list item:

- The article short description or the question.
- The knowledge base in which the item is stored.
- The first two lines of text from the article or question.
- Information about the item such as the author name, the number of views, and rating information.
- An icon that represents the type of item.

**Search results list header**

The header displays the number of search results, which updates as the user selects and de-selects filters. Selected filter options appear just below the number of search results. The header also includes the available sort options.

**Filter facet widgets**

A number of filter facet widgets appear to the left of the search results list. Each filter facet widget includes a list of selectable options that can be used to refine the search results.

- Knowledge Base: lists the available knowledge bases
- Category: lists the available knowledge categories
- Author: lists the names of the authors for the knowledge articles included in the search results list
- Tags: lists the available knowledge tags
- Resource: lists the types of items available, such as knowledge articles and social Q&A
- Rating: lists article ratings from 0-5 stars (clicking a rating displays articles that have the selected rating and higher)
- Last Modified: lists selections based on the timing of knowledge item modifications such as Past Month or Past Week
- View Count: lists the knowledge item view counts such as More Than 50 or Less Than 10. Set the number of days to consider when calculating view count using the glide.knowman.view_age.days property.
Using the search results page

From the Knowledge Service Portal homepage, you can perform the following actions.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Perform a search</td>
<td>Use the search bar at the top of the page to search for additional information.</td>
</tr>
<tr>
<td>Sort the search results</td>
<td>Click a sort option in the search results list header to sort list items by relevance to the search term, number of views, newest, or alphabetical. Items are sorted in ascending order. Click the option again to sort in descending order.</td>
</tr>
</tbody>
</table>
| Filter the search results | Select options in the filter facet widgets to filter the items in the search results list. Clear selected filter options by:  
  • Deleting a single option from the search results list header.  
  • Clicking Clear all in the search results list header.  
  • Clicking Clear in the filter facet widget header. |
| View additional search results | Depending on the system setup, view additional search results using one of these options:  
  • Standard Pagination: displays the search results in multiple pages.  
  • Infinite Scroll: displays the search results while scrolling. |

Knowledge Management Service Portal article view page

The Knowledge Management Service Portal article view page displays the selected knowledge article, including the article number, short description, and article content.

If users select a question, the article view page displays the question, any answers to the question, and a text box for providing an answer.
Create An Email Signature

To create a personalized email signature:

1. Open a new message. On the Message tab, in the Include group, click Signature, and then click Signatures.
2. On the E-Mail Signature tab, click New.
3. Type a name for the signature, and then click OK.
4. In the Edit signature box, type the text that you want to include in the signature.
5. To format the text, select the text, and then use the style and formatting buttons to select the options that you want.
6. To add elements besides text, click where you want the element to appear, and then do any of the following:

<table>
<thead>
<tr>
<th>Options</th>
<th>How to</th>
</tr>
</thead>
<tbody>
<tr>
<td>To add an electronic business card</td>
<td>Click Business Card, and then click a contact in the Filed As list. Then click OK</td>
</tr>
<tr>
<td>To add a hyperlink</td>
<td>Click Insert Hyperlink, type in the information or browse to a hyperlink, click to select it, and then click OK</td>
</tr>
<tr>
<td>To add a picture</td>
<td>Click Picture, browse to a picture, click to select it, and then click OK. Common image file formats for pictures include .bmp, .gif, .jpg, and .png.</td>
</tr>
</tbody>
</table>

1. To finish creating the signature, click OK.

NOTE:
The signature that you just created or modified won't appear in the currently open message; it must be inserted into the message.
The Knowledge Management Service Portal article view page includes the following:

**Header**
For knowledge articles, the header includes the knowledge article number and enabled user actions. For questions, the header includes the question text.

**Knowledge article meta data**
Article information including the short description and author name, the date that the article was last modified, the number of views, and the average rating. If configured, it also includes article version information.

**Article or question content**
The text and images of the knowledge article or question.

**Feedback options**
Article feedback options include marking the article as helpful, rating the article, and providing a comment. Question feedback options include sharing a question, commenting on a question, providing an answer, and accepting an answer.

**List widgets**
The article view page includes the following list widgets for articles and questions:
- Most Recent Tasks
- Affected Products
- Most Viewed
- Most Useful
- Question Stats
- Recent Questions

From the Knowledge Service Portal article view page, you can do the following.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View content</td>
<td>View a knowledge article or question.</td>
</tr>
<tr>
<td>Edit an article</td>
<td>Users with contribute access can edit an article.</td>
</tr>
<tr>
<td>Flag an article</td>
<td>Users with contribute access can flag an article that contains incorrect or inappropriate content.</td>
</tr>
<tr>
<td>Subscribe to an article</td>
<td>This action is available to logged in users; availability is based on knowledge subscriptions user roles. Click Subscribe in the article header to subscribe to that knowledge article. Unsubscribe by clicking Unsubscribe. See Knowledge subscriptions for more information.</td>
</tr>
<tr>
<td>Copy the permalink to the article</td>
<td>Users can click Copy Permalink to copy the latest version of the article to the clipboard.</td>
</tr>
<tr>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Create an incident</td>
<td>If configured, the Create Incident link appears at the bottom of the article after the article is rated as not helpful.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Use the widget instance option for the article view page to enable the display of this link.</td>
</tr>
<tr>
<td>Provide feedback to an article</td>
<td>Feedback options include marking an article as helpful, providing a rating from one to five stars, and adding a comment. See Knowledge feedback for more information.</td>
</tr>
<tr>
<td>Post a question</td>
<td>All users can post a question.</td>
</tr>
<tr>
<td>Answer a question</td>
<td>All users can provide an answer to a question.</td>
</tr>
<tr>
<td>Accept an answer</td>
<td>The knowledge manager or the owner of a question can accept an answer as the correct answer.</td>
</tr>
<tr>
<td>Comment on a question or answer</td>
<td>All users can add a comment to a question or to an answer.</td>
</tr>
<tr>
<td>Edit a question, answer, or comment</td>
<td>All users can edit the questions, answers, and comments that they submit. Knowledge managers can edit questions, answers, and comments for the knowledge bases that they manage.</td>
</tr>
</tbody>
</table>

**Note:** For more information, see Social Q&A questions.

Enable external or public users to view knowledge articles from the Knowledge Service Portal

Enable knowledge articles on the Knowledge Management Service Portal to be visible to external or public users.

The Knowledge Management Service Portal plugin (com.snc.knowledge_serviceportal) must be enabled.

Role required: admin

If you are using Knowledge Management within the Customer Service application, you can automatically make knowledge public by activating and running the Make KM Service Portal Pages Public fix script after you install the Customer Service Management plugin (com.sn_customerservice).

If you are using Knowledge Management as a standalone application, perform the steps in this procedure.

1. Navigate to Service Portal Pages.
2. Search for kb_home and open it.
3. You have to be in the Global application to edit. If a message appears, click here to edit.
4. Perform one of the following actions.
To | Make knowledge service portal pages visible to public users
---|---
Do this | 1. Select the Public check box.  
2. Click Update.

To | Make knowledge service portal pages visible to external users
---|---
Do this | 1. Click the edit user roles icon.  
2. Select snc_external and click Done.  
3. Click Update.

5. Repeat these steps for kb_article_view and kb_search.
6. Perform one of the following actions.

<table>
<thead>
<tr>
<th>To</th>
<th>Do this</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable access to the knowledge base for public users</td>
<td>Ensure that no Can Read user criteria is defined in the knowledge bases you want to give access to.</td>
</tr>
</tbody>
</table>

| To | Enable access to the knowledge base for external users | Add Can Read access to the knowledge base. |

Knowledge Management Service Portal widgets

The Knowledge Management Service Portal uses a number of widgets to enable searches, display search results, and display articles and social Q&A.

The Knowledge Management Service Portal homepage, search results page, and article view page honor the Knowledge Management V3 system properties. If configured, widget instance options can override the system properties.

Users with the knowledge_admin or admin role can configure the widget instance options used on the Knowledge Management Service Portal pages. Use the control + right-click menu to access the widget instance options and configure a widget instance.

**Note:** Before configuring widget instance options, switch to the Knowledge Management - Service Portal scope.

**Homepage widgets:**
- Knowledge Homepage Search
- Knowledge Bases Browse
- Knowledge Featured Articles
- Knowledge Most Useful Articles
- Knowledge Most Viewed Articles

**Search results page widgets:**
- Knowledge Breadcrumbs
- Knowledge Search
- Knowledge Facet Header
- Knowledge Field Facet
- Knowledge Tags Facet
- Knowledge Resource Facet
- Knowledge Query Facet
- Knowledge Result Sort
- Knowledge Selected Filter
- Knowledge Result

Article view page widgets:
- Knowledge Breadcrumbs
- Knowledge Article Content
- Knowledge Article Helpful
- Knowledge Article Comments
- Knowledge Attachments
- Knowledge Attached Tasks
- Knowledge Affected Products
- Knowledge Most Viewed Articles
- Knowledge Most Useful Articles

Configure search widget instance options

Configure widget instance options for the search widgets on the Knowledge Management Service Portal homepage and search results page.

Role required: knowledge_admin or admin

The homepage uses the Knowledge Homepage Search widget and the search results page uses the Knowledge Search widget. Use the widget instance options to customize the search feature for these pages.

1. Navigate to the Knowledge Management Service Portal homepage or search results page.
2. Control + right-click the search bar.
3. Click Instance Options.
4. Configure the desired settings for the search widgets.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title of the search widget. The default for the homepage is Welcome to Knowledge.</td>
</tr>
<tr>
<td>Glyph</td>
<td>An icon that appears in the search bar.</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>The color of the search widget.</td>
</tr>
<tr>
<td>Bootstrap size</td>
<td>The size of the search widget.</td>
</tr>
<tr>
<td>CSS</td>
<td>See widget CSS for details.</td>
</tr>
<tr>
<td>Search Placeholder</td>
<td>Default text that appears in the search bar.</td>
</tr>
<tr>
<td>Allow Empty Search</td>
<td>Allow empty knowledge base searches. The default for the homepage uses the system property. The default for the search results page is Yes. For an empty search, the search results page returns all results.</td>
</tr>
<tr>
<td>Instance option</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Allow Instant Search On Keypress</td>
<td>Enables instant search results as you type a search term. The default for the search results page uses the system property.</td>
</tr>
<tr>
<td>Minimum Number of Characters for Search</td>
<td>The minimum number of characters required to generate a search.</td>
</tr>
<tr>
<td>Wait time (ms) between searches, if instant search is enabled</td>
<td>The time, in milliseconds, to wait between searches if the instant search feature is enabled. The default wait time is 500 ms.</td>
</tr>
<tr>
<td>Alternate URL Parameters for Search</td>
<td>Alternate parameters that appear in the search results URL. By default these parameters include keyword and query.</td>
</tr>
<tr>
<td>Alternate URL Parameters for Language</td>
<td>Alternate parameters that appear in the URL denoting the selected language.</td>
</tr>
</tbody>
</table>

5. Click Save.

Configure knowledge base tile widget instance options

Configure widget instance options for the knowledge base tile widgets on the Knowledge Management Service Portal homepage.

Role required: knowledge_admin or admin

The homepage uses the Knowledge Bases Browse widget to display knowledge base tiles.

1. Navigate to the Knowledge Management Service Portal homepage.
2. Control + right-click a knowledge base tile.
3. Click Instance Options.
4. Configure the desired settings for the knowledge base tile widgets.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title that appears above the knowledge base tiles. The default is Explore our Knowledge Bases.</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>The color of the widget.</td>
</tr>
<tr>
<td>CSS</td>
<td>See <a href="#">widget CSS</a> for details.</td>
</tr>
<tr>
<td>Order By</td>
<td>The order in which the knowledge base tiles appear on the homepage. Use any field on the Knowledge table. If this field is empty, tiles are displayed in alphabetical order. Other available options include article_count.</td>
</tr>
<tr>
<td>Reverse Order</td>
<td>Enable this check box to display knowledge base tiles in the reverse order.</td>
</tr>
<tr>
<td>Post Question Label</td>
<td>The label on the button used to post a question. The default is Ask a Question.</td>
</tr>
<tr>
<td>Create Article Label</td>
<td>The label on the button used to create an article. The default is Create Article.</td>
</tr>
</tbody>
</table>
## Configure sort widget instance options

Configure widget instance options for the knowledge sort widget on the Knowledge Management Service Portal search results page.

**Role required:** knowledge_admin or admin

The search results page uses the Knowledge Result Sort widget to provide sort options for the returned list of results. Use the widget instance options to customize the sort options.

1. Navigate to the Knowledge Management Service Portal search results page.
2. Control + right-click the sort options at the top of the results list.
3. Click Instance Options.
4. Configure the desired settings for the sort widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap color</td>
<td>The color of the search widget.</td>
</tr>
<tr>
<td>CSS</td>
<td>See <a href="#">widget CSS</a> for details.</td>
</tr>
<tr>
<td>Hide Relevancy</td>
<td>Removes the relevancy sort option.</td>
</tr>
<tr>
<td>Table</td>
<td>The table that contains the fields used to sort the list of knowledge items. The default table is Knowledge.</td>
</tr>
<tr>
<td>Sort Fields</td>
<td>The fields used for sorting the list of knowledge items.</td>
</tr>
<tr>
<td>Sort Field Labels</td>
<td>The labels for the fields that appear in the sort options. The default is Views:desc,Newest:desc,Alphabetical. The sort order for the sort field labels is ascending. To use a descending order, denote :desc.</td>
</tr>
</tbody>
</table>

5. Click Save.

## Configure article list widget instance options

Configure widget instance options for the article lists on the Knowledge Management Service Portal homepage.

**Role required:** knowledge_admin or admin

The homepage uses the Article List widget to display different lists of articles, including Featured, Most Useful, and Most Viewed.

1. Navigate to the Knowledge Management Service Portal homepage.
2. Control + right-click one of the article list headers.
3. Click Instance Options.
4. Configure the desired settings for the article list widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title of the article list.</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>The color of the widget.</td>
</tr>
<tr>
<td>Glyph</td>
<td>An icon that appears in the widget.</td>
</tr>
<tr>
<td>CSS</td>
<td>See <a href="#">widget CSS</a> for details.</td>

</table>
5. Click Save.

Configure filter facet widget instance options

Configure widget instance options for the filter facet widgets on the Knowledge Management Service Portal search results page.

Role required: knowledge_admin or admin

The homepage uses several widgets to filter the items in the search results list. There are two types of facet widgets:

- Simple field facets based on the Knowledge table fields
- Advanced query facets based on custom queries of the Knowledge table

Use the widget instance options to customize these facet widgets:

- Knowledge Field Facet (for filtering by knowledge base, knowledge category, and author)
- Knowledge Tags Facet (for filtering by tag)
- Knowledge Resource Facet (for filtering by resource, such as articles and social Q&A)
- Knowledge Query Facet (for filtering by rating, last modified, and number of views)

1. Navigate to the Knowledge Management Service Portal search results page.
2. Control + right-click a filter facet widget.
3. Click Instance Options.
4. Configure the desired settings for the selected type of facet widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title of the filter facet widget.</td>
</tr>
<tr>
<td>Glyph</td>
<td>An icon that appears to the left of the title.</td>
</tr>
<tr>
<td>Order</td>
<td>The order in which the filter facet widgets appear on the left side of the search results page. If empty, the filter facet widgets sort alphabetically.</td>

</tr>
<tr>
<td>Show Empty Value</td>
<td>If enabled, shows an empty filter facet option that users can select to filter for articles that do not have this field set. For example, if an article does not have an assigned category, clicking the empty option lists all articles with no assigned category.</td>
</tr>
<tr>
<td>Show Only Facet Values Matching Results</td>
<td>Creates a dynamic filter facet widget that displays only those filter values that match the search results rather than showing all values. Disabling this instance option can reduce the time needed to load the filter facet data.</td>
</tr>
</tbody>
</table>

5. Click Save.

Configure a user action for the article view page

Configure a user action for the Knowledge Management Service Portal article view page.

Role required: knowledge_admin or admin

The article view page uses the Knowledge Article Content widget to provide user actions. Use the widget instance options to customize these actions.

User actions available for the article view page appear in a menu after clicking the overflow icon ( três ) in the article header. These actions enable users to flag an article, edit an article, or create an incident for an article.

1. Navigate to the Knowledge Management Service Portal article view page.
2. Control + right-click the article header.
3. Click Instance Options.
4. Configure the desired settings for the Knowledge Article Content widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap color</td>
<td>The color of the widget header.</td>
</tr>
<tr>
<td>CSS</td>
<td>See widget CSS for details.</td>

<tr>
<td>Create Incident Action Label</td>
<td>The label for the user action that appears in the overflow icon menu. The default is Create Incident.</td>
</tr>
<tr>
<td>Create Incident Action URL</td>
<td>The target URL for the Create Incident user action. If no URL is specified, the system uses the URL in the glide.knowman.create_incident_link system property.</td>
</tr>
</tbody>
</table>

5. Click Save.

Knowledge Management Service Portal navigation

Navigate to the various sections of the service portal to find the information you need.

From the homepage, navigate to:

- The search results page by entering a word or term in the search bar and pressing Enter.
- A knowledge base by clicking a knowledge base tile.
- A knowledge article by clicking the article short description in the Featured, Most Useful, or Most Viewed article lists.

From the search results page, navigate to a knowledge article or a question by clicking the short description in the search results list.

From an article view page, navigate to recent tasks, affected products, or other articles listed in the widgets to the right of the article.

Use the breadcrumb

The breadcrumb appears at the top of the Knowledge Service Portal search page and article view page. The breadcrumb displays the location of the page or article currently in view.

Click links in the breadcrumb to move to the homepage, knowledge base, or search results page.

Knowledge Management Service Portal searching

The Knowledge Management Service Portal homepage includes a search bar with type ahead search.

Users can enter a search term and press the Enter key, which redirects to the search results page. The search results include items in which the short description, content, or attached files include the search term. By default, knowledge search results include articles, pinned articles, and social Q&A.

Users can search for information on the Knowledge Management Service Portal homepage as well as filter the search results.
Search auto-correct feature

The Knowledge Management Service Portal homepage search tool also includes an auto-correct feature. When enabled, users can auto-correct a typing error in a search term by clicking one of the suggestions.

When a search term contains a misspelling, the search tool displays the search results page and includes one or more suggested terms at the top of the page under the heading Did you mean. Clicking one of these suggestions shows all of the search results that match the selected term.

Users with the system administrator role can enable this feature.

1. Navigate to System Properties Text Search.
2. Set the following properties to true:
   - Suggest alternate search spellings for knowledge or global search (glide.ts.dym.enable_spell_correct)
   - Suggest related searches for knowledge or global search (glide.ts.dym.enable_chain_suggest)
3. Click Save.

Knowledge Management Service Portal sorting

Use the sort feature on the search results list page to sort knowledge articles and social Q&A in a variety of ways.

Sort the items in a knowledge base or search results list using the Sort by options at the top of the list.

- Views: sorts by number of article views.
- Newest: sorts by the date created or updated.
- Alphabetical: sorts alphabetically by the article Short description field.
- Relevancy: sorts by relevance to the search term.

By default, the selected option sorts in descending order. Click the option again to sort in ascending order.

The system saves the last selected sort option. When you navigate away from the search results page and then return, this sort option is retained.

Sorting by language

You can also sort articles by language if the I18N: Knowledge Management Internationalization Plugin v2 (com.glideapp.knowledge.i18n2) is activated.

Activating this plugin adds a language link at the top of the search results page. To sort by language, click this link and select the desired language from the drop-down menu. The search results list displays items in the selected language.
Knowledge Management Service Portal filtering

Filter knowledge base information or a list of search results using the filter facet widgets on the search results page.

The search results page includes multiple ways to filter the results using filter facet widgets. These widgets are listed in a column on the left side of the page and can be expanded and collapsed as needed. Refine results by expanding a filter and selecting specific items. Selections appear at the top of the search results list. By default, you can filter by:

- Knowledge Base: lists the available knowledge bases
- Category: lists the available knowledge categories
- Author: lists the names of the authors for the knowledge articles included in the search results list
- Tags: lists the knowledge tags for the items in the search results list.
- Resource: lists the types of items available, such as knowledge articles and social Q&A. For social Q&A, you can also filter for unanswered and answered questions, and question with answers that have been accepted.
- Rating: lists article ratings from 0-5 stars (clicking a rating displays articles that have the selected rating and higher)
- Last Modified: lists selections based on the timing of knowledge item modifications such as Past Month or Past Week
- View Count: lists the knowledge item view counts such as More Than 50 or Less Than 10

The selections that you make filter the items displayed in the search results list. The search results list updates to display only those items that match your selections. Deleting a selection reverses the filtering in the list. The number of matching results displayed at the top of the list changes as you add and remove filters.
Clear filter selections in the following ways:

- The Clear button at the top of a filter widget clears all of the selections in that widget.
- The Clear all button at the top of the search results list clears all of the widget selections.
- Clear individual filters at the top of the search results list by clicking the X in the filter name.

Integrating new knowledge portal pages with the service portal

Using the base system service portal, access the improved version of the knowledge portal that features an enhanced landing page with multiple knowledge bases, an article view page that includes new article widgets, and the search results page that displays global knowledge search results.

To access the enhanced knowledge portal pages from the service portal, as a system administrator, you can configure the following in the service portal:

**Note:** The knowledge portal page integrations described in this section can only be performed in the base system service portal.

- Link the Knowledge header menu and the Knowledge Base tile widget to point to the new Knowledge Management Service Portal homepage.
- Configure the type ahead and global knowledge search results links that currently point to the previous version of the knowledge portal article view page to point to the new Knowledge Management Service Portal article view page.
- Add a knowledge search widget to perform a highly configurable global knowledge search in the Knowledge Management Service Portal search results page.
- Replace the Top Rated article widget with one of the new widgets provided in the Knowledge portal.

Configure the knowledge header menu and tile widget

Access the new knowledge portal home page using the Knowledge header menu and the Knowledge Base tile widget in the service portal.

Role required: admin

1. Configure the Knowledge header link to point to the knowledge portal home page.

   ![Knowledge link on service portal header](image)

   **Figure 297: Knowledge link on service portal header**

   a) Navigate to Service Portal Portals.
   b) In the Service Portals list, select the Service Portal record.
   c) In the KB home page field, enter kb_home.
   d) Click Update.

   When you click Knowledge in the service portal header menu, it takes you to the knowledge portal home page.

2. Configure the Knowledge Base tile widget to link to the knowledge portal home page.
Figure 298: Knowledge tile widget

a) Navigate to the service portal page.

b) Control + right-click the knowledge base tile widget and select Instance Options.
   The Knowledge Base form appears.

c) In the Page field, change the value from kb_view to kb_home.

d) Click Save.

When you click the Knowledge Base tile widget in the service portal page, it takes you to the knowledge portal homepage.

Configure the knowledge portal URL to link to the article view page

Use the service portal to access the new knowledge portal article view page that features type ahead search and a highly configurable search results page.

Role required: admin

You must configure the type ahead knowledge portal link and knowledge global search results link in the knowledge base search source and in the service catalog search source, to point to the Knowledge Management Service Portal article view page.

1. Configure the type ahead knowledge portal link and the knowledge global search results link in the knowledge base search source.
   a) Navigate to Service Portal Search Sources and click the Knowledge Base search source.
   b) In the Search page template field, change the following line of code from:
      "?id=kb_article_view&amp;sys_kb_id={{item.sys_id}}"
      to "?id=kb_article&amp;sys_id={{item.sys_id}}"
c) In the Data Source tab, go to the Data fetch script field and add the following line of code:

```javascript
article.url = '?id=kb_article_view&sys_kb_id=' + kb.sys_id;
```
data.article_count = kb.getRowCount();

var kbCount = 0;
while (kb.next() && kbCount < data.limit) {
    // Does user have permission to see this item?
    if (!sp.canReadRecord("kb_knowledge", kb.getUniqueValue()))
        continue;

    var article = {};
    sp.getRecordDisplayValues(article, kb, 'sys_id, number, short_description, published, text');
    article.publishedTC = kb.getValue('published');
    article.type = "kb";
    if (article.text)
        article.text = $sp.stripHTML(article.text) = "";
    article.score = parseInt(kb.ir_query_score.getDisplayValue());
    article.label = article.short_description;
    article.priority = article.short_descriptions;

    article.url = '/id=' + kb_article_view_sys_kb_id + ' + kb.sys_id';
    results.push(article);
    kbCount++;
}

sp.logSearch('kb_knowledge', data.q, kb.getRowCount());
return results;
d) Right-click the form header and click Save.

2. configure the type ahead-knowledge portal link and the knowledge global search results link in the service catalog search source.
   a) Navigate to Service Portal Search Sources and click the Service Catalog search source.
   b) In the Search page template field, change the href tag to the following:

   ```html
   <a ng-if="item.content_type == "kb"" ng-href="?id=kb_article&sys_id=::{::item.kb_article}" class="h4 text-primary m-b-sm block">
   ```
c) In the Data Source tab, go to the Data fetch script field and change the code in line 45 to the following:

```javascript
item.url = '?id=kb_article_view&sys_kb_id=' + kb.sys_id;
```
3. Click Update.
The knowledge results from type ahead and global search in the service portal point to the new knowledge portal article view page.

*Enable search on all knowledge bases* on page 1437.

**Add a knowledge search widget to the Service Portal**

Create and add a new widget to the service portal search results page to navigate to the enhanced knowledge search results page.

Role required: admin

Create and add a Search Within knowledge widget to the service portal and link it to the Knowledge global search results page.

1. **Create a new widget** named Search Within, using the following settings:

   **Table 559: Field values to create a new knowledge search widget**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
</table>
   | HTML Template  | `<div role="list" class="list-group">  
   |                |   <span class="list-group-item active">${Search Within}</span>  
   |                |   <a role="link" class="list-group-item" ng-href="{{data.url}}">  
   |                |   ${Knowledge}</a> </div>`                                               |
   | Server Script  | `(function() {  
   |                |   var q = encodeURIComponent($sp.getParameter('q'));  
   |                |   var kb = $sp.getValue('kb_knowledge_base') || "";  
   |                |   data.url = '/sp?id=kb_search';  
   |                |   if(q)  
   |                |     data.url += "&keyword="+q;  
   |                |   if(kb)  
   |                |     data.url += "&kb_knowledge_base="+kb;  
   |                | })());`                                                                  |

2. Add the widget to the service portal search results page.
   
   a) Navigate to the service portal search page (https://<instance>.service-now.com/sp?id=search) in designer mode.
   
   b) In the Filter Widget search box, search for the Search Within widget and drag it into the container where you want the widget to appear in the service portal search results page.
The Search Within widget is added to the service portal search results page. In the service portal, when you click Knowledge in the Search Within widget, and search for a keyword, it redirects you to the knowledge global search results page.

Add knowledge quick-access widgets

Add Featured Articles, Most Useful Articles, and Most Rated Articles knowledge widgets to the service portal page.

Role required: admin

Replace the existing Top Rated knowledge widget in the service portal with one or more of the knowledge quick-access widgets.

The following knowledge quick-access widgets are available to be added to the service portal:

- Featured Articles
- Most Useful Articles
- Most Viewed Articles

1. Navigate to the service portal home page in designer mode.
2. In the Filter Widget search box, search for the widget you had created and drag it into the container in the location you want the widget to appear in the service portal home page.

Note: You can click Preview to verify the location and appearance of the newly added widget.

When you click a link in the newly added quick-access widget from the service portal, it takes you to the knowledge portal page.
Knowledge subscriptions

Subscribe to knowledge bases and knowledge articles and receive email notifications about new articles and article revisions or comments.

With the Knowledge Management knowledge subscription feature, users can subscribe to both knowledge bases and knowledge articles.

- Knowledge base owners are auto-subscribed to all articles in the knowledge bases they own. They receive email notifications when new articles are created or revised in the knowledge base.
- Knowledge authors are auto-subscribed to the articles they create. They receive email notifications when the articles they created are checked out or revised by other authors, and if the articles receive user comments.

Users can set their Knowledge notification preferences using System Settings.

- Users who subscribe to a knowledge base receive email notifications when new articles are created in the knowledge base or if the existing articles are revised.
- Users who subscribe to an article receive email notifications when the article is revised.

The knowledge subscription feature is available for both the Knowledge Management v3 user interface and the Knowledge Management Service Portal.

Activate the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) to use the knowledge subscription feature. The Knowledge Management Advanced plugin activates the Subscriptions and Activity Feed Framework plugin (com.snc.activity_subscriptions).

Note: The Knowledge Management Advanced plugin is not activated by default.

If the article versioning feature is enabled, the following notifications are also sent:

- An article is checked out
- An article is revised
- A new version of an article is published

Before using the article subscription feature, the system administrator must:

1. Activate the Knowledge Management Advanced plugin.
2. Configure the knowledge subscription properties.
3. If necessary, customize the article subscription email notification templates.

Configure knowledge subscription properties

These properties enable the knowledge subscription feature, identify the roles that can use the feature, and identify the article states that generate notifications.

Role required: knowledge_admin or admin

1. Navigate to Knowledge Administration Properties.
2. In the KM Subscription Properties section, configure the following properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable subscribe feature for KM</td>
<td>Enables or disables the Knowledge Management knowledge subscriptions feature.</td>
</tr>
</tbody>
</table>
Property | Description
---|---
List of roles (comma-separated) who can have subscription feature | A comma-separated list of the roles that can use the knowledge subscriptions feature and subscribe to knowledge bases and articles.

**[glide.knowman.enable_km_subscription.roles]**

List of workflow states (comma-separated) that can have subscription feature | A comma-separated list of the article states for which the knowledge subscription feature is available. The default states include Draft, Review, and Published.

**[glide.knowman.enable_km_subscription.workflow_state]**

3. **Click Save.**

**Knowledge subscription email notification templates**

The knowledge subscription feature uses email notification templates to send subscription notifications to knowledge users.

<table>
<thead>
<tr>
<th>Email template</th>
<th>Subscription type</th>
</tr>
</thead>
<tbody>
<tr>
<td>KM Subscription: Article created</td>
<td>Knowledge base</td>
</tr>
<tr>
<td>KM Subscription: Article revised in KB</td>
<td>Knowledge base</td>
</tr>
<tr>
<td>KM Subscription: Article checked out</td>
<td>Knowledge article</td>
</tr>
<tr>
<td>KM Subscription: Article revised</td>
<td>Knowledge article</td>
</tr>
<tr>
<td>KM Subscription: Article commented</td>
<td>Knowledge article</td>
</tr>
</tbody>
</table>

Users with the admin or knowledge_admin role can customize these email notification templates. To locate the template, navigate to System Notifications Email Notifications. For more information about customizing a template, see [Create an email notification](#). Subscriptions notifications include a link at the bottom of the email to the user's Notification Preferences page.

**Subscribe to a knowledge base**

Subscribe to a knowledge base and receive notifications when articles are added to that knowledge base.

Role required: knowledge

Users can subscribe to a knowledge base from either the Knowledge Management v3 user interface or the Knowledge Management Service Portal.

1. **Navigate to Knowledge Homepage.**
2. **Click the Subscribe link on the knowledge base tile.**
   The link changes to Subscribed and includes a check mark.

**Subscribe to a knowledge article**

Subscribe to a knowledge article within a knowledge base.

Role required: knowledge

Users can subscribe to a knowledge article from either the Knowledge Management v3 user interface or the Knowledge Management Service Portal.
Note:
Users who are already subscribed to a knowledge base are also subscribed to the articles within that knowledge base.

To subscribe to articles from the base service portal (https://<instance name>/sp?), you must navigate to the Knowledge Management Service Portal pages (for example: https://<instance name>/sp?id=kb_home) from the base service portal.

1. Navigate to Knowledge Homepage.
2. Click Subscribe at the top of the knowledge article.
   The system displays an information message about the article subscription and the button toggles to Subscribed.

Unsubscribe from a knowledge base
Unsubscribe from a knowledge base.
Role required: knowledge

Users can unsubscribe from a knowledge base from either the Knowledge Management v3 user interface or the Knowledge Management Service Portal.

Note: If you subscribe to an article and then subscribe to the knowledge base, unsubscribing from the knowledge base also unsubscribes you from the article.

1. Navigate to Knowledge Homepage.
2. Point to and click the Subscribed link on the knowledge base tile, which toggles to Unsubscribe.
   After unsubscribing you from the knowledge base, the link toggles to Subscribe.

Unsubscribe from a knowledge article
Unsubscribe from a knowledge article.
Role required: knowledge

Users can unsubscribe from a knowledge article from either the Knowledge Management v3 user interface or the Knowledge Management Service Portal.

Note: If you are subscribed to a knowledge base and you unsubscribe from an article in that knowledge base, you must also unsubscribe from the parent knowledge base.

1. Navigate to Knowledge Homepage.
2. Point to and click Subscribed, which toggles to Unsubscribe.
   If you are subscribed to the knowledge article, this action results in an information message that the article subscription has been removed. If you are also subscribed to the parent knowledge base, proceed to the next step.
3. If you are subscribed to the parent knowledge base, click Yes on the Unsubscribe pop-up window.
   This action results in an information message that the knowledge base subscription has been removed.
Set knowledge subscription notification preferences

Set notification preferences for knowledge bases and knowledge articles.

Role required: knowledge

Users can set notification preferences from the Knowledge menu or from the Knowledge Management Service Portal.

1. Navigate to the Notification Settings page.

<table>
<thead>
<tr>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From the Knowledge application</td>
<td>Click the Notification Settings module.</td>
</tr>
<tr>
<td>From the Knowledge Management Service Portal</td>
<td>Click the user name in the portal header and then click Notification Settings.</td>
</tr>
</tbody>
</table>

2. Click the Notification Preferences tab.
3. Click Knowledge Base and enable or disable the knowledge base notification options.
4. Click Knowledge Articles and enable or disable the knowledge article notification options.

Manage knowledge subscriptions

Manage knowledge base and knowledge article subscriptions from the Notification Settings page.

Role required: knowledge

Users can manage knowledge subscriptions from the Knowledge application or from the Knowledge Management Service Portal.

1. Navigate to the Notification Settings page.

<table>
<thead>
<tr>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From the Knowledge application</td>
<td>Click the Notification Settings module.</td>
</tr>
<tr>
<td>From the Knowledge Management Service Portal</td>
<td>Click the user name in the portal header and then click Notification Settings.</td>
</tr>
</tbody>
</table>

2. Click the Subscriptions tab.
3. Click Knowledge Base or Knowledge Articles to see a list of current subscriptions.
4. To unsubscribe from a knowledge base or knowledge article, click Subscribed. The link toggles to Unsubscribed.

Article quality index for knowledge management

Assess the quality of knowledge articles with the article quality index (AQI). The AQI helps maintain consistent quality of knowledge articles attached to a knowledge base where articles are written by various authors.

Using AQI feature, a knowledge administrator (a user with knowledge_admin role) creates a checklist and adds a set of true or false questions to the checklist to assess the quality of knowledge articles. For each question, the knowledge_administrator assigns a weight based on its importance to the quality measurement and then attaches the checklist to a knowledge base.

A knowledge reviewer (a user with knowledge_coach and knowledge_domain_expert role) performs AQI review on knowledge articles attached to the knowledge base by answering the true or false questions in the checklist. The article quality is then scored based on the cumulative weight of all answers set to true in the checklist.
Activating article quality index

The article quality index feature is activated with the Knowledge Management Advanced (com.snc.knowledge_advanced) plugin. For details see, *Activate the Knowledge Management Advanced plugin* on page 1378.

Create an AQI checklist

Create a checklist of questions that reviewers can use to evaluate the quality of knowledge articles.

Role required: knowledge_admin or admin

1. Navigate to Knowledge Article Quality Index AQI checklists, and click New.
2. Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Checklist</td>
<td>Name for the checklist.</td>
</tr>
<tr>
<td>Description</td>
<td>Description for the checklist.</td>
</tr>
</tbody>
</table>

3. Right-click the form header and click Save.
4. In the Checklist Questions related list, add questions to the checklist.

Add questions and adjust the weight of the questions until the combined weight of all questions is equal to 100. The weight defines the score that is added to the total AQI review score of the article when the answer for that question is set to true. The maximum score that can be applied to an article in an AQI review is 100.

**Note:** The default AQI pass score is 70. You can change the pass score in the Article Quality Index properties.

To add a question:

a) Click New.

b) Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Question</td>
<td>Text for the question to evaluate articles.</td>
</tr>
<tr>
<td>Description</td>
<td>Short description for the question.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Order  | Value for the display order of questions in the checklist. The lower the value in the Order field, the higher the question displays in the checklist.  

**Note:** Before you assign a value for the display order, think about how many questions you would create for the checklist. For example, if you have five questions in a checklist, you can assign the value in increments of 20. This ensures that you have enough values to assign if you add questions to the checklist later. |
| Weight | A value for the question to score the article quality. This value is added to the AQI score when the answer for the question is set to true.  

**Note:**  
- The combined weight of all questions cannot exceed 100.  
- The sum of weights of all questions in a checklist must be equal to 100 to be assigned to a knowledge base. |

c) Click Submit.

5. After you finish adding questions to the checklist, click Update on the AQI Checklist form.

After you create a checklist, [assign it to a knowledge base](#).

**Assign an AQI checklist to a knowledge base**

Before a knowledge reviewer can start performing the AQI review, you must assign an AQI checklist to a knowledge base.

You can only assign a checklist to a knowledge base when the weight of all questions in the checklist is equal to 100. Each knowledge base can have one assigned checklist. However, a checklist can be assigned to more than one knowledge base.

Role required: knowledge_admin or admin
1. Navigate to Knowledge Administration Knowledge Bases.
2. Click a knowledge base to which you want to assign a checklist.
3. On the Knowledge Base form, click the search icon in the Checklist field and select the AQI checklist to apply.
4. Click Update.

After you assign an AQI checklist to a knowledge base, you can start performing AQI reviews.

### Remove an AQI checklist from a knowledge base

Before you can edit a checklist that is assigned to a knowledge base, you must remove it from the knowledge base.

A checklist with pending AQI reviews cannot be removed from the knowledge base until all AQI reviews associated with the checklist are complete.

Role required: knowledge_admin or admin

1. Navigate to Knowledge Administration Knowledge Bases.
2. Click a knowledge base from which you want to remove a checklist.
3. On the Knowledge Base form, delete the name of the AQI checklist from the Checklist field.
4. Click Update.

### Delete questions from an AQI checklist

Deleting a question in a checklist deletes the text in the question of previously performed AQI reviews that use the checklist. Deleting an AQI question from a checklist will not affect the score of the previously performed AQI reviews. However, the text of the question will not be displayed in the checklist.

You can delete questions from a checklist if the following conditions are met:

- The checklist is not attached to a knowledge base. For more information, see Remove an AQI checklist from a knowledge base on page 1505.
- There are no AQI reviews using the checklist in progress.

Role required: admin

1. Navigate to Knowledge Article Quality Index AQI checklists.
2. Click the AQI checklist from which you want to delete one or more questions.
3. In the Checklist Questions related list, select the check box next to the questions that you want to delete.
4. From the Actions on Selected Rows choice list, select Delete.
5. In the Confirmation window, click Delete.

### Perform an AQI review

Perform the AQI review to evaluate the quality of the article.

The knowledge base must have an assigned AQI checklist.

Role required: knowledge_domain_expert, knowledge_coach, knowledge_admin, or admin

Configure the glide.knowman.aqi.article_workflow_states property to set the article workflow states where you could perform AQI reviews. You can perform several AQI reviews for an article. If you perform several
AIOI reviews for the same version of the article, the latest AIOI score appears in the Latest AIOI field in the article.

1. Navigate to Knowledge Articles Published, and click on an article to perform the AIOI review.
2. Perform one of the following actions:

<table>
<thead>
<tr>
<th>Option</th>
<th>Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>The AIOI review is not yet started.</td>
<td>Click Perform AIOI in the form header.</td>
</tr>
<tr>
<td>The AIOI review was started and is pending.</td>
<td>Click Continue AIOI in the form header.</td>
</tr>
</tbody>
</table>

An Article Checklist Summary form appears.

3. In the Article Checklist Answers related list, read the questions and evaluate which ones are true. Double-click the Answer cell for each question that is true, select true, and click the green check mark.

   **Note:** The associated Weighted Score is applied to the AIOI score when the answer is set to true.

4. Perform one of the following actions:
Submit the completed AQI review.

<table>
<thead>
<tr>
<th>To</th>
<th>Do This</th>
</tr>
</thead>
</table>
| To submit the completed AQI review. | Click Submit. The form refreshes and the total score of the AQI review is displayed in the AQI score field. The system sends an email notification as follows:  
  • If the AQI review was performed on the first version of the article, the system sends an email notification to the author of the article.  
  • If the AQI review was performed on subsequent versions of the article, the system sends an email notification to the author and creator of the article versions.  
  Note: The notification includes the AQI review score and AQI review result. You can customize the content and design of the notification emails. |

Save the pending review to complete later.

<table>
<thead>
<tr>
<th>To</th>
<th>Do This</th>
</tr>
</thead>
<tbody>
<tr>
<td>To save the pending review to complete later.</td>
<td>Click Update and return to the Article Checklist Summaries list. The checklist with pending reviews is added to the My Pending AQI Checklists queue. When you want to complete the AQI reviews, navigate to Knowledge My Pending AQI Checklists and complete the reviews.</td>
</tr>
</tbody>
</table>

To view all the AQI reviews you completed, navigate to Knowledge My Completed AQI Checklists.

View all pending and completed AQI reviews

View checklists of all users to monitor the pending and completed reviews.  
Role required: knowledge_admin or admin  
1. Navigate to Knowledge Article Quality Index  
2. Do one of the following:  
   • To view all completed AQI checklists, select All Completed AQI Checklists.  
   • To view all pending AQI checklists, select All Pending AQI Checklists

Knowledge article templates

Article templates have pre-defined fields structured in a specific order. These templates help create a consistent structure for knowledge articles.  
Using the Knowledge Article Templates feature, as a knowledge administrator (a user with knowledge_admin role), you can create article templates, add or customize fields in a template, and activate or deactivate a template.
As a security administrator (a user with security_admin role), you can configure field-level security in any template to make it visible to specific users.

As an author, you can create articles using pre-defined article templates or any newly created article templates.

**Pre-defined knowledge article templates**

Use either the Standard template or one of the pre-defined How To, What Is, FAQ or KCS article templates.

---

**Note:**

When you upgrade from a previous release version of Knowledge Management, all existing articles from that release version automatically use the Standard template.

All pre-defined templates are inactive by default. If you do not activate a template, the articles automatically use the Standard template. As a knowledge admin, you can activate a template by navigating to Knowledge Administration Article Templates. Then in the article template list, set the Active field to true for one or more templates you would like to activate.

The table below lists the fields available in each template and the name of the template table.

---

### Table 561: Pre-defined knowledge article templates

<table>
<thead>
<tr>
<th>Template name</th>

---

**Activating knowledge article templates**

The Knowledge Article Templates feature is activated with the Knowledge Management Advanced (com.snc.knowledge_advanced) plugin. For details, see *Activate the Knowledge Management Advanced plugin* on page 1378.

© 2018 ServiceNow. All rights reserved.
Create an article template

Create new article templates in addition to the pre-defined templates. Add new fields based on how you want to customize and display your content.

Role required: knowledge_admin or admin

For each new article template, a child table of the Knowledge [kb_knowledge] table is created. When you add a new field to the template, a new column is added to that table created for the template.

1. Navigate to Knowledge Administration Article Templates, and click New.
2. Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the article template.</td>
</tr>
<tr>
<td>Description</td>
<td>Description for the article template.</td>
</tr>
<tr>
<td>SEO Description Tag</td>
<td>Article template field name. The content in this field is used as meta description tags to search for articles created using this article template.</td>
</tr>
</tbody>
</table>

The Active check box is selected by default making the template available for use.

3. Right-click the form header and click Save.
4. In the Article Templates Field related list, add fields to the template.

To add a field:

a) Click New.
b) Fill in the following fields as required:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field Name</td>
<td>Title to display on the template form.</td>
</tr>
<tr>
<td>Field Type</td>
<td>Available field types:</td>
</tr>
<tr>
<td></td>
<td>• HTML</td>
</tr>
<tr>
<td></td>
<td>• String</td>
</tr>
<tr>
<td></td>
<td>• Integer</td>
</tr>
<tr>
<td></td>
<td>• Date</td>
</tr>
<tr>
<td></td>
<td>• Date and time</td>
</tr>
<tr>
<td>Order</td>
<td>Position of the field in the article page view and the article edit view.</td>
</tr>
<tr>
<td>Article Template</td>
<td>(Read-only) Name of the article template associated with this field.</td>
</tr>
<tr>
<td>Template Table</td>
<td>(Read-only) Name of the table for this template.</td>
</tr>
<tr>
<td>Template Field</td>
<td>(Read-only) Name of the template column associated with this field.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>If checked, this field is mandatory.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>Active</td>
<td>If checked, this field displays in the template.</td>
</tr>
</tbody>
</table>

c) Click Submit.

The field is added to the template.

5. Configure the article template form to display the fields that you added to the template.

   **Note:** You must have the admin role to configure the form layout. If the field is not available in the form layout, use the form designer to configure the fields.

a) Navigate to Knowledge Articles Create New.
b) Select the template in which you want to display the fields.
c) Right-click the header and select Configure Form Layout
d) Select and move the required fields from the Available to the Selected list.
e) Click Save.

   **Note:** Authors who started a session before a template was created or activated will see the newly added template upon their next login.

Restrict access to fields in an article template

Use encryption context to set field-level security in article templates and display the fields based on user permissions.

Activate the Encryption Support plugin to enable field-level security using encryption context.

Role required: security_admin

2. In the Name field, enter a name for the encryption context and click Submit.
3. Set the Type field for a table to Encrypted Text.
   To set the Type field for a table to Encrypted text:
   a) Navigate to System Definition Dictionary.
   b) Select the table to set the Type field to Encrypted Text.
   c) In the Type field, select Encrypted Text.
   d) Click Update.

The field is configured for encryption context.

4. Configure roles that can view the fields configured for encryption context.
   To configure the roles that can view the fields:
   a) Navigate to User Administration Roles and select the role you want to assign permissions to view this field.
   b) In the Encrypted context field, select the name of the encryption context to apply for this role.
Generate SEO information for articles using article templates

Improve the searchability of knowledge articles by using the content in an article template field to generate SEO tags for articles created using that template.

Role required: knowledge_admin or admin

Note: If you are using the Standard article template, the content of the Text field is used to generate the tags.

You can define the number of characters to be used as tags in the glide.knowman.seo.pages.meta_description.length system property.

1. Navigate to Knowledge Article Templates.
2. Select an article template.
3. In the SEO Description Tag field, select an article template field.
4. Click Update.

Note: You can change which article template field is used for generating SEO. Changes are applied only to knowledge articles created or updated after the change was made. To apply the update to all existing published articles created using this template, run the Populate Meta Description on KB Articles fix script.

Integration with external knowledge sources

Use the external content integration feature to integrate content from various external sources and enable unified knowledge search results.

Users store and manage knowledge using various external sources and search each source separately for relevant results. External content integration enables acquiring and searching all WebDAV-compliant source content from a single location. This provides users with a seamless search experience across multiple knowledge sources and drives more usage to the platform.

Using this feature, knowledge administrators can define the external content to be imported into a knowledge base and periodically run a job to import the content. Knowledge users have a seamless user experience searching for relevant content across multiple knowledge sources.

Activate the External Content Integration plugin

The External Content Integration feature is activated with the Knowledge Management - External Content Integration plugin (com.snc.knowledge.external_integration).

Role required: admin

The Knowledge Management - External Content Integration plugin is not active by default.

The following plugins are automatically activated when the Knowledge Management - External Content Integration plugin is activated:

• Centralized Connection and Credentials plugin (com.snc.core.automation.connection_credential)
- **Knowledge Management V3 plugin** (com.snc.knowledge3)
- **Knowledge Management Advanced Installer plugin** (com.snc.knowledge_advanced.installer)

The Knowledge Administration module displays the External Knowledge Sources and External Knowledge Jobs sub-modules when the Knowledge Management - External Content Integration plugin is activated.

1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   
   If the plugin depends on other plugins, these plugins are listed along with their activation status.

   If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).

4. If available, select the Load demo data check box.
   
   Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.

   You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.

5. Click Activate.

Define an external knowledge source

Before you import content, create and configure the connection between the a Web Distributed Authoring and Versioning (WebDAV) - compliant external knowledge source and the ServiceNow knowledge base into which you want to import content. Define import parameters for the external knowledge source.

Define **basic authentication credentials** and create an **HTTP connection** to the external source.

---

**Caution:** This feature expects that the external source endpoint is a publicly accessible endpoint. Mid-server configuration is not supported.

Role required: admin

1. Define the connection from the external source and the target knowledge base.
   a) Navigate to Knowledge Administration External Knowledge Sources.
   b) Click New.
   c) Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Instruction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter unique name for the external source.</td>
</tr>
<tr>
<td>Target Knowledge Base</td>
<td>Select the knowledge base in which you want to create articles for the external content.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Select the connection alias to connect to the external source.</td>
</tr>
</tbody>
</table>
d) Right-click the form header and click Save.

2. Set import parameters for the external content.
   a) In the Parameter related list, click New.
   b) In the Name field, select the name of the parameter from the drop-down list.
   c) In the Value field, enter the desired value for the parameter.

   The table below lists the parameters and the corresponding values that can be set for the external source.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum size limit (in MB) for this source</td>
<td>Set maximum allowed content size for this source. Once this limit is reached, no further content is processed. Default value is 400 MB.</td>
</tr>
<tr>
<td>Maximum size limit (in KB) per file/content in this source</td>
<td>Set maximum allowed size limit for each file from this external source. If a file exceeds this limit, that file is not processed. Default value is 4000 KB.</td>
</tr>
<tr>
<td>Open search results in the original source system</td>
<td>Set value to true to open search results in the external source system. Set value to false to open search results in the target knowledge base. Default value is set to false.</td>
</tr>
<tr>
<td>Include folders with names that match these regex patterns</td>
<td>Enter a comma-separated list of regular expressions for folder names that need to be included from this external source.</td>
</tr>
<tr>
<td>Exclude folders with names that match these regex patterns</td>
<td>Enter a comma-separated list of regular expressions for folder names that need to be excluded from this external source.</td>
</tr>
<tr>
<td>Create articles when file names match these regex patterns</td>
<td>Enter a comma-separated list of regular expressions for file names that need to be included to create articles.</td>
</tr>
<tr>
<td>Do not create articles when file names match these regex patterns</td>
<td>Enter a comma-separated list of regular expressions for file names that need to be excluded to create articles.</td>
</tr>
<tr>
<td>Maximum retry limit</td>
<td>Maximum number of retries to send request to the external source.</td>
</tr>
</tbody>
</table>

d) Click Submit.

Import content from an external knowledge source

Run an import job manually or set up a schedule to process the integrated external content.

Role required: admin or knowledge_admin
Each external source is associated with two handlers: the Acquire handler and the Process handler, for running the import job. The acquire handler uses a WebDAV client to acquire external content to create articles. You can customize the process handler to assign categories to articles or populate additional metadata for the knowledge articles.

1. Navigate to Knowledge Administration External Knowledge Sources.
2. Select the external knowledge source from which you would like to import content.
3. In the Handler tab, set a schedule to run the acquire and process handlers.
4. In the Related Links section, click Run Scheduled Job.
5. To view all jobs scheduled to run to import content for the external source, click the Jobs.
   You can open the most recent job to monitor the status.

Open knowledge search results in source system

Configure the URL to the external source system to open articles from search results directly in the source system.

Make sure the Open search results in the original source system import parameter for the external knowledge source is set to true.

Role required: admin

1. Navigate to System Definition Script Includes.
2. Open KBWebDAVContentHandler.
3. In the Script window, override the function getFileURL using script shown below.
   The getFileURL function is shown below.
   ```javascript
   getFileURL: function(fileObj) {
     //write your logic here
   },
   ```
4. Click Update.

Sample configuration for integrating external knowledge content

You can integrate content from multiple external sources so your users can acquire and search knowledge from a single location. Use this sample configuration to create a connection to your external account, configure external knowledge sources, and import content to enable search results for unified content.

Requirements for integrating external content

Make sure the Knowledge Management -- External Content Integration plugin (com.snc.knowledge.external_integration) is enabled and your external source is WebDAV compliant.
Integrate external knowledge sources into the Knowledge Management application

Create authentication credentials and a connection alias to connect your external knowledge source to the ServiceNow Knowledge Management application. Define import parameters for your external source to import integrated content.

Role required: admin

1. Enable basic authentication on your external account.

   **Note:** Your external account password is not affected when you enable basic authentication.

2. Create the connection to your external account using the basic authentication credentials.
   a) Navigate to Connections and Credentials Credentials .
   b) Click New.
   c) Click Basic Auth Credentials.
      Fill in the following fields:

      | Field       | Description                                      |
      |-------------|--------------------------------------------------|
      | Name        | Name for the credential. For example, Demo_Auth. |
      | User name   | The external account user name created for basic authentication. |
      | Password    | The external account password for the user name. |

   d) Click Submit.

3. Create an HTTP connection to your external account.
   a) Navigate to Connections & Credentials Connection & Credential Aliases .
   b) Select New.
   c) In the Name field, enter the name of the connection alias. For example, Demo_Account.
   d) Right-click the form header and click Save.
   e) In the Connections related list, click New.
      Fill in the following fields:

<pre><code>  | Field   | Description                                                      |
  |---------|-----------------------------------------------------------------|
  | Name    | Name for the HTTP connection. For example, Demo_Connection.      |
  | Credential | Credential created to connect to the external account. For example, Demo_Auth. |
</code></pre>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection URL</td>
<td>WebDAV URL to your external account. This is the WebDAV end point of your external account.</td>
</tr>
</tbody>
</table>

**Note:** You can also import contents from a specific folder by appending the folder path to the URL. For example, https://<web link to your external_account>/KnowledgeIT.

f) Click Submit.

4. Configure the external knowledge source for importing content.
   a) Navigate to Knowledge Administration External Knowledge Sources.
   b) Click New and fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for the external source. For example, Demo_knowledge.</td>
</tr>
<tr>
<td>Target Knowledge Base</td>
<td>Knowledge base in which you want to create articles for the external content. For example, IT.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Connection alias to connect to the external source. For example, Demo_Account.</td>
</tr>
</tbody>
</table>

   c) Right-click the form header and select Save.
   d) In the Parameter related list, click New.
   e) On the Parameter form, select the name of the import parameter that you want to configure for your external source and then set the value for the parameter.

   The table below lists the parameters and the corresponding values that can be set for the external source.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum size limit (in MB) for this source</td>
<td>Maximum allowable content size to import from your external source. For example, 250 MB.</td>
</tr>
<tr>
<td>Maximum size limit (in KB) per file/content in this source</td>
<td>Maximum allowable size for each article, including attachments, that you can import from this external source. For example, 2000 KB.</td>
</tr>
<tr>
<td>Open search results in the original source system</td>
<td>Opens search results in the external source system if this value is set to true.</td>
</tr>
<tr>
<td>Include folders with names that match these regex patterns</td>
<td>Comma-separated list of regular expressions for folder names to include from this external source. For example, to include all folders names that start with the letters a and b, enter a.<em>,b.</em>.</td>
</tr>
</tbody>
</table>
### Parameter name | Value
--- | ---
Exclude folders with names that match these regex patterns | Comma-separated list of regular expressions for folder names to exclude from this external source. For example, to exclude all folders names that start with the letters a and b, enter `a.*,b.*`.  

Create articles when file names match these regex patterns | Comma-separated list of regular expressions for file names that to include when creating articles. For example, to include all file names have `.docx` and `.pdf` extensions, enter `.*\docx,.*\.pdf`.  

Do not create articles when file names match these regex patterns | Comma-separated list of regular expressions for file names to exclude when creating articles. For example, to exclude file names have `.docx` and `.pdf` extensions, enter `.*\docx,.*\.pdf`.  

Maximum retry limit | Maximum limit for the number of times a connection request can be sent to the external source. For example, 5.

---

*Import content from an external knowledge source.*

Automating feedback management to improve content

Manage high volumes of article feedback by enabling task generation for negative feedback. When an article is rated poorly or marked as unhelpful, a feedback task is generated and assigned to the author or reviser of the article.

The task assignee can update the article, create a new article, request additional feedback, or reassign the task and receives notification after the feedback is updated or resolved.

**Note:** Feedback tasks are only generated if feedback is given on the Knowledge Service Portal.

Enable actionable knowledge feedback

The actionable knowledge feedback feature is available when the Knowledge Management-Service Portal (com.snc.knowledge_serviceportal) plugin is activated and the actionable knowledge feedback properties are enabled.

Role required: admin

Refer to [Knowledge Management Advanced plugin](#) and [Knowledge Management - Service Portal plugin](#) sections on how to activate the plugins.

By default, negative article feedback does not automate the triggering of feedback tasks. You must configure these properties to generate feedback tasks when an article is marked as not helpful or rated below a set value.

1. Navigate to Knowledge Administration Properties.
2. In the Actionable Feedback Properties section, configure the following properties:
Create actionable feedback task when an article is marked as not helpful.

Enter a value from 1 to 5 to specify the rating threshold for generating a feedback task. For example, if you set this value to 3, a feedback task is generated when a user selects three or less stars to rate an article.

**Note:** If you enter '0', a negative article feedback does not generate a feedback task.

<table>
<thead>
<tr>
<th>Property</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create actionable feedback task when an article is rated at or lower than this value. 0 or no value indicates that actionable feedback tasks are not enabled for Rating type feedback.</td>
<td>Enter a value from 1 to 5 to specify the rating threshold for generating a feedback task. For example, if you set this value to 3, a feedback task is generated when a user selects three or less stars to rate an article. <strong>Note:</strong> If you enter '0', a negative article feedback does not generate a feedback task.</td>
</tr>
</tbody>
</table>
Change the feedback task state to | If you want to
--- | ---
**Awaiting information** | Request clarification from the feedback submitter. 
In the Additional Comments field, enter information you need from the submitter and click Update. This triggers an email notification for the feedback task submitter.

**Resolved** | Resolve the feedback task. 
In the Resolution Code field, select the code for resolving the article. In the Resolution notes field, enter the reason for the resolution and click Update. An email notification is sent to the feedback submitter to accept or reject the feedback.

**Closed** | Close the feedback task without the submitter having to accept the feedback resolution.

**Note:** If the submitter accepts the feedback resolution, the state for the feedback task is automatically set to Closed. You can view all closed feedback tasks in your queue by navigating to Knowledge Feedback Management My Closed Tasks.

---

**Track the progress on a feedback task**

Monitor open and closed feedback tasks and track the duration of time a feedback task remains in each state.

**Role required:** Owner of the knowledge base, knowledge_manager, knowledge_admin, or admin

1. Navigate to the open or closed tasks you want to track.

<table>
<thead>
<tr>
<th>To</th>
<th>Navigate to</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>View open feedback tasks</strong></td>
<td>Knowledge Feedback Management All Open Tasks and select a feedback task.</td>
</tr>
<tr>
<td><strong>View closed feedback tasks</strong></td>
<td>Knowledge Feedback Management All Closed Tasks and select a feedback task.</td>
</tr>
</tbody>
</table>

2. In the Knowledge Feedback Task Metrics related list section, select a feedback task metric to view the start and end time and the duration of the feedback task.

**Note:** If you are a knowledge administrator, you can view the feedback tasks and task metrics of articles in the knowledge bases. If you are a knowledge owner or knowledge manager, you can view feedback tasks and task metrics of all articles in the knowledge bases you own or manage.

---

**Knowledge blocks**

Knowledge blocks are reusable pieces of content secured by user criteria that you can add to knowledge articles in a knowledge base. The user criteria controls which users can read or not read the block content.
in an article or search. Knowledge blocks enable enterprise organizations to simplify knowledge authoring for writers and knowledge consumption for readers.

**How to use knowledge blocks**

To use knowledge blocks, a knowledge administrator or manager must enable the knowledge blocks feature for each knowledge base where the blocks will be used.

- *Enable knowledge blocks for each knowledge base* on page 1522

Knowledge contributors can create knowledge blocks and insert them into articles in a knowledge base:

- *Create a knowledge block* on page 1523
- *Add knowledge blocks to a knowledge article* on page 1528

Knowledge block content can be read or not read in an article or search, based on user criteria set at the knowledge base and knowledge block level. See *Select user criteria for a knowledge block* on page 1525 for more information.

**Knowledge blocks for location-specific content**

An enterprise HR organization wants to provide a holiday calendar for employees in the company knowledge base. Since employees in the company work from many different locations, the holiday dates vary. There are several ways that HR could create the calendars.

One way is that HR could create a knowledge article for each location, with an article for Location A, Location B, and so on.

- **Pros:** simplified consumption. Employees have a single article to search for and read.
- **Cons:** more work for HR. HR has multiple articles to manage and update for each location where the company has employees.

Another way is that HR could create a single article that includes sections for each location.

- **Pros:** simplified authoring. HR has a single article to manage and update.
- **Cons:** more work for employees. Employee must scroll through and disregard extraneous content to find the section in the article that pertains to them.

With knowledge blocks, HR can create a single article with location-specific block content secured by user criteria. This approach helps to reduce the workload for both HR and employees. HR has a single article to manage and update. Employees have a single article to search for and read, with the user criteria ensuring that they only view content that is relevant to them.

**If you are using a custom search or knowledge article viewer**

If you are using a custom search or knowledge article viewer with your application, you should integrate it with the appropriate knowledge or knowledge blocks API. (Integration is only necessary if you are using a custom search or knowledge article viewer.)

- *Integrating a custom search or knowledge article viewer with knowledge blocks* on page 1533
Activation information

To use knowledge blocks in your application, you must activate knowledge blocks. For information on what components are installed with the feature, see Components installed with knowledge blocks on page 1522.

Note: Activating knowledge blocks automatically activates Knowledge Management Advanced, which enables advanced features such as article versioning. Knowledge blocks can be used with or without the article versioning feature. To disable the feature, see Disable the article versioning feature on page 1460.

Activate knowledge blocks

You can activate knowledge blocks [com.snc.knowledge_blocks] if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Role required: admin

Knowledge blocks activates these related plugins if they are not already active.

Table 562: Plugins for knowledge blocks

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Management Advanced [com.snc.knowledge_advanced]</td>
<td>Enables advanced features for Knowledge Management, such as article versioning. For a full list of features, see activate the Knowledge Management Advanced plugin.</td>
</tr>
</tbody>
</table>

Note: Knowledge blocks can be used with or without the article versioning feature. To disable the feature, see Disable the article versioning feature on page 1460.

1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
   - If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. If available, select the Load demo data check box.
   - Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
   - You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.
5. Click Activate.
Components installed with knowledge blocks

Several types of components are installed with activation of the knowledge blocks plugin, including tables.

**Note:** To view all other components installed with this plugin, see the Application Files table. For instructions, see *Find components installed with an application*.

Demo data is available for this feature.

### Tables installed

<table>
<thead>
<tr>
<th>Table</th>

</tbody>
</table>

### Enable knowledge blocks for each knowledge base

Enable the knowledge blocks feature for each knowledge base where you plan to use the blocks. Once enabled, you can create knowledge blocks to add to knowledge articles within a knowledge base.

Role required: knowledge_admin or knowledge_manager

1. Navigate to Knowledge Administration Knowledge Bases.
2. Open the knowledge base record.
3. In the Knowledge Base form, select the Enable blocks check box.

**Note:** If the Enable blocks check box is not visible, you can add the field to the form by right-clicking the form header and navigating to Configure Form Layout.
4. Click Update.

**Note:** If you decide to later disable the knowledge blocks feature, all knowledge blocks within the knowledge base must be deleted before you can clear the box.

If there are more knowledge bases that require the knowledge blocks feature, repeat the process. Otherwise, you can create knowledge blocks for use within the enabled knowledge base.

Create a knowledge block

As a knowledge contributor, you can create or modify a knowledge block within a knowledge base. The block is secured by user criteria, which controls what users, groups, roles, companies, locations, or departments can read or not read the content in an article or search.

Role required: user must have contributor access to the knowledge base.

1. Navigate to Knowledge Knowledge Blocks Create New.
2. Click New or open a record.
3. Fill in the fields on the form.
Table 563: Knowledge Block form

<table>
<thead>
<tr>

<td>Description of the knowledge block.</td>
</tr>
<tr>
<td>Text</td>
<td>Text of the knowledge block.</td>
</tr>
<tr>
<td>Version</td>
<td>This field is automatically set to a version number when the article versioning feature is enabled.</td>
</tr>
</tbody>
</table>

**Note:** Knowledge blocks can be used with or without the article versioning feature. To learn more about article versioning, including how to disable the feature, see [Article versioning](#) on page 1451.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Article type</td>
<td>This field is automatically set to HTML.</td>
</tr>
<tr>
<td>Workflow</td>
<td>This field is automatically set to the publication state of the block, such as Draft, Published, or Retired.</td>
</tr>
<tr>
<td>Source task</td>
<td>Not applicable.</td>
</tr>
</tbody>
</table>

4. Click Save or Update to create or update the block.
5. Click Publish to publish the block.

**Note:** Any additional steps required to publish the knowledge block, such as approvals, depend on the publishing workflow for the knowledge base. See [Knowledge workflows](#) on page 1419 for more information.

After the knowledge block is published, you can add the block to an article within the knowledge base.

### Select user criteria for a knowledge block

User criteria set at the knowledge base and knowledge block level controls which users can read or not read block content within an article in a knowledge base. As a knowledge contributor, you can apply user criteria at the knowledge block level.

**Role required:** user must have contributor access to the knowledge base.

1. Navigate to Knowledge Knowledge Blocks All.
2. Open a knowledge block.
3. Apply the desired user criteria for the Can Read and Cannot Read fields.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can Read</td>
<td>User criteria to apply for read access at the knowledge block level.</td>
</tr>
<tr>
<td>Cannot Read</td>
<td>User criteria to apply for cannot read access at the knowledge block level.</td>
</tr>
</tbody>
</table>

**Note:**

- You can use existing or create user criteria records. To create a new record, see [Create a user criteria record in Knowledge Management](#) on page 1400.
• If a user meets any Can Contribute criteria at the knowledge base level, they can read all knowledge block content, regardless of the Can read and Cannot read criteria set at the knowledge block level.
• If a user meets any Cannot read criteria at the knowledge block level, they cannot read the block content, regardless of the Can read criteria set at the knowledge block level.
Can Contribute access at knowledge base level?

Yes

Can Read access at knowledge base level?

No

Cannot read block

Yes

Can read block

No

Can read access at block level?

Yes

No

Cannot read block
4. Right-click the form header and click Save.

- To finish and publish the block, see *Create a knowledge block* on page 1523.
- To add the block to an article, as well as preview the article by impersonating different users, see *Add knowledge blocks to a knowledge article* on page 1528.

Retire a knowledge block

You can retire a published knowledge block so that it is no longer available for users to view or search. A knowledge block can only be retired if it is not being used in any knowledge articles.

Role required: user must have contributor access to the knowledge base.

1. Navigate to Knowledge Knowledge Blocks Published.
2. Open the applicable record.
3. In the Articles related list, verify that the knowledge block is not being used in any knowledge articles.

   **Note:** A knowledge block can only be retired or deleted if it is not being used in any knowledge article, including any retired article or previous version of an article.

4. Click Retire to retire the knowledge block.

   **Note:** Any additional steps required to retire the knowledge block, such as approvals, depend on the workflow for the knowledge base. See *Knowledge workflows* on page 1419 for more information.

Add knowledge blocks to a knowledge article

As a knowledge contributor, you can insert one or more knowledge blocks into a knowledge article within a knowledge base. Each knowledge block is secured by user criteria, and you can preview the article by impersonating different users to see how the article displays or hides block content based on the read and cannot read access.

Role required: user must have contributor access to the knowledge base.

1. Navigate to Knowledge Articles All.
2. Click New or open a record.
3. Fill in the fields on the form, as appropriate.
   For further details on creating a knowledge article, see *Create a knowledge article* on page 1394.
4. To add blocks to the article:
   a) Click Add Blocks to open the Add Blocks side panel.

   **Note:** If the Add Blocks button is not visible, make sure that the knowledge blocks feature is enabled for the knowledge base that the article is in. See *Enable knowledge blocks for each knowledge base* on page 1522 for more information.
b) In the Add Blocks side panel, you can search for, do an advanced search, view, and insert blocks into the article. You can also create blocks directly from the side panel.

**Note:** If there are knowledge blocks you cannot find, make sure that the blocks are published, in the same language, and in the same knowledge base as the article.
5. Click Save or Update to create or update the article.
6. To preview the article as different users:
   a) In the Related Links section, click Preview Article with Blocks.
b) In the View As field, you can search for and impersonate different users to see how the article appears based on the user's can and cannot read access.

The following GIF shows an example of the author previewing the article as different users in different locations. Ashley Aoto sees the block content for Location A, Beth Berry sees the block content for Location B, and Claire Chaganti sees the block content for Location C.
Company Holiday Calendar

Employees in Location A have the following company holidays.

- Mon, January 1 - New Year's Day
- Mon, February 19 - Presidents' Day
- Mon, May 28 - Memorial Day
- Wed, July 4 - Independence Day
- Mon, September 3 - Labor Day
- Thurs, November 22 - Thanksgiving
- Tues, December 25 - Christmas Day
- Mon, December 31 - New Year's Eve

Employees in Location B have the following company holidays.

- Mon, January 26 - Republic Day
- Tues, May 1 - May Day
- Fri, June 13 - Eid al-Fitr
- Wed, August 15 - Independence Day
- Thurs, September 13 - Ganesh Chaturthi
- Tues, October 2 - Gandhi Jayanthi
- Wed, November 7 - Diwali
- Tues, December 25 - Christmas Day

Employees in Location C have the following company holidays.

- Mon, January 1 - New Year's Day
- Fri, March 30 - Good Friday
- Mon, April 2 - Easter Monday
- Mon, May 7 - Early May Bank Holiday
7. Click Publish to publish the article.

**Note:** Any additional steps required to publish the knowledge article, such as approvals, depend on the publishing workflow for the knowledge base. See *Knowledge workflows* on page 1419 for more information.

Integrating a custom search or knowledge article viewer with knowledge blocks

If you are using a custom search or knowledge article viewer with your application, you can integrate that custom search or viewer with the appropriate knowledge or knowledge blocks API.

**Note:** Integration is only necessary if you are using a custom search or knowledge article viewer.

**KBPortalServiceImpl - Global**

The KBPortalServiceImpl API is included with Knowledge Management V3 [com.snc.knowledge3] as a script include. It provides methods to use with knowledge, such as integration with a custom search.  

*KBPortalServiceImpl - KBPortalServiceImpl()*

Instantiates a KBPortalServiceImpl object in a global application.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*KBPortalServiceImpl - getResultData(Object request)*

Returns search results based on keywords from the knowledge article and from relevant knowledge block content that the user has access to read.

If you have activated the knowledge blocks feature and are using a custom search for knowledge with your application, your search may not return relevant articles when keywords are contained in the blocks. To return search results based on keywords from the article and from relevant block content that the user has access to read, you must call the getResultData() method inside your custom search.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>request</td>
<td>Object</td>
<td>JSON object to refine the search.</td>
</tr>
</tbody>
</table>

**Table 566: Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Array of search results in JSON format based on keywords from the knowledge article and from relevant knowledge block content that the user has access to read.</td>
</tr>
</tbody>
</table>
Integrating a custom search with knowledge blocks

```javascript
function doKeywordSearch(queryText, count, queryLocation) {
  var results = [];

  // To set up the request.
  var request = {
    keyword: queryText,
    language: "",

    // To pass data to filter on different metadata.
    variables: {
      kb_knowledge_base: ['Knowledge'],
      kb_category: '',
      author: ['']
    },

    // Provide the following.
    context: gs.getProperty('glide.knowman.sp.search_context', 'Knowledge Search'),
    resource: 'Knowledge',
    order: "relevancy,true",

    // Provide the pagination variables.
    start: queryLocation,
    end: queryLocation+count,

    attachment: false,

    // Provide any additional metadata you want to include in your results.
    knowledge_fields: [
      "number",
      "sys_id",
      "published"
    ]
  };

  // To execute the search.
  var response = new KBPortalServiceImpl();
  response.getResultData(request);

  // To send the search results back to the UI or to store results in your object.
  for (var i = 0; i < response.results.length; i++) {
    result = response.results[i];
    var article = {};
    article.sys_id = result.meta.sys_id.display_value;
    article.number = result.meta.number.display_value;
    article.short_description = article.short_description;
    article.title = result.title;
    article.published = result.meta.published.display_value;
    article.publishedUTC = result.meta.published.display_value;
    article.text = article.text;
    article.score = result.meta.score;
    article.label = article.short_description;
    article.shortDescription = article.short_description;
    results.push(article);
  }

  return results;
}
```
KBBlock - Global

The KBBlock API is included with knowledge blocks [com.snc.knowledge_blocks] as a script include. It provides methods to use with the knowledge blocks feature, such as integration with a custom knowledge article viewer.

KBBlock - KBBlock()

Instantiates a KBBlock object in a global application.

Table 567: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

KBBlock - getArticleContent(GlideRecord knowledgeRecord)

Gets knowledge articles with relevant knowledge block content that a user has access to read.

If you have activated the knowledge blocks feature and are using a custom knowledge article viewer with your application, your viewer may not display articles that expand the relevant block content. To expand block content that a user has access to read, you must call the getArticleContent() method inside your custom viewer.

Table 568: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>knowledgeRecord</td>
<td>GlideRecord</td>
<td>GlideRecord of the knowledge article to display.</td>
</tr>
</tbody>
</table>

Table 569: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Knowledge article with relevant knowledge block content that a user has access to read.</td>
</tr>
</tbody>
</table>

Integrating a custom knowledge article viewer with knowledge blocks

// This function returns the article text with expanded block content.
function getArticleText(kbSysId) {
  var knowledgeRecord = new GlideRecord('kb_knowledge');
  var kbText='';
  if(knowledgeRecord.get(kbSysId)) {
    if(new GlidePluginManager().isActive('com.snc.knowledge_blocks')) {
      kbText = new KBBlock();
      kbText.getArticleContent(knowledgeRecord);
    } else
      kbText = knowledgeRecord.getValue('text');
  }
  return kbText;
}
Managed Documents

Use the ServiceNow® Managed Documents application to control electronic documents within your instance.

After parameters have been set by the administrator and the Knowledge Document plugin installed, documents can move through the managed document cycle.

Note: Step through the process below on your test (or any non-production) instance.

Managed Document features

Managed Documents is a lightweight, ITIL-based solution for creating and managing electronic documents within your instance.

This application adds a layer of control around any document by providing workflow, storage, security, and categorization options. It can be used for a variety of internal documents, such as policies and procedures, compliance documentation, and knowledge articles. Because it is integrated within the instance, Managed Documents offers a seamless alternative to 3rd-party systems.

Table 570: Features

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Check-in/Check-out</td>
<td>Track revisions, approval history, and automated notifications for approvers and reviewers. Useful for compliance and risk authors, policy and procedure writers, and contract administrators.</td>
</tr>
<tr>
<td>Categorization</td>
<td>Classify documents for organization and search.</td>
</tr>
<tr>
<td>Access control</td>
<td>Share documents with selected users.</td>
</tr>
<tr>
<td>Revision control</td>
<td>Track changes to documents.</td>
</tr>
<tr>
<td>Digital signature for approval</td>
<td>Integration with the Approval with E-Signature plugin.</td>
</tr>
<tr>
<td>Workflow</td>
<td>Support consistent content review and approval.</td>
</tr>
<tr>
<td>Security</td>
<td>Use high security setting.</td>
</tr>
</tbody>
</table>

Managed Document concepts

The following concepts explain Managed Documents: Managed Document, Document Collection, Document Revisions, and Document Parameters.
### Table 571: Concepts

<table>
<thead>
<tr>
<th>Concept</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Managed Document</td>
<td>The Document [dms_document] table contains the documents controlled through the managed documents process.</td>
</tr>
<tr>
<td>Document Collection</td>
<td>The Document Collection [dms_collection] table allows related documents to be grouped together.</td>
</tr>
<tr>
<td>Document Revisions</td>
<td>Because managed documents must have clear records of individual versions of a document, revisions (including the file) are attached to the master document record through a related list. Document revisions are controlled to keep a standard naming scheme and consistent version numbers. Once a document revision is ready, it can be submitted for review.</td>
</tr>
</tbody>
</table>

#### Document Parameters

**Attention:** Parameters do not control application or document security. Parameters only organize documents, they do not affect who can access documents. To grant access to the Managed Documents application, you can assign a role. To grant access to a specific document, set user and group permissions.

Each document can be associated with predefined parameters. The parameters can help with grouping documents.

- **Type:** Defines the type of document being controlled. Documents of the same type use the same controls.
- **Classification:** Defines document restriction level, such as public, restricted, or confidential.
- **Audience:** Defines the groups with access to the document, such as internal or external.
- **Name Formats:** Defines the format of document names, ensuring that documents of the same type have the same name scheme assembled from name components.
- **Name Components:** Defines the document values used in the name formats.
- **Approval Rules:** Defines the approvals the document must have before it can be published.
Install the Managed Documents plugin

The Managed Documents plugin is available for activation by users with the admin role.

1. Navigate to System Definition Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.
   If the plugin depends on other plugins, these plugins and their activation status are listed.
3. [Optional] Select the Load demo data check box.
   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when first activating the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click Activate.

Managed Documents plugin

This page describes the applications and modules, database table structure, scripts, and roles.

Database table structure

The following tables are added:

<table>
<thead>
<tr>
<th>Display Name (Table Name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

Roles

This plugin introduces two new roles:

Table 576: Roles

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>document_management_user</td>
<td>This role enables a user to access the Managed Documents plugin, create documents, and search for documents. Document reviewers and approvers need the document_management_user role to access the Managed Document plugin. (Please note that reviewers and approvers can also access a document revision from an approval record.)</td>
</tr>
<tr>
<td>document_management_admin</td>
<td>This role enables a user to change administrative settings for the Managed Documents plugin.</td>
</tr>
</tbody>
</table>

**Note:** Each document has individual permissions, so even if a user is given the document_management_user role and has permissions to the application, the user can only view documents to which they have been given access.

Create a new managed document record

Configure the properties and policies for a managed document.

1. Navigate to Managed DocumentsCreate New.
2. In the Name field, type Policy.
3. In the Requested by field, add your name.
4. In the Owner field, add your name.
5. In the Reviewer field, add your name.
6. In the Type field, select Policy.
7. In the Classification field, select Confidential.
8. In the Audience field, select Internal.
9. Under Revision Settings, select the Auto increment revision option.
10. Click Submit.

Check in a document after making changes

After making changes to a document, check the revised document into Managed Documents.
1. Open the document record.
2. Click the Upload/Check in Revision related link.
3. Click Choose File, select the revised file, and click Open.
4. Check that the Name and Revision Number contain the updated number.
5. Ensure that the Check in option is selected.
6. Click OK.

The Document Revisions list updates to contain the most recent revision.

Check out a document to make changes

After a document is added to a managed document record, check the file out to make changes. Checking documents in and out keeps a record of document changes and ensures that only one person at a time is editing the document.
1. Open the document record.
2. Select the Check Out Document related link.
4. Click Check Out.
5. Open the file and make a small change.
6. Save the document with the same name, but a new revision number. For example, Policy_POL_02.txt.

Publish a document in Managed Documents

After the document is reviewed and approved, publish the document within Managed Documents.

1. Open the document record.
2. In the Document Revisions list, click the name of the revision that was approved and is listed in the Ready for Publishing stage.
3. In the header bar, click Publish Revision.

4. In the Publish revision dialog box, check that the name and revision number are correct and click Publish.
   In the Document Revisions list, the revision you just published is now in the Published stage.
Send a document out for review and approval

When a document is ready, send it out for review and approval. If a reviewer or approver is not identified in the document record, the document is moved directly to the publishing stage.

1. In the Document Revisions list, right-click the revised document and select Submit Revision.

Because you identified yourself as the reviewer, you receive an approve request email message.

2. In the email message, click the link next to Click here to view Approval Request.
3. (Optional) View the document by clicking the attachment name under Document Revision.
4. Click Approve.
   The Approvals page displays and lists the document you just approved.
5. Open the document record.
6. In the Document Revisions list, the revision you approved is now in the Ready for Publishing stage.

Upload a document as an attachment

After creating a document record, add the document to the record as an attachment.

1. Open the document record.
2. Select the Upload/Check in Revision related link.

3. Click Choose File.
4. Select a simple document, such as a text file, and click Open.
5. Check that the name reads Policy_POL_0.1.
6. Click OK.
   The document is listed under Document Revisions.
Defining Document Parameters

Before using the Managed Documents application, the user with the document_management_admin role needs to set the parameters that define the kinds of documents to be managed through the application. Managed Documents provides both base and custom parameter options.

Defining Document Parameters

The following document parameters should be defined:

- **Type**: identifies the purpose of the document. The type also determines the default document format and name format.
- **Classification**: indicates the security level assigned to the document and determines who can view or edit the document.
- **Audience**: specifies the intended readers of the document.
- **Name format**: specifies the name format to use when a document revision is added.
- **Name components**: are individual identifiers used inside a name format. Name components define a reference path (often by dot-walking) that holds the value specific to the document.
- **Approval rules**: determine which approvers are added to documents (in addition to the Reviewers specified on the document record).

Defining Types

To define a new type, navigate to Managed Documents Administration Type and click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the type.</td>
</tr>
<tr>
<td>Code</td>
<td>A short code for the type. Referenced as a name component for the name format.</td>
</tr>
<tr>
<td>Label</td>
<td>A label to display in the Type choice list.</td>
</tr>
<tr>
<td>Name Format</td>
<td>The name format that documents of this type will use.</td>
</tr>
<tr>
<td>Order</td>
<td>A number indicating the type's sequence in the choice list.</td>
</tr>
</tbody>
</table>

The following types are available in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Code</th>
<th>Label</th>
<th>Name format</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>-- None --</td>
<td>null</td>
<td>-- None --</td>
<td>null</td>
<td>1</td>
</tr>
<tr>
<td>policy</td>
<td>POL</td>
<td>Policy</td>
<td>Default Policy</td>
<td>2</td>
</tr>
<tr>
<td>guideline</td>
<td>GUI</td>
<td>Guideline</td>
<td>Default</td>
<td>3</td>
</tr>
<tr>
<td>procedure</td>
<td>PROC</td>
<td>Procedure</td>
<td>Default</td>
<td>4</td>
</tr>
<tr>
<td>contract</td>
<td>CON</td>
<td>Contract</td>
<td>Default</td>
<td>5</td>
</tr>
</tbody>
</table>
**Note:** For documents with a Type of Contract, a Contracts related list appears on the document record, listing any contracts the document is associated with.

### Defining Approval Rules

To define a new approval rule, navigate to Managed Documents Administration Approval Rules and click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique identifier for the approval rule.</td>
</tr>
<tr>
<td>Active</td>
<td>A check box indicating whether this approval rule is used.</td>
</tr>
<tr>
<td>Condition</td>
<td>A condition builder that determines which documents use this approval rule.</td>
</tr>
<tr>
<td>Description</td>
<td>A short description of the approval rule.</td>
</tr>
</tbody>
</table>

Once the approval rule is saved, the Approvers related list defines which approvers are added if the conditions in the Condition field are met.

The following approval rules are available in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Internal policy</td>
<td>type=Policy ^ audience=Internal</td>
</tr>
<tr>
<td>Development policy</td>
<td>type=Policy ^ department=Development</td>
</tr>
</tbody>
</table>

### Defining Audiences

To define a new audience, navigate to Managed Documents Administration Audience and click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audience Name</td>
<td>A unique name for the audience.</td>
</tr>
<tr>
<td>Audience Code</td>
<td>A short code for the audience. Referenced as a name component for the name format.</td>
</tr>
<tr>
<td>Label</td>
<td>A label to display in the Audience choice list.</td>
</tr>
<tr>
<td>Order</td>
<td>A number indicating this audience's sequence in the choice list.</td>
</tr>
</tbody>
</table>

The following audiences are available in the base system.

<table>
<thead>
<tr>
<th>Audience</th>
<th>Audience code</th>
<th>Label</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>internal</td>
<td>INT</td>
<td>Internal</td>
<td>1</td>
</tr>
<tr>
<td>external</td>
<td>EXT</td>
<td>External</td>
<td>2</td>
</tr>
</tbody>
</table>
Defining Classifications

Define a new classification on the Classification form.

Navigate to Managed Documents Administration Classification and click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the classification.</td>
</tr>
<tr>
<td>Code</td>
<td>A short code for the classification. Referenced as a name component for the name format.</td>
</tr>
<tr>
<td>Label</td>
<td>A label to display in the Classification choice list.</td>
</tr>
<tr>
<td>Order</td>
<td>A number indicating this classification's sequence in the choice list.</td>
</tr>
</tbody>
</table>

The following classifications are available in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Code</th>
<th>Label</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>public</td>
<td>P</td>
<td>Public</td>
<td>1</td>
</tr>
<tr>
<td>restricted</td>
<td>R</td>
<td>Restricted</td>
<td>2</td>
</tr>
<tr>
<td>confidential</td>
<td>C</td>
<td>Confidential</td>
<td>3</td>
</tr>
</tbody>
</table>

Defining Name Components

Name components define the document values used in the name format.

For example, the name component `document.audience.code` dot-walks from the document record to the audience Code.

To define a new name component, navigate to Managed Documents Administration Components and click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique identifier for the name component.</td>
</tr>
<tr>
<td>Short Description</td>
<td>A short description of the name component value.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Value</td>
<td>The path to the field holding the value used for the name format. Defined relative to a current revision record. For example: • Enter revision to use the revision Number field on the revision record. • Enter document.name to use the Name field on the revision’s referenced document. • Enter document.audience.code to use the Code field for the audience referenced by the document. This dot-walking approach makes it possible to get any value related to the revision into the name format.</td>
</tr>
</tbody>
</table>

**Note:** The revision component is a special component replaced by the appropriate revision number (rather than querying a value related to the current record). The revision is either automatically incremented or uses the latest revision number, depending on the setting on the document form.

The following components are defined in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Short description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audience code</td>
<td>Displays the code assigned to the document audience.</td>
<td>document.audience.code</td>
</tr>
<tr>
<td>Classification code</td>
<td>Displays the classification code.</td>
<td>document.classification.code</td>
</tr>
<tr>
<td>Document name</td>
<td>Displays the document name.</td>
<td>document.name</td>
</tr>
<tr>
<td>Revision</td>
<td>Displays the document revision.</td>
<td>revision</td>
</tr>
<tr>
<td>Type code</td>
<td>Displays the code assigned to the document type.</td>
<td>document.type.code</td>
</tr>
</tbody>
</table>

**Defining Name Formats**

The name format automatically generates a name for a document revision by arranging name components in a standard code to match naming conventions.

For example, a name format with the name components Type Code, Document Name, and Revision Number and the separator -, would be formatted as:

```
TYPECODE-Name-RevNumber.fileformat
```

In this example, a policy (code POL) named IT Off-Boarding Policy, with revision number 1.0, and uploaded as a .docx file would have the name:

```
POL-IT Off-Boarding Policy-1.0.docx
```

To define a new name format, navigate to Managed Documents Administration Name Formats and click New.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the name format.</td>
</tr>
<tr>
<td>Separator</td>
<td>A separator to put between each of the components. Hyphens (-) and underscores (_ ) are commonly used. Using alphanumeric characters can create a confusing name format.</td>
</tr>
<tr>
<td>Description</td>
<td>A description of the name format.</td>
</tr>
</tbody>
</table>

Use the related list to add name components. Use the Order field to set the sequence in which name components are used.

The following name formats are defined in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Separator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>_</td>
<td>The default format. Document name and revision separated by an underscore.</td>
</tr>
<tr>
<td>Default Policy</td>
<td>_</td>
<td>The format for the policy document type.</td>
</tr>
<tr>
<td>Development documentation</td>
<td>(no separator)</td>
<td>The format for the software documentation type.</td>
</tr>
<tr>
<td>Development Sources</td>
<td>(no separator)</td>
<td>The format for the development and code sources type.</td>
</tr>
<tr>
<td>Intranet Improvement</td>
<td>(no separator)</td>
<td>The format for documents that describe intranet use.</td>
</tr>
</tbody>
</table>

**Defining Document Workflow**

In the base system, all managed documents use the Managed Documents workflow after the Active check box is selected.
Figure 299: Document workflow
The document parameters defined in the workflow are often used as conditions to trigger more specific workflows, such as type-specific workflows or classification-specific workflows. If different kinds of documents should follow different workflows, use the Graphical Workflow Editor to create new workflows.

**Knowledge document**

The Knowledge Document plugin extends the Managed Documents plugin by providing the functionality for managed documents to be published to the knowledge base.

**Installed with knowledge document**

These elements are installed with the knowledge document plugin.

**Dependencies**

The Knowledge Document plugin depends on the Managed Documents plugin. Activating Knowledge Document activates Managed Documents.

**Tables**

Table 577: Tables

<table>
<thead>
<tr>
<th>Display Name [table_name]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Records [m2m_document_knowledge]</td>
<td>A many-to-many table storing the relationship between a document and a knowledge article.</td>
</tr>
</tbody>
</table>

**UI Actions**

Table 578: UI actions

<table>
<thead>
<tr>
<th>UI action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link to Knowledge</td>
<td>Creates or updates a knowledge article related to the current document, depending on whether a knowledge article already exists.</td>
</tr>
</tbody>
</table>

**Scripts**

Table 579: Script includes

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KnowledgeDocument</td>
<td>Holds the main logic for the Knowledge Document plugin.</td>
</tr>
</tbody>
</table>
Knowledge settings fields

These fields appear on the Managed Document form Knowledge Settings section.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Behavior</td>
<td>Defines the process performed when the Link to Knowledge related link is clicked. Select Always create record to create a new knowledge article with the latest published revision attached. The knowledge article is then linked to the document. Select Update existing record to update the existing knowledge article to the latest published revision. If no knowledge articles exist for the document, a new knowledge article is created. The Update existing record option is not available when many knowledge articles are linked to a document.</td>
</tr>
<tr>
<td>Type</td>
<td>Specifies the type of knowledge article. Use Knowledge or any option that extends the kb_knowledge table. For example, if you have the IT GRC plugin installed to create GRC policies, select the type Policies. Note that when a knowledge article is created, the Type field becomes read-only.</td>
</tr>
<tr>
<td>Topic</td>
<td>Defines the subject of the document. Adds the topic information to the same field in the knowledge article.</td>
</tr>
<tr>
<td>Published</td>
<td>Date that the article should be published. Adds publishing date information to the same field in the knowledge article.</td>
</tr>
<tr>
<td>Valid to</td>
<td>Date that the article expires. Adds valid to date information to the same field in the knowledge article.</td>
</tr>
<tr>
<td>Short description</td>
<td>A few words or short phrase describing the knowledge article. Adds the short description to the same field in the knowledge article.</td>
</tr>
</tbody>
</table>

View knowledge linked to a document

You can view the knowledge linked to a document from the document record.

1. Navigate to the document record.
2. Select the Knowledge Records related list.
3. Select the knowledge article to view.

Create a document

After Managed Documents parameters have been set by the administrator, documents can be created, requested, checked out, edited, checked in, copied, and, if necessary, rolled back to an earlier version. Once documents have been added to the Managed Documents application, they can be grouped into document collections.

Approval process

During the approval process, the approver approves or rejects the document. A document goes through the approval process after the review process.

Approval workflow

After the document has been reviewed, submit the document for approval. If the document does not have an approver, the approval process is omitted.

When the document is Active, the workflow Document Management Default is used to manage approvals:
Figure 300: Document Management Default workflow
If the approver rejects the document, the author and owner are notified and the document review is cancelled. The author, owner, and approver should discuss what changes need to be made to the document. When the document is ready, a new review can be initiated.

If the final approver approves the document, the author and the owner are notified. Once final approval is successful, the document stage changes to Ready for Publishing in the Document Revisions list:

![Figure 301: Document Management Default workflow result](image)

Related Links
- [Show Workflow]

Process modification for multiple approvers

If there are multiple approvers, the approval process works in sequence and multiple approvers can be assigned to a single sequence. For example:

Sequence 1: approvers A and B
Sequence 2: approvers C and D
Sequence 3: approver E

Because the sequences take place in ascending chronological order, approvers A and B receive the approval request first (approvers C, D, and E are not part of the process yet). Similar to the review process, the first approver to act within a sequence dictates what happens to the document. If approver A acts first and rejects the document, the approval process stops and the state is set to Cancelled. Approver B's status is changed to No Longer Required. If approver A acts first and approves the document, the process stops and approver B's status is changed to No Longer Required. Then, the document moves to approval
sequence 2. After at least one approver in each sequence approves the document, the author and the owner are notified that the document has been approved.

Review process

During the review process, the reviewer approves or rejects the document. Sometimes a document will have multiple reviewers.

If the reviewer rejects the document, the author and owner are notified and the review is cancelled. The author, owner, and reviewer should discuss what changes need to be made to the document. If the reviewer approves the document, the author and owner are notified that the review was successful and the document can move to the approval stage.

If multiple reviewers are assigned to a document, the first reviewer to act dictates what happens to the document. For example, there are two reviewers, A and B. If reviewer A acts first and rejects the document, the review process stops and the revision state is set to Cancelled. Reviewer B receives a notification email stating that the review was rejected and their status is changed to No Longer Required. If reviewer A acts first and approves the document, the review process stops and the document can move to the approval stage. Reviewer B's status is changed to No Longer Required.

Enable electronic signature for approval

This topic explains how to enabling electronic signatures for approval. Electronic signatures are helpful if you must obtain a digital signature for compliance or auditing purposes.

You can activate the Approval with E-Signature plugin to require that users type in a user name and password when reviewing and approving documents.

The digital signature is not tracked or stored in the document record. Users must simply type in a user name and password after clicking the Approve or Reject button.

Figure 302: Digital signature

After activating the Approval with E-Signature plugin, ensure that a row in the e-signature registry table is created for the dms_document_revision table.

1. Navigate to System Definition e-Signature Registry.
2. Check if dms_document_revision is already listed and Enabled is set to true.
3. If not listed, click New.
4. In Table name, select Document Revision.
5. Select Enabled.
6. Click Submit.

Publish an approved revision

This topic explains how to publish a document revision that has been approved.

Once a document has been created and edited, a specific revision can be submitted for draft review and final approval. After final approval, the document can be published.

Publish the approved revision from the Document Revisions list.

**Note:** Publishing documents to the Knowledge Base requires the Knowledge Document Plugin.

1. Navigate to the document record.
2. In the Document Revisions List, click the revision marked Ready for Publishing.
3. Click Publish Revision to display the Publish dialog box.

The revision number matches the latest revision number. If your standard is to change the revision number when the document is published, such as incrementing the version number to 1.1 or 1.0.1, the change can be made on this dialog box manually.

4. Click Publish.

The published revision is highlighted in green and the stage of previous revisions is automatically changed to Retired:
Note: If the approval and publishing process is repeated, the published revision is retired when the new revision is published. Any workflows running against previous revisions are canceled when the document is published.

Submit a revision for draft review

This topic explains how to submit a document draft for review.

Once a document has been created and edited, a specific revision can be submitted for draft review and final approval. After final approval, the document can be published.

When a draft of the document is ready, submit the draft for review. If the document does not have reviewers identified in the Reviewers field of the document record, the review process is omitted.

1. Navigate to the document record.
2. Right-click the appropriate revision.
3. Select Submit Revision.
   
   The revision stage is set to Awaiting Review.
Create or request a new document

Once an administrator has set parameters for the Managed Documents application, you can create or request new documents.

1. Navigate to Managed Documents Create New.
2. Complete the following fields:

<table>
<thead>
<tr>
<th>Table 581: New document fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>Number</td>
</tr>
<tr>
<td>Field</td>
</tr>
<tr>
<td>---------------------</td>

</tr>
<tr>
<td>Department</td>
</tr>
<tr>
<td>Type</td>
</tr>
<tr>
<td>Classification</td>
</tr>
<tr>
<td>Audience</td>
</tr>
<tr>
<td>State</td>
</tr>
<tr>
<td>Checked out by</td>
</tr>
<tr>
<td>Description</td>
</tr>
<tr>
<td>Revision Settings</td>
</tr>
<tr>
<td>Name format</td>
</tr>
<tr>
<td>Revision format</td>
</tr>
<tr>
<td>Auto increment revision</td>
</tr>
</tbody>
</table>

The User Permissions related list determines which users have rights to view and contribute to the document:
### Table 582: User permissions

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>A reference to a user who is entitled to read and contribute to the document.</td>
</tr>
<tr>
<td>Type</td>
<td>A choice list describing how the user can interact with the document. Options are:</td>
</tr>
<tr>
<td></td>
<td>• Reader - The user can read the document versions.</td>
</tr>
<tr>
<td></td>
<td>• Editor - The user can upload new versions.</td>
</tr>
<tr>
<td></td>
<td>• Owner - The user can edit the document.</td>
</tr>
</tbody>
</table>

The Group Permissions related list determines which groups have rights to view and contribute to the document:

### Table 583: Group permissions

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group</td>
<td>A reference to a group of users who are entitled to read and contribute to the document.</td>
</tr>
<tr>
<td>Type</td>
<td>A choice list describing how group members can interact with the document. Options are:</td>
</tr>
<tr>
<td></td>
<td>• Reader - Group members can read the document versions.</td>
</tr>
<tr>
<td></td>
<td>• Editor - Group members can upload new versions.</td>
</tr>
<tr>
<td></td>
<td>• Owner - Group members can edit the document.</td>
</tr>
</tbody>
</table>

### Specify an approver

You can specify approvers for a document record after you save it.

You can have one approver or multiple approvers. For example, set multiple approvers to have one person do a quality check of the document and a different individual to serve as a final approver. Approvers are assigned a number. The lowest number (usually number one) approver always goes first, then any other approvers in ascending chronological order. Multiple approvers can have the same sequence number. For example, two approvers can do a quality check and be assigned sequence number 1. Then, two individuals can be final approvers and be assigned sequence number 2.

1. Navigate to the document record.
2. Right-click in the document header bar and select Add Approver.
3. Add a user name.
4. Select a sequence number from the drop-down list. (Lower numbers approve before higher numbers. For example, approver number one approves before number two.)
5. Click Add User.
6. Repeat steps 2-5 to add more approvers.

Check in a document

Check in the document after you revise it so other users can check out the document.
1. Navigate to the document record.
2. Select the Upload/Check In Revision related link.
3. Click Browse and navigate to the revised file.
4. Click Open.
5. Check the Name and Revision Number.
6. Click OK.

The Document Revisions related list updates to contain the most recent revision:

![Document Revisions](image)

Figure 304: Document revisions

Copy a document

A document can be duplicated at any time. This is useful if you have an existing document that you want to use as a base for a new document.
1. Navigate to the document record.
2. Right-click the header bar and select Copy Document.
   An information message with a link to the new document displays:
3. Click OK.
   The new document is renamed and includes the word “Copy.”

Note: Only the latest revision is copied.

Deactivate a document

To change the document state to Inactive, deactivate the document. This is useful when changes to a document have been put on hold. An inactive document can be reopened at any time.
1. Navigate to the document record.
2. Right-click the header bar and select Deactivate Document.

**Note:** To activate a document, right-click on the header and click Reopen Document.

Reopen a deactivated document

A document that has been deactivated can be reopened.

1. Navigate to the document record.
2. Right-click the header bar and select Reopen Document.

Roll back a document

A document can be rolled back to an earlier revision at any time. Before rolling back to an earlier revision, ensure that the document is not checked out and that you have Editor or Owner permissions for the document.

1. Navigate to the document record.
2. In the Document Revisions list, click the revision to which you want to roll back.
3. Right-click the header bar and select Rollback. The Rollback to Revision dialog box displays. The name and revision number are new. The note specifies the revision to which you are rolling back.

4. Change any information on the Rollback to Revision dialog box as necessary.
5. Click OK. The latest revision is now the revision you selected for rollback.

Cancel a document

Change the document state to Cancelled when no more changes will be made to the document.

When canceling a document, there is no confirmation message, so ensure that you want to cancel the document.

1. Navigate to the document record.

© 2018 ServiceNow. All rights reserved. 1562
2. Right-click the header bar and select Cancel Document. An info message confirms the cancellation:
   The State is set to Cancelled:

   ![Figure 305: MDOC cancel 3]

Check out a document

Documents in the Managed Documents application can only be revised by one user at a time. Check out the document to revise it.

1. Navigate to the document record.
2. Select the Check Out Document related link.
3. Select Download file to download the current version of the document when it is checked out.

4. Click Check Out.
   After checking out a document, you can edit the document and make any necessary changes.

Create a document collection

A document collection is a set of individual documents. After documents have been uploaded into Managed Documents, organize the documents by grouping them into collections.

1. Navigate to Managed Documents Document My Collections.
2. Select New.
3. Type in a Name.
4. (Optional) Type in a Description.
5. Click Submit.
6. Click the name of the collection you created.
7. Click Edit.
8. On the left, double-click an available document or select a document and click Add.
9. Click Save. The Document Collection page displays and the individual documents in the collection are listed:

![Image of Document Collection]

**Figure 306: Document collection**

**Upload a document**

Upload a document into a saved record. You can upload text files, spreadsheets, presentations, PDF files, and more.

1. Navigate to the document record.
2. Click the Upload/Check In Revision related link.
3. Click Choose File and navigate to the file.
4. Click Open.
5. Check the Name and Revision Number.
6. Click OK.
Domain separation and Managed Documents

This is an overview of domain separation in Managed Documents. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

Support: Data only

Domain separation in this application is supported at the Data only level, meaning it supports the data security model of separating visibility of data from one domain to another. To learn more, see Application support for domain separation.

MetricBase application

Use the MetricBase application to collect, retain, analyze, and visualize time series data on the Now Platform.

Time series data is a collection of values for an item taken at specific time intervals. Time series data is stored in a separate database, called the MetricBase database. An example is collecting CPU usage values for a computer every hour. You can then use the time series data to evaluate system capacity issues.

The MetricBase application is integrated with the Now Platform making it easy to handle time series data for applications on the Now Platform. The MetricBase database saves values as floating-point numbers.

You can create a trigger that is used with Flow Designer to define when a flow is to be run. A MetricBase trigger can be created with the MetricBase application, or from the Flow Designer.

MetricBase data can be accessed through the Performance Analytics and Reporting application. See the Create time series reports from MetricBase data topic to create advanced reports.

A demonstration plugin is available that contains a user created table with metric fields, triggers, a scheduled job to create data, and the Data Explorer that provides a place to experiment with transform APIs. See MetricBase demonstration application on page 1577 for more information.

The MetricBase product is available as a separate subscription. For more information, see Request the MetricBase product on page 1565.

Request the MetricBase product

The MetricBase product requires a separate subscription and must be activated by ServiceNow personnel. A demonstration plugin with sample tables, metrics, triggers, and data is available. Be sure to request the MetricBase Demo plugin with the MetricBase product.

Role required: none

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and sub-production instances, generally within a few days.
View time series retention policies

The MetricBase application provides pre-defined retention policies that define the data collection interval for a metric.

Role required: clotho_admin

How often time series data is collected and how long the time series data is retained are important parameters for each metric. The MetricBase application provides pre-defined retention policies. You cannot create retention policies.

A retention policy is a series of time periods and collection rates. An example is 8d@1h, which means for eight days data is collected at one hour intervals. A retention policy is a series of these time periods with longer intervals for each subsequent time period. For example, 8d@1m,94d@10m,397d@1h.

Retention policies define the collection interval, which changes with the age of the data. Older data is compacted and stored with lower fidelity. You can see the available retention policies with the Retention Policies module. The 8d@1m,31d@30m,397d@1h retention policy means

- For the last eight days, data points are available at 1-minute intervals.
- Data points from 9 through 31 days are compressed to 30-minute intervals.
- Data points older than 32 days are compressed to 1-hour intervals.
- If data is ingested at 30-second intervals in the last eight days, one data point is lost. Data in the last eight days are always stored at 1-minute intervals.
- If data is ingested at 2-minute intervals in the last eight days, the missing data points are stored as NaN. Data in the last eight days are always stored at 1-minute intervals.

1. Navigate to MetricBase Retention Policies.
2. Click a policy to view the collection interval specification.

Create a time series metric

Create a time series metric record for each item for which time series data is to be collected. You must define the table, metric field name, and the retention policy.

Role required: clotho_admin

2. Click New.
3. Complete the time series metric definition form then click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Name of the metric.</td>
</tr>
<tr>
<td>Table name</td>
<td>Required. Name of the table to contain the metric. A table can have multiple metric columns.</td>
</tr>
<tr>
<td>Metric field name</td>
<td>Required. Define the name of the column to be added to the target table.</td>
</tr>
<tr>
<td>Retention policy</td>
<td>Required. Retention policy to use. Select one of the available retention policies.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Application</td>
<td>Application for which this metric is defined.</td>
</tr>
<tr>
<td>Display value aggregator</td>
<td>Aggregation to use for the metric field display value on the list view of the table.</td>
</tr>
<tr>
<td>Display value aggregate duration</td>
<td>Sample interval to use for the metric field display value on the list view of the table.</td>
</tr>
</tbody>
</table>

Adds a float field with the name specified in the Metric field name field to the target table.

**MetricBase triggers**

Use MetricBase triggers with the Flow Designer to determine when flows should run.

The MetricBase application supports three kinds of triggers.

- **Band trigger** — Used to detect when a metric value meets a certain threshold or is within a range.
- **Linear Predictor trigger** — Used to detect when a series of metric values follows an upward or downward trend, and is expected to reach a specified threshold.
- **Gap trigger** — Used to detect when no data is received for a metric.

For each trigger, you define levels that are available when the trigger runs. The levels can be considered severity levels that indicate which threshold has been crossed or range has been entered (band trigger), how long before a threshold value is expected to be reached (linear predictor trigger), or how long it has been since a data value has been received (gap trigger).

**Legacy triggers**

Legacy triggers are used to create a band trigger that evaluates data and executes a script when the trigger criteria are met. See *Create a legacy MetricBase trigger* on page 1572 for the steps to create a legacy trigger.

**Note:** Legacy triggers are not available in new instances.

**Create a MetricBase band trigger**

Create a MetricBase band trigger to use with Flow Designer to detect when a metric value meets a certain threshold or is within a range.

Role required: admin

Define a band trigger to detect when a metric value meets a certain threshold or is within a specified range. You define threshold values and ranges. The level defines which threshold or range has been met.

1. Navigate to MetricBase MetricBase Triggers Trigger Definitions, and click New. The MetricBase Trigger Creation form is shown.
2. Click Band Trigger - Detects and takes action when metric value meet certain threshold or is within a range.
3. Fill in the fields as needed.
Table 585: MetricBase Band trigger form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the trigger.</td>
</tr>
<tr>
<td>Aggregator</td>
<td>Specify the aggregation to be done, or none.</td>
</tr>
<tr>
<td>Table name</td>
<td>Specify the table that contains the metric. Only tables that have a metric field are shown in the list.</td>
</tr>
<tr>
<td>Metric</td>
<td>Specify the metric. When you select a metric, the Table name field is updated for the selected metric.</td>
</tr>
<tr>
<td>Active</td>
<td>Specify if the trigger is to be used. Default is checked.</td>
</tr>
<tr>
<td>Description</td>
<td>Describe the trigger.</td>
</tr>
</tbody>
</table>

4. Click Save.
The MetricBase Band Trigger Levels area is added to the form.

5. Do one of the following to add a threshold or a range.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Click New.</td>
<td>The MetricBase Band Trigger Level form is shown.</td>
</tr>
</tbody>
</table>

Edit the cells in the table row.

Table 586: MetricBase trigger form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>

6. Click Update.

Create a MetricBase linear predictor trigger

Create a MetricBase linear predictor trigger to use with Flow Designer to detect when a metric value is expected to cross a specified threshold within a specified time with a specified confidence level.

Role required: admin

Define a linear predictor trigger to do a linear prediction on metrics that are expected to have an upward or downward trend. You define a time window, confidence interval, expected slope, threshold, and severity level. The severity level defines how soon the metric data is expected to reach the threshold value.

The linear predictor trigger uses the most recent data within the defined window to generate a linear formula \( y = a \cdot X + b \). The confidence interval is used to determine when the results are significant enough to be used.

When the confidence interval is met, the linear predictor trigger predicts how soon the data is expected to reach the threshold. The generated regression model slope is checked to see if it is the same as the user-defined slope. A trigger transition is generated when a severity level is met.

If the most recent data point exceeds the threshold, a trigger transition is generated regardless of the calculations.

The confidence level and the trigger levels are two different things. The confidence level is the result of the prediction algorithm, and the trigger levels are what you define for the trigger criteria.

1. Navigate to MetricBase MetricBase Triggers Trigger Definitions, and click New. The MetricBase Trigger Creation form is shown.
2. Click Linear Predictor Trigger - Predicts and takes action when a metric follows an upward or downward trend and is expected to reach a given threshold in the future.
3. Fill in the fields as needed.

Table 587: MetricBase Linear Predictor Trigger form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the trigger.</td>
</tr>
<tr>
<td>Window</td>
<td>Length of time to be evaluated.</td>
</tr>
<tr>
<td>Table name</td>
<td>Name of the table containing the metric.</td>
</tr>
<tr>
<td>Confidence Level (%)</td>
<td>Confidence level required for the trigger.</td>
</tr>
<tr>
<td>Metric</td>
<td>Metric to use.</td>
</tr>
<tr>
<td>Trend</td>
<td>Whether the values are increasing or decreasing.</td>
</tr>
</tbody>
</table>
4. Click Save.
The MetricBase Linear Predictor Trigger Levels area is added to the form.

5. Do one of the following to add a level.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Click New.</td>
<td>The MetricBase Band Trigger Level form is shown.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Specify if the trigger is to be used. Default is checked.</td>
</tr>
<tr>
<td>Threshold</td>
<td>Value the trigger predicts the metric will cross.</td>
</tr>
<tr>
<td>Description</td>
<td>Describe the trigger.</td>
</tr>
</tbody>
</table>

6. Click Update.

Create a MetricBase gap trigger

Create a MetricBase gap trigger to use with Flow Designer to detect when new metric values have not been stored for a metric for a specified period.

Role required: admin

Define a gap trigger to determine when no data is received for a metric within a time window. You can define severity levels for different gap periods. There must be at least 10 minutes between gap periods, for example, 30 minutes for level 1 and 40 minutes for level 2.

The frequency the system checks for gap triggers is determined by the minimum difference between two levels, divided by 2. If a gap trigger defines level 1 as 30 minutes and level 2 as 50 minutes, the difference between the two is 20 minutes. Dividing 20 minutes by 2 gives the frequency of 10 minutes. If more than two levels are defined, the smallest gap between levels is used in the calculation.

The frequency the system checks for a gap trigger is at least every 30 minutes, but no more often than every 5 minutes.
The gap trigger may happen after the gap period. For example, when the frequency of checking for gaps in data is 10 minutes, and a gap period is 30 minutes, the trigger may occur as late as 40 minutes after the last data value was received.

1. Navigate to MetricBase MetricBase Triggers Trigger Definitions, and click New. The MetricBase Trigger Creation form is shown.
2. Click Gap Trigger - Detects and takes action when no data is received for a metric.
3. Fill in the fields as needed.

### Table 589: MetricBase gap trigger form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the trigger.</td>
</tr>
<tr>
<td>Table name</td>
<td>Specify the table that contains the metric. Only tables that have a metric field are shown in the list.</td>
</tr>
<tr>
<td>Metric</td>
<td>Specify the metric. When you select a metric, the Table name field is updated for the selected metric.</td>
</tr>
<tr>
<td>Active</td>
<td>Specify if the trigger is to be used. Default is checked.</td>
</tr>
<tr>
<td>Description</td>
<td>Describe the trigger.</td>
</tr>
</tbody>
</table>

4. Click Save. The MetricBase Gap Trigger Levels area is added to the form.

5. Do one of the following to add a threshold or a range.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>Click New.</td>
<td>The MetricBase Band Trigger Level form is shown.</td>
</tr>
</tbody>
</table>

**Edit the cells in the table row.**

### Table 590: MetricBase Gap Trigger Level form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trigger</td>
<td>This field is pre-filled with the trigger on which you were working. Use the lookup list to select a different trigger.</td>

<td>Level number. Set to the next available number. You can change the number.</td>
</tr>
<tr>
<td>Function</td>
<td>Function to use on the value.</td>
</tr>
<tr>
<td>Window</td>
<td>Length of time that no data has been received.</td>
</tr>
</tbody>
</table>

6. Click Update.
Create a legacy MetricBase trigger

Create a trigger to run a script. The trigger is based on static thresholds you create. Data is checked when added to the MetricBase database.

Role required: admin

**Note:** The legacy MetricBase trigger is deprecated and is unavailable for new instances, but is still available on instances upgraded from a previous release.

To create a trigger, select the metric, create a filter to select the records to be evaluated against the trigger criteria, define the trigger criteria, and write the script to run when the trigger criteria are met.

**Note:** The script is not used to determine when the trigger is triggered.

After the trigger has been created, you can specify the trigger levels. Trigger levels define a value or range of values and are part of the trigger criteria. The trigger level whose criteria has been met is one of the parameters to the trigger script. You can define one or more trigger levels for a trigger.

You can use the condition builder to use any field in the table containing the metric to specify the records to be used by the trigger criteria.

A trigger script should have a short execution time. Do not write a script that performs significant amounts of processing. Instead, update a field or create an event and then exit.

1. Navigate to MetricBase Trigger Definitions, and click New.
   The MetricBase Trigger New Record form is shown.
2. Fill in the fields as needed.

### Table 591: MetricBase trigger form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the trigger.</td>
</tr>
<tr>
<td>Aggregator</td>
<td>Specify the aggregation to be done, or none.</td>
</tr>
<tr>
<td>Window</td>
<td>Specify the time period to be used for the aggregation.</td>
</tr>
<tr>
<td></td>
<td>This field appears when Min, Max, or Average is selected from the Aggregator field.</td>
</tr>
<tr>
<td>Table name</td>
<td>Specify the table that contains the metric. Only tables that have a metric field are shown in the list.</td>
</tr>
<tr>
<td>Metric</td>
<td>Specify the metric.</td>
</tr>
<tr>
<td></td>
<td>When you select a metric, the Table name field is updated for the selected metric.</td>
</tr>
<tr>
<td>Active</td>
<td>Specify if the trigger is to be used.</td>
</tr>
<tr>
<td>Filter</td>
<td>Specify the criteria for selecting records from the table.</td>
</tr>
<tr>
<td>Description</td>
<td>Describe the trigger.</td>
</tr>
</tbody>
</table>
3. Click Submit.

Create a legacy MetricBase trigger level

Define levels or ranges for a trigger.

Role required: admin

The trigger must be defined before you can create a trigger level. Trigger bands must not overlap.

**Note:** The legacy MetricBase trigger level is deprecated and is unavailable for new instances, but is still available on instances upgraded from a previous release.

1. Navigate to MetricBase Trigger Definitions, and click the trigger for which you want to add a trigger level.
   The MetricBase Trigger form is shown.
2. Scroll down to the MetricBase Trigger Levels list, and click New.
   The MetricBase Trigger Level New record form is shown.
3. Fill in the fields as needed.

**Table 592: MetricBase trigger form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trigger</td>
<td>This field is pre-filled with the trigger on which you were working. Use the lookup list to select a different trigger.</td>
</tr>
<tr>
<td>Level</td>
<td>Level number. Set to the next available number. You can change the number.</td>
</tr>
<tr>
<td>Function</td>
<td>Function to use on the value.</td>
</tr>
<tr>
<td>Band Function</td>
<td>To define a range, select the function to be applied to the second value.</td>
</tr>
<tr>
<td>Value</td>
<td>Value to cause a trigger. If no band function is selected, the trigger is a fixed number.</td>
</tr>
<tr>
<td>Band Value</td>
<td>Second value to use to define a range. When a band function is selected, this value is required. This field appears when Greater than, Less than, Greater than or is, or Less than or is is selected from the Band Function field.</td>
</tr>
</tbody>
</table>
Create an Action Condition

An Action Condition is a script that is run when trigger conditions are met, but before the Flow actions begin. If the Action Condition script returns true, the Flow actions are executed. If the Action Condition script returns false, the Flow actions are not executed.

Role required: admin

Use the Action Condition to check for duplicate triggers. You can determine if the record that the flow action is going to update has already been updated, and return false to prevent the flow action from being executed.

In the Flow Designer, use the Additional Filtering field to assign the Action Condition to a flow.

1. Navigate to MetricBase MetricBase Triggers Trigger Moderators, and click New.
   The Additional MetricBase Trigger Filtering and Moderation form is shown.

2. Fill in the fields as needed.

   Table 593: Additional MetricBase Trigger Filtering and Moderation form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the Action Condition.</td>
</tr>
<tr>
<td>Application</td>
<td>Application for which the Action Condition is defined.</td>
</tr>
<tr>
<td>Description</td>
<td>Describe the Action Condition.</td>
</tr>
<tr>
<td>Script</td>
<td>Specify the script. The trigger definition record, the record containing the metric that created the trigger, the date and time the trigger occurred, and the band level for the trigger are input parameters to the script. If the script returns true, the Flow action is executed.</td>
</tr>
</tbody>
</table>

3. Click Submit.

Store time series data

Use JavaScript, REST, or scriptable REST APIs to add time series data to a metric field.
It is recommended that you use the REST APIs to store time series data.

For information on the MetricBase REST APIs see the REST API Explorer on an instance with the MetricBase application installed, or see the Clotho Time Series API.

For information on the MetricBase JavaScript APIs, see Client, Data, DataBuilder, Transformer, TransformPart, TransformResult.

In practice, for performance reasons, batch multiple series of multiple data points and store them at one time, do not insert each data point individually.

**Store time series data using REST APIs**

```bash
```

**Store time series data using JavaScript APIs**

```javascript
// get the subject GlideRecord with which we are going to put metric data
var gr = new GlideRecord('cmdb_ci_computer');
gr.get(<sys id of record containing metric to be stored>);

// build time series data for cpu_percentage metric. time is GlideDateTime
var dataBuilder = new sn_clotho.DataBuilder(gr, 
    'cpu_percentage').add(time, 0.75);

// use clotho client to insert data
new sn_clotho.Client().put(dataBuilder);
```

**Analyze time series data**

Use JavaScript or REST APIs to extract time series data from the MetricBase database, and to run transforms on the data.

For information on the MetricBase REST APIs see the REST API Explorer on an instance with the MetricBase application installed, or see the Clotho Time Series API.

For information on the MetricBase JavaScript APIs, see Client, Data, DataBuilder, Transformer, TransformPart, TransformResult.

To use MetricBase time series data in report visualizations, see Create time series reports from MetricBase data.

**Analyze time series data with the JavaScript APIs**

This example is to get the average CPU percentage over the specified time for each XYZ computer.
// Query the cmdb_ci_computer table for the records for
var gr = new GlideRecord('cmdb_ci_computer');
gr.addEncodedQuery('manufacturer=xyz');
gr.query();

// Create a DataSelector object and specify the metric
// cpu_percentage, the transform (avg), and label (avg cpu)
var transform = new
sn_clotho.Transformer(gr).addMetric('cpu_percentage').avg().label('avg-cpu-percentage');

// Run the transform between startTime and endTime.
// startTime and endTime are GlideDateTime
var data = transform.execute(startTime, endTime);
var values = data['avg-cpu-percentage'].getValues();

View time series data

You can view time series data for a metric. A metric is defined for all records in a table, and you can view
the time series data for all records.

Role required: admin

See the Create time series reports from MetricBase data topic to create advanced reports.

1. Navigate to the table containing the metric.
   In the Filter Navigator, type <table name>.list, and hit enter.
2. Click the menu icon above the metric column, and select Time Series Chart.
3. Change the Time Span and Transform fields to evaluate the data.
   When you select the Add, Multiply, or Divide transforms, the Value field and Submit button are shown.
Enter a value and click Submit to view the adjusted data. The adjusted data is not saved to the
MetricBase database.

View MetricBase status

You can view the status of the MetricBase database.

Role required: admin

1. Navigate to MetricBase MetriBase Status.
   A list of MetricBase statistics is shown. Each item is information about the MetricBase database. Use
   the personalize icon to add fields to the form. Then, click on a metric to view the time series data.
2. Set up the list to show the information that you want to check.
   a) Click the Update Personalized List icon.
   b) Use the slushbucket to move the desired metric to the display, and click OK.
3. Click the metric value to view the time series data for that statistic.

Debug MetricBase

You can use session debug tools and statistics to debug issues.
Role required: admin

1. To use MetricBase session debug.
   a) Navigate to System Diagnostics Session Debug Debug MetricBase. Session debug tracking for MetricBase activities starts.
   b) Navigate to MetricBase MetricBase Status, and scroll to the bottom of the list. Debug information is listed below the list.

2. To view MetricBase statistics
   a) Navigate to System Diagnostics Stats Stats
   b) Scroll down to find MetricBase Statistics

MetricBase demonstration application

Investigate an example application that uses MetricBase features. The demonstration application is in the MetricBase Demo plugin.

The demonstration application contains a table that has metric fields defined. Triggers have been created for evaluating data as it is added to the MetricBase database. A scheduled job that runs every five minutes adds data to the MetricBase database. You can use the Data Explorer module to experiment with transform APIs.

The MetricBase Demo application has these modules.

Table 594: MetricBase Demo modules

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drones</td>
<td>A table created for this application. You can add records.</td>
</tr>
<tr>
<td>Fleets</td>
<td>A table created for this application. It provides a mechanism for grouping drones. You can add records.</td>
</tr>
<tr>
<td>Data Generators</td>
<td>A table defining how data is created for the drone records. This is provided for informational purposes. You cannot change or add records.</td>
</tr>
<tr>
<td>Metrics</td>
<td>Shows the metrics defined for the system. This is the same table as MetricBase Time Series Metrics. You can add metric fields.</td>
</tr>
<tr>
<td>Scheduled Jobs</td>
<td>Shows the scheduled job created for the demonstration application. The job runs every five minutes to add data to the MetricBase database. You can change the schedule.</td>
</tr>
</tbody>
</table>

Note: When you hit the back button, you are taken to the system Scheduled Script Executions table that shows all scheduled scripts in the system. Use the Navigator to return to the demonstration modules.
<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Triggers</td>
<td>Shows the triggers defined for the system. This is the same table as MetricBase Triggers Trigger Definitions. You can create triggers.</td>
</tr>
<tr>
<td>Anomaly Logs</td>
<td>Shows a list of anomaly logs. The Low-Flying Drone trigger creates the anomaly logs.</td>
</tr>
<tr>
<td>Data Explorer</td>
<td>Provides a form for experimenting with MetricBase APIs using the demonstration application's data. See MetricBase Data Explorer for more information.</td>
</tr>
</tbody>
</table>

**MetricBase Data Explorer**

Experiment using MetricBase APIs on the data created by the demonstration application.

Role required: admin

The Data Explorer screen has three sections, the Data Explorer Script Result Display on top, the Data Explorer Script area in the middle, and the Server Output area on the bottom.

**Note:** You may need to scroll down the screen to see the bottom two sections. The buttons are located below the script field.

The Data Explorer Script Result Display is initially blank.

The Data Explorer Script section is initially contains a script that you can run. The results of the script are shown in the Data Explorer Script Result Display. Using the Example Script list you can select one of the provided scripts. You can modify the scripts provided or write your own scripts.

**Note:** If you want to keep a modified script or a script you create, you will need to save the script separately.

The Server Output section is initially empty. You can add gs.info() statements to a script to provide debug information that shows in the Server Output section.

1. Navigate to MetricBase Demo Data Explorer.
2. To execute a script, click Run.
3. To change the script to be run.
   a) Select a script from the Example Script list.
   b) Click Load Example.
   c) Click Run.

**Domain separation and MetricBase**

This is an overview of domain separation and the MetricBase application. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.
Overview

Support: Data only

Domain separation in this application is supported at the Data only level, meaning it supports the data security model of separating visibility of data from one domain to another. To learn more, see Application support for domain separation.

MID Server

The ServiceNow® MID Server application facilitates communication and movement of data between the platform and external applications, data sources, and services.

Introducing the MID Server

The Management, Instrumentation, and Discovery (MID) Server is a Java application that runs as a Windows service or UNIX daemon on a server in your local network.

The MID Server facilitates communication and the movement of data between a ServiceNow instance and external applications, data sources, and services.

This video gives you an overview of the MID Server:
Applications that use MID Servers

<table>

</tbody>
</table>

Communicating with the MID Server

The MID Server initiates all communications with the ServiceNow® instance. The instance never initiates communications with the MID Server. This communication is recorded as records in the ECC queue, which is essentially the communication log between the instance and the MID Server. See The MID Server ECC Queue on page 1710 for more information.

MID Server selection

An application can select a MID Server in these ways.

• Auto-selection: The application can automatically find an appropriate MID Server that meets the necessary selection criteria. The criteria is different for each application.
• Default selection: The application defaults to a single MID Server that you can specify for each application.

See MID Server selection on page 1630 for details.

Asynchronous Message Bus

The MID Server opens a persistent connection to the instance through the Asynchronous Message Bus (AMB) Client and listens on the /mid/server/<mid_sys_id> AMB channel. When an output record is inserted into the Queue [ecc_queue] table, an AMB message is sent to the MID Server’s channel. The MID Server receives this message and immediately polls the ecc_queue table for work.

The MID Server polls the ECC queue on the regular interval defined in the mid.poll.time configuration parameter, regardless of AMB message activity. The default polling interval is set to 40 seconds, but can be reconfigured. This polling of the ECC queue at a regular interval is done in case the AMB connection is dropped.
Figure 307: MID Server ECC queue polling process

Note: The AMB client on the MID Server does not work in all environments and might need to be disabled to avoid performance issues. To disable AMB in your environment, set the mid.disable_amb parameter to true. When you disable AMB, the MID Server reverts to a default polling interval of 5 seconds, unless the mid.poll.time parameter is set to a different value.
System clones and the MID server

See KB0547597 for information on what to do with MID Servers when you are cloning your instance.

Using guided setup to implement a MID Server

MID Server guided setup provides a sequence of tasks that help you configure a MID Server on your ServiceNow instance. To open MID Server guided setup navigate to Guided Setup ITOM Guided Setup.

For more information about using the guided setup interface, see Using guided setup.

MID Server heartbeat

The Now Platform checks the MID Server for a response every 5 minutes, using a synthetic transaction monitoring system.

Checking for a heartbeat

ServiceNow instances send a synthetic transaction via the Heartbeat probe to every MID Server every 5 minutes. The Heartbeat probe functions exactly as a normal probe does and is sent by writing an output record to the ECC queue. A MID Server retrieves the record when it queries the ECC queue for work. The MID Server processes the probe just as it would any other probe and responds back to the instance. If the instance does not detect a response from a MID Server, the instance marks that MID Server as Down. If the MID Server responds, the instance considers the MID Server to not be Down and is communicating properly with the instance.

Note: Make sure that your MID Server can communicate on port 443. See Configure MID Server network connectivity on page 1590 and MID Server system requirements on page 1583 for more information.

System events

When a MID Server transitions from one state to another, one of these events is triggered:

- mid_server.up: The MID Server goes from a status of Down, Paused, or Upgrading to a status of Up.
- mid_server.down: The MID Server goes from a status of Up to a status of Down.
- mid_server.paused: The MID Server is paused.
- mid_server.upgrading: The MID Server is being automatically upgraded because the instance is being upgraded.

You can use these events to send notifications or trigger actions that you specify in scripts.

Scheduled job

To change the trigger interval for the Heartbeat probe, navigate to System Scheduler Scheduled Jobs Scheduled Jobs. Open the MID Server Monitor record and edit the interval.
Figure 308: MID Server heartbeat trigger interval

MID Server system requirements

Use these minimum system requirements to allocate resources for computers hosting MID Servers.
MID Server supported systems

The following systems support the MID Server.

  **Note:** .NET Framework version 3.5, 4.0, 4.5, 4.6, or 4.7 is required for Service Mapping support and for Windows pattern-based discovery.

• Linux: The MID Server is supported on Linux Red Hat 6 and above, Ubuntu 12 and above, and CentOS 6 and above. Linux MID Servers support virtual machines and 64-bit systems. On 64-bit Linux systems, you must install the 32-bit *GNU C library* (glibc). The installation command for CentOS is: `yum install glibc.i686`.

Java version support

The MID Server installer package does not include the Java Runtime Environment (JRE). You must install the JRE separately on each MID Server host before running the installer or verify that the correct version is already running on the host. If a supported version is present, ensure that the JAVA_HOME environment variable is pointed to that JRE or that java is available in the PATH environment.

The supported JRE version required for the MID Server host is any version in the Java 1.8 family, later than 1.8.0_152. Java 9 and 10 families are not supported. Both the 32 bit and 64 bit MID Servers use the supported JRE.

  **Note:** There is no change in the way the instance upgrades existing MID Servers to the supported JRE version.

Java Service Wrapper

The MID Server installer includes the Tanuki Java Service Wrapper, version 3.5.34.

Setting the JVM Memory size

The MID Server installs with 1 GB of JVM memory. If the suggested memory size for your product is greater than 1 GB, see *Set the MID Server JVM memory size* on page 1706 for the procedure to override the default setting.

Deployment types

System requirements for your instance are determined by the needs of the individual products you use that require a MID Server.

Standard deployments

The following products are considered “standard” because their MID Servers share the same minimum disk space and memory requirements:

• Discovery
• Event Management
• Integrations
• Orchestration
• Service Mapping

The minimum standard requirements pertain to both a single product and a combined product deployment. You can deploy a single MID Server for multiple standard products without significantly increasing the disk or memory requirements.

High resource deployments

Cloud Management Platform (CMP), alert aggregation and RCA, and Operational Intelligence are processing intensive and require more resources for each MID Server than the standard products. Install MID Servers for these products on dedicated hosts that do not support MID Servers for other products.

Recommended MID Server minimum requirements

All configurations listed here require a quad core processor with a speed of 2 GHz or greater and were calculated for a Windows Server 2012 R2 host.

**Note:** The MID Server minimum system requirements for 25 concurrent threads includes resource overhead that is independent of the number of threads. As a result, the system requirements for 200 threads do not require a linear increase in resources.

<table>
<thead>
<tr>
<th>Product</th>
<th>Disk space (GB)</th>
<th>Memory (GB)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>OS</td>
<td>MID Server + product</td>

<tr>
<td>Alert aggregation and RCA</td>
<td>36 GB</td>
<td>10 GB</td>
</tr>
<tr>
<td>Cloud Management Platform (CMP)</td>
<td>36 GB</td>
<td>4 GB</td>
</tr>
<tr>
<td>Operational Intelligence</td>
<td>36 GB</td>
<td>16 GB</td>
</tr>
<tr>
<td>Standard</td>
<td>36 GB</td>
<td>4 GB</td>
</tr>
</tbody>
</table>

Table 596: MID Server minimum system requirements for 200 concurrent threads (customer configured)

<table>
<thead>
<tr>
<th>Product</th>
<th>Disk space (GB)</th>
<th>Memory (GB)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>OS</td>
<td>MID Server + product</td>
</tr>
<tr>
<td>Alert aggregation and RCA</td>
<td>36 GB</td>
<td>10 GB</td>
</tr>
</tbody>
</table>
### Table 597: One MID Server for multiple standard products

<table>
<thead>
<tr>
<th>Product</th>
<th>Disk space (GB)</th>
<th>Memory (GB)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>OS</td>
<td>MID Server + product</td>
</tr>
<tr>
<td>Cloud Management Platform (CMP)</td>
<td>36 GB</td>
<td>4 GB</td>
</tr>
<tr>
<td>Operational Intelligence</td>
<td>36 GB</td>
<td>16 GB</td>
</tr>
<tr>
<td>Standard</td>
<td>36 GB</td>
<td>4 GB</td>
</tr>
</tbody>
</table>

Use case 1: Single MID Server deployed for multiple standard products

In this example, Service Mapping, Discovery, and Orchestration share a MID Server with 25 threads that is installed on a dedicated host. The disk space and memory requirements specified here satisfy the minimum recommended requirements for the combined product deployment.

### Table 598: Calculating resources for multiple MID Servers on a single host

<table>
<thead>
<tr>
<th>Product</th>
<th>Disk space (GB)</th>
<th>Memory (GB)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>OS</td>
<td>MID Server + product</td>
</tr>
<tr>
<td>MID Server 1</td>
<td>36 GB</td>
<td>4 GB</td>
</tr>
<tr>
<td>MID Server 2</td>
<td>4 GB</td>
<td></td>
</tr>
<tr>
<td>MID Server 3</td>
<td>4 GB</td>
<td></td>
</tr>
</tbody>
</table>

Use case 2: Multiple MID Servers deployed to a single host

In this example, three MID Servers (not clustered) are assigned to different standard products. All three MID Servers are deployed to a single host, where each MID Server has 25 threads. The required resources are calculated as follows:

- **Total disk space required**: Add the recommended disk space for the operating system from the OS column to the sum of the values in the MID Server + product column for all products mapped.
- **Total memory required**: Add the recommended memory for the operating system from the OS memory column to the sum of the values in the JVM memory column for all products mapped.
<table>
<thead>
<tr>
<th>Product</th>
<th>Disk space (GB)</th>
<th>Memory (GB)</th>
</tr>
</thead>
<tbody>
<tr>
<td>OS</td>
<td>MID Server + product</td>
<td>Total</td>
</tr>
<tr>
<td>Recommended minimum</td>
<td>36 GB</td>
<td>12 GB</td>
</tr>
</tbody>
</table>

**Monitoring performance**

To ensure that the MID Server resource allocations are sufficient for your environment, monitor performance during peak periods of product execution from the *MID Server dashboard*.

**MID Server version compatibility**

The version of the MID Server must be compatible with the version of the instance. Otherwise, the MID Server cannot process commands or communicate with the instance.

The instance determines which version of the MID Server is allowed. The MID Server version must at minimum belong to the same major release, such as Helsinki. If the MID Server version belongs to the same major release, it can, but does not have to, belong to the same minor version, such as Helsinki Patch 1. In this case, communication with the instance might still be possible, but it is always suggested that you upgrade to the latest version.

**Caution:** You can pin the MID Server to a specific version using the `mid.version.override` property, but you should be aware that the version might become out of date.

For more information on upgrades, see *MID Server upgrade* on page 1619.

**Version indicators**

If the version is not compatible, the MID Server status is not changed to Down in the MID Server dashboard. So it might still appear to be processing commands when it actually is not doing so. You must check the MID Server Version on the dashboard, which is available starting with the Istanbul release.

The icons in the Version column indicates the following:

- **Red:** Incompatible. The MID Server and instance do not belong to the same release. You must upgrade the MID Server and verify that it is not pinned to an older version with the `mid.version.override` property. The MID Server will not be upgraded until the parameter is cleared.
- **Yellow:** Compatible, but an upgrade is recommended. This indicates that the MID Server version belongs to the same family as the instance, but not the same version.
- **Green:** Compatible. No upgrade necessary.
- **Gray:** Incompatible. The instance cannot detect the version.

See *KB0535181* for additional MID Server troubleshooting information.

**MID Server installation**

The installation of the MID Server requires you to satisfy certain connection prerequisites and create a MID Server user before you download and install the MID Server on a host machine. All MID Servers must be validated before they can be used.
Using guided setup to implement a MID Server

MID Server guided setup provides a sequence of tasks that help you configure a MID Server on your ServiceNow instance. To open MID Server guided setup, navigate to Guided Setup ITOM Guided Setup. For more information about using the guided setup interface, see Using guided setup.

MID Server installation and setup process

To install and configure a MID Server, perform these tasks in the order shown here:

1. Configure communication between the MID Server and the instance on the appropriate port and enable the required web services. See Configure MID Server network connectivity on page 1590 for details.

2. Create the MID Server user and grant that user the mid_server role.

3. Download the installer file for the host machine.

4. Install the MID Server on a Linux or Windows host.

5. Test the MID Server connection to the instance.

6. Validate the MID Server to ensure that it is trusted to access credentials used by the instance for automations.

7. Configure MID Server parameters, which control various aspects of MID Server functionality, including proxy servers, debugging, and upgrade.

MID Server connection prerequisites

Before you install the MID Server, perform the necessary prerequisites that it needs to connect to elements inside and outside your network. This includes network privileges and security considerations.

Network privileges

The host machine must have these network privileges:

- Firewall access: Configure any firewalls between the MID Server and the target devices to allow a connection. If your network uses a DMZ, and if your network security protocols limit port access from within the network to the DMZ, you might have to deploy a MID Server to a machine within the DMZ to probe the devices there.
- Network access: Configure target devices to allow the MID Server probe to connect. If network security prevents you from configuring new machines that can connect to the targets, install the MID Server on an existing machine with connection privileges.
- Network account: Install the MID Server with the proper account, either local or domain administrator.

Additionally, for the MID Server to access your ServiceNow instance, satisfy these prerequisites:

- Network access to the ServiceNow instance: Configure the network that the MID Server uses to allow traffic over TCP port 443.
- A MID user: Create a ServiceNow user record for the MID Server to use. This user record must have the mid_server and import_admin roles.

Note: Verify that the baseline public page InstanceInfo is active for the MID Server to connect to the instance.
Security considerations

Sometimes computers or devices have additional security measures configured, and these measures may interfere with the MID Server's ability to run commands or queries on those systems.

For example, a Linux server might be configured to allow only certain IP address to connect to it via SSH. Similarly, a network router might be configured to allow only certain IP address to query SNMP on it. To allow access in such cases, use one of the following methods:

• Update the configuration of those computers or devices to allow the desired MID Server to run commands or query them. For example, a network router may be configured to only allow the network management systems to query SNMP on it. In that case, add the MID Server as though it were another network management system.
• Install a MID Server on a computer that already has access to the computers or network devices with such restrictions. For example, to use Discovery within a DMZ (where communication from outside the DMZ will be severely restricted), install a MID Server on a computer that is already in the DMZ.

External connectivity requirements

These requirements are specifically for the use of MID Servers with the ServiceNow Discovery and Orchestration products.

The MID Server communicates securely on port 443 to the instance and requires no inbound connections. In some cases, it might be necessary to allow this communication through the firewall if the MID Server fails to register on the instance. To determine if the application or a network security restriction is to blame for connection failure, attempt to telnet to the instance on port 443 from the server that is hosting the MID Server application. If this connection fails, then the problem could be a web proxy (since 443 is an https connection) or a Firewall rule preventing external TCP connections from that host. Contact network security personnel for the proxy information to add to the config.xml file, or request that the firewall be configured to allow access using one of the following syntaxes:

• <source IP> to <any>
• <source IP> to <ServiceNow> any established
• <source IP> to <instance_name.service-now.com> 443

The MID Server installer download process has changed for new instances in the London release. Access to install.service-now.com is no longer required for the MID Server host machines in your environment. When you request a MID Server installer, the download is performed by the instance, not the MID Server host. This change does not require any additional configuration. Customer instances hosted in a ServiceNow® datacenter have access to install.service-now.com automatically.

Existing MID Servers on upgraded instances do not have the code required to make upgrade requests through the instance and must have access to install.service-now.com for auto-upgrades. During the first MID Server upgrade, however, these MID Servers receive the updates they need to request future upgrades from the instance. You can then configure these MID Servers to send upgrade requests to the instance or continue using the existing download process. All new MID Servers installed for upgraded instances are equipped to make their upgrade requests through the instance.

Internal connectivity requirements

These methods are used for discovering various devices on a network and are specifically for the use of MID Servers with the ServiceNow Discovery and Orchestration products.

• SSH: For UNIX-like machines, Discovery and Orchestration use SSH protocol, version 2 to access target machines. SSH is a network protocol that allows data to be exchanged using a secure channel
between two networked devices. SSH communicates on port 22 within an encrypted datastream and requires a login to access the targets using two available methods of authentication: a user name and password combination and a user name and shared private key. Specify SSH authentication information and type in the Credentials module. If multiple credentials are entered, the platform tries one after the other until a successful connection is established or all are ultimately denied. To provide for application relationships a limited number of SUDO commands must be available to be run. Additional details to these requirements can be found in UNIX/Linux commands requiring root privileges for Discovery and Orchestration.

- **WMI**: For Windows machines, Discovery uses the **Windows Management Instrumentation (WMI)** interface to query devices. Due to security restrictions for WMI, the MID Server application executing the WMI queries must run as a domain user with local (target) administrator privileges. When Discovery detects activity on port 135, it launches a WMI query. The response from the Windows device is sent over a Distributed Component Object Model (DCOM) port configured for WMI on Windows machines. This can be any **port**. Ensure that the MID Server application host machine has access to the targets on all ports due to the unique nature of the WMI requirements.

- **Windows PowerShell** is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications. Orchestration uses PowerShell to run Workflow activities on Windows machines. PowerShell must be installed on any MID Server that executes these activities. MID Servers using PowerShell must be installed on a supported Windows operating system. ServiceNow supports PowerShell 2.0 and 3.0. Orchestration activities for PowerShell require a credentials Type of **Windows**.

- **SNMP - Network**: For network devices, Discovery uses an **SNMP scan** to get device specific MIBs and OIDs. SNMP is a common protocol used on most routers, switches, printers, load balancers and various other network enabled devices. Use a **community string** (password) for authentication when scanning a device via SNMP. Many devices have a default community string of public which Discovery uses by default when querying a target. Define additional community strings in the **SNMP credentials** form which are tried in succession, along with public, until a successful query returns. In addition to the credentials, the platform also requires the ability to make SNMP requests on port 161 from the MID Server to the target. If Access Control Lists (ACLs) are in place to control the IP addresses that can make these queries, ensure that the IP address of the MID Server is in the ACL. ServiceNow Discovery supports SNMP versions 1, 2c, and 3.

- **WBEM**: Web-Based Enterprise Management (WBEM) defines a particular implementation of the Common Information Model (CIM), including protocols for discovering and accessing each CIM implementation. WBEM requires either of two ports, 5989 or 5988 and uses the HTTP transport protocol. WBEM supports SSL encryption and uses CIM user name/password credentials. ServiceNow Discovery launches a WBEM port probe to detect activity on the target ports and to append gathered data to a classification probe that explores CIM Servers.

### Configure MID Server network connectivity

Before attempting to install and configure the MID Server, prepare your network to allow the MID Server to connect with the ServiceNow® instance.

**Role required**: admin

1. Configure the network to allow MID Server network connectivity to the ServiceNow instance over TCP port 443.
2. Configure basic authentication for SOAP communications with the ServiceNow instance.
3. Navigate to System Web Services Scripted Web Services Scripted SOAP Services.
4. Confirm that the following web services are active:
   - GetMIDInfo
   - InstanceInfo
   - MIDAssignedPackages
   - MIDFieldForFileProvider
   - MIDFileSyncSnapshot

© 2018 ServiceNow. All rights reserved.
5. Type sys_public.list in the navigation search field and press Enter.
The Public Pages record list appears.
6. Verify that the InstanceInfo public page is active, to allow the MID Server to validate its version.

Create the MID Server user and grant the role

Create the MID Server user ID and grant this user the role it needs to communicate with the instance.
Role required: admin

The MID Server connects to an instance by using the SOAP web service. To allow authentication with the instance, create a separate user account for each MID Server or share the same account across multiple MID Servers. Grant each MID Server user the mid_server role, which is required for the MID Server user on any instance on which basic authentication is enabled. The mid_server role allows the MID Server to access protected tables when strict SOAP security is in place. The system adds the necessary SOAP roles automatically with this role.

**Note:** The strict SOAP security feature, enabled by default for any instance that uses basic authentication, protects all tables with Access Control Lists (ACL).

1. From the instance, navigate to User Administration Users.
2. Click New.
3. Complete the fields in the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>User name for the MID Server user. This name is specified in the mid.instance.username parameter of the configuration file that the MID Server installer creates. For details, see MID Server parameters on page 1648.</td>
</tr>
<tr>
<td>First name</td>
<td>The user's first name.</td>
</tr>
<tr>
<td>Last name</td>
<td>The user's last name.</td>
</tr>
<tr>
<td>Password</td>
<td>Password for the MID Server user. This password is specified in the mid.instance.password parameter of the configuration file that the MID Server installer creates.</td>
</tr>
</tbody>
</table>

4. Right-click the header and select Save.
5. Under the Roles related list, click Edit.
6. Select the mid_server role for this user.
   Each MID Server account must have this role to access protected tables.

**Important:** The mid_server and security_admin roles are incompatible and cannot be assigned to the same user. For information on how the instance checks role assignments, see MID Server role validation on page 1592

7. Click Save.
8. Confirm that the MID Server account was created successfully and the account has connectivity to the instance.
   a) On the host machine where you intend to install the MID Server, open a browser and navigate to the instance.
   b) Use your new MID Server user credentials to log in.
      If the login is successful, then any MID Servers you install on that host will be able to connect to the instance.

MID Server role validation

Real-time system validation of MID Server role assignments prevents incompatible settings.

To prevent MID Server validation failure and ensure that your MID Server is configured correctly, the system runs several business rules that monitor the roles and settings you select for your MID Server user. The instance displays a warning and blocks the change when you attempt to save an incompatible configuration.

Elevated privileges not permitted

The mid_server role cannot be configured for elevated privileges. The Invalid MID Server settings business rule runs on the Role [sys_user_role] table and prevents the elevated_privileges field from being set to true for the mid_server role.
Figure 309: Warning for elevated privileges on the mid_server role

Relationship table protection

The User Role [sys_user_has_role] table creates the relationship between the [sys_user] and the [sys_user_role] tables.

- Incompatible role

The mid_server and security_admin roles are incompatible and cannot be assigned to the same user. The system determines the user’s current role and runs the Security Admin incompatible with MID business rule on the User Role [sys_user_has_role] table. This rule prevents an administrator from adding the security_admin role for a user who currently has the mid_server role.
Figure 310: Warnings for incompatible security_admin role assignment

- Incompatible user role and user record settings
  
The Incompatible MID Server user role business rule runs on the User Role [sys_user_has_role] table to protect its data from incompatible configurations. Validation for this related table ensures that an administrator cannot assign the mid_server role to a user who:
  
  - Already holds the security_admin role.
  - Has the web_service_access_only field set to true.
  - Has the internal_integration_user field set to true.
### Warning Messages:

1. A user with the 'Web-Service Access' option set to true cannot be granted the mid_server role.
2. A user cannot be granted both the mid_server and security_admin roles.
3. "MD Server" role assignment rejected.

Incompatible user record settings

Certain settings in the user record are not permitted with the mid_server role. The User settings incompatible with MID business rule runs on the User [sys_user] table to monitor the settings of the web_service_access_only and internal_integration_user check boxes. If the user has the mid_server role, this rule prevents either of these fields from being set to true.

![User settings](image)

Figure 312: Incompatible MID Server settings

**Note:** If you upgrade from a previous release with incompatible MID Server roles and settings, the system displays the appropriate warning messages when any change is made to the tables monitored by these business rules. If the change is unrelated to any role and settings validation, the system permits the updates and simply warns you of the existing incompatibilities. If the changes violate any compatibility rules in the Jakarta release, the business rules enforce the restrictions appropriately.

Download the MID Server files

The MID Server application is downloadable from the ServiceNow instance.

**Note:**
The MID Server installer download process has changed for new instances in the London release. Access to install.service-now.com is no longer required for the MID Server host machines in your environment. When you request a MID Server installer, the download is performed by the instance, not the MID Server host. This change does not require any additional configuration. Customer instances hosted in a ServiceNow® datacenter have access to install.service-now.com automatically.

You download the MID Server and then enable Discovery, Orchestration, or any integration that requires the use of the MID Server.

2. Select and download the MID Server for the appropriate operating system.
   There might be a few seconds delay while the instance processes the request and initiates the download.
Figure 313: MID Server downloads

3. Save the download file to a temporary file on the local drive.
4. Move the file into the designated MID Server folder you create for your operating system and run the installer from that location.
   - Linux
   - Windows

Install a MID Server on Linux

The MID Server installer automates the installation of a MID Server on a Linux computer.

Verify that the host computer meets the MID Server system requirements.

Role required: admin, mid_server

**Important:** The MID Server installer package does not include the Java Runtime Environment (JRE). You must install the JRE separately on each MID Server host before running the installer or verify that the correct version is already running on the host. If a supported version is present, ensure that the JAVA_HOME environment variable is pointed to that JRE or that java is available in the PATH environment.

You can install a MID Server on a 32-bit or 64-bit Linux computer. Click this link to view the installation video:

1. Verify that the MID Server host has the correct JRE installed.
The supported JRE version required for the MID Server host is any version in the Java 1.8 family, later than 1.8.0_152. Java 9 and 10 families are not supported.

2. If the MID Server host does not have the JRE installed or is running an unsupported version, download and install the correct version, and then configure either of the following:
   • Set the JAVA_HOME environment variable to point to a supported JRE.
   • Make java available in the PATH running environment.

3. From the Linux command line, type `mkdir -p /servicenow/mid server name` to create the installation directory. You need to have read/write/execute permissions on this folder.

4. Extract the downloaded MID Server archive file, `mid.os.zip` into the `/servicenow/mid server name/` directory. Use the MID Server name created in the instance or create a new name that you will use for this MID Server moving forward.
   The resulting directory structure is `/servicenow/<mid server name>/agent`.

5. Change to the `/servicenow/mid server name/agent` directory, and enter the following command to start the MID Server installer: `./installer.sh`.
   If you prefer to manually configure the MID Server instead, skip to this step.

6. Use the installer to enter the following information.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ServiceNow instance URL</td>
<td>Enter the full URL of your instance, for example:</td>
</tr>
<tr>
<td></td>
<td><a href="https://mycompanyinstance.service-now.com">https://mycompanyinstance.service-now.com</a></td>
</tr>
<tr>
<td>ServiceNow MID Server username</td>
<td>Enter the user name of the MID Server user that you already created. The MID Server user must have the mid_server role.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ServiceNow MID Server password</td>
<td>Enter the password for the user in the ServiceNow MID Server username.</td>
</tr>
<tr>
<td>Use proxy</td>
<td>Select this check box if your MID Server communicates through a proxy to connect to the instance.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Your proxy server must use Basic Authentication for the MID server to connect to the instance.</td>
</tr>
<tr>
<td>Proxy host</td>
<td>Enter the proxy server host name or IP address. Do not include the protocol in the host name. For example, enter proxyserver.domain.com, not <a href="https://proxyserver.domain.com">https://proxyserver.domain.com</a>.</td>
</tr>
<tr>
<td>Proxy port</td>
<td>Enter the port through which the proxy server communicates. If you leave this field blank, it should use the proxy server's default port number.</td>
</tr>
<tr>
<td>Proxy username</td>
<td>Enter the user name that has administrator rights to the proxy server.</td>
</tr>
<tr>
<td>Proxy password</td>
<td>Enter the password for the user name.</td>
</tr>
</tbody>
</table>

7. Click Test your connection to validate the credentials and instance information. If you encounter any errors, verify the information that you input.

8. Click Next.

9. Configure the MID name parameters (see table).
Table 599:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Server name</td>
<td>Enter any MID Server name.</td>
</tr>
<tr>
<td>MID Service wrapper name</td>
<td>Modify this field if necessary. It is populated automatically by prefixing snc_mid_ to the MID Server name. In most cases, you do not need to modify this.</td>
</tr>
<tr>
<td>MID Server wrapper display name</td>
<td>Modify this field if necessary. It is populated automatically by prefixing ServiceNow MID Server_ to the MID Server name. In most cases, you do not need to modify this.</td>
</tr>
</tbody>
</table>

10. Click Next to view the summary.
11. Click Start MID Server.
   The local host starts the MID Server.

When the MID Server service starts, it verifies that it is the only active (not down) MID Server with that name. If the MID Server discovers another active MID Server with the same name, the starting MID Server waits 5 minutes and sends another query. The MID Server repeats this query three times and logs each attempt in the agent log. If the MID Server still detects a duplicate after this cycle, it creates a record in the *MID Server Issue [ecc_agent_issue] table* and shuts itself down.

**Note:** The record in the MID Server Issue [ecc_agent_issue] table cannot be resolved automatically by the instance. Close this record manually for accounting purposes. Either mark the issue Resolved or delete it.
12. Click Mid Servers List Page.
The installer opens the MID Server list from your instance.

13. Select the MID Server name from the list.

   **Note:** It may take a few seconds for the MID Server time to establish a connection with your instance.

   The system displays the MID Server record.

14. From Related Links, click Validate.
The MID Server Validated changes to Yes.

15. To configure the MID Server manually, change to the servicenow/mid server name /agent directory, and then edit the config.xml file as follows:
   a) Find the element `<parameter name="url" value="https://YOUR_INSTANCE.service-now.com" />` and change the value to the URL of your instance.
   b) Enter the MID user credentials in the mid.instance.username and mid.instance.password parameters.
      By default, the MID Server, uses basic authentication for SOAP messages. The password value is also encrypted authentication.
   c) Find the `<parameter name="name" value="YOUR_MIDSERVER_NAME_GOES_HERE" />` element and change the value for the MID Server name.
   d) Enter connection information for the proxy server. Remove the appropriate comment tags from the proxy configuration information.
      For example, you can configure these parameters:
      - mid.proxy.use_proxy
      - mid.proxy.host
      - mid.proxy.port
      - mid.proxy.username
      - mid.proxy.password

16. Start the MID Server and verify that it is active.
   a) In the MID Server home directory (agent), execute the shell script start.sh to start the new MID Server.
   b) Log into the instance and navigate to MID Servers Servers to verify that your new MID Server has a Status or Up.
      Additional log information appears here:
      - The MID Server log on the instance.
      - The corresponding `agent0.log.0` and wrapper logs (`wrapper.log`) in the MID Server `agent/logs` folder.

17. To configure the MID Server to restart automatically when the host is restarted, run `${base_install_dir}/agent/bin/mid.sh install` as root to add the auto start scripts to the init.d directory.

18. To stop the MID Server, navigate to the MID Server home (agent) directory and execute the stop.sh shell script.

19. To restart a stopped MID Server, use either of these procedures:
   - In the instance, navigate to MID Servers Servers and open the record for a Down server. Under Related Links, click Restart MID.
   - Navigate to the MID Server home (agent) directory and execute the restart-service.sh script, using one of these commands:
Configure **MID Server parameters**, which control several aspects of MID Server functionality, including proxy servers, debugging, and upgrade.

### Uninstall a Linux MID Server

The MID Server runs as a stand-alone service. You can remove a stand-alone MID Server service to accommodate such tasks as redeploying the MID Server to another host machine or changing the unique name of a MID Server when deploying multiple MID Servers.

**Role required:** admin

1. From the MID Server home directory (agent directory) type `stop.sh`.
2. From a command prompt, go to the `agent\bin` directory in the MID Server installation directory.
3. Confirm that the MID Server is stopped by executing the `bin/mid.sh status` shell script.
4. After the MID Server stops, delete the files in the agent directory.

### Install a MID Server on Windows

The MID Server installer automates the installation of a MID Server on a Windows computer.

**Verify that the host computer meets the MID Server system requirements.**

**Role required:** admin or mid_server

---

**Important:** The MID Server installer package does not include the Java Runtime Environment (JRE). You must install the JRE separately on each MID Server host before running the installer or verify that the correct version is already running on the host. If a supported version is present, ensure that the JAVA_HOME environment variable is pointed to that JRE or that java is available in the PATH environment.

---

You can install one or more MID Servers on a supported Windows computer. Click this link to view the installation video:

1. Verify that the MID Server host has the correct JRE installed.
   - The supported JRE version required for the MID Server host is any version in the Java 1.8 family, later than 1.8.0_152. Java 9 and 10 families are not supported.
2. If the MID Server host does not have the JRE installed or is running an unsupported version, download and install the correct version, and then configure either of the following:
   - Set the JAVA_HOME environment variable to point to a supported JRE.
   - Make java available in the PATH running environment.
3. Log in to the Windows host machine where you want to install the MID Server.
4. Create a folder for the MID Server on the top level of the drive such as `ServiceNow\MID Server1`.
5. Download the MID archive file into the new folder.
6. Right-click the archive and select Extract All.
7. Navigate to the `service-now\<mid server name>\agent` folder that was created when the file was extracted.
8. Run `installer.bat` to start the MID Server installer.
To configure the MID Server manually, skip to this step.

9. Use the installer to enter the following information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ServiceNow instance URL</td>
<td>Enter the full URL of your instance, for example:</td>
</tr>
<tr>
<td></td>
<td><a href="https://mycompanyinstance.service-now.com">https://mycompanyinstance.service-now.com</a></td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ServiceNow MID Server username</td>
<td>Enter the name of the MID Server user that you already created. The MID Server user must have the mid_server role.</td>
</tr>
<tr>
<td>ServiceNow MID Server password</td>
<td>Enter the password for the user in the ServiceNow MID Server username.</td>
</tr>
<tr>
<td>Use proxy</td>
<td>Select this check box if your MID Server communicates through a proxy to connect to the instance.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Your proxy server must use Basic Authentication for the MID server to connect to the instance.</td>
</tr>
<tr>
<td>Proxy host</td>
<td>Enter the proxy server host name or IP address. Do not include the protocol in the host name. For example, enter proxyserver.domain.com, not <a href="https://proxyserver.domain.com">https://proxyserver.domain.com</a>.</td>
</tr>
<tr>
<td>Proxy port</td>
<td>Enter the port through which the proxy server communicates. If you leave this field blank, it should use the proxy server's default port number.</td>
</tr>
<tr>
<td>Proxy username</td>
<td>Enter the user name that has administrator rights to the proxy server.</td>
</tr>
<tr>
<td>Proxy password</td>
<td>Enter the password for the user name.</td>
</tr>
</tbody>
</table>

10. Click Test your connection to validate the credentials and instance information. If you encounter any errors, verify the information that you input.
11. Click Next.
12. Configure the MID name parameters (see table).
Configure MID name parameters

*MID Server name: My_Windows_MID_Server

MID Service wrapper name: snc_mid_My_Windows_MID_Server

MID Service wrapper display name: ServiceNow MID Server_My_Windows_MID_Server

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Server name</td>
<td>Enter any MID Server name.</td>
</tr>
<tr>
<td>MID Service wrapper name</td>
<td>Modify this field if necessary. It is populated automatically by prefixing snc_mid_ to the MID Server name. In most cases, you do not need to modify this.</td>
</tr>
<tr>
<td>MID Server wrapper display name</td>
<td>Modify this field if necessary. It is populated automatically by prefixing ServiceNow MID Server_ to the MID Server name. In most cases, you do not need to modify this.</td>
</tr>
</tbody>
</table>

13. Click Next to view the summary.
14. Click Start MID Server.
   The local host starts the MID Server.
   
   When the MID Server service starts, it verifies that it is the only active (not down) MID Server with that name. If the MID Server discovers another active MID Server with the same name, the starting MID Server waits 5 minutes and sends another query. The MID Server repeats this query three times and logs each attempt in the agent log. If the MID Server still detects a duplicate after this cycle, it creates a record in the **MID Server Issue [ecc_agent_issue] table** and shuts itself down.

   **Note:** The record in the MID Server Issue [ecc_agent_issue] table cannot be resolved automatically by the instance. Close this record manually for accounting purposes. Either mark the issue Resolved or delete it.
15. Click Mid Servers List Page.
The installer opens the MID Server list from your instance.

16. Select the MID Server name from the list.

*Note:* It may take a few seconds for the MID Server time to establish a connection with your instance.

The system displays the MID Server record.

17. From Related Links, click Validate.
The MID Server Validated changes to Yes.

18. To configure the MID Server manually, edit the config.xml file with a text editor such as WordPad:

   a) Find the element `<parameter name="url" value="https://YOUR_INSTANCE.service-now.com" />` element and change the value to the URL of your instance.

   b) Enter the MID user credentials in the mid.instance.username and mid.instance.password parameters.
      By default, the MID Server, uses basic authentication for SOAP messages. The password value is also encrypted authentication.

   c) Find the `<parameter name="name" value="YOUR_MIDSERVER_NAME_GOES_HERE" />` element and change the value for the MID Server name.

   d) Enter connection information for the proxy server. Remove the appropriate comment tags from the proxy configuration information.
      For example, you can configure these parameters:
      - mid.proxy.use_proxy
      - mid.proxy.host
      - mid.proxy.port
      - mid.proxy.username
      - mid.proxy.password

19. Start the MID Server and verify that it is active.

   a) In the MID Server home directory (agent), execute the batch file start.bat to start the new MID Server.

   b) Log into the instance and navigate to MID Servers Servers to verify that the Status of your new MID Server is Up.
      Additional log information appears here:
      - The MID Server log on the instance.
      - The corresponding agent0.log.0 and wrapper logs (wrapper.log) in the MID Server agent/logs folder.

20. To stop the MID Server, use either of these procedures:

   - Windows command line: From the MID Server home directory (agent) run stop.bat.
   - Windows Services console: Right click ServiceNow <MID Server name>, and then select Stop.

21. To restart a stopped MID Server, use any of these procedures:

   - In the instance, navigate to MID Servers Servers and open the record for a Down server. Under Related Links, click Restart MID.
   - Windows command line: In the MID Server home directory (agent), run Restart.bat.
Configure **MID Server parameters**, which control several aspects of MID Server functionality, including proxy servers, debugging, and upgrade.

**Manually install a MID Server as a Windows Service**

If you did not start the MID server at the end of the installation procedure, you can manually install the MID Server to run as a Windows service.

Role required: admin

You can install a MID Server as a Windows service in these operating systems:

- Windows Server 2008
- Windows Server 2012
- Windows Server 2016

1. Open the agent directory in the directory you created for the MID Server installation files. For example, the path might be `C:\ServiceNow\MID Server1\agent`.
2. Right-click the start.bat file, and select Properties.
3. Select the option to Run as administrator.
4. Double-click the start.bat file to install the Windows service.

**Uninstall a Windows MID Server**

The MID Server runs as a stand-alone service. You can remove a stand-alone MID Server service to accommodate such tasks as redeploying the MID Server to another host machine or changing the unique name of a MID Server when deploying multiple MID Servers.

Role required: admin

1. Stop the running MID Server service, using one of these procedures:
   - Windows command line: From the MID Server home directory, for example from the agent folder, type `stop.bat`.
   - Windows Services console: From the Windows Services console, right-click the ServiceNow MID Server name and then select stop.
2. From a command prompt, go to the `\agent\bin` directory in the MID Server installation directory.
3. Double-click the `UninstallMID-NT.bat` file.
4. Check in the Windows Services console for a service named ServiceNow WMI Collector. If it is running, open a command prompt, navigate to `agent\bin\sw_wmi\tools`, and double-click `uninstall_wmi.bat`.

**Test MID Server connectivity**

Confirm network connectivity to the MID Server host or to the instance for automatic upgrades, and then ensure that the MID Server can communicate with the instance.

Role required: admin

The MID Server installer download process has changed for new instances in the London release. Access to `install.service-now.com` is no longer required for the MID Server host machines in your environment.

When you request a MID Server installer, the download is performed by the instance, not the MID
Server host. This change does not require any additional configuration. Customer instances hosted in a ServiceNow® datacenter have access to install.service-now.com automatically.

Existing MID Servers on upgraded instances do not have the code required to make upgrade requests through the instance and must have access to install.service-now.com for auto-upgrades. During the first MID Server upgrade, however, these MID Servers receive the updates they need to request future upgrades from the instance. You can then configure these MID Servers to send upgrade requests to the instance or continue using the existing download process. All new MID Servers installed for upgraded instances are equipped to make their upgrade requests through the instance.

The computer that hosts existing MID Servers in an upgraded system must be able to access one of these URLs to upgrade automatically for the first time:

- HTTPS: https://install.service-now.com on the default HTTPS port (443)
- HTTP: http://install.service-now.com on the default HTTPS port (80)

1. Use PING to test connectivity with the host on the network (ping<host IP>).
2. If no ping response is returned, use TRACEROUTE to see where traffic might be stopped (traceroute<host>).
3. Use TELNET to connect to any of the TCP ports (telnet<host> <port>).
4. Use an SNMP scanning tool to determine if a potential network device is responsive.
5. Resolve the most likely issues around network connectivity:
   - Routing: Confirm that the MID Server host has network access to the IP ranges you are attempting to discover.
   - Firewalls: Confirm access to the physical firewalls that protect a large environment such as the Data Center. Confirm access to any logical firewalls that protect an individual computer. MID Server communications are initiated inside the firewall and therefore do not require any special firewall rules or VPNs.
   - Access Control Lists (ACL): Confirm that ACLs contain the IP addresses based list on SNMP network devices that allows communication to a particular target.
   - Resolve all issues with your network teams to better understand your topology. Deploy additional MID Servers if necessary to help keep your network secure. Configure access from your existing MID Server host to networking components.

6. Verify that the MID Server service is running on the host:
   - Windows: In the Windows Services console, locate the ServiceNow [MID Server name] and confirm that each MID Server has the Started Status value.
   - Linux: Ensure that the agent0.log.0.lck appears in the /servicenow/ MID Server name]/agent folder.

7. After each MID Server restart, open the agent0.log.0 and address all error messages.
8. From the ServiceNow instance, navigate to MID Server Servers.
9. Review and verify that all MID Servers that are connected to the instance are listed.
10. Verify that the Status is Up for the MID Servers.

Validate the MID Server

You must manually validate the MID Server after it is installed to enable it to execute automation tasks. You can invalidate a MID Server you suspect has been compromised to prevent it from accessing automation credentials in the instance or executing outbound ECC probes.

Role required: agent_admin, admin

Make sure that the MID Server version is compatible with the instance.
Validation restricts access to automation credentials to trusted MID servers only.

Starting in the Istanbul release, you can specify that the MID should be used for all capabilities, applications, and IP ranges when you validate a MID Server. You will be prompted to set the initial selection criteria when you validate MID Servers that do not already have capabilities, applications, or IP ranges already configured. You do not have to set the initial selection criteria to actually validate the MID Server. See MID Server selection on page 1630 for more information on capabilities, applications, and IP ranges.

**Note:** When you upgrade to Geneva and later releases, MID Servers that are already configured in your instance are automatically validated. This prevents the interruption of automation tasks that MID Servers might be performing. See MID Server upgrade on page 1619 for more information.

1. Install the MID Server using the instructions in MID Server installation on page 1587. This creates a record in the MID Server [ecc_agent] table.
2. Navigate to MID Server Servers.
3. Open the new MID Server from the list of MID Servers.
4. Under Related Links click Validate.
   The Set Initial Selection Criteria window appears if there are no records in the Supported Applications, IP Ranges, or Capabilities related lists.
5. On the Set Initial Selection Criteria window, use the switches to enable or disable selection criteria for this MID Server:
   • Allow ALL capabilities: Allow all capabilities for Orchestration and Event Management use this MID Server.
     **Note:** Service Mapping and Event Management alert aggregation and RCA, which used capabilities in previous releases, rely on the application for MID Server selection starting with the Istanbul release.
   • Allow ALL applications: Allow all applications that use MID Servers use this MID Server.
   • Allow ALL IP ranges: Make all IP ranges valid for this MID Server, meaning that it can target any IP address.

   ![Set Initial Selection Criteria](image)

   **Figure 314: Setting initial selection criteria**

   If you click Cancel, the validation continues but none of the capabilities, applications, or IP ranges are added.
   6. Click OK.
The Validated field on the dashboard is set to Validating, and then set to Yes after the validation completes.

7. To invalidate a MID Server, open the record for the MID Server you suspect has a security issue.
8. Under Related Links, click Invalidate.

Invalidating a MID Server forces it to clear its memory and restart. The MID Server generates a new keypair on restart.

**Multiple MID Server deployments**

Depending upon how you use the MID Server (for an external integration, Discovery, Service Mapping or Orchestration) and the load placed on it, you might find it necessary to deploy multiple MID Servers in your network.

Factors determining the number of MID Servers your network will require to support external applications that integrate with ServiceNow include the following:

- The security constraints in your network.
- Your network policies.
- The amount of traffic between ServiceNow and the integrations.
- The reliability of the MID Server machines.

**Network policies and security**

Security policies in your network (firewalls between network segments, for example) might make direct communication impossible between your instance and an integration's data source (JDBC, LDAP, etc.). To retrieve data for the instance, you can install a MID Server that has access to both the data source and the instance.

These network policies can determine if you need to install multiple MID Servers in your environment:

- Access control lists (ACL): If your security policy controls access to network devices (e.g. switches and routers) with an ACL, it might be necessary to install one or more MID Servers on a machine in the network that is already on the ACL.
- DMZ: Your network policy might require you to install one or more MID Servers in your DMZ to probe the devices there. This is common in networks that tightly regulate the ports that are opened on the inside firewall.
- Probe types: If you are conducting probes of different operating systems, your network policy might require a separate MID Server for each type of probe (e.g., one MID server for Windows WMI probes and another for SSH probes on UNIX).

**Load balancing**

Deploy multiple MID Servers where capacity is an issue, as when Discovery has to gather information about thousands of configuration items quickly. In a high volume environment, it might be necessary to deploy multiple MID Servers as load balancers for certain transactions. For example, JDBC data transfers can tie up the resources of a MID Server, making it unable to respond to other requests. The following operations between an integration might require separate MID Servers in a busy network:

- File exports
- Running scripts
- JDBC data sources
• Reading files

**High availability model**

Avoid installing MID Servers for critical integrations on a machine that might experience any type of planned outage or an outage caused by overloaded processes. If necessary for reliability, consider deploying these types of MID Servers to dedicated machines for high reliability.

**Note:** Do not integrate with an external application on a MID Server provisioned for ServiceNow Discovery or Orchestration.

**Wide area network (WAN)**

When determining where to deploy MID Servers in a WAN, consider the bandwidth available between your local area networks. In most cases, install a MID Server on each LAN to probe devices locally, rather than deploying MID Servers that must probe devices across slow WAN connections. An alternative to this type of deployment is to install MID Servers that probe other LANs via VPN connections that take advantage of fast Internet connections. If the bandwidth of your WAN connections is comparable to that of your Internet connection, then there is no performance impact in running MID Server probes across WAN connections.

**Domain separation**

In deployments where domain separation is enabled and domains are configured to form a hierarchy, place the MID Servers at the lowest domain level.
Install multiple MID Servers on a single system

You can install multiple MID Servers on the same host computer.

Role required: admin, mid_server

You can install multiple MID Servers on a single host or on a virtual machine using either Linux or Windows. Installing multiple MID Servers may involve other setup steps depending on your network configuration.

1. Log in to the host system or virtual machine where you want to install multiple MID Servers.
2. Create a directory for each MID Server on the top level of the drive.
   Make sure you create a unique and descriptive name for each MID Server, such as MIDSserver_SMS_Int or MIDSserver_Disc1.
3. Extract the downloaded MID Server archive file into each MID Server directory.

Figure 315: Deploying MID Servers with domain separation
When the extract completes, there should be a directory path that resembles the following for each MID Server. For example, ServiceNow<MID Server name>\agent.

4. For each MID Server, run the installer appropriate to the host's operating system.

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Installer path</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows</td>
<td>/agent/installer.bat</td>
</tr>
<tr>
<td>Linux</td>
<td>/agent/installer.sh</td>
</tr>
</tbody>
</table>

5. Use the installer to enter the following information.
   - URL to your instance
   - User credentials to run the MID Server
   - Proxy server connection details
   - MID server name
   - MID server service wrapper name and display name (Windows systems only)

   **Note:** The MID Server user must have the mid_server role.

6. From the installer, click Start MID Server.
The local host starts the MID Server.

7. Click Mid Servers List Page.  
The installer opens the MID Server list from your instance.

8. Select the MID Server name from the list.

  **Note:** It may take a few seconds for the MID Server time to establish a connection with your instance.

The system displays the MID Server record.

The MID Server Validated changes to Yes.
Configure Windows MID Server service credentials

MID Server service credentials are required to manage the MID Server service on the host machine, including its ability to successfully auto-upgrade.

By default, the MID Server service runs as a Local System account. This account has privileges to create and run the MID Server service and to download, create, and move files for the MID Server auto-upgrade process.

Windows service credentials are not the same as the MID Server user credentials, which allow communication between the MID Server and the instance. You must configure both of these credentials separately. See Create the MID Server user and grant the role on page 1591 for instructions on MID Server user credentials.

Attention: This procedure is optional. Allowing the MID Server service to run as a Local System account is sufficient for a majority of users.

1. Open the Windows Services console.
2. Double-click the ServiceNow <MID Server name> service for each MID Server.
3. Select the Log On tab.
4. Set Log on as privileges with the user account (local or on a domain) that has local admin access to the MID Server host.
   The MID Server upgrade process deploys a temporary Windows service which requires local administrator privileges.
5. In the General tab, set the Startup type. The field is set to Automatic by default.
6. Click OK.
7. Restart the ServiceNow <MID Server name> service, and make sure that ServiceNow\<MID Server name>\agent\logs\agent0.log does not have error messages. If the MID Server does not start, see the ServiceNow knowledge article Review the agent log for MID Server errors (article KB0535148).
8. On the instance to which this MID Server is connected, navigate to MID Server Servers. If Discovery is installed, alternately navigate to Discovery MID Servers.
   All MID Servers connected to this instance are listed.
9. Make sure that the Status of the MID Server you just installed is Up.

Monitor the MID Server

Monitoring MID Servers involves verifying entries in log files, confirming network connectivity, and checking MID server status.

Role required: agent_admin or admin

You can monitor MID Servers hosted by Windows or Linux MID servers.

1. For Windows only, navigate to the Windows Services console, locate the service name that matches the name that appears from the wrapper-override.conf file. If the MID Server process is the only Java process running on the host, monitor the memory used by java.exe and alert on less than the maximum configured memory defined in the \agent\conf\wrapper-override.conf folder.
2. Ensure that the agent0.log.0.lck file appears in the \agent\logs folder to confirm that the MID Server running and logging system activity in the agent0.log.0 file.
3. Review the following logs for warning, critical, and severe errors:
   • \agent\logs\agent0.log.0

© 2018 ServiceNow. All rights reserved.
See Manage ECC Queue content for a MID Server on page 1712 to see how to open log entries from the instance.

4. **Confirm network connectivity.**

5. From the MID Server instance, navigate to the MID Servers page, and review the status of the MID Server. For additional information, click a Name.

6. **Use Windows or Linux tools to monitor:**
   - CPU
   - Disk utilization
   - Events
   - Memory
   - syslog

Set up email, SMS, and push notifications to alert you when issues occur with MID servers. The MID Server Down notification is enabled by default. See **Notifications** on page 596 for details.

**MID Server upgrade**

MID Servers are automatically upgraded, but you can also manually upgrade each MID Server separately.

**Access to the MID Server download site**

The MID Server installer download process has changed for new instances in the London release. Access to install.service-now.com is no longer required for the MID Server host machines in your environment. When you request a MID Server installer, the download is performed by the instance, not the MID Server host. This change does not require any additional configuration. Customer instances hosted in a ServiceNow® datacenter have access to install.service-now.com automatically.

Existing MID Servers on upgraded instances do not have the code required to make upgrade requests through the instance and must have access to install.service-now.com for auto-upgrades. During the first MID Server upgrade, however, these MID Servers receive the updates they need to request future upgrades from the instance. You can then configure these MID Servers to send upgrade requests to the instance or continue using the existing download process. All new MID Servers installed for upgraded instances are equipped to make their upgrade requests through the instance.

**Note:** Future versions of the platform will require all MID Server download requests to go through the instance.

These system properties control access to the MID Server download site:

- **mid.download.through.instance:** Enables the MID Server download through the instance. This property is set to true for all new instances and sends all auto-upgrade requests through the instance. For upgraded instances, the property is set to false which retains the previous behavior of sending upgrade requests from the MID Server host. To configure MID Server auto-upgrades through the instance, add *this property* to the System Property [sys_properties] table and set it to true.
- **concurrent.dist.download:** Sets the number of concurrent MID Server auto-upgrades permitted by the instance. The default value of this property is 2, which allows the MID Server to use 2 of the 4 semaphores available on the instance for upgrading. If your instance has more than 4 INT semaphores, you can increase the value in this property to allow more concurrent upgrades.
Upgrade methods

- **Automatic**: Allow the instance to automatically upgrade the MID Server. This functionality is available by default. Automatic upgrade occurs:
  - Every hour, when the MID Server checks with the instance to see if there is a different version available for upgrade. You cannot modify this time period.
  - When the instance is upgraded and the MID Server for that version is different than the version currently on the MID Server.
  - When the MID Server pre-upgrade test passes without an error. Any errors encountered during this automatic test prevent the upgrade from occurring until the issues are resolved. The pre-upgrade test is enabled by default, but can be disabled by adding and setting a system property.

- **Manual**: Manually start the upgrade by clicking a related link on the MID Server record. Use this method when you do not want to wait until the next hourly automatic update or if your upgrade failed and you want to force an upgrade. See [Upgrade the MID Server manually](#) on page 1625 for instructions.

The Upgrade state

The instance initiates the upgrade by sending the autoUpgrade system command to the MID Server. Starting with MID Servers upgrading from an Istanbul version MID Server, the MID Server Status is changed to Upgrading while the upgrade is running. The Upgrading state is similar to the Paused state. This is done to avoid potential miscommunication between the new version of the instance and the previous version of the MID Server during upgrade. For the upgrade to run, MID servers must be in the Up state and must be **validated**.

While in the Upgrading state, you cannot resume or restart the MID Server. However, you can perform the same actions that you can when the MID Server is in the Paused state. After a successful upgrade, the queued output is sent to the instance and the MID Server starts retrieving new commands to process. The status also changes to Up.

When the instance sends the autoUpgrade system command to the MID Server, if it is Down or Paused, or if it has not been validated, the command remains in the ECC Queue until the MID Server status changes to Up. Then the command is processed.

**Note**: If you are using an Istanbul instance but you are upgrading a pre-Istanbul MID Server to Istanbul, these upgrade states are not available. They are available only for MID Servers that are already on Istanbul.

Failed upgrades

Failed upgrades are handled differently based on the version you are upgrading to:

- Upgrade to another major release: (such as Istanbul to the next full release): the status changes to Upgrade Failed.
- Upgrade from a minor version within a release (such as Jakarta patch 1 to patch 2): the MID Server continues using the version it is currently running. It does not perform the upgrade and the status eventually changes to Up, assuming the MID Server was already functioning properly.
Upgrading MID Servers in the Down state

If a MID Server is in the Down state, it cannot process the upgrade command. When the MID Server changes to Up, it immediately checks to see if an upgrade is necessary. If it does need to upgrade, the upgrade process starts before the MID Server processes any other commands.

Upgrade error messages

The MID Server can display the following upgrade error messages.

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unable to refresh packages</td>
<td>Generic error when the error is not handled by a defined error message.</td>
</tr>
<tr>
<td>Failed to query instance for MID Server buildstamp</td>
<td>Instance is unavailable or there is a major version mismatch between the MID Server and the instance.</td>
</tr>
<tr>
<td>Not a valid package buildstamp</td>
<td>InstanceInfo returned an assigned buildstamp that was not in the correct format, such as a version mismatch.</td>
</tr>
<tr>
<td>Method failed (&lt;instance URL&gt;) HTTP/1.1 409 Conflict with code: 409</td>
<td>MID Server auto-upgrade request rejected when number of concurrent upgrades exceeds 2. The configured number of available semaphores for MID Server upgrades on the instance is set at 2 to prevent performance degradation.</td>
</tr>
</tbody>
</table>

| Note: The MID Server re-sends the request every 20 seconds until it can get the semaphore. |

MID Server pre-upgrade check

The instance automatically tests the MID Server's ability to upgrade on your system prior to the actual upgrade, to identify issues that could cause a MID Server outage or require reinstallation.

Each MID Server contains an AutoUpgrade monitor that compares the MID Server version with that of the instance to determine if the MID Server needs to upgrade. If the AutoUpgrade monitor discovers that the MID Server version is out of date, the monitor runs pre-upgrade validation tests for that MID Server. If an issue is detected, a message is logged to the MID Server Issue [ecc_agent_issue] table, and the upgrade is blocked. The AutoUpgrade monitor continues to run every hour, until the tests all pass. If there are no blocking issues, the MID Server downloads the appropriate upgrade package and begins the upgrade process.

Failed tests leave the MID Server in one of these states:

- Upgrade Failed: For upgrades to a different release family, such as from Geneva to Jakarta.
- Up: For upgrades within the same release family, such as an upgrade to a patch.
Errors, such as insufficient disk space for the installer and lack of connectivity to install.service-now.com, are written to both the MID Server agent log and to the MID Server Issue [ecc_agent_issue] table. These errors are published before the actual MID Server upgrade occurs and must be resolved before the upgrade can continue. You can view issues from the MID Server Issue [ecc_agent_issue] table in any of these locations:

- MID Server Issues related list in a MID Server record.
- MID Server Server Issues navigation module.
- MID Server Issues gauge on the MID Server dashboard.

**Attention:** MID Servers on new instances of the London release send upgrade requests to the instance, which then retrieves the installation package from install.service-now.com. MID Servers for upgraded instances cannot request upgrades from the instance and must have access to the download site. After the initial upgrade, these MID Servers can be configured to request upgrades through the instance. See MID Server upgrade on page 1619 for details.

### Pre-upgrade tests

The pre-upgrade validation tests check these requirements:

- At least 1GB of free disk space.
- Access to the download site at install.service-now.com.
- Permission to execute these file operations:
  - Extract a ZIP archive to a temp folder.
  - Copy files from the temp folder to the agent folder.
  - Read a text file.
  - Delete the pre-upgrade contents.
- For Windows, ensure that the Log On As user for the Windows service is either LocalSystem or a user that is part of the local Administrator group. By default, domain administrators are added to the local Administrator group when joining a computer to a domain. If the PowerShell script that performs this test does not return the expected output, the system logs a warning to the MID Server Issue [ecc_agent_issue] table, but the test passes.

### Data provided

When the instance encounters issues during the pre-upgrade check, it populates these fields in the MID Server Issue [ecc_agent_issue] table:

**Table 602: MID Server issue fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last detected</td>
<td>Date and time the issue was last detected.</td>
</tr>
<tr>
<td>Short description</td>
<td>Contents of the generated message that specifies a possible issue with available disk space, download server access, or file permissions.</td>
</tr>
<tr>
<td>MID Server</td>
<td>Name of the MID Server affected by a pre-upgrade test failure.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Issue source</td>
<td>The process that identified the issue. For all issues with MID Server pre-upgrade testing, the source is UpgradeCheck.</td>
</tr>
<tr>
<td>State</td>
<td>The current state of the issue. Possible states are:</td>
</tr>
<tr>
<td></td>
<td>• New: Starting state when the instance creates the issue.</td>
</tr>
<tr>
<td></td>
<td>• Acknowledged: State set by the administrator when he or she first examines the issue.</td>
</tr>
<tr>
<td></td>
<td>• Resolved: Ending state, set by the instance, indicating that the issue has been resolved. If the scheduled job does not encounter the issue when it runs again, the instance automatically sets the state to this value.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain for the MID Server. For all issues derived from MID Server pre-upgrade testing, the domain value is inherited from the domain of the MID Server user.</td>
</tr>
<tr>
<td>Count</td>
<td>Number of times an issue has been detected. Each time the pre-upgrade tests run and encounter the same issue, the AutoUpgrade monitor increments this field.</td>
</tr>
</tbody>
</table>

**Errors that block the upgrade**

These messages describe issues detected by the pre-upgrade test and published to the MID Server Issue [ecc_agent_issue] table. Failure of any of these tests blocks the upgrade.

- Not enough free disk space. The system reports \(<n>\) bytes free: This message is displayed when less than 1GB of free disk space is detected on the MID Server host. This error is also written to the MID Server agent log.
- Unable to download updates from install server: This message indicates that either the instance or MID Server host does not have permission to download the installation package from install.service-now.com, or network problems prevent connection. This error is also written to the MID Server agent log.
- Unable to extract contents of pre upgrade check zip: This message indicates that the service account on the MID Server host does not have permission to extract the pre-upgrade ZIP archive to the temporary folder specified by the system property, java.io.tmpdir. On a UNIX host, the value for this property is typically /tmp or /var/tmp. On Microsoft Windows hosts, the path is c:\WINNT\TEMP.
- Unable to create folder <upgrade check file path>: This message indicates that the MID Server service account does not have permission to create the upgradeCheck folder for the pre-upgrade checking files in the agent/package path.
- Unable to verify file permissions: <message>: This message indicates an exception has occurred when checking file permissions, such as a file that does not exist or access failure.
- MID Server Windows Service is not running as LocalSystem or a local Administrator: This message warns that the Windows service is not running with the desired permissions.
Non-blocking warnings

These warnings are displayed in the MID Server Issue [ecc_agent_issue] table and do not prevent a Windows MID Server from upgrading:

- **WARN: Unable to parse $logOnAsUser**: This message warns that the Log On As User value for the Windows service is not in either of these expected formats:
  - user@domain.company.com
  - domain\user
- **WARN: Unable to look up Log On As user's groups**: When the instance attempts to look up the logged on user's group memberships, it executes the `net user <username>` command. The instance expects a certain output structure by the Windows service from this command and issues this warning if the expected output does not match the actual output.

These PowerShell warnings are written to the MID Server agent log only. Because PowerShell is not required to use a MID Server, these configuration issues do not prevent a Windows MID Server from upgrading. However, these warnings might indicate issues in your environment that require attention.

- **Skipping PowerShell upgrade checks since PowerShell is not usable**: PowerShell 2.0 (at a minimum) is not installed or `powershell.exe` is not available to the MID Server service user.
- **Continuing with upgrade, but the following issue was encountered during upgradeCheck**: `<exception message>`: This message indicates that there was an issue running the PowerShell portion of the pre-upgrade tests.

Disabling the pre-upgrade check

A MID Server configuration parameter called `mid.upgrade.run_precheck` is set to true by default, which allows the automatic pre-upgrade test to run. To disable these tests for a single MID Server, add this parameter to that MID Server's config.xml file and set it to false. To disable these tests for all MID Servers, add a new record to the MID Server Property [ecc_agent_property] table called `mid.upgrade.run_precheck`. Set the value of this property to false and leave the MID Server field blank.

MID Server version selection

You can pin all the MID Servers in your environment to a specific version by setting a system property, or you can configure specific versions for individual MID Servers.

**Note**: Do not pin the MID Server to a specific version for a significant amount of time, especially if you upgrade the instance. Under most circumstances, let the instance determine which MID Server version to use.

Version control properties

These properties control the version for all MID Servers:

- **mid.buildstamp**: Identifies the MID Server version with an identifier based on the date of the build. This property uses a date and time format of `yyyy-mm-dd-hhmm`. The MID Server checks for version information hourly. If no override version is configured, the MID Server looks at the mid.buildstamp property for the version to use. This property resets itself to the default version (the version that matches your instance version) when the instance is restarted or upgraded, so any user changes are lost at that time.
• mid.version.override: Sets an override condition for the current version for all MID Servers in your environment. This action pins the MID Servers to a single version and disables the automatic upgrade feature. This property is not visible in the base system and must be added to the System Property [sys_properties] table when it is set. For details, see Add a property using sys_properties.list.

When the MID Servers check the version each hour, they look at the mid.version.override property first. If this property is empty, the MID Servers get their version information from the mid.buildstamp property. If an override version is configured, the MID Servers use this value and ignore the version information in the mid.buildstamp property. This override value remains when the instance is restarted and is passed to the MID Servers.

Attention: The value in the mid.version.override property is cleared during an upgrade, which forces the MID Server to reset itself to the version in the mid.buildstamp property.

Version control configuration parameter

To pin specific MID Servers on a desired version, set the mid-pinned.version parameter with the name of that version in the config.xml file of each MID Server. This setting overrides the property setting for the pinned MID Server version. For instructions, see Add a MID Server parameter on page 1672.

Note: The value set in this parameter is not affected by an upgrade.

Upgrade the MID Server manually

You can manually upgrade MID Servers at any time if you do not want to wait for the automatic upgrade.

Role required: mid_server or admin

For the upgrade to run, MID servers must be in the Up state and must be validated.

The MID Server is upgraded to the version specified by build stamp on the instance, or by the upgrade property that you specify.

1. Navigate to Discovery MID Servers or Orchestration MID Server Configuration MID Servers.
2. Open the record of the MID Server that you want to upgrade.
3. Click Upgrade MID under Related Links.
4. Confirm that you want to perform the upgrade.

MID Server configuration

Administrators must configure a MID Server to ensure that it has access to sufficient system resources, probes the proper data sources, and communicates with the instance as expected.

You must complete all the steps in MID Server Installation before attempting any of the configuration steps explained here.

Restart a MID Server after any configuration change for the changes to take effect.

Note: All new MID Servers must be validated before use. Validation ensures that the MID Server is trusted to access credentials used by the instance for automations. For instructions, see Validate and invalidate the MID Server.
MID Server Records that cannot be altered

These records cannot be modified or deleted.

<table>

Using special characters in an XML file

The XML specification defines five predefined entities that represent special characters, and requires that all XML processors honor them. If these characters are used in a password, you will experience unexpected results.

The following characters represent the five pre-defined entities:

• "
• &
• '
• <
• >

If you use the pre-defined entity characters in an XML file, such as the MID Server configuration file, you need to encode them. To encode pre-defined entities into an XML document:

• replace " with &quot;
• replace & with &amp;
• replace ’ with &apos;
• replace < with &lt;
• replace > with &gt;

For example, to specify the password as test&amp; in the MID Server config.xml file:

```xml
<parameter encrypt="true" name="mid.instance.password" value="test&amp;"/>
```

The MID Server dashboard

The MID Server dashboard is a central place for MID Server users to monitor ongoing operations. The dashboard consists of reports and gauges that display information from the MID Server Status table.

The MID Server Dashboard is available from the MID Server Dashboard module.
The MID Server status gauge

The MID Server Status gauge on the dashboard displays basic information about each MID Server. This information comes from the MID Server Status [ecc_agent_status] table.

<table>
<thead>
<tr>

</table>
| Version | The version of the MID Server. An icon indicates the validity of the MID Server:  
- Red: Incompatible. The MID Server and instance do not belong to the same release. You must upgrade the MID Server and verify that it is not pinned to an older version with the mid.version.override property. The MID Server will not be upgraded until the parameter is cleared.  
- Yellow: Compatible, but an upgrade is recommended. This indicates that the MID Server version belongs to the same family as the instance, but not the same version.  
- Green: Compatible. No upgrade necessary.  
- Gray: Incompatible. The instance cannot detect the version. |
| User | The login name of the user. An icon indicates the validity of the user:  
- Red: Incompatible. The user does not have the mid_server role or the user does not match the value in the mid.instance.username parameter (in the config.xml configuration file). Reconfigure the MID Server user and verify that it works.  
- Green: Compatible. The user has the mid_server role and matches the user in the configuration file.  

**Note:** The user can also have any of the SOAP roles that the mid_server role inherits. |

**CPU and maximum memory usage**

This graph shows the average percentage of CPU usage on all the systems that host MID Servers in the last 30 days.
This graph shows the average percentage of maximum memory used by all the systems that host MID Servers in the last 30 days.
MID Server selection

You can configure MID Server selection by application, IP address ranges, network capability, or behavior.
MID Server criteria

MID Servers offer these types of criteria that help an application determine which MID Server to use:

- **Application**: The application that you specify on the MID Server. You can designate these applications for a specific MID Server:
  - Discovery
  - Orchestration
  - Service Mapping
  - Event Management
  - Operational Intelligence
  - Cloud Management

  An ALL application option is also available. By default, this option includes all applications except Event Management alert aggregation and RCA, which requires an exclusive MID Server. You can configure which applications are included in the ALL designation.

- **IP address or range**: The IP address or the IP ranges that the MID Server is allowed to work within. You can specify an IP address or IP range in the application, such as on a Discovery schedule or an Orchestration activity, and for the MID Server. If the IP configured in the application matches the IP address or falls within the allowable IP range configured on the MID Server, a match is possible, and that MID Server passes this criteria. To have the instance automatically assign IP ranges (subnets) to available MID Servers, see MID Server IP range auto-assignment on page 1640.

- **Capabilities**: The network capability an application needs to use, such as the PowerShell Orchestration activity or the Flow Designer PowerShell step on page 1296. Some applications, like Cloud Management and alert aggregation and RCA, require a specific capability.

  **Note**: Discovery and Service Mapping can also use behaviors, which determine the type of port probes used during the port scan phase of Discovery. Both Discovery and Service Mapping use a behavior to discover load balancers running on Linux. Other applications do not use behaviors. Behaviors are not used for auto-selection, default MID Servers, or specific MID Servers as described below. See Discovery behaviors for more information.

How an application selects a MID Server

If you do not specify a specific MID Server for an application to use, the application tries to select one. Each application relies on different criteria to select an appropriate MID Server.

<table>
<thead>
<tr>
<th>Application</th>
<th>Supported Application on the MID Server</th>
<th>IP address range</th>
<th>Capability</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discovery (Select Auto-Select MID Server on the Discovery schedule)</td>
<td>The Discovery or ALL application must be specified on the MID Server.</td>
<td>Discovery uses IP ranges that you configure on the Discovery Schedule form to see if they fall within the IP ranges that you configure on the MID Server, or the ALL IP ranges option must be selected on the MID Server.</td>
<td>N/A</td>
</tr>
</tbody>
</table>

  **Note**: Any configured behaviors are ignored.
<table>
<thead>
<tr>
<th>Application</th>
<th>Supported Application on the MID Server</th>
<th>IP address range</th>
<th>Capability</th>
</tr>
</thead>
<tbody>
<tr>
<td>Orchestration</td>
<td>The Orchestration or ALL application must be specified on the MID Server.</td>
<td>The target IP address that you configure in an Orchestration activity must fall within the IP ranges that you configure on the MID Server, or the ALL option must be selected on the MID Server.</td>
<td>The capability that is required for an Orchestration activity must match the capabilities you configure on the MID Server, or the MID Server capability must be set to ALL.</td>
</tr>
<tr>
<td>Alert aggregation and RCA (as part of Event management)</td>
<td>The Service Analytics application must be specified on the MID Server.</td>
<td>N/A</td>
<td>One of these capabilities must be present on the MID Server: the RCA capability for alert aggregation and RCA and the Metrics capability for Operational Intelligence.</td>
</tr>
<tr>
<td>Service Mapping</td>
<td>The Service Mapping or ALL application must be specified on the MID Server.</td>
<td>The endpoint IP address must fall within the IP range that you configure on the MID Server, or the ALL option must be selected on the MID Server.</td>
<td>One of the supported Service Mapping capabilities (for new installs) must be configured on the MID Server, or the MID Server capability must be set to ALL.</td>
</tr>
<tr>
<td>Event Management</td>
<td>The Event Management or ALL application must be specified on the MID Server.</td>
<td>The IP configured in the event connector instances, such as HPOM, must fall within the IP range configured on the MID Server.</td>
<td></td>
</tr>
<tr>
<td>Cloud Management</td>
<td>N/A</td>
<td>N/A</td>
<td>The Cloud Management or ALL capability must be added.</td>
</tr>
</tbody>
</table>

**Using a specific MID Server**

Discovery and Event Management can use a MID Server that you specifically call out.

**Note:** Selecting a specific MID Server is not the same as specifying the default MID Server for an application. A specific MID Server is always used. If it is Down or not validated, the application does not execute commands against the MID Server. A default MID Server is fallback that is used when the auto-selection of MID Servers does not find any eligible MID Server.
Application | How you specify a specific MID Server | Criteria that the default MID Server must meet
---|---|---
Discovery | Choose the MID Server on the Discovery schedule. | You can use any MID Server as long as it does not have the RCA capability. If you select a MID Server for the Discovery or ALL application, it automatically adds the Discovery application. 

**Note:** You can also specify a cluster of MID Servers.

Orchestration | N/A | N/A
Alert aggregation and RCA | N/A | N/A
Service Mapping | N/A | N/A
Event Management | Choose one or more MID Servers on the connector instance event collection, such as HPOM. | N/A
Cloud Management | N/A | N/A

**Note:** If a MID Server manages resources within defined IP ranges for Orchestration, you must map the fully-qualified domain name (FQDN) of a server with its IP address to run certain activities, such as Exchange activities.

### Domain separation

If you are using domain separation, you can configure MID Servers to be in separate domains. The domain that the MID Server is in affects how the application selects the domain:

- **Discovery and Service Mapping:** On the Discovery schedule, the MID Servers and clusters that available for selection are limited to the same domain of the user who is configuring the schedule. This also applies to the auto-selection option: only MID Servers in the same domain as the user can be automatically selected.

- **Alert aggregation and RCA (Event Management):** The metrics for a business service is done on the MID Server that is in the same domain as the business service. Otherwise, a MID Server from the global domain is used.

### MID Server selection test

If Service Mapping is active, you can preview which MID Server that Service Mapping uses for a specific target device or computer. To do this, navigate to Service Mapping MID Servers and click MID Selection Test. Enter the IP address and an optional application and capability, and then click OK. The name of the MID Server that Service Mapping will use appears in the window.

### Configure a default MID Server for each application

You can configure a default MID Server that an application can use if all other possible MID Servers are unavailable.

**Role required:** agent_admin or admin

Applications are only available when their respective plugins are activated.

The default MID Server is used when applications fail to find a suitable MID Server that matches configured criteria during auto-select. The default MID Server for the ALL application is used if the default
MID Server for the specific application is not available. Some applications also offer a property to set the default MID Server.

**Important:** If you configure a MID Server for ALL IP ranges (type Include) and also create an IP range of type: Exclude for the same MID Server, the system ignores the excluded IP range for that MID Server.

The default MID Server does not need to meet any criteria (application, IP range, behavior, or capability) to be used. Specifying a default MID Server is optional, and you can use a MID Server as the default for more than one application.

<table>
<thead>
<tr>
<th>Application</th>
<th>Additional notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discovery</td>
<td>Discovery attempts to use the default MID Server when the Discovery schedule specifies Auto-Select MID Server and Discovery cannot find any MID Servers with the correct application and IP range.</td>
</tr>
<tr>
<td>Orchestration</td>
<td>Orchestration attempts to use the default MID Server when it cannot find any MID Servers with the capabilities that you define in the Orchestration activity. You can also specify a default MID Server. The value in that property automatically synchronizes with the default MID Server you select in the Orchestration application.</td>
</tr>
<tr>
<td>Alert aggregation and RCA</td>
<td>Not applicable. The MID Server is selected if it has the RCA capability. Route to right MID by domain.</td>
</tr>
<tr>
<td>Service Mapping</td>
<td>If there are no MID Servers with matching application, capability, or IP range, Service Mapping uses the default MID Server.</td>
</tr>
<tr>
<td>Event Management</td>
<td>You can specify a default MID Server for Event Management using the mid.server.connector_default system property. Event Management does not use the default MID Server in the application record.</td>
</tr>
<tr>
<td>Cloud Management</td>
<td>N/A</td>
</tr>
</tbody>
</table>

1. Navigate to **MID Server Applications**. The list of installed applications that can use MID Servers appears.
2. Click the name of an installed application.
3. Select a MID Server from the list in the Default MID Server field.
4. To select additional MID Servers for this application, click Edit in the MID Servers related list and select alternate MID Servers that this application is allowed to use.
5. Click Update.

**Configure an IP address range for the MID Server**

You can manually configure an IP address range for the MID Server to explore.

Role required: agent_admin or admin

Applications, such as Discovery and Orchestration, can specify an IP range or the specific IP address of a target. When the application looks for a MID Server to use during auto-selection, it chooses a MID Server whose IP range includes the application's range or specific IP address. Applications also use other criteria, such as the MID Server's supported application or capability. See **MID Server selection** on page 1630 for more information.
**Note:** This is a manual configuration procedure. To learn how the system can assign IP address ranges to selected MID Servers automatically, see *MID Server IP range auto-assignment* on page 1640.

These applications use IP ranges as follows:

- **Orchestration:** Use the IP address of the target machine (together with the capability) to select the correct MID Server for Orchestration activities. Refer to the procedure in this topic to configure the IP address.

- **Service Mapping:** Select the MID Server whose IP address range matches the IP in the discovery request. See *MID Server configuration for Service Mapping* for more information.

- **Discovery:** Can select an IP address range using the same criteria as Service Mapping. Discovery can also use a *quick IP range* that you specify in the Discovery schedule.

**Tip:** You can also use the ALL IP range, which allows the MID Server to be used with any range of IP addresses that an application specifies. This only allows the MID Server to access IP ranges, it does not mean that the MID Server can actually reach all of the IP ranges. To function with an application, the MID server must have access to the IP ranges that the application needs.

Valid IP address ranges can be as follows:

- **An IP address in dotted decimal or hexadecimal format.** The hexadecimal format can be explicitly prefixed with 0x, this is not mandatory. Here are examples:
  - 10.11.144.155
  - 0xA0B909B
  - A0B909B

- **An IP address range in dotted decimal or hexadecimal format.** Here are examples:
  - 10.11.144.150-10.11.144.160
  - 0xA0B9096-0xA0B90A0
  - 10.11.144.150-0xA0B90A0

- **An IP network address with the net mask specified after a slash (/) in regular notation (0-32 inclusive) or in IP address notation.** Dotted decimal or hexadecimal format is not allowed. Here are examples:
  - 10.11.144.0/24 10.11.144.0/255.255.255.0
  - 10.11.144.0/FFFFFF00
  - 0xA0B9000/24
  - 0xA0B9000/FFFFFF00

1. Navigate to **MID Server IP Ranges**.
2. Click **New**.
3. Complete the form, using the fields in the table.
Figure 318: IP address ranges

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for this IP range. The default is Global.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Type    | Select the type of range:  
- **Include**: Include the specified IP range.  
- **Exclude**: Exclude the IP address range.  

**Note:** If a MID Server is configured for ALL applications, any IP addresses configured for exclusion are ignored by the system. If your goal is to configure default MID Servers for separate applications in your system, see [Configure a default MID Server for each application](#) on page 1633.

<table>
<thead>
<tr>
<th>Range</th>
<th>Enter the range in a valid format.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Related list</td>
<td>The MID Servers that can use this IP address range.</td>
</tr>
</tbody>
</table>

4. Click Save.

**Important:** IP ranges assigned manually prior to using auto-assignment in the Discovery Quick Start are affected as follows:

- Individual IP ranges are retained and appended to the ranges assigned automatically by the system for the designated MID Server.
- If the MID Server was configured with the ALL ranges selection, the auto-assignment feature overwrites that designation with the ranges it finds.

Open the ALL IP range record and configure the MID Servers that you want to use with any set of IP addresses.

### Select applications to include in the definition of ALL for a MID Server

You can narrow down the list of applications that are included in the definition of ALL.

**Role required:** agent_admin or admin

You can specify the ALL application for a MID Server, which means that the MID Server is allowed to work with any of the applications that require MID Servers, such as Discovery, Event Management, Service Mapping, and so on. But you might not want all applications to be included in the definition of ALL. For example, you might want to exclude Service Mapping from all the ALL definition if you already have a dedicated MID Server to work with Service Mapping.

1. Navigate to MID Server Applications.
   The list of installed applications that can use MID Servers appear.

2. If you do not see the Included in application ALL column, you can personalize the list and add it.
3. For each application, double-click the value in the Included in application ALL column.
4. Change the value to true (to include) or false (to exclude).

Override the MID Server selection filter

You can use the override feature to write your own filter condition that overrides the normal MID Server selection criteria for an application. An override has precedent over the default filter and can be defined for a specific selection condition.

Before attempting to create an override filter, be sure you understand the criteria the platform uses to select MID Servers. See MID Server selection on page 1630 for details.

Role required: admin

**Note:** In the London release, the override feature is intended for Cloud Management and Cloud Discovery only. The Override by capability filter is provided by default.

There are four MID Server selection filters included in the base ServiceNow system. These filters are applied to all MID Servers in order until the system finds a matching condition:

- Status Filter
- App Filter
- Capability Filter
- IP Filter

**Important:** The override feature allows multiple filter types but only one override filter for each filter type. The Override selector filter type overrides all other filters and takes complete control of the MID Server selection. If this type is active, it is the only filter applied.

1. Navigate to MID Server Mid Selector Override.
   The list of MID Server overrides appears.
2. Click New to create a new filter.
3. Complete these fields:
   - Name: Unique name for this override. Ensure that you can identify the override type by the name.
   - Script: Condition for this filter. Create the MID Server selection logic for your override in this field, using the directions provided in the function template. Look at the Override by capability filter as an example before starting to create your filter.
• Type: Type of override being configured. Select one of the four default filters to override with your condition, or select Override selector to create a filter that overrides all the others.

4. Click Submit.

```javascript
(function filter(candidateMIDList) {
    // Check if this is cloud capability - if not nothing to do
    if (!hasCloudCapability) {
        return defaultSelectedMIDList;
    }

    // get first non cloud capability (e.g AWS) - there should be only one more
    var capability = getNonCloudCapability(requestedParameters.capabilities);
    if (JSUtil.isNullOrEmpty(capability)) {
        return defaultSelectedMIDList;
    }

    // get mid with AWS capability
    var mids = getMidsWithCapability(capability);
    if (mids.length > 0)
```
MID Server IP range auto-assignment

IP ranges that represent a subnet can be automatically assigned to qualified MID Servers by the Discovery Quick Start feature.

To be automatically assigned to a subnet, a MID Server must be:

- In a running (Up) state.
- Successfully validated.
- Able to access one or more subnets in your network.

The subnet assignments that the instance makes for your MID Servers are stored in the Automation Status Set [automation_status_set] table. For details about MID Server auto-assignment, see Discovery Quick Start.

**Important:** You must auto-assign at least one MID Server to create a schedule automatically.

Required SNMP OIDs for MID Server IP range auto-assignment

Customers who use network service providers must request specific SNMP access to use MID Server IP range auto-assignment.

IP range auto-assignment requires SNMP credentials for read-only access to all routers that Discovery uses to identify subnets. In addition, your service provider must grant the following SNMPWALK access:

- iso.org.dod.internet.mgmt.mib-2.ip.ipRouteTable (1.3.6.1.2.1.4.21)
  - ipRouteDest (1.3.6.1.2.1.4.21.1.1)
  - ipRouteNextHop (1.3.6.1.2.1.4.21.1.7)
  - ipRouteType (1.3.6.1.2.1.4.21.1.8)
  - ipRouteMask (1.3.6.1.2.1.4.21.1.11)
- iso.org.dod.internet.mgmt.mib-2.ip.ipForward.ipCidrRouteTable (1.3.6.1.2.1.4.24.4)
  - ipCidrRouteDest (1.3.6.1.2.1.4.24.4.1.1)
  - ipCidrRouteMask (1.3.6.1.2.1.4.24.4.1.2)
  - ipCidrRouteNextHop (1.3.6.1.2.1.4.24.4.1.4)
  - ipCidrRouteType (1.3.6.1.2.1.4.24.4.1.6)

View automation status sets and IP range assignments

The Automation Status Set form shows summary details of a subnet Discovery and the subsequent IP range assignments for MID Servers selected for automatic subnet assignment.

Role required: admin

1. Navigate to MID Server Automation Status Sets.
2. Select a status record for a subnet Discovery you want to view.
   The form contains read-only status information about the selected Discovery, the subnets found, and the range assignment process for the MID Servers you selected for auto assignment.

**Important:** IP ranges assigned manually prior to using auto-assignment in the Discovery Quick Start are affected as follows:

- Individual IP ranges are retained and appended to the ranges assigned automatically by the system for the designated MID Server.
• If the MID Server was configured with the ALL ranges selection, the auto-assignment feature overwrites that designation with the ranges it finds.
The Automation Status Set shows the IP range assignments for the MIO Servers selected for automatic range configuration. All auto-populated MIO Server ranges from this process are subnets only. This form includes summary details of the Discovery that identified the available subnets and their ranges.

3. Select the Subnets Discovered related list to view the list of subnets available for assignment.

![List of subnets associated with a discovery status]

4. Select the IP Range Assignments related list to view the IP ranges that were assigned to a MID Server.

**Caution:** IP ranges identified by Discovery are stored in the IP collection [ip_address_collection] table, which is only used for MID Server IP range auto-assignment in the Jakarta release. This table is intended for future development and should not be used in any customizations, including column additions, business rules, or scripting actions.
MID Server properties

Properties control the behavior of all MID Servers or a particular MID Server.

The MID Server properties are in the MID Server Property [ecc_agent_property] table and can be accessed by navigating to MID Server Properties. You must add these properties if they are not already present.

Table 603: MID Server properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| mid.discovery.max_pattern_payload_size      | Defines the maximum overall payload size for the payload of results that come from patterns.
<p>|                                             | • Type: integer (bytes)                                                    |
|                                             | • Default value: 300000                                                    |
|                                             | You can also configure this as a configuration parameter on a individual MID Server. |</p>
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| **mid.discovery.max_payload_size** | Specifies the maximum string length of Discovery results that the MID Server sends to the instance. If the Discovery probe results exceed the limit, the MID Server discards them and returns a warning message.  
For probes, this applies only to those probes where the Used by Discovery field is true. For patterns, this applies to the Horizontal Pattern probe.  
Set the value to any negative number to disable the payload limit and allow payloads of any size to be sent to the instance. For example, -1.  
  - Type: integer (bytes)  
  - Default value: 5000000  
You can also configure this as a configuration parameter on a individual MID Server. |
| **mid.eccq.max_payload_size** | Specifies the maximum string length of a payload that the MID Server sends to the instance. The MID Server verifies the size of the payload before sending it to the instance. If the payload size exceeds the limit, the MID Server discards it and returns an error message in the payload.  
  - Type: integer (bytes)  
  - Default value: 20000000  
You can also configure this as a configuration parameter on a individual MID Server. |
| **mid.max_ci_count_per_page** | Defines the size of each chunk in a payload of results that come from patterns. The chunk can be greater than this parameter value, depending on the relationships of the CIs.  
  - Type: integer (bytes)  
  - Default value: 300000  
You can also configure this as a configuration parameter on a individual MID Server. |

Create a MID Server property

Use a MID Server property to control either the behavior of all MID Servers or a particular MID Server.

Role required: admin

You set MID Server properties to override MID Server parameters. Configure MID Server properties in the MID Server plugin. Do not configure MID Server properties in the glide.properties file that is located in the properties folder of the agent. The glide.properties file gets overwritten during the upgrade process.

1. Navigate to MID Server Properties.
2. Click New.
3. Fill in the fields, as appropriate (see table).

Table 604: MID Server properties fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the property name.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
Value | You can enter the value you want the property to have.  

**Note**: If you are amending JDBC operations through the mid.property.jdbc_operations properties, you can enter verbs like BEGIN, END, IF, or common PL/SQL block statements. This will assist in being able to run CREATE or ALTER statements. You might have to restart the MID server before running some of the statements.

MID Server | Leave this field blank to set a MID Server property that affects all MID Servers. To set a MID Server property for a particular MID Server, select the MID Server.

4. After setting any MID Server properties, restart the MID Server to ensure the properties sync with the instance.

**MID Server parameters**

Parameters control the behavior of a particular MID Server and have lower precedence than MID Server properties.

**Important**: Changes to parameters only take effect when the MID Server is started (or restarted).

**Required parameters**

**Note**: Using special characters in an XML configuration file requires you to encode them.

<table>
<thead>
<tr>
<th>Description</th>
<th></th>
</tr>
</thead>
</table>
| **Instance** | the URL to the associated instance. Normally the URL is similar to https://instance.service-now.com, where you replace `instance` with the instance name. If you host your own instance, use the URL set by your organization.  
• Type: string  
• Default value: none |
| **mid_sys_id** | the MID Server record's unique identifier. This parameter should be empty when you initially configure a MID Server. Do not change the value.  
• Type: string  
• Default value: automatically set (GUID) |
<table>
<thead>
<tr>
<th>Description</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Use this parameter to supply a name that is meaningful for you. If you do not supply this parameter, the MID Server uses the default value. A set of business rules synchronizes the name in the configuration file with the name in the MID Server record. The business rules ensure that changing the name in one location also changes the name in the other location. | MID | Type: string  
Default value: YOUR_MIDSERVER_NAME_GOES_HERE |
| If the ServiceNow instance has authentication enabled, as it is by default, set this parameter to define the user name the MID Server should use to log in to the instance. This user should have the mid_server role on the ServiceNow instance in order to access necessary tables and fields. You can use this parameter to define user names with special characters. | Instance user name | Type: string  
Default value: none |
| If your ServiceNow instance has authentication enabled, as it is by default, set this parameter to define the password the MID Server should use to log in to the instance. You can use this parameter to define passwords with special characters. | Instance password | Type: string  
Default value: none |

### CIM parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Maximum number of messages sent at once to a CIM server. | mid.cim.batch.size | Specifies the maximum number of messages sent at once to a CIM server.  
Type: integer  
Default value: 1 |
| Interval to wait between requests to the same CIMOM (ms). | mid.cim.request.interval | Specifies the number of milliseconds to wait between requests to the same Common Information Model Object Manager (CIMOM).  
Type: integer (milliseconds)  
Default value: 0 |
| The maximum amount of simultaneous connections allowed per CIMOM. | mid.cim.host.connection.limit | Specifies the maximum number of simultaneous connections to each Common Information Model Object Manager (CIMOM). A value of zero disables simultaneous connections.  
Type: integer (number of connections)  
Default value: 0 |
## Connection parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Asynchronous Message Bus Client disable    | mid.disable_amb    | Disables the Asynchronous Message Bus (AMB) Client. When AMB is enabled, the MID Server uses a default polling interval of 40 seconds. When the AMB client is disabled, the default polling interval switches to 5 seconds. If you set a polling interval with the `mid.poll.time` parameter, the MID Server uses that value whether or not the AMB client is enabled.  
  - Type: true | false  
  - Default value: false |
| Instance date format                       | instance.date.format | Specifies the format the instance uses for dates and times. The primary impact of setting this parameter is to allow the MID Server to correctly refresh its start and stop times on the MID Server record in ServiceNow. The format of this date/time string is identical to that used by the Java SimpleDateFormat class.  
  - Type: string (Date format)  
  - Default value: yyyy-MM-dd HH:mm:ss |
| MID Server immediate response enable       | glide.mid.fast.responses | Instructs the MID Server to try sending messages to the instance as soon as they are ready. Normally the MID Servers ends message to the ServiceNow instance serially (that is, one message at a time). Since many probes can be run in parallel, there can be multiple messages simultaneously transmitted to the instance. Setting this parameter to true may decrease the time between a probe's completion and its response arriving at the instance. However, the multiple simultaneous messages consume resources, decreasing the overall instance responsiveness. If there are communications problems, this parameter's value can also cause a logjam on the MID Server, as threads normally used for running probes may be consumed for sending messages. Generally, leave this parameter out of your configuration. Setting it to true is meaningful only under very special circumstances.  
  - Type: true | false  
  - Default value: false |
<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| MID Server JMX enable | mid.jmx.enabled | Enables a JMX server on the MID Server, which exposes some management information to JMX consoles. Implementing JMX requires additional configuration of the Java runtime environment. Setting this parameter to true is only recommended for those with detailed knowledge of the Java security architecture and a specific need for JMX.  
  - Type: true | false  
  - Default value: false |
| MID Server max transmission queue size | glide.mid.max.sender.queue.size | Places an upper limit on how large the queue is allowed to get. The MID Server starts deleting queued messages if this limit is exceeded. When the MID Server generates messages to the ServiceNow instance faster than it can send them, it queues them temporarily on the file system of the MID Server’s host. This queue is normally quite small, and is completely emptied as soon as the MID Server processing slows for a short period. However, this queue can grow in size when there are communication problems between the MID Server and the instance, and especially if there is an integration running on the MID Server.  
  - The parameter is of the form \{number\}{multiplier}, where \{number\} is any positive decimal number including non-integers, and the optional multiplier is any spelling of bytes, kilobytes, megabytes, gigabytes, or terabytes (only the first character is tested, and the test is case-insensitive). The default multiplier is bytes.  
  - White space is liberally tolerated. The following strings all represent valid parameters: "1000000000", "0.5m", "5 GB", "7.67gigas", "145.69392 meg", and "1.1 terra".  
  - Type: string  
  - Default value: 0.5 GB |
| MID Server maximum number of probe threads | threads.max | Controls the number of execution threads (simultaneous work) that probes may use. This parameter provides direct control over what CPU resources the MID Server consumes on the computer that hosts it. To decrease the MID Server’s CPU consumption, lower the number of threads. To make the MID Server work faster, increase the number of threads. See Set MID Server Thread Use.  
  - Type: integer (threads)  
  - Default value: 25 |
| Maximum amount of interactive messages to queue in memory for processing. | threads.interactive.max | Sets the maximum amount of interactive messages to queue in memory for processing.  
  - Type: integer (threads)  
  - Default value: 4 |
<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Maximum amount of expedited messages to queue in memory for processing. | threads.expedited.max         | Sets the maximum amount of expedited messages to queue in memory for processing.  
- Type: integer (threads)  
- Default value: 4 (threads) |
| MID Server poll time in seconds when MID server is not busy. | mid.poll.time                  | Sets the default MID Server polling interval (in seconds). The polling interval is the amount of time the MID Server waits before checking the ECC queue for work when the ECC queue is not busy. The MID Server polls the ECC queue using this interval if the AMB client connection is dropped.  
**Note:** The default polling interval resets to 5 seconds when the AMB client is disabled. If you configure the mid.poll.time parameter, the MID Server uses this polling interval whether or not the AMB client is connected.  
- Type: integer (seconds)  
- Default value: 40 |

### Credentials parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Credentials provider.                      | mid.credentials.provider | Specifies the Java class name of the credentials provider.  
- Type: string  
- Default value: com.service_now.mid.creds.standard.StandardCredentialsProvider |
| Class that the MID server uses to generate secure key pairs. | mid.secure_credentials.key_pairs.provider | Specifies the Java class name of the credentials provider.  
- Type: String  
- Default value: com.service_now.mid.keypairs.provider.standard.StandardKeyPairsProvider |
### Debug parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Debug logging enable. | debug.logging | [Deprecated] Specifies whether to enable logging of MID Server events and messages (both sent and received). Normally this parameter is only used by developers, but it is occasionally useful when troubleshooting a problem. Be aware that setting this parameter to true causes intensive logging on the MID Server, potentially using considerable disk space.  
  - Type: True | False  
  - Default value: false  

This parameter has been replaced by the mid.log.level parameter.

| Debug mode enable. | debug | [Deprecated] Specifies whether to enable debug logging on the MID Server. Normally this parameter is only used by developers, but it is occasionally useful when troubleshooting a problem. Be aware that setting this parameter to true causes intensive logging on the MID Server, potentially using considerable disk space.  
  - Type: True | False  
  - Default value: false  

This parameter has been replaced by the mid.log.level parameter.

| Debug file probe templates. | file.probe.template.debug | Specifies whether to debug file probe templates.  
  - Type: True | False  
  - Default: false  

| Enables debug logging for CIM / WBEM / SLP / SMI-S. | mid.cim.debug | Specifies whether to enable debug logging for CIM, WBEM, SLP, or SMI-S.  
  - Type: True | False  
  - Default value: false |
<table>
<thead>
<tr>
<th>Label</th>

| Enable debug logging for ServiceNow SSH Client.                      | mid.ssh.debug | Enables SSH debug information in the log file. The parameter usage depends on whether the ServiceNow SSH client is enabled.  
When the ServiceNow SSH client is enabled, the parameter functions as follows:  
• Type: String  
• Default value: false  
The following string values are valid for the ServiceNow SSH client:  
• true: Enables SSH debug information in the log file.  
• false: Disables SSH debug information in the log file.  
• <IP Addresses>: Specify which IP ranges to enable SSH debug information in the log file. You can enter IP addresses in the following formats:  
  • An IP range defined by a slash and the number of bits in the subnetwork. For example, the string 10.10.0.0/24 scans 24 bits of IP addresses from 10.10.0 to 10.10.254.  
  • An IP range defined by a dash. For example, the string 10.10.11.0-10.10.11.165 scans the IP addresses from 10.10.11.0 to 10.10.11.165.  
  • A comma-separated list of specific IP addresses. For example the string 10.10.11.200,10.10.11.235 scans the IP addresses 10.10.11.200 and 10.10.11.235.  
• deferred: Logs SSH debug information in memory unless an error or warning occurs. If an error or warning occurs, the platform publishes the debug information to the log file. This ensures that only the part of the log file pertaining to the error or warning is recorded. If no error or warning is detected, the platform deletes the unused log data from memory when the session closes. Each session stores up to 1000 log messages. If the session exceeds 1000 log messages, the deferred log discards the oldest log message to make room for the newest log message.  
When the ServiceNow SSH client is disabled, the parameter enables or disables SSH debug information in the log file:  
• Type: True | False  
• Default value: false |

| MID Server logging level. | mid.log.level                 | Specifies the logging level for the MID Server. Possible values are: debug, info, warn, error  
|       |                               | **Note:** Values are case insensitive.                                                                                                         |
|       |                               | • Type: String  
|       |                               | • Default value: info  
| Enables debug logging for the Idle Connection Monitor. | mid.http.idle_connection_monitor.debug | Enables debug logging for the Idle Connection Monitor.  
|       |                               | • Type: True | False  
|       |                               | • Default value: false  

### DNS parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| DNS scanning regulator interval (ms) | mid.dns_scan.regulator.interval_ms | Specifies the interval between DNS scans in milliseconds.  
|       |                                                          | • Type: Integer  
|       |                                                          | • Default value: 10  
| DNS scanning regulator packets per interval | mid.dns_scan.regulator.packets_per_interval | Specifies the number of regulator packets per DNS scan.  
|       |                                                          | • Type: Integer  
|       |                                                          | • Default value: 1  
| DNS scanning default name servers | mid.dns_scan.default_name_servers | Specifies the host names or IP addresses of the default name servers.  
|       |                                                          | • Type: String  
|       |                                                          | • Default value: none  
| DNS scanning additional name servers | mid.dns_scan.additional_name_servers | Specifies the host names or IP addresses of any additional name servers.  
|       |                                                          | • Type: String  
|       |                                                          | • Default value: none

</table>
| DNS scanning load balancing enable | mid.dns_scan.load_balancing_enable | Specifies whether to enable load balancing of name servers.  
  - Type: True | False  
  - Default value: false |
| FTP connection parameters | | |
| Max size of the FTP Connection Pool | mid.ftp.max_pool_size | Specifies the maximum size of the FTP Connection Pool, in megabytes.  
  - Type: Integer  
  - Default value: 25 |
| Max number of the FTP connections per target | mid.ftp.max_per_target | Specifies the maximum number of the FTP connections per target.  
  - Type: Integer  
  - Default value: 5 |
| Max amount of time that an FTP connection can sit idle in the pool | mid.ftp.max_conn_idle_time | Specifies the maximum amount of time, in milliseconds, that an FTP connection can sit idle in the pool.  
  - Type: Integer  
  - Default value: 300000 |
| Max number of files that can be returned in the filesystem list directory command | mid.filesystem.max.ls | Specifies the maximum number of files that can be returned in the filesystem list directory command.  
  - Type: Integer  
  - Default value: 10000 |
| Logging parameters | | |
| Disable monitor checking | disable_monitors | Specifies whether to disable the MID Server from actively checking for monitors on the instance.  
  - Type: True | False  
  - Default value: false |
### Query logging enable

**Label:** Query logging enable  
**Names:** mid.show.queries

Instructs the MID Server whether to log details about every query it makes to the ServiceNow instance. Typically this parameter is only used by developers, but it is occasionally useful when troubleshooting a problem. Be aware that setting this parameter to true causes intensive logging on the MID Server, potentially using considerable disk space.

- **Type:** True | False
- **Default value:** false

### Remote logging disable

**Label:** Remote logging disable  
**Names:** disable.remote.logging

Prevents the MID Server from logging any information to the MID Server log on the instance. Relatively little information is logged on the instance in any case, but setting this parameter to true eliminates all logging on the instance.

- **Type:** True | False
- **Default value:** false

### Status sending disable

**Label:** Status sending disable  
**Names:** disable.status

Prevents the MID Server from sending a status report to the instance every 10 minutes.

- **Type:** True | False
- **Default value:** false

</table>
| Suppress history file generation for SSH               | mid.ssh.suppress_history                  | Suppresses the generation of the SSH history file. This parameter applies to the legacy SSH client only.  
  - Type: true | false  
  - Default value: false                                                                             |
| Timeout in ms for SSH socket read                       | mid.ssh.socket_timeout                    | Specifies the timeout value for the SSH socket to prevent issues created by a socket timeout. Some devices, such as systems with embedded controllers like UPSs and PDUs, that have SSH enabled require more time to respond to an authentication request. The default value of 2 minutes ensures such requests do not timeout prematurely.  
  - Type: integer (milliseconds)  
  - Default value: 120000 (2 minutes)                                                                   |
| Timeout in ms for SSH channel activity                 | mid.ssh.channel_timeout                   | Specifies the amount of time that the MID Server waits for activity on the SSH socket before closing the connection. If there has been no activity on the SSH socket for the specified timeout value, the MID Server closes the connection. Some devices, such as systems with embedded controllers like UPSs and PDUs, that have SSH enabled may require more time to respond to an authentication request.  
  - Type: integer (milliseconds)  
  - Default value: 120000 (2 minutes)                                                                   |
| Timeout in ms for SSH socket read                       | mid.ssh.session_timeout                   | Specifies the amount of time that a cached session remains in memory after last use. Excessively small values tend to decrease performance. This parameter applies to the ServiceNow SSH client only.  
  - Type: integer (milliseconds)  
  - Default value: 300000 (5 minutes)                                                                    |
| Timeout for SSH command execution (ms)                 | mid.ssh.command_timeout_ms                | The timeout duration, in milliseconds, for the execution of an SSH command.  
  - Type: integer (milliseconds)  
  - Default value: 300000 (5 minutes)                                                                    |
<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>

</table>
| Use keyboard interactive authentication for SSH | mid.ssh.use_keyboard_interactive | Uses the keyboard interactive authentication mode on SSH daemons on which it is activated.  
  - Type: true | false  
  - Default value: false  
  **Caution:** An issue exists in Mac OS X Sierra and later with the authentication order of the password and keyboard-interactive modes that can cause Discovery to fail. For details about this issue and the configuration required for proper SSH authentication, see KB0623600. |
| Min size of DH group in bits | mid.ssh.dh_group_length_min | Specifies the minimum group length in bits used for generating a "shared secret" key in Diffie-Hillman key exchange. The larger the key the more secure the SSH connection is but at the cost of performance.  
  - Type: integer (bits)  
  - Default value: 1024 |
| Max size of DH group in bits | mid.ssh.dh_group_length_max | Specifies the maximum group length in bits used for generating a "shared secret" key in Diffie-Hillman key exchange. The larger the key the more secure the SSH connection is but at the cost of performance.  
  - Type: integer (bits)  
  - Default value: 2048 |
| List of bourne-compatible shells | mid.ssh.shells_supported | Defines the bourne-compatible shells supported by MID Server. This value is a comma-separated list of supported shells, such as ksh, dsh, bash and sh.  
  - Type: string  
  - Default value: ksh,bash,sh |
| Discard long running command error output, emulating legacy behavior. | mid.ssh.discard_lrc_error | Discard long running command error output, emulating legacy behavior.  
  - Type: String  
  - Default value: j2ssh - true, sncssh - false |
| Ratio of ssh session pool capacity to mid thread number in percentage. | mid.ssh.pool_thread_ratio | Ratio of the SSH session pool capacity to the configured MID Server thread number (threads.max), expressed as a percentage. The number of permitted pool capacity sessions is set in this parameter. Regardless of the value set in this parameter, the system never permits the pool capacity to fall below 25 sessions.  
  - Type: Integer  
  - Default value: 150 |
### Disable the privilege check for SSHCommand.

**Label:** Disable the privilege check for SSHCommand.

**Names:** mid.ssh.disable_privilege_check

**Description:**
When this parameter is set to true, the Mid Server assumes that the user configured in the credential has the privilege to run the given command. For example, if you configure a Mid Server to use sudo, the Mid Server will assume that discovery user can run any command with “sudo”. The Mid Server still validates that sudo commands can be run on the target.

- **Type:** true | false
- **Default value:** false

By default, the MID Server is configured to search for SSH commands in the following paths and the logged-on user’s default paths:

- /usr/sbin
- /usr/bin
- /bin
- /sbin

### Upgrade parameters

#### Fixed MID Server version

**Label:** Fixed MID Server version

**Names:** mid.pinned.version

**Description:** Name of the version to which this MID Server is pinned.

- **Type:** string
- **Default value:** MID buildstamp

**Note:** To see the MID buildstamp for your instance, type stats.do in the navigation filter. An example of the buildstamp format is 04-29-2018_1930.

#### Upgrade proxy enable

**Label:** Upgrade proxy enable

**Names:** mid.upgrade.use_proxy

**Description:** If your MID Server must go through a web proxy to access the upgrade URL, set this parameter to true to instruct the MID Server to use the proxy. You must also set the proxy server’s host and port. If the instance proxy user name and password are set, they are used for the upgrade proxy as well.

- **Type:** true | false
- **Default value:** false

#### Upgrade proxy host

**Label:** Upgrade proxy host

**Names:** glide.mid.autoupgrade.proxy_host or glide.glidesoap.proxy_host

**Description:** If your MID Server must go through a web proxy to access the upgrade URL, define the proxy’s host here.

- **Type:** string (URL)
- **Default value:** none
## Upgrade proxy port

<table>
<thead>
<tr>
<th>Label</th>

<th>Description</th>
</tr>
</thead>
</table>
| Upgrade proxy port  | glide.mid.autoupgrade.proxy_port or glide.glidesoap.proxy_port | If your MID Server must go through a web proxy to access the upgrade URL, define the proxy's port here.  
  - Type: integer (0-65535)  
  - Default value: 80 |

## Upgrade proxy user

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Upgrade proxy user  | glide.mid.autoupgrade.proxy_user            | If your MID Server must go through a web proxy to access the upgrade URL, define the proxy's user name here.  
  - Type: string (URL)  
  - Default value: none |

## Upgrade proxy password

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Upgrade proxy password | glide.mid.autoupgrade.proxy_password         | If your MID Server must go through a web proxy to access the upgrade URL, define the proxy's password here.  
  - Type: string  
  - Default value: none |

### Windows Discovery parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Maximum number of sessions allowed in the session pool. | mid.powershell_api.session_pool_max_size | Specifies the maximum number of sessions allowed in the session pool.  
  **Note:** Setting or changing this parameter requires restarting the MID Server.  
  - Type: Integer  
  - Default value: 25 |

| Maximum number of sessions allowed in the pool per target. | mid.powershell_api.session_pool_target_max_size | Specifies the maximum number of sessions allowed in the pool per target host.  
  **Note:** Setting or changing this parameter requires restarting the MID Server.  
  - Type: Integer  
  - Default value: 2 |

| Enables MID Server to use PowerShell Remoting | mid.sa.prefer_powershell | Enables MID Server to use PowerShell Remoting.  
  - Type: True | False  
  - Default value: false |
<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Idle PowerShell session timeout (seconds). | mid.powershell_api.idle_session_timeout | Specifies the timeout value of idle PowerShell sessions in seconds.  
**Note:** Setting or changing this parameter requires restarting the MID Server.  
- Type: Integer  
- Default value: 60 |
| Sets the WinRM https port | mid.powershell_api_winrm.remote_https_port | Sets the WinRM https port for connecting to Windows servers using PowerShell over HTTPS.  
- Type: Integer  
- Default value: 5986 |
| Set the port WinRM will use to connect to remote hosts | mid.powershell_api_winrm.remote_port | Configures the port for connecting to Windows servers using PowerShell over HTTP.  
- Type: Integer  
- Default value: 5985 |
| Skip SSL certificate check with WinRM | mid.powershell_api_winrm.skip_ssl_cert_check | Skips the SSL certificate check when using WinRM for HTTPS connections.  
- Type: True | False  
- Default value: false |
| Options used to skip SSL certificate check with WinRM | mid.powershell_api_winrm.skip_ssl_cert_check_options | Skips specific SSL certificate checks when using WinRM for HTTPS connections. Configure the MID Server to skip checks for certificates from a Certification Authority (CA), from the Common Name (CN) that identifies the host associated with the certificate, and for revoked certificates.  
- Type: String  
- Default value: -SkipCACheck -SkipCNCheck -SkipRevocationCheck |
| Requires the use of SSL certificates for HTTPS connections using WinRM | mid.powershell_api_winrm.use_ssl | Requires the use of SSL certificates for HTTPS connections using WinRM.  
- Type: True | False  
- Default value: false |

</tr>
</thead>
</table>
| Enable or disable PowerShell parameter passing via the command line. | mid.powershell.command.parameter_passing | Enable this parameter to allow passing PowerShell parameters from the command line.  
  - Type: True | False  
  - Default value: false |
| Enable or disable the PowerShell script parameter passing via the command line. | mid.powershell.command.script.parameter_passing | Enable this parameter to allow passing PowerShell scripts from the command line.  
  - Type: True | False  
  - Default value: true |
| Enable or Disable the enforcement of UTF-8 for command output | mid.powershell.enforce_utf8 | Enable this parameter to force commands on a target Windows system to return UTF-8 encoded output. Disabling it allows the target system to use its default encoding. This parameter is only valid when PowerShell is enabled.  
  Setting this value to false may result in incorrect values in the CMDB when non-ASCII characters are returned by a probe.  
  - Type: true | false  
  - Default value: true |
| Enable/Disable automatically falling back to the MID Server service user credential if all other credentials fail. | mid.powershell.local_mid_service_credential_fallback | Specifies the login credentials the MID Server uses if all other credentials fail.  
  - Type: True | False  
  - Default value: false |
<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| PowerShell executable path    | mid.powershell.path       | Enables an administrator to point to a specific PowerShell on a MID Server in cases where more than one PowerShell is installed. Supply the path to the folder containing the PowerShell executable, for example, C:\mypowershell or C:\mypowershell\. ServiceNow automatically appends the string powershell.exe to the path. Configure this parameter when both a 32-bit and 64-bit PowerShells are active on the same MID Server, and it becomes necessary to launch the correct PowerShell for the context. 64-bit Windows employs file system redirection and the MID Server runs as a 32-bit application. If trying to specify a path in %WinDir%\System32, Windows automatically redirects to %WinDir%\SysWOW64. To avoid redirection, specify the path as %WinDir%\Sysnative. For example, instead of C:\WINDOWS\system32\WindowsPowerShell\v1.0, specify C:\WINDOWS\sysnative\WindowsPowerShell\v1.0.  

**Note:** On a 64-bit version of Windows Server 2003 or Windows XP, a Microsoft hotfix may be required to enable this.

To discover applications running on a 64-bit Windows machine, the MID Server must be running on a 64-bit Windows host machine.

- Type: string (path)  
- Default value: none  

| PowerShell credentials        | mid.powershell.use_credentials | Determines the credentials to use for Discovery with PowerShell. A setting of true directs the MID Server to run probes with the Windows credentials from the credentials table. To run probes with the credentials of the user for the MID Server service, set this parameter to false.  

- Type: true | false  
- Default value: true  

| Enable PowerShell for Discovery | mid.use_powershell | Enables or disables PowerShell for Discovery. Restart the MID Server after changing the value. If PowerShell is not installed or the version installed is less than version 2.0, Discovery reverts to using WMIRunner.  

- Type: true | false  
- Default value: true, in the Fuji release.  
- Default value: false, in releases prior to Fuji.

### London ServiceNow Now Platform Capabilities

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Set the protocol MID Servers use to communicate with remote Windows hosts. | mid.windows.management_protocol | Enables administrators to select the Windows management protocol used for device and process classification. Options include:  
• WMI  
• WinRM  
• Type: String  
• Default value: WMI |
| Timeout for all Windows probes on a MID Server. | mid.windows.probe_timeout | Sets the timeout interval for all Windows probes on a specific MID Server. This value is overridden by the values configured for individual probes with the wmi_timeout probe parameter.  
• Type: Integer  
• Default value: 300 |

### SNMP configuration parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Enable automatic inclusion of SNMP public community string. | mid.snmp.enable_auto_public | Specifies whether to use the SNMP public community string automatically if no other SNMP credentials were successful.  
• Type: True | False  
• Default value: true |
| Maximum time to wait for a response for the first OID request. | mid.snmp.request.timeout | Specifies the timeout value for the first OID request in milliseconds. For subsequent requests (for example, table OIDs), the mid.snmp.session.timeout configuration parameter (see below) takes effect.  
**Note:** You can override this parameter with the timeout SNMP probe parameter.  
• Type: Integer  
• Default value: 1500 |
<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Maximum time to wait for responses to OID requests once a session has been established. | mid.snmp.session.timeout                   | Specifies the timeout value for subsequent OID request, in milliseconds. SNMP communication is stateless and does not have a session or connection in the normal sense. The system regards a positive response from the first OID request as a sign that it should expect prompt responses to subsequent requests. While the default is short, it may be useful to increase this parameter value to the same value that used for mid.snmp.request.timeout.  
  
  **Note:** You can override this parameter with the `establish_session_timeout` SNMP probe parameter.  
  
  - Type: Integer  
  - Default value: 500  

| Use the Snmp4j library for SNMP communication.                      | mid.snmp.use_snmp4j                       | Use the Snmp4j library for SNMP communication. This is a strict requirement for SNMPv3. This parameter should only be set to false based on advice from customer support.  
  
  - Type: True | False  
  - Default value: true  

| Use SNMP v1 and v2c for probes.                                    | mid.snmp.use_snmp_v1_v2c                  | Attempt communication using these SNMP protocol versions. Requires configuration of SNMP community string credentials or the mid.snmp.enable_auto_public parameter set to true, as applicable for targeted devices.  
  
  - Type: True | False  
  - Default value: true  

| Use SNMP v3 for probes.                                            | mid.snmp.use_snmp_v3                     | Attempt communication using the SNMPv3 protocol version. Requires configuration of SNMPv3 credentials.  
  
  - Type: True | False  
  - Default value: true

</thead>
</table>
| Waiting period on empty queue for sending events                     | mid.probe.event.wait_time           | Waiting period on an empty queue for sending events.  
- Type: Integer  
- Default value: 1000                                                  |
| Enables or disables sending events.                                   | mid.probe.event.send.enabled        | Enables or disables the sending of events.  
- Type: True | False  
- Default value: true                                                  |
| Maximum size of events queue allowed before events will be rejected  | mid.probe.event.queue.max_size      | Specifies the maximum size permitted for the event queue before incoming events are rejected.  
- Type: Integer  
- Default value: 100,000                                                |
| If true then bulk of events will be sent to the server instead of single event sending | mid.probe.event.queue.use_bulk      | Specifies whether events are sent to the server singly or in bulk. If this parameter evaluates to true then events are sent to the server in bulk.  
- Type: True | False  
- Default value: true                                                  |
| Policy to prevent whitespace in event description field.             | mid.probe.event.suppress.whitespaces | Allows line breaks in description fields for multi-line events. Apply this parameter to each MID Server used with event connector instances. Choices are:  
- all  
- leave_as_is  
- keep_newline  
- Type: String  
- Default: all                                                             |
| Limit of number of active metrics to CI mappings                     | mid.em.metric.metric_to_ci_map_limit | Specifies the maximum number of active metrics allowed per CI map.  
- Type:  
- Default value: 200,000                                                |
| Number of seconds to wait before resending unhandled event           | mid.em.metric_binding_timeout       | Specifies the number of seconds to wait before resending unhandled events  
- Type: Integer  
- Default value: 300                                                      |
| Max number of seconds to wait before resending unhandled event       | mid.em.metric_binding_timeout       | Specifies the maximum number of seconds to wait before resending unhandled events.  
- Type: Integer  
- Default value: 10800                                                  |
<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Max number of seconds before refreshing the metric source type cache in memory | mid.em.metric_max_elapsed_time_before_refresh | Specifies the maximum number of seconds before the metric source type cache is refreshed in memory.  
  - Type: Integer  
  - Default value: 60 |
| Max length of string used for SQL command                           | mid.em.metric_max_sql_string_length_for_types | Specifies the maximum length of the string (composed of types) used for an SQL command  
  - Type: Integer  
  - Default value: 30000 |
| Period, in seconds, between statistics reports to the instance.      | mid.em.statistics_report_period  | Specifies the period, in seconds, between statistics reports to the instance. Use 0 to disable reporting. This parameter requires a restart.  
  - Type: Integer  
  - Default value: 60 |
| Max number of seconds to collect metrics in every cycle             | mid.em.metric_connector_max_run_time_seconds  | Specifies the maximum number of seconds to collect metrics in every cycle.  
  - Type: Integer  
  - Default value: 300 |
| Number of minutes to go back in history to retrieve metrics         | mid.em.metric_connector_history_min | Specifies the number of minutes to go back in history to retrieve metrics.  
  - Type: Integer  
  - Default value: 180 |
| Metric/Event Log Level                                              | mid.em.metric_event_logging | Specifies the level of metric and event logging. Choices are:  
  - none  
  - all  
  - events  
  - metrics  
  - metrics:<filter>  
  - events:<filter>  
  - Type: String  
  - Default value: none |
| Number of seconds of delay when collecting metrics                  | mid.em.metric_connector_late_arrivals_delay | Specifies the number of seconds to delay when collecting metrics.  
  - Type: Integer  
  - Default value: 30 |
Add a MID Server parameter

Use a MID Server parameter to control the behavior of a particular MID Server.

Role required: admin

1. Navigate to MID Server Servers.
2. From the list of MID Servers, select a MID Server to configure.
3. Select the Configuration Parameters related list.

This related list shows all the parameters currently in the MID Server 's configuration file. If there are any passwords, they are displayed in asterisks for security reasons.
4. To add parameters, click New, and then complete the form. After the form is submitted, the configuration file for that MID Server is modified to include the new parameter. Changes to existing parameters are reflected in the MID Server configuration file as well. Changes made to the MID Server configuration file do not take place immediately, but rather the next time the MID Server is restarted. The MID Server form has a related link for restarting the MID Server.

**Note:** ServiceNow prevents you from saving changes, such as modifying or deleting parameters, that would cause the MID Server to lose communications with the instance. For
example, you cannot change the url parameter. Any changes to these protected properties must be made directly in the config.xml file for that MID Server.

Setting Parameters from the config.xml File

MID Server configuration is controlled by an XML file called config.xml. This file is located in the \agent directory, immediately under the directory where the MID Server is installed. Edit this file directly to make any configuration changes to protected parameters. Many configuration changes, such as those that do not disrupt communication between the MID Server and the ServiceNow instance, may also be made from the instance.

The structure of the config.xml file is simply an outer parameters tag and a series of inner parameter tags. Each parameter tag has name and value attributes.

• To change the value of a parameter, edit the value attribute.
• To add a parameter, add another parameter tag with its name and value.
• To delete a parameter, delete the entire parameter tag.

The order of the parameters within the file is not important. Notice the green comment sections in the sample. Use these elements to add useful comments to the configuration file.

Note: When configuring the MID Server for use with a proxy server, be sure to remove the comment tags around the proxy sections that you configure.
Figure 322: MID Server config.xml file

**Note:** The sample file here is from a Firefox browser. Conventional text editors, such as Notepad, WordPad, or TextEdit, do not display colors and variable fonts.

### MID Server pause

The MID server can be put into a Paused state to temporarily prevent it from polling the ECC Queue for work or sending Discovery results back to the instance.

You might want to pause the MID Server when your network infrastructure is undergoing changes. This prevents applications like Discovery from throwing errors during a particular maintenance window.

A paused MID Server continues processing commands that it had already retrieved before it was paused. When you resume the MID Server, the MID Server starts retrieving new commands to process.
Note: Discovery continues to assign jobs to MID Servers that are Paused. MID Servers that are Down are not assigned jobs.

Unlike stopping the MID Server from the Windows or Linux server command line on the MID Server machine, pausing the MID server is something that you can do from the instance. The MID Server pause feature is available starting with the Istanbul release.

Note: You can only pause validated MID Servers.

You can still perform these actions when the MID Server is paused:

- Access the MID Server logs and delete log entries.
- View MID server statistics. While the MID Server is in the Paused state it stops generating statistics. But you can still view the statistics generated before you paused the MID Server.
- Retrieve the MID Server thread dump.
- Make and save configuration changes and property changes to the server. The changes take effect after the MID Server is resumed.
- Clear the ECC queue.

The MID server heartbeat continues to function while the MID Server is in the Paused state. If the MID Server is upgraded while it is in the Paused state, the MID Server state automatically changes to Up after successful upgrade. It does not return to the Paused state.

During MID Server selection, paused MID Server can still be selected but are prioritized below MID Servers that are not paused.

Events that occur during MID Server pause

The vCenter and SNMP event collectors, continue to run and process events when you pause the MID Server. These events are not part of the normal synchronous communication that the MID Server has with the instance that you see in the ECC queue. Events are still relayed to the instance and can even trigger actions on records in the instance, such as a CI update. For example, if vCenter detects that a virtual machine goes down or is deleted, a vCenter event makes a change to the status of the corresponding CI record for that virtual machine.

To prevent these events from being processed, stop the extensions from running. See:

- Configure and run the vCenter event collector extension
- Configure the SNMP Trap Collector Extension

Pause the MID Server

Pause the MID Server to temporarily prevent it from polling the ECC Queue for work or sending Discovery results back to the instance.

Role required: agent_admin

You can only pause validated MID Servers.

1. Open the MID server record.
2. Select a running MID Server that has been validated.
3. On the MID Server form, select Pause MID under Related Links.
   The state of the MID Server changes to Paused.
4. To resume MID Server processing, select Resume MID under Related Links.

**MID Server domain separation**

MID Servers can be configured in separate domains.

The records that can be read, updated, or created by a MID Server are determined by the credentials configured for that MID Server in the config.xml file. These are the user credentials that a MID Server uses to access the instance and specify which domain's records that MID Server can access.

You can create versions of these specific MID Server policy records that only a MID Server from the same domain can use. This process separation is supported for records in tables that extend MID Server Synchronized Files [ecc_agent_sync_file]:

- MID Server MIB File [ecc_agent_mib]
- MID Server JAR File [ecc_agent_jar]
- MID Server Script File [ecc_agent_script_files]

See [Set up domain separation for MID servers](#) on page 1677 for instructions on setting up domain separation through the MID server.

**Note:** Attachments on MIB or JAR file records might not appear as they did in a non-domain separated environment. The attachments do not appear because the Attachments [sys_attachment] table is data separated. When data is separated between domains, a record in a child domain cannot access records in a parent domain.

### Set up domain separation for MID servers

Set up domain separation through the MID server user role and the MID Server configuration file.

Role required: admin, agent_admin

1. **Configure a MID Server user** within a specified domain with the proper mid_server role.

2. Specify this user within the MID Server config.xml file. When you set the **MID Server user credentials** in the config.xml file, make sure they are in the proper domain.

If you must change the MID Server domain:

1. Stop the MID Server and delete the ecc_agent record.

2. Update the MID Server config.xml with the new user in the new domain and restart the MID Server service.

If you need to create versions of specific MID Server files that only MID Servers in your domain can use:

1. Open or create a record in one of these MID Server modules:
• SNMP MIBs
• JAR Files
• Script Files

2. Update an existing domain policy or submit a new record.

   **Note:** Attachments on MIB or JAR file records might not appear as they did in a non-domain separated environment. The attachments do not appear because the Attachments [sys_attachment] table is data separated. When data is separated between domains, a record in a child domain cannot access records in a parent domain.

Configure a multi-domain MID Server

You can create a MID Server in the global domain that can explore targets in other domains.

Before configuring a multi-domain MID Server:

- Ensure that your instance is *domain separated*.

Role required: admin

1. Type sys_properties.list in the navigation filter and press Enter.
2. Locate the glide.ecc.enable_multidomain_mid property.
3. Set the value of the property to true.

   **Note:** Enabling this property has no effect on existing MID Servers. MID Servers in a domain prior to setting this property, remain in that domain.

4. Create a MID Server in the global domain.

   A MID Server created in the global domain after this property is set to true can explore any domain for which it has the credentials. However, this MID Server is restricted to trying only the credentials for the target domains requested by ECC Queue inputs.

   **Caution:** If you reset the glide.ecc.enable_multidomain_mid property to false after creating a multi-domain MID Server in the global domain, that MID Server writes all the data it receives to the global domain and not to the correct domains.

MID Server privileged commands

To discover certain information on a host server, the MID Server must run SSH commands with higher privileges. The platform provides default privileged commands for the MID Server to use and the ability to add additional commands to the system.

An example of information that requires elevated privileges is information about storage disks on a host server, retrieved with the fdisk -l command. If your system cannot use sudo commands, you must configure the hosts in your network to use one of the other privileged commands. You can have different privileged commands set up for different hosts. However, Discovery supports only one privileged command per host.

   **Important:** You can edit supported privileged commands, but do not delete them.

For a list of possible SSH commands requiring root privileges, see *SSH credentials* on page 1045.
### Table 606: SSH privileged escalation command requirements

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| sudo    | • Host must support the `sudo -S -p <password>` command and return the correct list of allowed SSH commands.  
• Credentials provided for Discovery must be able to run the command `sudo -S -p <password> <commands>`. |
| pbrun   | • Host must support the `pbrun -v` command and return the correct version of PowerBroker.  
• Credentials provided for Discovery must be able to run `pbrun <commands>`.  
• Discovery does not support any other `pbrun` options, such as a password prompt.  
• The instance must be able to reach the target host via SSH. |
| pfexec  | • Host must support the `pfexec id -a` command and return the correct ID.  
• Credentials provided for Discovery must be able to run `pfexec <commands>`.  
• Discovery does not support any other `pfexec` options, such as a password prompt. |
| dzdo    | • Host must support the command `–v dzdo` command and return the path to `dzdo` in standard output.  
• Credentials provided for Discovery must be able to run `dzdo <commands>`.  
• Discovery does not support any other `dzdo` options, but Discovery supports password authentication for `dzdo`. |

### Long-running commands with sudo

Configure J2SSH and ServiceNow SSH to prevent long running commands using sudo from failing when the MID Server disconnects.

ServiceNow SSH allows probes to run sudo against individual commands or an entire, long-running script. This is also supported for the `pbrun` and `pfexec` privileged commands.

#### Sudo for individual commands

You can run sudo against individual commands within a probe, but only if all the following sudoer configurations are performed on the target:

- The `!requiretty` option is required.
• Allow individual commands to be run by the user in the provided credential with NOPASSWD configured.
• The target specifies an individual sudo call in the command or referenced scripts. For example, set sudo as "sudo fdisk -l" or "$\{sudo:fdisk -l\}" rather than "must_sudo" for the entire script.

Note: Running sudo against individual commands with ServiceNow SSH produces detailed and useful entries in the sudo logs on the target computer.

Running sudo on an entire script

If any of the required sudoer configuration requirements for individual commands is not in place, Discovery applies sudo to the initial and complete probes, and does not execute sudo remotely inside the command. This condition can be forced by setting must_sudo on the probe and eliminating any sudo commands within the probe.

This approach prevents long running commands from failing when the probe disconnects, but cannot specify individual commands in the sudoers configuration.

Logging

The logs from ServiceNow SSH sudo activity run against an entire script show cryptic entries, such as /tmp/.run.aef13123fe124123, which prevent administrators from controlling permissible commands and knowing the exact command that was run. Sudo run against individual commands produces more detailed log entries, such as /sbin/fdisk –l.

Add a new privileged command for use by the MID Server

Add a new privileged command to the Privileged Command [privileged_command] table that is available to your MID Servers.

Role required: admin

Important: Do not delete any of the supported commands.

1. Navigate to MID Server Privileged Command and click New.
2. Complete these fields:
   • Command: The name of the privileged command.
   • Password Prompt: The password prompt displayed to the user for this privileged command, or a regular expression that matches this password prompt. If this field is empty, no password is required for this privileged command, and no prompt is displayed. SUDO commands do not require a password prompt.
3. Click Submit.

Configure the MID Server to use specific privileged commands

You can configure the MID Server to use specific commands in a defined order.

Role required: admin

1. Navigate to the list of MID Servers using one of the following paths:
   • MID Server Servers
   • Discovery MID Servers
• Orchestration MID Servers

2. Select the MID Server you want to configure.
3. Click the menu icon in the header bar and select View Advanced from the context menu.

4. In the Privileged Command related list, click Edit.
5. Select the command you want this MID Server to use and click Save.

The default order of privileged commands is 100, but you can change the order as necessary. The privileged command with the smallest order number is tried first.
Create a pbrun profile privileged command

You can create a special configuration for the pbrun privileged command that allows it to run as a profile.  

Role required: discovery_admin, admin

Of all the privileged commands, only the pbrun command can be configured to run as a profile, and only one of these special pbrun configurations can function on a MID Server.

**Important:** Edit the existing pbrun record for this purpose. The system ignores any additional commands you create for pbrun.

1. Navigate to MID Server Privileged Command.
2. Select pbrun from the list.
3. In the Privileged Command record, edit the value in the Command field to use the format pbrun -u <profile>.
   For example, you can set pbrun -u admin as a command to run with an admin profile.
4. Click Update.

Map an IP address to a DNS name

If the MID Server manages resources within defined IP ranges, all host servers must have their DNS names mapped to an IP address.

Role required: admin
The association of an IP address to a DNS name ensures that the appropriate MID Server is selected based on the IP Address range configuration. If this is not done, Orchestration reverts to the default MID Server.

If Discovery cannot discover the server and resolve the DNS name to an IP address, you must creating the mapping manually, using this procedure.

1. Enter cmdb_ci_dns_name.list in the navigation filter.
   A list of DNS names appears.
2. Check the list for your host server.
   If the server does not appear in the list, continue with this procedure.
3. Click New.
4. Enter the fully-qualified domain name (FQDN) of the host server in the Name field.
5. Right-click in the form header and select Save from the context menu.
6. In the IP Address related list, click New.
7. In the IP Address field, enter the IP address of your host server.
8. In the Nic field, select eth0 or your preferred network interface controller.
9. Leave the Netmask field blank.
10. Click Submit.

**MID Server security and encryption**

Several options are available for you to enhance security on MID Servers, including credential and encryption security, the authorization of SOAP requests, and the establishment of secure socket layer (SSL) connections.

**How MID Server encryption works**

The MID Server login credentials appear in the config.xml file in clear text by default, but you can encrypt them. While the username and password are initially set in a config.xml configuration file on the MID server, once the MID server retrieves the credentials, it can replace the clear-text password with an encrypted password. For the encryption of the local MID server service account, the password is encrypted using an AES128 encryption algorithm. The MID server also maintains an encryption key that is generated each time it starts and remains in memory and not on the hard disk. When credentials need to be sent from the instance to the MID server, the following process takes place:

1. The instance retrieves the encrypted password and the unencrypted username from the instance database table.
2. The instance decrypts the encrypted password, and then re-encrypts it using the MID server encryption key.
3. The username and re-encrypted password are sent to the MID Server through the encrypted TLS session was already established between the MID server and the instance.
4. The MID server receives the credentials and decrypts the password in memory before using the credentials for remote operations. At no point is the credential password stored on the disk in an unencrypted format.

To enable this encryption, see *Encrypt MID Server login credentials* on page 1684.
MID Server encryption keypairs

Automation credentials are secured by encrypting them in the instance with the MID Server’s trusted public key prior to transmission. When the MID Server is created, it generates a keypair, consisting of a public and private key. After the MID Server is validated, it can use the private key to decrypt automation credentials. You should occasionally rekey the MID Server to meet your organization's security requirements. See Rekey a MID Server on page 1693 for instructions.

SSL certificates

You can add certificates to the MID Server if you want communication to occur over SSL. You can add these certificates to the cacerts keystore file:

- Signing Certificate Authority (CA) certificate
- MID Server certificate

See Add SSL certificates for the MID Server on page 1693 for instructions.

Note: The MID Server does not support SSL when importing data from an integration, such as an LDAP server.

Basic authentication credentials and SOAP requests

You can enforce basic authentication on each request. The MID Server is not able to communicate through a proxy server if the proxy server supports only NTLM authentication. You can use basic authentication with a proxy server or create an exception for the MID server host.

Supplying basic authentication information, regardless of whether it is required, has an added advantage. The web service invocation creates or updates data using the supplied credentials. For example, when you create an incident record, the journal fields have the user id of the basic authenticated user instead of the default Guest user. This behavior allows you to identify data added by a specific MID Server.

You can set basic authentication credentials for SOAP requests. See Require basic authorization for incoming SOAP requests on page 1693 for instructions. Each SOAP request contains an Authorization header as specified in the Basic Authentication protocol.

Note: The setting for enforcing strict security controls how the instance uses the credentials you provide for the MID Server. When the setting is enabled, you must provide a user ID with access to the tables the MID Server is trying to access. When the setting is disabled, any valid user ID allows the MID Server to access to all tables.

Encrypt MID Server login credentials

Encrypt the MID Server login credentials for added security.

Role required: admin

Any field in the config.xml file can be encrypted, but once encrypted, a field can be managed only from within the instance. You should encrypt password fields only for the MID Server and any proxy server specified.
Note: An encryption interface is available that enables you to move encryption out of the config.xml file entirely and into an external system.

1. Navigate to the agent directory that was created when the MID Server was installed and open the config.xml file using a text editor such as WordPad.

   The instance credentials section of the config.xml file looks like this:

   <!-- If your instance has authentication enabled (the normal case), set these parameters to define the user name and password the MID Server will use to log into the instance. -->

   <parameter name="mid.instance.username" value="midsrvadmin" />
   <parameter name="mid.instance.password" value="securepassw0rd" />

2. Add the encrypt="true" attribute to the password tag.

   <parameter name="mid.instance.username" value="midsrvadmin" />
   <parameter name="mid.instance.password" encrypt="true" value="securepassw0rd" />

3. Save the config.xml file, and then restart the MID Server service.

4. Open the config.xml file and view the encrypted password.

   <parameter name="mid.instance.username" value="midsrvadmin" />
   <parameter name="mid.instance.password" encrypt="true" value="encrypted:rhrfUNYRzZAI8/BkTtZmNA==" />

   The password cannot be decrypted, which means displaying it in clear text again, by changing the encryption attribute to false or by deleting the attribute. If the password is changed in the config.xml file and the MID Server restarted, the new password is encrypted.

ECC queue data encryption with the automation API

The automation API encrypts sensitive probe data that is sent from an instance to the MID Server through the ECC Queue.

You can use the automation API to encrypt data that you send from a custom application to the ECC queue and prevent that data from appearing in clear text. For example, you can encrypt a password used by a MID Server to authenticate on a REST endpoint.

Methods

The API provides these methods:

- encrypt()
- isEncrypted()

The following example shows how you might call these methods:

```javascript
var automation_api = new sn_automation.AutomationAPI();
var password = 'xyz';
var encrypted_password;
if (automation_api.isEncrypted(password))
    encrypted_password = password;
else
    encrypted_password = automation_api.encrypt(password);
```

The encrypted_password value can then be passed safely to the ECC Queue and on to the desired MID Server.
MID Server configuration file security

Sensitive MID Server configuration data can be protected using several different schemes, including internal and external data encryption and external data storage.

The MID Server provides the following built-in security options for content in the config.xml file:

- Default security provider: Secures the data in the config.xml file by encryption. When the MID Server is restarted, any unencrypted data is encrypted and written to the config.xml file. The default security provider offers these encryption options:
  - Default encryptor: Default process for encrypting data in the MID Server config.xml file. See Encrypt MID Server login credentials on page 1684 for details.
  - Windows Data Protection API (DPAPI): The operating system performs the data encryption, rather than the MID Server. DPAPI encryption is based on the logged in user's account. When this scheme is used, the data can only be decrypted by the same user account. If the account changes, the data must be re-encrypted.
  - Custom encryption: Implement the IMidServerEncrypter interface to create your own custom encryption scheme to manage sensitive config.xml data.

- CyberArk: Data security is provided by CyberArk's Privileged Account Security system, which moves sensitive data from the config.xml file to a secure CyberArk vault. This solution does not encrypt the data.

- Custom external storage: Implement the ISecuredConfigProvider interface to create your own custom external storage system to manage sensitive config.xml data.
Encrypt MID Server configuration data with DPAPI

Windows Data Protection API (DPAPI) encrypts sensitive data from the config.xml file, based on the MID Server user account.

Role required: admin

DPAPI encryption provides another level of security for data such as credentials, IP addresses, and URLs in the MID Server config.xml file. The operating system performs the data encryption, rather than the MID Server. DPAPI encryption is based on the logged in user's account. When this scheme is used, the data can only be decrypted by the same user account. If the account changes, the data must be re-encrypted.

1. Open the config.xml file in a text editor.
   This file is located in the /agent folder in your MID Server installation path.

2. Enable this parameter and value:
   ```xml
   <parameter name="mid.secure_encrypter" value="com.service_now.mid.services.config.WindowsDPAPIEncrypter"/>
   ```

3. Save the configuration file.
4. Restart the MID Server.
   Any values in clear text in the config.xml file are encrypted by the operating system.

5. Follow this procedure if you need to change the MID Server user account that is used for encryption.
   a) Stop the MID Server service.
   b) Open the config.xml file in a text editor.
      This file is located in the /agent folder in your MID Server installation path.
   c) Re-enter all the encrypted values in clear text.
   d) Make the changes to the MID Server user account in the ServiceNow® instance.
   e) Restart the MID Server service.
      The data is re-encrypted by the operating system, based the new MID Server user account.

Use CyberArk as a secure configuration provider
You can use a CyberArk vault to secure any sensitive data from the MID Server config.xml file.

Role required: admin
CyberArk is commonly used to secure credentials in its external vault. However, a MID Server parameter in the config.xml file enables you to store other types of data in CyberArk.

1. Open the config.xml file in a text editor.
   This file is located in the /agent folder in your MID Server installation path.
2. Enable this parameter and value:
   <parameter name="mid.secure_config.provider" value="com.service_now.mid.services.config.CyberArkSecuredConfigProvider"/>
3. Configure specific data to secure in the CyberArk vault, as shown in these examples.
   a) Secure the MID Server credentials by setting this parameter to match the ID and Type for that data in your CyberArk configuration.
      <parameter name="mid.instance.username" secure="true" value="cyberark:id=<CyberArk ID>, type=<CyberArk type>"/>
      <parameter name="mid.instance.password" secure="true" value="cyberark:id=<CyberArk ID>, type=<CyberArk type>"/>
   b) Secure the URL of the instance by setting this parameter to match the ID and Type for that data in your CyberArk configuration.
      <parameter name="url" secure="true" value="cyberark:id=<CyberArk ID>, type=<CyberArk type>"/>
4. Save the configuration file.
5. Restart the MID Server.

Change MID Server configuration file security schemes
The MID Server provides several schemes for securing sensitive data in the config.xml file and allows you to switch between these options to suit your security requirements.

Role required: admin
To switch between configuration security schemes:
1. Stop the MID Server service.
2. Open the config.xml file in a text editor.
   This file is located in the /agent folder in your MID Server installation path.
3. Re-enter all the encrypted values in clear text.
4. Disable the previous security scheme and configure the MID Server to use the new provider. 
5. Restart the MID Server service. 
   The data is re-secured or encrypted, based on the security scheme you have selected.

_MID Server ISecuredConfigProvider interface_
Use the methods in this interface to create custom providers that manage secured parameter values in the MID Server config.xml file.

**Note:** These methods are contained in the snc-automation-api.jar file, located in the MID Server installation folder.

### initialize

This method initializes the provider with additional configuration parameters and does not return a value.

**Table 607: Example**

```java
void initialize(java.util.Properties properties,
               IMidServerEncrypter encrypter)
throws java.lang.Exception
```

**Table 608: Parameters**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>properties</td>
<td>Initialization properties.</td>
</tr>
<tr>
<td>encrypter</td>
<td>Encrypter to use if the provider is encryption</td>
</tr>
<tr>
<td></td>
<td>based.</td>
</tr>
</tbody>
</table>

**Table 609: Exception**

```
java.lang.Exception
```

### isParameterValueSecured

This method checks to see if the parameter value has been secured or not. This method returns a boolean type value.

**Table 610: Example**

```java
boolean isParameterValueSecured(java.lang.String paramValue)
```
Table 611: Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>paramValue</td>
<td>The parameter value.</td>
</tr>
</tbody>
</table>

Table 612: Returns

The parameter returns true if the parameter value is secured.

**secureParameterValue**

This method secures the parameter value if it has not been secured. This method returns a string type value.

Table 613: Example

```java
java.lang.String secureParameterValue(java.lang.String unsecuredParameterValue) throws java.lang.Exception
```

Table 614: Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unsecuredParameterValue</td>
<td>The unsecured parameter value.</td>
</tr>
</tbody>
</table>

Table 615: Returns

This method returns the unsecured parameter value.

Table 616: Exception

```java
java.lang.Exception
```

**unsecuredParameterValue**

This method returns the unsecured value of the parameter. This method returns a string type value.

Table 617: Example

```java
java.lang.String unsecuredParameterValue(java.lang.String parameterName) throws java.lang.Exception
```
Table 618: Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameterName</td>
<td>The parameter name.</td>
</tr>
</tbody>
</table>

Table 619: Returns

This parameter returns the unsecured value.

Table 620: Exception

java.lang.Exception

MID Server IMidServerEncrypter interface

Use the methods in this interface to create a custom external encrypter for the MID Server config.xml file.

Note: These methods are contained in the snc-automation-api.jar file, located in the MID Server installation folder.

initialize

This method initializes the encrypter with additional configuration parameters and does not return a value.

Table 621: Example

```java
void initialize(java.util.Properties properties)
    throws java.lang.Exception
```

Table 622: Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>properties</td>
<td>Initialization properties.</td>
</tr>
</tbody>
</table>

Table 623: Exception

java.lang.Exception

encrypt

This method encrypts the unencrypted data and returns a byte[] type value.
encrypt

Table 624: Example

```java
byte[] encrypt(byte[] unencryptedData)
throws java.lang.Exception
```

Table 625: Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unencryptedData</td>
<td>The data unencrypted.</td>
</tr>
</tbody>
</table>

Table 626: Returns

Encrypted data

Table 627: Exception

java.lang.Exception

decrypt

This method decrypts encrypted data and returns a byte[ ] type value.

Table 628: Example

```java
byte[] decrypt(byte[] encryptedData)
throws java.lang.Exception
```

Table 629: Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>encryptedData</td>
<td>The data decrypted.</td>
</tr>
</tbody>
</table>

Table 630: Returns

Decrypted data.

Table 631: Exception

java.lang.Exception
Rekey a MID Server

Rekeying a MID Server forces it to restart and generate a new private key. Typically, this is only necessary if the MID Server keystore is compromised.

Role required: admin

When the MID Server comes back online, the system automatically validates the new key, and the MID Server resumes processing automation tasks.

1. Navigate to MID Server Servers.
2. Open the MID Server whose keypairs you want to rotate.

Add SSL certificates for the MID Server

Configure the MID Server to connect to a source over SSL.

Role required: admin

---

**Note:** The MID Server does not support SSL when importing data from an integration, such as an LDAP server.

1. Open a command prompt and navigate to the folder containing the JRE `keytool`. This is the location of the JRE you installed. An example path might be: C:\Program Files\Java\jre1.8.0_161\bin
2. Import a certificate into the MID Server's cacerts keystore, using this command:
   `keytool -import -alias <certificate alias> -file "<path to certificate>" -keystore "<path to the JRE>\lib\security\cacerts"
   
   For example, you might enter: `keytool -import -alias MyCA -file "C:\myca.cer" -keystore "C:\Program Files\Java\jre1.8.0_161\lib\security\cacerts"

   **Note:** The keytool prompts you for a certificate password. If the certificate is for a CA, the keytool also asks whether to trust the certificate authority. To add a certificate to an instance, see Upload a certificate to an instance.

---

Require basic authorization for incoming SOAP requests

For added security, you can enforce basic authentication on each incoming SOAP request to the MID Server.

Role required: admin

1. Navigate to System Properties Web Services.
2. Select the check box for Require basic authorization for incoming SOAP requests.
3. Click Save.
4. To provide basic authentication credentials for a MID Server, navigate to C:\Program Files\ServiceNow\<MID Server name>\agent and edit the config.xml file, as follows:
   a) Find the element `<parameter name="mid.instance.username" value=""/>` and enter the instance administrator user name as the value.
      For example, you might enter `<parameter name="mid.instance.username" value="admin"/>
   b) Find the element `<parameter name="mid.instance.password" value=""/>` and enter the configured password for this instance as the value.
For example, you might enter `<parameter name="mid.instance.password" value="abc123"/>`.

**Configure WinRM trusted hosts on MID Server**

In environments using Windows Remote Management (WinRM), Discovery or Service Mapping can discover servers using the WinRM protocol. Add servers, which are part of WinRM, as trusted hosts on all MID Servers that Discovery or Service Mapping use for discovery.

Role required: mid_admin

MID Server cannot access servers using the WinRM protocol unless these servers are configured as trusted hosts for this MID Server.

Perform this procedure on each MID Server used by Service Mapping or Discovery.

1. On the MID Server, open the command-line shell.
2. To add all servers to the TrustedHosts lists, run the following command:
   ```bash
   winrm s winrm/config/client @{TrustedHosts="*"}
   ```
3. To add specific servers to the TrustedHosts list, run the command with the comma-separated hosts instead of the asterisk (`*`), for example:
   ```bash
   winrm s winrm/config/client @{TrustedHosts="serverA,serverB,serverC"}
   ```

**Advanced MID Server configuration**

There are several advanced options available for you to customize and configure the MID Server.

**Install and uninstall Nmap on a MID Server**

If you decide to use *credential-less Discovery* in your network, you must install Nmap on each Windows MID Server that you want to use for this purpose. Self-hosted customers whose network security does not permit downloads from install.service-now.com must use a specific manual process to install and configure Nmap.

- Assign MID Server IP ranges to all deployed MID Servers. The quickest and most reliable way to do this is with the *MID Server IP range auto-assignment* on page 1640 feature available in the Discovery Quick Start wizard. This method ensures that the set of MID Servers configured to access an IP address range is comprehensive.
- Identify the IP ranges you want to explore with credential-less Discovery. Ensure that these ranges can only be accessed by MID Servers with Nmap installed, running on supported Windows hosts.
- Use the All option for selecting IP ranges and observe these requirements:
  - Restrict the use of this feature to Windows MID Servers only.
  - Ensure that Nmap is installed on each of these MID Servers.
  - Ensure that the MID Servers can access the entire customer network.
- When you create a Discovery schedule with Nmap enabled, observe these requirements for the MID Server selection options:
  - Specific MID Cluster: Verify that Nmap is installed on all MID Servers in the cluster, where each MID Server in the cluster is configured to access the same set of IP ranges.
  - Auto-Select Mid Server: When running horizontal Discovery, verify that Nmap is installed on at least one of the MID Servers that can access the Discovery schedule’s configured MID Server IP ranges.
• Specific MID Server: Verify that Nmap is installed on each MID Server that can access the schedule’s configured MID Server IP Ranges.

**Note:** To use credential-less Discovery for Service Mapping, install Nmap on all MID Servers that can access the Discovery schedule’s configured MID Server IP ranges.

• The Nmap installer download process has changed for new instances in the London release. Access to install.service-now.com is no longer required for the MID Server host machines on which Nmap is installed. When you request Nmap for a MID Server, the download is performed by the instance, not the MID Server host. This change does not require any additional configuration. Customer instances within a ServiceNow® datacenter have access to install.service-now.com automatically.

Role required: agent_admin

**Attention:** Self-hosted customers whose network security does not permit downloads from install.service-now.com must install and configure Nmap manually on their system. Refer to the procedure here for installing Nmap on a self-hosted system.

The Discovery - IP Based [com.snc.discovery.ip_based] plugin provides connection to the installer for Nmap and the programming elements that allow a Windows MID Server to run approved scripts on target CIs for credential-less Discovery. MID Servers on which Nmap is installed can execute an Nmap command configured to perform reverse DNS name resolution, discover MAC addresses, or gather OS information on target CIs without using credentials. The Discovery - IP Based plugin is activated automatically when the Discovery [com.snc.discovery] or Event Management and Service Mapping Core [com.snc.service-watch] plugins are activated.

**Important:** Service Mapping does not check for the presence of the Nmap capability and selects the MID Server based on the IP address only. To ensure that Service Mapping does not select a MID Server without the Nmap capability, install Nmap on all MID Servers assigned to the IP address ranges for which you want credential-less Discovery to be available. If Service Mapping selects a MID Server for credential-less Discovery that does not have Nmap capabilities, this error message appears in the map at the site of the CI being discovered: Nmap is not installed on MID Server. Verify all MIDs configured to handle selected IP Address have Nmap Capability. Nmap root directory path does not exist: <path>.

Nmap is supported on all editions of these operating systems, including virtual machines and 64 bit systems:
• Windows 2008
• Windows 2012
• Windows 2016

Nmap can be installed on MID Servers that meet these requirements:
• Status is Up.
• MID Server is validated.
• MID Server does not already have the Nmap capability.

**Important:** Running Nmap scans to or from any resource within the Amazon Web Service AWS environment is tightly regulated and requires the permission of AWS through the [AWS Vulnerability/Penetration Testing Request](https://aws.amazon.com/vulnerability-testing/) form. AWS only permits testing of EC2 and RDS instances that you own. Tests against any other AWS services or AWS-owned resources are prohibited. In addition, any Nmap scan of a permitted instance must be performed within an approved time window. For these reasons, credential-less Discovery within an AWS environment is not appropriate, and if a violation of their policy occurs, could result in expulsion from the service.
To install Nmap on a Windows MID Server:

1. Navigate to MID Server Servers.
2. Open the desired MID Server record.
3. Under Related Links, select Enable Credential-less Discovery.
   A confirmation dialog box appears.

4. Click Yes to continue with the installation.
   The instance runs the Nmap installer from https://install.service-now.com, a site within a ServiceNow datacenter that contains installers for the platform. This progress notice appears during installation:

   ![Enable Credential-less Discovery](image)

   The Logs tab in the MID Server record shows the message: Running system command: installNmap.

5. Click OK if you want to hide the dialog box while the installer continues to run in the background.
   Installing Nmap also installs Npcap on the host, if it is not already installed. Npcap is Nmap's packet capture library for Windows that allows Nmap to perform port scans quickly and to identify the family of the operating system running on the target. Npcap is installed once on the host and can be used by any other application that requires it, such as Wireshark.

   ![Enable Credential-less Discovery](image)

   **Note:** If a more recent version of Npcap is already installed on the Windows MID Server host, Nmap is installed without Npcap. If an older version of Npcap is installed on the host, the Nmap installer upgrades it to the newer version.

The installation process has either of these outcomes:

- **Success:** These conditions indicate a successful installation:
  - The version of Nmap that is installed appears in the Nmap version field in the MID Server record
• The Related Link changes to Disable Credential-less Discovery.
• The Nmap capability is assigned to the MID Server and appears in the Capabilities tab of the MID Server record.

• Failure: If the installation fails, an error message is logged to the MID Server Issue [ecc_agent_issue] table. If you run the installer again with success, the issue is marked as Resolved.

6. To uninstall Nmap for a selected MID Server, select Disable Credential-less Discovery under Related Links in the MID Server record.

This dialog appears during the uninstallation process:

![Disable Credential-less Discovery](image)

The Logs tab in the MID Server record shows the message: Running system command: uninstallNmap.

**Note:** Uninstalling Nmap does not uninstall Npcap. This must be done manually.

---

**Install Nmap on a self-hosted system**

Use this procedure to install Nmap on MID Server host machines in a self-hosted environment that does not allow network access to the ServiceNow® install.service-now.com download site.

**Role required:** admin, maint

You must install Nmap manually on each MID Server host, and then configure the instance to execute credential-less Discovery.

**Note:** This procedure does not apply to self-hosted customers whose instance can access install.service-now.com from within their network.

1. Navigate to MID Server Properties (MID Server Property [ecc_agent_property] table) and open the record for the mid.nmap.version property.

   This property contains the version of Nmap that you must install. Record the version number.

2. Download the correct installer executable from one of these URLs:

   • [https://nmap.org/dist](https://nmap.org/dist): If the Nmap version in the property is 7.50, the executable you need is [https://nmap.org/dist/nmap-7.50-setup.exe](https://nmap.org/dist/nmap-7.50-setup.exe).

3. Create a folder called nmap in the MID Server agent folder of every MID Server you want to use for credential-less Discovery.
4. Copy the Nmap installer file that you downloaded to the nmap folder and rename it to nmapInstaller.exe.

5. Run the agent\scripts\PowerShell\NmapInstallation.ps1 script and pass it the following parameters in the order in which they appear.
   This script runs the nmapInstaller.exe file.

   1. $operation: Task that NmapInstallations.ps1 will process. To install Nmap, the task is install.
   2. $nmap_root_path: Complete path for the nmap folder that you create in step 4.
   3. $nmap_self_installer: Complete path for nmapInstaller.exe file that you copied in step 5.
4. $nmap_command: Complete path for the Nmap install command. The NmapInstallations.ps1 script installs Nmap in the nmap folder created in step 4. This parameter is $nmap_root_path
\nmap.exe.

5. $nmap_uninstall_command: Complete path for the Nmap uninstall command. This command is $nmap_root_path\Uninstall.exe.

6. $nmap_npcap_version: The Npcap version installed with Nmap. This value must be the same as the value of the mid.nmap.npcap.version property in the MID Server Property [ecc_agent_property] table.

7. $nmap_safe_scripts: List of safe scripts that Nmap uses. You can retrieve this list from the mid.nmap.safe.scripts property in the MID Server Property [ecc_agent_property] table.

Set up the parameters in the NmapInstallation.ps1 script in this order:

`.\NmapInstallations.ps1 $operation $nmap_root_path $nmap_self_installer $nmap_command $nmap_uninstall_command $nmap_npcap_version $nmap_safe_scripts

For example, the script might look like this:

```
PS C:\MidServers\mid1\agent\scripts\PowerShell> .\NmapInstallation.ps1 "install"
"C:\MidServers\mid1\agent\nmap" "C:\MidServers\mid1\agent\nmap\nmapInstaller.exe"
"C:\MidServers\mid1\agent\nmap\nmap.exe"
"C:\MidServers\mid1\agent\nmap\Uninstall.exe" "0.91"
"allseeingeye-info.nse,amqp-info.nse,db2-das-info.nse,drda-info.nse,freelancer-info.nse,
ike-version.nse,mcafee-epo-agent.nse,mqtt-subscribe.nse,openlookup-info.nse,oracle-tns-version.nse,
quakel-info.nse,quake3-info.nse,rfc868-time.nse,rpcinfo.nse,snmp-info.nse,ventrilo-info.nse,
weblogic-t3-info.nse,xmpp-info.nse"
```

7. After installation is complete, add the Nmap capability to each MID Server you want to use for credential-less Discovery.

```
Attention: Only a maint user can add the Nmap capability to a MID Server. Contact ServiceNow customer support to request temporary maint access to your instance.
```

a) On the instance, open the MID Server record.
b) Select the Capabilities related list.
c) Click Edit.
d) Select Nmap from the list of available capabilities and click Save.
Uninstall Nmap on a self-hosted system

Use this procedure to uninstall Nmap in a self-hosted environment that does not allow network access to the ServiceNow install.service-now.com download site.

Role required: admin, maint

Nmap must be manually uninstalled from each MID Server host machine and then disabled on the ServiceNow instance.

1. Run Uninstall.exe in the nmap folder on each MID Server host configured for credential-less Discovery.
2. After uninstallation is complete, delete the nmap folder from the agent folder.
3. Remove the Nmap capability from each MID Server record.

**Attention:** Only a maint user can remove the Nmap capability from a MID Server. Contact ServiceNow customer support to request temporary maint access to your instance.

a) On the instance, open the MID Server record.

b) Select the Capabilities related list.

c) Click Edit.

d) Remove Nmap from the active capabilities list and click Save.

Enable script file synchronization for Windows enhanced security

Windows Internet Explorer enhanced security blocks downloaded files that it determines are potentially dangerous.

Enhanced security in Windows browsers, such as Internet Explorer, blocks downloaded files that it determines are potentially dangerous. This would block files downloaded for use by the MID Server. You would need to unblock each file manually through the browser.

To get around this issue, use file synchronization. File synchronization requires you to proactively take script files from your instance and save them on the MID Server. The files on the instance and the MID server stay synchronized, but there is no longer any need for the MID Server to download the whole file. File synchronization also protects any updates you make in those script files from being overwritten during the upgrade of an instance.
Script files synchronized with the MID Server are stored on the instance in the MID Server Script File [ecc_agent_script_file] table, which you can access in the MID Server Script Files module.

When the MID Server first connects to the instance, the instance creates a directory called \scripts in the MID Server root. The instance then creates a parent directory in the path \scripts\<parent name> using definitions from the ecc_agent_script_file table. Finally, the instance creates the script files themselves inside the parent directory using the records from the ecc_agent_script_file table.

The record for the parent directory looks like this:

![Parent Directory Record](image)

The instance creates each script file in the parent directory on the MID Server using the record Name from the ecc_agent_script_file table as the file name and the Script field payload as the file contents. A script file record looks like this:

![Script File Record](image)
The synchronization of the script file continues to work as if the script was manually added to the form. See *Attach a script file to a MID Server* on page 1702 for instructions on how to attach a script file.

**Note:** The MID Server Script File [ecc_agent_script_file] table is domain separated. You can create versions of these policies that only a MID Server from the same domain can use. For instructions, see *Set up domain separation for MID servers* on page 1677.

---

### Attach a script file to a MID Server

You can attach a script file to synchronize to a connected MID Server, to enable using the script file attachment.

**Role required:** admin

You can attach multiple files, but the last attached file gets synchronized to the MID Server. If you delete the attachment, the script file becomes inactive, and the synchronized file is deleted from MID Server.

1. Navigate to **MID Server Script Files**.
2. Open the file to which you would like to attach the script file, or click **New** to create a new file.
3. Select **Use attachment**, and then click the paperclip icon to add the attachment.
Note: When Use attachment is checked, an attached script file overrides the script contained in the Script field. If this check box is cleared, the script in the Script field is used instead of the attachment.

The script file attachment name must match the MID Server script file name, since the record can contain other attachments.

4. Click Update to initiate the synchronization process.
   Ensure that the file name matches the script name.

Note: If you receive the error message: File type not permitted or mime type does not match the file content, request that your administrator turn off mime type validation on attachments. The system property glide.security.file.mime_type.validation controls this setting.

Configure a MID Server for alert aggregation and RCA

To enable the Event Management alert aggregation and root cause analysis (RCA) capability, configure at least one dedicated MID Server with the ServiceAnalytics as a supported application, and with the RCA capability. To ensure uninterrupted services, it is recommended that you also configure a failover MID Server cluster for RCA.

If the Domain Support - Domain Extensions Installer plugin is activated, then you can configure a dedicated MID Server with the RCA capability, per domain. In this case, RCA for a business service is done on the MID Server that is in the same domain as the business service. Otherwise, a MID Server from the global domain is used.

Table 632: Hardware requirements

<table>
<thead>
<tr>

</tbody>
</table>

Role required: admin

The RCA MID Server supports the Event Management RCA process by hosting the RCA Learner and the real-time RCA query handler. On the RCA MID Server, the system builds models that support responses to root cause queries. The learner data on the RCA MID Server persists by default for a maximum of 90 days.

By default, the MID Server is set up as a dedicated MID Server for Event Management RCA, and an attempt to add additional supported applications to the same MID Server is prevented. It is recommended that Operational Intelligence is also implemented with its own dedicated Operational Intelligence MID Server. These recommendations ensure high level of performance. However, if needed, you can modify this default behavior and configure the RCA MID Server or the Operational Intelligence MID Server with additional supported applications. For information about modifying the behavior of the ALL option when selecting supported applications, see Select applications to include in the definition of ALL for a MID Server on page 1637.

1. Ensure that the MID Server is validated.
   For more information, see Validate the MID Server on page 1611.
2. Navigate to MID Server Servers.
3. Double-click the MID Server that you want to configure as an RCA MID Server.
4. Add the ServiceAnalytics application:
   a) At the center of the MID Server form, click Supported Applications.
   b) In the Supported Applications section click Edit.
   c) In the slushbucket select ServiceAnalytics and click the > add button.
   d) click Save.

If the MID Server needs to support ServiceAnalytics as well as one or more other applications, you can modify the definition of the ALL option to include these applications, and then select ALL in the slushbucket. ALL is the only option to which it is valid to add the ServiceAnalytics option. Performance might be compromised with these settings.

5. Add the RCA capability:
   a) At the center of the MID Server form, click Capabilities.
   b) In the Capabilities section click Edit.
c) In the slushbucket select RCA and click the '>' add button.
d) click Save.

6. Click Update.

The RCA MID Server is automatically configured with a Discovery IP range set to 0.0.0.0-0.0.0.0.
Create a failover cluster for RCA. In this cluster, add the MID Servers that were configured for RCA. For more information, see Configure a MID Server cluster on page 1715.

MIDSystem methods

MIDSystem variables (referred to by the variable name ms.) provide a variety of methods to get information about the MID Server.

<table>
<thead>
<tr>
<th>Method summary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log(String message)</td>
<td>Logs the given message with a standard prefix to indicate that the message was generated by JavaScript.</td>
</tr>
<tr>
<td>getConfigParameter(String parameter name)</td>
<td>Returns the value of the named configuration parameter.</td>
</tr>
<tr>
<td>include(String script include)</td>
<td>Include the MID Server script include with the given name into the current context.</td>
</tr>
<tr>
<td>getName()</td>
<td>Returns the name of the MID Server.</td>
</tr>
<tr>
<td>getSysID()</td>
<td>Returns the sys_id of the MID Server.</td>
</tr>
<tr>
<td>toJavaScript(Object)</td>
<td>Converts the given Java object into the equivalent JavaScript object.</td>
</tr>
</tbody>
</table>

This example writes a message to the log:

ms.log('Attempting to log in with user: ' + this.getParameter('user'));

Synchronize a JAR file to MID Servers

You can upload a JAR file to an instance and synchronize it to all MID Servers, or write custom probes that use the synchronized JAR file.

Role required: admin, agent_admin

The MID Server JAR File [ecc_agent_jar] table is domain separated. You can create versions of these policies that only a MID Server from the same domain can use. For instructions, see Set up domain separation for MID servers on page 1677.

Caution: Synchronizing a JAR file with this procedure causes all MID Servers connected to the instance to restart automatically.

1. Navigate to MID Server JAR Files.
2. Click New.
3. Complete the following fields:
• Name: A unique and descriptive name for identifying the file in the instance.
• Version: A version number for the file, if one is available.
• Source: Location of the JAR file for reference purposes. Source information is not used by the system.
• Description: Short description of the JAR file and its purpose in the instance.

4. Click the paper clip icon in the banner.

5. In the Attachments dialog box, click Browse and select the file you want to attach.
   
   The platform attaches the JAR file to the record and restarts the MID Servers to synchronize the file. It is not necessary to update the record to attach the file.

Set the MID Server JVM memory size

The MID Server starts with a default JVM memory allocation, but you can modify this setting in the configuration file.

Role required: admin

In the base ServiceNow system, the MID Server JVM memory is set to 1024MB, which is configured in the `agent\conf\wrapper-override.conf` file in the MID Server installation directory. This setting might not be appropriate for the way your organization uses the MID Server. If you want the MID Server to work harder, allocate more resources to it. If the MID Server is located in a small branch office and runs in an environment where memory allocation is shared between a print server, mail server, or web proxy server, the allocation might have to be reduced.

---

**Note:** For a complete list of minimum MID Server requirements, see [MID Server system requirements](#) on page 1583.

1. Open the `\ServiceNow\<MID Server name>\agent\conf\wrapper-override.conf` file in a text editor.
   
   For more information about this file, see [Installing Multiple MID Servers on a Single System](#).

2. Locate the following lines in the file:
   
   ```
   # OPTIONAL: Maximum Java Heap Size (in MB)
   wrapper.java.maxmemory=1024
   ```

3. Edit the memory allocation.

4. Remove the comment tag (`#`) from the memory allocation parameter.

5. Save the file.
6. Restart the MID Server service.

Set MID Server thread use

If the MID Server is running on a host containing many other programs that must compete for CPU time, fewer threads than the default of 25 might be necessary.

Role required: admin

You can set the MID Server to use as few as 5 threads without issues. If the MID Server needs more speed, and the host is powerful enough or lightly loaded with other programs, raise the thread setting. The thread limit depends on the hardware and the operating system of the host. You might have to experiment to find the optimal value for your situation. The following general observations may be useful:

- Most MID Server tasks require file handles to do their job.
- Windows: On the Windows operating system, file handles are available in a fixed quantity. If you configure too many MID Server threads on a Windows host, the MID Server can consume all the file handles before approaching maximum CPU usage. This situation appears as an Out of file handles error in the MID Server log and indicates that the MID Server is trying to use too many threads.
- UNIX and Linux: UNIX and Linux hosts have a much different scheme for allocating file handles. Generally, you can increase MID Server thread use on these operating systems until the CPU of the host is overloaded. See your OS documentation for monitoring CPU usage.
- Each thread on the MID Server requires some memory. Exactly how much memory varies considerably from task to task and depends on the equipment being discovered. To increase the number of threads, you might have to increase the amount of memory that Java uses. If you configure insufficient memory, an Out of memory error appears in the MID Server log.

Follow the steps below to change the config.XML file. Alternatively, use the threads.max connection parameter.

1. Open the \agent\config.xml file using any text editor.
2. Locate the following lines:
   ```xml
   <!-- MID Server Threads --><parameter name="threads.max" value="25"/>
   ```
3. Edit the value. Keep in mind the cautions described above.
4. Save the record.
5. Restart the MID Server service.

ECC queue retry policy

Define retry policies for outbound Web Services that are executed via the ECC Queue table.

Retry policies specify a matching error condition for ECC Queue input records that are a result or response of an output queue record, the interval for retry, and the maximum number of retries. Because it matches on the input queue record, the retry policies only work when an input ECC Queue record is expected, and therefore requires that the outbound messages are queued on the ECC Queue table as well. Advanced matching criteria may be specified using script.

Retry activity

The retry activity records document each attempt to retry the output queue record.

When the current policy is being retried, the Status of the activity will indicate Retrying. When all retries are exhausted, e.g. the maximum number of retries have occurred and the output queue still failed, the
Status field will indicate a Failed state. Otherwise, at anytime during the retry, if the request then becomes successful, it indicates Succeeded.

![Queue Retry Activity Table]

You may also display the current list of retry activities and their states by selecting the Queue Retry Activity module.

**Figure 327: Queue Retry Activity**

You may also display the current list of retry activities and their states by selecting the Queue Retry Activity module.

Figure 328: Queue Retry Activities
Retry policy example

This retry policy defines the matching criteria when an UnknownHostException response is received during a SOAPClient (outbound SOAP message invocation) call.

![Queue Retry Policy Table]

The policy will only match if the Agent, Topic, ECC Name (matches the Name field), and Source fields match that of an input ECC queue record. Additionally, the Condition and Condition script criteria will also have to match "State == error" and the error_string field contains the text java.net.UnknownHostException.

When these conditions are met, and an input record is matched, it will retry the originating output queue record after 15 seconds, and for a maximum of 3 times.

Figure 329: Default Queue Retry Policy

The policy will only match if the Agent, Topic, ECC Name (matches the Name field), and Source fields match that of an input ECC queue record. Additionally, the Condition and Condition script criteria will also have to match "State == error" and the error_string field contains the text java.net.UnknownHostException.

When these conditions are met, and an input record is matched, it will retry the originating output queue record after 15 seconds, and for a maximum of 3 times.

The MID Server ECC Queue

The External Communication Channel (ECC) Queue is a connection point between an instance and the MID Server. Jobs that the MID Server needs to perform are saved in this queue until the MID Server is ready to handle them.

The MID Server subscribes to messages published by the Asynchronous Message Bus (AMB), which notifies the MID Server that it has pending tasks in the ECC Queue. If a job exists in the ECC Queue
for that MID Server, the MID Server sets the status to "I'm working on it." When finished working on a requested job, the MID Server reports back to the ECC queue with the results.

You can access the ECC Queue by navigating any of these paths:

- Discovery Output and Artifacts ECC Queue
- Discovery Discovery Schedules {schedule name} {Discovery status record}
- ECC Queue
- {Discovery Status record} ECC Queue

### ECC Queue fields

An ECC Queue provides the following information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agent</td>
<td>The name of the external system that this messages is either from or to. If the message is from or to a MID Server, the agent name is in the form mid.server.xxx, where xxx is the name of a particular MID Server.</td>
</tr>
<tr>
<td>Topic</td>
<td>The name of the probe the MID server ran. If you are using a pattern for discovery, the Horizontal Pattern probe appears.</td>
</tr>
<tr>
<td>Name</td>
<td>The actual command the probe ran. For example, if Topic is SSHCommand, then the Name field contains the actual shell command to run. If you are using a pattern for discovery, the following appears: Pattern Launcher: followed by the name of the pattern and the multipage number.</td>
</tr>
<tr>
<td>Source</td>
<td>The IP address that the discovery is to run against. A few probes run against multiple IP addresses; in those cases, this field contains a human-readable description.</td>
</tr>
<tr>
<td>Response to</td>
<td>This optional field contains a reference (sys_id) to the ECC Queue message that this message is in response to. Discovery makes extensive use of this field to track the hierarchy of messages that result from a given scheduled Discovery. Click the record icon for the value in this field to open the ECC Queue record for the activity that spawned the current probe or sensor record.</td>
</tr>
<tr>
<td>Queue</td>
<td>An indicator of whether this message was an input message or an output message.</td>
</tr>
<tr>
<td>State</td>
<td>The state of the current ECC queue record. States update automatically.</td>
</tr>
<tr>
<td>Processed</td>
<td>The time when this message was processed.</td>
</tr>
<tr>
<td>Created</td>
<td>The time when this message was created.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sequence</td>
<td>The unique sequence number for this message. This value is automatically generated when an ECC Queue record is inserted. Its use is deprecated.</td>
</tr>
<tr>
<td>Error string</td>
<td>An error message, if an error occurred during processing. This field is hidden on the standard form unless there was an error.</td>
</tr>
<tr>
<td>Payload</td>
<td>The body of the message in XML format. The returned XML has a root tag of &lt;results&gt; containing one or more &lt;result&gt; tags and a single &lt;parameters&gt; tag. The parameters are simply an echo of those sent to the MID server in the probe; they vary from probe to probe, but in general they tell the probe the details of what it is to do and how it should behave. The result tags are the most interesting ones: they contain the actual data generated by the probe.</td>
</tr>
</tbody>
</table>

**ECC queue controls**

The ECC Queue form contains these related links:

<table>
<thead>
<tr>
<th>Related link</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run again</td>
<td>Runs the probe again. You can re-run probes when you encounter a failed discovery or other unexpected results.</td>
</tr>
<tr>
<td>Go to CMDB item</td>
<td>Open the CI record for the CI that was updated during the discovery.</td>
</tr>
<tr>
<td>Go to Sensor</td>
<td>Open the record for the associated sensor.</td>
</tr>
</tbody>
</table>

**Manage ECC Queue content for a MID Server**

The ECC Queue allows you to create ECC Queue messages, access MID Server log entries, and retrieve statistics from an individual MID Server record.

Role required: admin, mid_server

1. Send remote commands through a MID Server to a hosting device directly from the ECC Queue without running Discovery.
   a) Navigate to the ECC Queue and click New.
   b) Create a message with these settings:
      - Agent: The name of the MID Server that executes the command.
      - Topic: Command
      - Name: The actual command that you want to process. For Windows, this is expressed in a DOS command line structure. For Linux, the structure could be a bash command line entry.
      - Queue: Output
• Payload: With proper XML tags, you can specify the command here instead of in the Name field. The advantage to this is that the command is not restricted by the Name field length of 120 characters. Use the following XML format for the command:

```xml
<parameters>
  <parameter name="name" value="ACTUAL_COMMAND_LINE"/>
</parameters>
```

2. Access entries in the ECC Queue that show agent0.log.0 logs and wrapper.log logs for an individual MID Server.

   a) Open a MID Server record.
   b) Under Related Links, click Grab MID Logs.

      ECC queue records appear in the list using the following filter:
      - [Topic] [is] [SystemCommand]
      - [Source] [is] [grabLog]
      - [Agent] [is] [your MID Server]

      Only agent0.log.0 and wrapper.log entries appear. These logs are also accessible in the ~\agent \logs\ file path.
   c) To open a log entry, click the link under the Created column.

3. Access the queue.stats topic for useful information about individual MID Servers, such as memory and CPU usage data.

   a) Open a MID Server record.
   b) Under Related Links, click MID Statistics.

      ECC queue records appear in the list using the following filter:
      - [Topic] [is] [queue.stats]
      - [Agent] [is] [your MID Server]

MID Server cluster configuration

MID Server clusters enable multiple MID Servers with the appropriate capabilities to be grouped together for load balancing and fail-over protection.

External data sources

For performance and reliability reasons, these data sources should not be used with MID Server clusters:

- LDAP
- Export sets
- JDBC data sources

These external data sources should only be used with dedicated MID Servers.
How clusters work

MID Servers in clusters must be able to connect to the instance and to all the devices with which they are expected to communicate. If all MID Servers in a cluster are down, the discovery is canceled. Make sure all the MID Servers are added to any Access Control List (ACL) in use. MID Server clusters are managed by a business rule called MID Server Cluster Management, which checks to see if the MID Server assigned to a job in the ECC Queue belongs to a cluster.

Load balancing

If the cluster business rule determines that a MID Server is part of a load balancing cluster, the application using the MID Server automatically balances the work between the MID Servers in that cluster. It is good practice to put MID Servers with the same capabilities in a load balancing cluster.

Fail-over protection

MID Servers in a fail-over cluster each have a configured order that the platform uses to determine which MID Server to use next in case of failure. MID Servers in a fail-over cluster work independently and do not load balance with other MID Servers in that cluster (although they might also be members of load balancing clusters). When a MID Server fails, the MID Server Cluster Management business rule selects the highest available MID Server in the order to take over the work. The selected MID Server checks the ECC Queue and starts with jobs that are either Processing or Ready.

Note: MID Server clustering does not supported the ECC queue topics Command or SystemCommand. If these commands are received, the clustered MID Servers do not redirect the ECC queue to another MID Server. The ECC queue records stay on the ECC queue without being processed.

Configure a fail-over MID Server with at least the same capabilities as the MID Server it is intended to relieve.

Note: If a MID Server fails while the Shazzam probe is running and auto-selection is configured, failover is not available. The Shazzam discovery stops. Discovery does not automatically choose another MID Server.

MID Server cluster event

The following event is triggered when the platform cannot find a MID Server with the appropriate capabilities to replace a MID Server in a fail-over cluster. Use this event to create an email to notify appropriate users that the cluster has failed.
Table 634: MID Server cluster event

<table>
<thead>
<tr>
<th>Event</th>
<th>Table</th>
<th>Description</th>
<th>Business Rule</th>
</tr>
</thead>
<tbody>
<tr>
<td>mid_server.cluster.down</td>
<td>MID Server Cluster [ecc_agent_cluster]</td>
<td>A MID Server cluster has failed</td>
<td>MID Server Cluster Management</td>
</tr>
</tbody>
</table>

**Combining clusters**

A MID Server can be added to both types of clusters at the same time. This diagram shows a scenario in which a MID Server from a load balancing cluster (MID Server D) is also present in a fail-over cluster. If MID Server D fails, MID Server E in the failover cluster is available to the load balancing cluster to perform the tasks previously assigned to MID Server D.

![Diagram of combining clusters]

**Specifying a specific MID Server cluster**

You can specify a specific MID Server cluster for a Discovery schedule. The discovery process uses that cluster only. You cannot chain clusters or specify a single MID Server that belongs to multiple clusters.

**Configure a MID Server cluster**

Configure a cluster of MID Servers for either failover or load balancing.

*Role required: admin*

You can select a MID Server cluster from the Discovery Schedule form.

1. Navigate to MID Server Clusters.
2. Click New.
3. Name the cluster and select the cluster type: Failover or Load Balance.
4. Right click in the header bar and select Save from the context menu.
5. Click Edit in the Includes MID Servers Related List.
6. Select appropriate MID Servers for this cluster from the slushbucket.

**Note:** All MID Servers in a cluster should have capabilities defined. Ensure that each MID Server has the appropriate capabilities for the job. A MID Server in a fail-over cluster must have the same capabilities (or expanded capabilities) as the MID Server it is expected to replace.
MID Server capabilities

MID Server capabilities define the specific functions of a MID Server within an IP address range.

Several applications, such as Discovery, Service Mapping, Cloud Management, and Orchestration can use capabilities, IP ranges, and MID Server selection on page 1630 to narrow the pool of MID Servers the applications need.

Note: At least one capability is required for each MID Server used by Orchestration. See MID Servers for Orchestration on page 2103 for more information.

The following capabilities are available by default with Discovery:

- All
- Cloud Management
- Nmap
- PowerShell
- Resolve DNS
- REST
- SNMP
- SOAP
- SSH
- VMware
- WMI

Nmap capability

The Nmap capability is only assigned to MID Servers for which the Network Mapper (Nmap) scanner has been installed for credential-less Discovery. This capability cannot be added to or removed from any MID Server manually. For instructions on installing or uninstalling Nmap, see Install and uninstall Nmap on a MID Server on page 1694

MID Server capability values

Capabilities provided in the base system do not have a defined value string. A MID Server configured to use a capability that has no value can locate any device using that capability's protocol. If a capability has a defined value, the MID Server using that capability finds only those devices using that protocol that match the value string exactly. The exception to this is the Resolve DNS capability, which is configured to resolve any DNS name into an IP address using a partial string match.

Starting with the London release, the [capability name]:[value] combination appears in the slushbucket when you add a capability to a MID Server. This combination allows you to see all the capabilities that have different values, even if the capability name is the same. For example, if you are using the Cloud Management capability, and you use the value field to specify the us-west logical datacenter on one of the capability records, you can see the combination in the Collection list.
Scripted MID Server capability value matching

You can use value tests to create capabilities that find devices using values without requiring exact string matching. Action on these values is controlled by a user-defined script.

The Resolve DNS capability is provided in the base system and is configured to resolve DNS names into IP addresses for devices whose names end with a specified domain name. The capability Value entered is automatically prefaced with a dot during processing to match domain syntax. This value can contain one or more sub-domains, but must include the end of the domain string. Matching devices must end with the identical syntax. The script for the Resolve DNS capability determines if a device name matches the criteria defined by Value. If a match exists, the platform performs the address resolution automatically. For example, if the value for the Resolve DNS capability is service-now.com, the MID Server with this capability finds lnxlab01.sandiego.service-now.com and dbsrv101.sanjose.service-now.com. If the value is changed to sandiego.service-now.com, then the MID Server finds only lnxlab01.

**Note:** If Value in the Resolve DNS capability is blank, then all domains match.

To view the script for evaluating this capability, navigate to MID Server Capability Value Tests and select Resolve DNS from the list.
Configure MID Server capabilities

A capability is required for each MID Server to work with Orchestration, Cloud Management, Service Mapping, and alert aggregation and RCA.

Role required: admin or sm_admin

1. Navigate to MID Server Capabilities.
2. Select an existing capability. You can also select ALL to include all capabilities.

   **Note:** Ensure that each IP address range has MID Servers with the necessary capabilities to complete the Orchestration activities on that network segment.

3. Create a new capability:
   a) Click New.
   b) Configure the value for a custom capability.
      An example is a capability for DOMAIN, with a value of service-now.
   c) Click Submit.

4. Click Edit in the MID Servers related list to add MID Servers to the capability.
5. Select one or more MID Servers for this capability from the slushbucket.
6. Click Save.
   The capability defined here also appears in the primary record for this MID Server.

### MID Server troubleshooting

The Knowledge Base on Hi contains several articles to help you troubleshoot MID Server issues.

<table>
<thead>
<tr>
<th>The MID Server Troubleshooting Guide</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>KB0597571</strong></td>
</tr>
<tr>
<td>Start here if you are experiencing symptoms such as the MID Server going down or not responding, or CIls being duplicated during discovery.</td>
</tr>
</tbody>
</table>

You can also see the following video on NOWsupport YouTube channel: *How to set up a MID Server*

### MID Server active issues

The ServiceNow® instance has a dedicated table that publishes active issues with MID Servers and alerts administrators when a MID Server is in danger of exceeding its resources.

The MID Server Issue [ecc_agent_issue] table displays a number of common issues that a MID Server can experience, as they occur. Error checking processes attempt to pinpoint the most likely cause of the issue. Informative error messages name the affected MID Server and explain the possible cause of the issue.

The ecc_agent_issue table retains its records for 30 days.

To access records in this table, navigate to MID Server Server Issues.

Supported MID Server active issues:

- Bad user credentials after instance cloning.
- Unsupported Java Runtime Environment (JRE) on the MID Server host.
- Approaching resource thresholds for CPU usage and JVM memory.
- Errors detected during pre-upgrade testing.
- User authentication and authorization failures.
- Network connectivity interruptions and role configuration errors.
Active MID Server post-cloning credential issues

The system provides automatic processes to detect and notify you of possible MID Server credential issues after instance cloning.

During an instance clone, the MID Server [ecc_agent] table is not copied from the source instance, but the User [sys_user] table is copied. As a result, the source MID Server user credentials copied into the target instance might not match those used by the existing set of MID Servers used by the target. Bad credentials can cause those MID Servers to be down for the target instance. Processes on the instance notify you if a MID Server is down from suspected bad credentials following an instance clone.

Table for post-cloning credential issues

The MID Server Issue [ecc_agent_issue] table stores active MID Server issues after an instance clone. Records in this table show a MID Server's current state, evaluation times, and the Issue source. For cases
in which a MID Server for a cloned instance is down because of possible bad credentials, the Issue source is InstanceClone. Data from the MID Server Issue [ecc_agent_issue] table are displayed in a related list on a MID Server record. Records in this table are removed after 10 days, regardless of their state. Ongoing issues reappear as they occur.

**Post-cloning cleanup script and scheduled jobs**

A cleanup script called Bad MID Server credentials after clone runs on the target instance after cloning and calls a script include called BadMIDCredentialAfterClone. This script include schedules the execution of the following jobs on the Schedule Item [sys_trigger] table:

- BadMIDCredentialAfterClone-1: Runs 15 minutes after clone execution.
- BadMIDCredentialAfterClone-2: Runs 75 minutes after clone execution.

These jobs log to the MID Server Issue [ecc_agent_issue] table any MID Servers that existed on the target instance prior to the clone that are in the Down state. These MID Servers are not ready for normal processing and might be down due to invalid credentials resulting from the cloning process. The state of MID Servers added to the target instance after the clone is not evaluated.

---

**Note:** The MID Server log shows that the MID Server user associated with the target instance could not be authenticated or was missing the proper role.

---

**Business rule that checks for bad credentials**

The Check for bad MID credential after clone business rule monitors the MID Server [ecc_agent] table for MID Servers that are transitioning from Down to Up. If the business rule finds a MID Server making that transition, the rule attempts to find a matching MID Server in the MID Server Issue [ecc_agent_issue] table that has an issue source of InstanceClone and a state other than Resolved. If a match is found, the business rule updates the state of the MID Server in the [ecc_agent_issue] table to Resolved.

**Resolving MID Server issues**

The error message in the MID Server Issue [ecc_agent_issue] table names the affected MID Server user. This message appears each time the business rule runs and finds a MID Server that is down from suspected bad credentials:

MID Server not operational (status: Down), possibly due to recent clone.
Verify credentials for logged in User 'local-midserver'.

Attempt to resolve the issue first by comparing the user's credentials with the credentials that the affected MID Server is expecting. If the credentials are incorrect, fix the problem and check the MID Server status again. If the credentials are correct, but the MID Server remains down, check the Knowledge Base for other possible causes.

**MID Server resource threshold alerts**

The instance displays warnings when a MID Server breaches its resource thresholds for CPU and JVM memory usage, enabling users to create email notifications or custom scripts when a breach occurs.

The MID Server Issue [ecc_agent_issue] table warns users when a MID Server exceeds configured thresholds of its allocated CPU and memory resources. These warnings are published before the MID Server experiences performance degradation or an out-of-memory error, enabling the administrator to increase resources and avoid downtime. Administrators can use a registered event to send email notification to selected recipients, advising them of any threshold breaches, or to create a custom script
to do some other type of work. The instance continues to update the MID Server Issue [ecc_agent_issue] table to keep unresolved issues current.

By default, CPU and memory threshold alerts are disabled and no alerts are published to the MID Server Issue [ecc_agent_issue] table. To enable both types of alerting, add these properties to the System Property [sys_properties] table, and then set their values to true:

• mid.threshold.resource.breach.enable.cpu.alerts
• mid.threshold.resource.breach.enable.memory.alerts

For details on adding system properties to the platform, see Add a property using sys_properties.list.

**Evaluation process**

This processing occurs whether or not alerting is enabled:

1. Every 10 minutes, each MID Server transmits its CPU and memory consumption metrics to the instance. The instance inserts CPU metrics into the Mean CPU used % field of the ECC Agent Scalar Metrics [ecc_agent_scalar_metric] table and memory metrics into the Max memory used % field of the ECC Agent Memory Metrics [ecc_agent_memory_metric] table.

2. After a successful insert, the following business rules run on each table, invoking a script include that calls an appropriate function. Each function takes an average of the metric sets inserted into the tables, based on the configured sampling intervals.

   • Update cpu mean on MID Server Status: Calls the MIDResourceThresholdBreach.checkCpuUsage() script include.
   • Update max memory on MID Server Status: Calls the MIDResourceThresholdBreach.checkMemoryUsage script include.

Each function takes an average of the metric sets inserted into the tables, based on the configured thresholds and sampling intervals. The instance first looks at each MID Server for configuration parameters that set custom threshold values or sampling intervals for that MID Server. If no configuration parameters for these attributes are found, the instance looks in the System Properties [sys_properties] table for custom values to use. If no properties are found, the instance uses the default threshold and interval values from the code.

**Note:** Both the threshold percentages and the sampling intervals are configurable. See Configuring thresholds and sampling intervals on page 1725 for details.

**Alerting process**

When alerting for CPU or memory thresholds is enabled, this processing occurs:

1. If the aggregated average metric value equals or exceeds the configured percent threshold, the instance triggers the mid.threshold.resource.breach event. Administrators can use this event to create email notifications for threshold breach alerts or to create a custom script.

2. The instance inserts a record of the breach into the MID Server Issue [ecc_agent_issue] table with a State value of New and a Count of 1, and then publishes a message containing all the pertinent details of the breach. An example of this message is Mean CPU used % has exceeded threshold (96>=91) for a 40 minute interval span, occurring after start date 2017-01-11 14:25:19. This message appears in the Short description field of the MID Server Issue form and in the event. You can copy any part of the message into your email notifications.
**MID Server issue states**

When the administrator first examines an issue in the MID Server Issue [ecc_agent_issue] table, the administrator can change the State of the issue to Acknowledged to indicate that the issue is being addressed. Each time the instance detects a breach, it attempts to match the breach with an existing issue. If a MID Server already has an issue record for that breach in a State of New or Acknowledged, the instance updates the Last Detected field with the current date/time and increments the Count field in the existing record. This prevents the creation of duplicate records in the MID Server Issue [ecc_agent_issue] table and records the number of times after the initial incident that the breach reoccurred. The administrator can increase MID Server resources gradually and watch the effect on the Count field. When the counter stops incrementing, the administrator knows that the MID Server has adequate resources. When the MID Server resource have been adjusted appropriately, the administrator sets the State to Resolved. If a new threshold breach is logged that matches a MID Server issue with a State of Resolved, the instance creates a new issue record.

**Note:** Any record in the MID Server Issue [ecc_agent_issue] table that has not been updated in 30 days is deleted, regardless of its state.

**Recommendations for resolving resource issues**

Administrators have the opportunity to resolve any resource issues with a MID Server when they receive notification of the event. Follow these recommendations for reducing the strain on MID Server resources:

- **JVM memory:**
  - Allocate more max memory to the MID Server. For more information, see *Set the MID Server JVM memory size* on page 1706.
  - Add additional MID Servers to share the workload. For more information, see *MID Server cluster configuration* on page 1713.
  - Reduce the amount of concurrent processing for the MID Server. This includes segmenting IP Address ranges into smaller segments for a Discovery schedule or loading smaller segments of data within an import job.

- **CPU:** Reduce the activity on the host or migrate the MID Server to a new host with more available resources.
### Tables used for resource threshold evaluation

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
</table>
| MID Server Issue [ecc_agent_issue]         | Stores data on various types of MID Server issues, including breaches of configured CPU and memory thresholds. Fields used for resource threshold breaches are:  
• count: Number of times a previously reported threshold breach occurs, if the event is not marked Resolved.  
• last_detected: Current date and time a threshold breach is detected. This field is updated each time a previously detected breach is found, if it is not marked Resolved.  
• message: Descriptive message summarizing the conditions that triggered the threshold breach event. This message includes the actual percentage of CPU and memory calculated and the configured thresholds that were breached.  
• mid_server: Name of the MID Server experiencing the resource threshold breach.  
• source: The issue source for the breach. These are the possible sources:  
  • CpuMIDResourceThresholdBreach: CPU threshold issue sources.  
  • MemoryMIDResourceThresholdBreach: Memory threshold issue sources. |
| MID Server Status [ecc_agent_status]       | Stores the percentages used for the CPU and memory resources, averaged over configurable intervals for each resource. The fields used are:  
• Mean CPU used %  
• Max Memory used % |
| ECC Agent Scalar Metric [ecc_agent_scalar_metric] | Stores the CPU usage data inserted by each MID Server every 10 minutes. The table field used by resource threshold alerting is mean. |
| ECC Agent Memory Metric [ecc_agent_memory_metric] | Stores the memory usage data inserted by each MID Server every 10 minutes. The table field used by resource threshold alerting is max_used_pct. |
Business rules that check for threshold breaches

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update cpu mean on MID Server Status</td>
<td>Runs after the MID Server inserts a record into the ECC Agent Scalar Metric [ecc_agent_scalar_metric] table. This business rule triggers the MIDResourceThresholdBreach script include function that evaluates threshold settings to determine if the MID Server has breached its configured CPU resource thresholds.</td>
</tr>
<tr>
<td>Update max memory on MID Server Status</td>
<td>Runs after the MID Server inserts a record into the ECC Agent Memory Metric [ecc_agent_memory_metric] table. This business rule triggers the MIDResourceThresholdBreach script include function that evaluates threshold settings to determine if the MID Server has breached its configured memory resource thresholds.</td>
</tr>
</tbody>
</table>

Configuring thresholds and sampling intervals

You can use the default threshold percentages and sampling intervals or configure custom values using either of these methods:

- **Add system properties** to the instance and change the default values for all MID Servers.
- **Add configuration parameters** to change the default resource values for individual MID Servers.

The system properties and the configuration parameters use the same names.

<table>
<thead>
<tr>
<th>Property/configuration parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| mid.threshold.mean_cpu.aggregate_interval_span        | Number of 10 minute units in the interval for sampling CPU usage data. The default interval is 30 minutes (3 x 10 min.)  
Default: 3                                                                                         |
| mid.threshold.mean_cpu.percent                        | Usage percentage of the total CPU resources that initiates a threshold breach alert.  
Default: 95                                                                                         |
| mid.threshold.mean_max_memory.aggregate_interval_span | Number of 10 minute units in the interval for sampling memory usage data. The default interval is 30 minutes (3 x 10 min.)  
Default: 3                                                                                         |
| mid.threshold.mean_max_memory.percent                 | Usage percentage of the total memory resources that initiates a threshold breach alert.  
Default: 95                                                                                         |
**MID Server resource reporting**

The *MID Server dashboard* contains two reports that give you views into the consumption of CPU and JVM memory resources. These reports show usage over the previous 30 days.

- **Avg Percentage of CPU Used**: Trending the daily average on CPU usage helps illustrate the amount of CPU processing that the MID Server host consumes. MID Servers deployed on the same host will report the same CPU usage.
- **Avg Percentage of Max Memory Used**: The maximum used percentage (max_used_pct) is a useful metric for determining if the MID Server has enough memory resources. This metric is a percentage of the max used memory over the total available memory. Trending this over time provides a visualization of how much memory is needed by the MID Server.

**MID Server user connectivity issues**

The instance writes issues involving MID Server user logins and network connectivity to the MID Server Issue [ecc_agent_issue] table and creates events you can use in custom scripts or to send email notifications.

Records in the MID Server Issue [ecc_agent_issue] table can provide insight into why your MID Server user cannot log in or why a MID Server cannot connect to the instance. The system displays records for connectivity problems in this table that include informative error messages suggesting possible causes. By default, a scheduled job called MIDUserConnectivity runs every four hours and launches the MIDUserConnectivity script include to evaluate MID Server connection activity. Records in the MID Server Issue [ecc_agent_issue] table reflect the status of MID Server login attempts and connectivity at the time the scheduled job runs.

From the perspective of the instance, the MID Server is Down when:

- User authentication fails
- User authorization fails.
- Network issues prevent MID Server from establishing a TCP/IP connection.

**Note**: To associate a user with a MID Server, navigate to the servicenow/<mid server name>/agent/config.xml file and enter the user credentials in the mid.instance.username and mid.instance.password parameters. Make sure to restart the MID Server to activate your changes.

**How issues are logged**

User authentication failures and authorization issues are logged automatically to the MID Server agent log file. The message for both is the same: User cannot be authenticated or is missing the proper roles. If the issue is related to authorization, the agent.log file shows the list of missing roles.

When debugging is enabled, MID Server issues are logged to the system log (syslog) and are available for display in either a summary or a detailed format. You can also change the sampling interval from the default 4 hours to something shorter for tracking your remediation efforts. For instructions on enabling and configuring debugging for MID Server user issues, see *Test remediation efforts for MID Server user connectivity issues* on page 1733.

**Data provided**

When the instance encounters user connectivity issues, it opens a record in the MID Server Issue [ecc_agent_issue] table.
Figure 331: Example user authentication error message

The MID Server Issue table contains these fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last detected</td>
<td>Date and time the issue was last detected.</td>
</tr>
<tr>
<td>Short description</td>
<td>Contents of the generated message that specifies a possible issue with the named user or the MID Server.</td>
</tr>
<tr>
<td>MID Server</td>
<td>Empty in the Jakarta release.</td>
</tr>
<tr>
<td>Issue source</td>
<td>The process that identified the issue. For all issues with MID Server user connectivity, the source is MIDUserConnectivity.</td>
</tr>
</tbody>
</table>
### User authentication failure

The credentials that the instance uses to authenticate a MID Server user are configured in the MID Server Configuration Parameters [ecc_agent_config] table. If the MID Server user attempts to log into the instance with invalid credentials, the instance rejects the connection, and writes the login.failed event to the Events [sysevents] table for the user. Administrators can use this event in a custom script or in email notifications for authentication failure.

**Note:** If user authentication fails, user authorization is not attempted.

#### User accounts associated with a MID Server

Either of the following messages in the MID Server Issue [ecc_agent_issue] table indicate authentication failure for user accounts that are associated with a MID Server:

- Login authentication failure for User `<user name>` associated with 1 down MID Server. Check password on MID server.
- Login authentication failure for User `<user name>` associated with `<n>` down MID Servers. Check password on MID servers.

The necessary conditions for these messages to appear are:

- The Status field in the MID Servers [ecc_agent] table that is associated with the MID Server indicates that the MID Server is Down.
- The user identified in the MID Server Configuration Parameters [ecc_agent_config] table is the user that one or more MID Servers is configured to use for authentication and authorization when connecting to the instance. The record in the [ecc_agent_config] table must have these values:
  - Parameter name [param_name] field set to mid.instance.username.
  - Value [value] field set to the user's name, corresponding to the User ID [user_name] field in Users [sys_user] table.
• The Events [sysevent] table contains posts showing that the last login attempt associated with the user failed during the scheduled time period. The record created in the [sysevent] table contains these field values:
  • Event Name [name] field is set to login.failed.
  • Parm1 [parm1] field is set to the user’s name.

Note: The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).

User accounts with the mid-server role not associated with a MID Server

The following message appears when a user with the mid_server role who is not associated with a MID Server fails to authenticate: Login authentication failure for User <user name> with mid_server role not associated with a MID Server.

The necessary conditions for this message to appear are:
• The User Roles [sys_user_has_role] table contains a record linking the sys_id associated with the user record stored in the [sys_user] table, with the sys_id associated with the mid_server role record stored in the [sys_user_role] table.
• The user is not identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
• The Events [sysevent] table contains posts showing that the last login attempt associated with the user failed during the scheduled time period.
  • The [sysevent] table contains a record with the Event Name [name] field set to login.failed.
  • The Parm1 [parm1] field is set to the user’s name, corresponding to the User ID [user_name] field in Users [sys_user] table.

Note: The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).

User authorization failure

The user authorization check occurs after the MID Server has successfully authenticated on the instance. In this step, the system ensures that the user account associated with a MID Server is granted the minimum roles required. A SOAP web service called MIDServerCheck performs the role checking on the instance. If the MID Server user has the proper roles, the connection is allowed and a login event is written to the Events [sysevents] table. If the user does not have the proper roles, the instance writes a login.authorization.failed event to the Events [sysevents] table. This event provides a comma separated list of the user’s missing roles. Administrators can use this event in custom scripts or in email notifications for authorization failure.

Authorization can fail if a user is missing the mid_server role or any of the important SOAP roles, as in these cases:
• If the user has the soap_script role, the MIDServerCheck SOAP web service runs to check for the appropriate MID Server roles. If the user lacks the mid_server role or any of the other SOAP roles, authorization fails, and the login.authorization.failed event is created.
• If the user is missing the soap_script role, that user is not authorized to launch the MIDServerCheck SOAP web service, which checks for all required MID Server roles. Authorization fails, but the
login.authorization.failed event is not created. When this occurs, the instance displays this message: Connectivity of MID Server user <user name> cannot be detected by the instance.

Users associated with one or more down MID Servers

Either of the following messages in the MID Server Issue [ecc_agent_issue] table indicate authorization failure for user accounts that are associated with a MID Server that is Down:

- Login authorization failure for User <user name> associated with 1 down MID Server. Re-assign mid_server role to grant all required roles.
- Login authorization failure for User <user name> associated with <n> down MID Servers. Re-assign mid_server role to grant all required roles.

The MIDUserConnectivity script include identifies active users associated with one or more down MID Servers whose last login attempt within the reporting period failed user authorization. This message is generated when user authorization failures are detected and reported by the MIDSer verCheck scripted web service. However, user authorization failures are not reported for users who are not assigned the soap_script role. Should this occur, problems with the user are reported by the network connectivity message.

This message appears in the MID Server Issue [ecc_agent_issue] table when:

- The user may or may not have the mid_server role.
- The user is identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- The Events [sysevent] table contains posts showing that the last login attempt associated with the user failed during the scheduled time period. The [sysevent] table contains a record with these settings:
  - Event Name [name] field set to login.authorization.failed.
  - Parm1 [parm1] field set to the user’s name, corresponding to the User ID [user_name] field in Users [sys_user] table.

**Note:** The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).

Users with the proper role not associated with a MID Server

The following message appears when a user with the mid_server role who is not associated with a MID Server fails authorization: Login authorization failure for User <user name> with mid_server role not associated with a MID Server.

This message is generated when user authorization failures are detected in which the user account, with the mid_server role, is not identified as a configured MID Server user in the [ecc_agent_config] table. It is possible that the user account was associated with a MID Server at the time of the failure.

This message appears in the MID Server Issue [ecc_agent_issue] table when:

- The user has the mid_server role. The User Roles [sys_user_has_role] table has a record linking the sys_id associated with the user record stored in the [sys_user] table, with the sys_id associated with the mid_server role record stored in the [sys_user_role] table.
- The user is not identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- The Events [sysevent] table contains posts showing that the last login attempt associated with the user failed during the scheduled time period. The [sysevent] table contains a record with these settings:
  - Event Name [name] field set to login.authorization.failed.
Network issues

A network issue can prevent the MID Server from connecting to the instance's TCP/IP server to begin a session. In this case, the instance marks the MID Server as Down, because the instance failed to receive the MID Server heartbeat within the prescribed 5 minute interval.

Users associated with down MID Servers who have not attempted to log in

Either of the following messages in the MID Server Issue [ecc_agent_issue] table name users associated with MID Servers who have not attempted to log in during the reporting period:

- User <user name> is associated with 1 down MID Server. No login attempts within reporting period.
- User <user name> is associated with <n> down MID Servers. No login attempts within reporting period.

The MIDUserConnectivity script includes reports active users associated with down MID Servers where network connectivity cannot be detected by the instance.

This message appears in the MID Server Issue [ecc_agent_issue] table when:

- The user may or may not have the mid_server role.
- The user is identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user which one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- There are no login attempts, either failed or successful, recorded in the Events [sysevent] table for the user during the scheduled reporting period.

Users not associated with MID Servers who have not attempted to log in

The following message appears when a user with the mid_server role who is not associated with a MID Server has not attempted to login during the configured reporting interval: User <user name> with mid_server role is not associated with a MID Server. No login attempts within reporting period.

The MIDUserConnectivity script includes reports active users with the mid_server role not associated with a MID Server, where connectivity cannot be detected by the instance.

This message appears in the MID Server Issue [ecc_agent_issue] table when:

- The user has the mid_server role. The User Roles [sys_user_has_role] table has a record linking the sys_id associated with the user record stored in the [sys_user] table, with the sys_id associated with the mid_server role record stored in the [sys_user_role] table.
- The user is not identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- There are no login attempts, either failed or successful, recorded in the Events [sysevent] table for the user during the scheduled reporting period.
Configuration issues

Any of the following messages, discussed above, can indicate a configuration issue:

- Login authentication failure for User <user name> with mid_server role not associated with a MID Server.
- Login authorization failure for User <user name> with mid_server role not associated with a MID Server.
- User <user name> with mid_server role is not associated with a MID Server. No login attempts within reporting period.

These are some common configuration errors:

- An administrator neglected to associate the user record with the MID Server record as shown in the MID Server Configuration Parameters [ecc_agent_config] table. This table is read-only and cannot be updated directly. To associate a user with a MID Server, configure the user name and password in the MID Server's config.xml file and restart the MID Server.
- During the process of reconfiguring a MID Server to use a different account for TCP/IP connection, the administrator has not yet removed the mid_server role from the account or deleted the account.
- A multipurpose user account was created and granted a large number of roles, including the mid_server role, although this account was never intended to be used as a MID Server account.

User who successfully authenticates and authorizes but might not need mid_server role

The following message appears when a user with the mid_server role who is not associated with a MID Server successfully logs in: User <user name> with mid_server role successfully connected but not associated with a MID Server. The mid_server role should be reserved for MID Server use only.

The MIDUserConnectivity script includes reports active users with the mid_server role who are not identified as a configured MID Server user, and whose last login attempt was successful during the scheduled time period. This message suggests that the user's credentials are being used by a system administrator or a process that is not running on a MID Server. The assumption here is that the mid_server role should only be used for applications deployed to a MID Server. The presence of this message reminds the system administrator to remove extraneous mid_server roles from user accounts that do not require them.

This message appears in the MID Server Issue [ecc_agent_issue] table when:

- The user has the mid_server role.
- The user is not identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- The Events [sysevent] table contains posts showing that the last login attempt associated with the user succeeded during the scheduled time period. The [sysevent] table contains a record with these settings:
  - Event Name [name] field set to login.
  - Parm1 [parm1] field set to the user's name, corresponding to the User ID [user_name] field in Users [sys_user] table.

Note: The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).
Test remediation efforts for MID Server user connectivity issues
After attempting to resolve a user connectivity issue that appears in the MID Server Issue [ecc_agent_issue] table, you can test your remediation efforts without having to wait until the next scheduled reporting period by shortening the sampling interval.

Role required: admin

Reconfigure the sampling interval using this procedure and then examine the results in the MID Server Issue [ecc_agent_issue] table. You can set any time span for the sample, but you should define a window of not less than 5 minutes, since this is the default interval of the MID Server heartbeat that reports its status. The recommended method for configuring a shorter sampling interval is to copy and modify the code from the MIDUserConnectivity scheduled job, and then run it manually in the background script utility.

**Caution:** Avoid editing the script in the MIDUserConnectivity schedule record. If you make any change to this record, it will not be updated when you upgrade the instance.

1. Navigate to System Definition Scheduled Jobs.
2. Open the MIDUserConnectivity scheduled job.
3. Copy this line from the Run this script field:
   
   ```
   MIDUserConnectivity(0).checkConnectivity(4 * (60 * 60 * 1000));
   ```

   This code sets the 4 hour sampling interval in milliseconds and turns debugging off with the MIDUserConnectivity(0) value.
4. Navigate to System Definition Scripts - Background.
5. Paste the code from the scheduled job into the Run script field.
6. Set the sampling interval to 5 minutes by changing the time calculation to (5 * 60 *1000). The modified command looks like this: MIDUserConnectivity(0).checkConnectivity (5 * 60 *1000);
7. Click Run script.
8. Open the record of the MID Server that had the issue and select the MID Server Issues related list. The issue is updated as follows:
   - If the issue persists, the Count column is incremented, and the Last detected column shows the current date and time.
   - If the issue no longer exists, the system changes the State to Resolved.
9. Optionally, you can enable debugging by selecting a level, and then run the script again to see the breakdown for each condition evaluated.

Use these settings to select a debugging level:
- For a summary view, enter MIDUserConnectivity(1).
- For a detailed view, enter MIDUserConnectivity(2).

For details about the type of debugging information provided, see *Interpreting MID Server user debugging output* on page 1733.

*Interpreting MID Server user debugging output*

Debugging output from the system log is available in either a summary or detailed view for MID Server user issues, but must be enabled manually.

To enable debugging and display all connectivity issues in either of the available formats, you must run a method manually on your instance. For instructions on enabling debugging, see *Test remediation efforts for MID Server user connectivity issues* on page 1733. For information about each error condition and how records are created in the MID Server Issue [ecc_agent_issue] table, see *MID Server user connectivity issues* on page 1726.
Available formats

You can configure the instance to generate a simple summary of the issue or a detailed output that identifies users and MID Servers. Summaries provide a quick look at the issue conditions, by count, while the detailed view allows you to examine roles, MID Server associations, and login activity by named users.

In this summary example of an authorization issue, the instance evaluates each condition and indicates how many users met that condition. You can see that a MID Server is down and that one of two users configured for a MID Server failed authorization. Because this is a summary, neither the MID Server nor the users are named.

Figure 332: Sample summary debug output

Authentication failure

When a MID Server user cannot authenticate on the instance, the system displays these error messages in the detailed output:

- Login authentication failure for User <user name> associated with 1 down MID Server. Check password on MID server.
- Login authentication failure for User <user name> associated with <n> down MID Servers. Check password on MID servers.
- Login authentication failure for User <user name> with mid_server role not associated with a MID Server.

In this example, three users with the mid_server role, midserver2, local-midserver, and ardis.maison, failed to authenticate. Two of these users were configured for MID Servers that were Down, and the other user was not configured for any MID Servers. Each of these users has an authentication failure and is named in the appropriate error message.
London  ServiceNow  Now Platform Capabilities

Figure 333: Detailed debugging log for authentication failure

1735
MID Server ID map

The debugging output lists all MID Servers that are marked as Down and maps them to their user accounts by the MID Server sys_id. This map includes all user accounts that have the mid_server role, whether or not they are associated with a MID Server. If there are no Down MID Servers, the map is not displayed in the debugging output.

The map is presented in three sections:

- User accounts not associated with any MID Servers.
- User accounts associated with Down MID Servers, identified by their sys_id.
- The sys_id of each Down MID Server, identified by name.

Figure 334: MID Server ID map

Authorization failure

If a user is missing any of the required roles, the instance generates these authorization failure messages:

- Login authorization failure for User <user name> associated with 1 down MID Server. Re-assign mid_server role to grant all required roles.
- Login authorization failure for User <user name> associated with <n> down MID Servers. Re-assign mid_server role to grant all required roles.
- Login authorization failure for User <user name> with mid_server role not associated with a MID Server.

In this example, three users with the mid_server role, midserver2, local-midserver, and ardis.maison have failed authorization. One user is not associated with any MID Server, but the other two users are. The system has logged an authorization failure, indicating that the user is missing at least one critical role. To see what roles are missing, look at the comma separated list in the Parm2 field in the login.authorization.failed event record. This record is the most recent login attempt in the Event [sysevent] table for the user account within the reporting period.
Network issues

Network issues may exist for these users who are associated with MID Servers, but who have not attempted to log in during the reporting period:

- User <user name> is associated with 1 down MID Server. No login attempts within reporting period.
- User <user name> is associated with <n> down MID Servers. No login attempts within reporting period.

Network issues may also exist for these users who are NOT associated with MID Servers, and who have not attempted to log in during the reporting period: User <user name> with mid_server role is not associated with a MID Server. No login attempts within reporting period.

In this example, no login attempts have been detected for midserver2, local-midserver, and ardis.maison, all of whom have the mid_server role. Two of those users are associated with MID Servers that are marked Down. The other user is not associated with any MID Server. None of these users has attempted to log in to the system within the configured reporting interval. The system assumes that these users would make an attempt to log in unless network issues prevented them from doing so.

**Note:** By default, the sampling period is 4 hours. However, during debugging or remediation, the sampling period can be reset to a value that matches the MID Server heartbeat interval of 5 minutes, or greater.

[1]: string = User local-midserver associated with 2 down MID Servers. No login attempts within reporting period.
[2]: string = User ardis.maison with mid_server role not associated with a MID Server. No login attempts within reporting period.

**Script**: MIDUserConnectivity: processing completed
Configuration issues

Any of the following messages can indicate a user configuration issue:

- Login authentication failure for User <user name> with mid_server role not associated with a MID Server.
- Login authorization failure for User <user name> with mid_server role not associated with a MID Server.
- User <user name> with mid_server role successfully connected but not associated with a MID Server. The mid-server role should be reserved for MID Server use only.
- User <user name> with mid_server role is not associated with a MID Server. No login attempts within reporting period.

In this example, a user with the mid_server role has logged in successfully within the configured sampling interval. However, this user is not configured for a MID Server and might have the role in error.

```log
*** Script: Log Object: MIDUserConnectivity: activeUserInWithMIDServerRole
  Array of 3 elements
  [0]: string = admin.example
  [1]: string = midserver
  [2]: string = localhost

*** Script: Log Object: configuredMIDServerUserIDs
  Array of 2 elements
  [0]: string = midserver
  [1]: string = local-midserver

*** Script: Log Object: MIDUserConnectivity: activeUserInWithMIDServerRoleWithNotAssociatedWithConfiguredMIDServer
  Array of 3 elements
  [0]: string = admin.example

*** Script: Log Object: MIDUserConnectivity: userNotAssociatedWithMIDServer
  User with mid_server role is not associated with a MID Server. No login attempts within reporting period.

In this example, a user with the mid_server role has logged in successfully within the configured sampling interval. However, this user is not configured for a MID Server and might have the role in error.

Introduction to Orchestration

Orchestration automates simple or complex multi-system tasks on remote services, servers, applications, and hardware.

An Orchestration process can cross all management disciplines and interact with hosted services and all types of infrastructure elements. These capabilities provide a powerful system for managing IT and Business processes quickly and reliably.

Orchestrated solutions aide collaboration among teams by providing reusable data and versioning for both the workflows and the activities within them. Subject matter experts can create activities that are reusable to numerous workflow developers. When an activity requires a change, developers can see the downstream implication of the change immediately by knowing which workflows use the activity. Well-designed orchestrations never fail and apply human tasks to address errors as they arise.

Orchestration tools

Orchestration can make calls outside of a ServiceNow instance, directly to web services or through a MID Server to systems within corporate firewall. Orchestration also enables the creation reusable activities.
that wrapper Java Script functions for manipulating things inside the platform. Orchestration extends the Workflow editor on page 3202 by providing these features:

- **Activity packs** containing ready-to-use activities.
- **Activity Designer**, which enables developers to create custom activities without an over dependence to create scripts to orchestrate to third-party systems.
- Ability to create activity packs using **Scoped Applications**.
- A **Databus** for following the flow of data across orchestration activities.

Orchestration Core provides entitlements to use specific applications:

**Client Software Distribution**

An application that automates software delivery from the Service Catalog. Provides OOB support for SCCM. Partner solutions support Macs using JAMF. Other third-party solutions provide support through the extension framework.

**Password Reset**

An application for users to reset their password in Active Directory. It can expand to communicate with other third-party systems.

**Orchestration ROI**

Enables users to evaluate estimated costs and actual costs for tasks, automate these tasks, and track the ROI of these tasks.

**Systems that Orchestration can automate**

Orchestration can automate tasks such as employee onboarding, user access rights, server management, managed file transfers, and Security Operations Orchestration activities. For example, you might use the Active Directory and Exchange activities provided in the base Orchestration system to set up network accounts and mailboxes for new employees.

If Orchestration does not provide the activities you need for an integration, create the necessary activities using the templates in the **Orchestration Activity Designer**. The external systems that Orchestration can automate for:

- Any system exposing web services (**SOAP, REST**)
- Any system accessible from the command line (such as a UNIX system accessible through **SSH**, a Windows system enabled for **PowerShell** remoting or **WMI**)
- Numerous proprietary services: Windows **Active Directory**, Microsoft **Exchange** mail servers, **InfoBlox**, **F5 Networks**, and **Workday**.

**Note:** For a full list of Activity Pack service offerings, see **Orchestration Core Activity Packs**.

- Any filesystem accessible by **SFTP**
- Any database with a compliant **JDBC** driver
- Additional Activity Packs are also available with other ServiceNow products, such as Security Operations
Orchestration workflow

When an Orchestration activity starts within a workflow, Orchestration launches a probe and writes a probe record to the ECC Queue. The workflow pauses as the MID Server picks up the request and executes the
probe. When the probe reports back, the workflow resumes as the results are analyzed. The workflow can exit or continue at this point.

Figure 339: Orchestration workflow

Orchestration video tutorial

Watch the introductory video for Orchestration.

Domain separation in Orchestration

This is an overview of domain separation and Orchestration. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

Support: Data only

Domain separation in this application is supported at the Data only level, meaning it supports the data security model of separating visibility of data from one domain to another. To learn more, see Application support for domain separation.

Activate Orchestration

The Orchestration (com.snc.runbook_automation) plugin is available as a separate subscription from the rest of the ServiceNow platform.

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization’s production and sub-production instances, generally within a few days.

If you do not have an account manager, decide to delay activation after purchase, or want to evaluate the product on a sub-production instance without charge, follow these steps.

Role required: none

1. In the HI Service Portal, click Service Requests Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
</tbody>
</table>
Specify the date and time you would like this plugin to be enabled

| Reason/Comments | Provide any information that would be helpful for the ServiceNow personnel activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows. |

3. Click Submit.

List of Orchestration plugins

This table lists all plugins available for Orchestration and their dependencies.

These Orchestration plugins are available for purchase or can be requested as part of your Orchestration subscription. Contact your account representative for details.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>

<td>Orchestration</td>
</tr>
</tbody>
</table>

**Orchestration Runtime plugin**

The Orchestration – Runtime plugin enables other applications on the ServiceNow® platform to automate tasks, without requiring an Orchestration subscription.

The Orchestration – Runtime plugin can be activated as part of another plugin or application. It is used by strategic technology partners and ServiceNow applications to distribute activity packs to customers who may not own Orchestration. For example, the Security Incident Response Management (SIRM) application provides orchestration content, which includes activities that are available from the Packs tab in the Workflow Editor. Customers who purchase SIRM can consume and modify the activities that SIRM ships without having to purchase an Orchestration license.
Included with the plugin

The Orchestration – Runtime plugin provides access to the Packs and Data tabs in the Workflow Editor. This plugin gives users access to custom activities for their applications and enables them to reuse data from the Databus. This plugin does not provide access to custom Orchestration activity packs or to the activity designer. The Custom tab in the Workflow Editor is not available without an Orchestration subscription.

Figure 340: Orchestration plugin relationships

Dependencies

The Orchestration – Runtime plugin activates these application plugins:

• Security Incident Response Orchestration
• Service Release Automation
**Access to activities**

Custom activities shipped with ServiceNow® applications are available in the Packs tab of the Workflow Editor for use in workflows. To edit these activities, navigate to Orchestration Activity Designer Activities and select the activity you want to modify. For information about the provider templates used to create these activities, see *Orchestration custom activity templates* on page 2027.

**List of Orchestration activities**

Use Orchestration activities in a Workflow to integrate with third-party systems.

Several Orchestration activities have been rewritten as *scoped* activities using the *activity designer* and grouped into *activity packs*. Other non-scoped activities are deprecated and may or may not appear in the Workflow Editor. However, all deprecated activities still function in existing workflows that use them.

**Global activities**

These activities run in the global scope only. Any activities you create in the global scope are organized in the Global category in the Packs and Custom tabs in the Workflow Editor.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Test Server Alive</td>
<td>Runs a command (including shell scripts) on a Linux or UNIX computer via SSH to validate whether the target system is alive.</td>
</tr>
</tbody>
</table>

**Active Directory (AD) activities**

All AD Orchestration activities were rewritten in the Geneva release as scoped activities and are available in the Active Directory activity pack. All previous version AD activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.

<table>

</table>

Available activity packs

Activity packs are available with your subscription to Orchestration.

Role required: admin

The following activity packs are available and active with your Orchestration subscription:
- **Orchestration - Active Directory** (com.snc.orchestration.ad)
- **Orchestration - Azure Active Directory** (com.snc.orchestration.azure.ad)
- **Orchestration - Exchange** (com.snc.orchestration.exchange)
- **Orchestration - SFTP** (com.snc.orchestration.sftp)
- **Orchestration - Infoblox DDI Activity Pack** (com.snc.orchestration.infoblox)
- **F5 Network Management activity pack** on page 1886 (com.snc.orchestration.f5)
- **Orchestration - SSH** (com.snc.orchestration.ssh)
- **Orchestration - PowerShell** (com.snc.orchestration.powershell)
- **Orchestration - System Center Configuration Manager** (com.snc.orchestration.sccm_mgnt)

1. In the HI Service Portal, click **Service Requests Activate Plugin**.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time. <strong>Note:</strong> Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Provide any information that would be helpful for the ServiceNow personnel activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows.</td>
</tr>
</tbody>
</table>

3. Click Submit.

**Deprecated Orchestration activities**

These Orchestration activities have been deprecated.

**Run Probe**

The Run Probe activity launches a MID Server probe on behalf of a document. All Orchestration activities that launch a probe on a target machine are based on the Run Probe activity. Your ServiceNow instance must have access to a MID Server configured to use SSH to run this activity.

**Attention:** This activity is deprecated and is unavailable for new workflows. To replace the functionality of this probe, use the **Probe activity template** to create a custom activity. Workflows from a previous release that use the Run Probe activity can continue to do so.
Table 636: Run Probe input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Probe</td>
<td>Select a MID Server probe from the list. This is the name of the probe as it appears in the discovery_probes table.</td>
</tr>
<tr>
<td>Source for probe</td>
<td>Enter the IP address of the host system against which the probe runs (the probe’s target).</td>
</tr>
<tr>
<td>Sensor script</td>
<td>The script to run using the results of the probe. The output from the probe is contained in a variable called output. Any error from the probe is contained in a variable called error.</td>
</tr>
</tbody>
</table>

**SOAP Request**

The SOAP Request activity executes a SOAP request on a target server.

**Attention:** This activity is deprecated and is replaced by the *SOAP Message workflow activity* on page 1758 activity. Workflows from a previous release that use the SOAP Request activity can continue to do so. However, this activity is not available for new workflows.

Table 637: SOAP Request input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAP URL</td>
<td>The SOAP endpoint.</td>
</tr>
<tr>
<td>Username</td>
<td>User name for basic authentication credentials.</td>
</tr>
<tr>
<td>Password</td>
<td>Password for basic authentication credentials.</td>
</tr>
<tr>
<td>Envelope Script</td>
<td>Script for setting up parameters for the web service.</td>
</tr>
<tr>
<td>Sensor Script</td>
<td>The script to execute after the request has been made and a response has been received.</td>
</tr>
</tbody>
</table>

**Reactivate a deprecated activity**

Orchestration activities that were converted to activity packs are deprecated for upgraded and new instances but can be reactivated for use in new workflows.

Role required: workflow_admin, admin

**Note:** Reactivation of deprecated activities for use in new workflows is discouraged. Legacy activities cannot use the unique features of the scoped applications, such as reuse of data from the databus and input variable testing.

1. Navigate to Workflow Administration Activity Definitions.
2. In the list of activities, clear the condition Category !=deprecated from the filter.
3. Open the definition record for the activity you want to reactivate.
4. Select the What to Display tab.
5. In the Category field, replace the value deprecated with another category.
   This can be an arbitrary string.
6. Click Update.
   The system creates a new category using the value provided and reactivates the activity, which becomes available in the Core tab of the Workflow Editor.

SOAP Message workflow activity

The SOAP Message activity uses SOAP messages defined in the System Web Services plugin and can call the messages using a MID Server.

Your instance must have access to a MID Server configured to use SOAP.

Input variables

Table 638: SOAP Message activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAP Message</td>
<td>soap_message</td>
<td>The SOAP Message defined under the System Web Services plugin's Outbound SOAP Message [sys_soap_message] table. ( System Web Services Outbound SOAP Message )</td>
</tr>
<tr>
<td>SOAP Message Function</td>
<td>soap_message_function</td>
<td>The function to call that is defined in the SOAP Message. Functions are listed in the SOAP Message Functions related list in each SOAP Message record.</td>
</tr>
<tr>
<td>SOAP Endpoint</td>
<td>soap_endpoint</td>
<td>Endpoint to use instead of the SOAP endpoint value in the SOAP Message Function record. Leave this field blank to use the defined endpoint in the SOAP Message Function record.</td>
</tr>
<tr>
<td>Field</td>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Variables           | variables         | Variables to substitute into the SOAP Envelope defined in the SOAP Message Function record. Use this format for the string:  

```
name1=value1,
name2=value2, ...
```

If either the name or value contains a comma or equal sign, escape these characters with a backslash.  

<table>
<thead>
<tr>
<th>Use MID Server</th>
<th>use_midserver</th>
<th>Check box for using a MID Server to send the SOAP message. A MID Server might be necessary to reach an endpoint within a firewall or a sub-network that is not visible from the instance. If this check box is selected (true), but no MID Server is defined in the MID Server field, workflow automatically attempts to find a MID Server.</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Server</td>
<td>midserver</td>
<td>Name of the MID Server to use. This field appears when you select the Use MID Server check box. The workflow ignores this parameter if the use_midserver parameter is disabled.</td>
</tr>
<tr>
<td>Sensor Script</td>
<td>sensor_script</td>
<td>The script to execute after the request has been made and a response has been received. You can access the full XML response body from the activity.output object.</td>
</tr>
</tbody>
</table>

**Note:** You can only select a specific MID Server in the legacy SOAP message activity and REST messages. These legacy activities do not use the MID Server selection criteria available starting with the Istanbul release.
Probes used by Orchestration

Certain probes, controlled by MID Servers, perform Orchestration tasks on remote computers, such as restarting a server or creating virtual machines from templates.

How Orchestration probes work

When a Workflow executes an Orchestration activity, that activity launches a probe, which writes an output record to the ECC Queue. The MID Server selected for the activity checks the ECC Queue for assignments, and then executes the appropriate probe to do the work on the target machine. The information about the activity (machine restarted, files copied, etc.) that is returned from the target machine by the probe is written to the ECC Queue as an input record. This information is then sent from the ECC Queue to a sensor that is built into the Workflow activity. The Workflow is updated, and the next activity is executed.

Note: The probe parameters are set by the activities that launch the probe.

Figure 341: How Orchestration uses probes

Probe List

The base system includes the following Orchestration probes (Orchestration Definition Probes).

<td>A generic VMware probe that executes the MID Server script include in the ECC queue name that is set by a VMware Orchestration activity. This probe can run any MID Server script include.</td>
</tr>
<tr>
<td>Probe Name</td>
<td>ECC Queue Topic</td>
<td>ECC Queue Name</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>----------------</td>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Windows - PowerShell | PowerShell     | Windows - PowerShell | A probe that runs a Windows PowerShell script on the MID Server. The PowerShell script is provided as the value of a parameter with name ending in .ps1. Two variables are available to the script:  
• $computer: The computer pointed to as the source for this probe  
• $cred: A PowerShell credential, using a user name and password from the Credentials table, that logs into $computer successfully. |

**PowerShell activities**

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications.

PowerShell must be installed on any MID Server that uses these activities. MID Servers using PowerShell must be installed on a supported Windows operating system. ServiceNow supports PowerShell 2.0 and above. PowerShell 3.0 does not support Windows 2003 Server.

The ServiceNow Orchestration plugin adds these basic PowerShell activities to workflows. For instructions on using activities from the PowerShell activity pack, see PowerShell activity pack on page 1922

*Legacy Run PowerShell activity*

The Run PowerShell activity executes Windows PowerShell commands on a MID Server.

**Attention:** This activity is deprecated and is unavailable for new workflows. To replace the functionality of this activity, use the Powershell activity template to create a custom, scoped activity. Workflows from a previous release that use the Run PowerShell activity can continue to do so.

**Result Values**

The workflow designer can assign a result value using activity.result from within a script field of the activity. By default, the success or failure of the PowerShell commands used determines the result value of the Run PowerShell activity. Possible result values are:

• Success
• Failure
**Scratchpad Entries**

Information written to stdout by the executing script is captured and returned to the activity in the `activity.output` variable. This information can be parsed, processed, or saved (to a scratchpad variable, for example) for future processing in the activity’s sensor script.

An example would be to run the `get-date` command to get the MID Server’s current time. This sensor script saves the full output received, but we can process it to return and save only the time.

![Figure 342: PowerShell activity](image)

**Note:** This is an over-simplified example. In most cases, the script operates against some remote Windows computer. However, the principal is the same – whatever is written to stdout is returned in `activity.output` and available to process.

**Input Variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>IP address of the target Windows machine. This value is mapped to the <code>$computer</code> variable for use in commands (see the example in the Command field). A PowerShell credential variable called <code>$cred</code> that is based on information in the ServiceNow Credentials table will authenticate on the computer pointed to by Hostname.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Command               | Enter the PowerShell command to run. For example, to execute a simple WMI query against a remote machine pointed to by the hostname variable, the command is:  
  ```powershell
  get-wmiobject <class> -computer $computer -credential $cred
  ```  
  If no credentials authenticate on the computer, the command runs in the context of the MID Server user.  
  You cannot run both a command and a script file. Specifying a command hides the Script file variable. |
| Sensor script         | The script to run using the results of the probe. The output from the probe is contained in a variable called output. Any error from the probe is contained in a variable called error. |
| Script file           | The MID Server script file to run. You cannot run both a script file and a command. Selecting a script file hides the Command variable.          |
| PowerShell script variables | Additional parameters, in JSON format, used by the specified script file.                                                                 |

**States**

The activity state tells the workflow engine what to do with the activity.

**Table 641: States**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the onExecute function of the activity.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was cancelled.</td>
</tr>
</tbody>
</table>

Add workflow variables for the command line using the normal workflow variable syntax. In the example above, if the `<class>` was in a workflow input variable called myclass, the command would look like:

```powershell
get-wmiobject ${workflow.inputs.myclass} -computer $computer -credential $cred
```

Similarly, if the variable is a scratchpad variable named `myclass`, the command would look like:

```powershell
get-wmiobject $ {workflow.inputs.myclass } -computer $computer -credential $cred
```
get -wmiobject ${workflow.scratchpad.myclass} -computer $computer -credential $cred

**HResult codes**

When a PowerShell script encounters an error, the Windows machine may return an HResult code as part of the error message.

PowerShell activities can read and interpret this code. Not all PowerShell errors include an HResult code. In the event of a failed PowerShell script, you can use the HResult code to move the workflow through a specific condition.

For example, when resetting an Active Directory password to a password that does not meet policy requirements, such as minimum length or complexity, the PowerShell script returns the HResult code -2146022651. To use this code, create an activity condition with the Condition value of activity.hresult = -2146022651. If the PowerShell script returns this code when the activity runs, the workflow transitions through this new condition.

**SSH activities**

SSH activities allow workflows to perform operations on Linux and Unix computers.

Your ServiceNow instance must have access to a MID Server configured to use SSH to run these Orchestration activities.

**Run Command activity**

The Run Command activity runs a command (including shell scripts) on a Linux or UNIX computer.

---

**Attention:** The Run Command activity is deprecated in this release. If you have a workflow created in a previous version that uses this activity, your workflow will continue to work normally after upgrading to Helsinki. However, to use this functionality in a new workflow, you must create a custom activity using the **SSH activity template** in the ServiceNow® activity designer.

**Input variables**

**Table 642: Run command input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Long running</td>
<td>Select this check box to disable the SSH connection timeout if you think the command will take longer to run than the default 60 seconds. Orchestration periodically checks the running process to determine its status until it is finished.</td>
</tr>
<tr>
<td>Hostname</td>
<td>Hostname or IP address of destination server for SSH activity.</td>
</tr>
<tr>
<td>Directory</td>
<td>Name of the working directory.</td>
</tr>
<tr>
<td>Command</td>
<td>The command to run from this activity.</td>
</tr>
<tr>
<td>Sudo</td>
<td>Select this check box to use <code>sudo</code> to run the command on the host machine.</td>
</tr>
</tbody>
</table>
Run SCP activity
The Run SCP activity uses Secure Copy Protocol (SCP) to copy a file from one computer to another, including the directory in which the file resides.

**Note:** This activity is deprecated in the Geneva release and is not available for use in new workflows. If you have a workflow created in a previous version that uses this activity, your workflow will continue to work normally after upgrading. The custom Secure Copy activity on page 1972 replaces the Run SCP activity in the Geneva release.

Input variables

<table>

</table>

Orchestration applications
Orchestration provides several applications with your subscription.

Orchestration ROI
The Orchestration ROI application allows you to estimate and compute cost savings for tasks in your system that could be automated with Orchestration.

After you automate the tasks, you can track cost savings by associating Orchestration workflows with corresponding task areas. Configuration in the application allows you to select the hourly rate for performing the task manually, the rules the system uses to select tasks for evaluation, and the time period of the evaluation. Orchestration ROI estimates your savings by multiplying the cost of performing repetitive tasks manually by the estimated number of times the system performs those tasks automatically during a
specific date/time range. The system also calculates the actual savings of your automations. Orchestration ROI is included with the base Orchestration subscription.

Orchestration ROI reports offer a number of views of the comparative data and allow you to access the associated records directly from the reports. The standard reports included with the Orchestration - ROI plugin provide summaries, estimated costs, and calculated costs for automated processes. The ROI premium dashboard uses Performance Analytics to provide detailed reports on calculated savings over time. Performance Analytics requires a different plugin and subscription.

**Note:** When Orchestration ROI is activated as a dependent plugin of Orchestration, demo data is not installed. If you want to use demo data as a template for your own ROI evaluation, submit a request to ServiceNow® technical support for an Orchestration ROI plugin upgrade with demo data selected.

To set up Orchestration ROI, complete the configuration tasks in the order shown here.

### Create Orchestration ROI labor rate cards

Before calculating your Orchestration ROI, you must create labor rate cards for the manual work that would be required to complete the tasks correlated to the ROI calculations.

Role required: orchestration_manager

The hourly rates defined in the rate cards are used to determine the savings from your orchestrated tasks.

1. Navigate to Orchestration ROI Labor Rate Cards.
2. Complete the fields in the form using the descriptions in Manage a labor rate card.
3. Click Submit.
4. Create additional rate cards as needed.

### Create an Orchestration ROI automation entry record

The ROI automation entry record couples the cost of performing a task with the specific workflow that automates the task, for the purpose of calculating the resulting savings.

Role required: orchestration_manager

Before starting this procedure, verify that the appropriate labor rate cards were created.

Use this record to apply a manual hourly rate to a task that is performed automatically by your instance. To determine the savings realized from orchestrating a task, the system can evaluate whether those savings were estimated or calculated.

- **Estimated savings:** Uses the labor rate, the time estimates for completion of the task, and the number of automations that have been run to determine savings.
- **Calculated savings:** Uses the labor rate, the time calculated for completion of the task, based on the configured evaluation period, and the number of automations that have been run to determine savings.

1. Navigate to Orchestration ROI Automation Entry Form.
2. Fill in the fields on the form, as appropriate.
Table 644: Automation Entry Form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>Category of the selected workflow automation. The following categories are provided in the base Orchestration - ROI system:</td>
</tr>
<tr>
<td></td>
<td>• Access &amp; Identity Management</td>
</tr>
<tr>
<td></td>
<td>• Datacenter Automation</td>
</tr>
<tr>
<td></td>
<td>• IT Service Management</td>
</tr>
<tr>
<td></td>
<td>• Other</td>
</tr>
</tbody>
</table>

**Note:** To create a category, open the dictionary record for the Automation Entry Form [automation_entry_form] table and add an option to the choice list.

<table>
<thead>
<tr>
<th>Item</th>
<th>Unique name for the specific task within the category. This value represents the work to which the labor rate card applies, such as Password Reset.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Resource</td>
<td>Labor rate card to apply to this automation entry. You must have IT Cost Management active on the instance for this field to appear.</td>
</tr>
<tr>
<td>Associated Workflows</td>
<td>Workflow automations created to automate this manual task. The system uses this field to identify the number of automations that have been run.</td>
</tr>
<tr>
<td>Estimated Duration (min) per Task</td>
<td>Estimated time to perform this task manually.</td>
</tr>
<tr>
<td>Estimated Volume per Month</td>
<td>Estimated number of times needed to perform this task manually per month.</td>
</tr>
</tbody>
</table>

**Read-only fields**

<table>
<thead>
<tr>
<th>Start time</th>
<th>Start time for the evaluation period. Configure this value in the Time Range for Calculated Averages module.</th>
</tr>
</thead>
<tbody>
<tr>
<td>End time</td>
<td>End time of the evaluation period. Configure this value in the Time Range for Calculated Averages module.</td>
</tr>
<tr>
<td>Calculated average duration per task (min)</td>
<td>Actual time required to perform this task manually.</td>
</tr>
<tr>
<td>Calculated average volume per month</td>
<td>Actual average number of times this task is performed manually per month.</td>
</tr>
</tbody>
</table>
3. Select one of these submission options:
   • Submit: Saves the record to the table without running any calculations.
   • Submit and process now: Saves the record and calculates the savings based on the hourly rate and the number of workflow contexts for this automation entry.

Create an Orchestration ROI correlated task rule

The correlated task rule applies configurable conditions to fields in a selected table that tell the instance which manual tasks correspond to an automation entry record.

Role required: orchestration_manager

Before starting this procedure, make sure you have created labor rate cards and the appropriate automation entry records for the automated tasks you want to evaluate.

Create conditions that the system can use to correlate manual tasks to the automation entry. For example, a rule on the Incident [incident] table uses these conditions to correlate the employee on-boarding task to values configured in the Employee OnBoarding automation entry record:

   • [Subcategory] [is] [Employee OnBoarding]
   • [Sort description] [contains] [new employee]

When a new employee opens an incident to request services or assets which are typically handled manually, Orchestration applies the usual labor rate for the manual work to the potential automated solution, and then computes the actual savings.

1. Navigate to Orchestration ROI Task Correlation Correlated Tasks Rules .
2. Click New.
3. Fill in the fields on the form, as appropriate.

Table 645: Automation entry form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automation entry</td>
<td>Automation entry record that correlates to the manual task defined by these conditions. The entry record names the workflow used to automate the task and defines the labor rate used to calculate the cost of the task.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to filter, using these conditions. The rule selects records from this table that match the conditions. Information from these records is used to calculate the actual time to perform a manual task and the actual volume for that manual task.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition builder to use to filter records for this table. Use these conditions to identify all manual tasks correlated to this automation entry.</td>
</tr>
<tr>
<td>Read-only fields</td>
<td></td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Processed on</td>
<td>Date and time that the system performs the matching records lookup. The system automatically searches for new manual tasks matching these conditions.</td>
</tr>
</tbody>
</table>

4. Select one of these submission options:
   - Submit: Saves the record to the table without running any calculations.
   - Submit and process now: Saves the record, looks up all matching tasks, and saves matching record information to the Correlated Tasks [manual_mapping_records] table.

5. To view a rule, select the link in the Table column of the Correlated Tasks Rules related list for the automation entry you want to see.

6. To view the list of tasks that match all correlated rules in the system, navigate to Orchestration ROI Task Correlation Correlated Tasks.

7. To view the list of tasks that match this rule in the system, click Correlated Tasks under Related Links in this form

**Configure the time range for Orchestration ROI calculations**

Select a date range to calculate the average number of tasks and the duration per month for the correlated tasks.

*Role required: orchestration_manager*

By default, the system creates a range ending at the current date and time and extending back over the previous month. You can change this range at any time and recalculate the ROI instantly.

1. Navigate to Orchestration ROI Task Correlation Time Range for Calculated Averages.
2. Enter a new start or end date and time or click the icon to select a date using the calendar.
3. Click Calculate to recalculate the ROI based on the new time range and to save your settings.

**Installed with Orchestration ROI**

Several types of components are installed with the Orchestration - ROI plugin (com.snc.runbook_automation.roi).

*Tables installed with Orchestration ROI*

Tables are added with activation of Orchestration ROI.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expense and Savings [run_rate_predicted_savings]</td>
<td>Contains the data for the reports in Orchestration ROI Reports Predicted Savings.</td>
</tr>
</tbody>
</table>
| Savings Report [savings_report] | Contains the number of automations that have been run before the date specified in the Processed On column, based on:  
   - Each automation entry’s associated workflows  
   - Estimated savings based on the estimated duration per task.  
   - Calculated savings based on calculated duration.        |
<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Detailed Savings Report</td>
<td>Contains a detailed list for the Savings Report [savings_report] table. This list contains each automation's run date and savings for that automation.</td>
</tr>
<tr>
<td>Automation Entries</td>
<td>Contains automation entries that couple labor resources to specific manual tasks. You can specify the estimated duration to perform a task manually and the estimated number of times that a task is performed per month. If this automation entry already has workflow automations implemented, you can specify the associated workflows. The system calculates the savings, based on the labor rate card and the number of workflow automations that have been performed.</td>
</tr>
<tr>
<td>Roadmap Planning</td>
<td>Contains roadmap planning for each automation entry to be implemented. You can provide estimated hours to implement a workflow automation, the automation percentage anticipated by the end of the year, and the starting month to implement the workflow.</td>
</tr>
<tr>
<td>Correlated Tasks</td>
<td>Contains all matching manual tasks for each automation entry. Each task's information is stored in this table for the system to use to calculate the actual duration and volume for each manual task.</td>
</tr>
<tr>
<td>Correlated Tasks Rules</td>
<td>Contains the correlated task rules the system uses to look up manual tasks corresponding to each automation entry.</td>
</tr>
</tbody>
</table>

**Plugins installed with Orchestration ROI**

Plugins are installed with activation of Orchestration ROI, if they are not already active.

<td>When a new automation entry is provided, this business rule inserts a new record into the Savings Report [savings_report] table with the automations_run field set to 0.</td>
</tr>
</tbody>
</table>

Orchestration ROI reports
Orchestration ROI provides a collection of standard and premium reports to help you calculate savings from automating services in your organization.

The ROI standard reports are included with Orchestration ROI. The premium reports provide enhanced views generated with Performance Analytics and require the Orchestration - ROI Premium plugin.

Orchestration ROI standard reports
The dashboard of standard ROI reports provides summaries, estimated costs, and calculated costs for automated processes.

To access the ROI standard dashboard, navigate to Orchestration ROI Reports Dashboard.

Summary tab
The Summary tab contains four reports on automation categories.

**Schedule Orchestration ROI calculations for standard reports**

The scheduled job that calculates Orchestration ROI standard reports is active by default and controlled by system properties.

**Role required:** orchestration_manager, admin

The system provides a default scheduled job called Processing ROI Schedule that allows you to configure when Orchestration calculates the ROI for standard reports. This schedule allows scripting for advanced conditions. To modify the schedule or write a script to run, open Processing ROI Schedule from System Scheduler Scheduled Jobs Scheduled Jobs and click Configure Job Definition. To execute the schedule directly from the job definition, click Execute Now.

To control the running of the schedule job with the Orchestration properties:

1. Navigate to Orchestration ROI Properties.
2. Configure the following properties:
Table 650: ROI schedule properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>roi.processing.active</td>
<td>Activate scheduled job for ROI processing. This property activates the Processing ROI Schedule scheduled job.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default: true</td>
</tr>
<tr>
<td>roi.processing.interval</td>
<td>Scheduled ROI processing interval (hours). This property sets the repeat interval for the scheduled job that processes savings reports and correlated tasks.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default: 24</td>
</tr>
</tbody>
</table>

3. Click Save to save your changes.

Orchestration ROI premium reports
The premium dashboard provides detailed reports on calculated savings over time.

The ROI premium reports require the Orchestration - ROI Premium plugin and are built using Performance Analytics concepts. The Orchestration - ROI Premium plugin is dependent on the Performance Analytics - Premium plugin which requires a separate subscription.

**Important**: You must activate the Performance Analytics scheduled collection job before Orchestration ROI premium can display data.

To access the ROI premium dashboard, navigate to Orchestration ROI Reports Premium Dashboard.

ROI By Category tab
The ROI By Category tab contains three reports showing the calculated savings over time by category.

Activate Orchestration ROI premium reports

To view the Orchestration ROI premium reports, you must activate the Orchestration - ROI Premium (com.snc.runbook_automation.roi_premium) plugin.
The Orchestration - ROI Premium plugin requires the Performance Analytics - Premium plugin, which must be purchased separately.

Role required: admin

The Orchestration - ROI Premium plugin is included with an Orchestration subscription, but must be activated by request.

1. In the HI Service Portal, click Service Requests Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.

| Reason/Comments | Provide any information that would be helpful for the ServiceNow personnel activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows. |

3. Click Submit.

Schedule Orchestration ROI calculations for premium reports

Orchestration ROI premium reports use a Performance Analytics job that must be activated before premium reports can be generated.

Role required: orchestration_manager, admin

The scheduled job required to calculate premium ROI reports is called [PA ROI] Historic Data Collection and is installed with the Orchestration - ROI Premium [com.snc.runbook_automation.roi_premium] plugin. This job is not active by default.

1. Navigate to Performance Analytics Data Collector Jobs.
2. Search for the [PA ROI] Historic Data Collection job.
3. Select the Active check box.
4. The scheduling options appear for the value selected in the Run field.
   For instructions on creating a schedule, see Create or schedule a data collection job.
5. To execute the schedule directly from the job definition, click Execute Now.
6. Click Update.
Client Software Distribution

The Client Software Distribution (CSD) application allows administrators to distribute software from the service catalog using third-party management systems.

CSD allows an administrator to create all the records necessary to deploy software from service catalog requests, including software models and catalog items. You can use the CSD application to automate the deployment and revocation of software from an SCCM host using the custom SCCM activity pack. You can define lease periods for software distributed from the Service Catalog and allow lease extensions in some cases, pending approvals. Deployment is accomplished using Orchestration activities and workflows.

CSD also integrates with Software Asset Management to manage license counts for deployed software.
Activate client software distribution

Client software distribution requires the Orchestration - Client Software Distribution plugin (com.snc.orchestration.client_sf_distribution), which is available by request with a subscription to Orchestration.
The Orchestration - Client Software Distribution plugin activates the Orchestration - System Center Configuration Manager plugin that contains the custom SCCM activities used to deploy or revoke software using an SCCM server. For additional plugin dependencies, see Plugins installed with client software distribution on page 1789.

**Note:** The Orchestration - Client Software Distribution plugin runs in its own application scope.

1. In the HI Service Portal, click Service Requests Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.

| Reason/Comments | Provide any information that would be helpful for the ServiceNow personnel activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows. |

3. Click Submit.

Installed with client software distribution

Several types of components are installed with client software distribution (CSD).

**Tables installed with client software distribution**

These tables are installed with the Orchestration - Client Software Distribution plugin (com.snc.orchestration.client_sf_distribution).

**Properties installed with client software distribution**
Properties for client software distribution (CSD) manage the installation status of requested software deployments and configure scheduled Discoveries.
To access CSD properties, navigate to Client Software Distribution Properties. The following properties are available:

<table>
<thead>
<tr>
<th>Property</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Status check expiration interval (days)            | sn_client_sf_dist.softwareInstallExpDays | Controls how many days the system waits before ignoring the software installation status. The default time limit for installing software is 30 days before the system stops checking the installation status of a deployment. Installation statuses are:  
  • Not installed: User has not installed requested software prior to the expiration of the configured time limit.  
  • Installed: Software was installed within the configured time limit.  
  • Status check expired: Time limit has expired for the user to install the requested software. The system no longer checks the status of this deployment.  
  • Revoked: Software was revoked by the administrator.  
  • Type: integer  
  • Default value: 30 |
| Reconcile software installation status interval (hours) | sn_client_sf_dist.softwareInstallIntervalHour | Determines when the scheduled job runs that determines the installation status. By default, the system checks the installation status every hour.  
  • Type: integer  
  • Default value: 24 |
### Property | Name | Description
--- | --- | ---
Set scheduled application Discovery interval (days). | sn_client_sf_dist.discoveryExeDay | Sets the repeat interval for the scheduled job that runs application Discovery. By default, Discovery runs at midnight on the day set with this value.  
- Type: integer  
- Default value: 5

Set lease execution schedule job interval (minutes) | sn_client_sf_dist.lease_execution_interval | Interval in which the CSD Lease Schedule scheduled job checks for requested software leases to start, stop, or extend.  
- Type: integer  
- Default value: 1

Set time prior to lease end to notify requester (days) | sn_client_sf_dist.lease_end_notification | Determines how many days prior to the end of a software lease to notify the requester. If lease extensions are allowed, ensure that this period provides enough time for the approval process to complete before the lease expires.  
- Type: integer  
- Default value: 5

---

### Workflows installed with client software distribution
These workflows are installed with the Orchestration - Client Software Distribution plugin

| Workflow | Description |
--- | --- |
Discover SCCM | Retrieves lists of applications, collections, and deployments from SCCM servers using custom CSD orchestration activities. An administrator runs this workflow from a UI action in a SCCM Server Instance record. |
Order Client Software | Runs automatically when a user orders software from the service catalog. |
Deploy SCCM Application | Triggered by the Order Client Software workflow to deploy software through SCCM server. This workflow adds either the user or the device into the SCCM collection. |
<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Revoke Client Software</strong></td>
<td>Begins the software revocation process for software deployed by an external provider. Administrators run this workflow from a UI action on the Requested Software record and the Installed Software Not Entitled record. This workflow triggers the appropriate provider workflow that performs the actual revocation. For example, this workflow triggers the Revoke SCCM Application workflow for applications in SCCM uninstall collections.</td>
</tr>
<tr>
<td><strong>Revoke SCCM Application</strong></td>
<td>Revokes SCCM applications that are members of an uninstall collection. The Revoke Client Software workflow triggers this workflow to revoke software deployed by an SCCM server. This workflow moves either the user or the device from the SCCM collection into the appropriate uninstall collection.</td>
</tr>
</tbody>
</table>

Create licenses and counters for distributed software

Licenses and software counters are associated with the software model and must be created if you want to track the license for software deployed by client software distribution (CSD).

Role required: sam or admin

You can create software licenses and counters in Software Asset Management for software items deployed from the service catalog by CSD. CSD depends on the software counter result to determine if the license is available for the requested software. If the license Valuation is greater than 0, and the license type is Not allocated, CSD assumes that the license is available for the software.

1. Navigate to Software Asset Software Licenses.
2. Add a new software license for the software model you used in CSD.
3. Navigate to Software Asset Reconciliation Software Counters.
4. Create a software counter for the software model you created.
5. Run the counter to retrieve the software license information.

Client software distribution ordering process

Software deployed by Client Software Distribution (CSD) can be ordered from the service catalog by individual users or by approved users on behalf of others.

Client Software Distribution catalog items have different options, depending on how ordering is configured.

Lease start and end dates

All software deployed by CSD requires users to specify the beginning date for the lease. This is enforced by the Orchestration - Asset Lease Management plugin that is activated automatically with CSD. The system prepopulates the Lease start field with the current date and time.

If the catalog item is configured for revocation (uninstall), the form displays the Lease end field, which allows the requester to define an end date and time for the lease. The system validates user input in these fields to ensure that the dates selected define a future window. The Lease end field is not mandatory and can be left blank to order software with no end date.
**Note:** For systems deploying software from Microsoft System Center Configuration Management (SCCM), the Lease end field is only available if the *SCCM configuration* specifies an uninstall collection.

---

**Software offered only to the logged in user**

If the *software catalog item* is configured with the Order on behalf of check box cleared, the User field does not appear on the order form. The logged in user selects the device on which to deploy the software from the Device to install this software on field. Only those devices assigned to the logged in user appear in the list.

In this example, a user has logged into the service catalog to order Firefox for a computer that is assigned to her. She selects the machine from a list of devices she owns and selects the date and time the lease should begin. This software is deployed through Microsoft System Center Configuration Management (SCCM), but does not have an uninstall collection configured and cannot be revoked automatically by the system. As a result, the Lease end field is not available.
Figure 349: Ordering software as the logged in user

Software ordered on behalf of another user

If the software catalog item is configured with the Order on behalf of check box selected, the User field appears on the form. The logged in user can select any user from this field. The Device to install this software on field only lists the devices assigned to the user selected in the User field. If an approval is required for software ordered on behalf of another user, the system automatically sends an approval request to the manager of the user receiving the software. The approval is skipped if the requester is the named user's manager.

In this example, a manager is ordering Google Chrome for a contractor. The manager selects the contractor from the User field and then chooses a computer from the list of devices assigned to the contractor. This software has an SCCM uninstall collection configured, which allows the manager to select an end date for the lease that coincides with the end of the user's contract. When the lease expires, SCCM automatically uninstalls the software from the device.
Extend a software lease

Users of software deployed by Client Software Distribution (CSD) can request the extension of a lease window, if the software is revocable by a software distribution system.

Role required: Any system user

If your software has a lease end date defined, and the software status is Installed, you can request an extension of the lease, pending any approvals your organization requires.

1. Navigate to Service Catalog My Requested Software.
   The list shows only the software you have requested from the service catalog.
2. Select the record for the installed software whose lease you want to extend.
3. Under Related Links click Extend Lease.
4. In the dialog box that appears, select a new lease end date in the calendar and click OK. You must select a date later than the current date.

If the lease extension is subject to manager approval, you are notified of the decision. If the request is approved, a notification shows the new lease end date. If the new end date is within 5 days (the default notification period) of the date when you made the request, CSD sends an immediate end-of-lease notification.

**Important:** If lease extensions in your organization require approval, make sure the approver is available and has enough time to process your extension request. If the extension cannot be approved before the original end date expires, the software is revoked.
Client software distribution from SCCM

You can use Client Software Distribution (CSD) to deploy and revoke software deployments from Microsoft System Center Configuration Management (SCCM) and manage distributions on SCCM hosts.

The SCCM activity pack contains Orchestration activities that CSD uses to deploy software from a service catalog request and manage user and device collections on SCCM servers. In addition, CSD can manage license counts for deployed software using ServiceNow Software Asset Management, revoke software deployed by SCCM without user interaction, and manage lease periods.

Configuring SCCM

Follow the SCCM configuration procedures in the order shown.

Configure the Application Administrator role on the SCCM server

To deploy software using ServiceNow® Client Software Distribution (CSD), ensure that an SCCM administrative user has the correct permissions to deploy software and that PowerShell is properly configured.

SCCM role required: Application Administrator

These instructions are for Microsoft 2012 R2 Server.

1. In the System Center Configuration Manager console, navigate to Administration Security Administrative Users.
2. Right-click the user to whom you want to grant the Application Administrator role.
3. Select Properties from the drop-down menu.
4. In the Properties dialog box, select the Security Roles tab.
5. Ensure that the user has the Application Administrator role.
6. If the user does not already have this role, click Add, select this role from the list, and click OK.
Figure 352: Granting the Application Administrator role on the SCCM server
7. Log into SCCM as the user with the Application Administrator role.
8. Open the menu from the upper left corner of the console and select Connect via Windows PowerShell.

![Figure 353: Connect to PowerShell](image)

9. Ensure that the user can access the CM console.
   This action establishes the environment path to PowerShell for the logged in Application Administrator user.

Update the SCCM cmdlet libraries
Ensure that the System Center Configuration Manager SCCM Cmdlet Library is up-to-date.

SCCM role required: Either current user or system administrator, depending on settings.

The System Center Configuration Manager SCCM Cmdlet Library installs and updates the Windows PowerShell module for SCCM. SCCM checks for library updates on a daily basis. Out-of-date libraries can cause Discovery of the SCCM server to fail, because the system cannot parse the SCCM activity output. This warning message appears in the ECC queue input records for the SCCM GET activities:

WARNING: An update to the System Center 2012 Configuration Manager Cmdlet Library is available. Please go to 'http://go.microsoft.com/fwlink/?LinkId=528947' to download the latest version.

Running cmdlet version: 5.0.8231.1004 Latest cmdlet version: 5.0.8328.1155

If you elect to use an earlier version library, use this procedure to disable the CM update check, which allows Discovery to proceed without issues.

1. Log into the SCCM console as an administrator.
2. Open the menu from the upper left corner of the console.
4. Run one of these commands to disable the update check:
   - Per-user: Set-CMCmdletUpdateCheck -CurrentUser -IsUpdateCheckEnabled 0
   - Per-system: Set-CMCmdletUpdateCheck -System -IsUpdateCheckEnabled 0

   **Important:** The per-system cmdlet must run in an elevated Windows PowerShell session.

5. Run the Get-CMCmdletUpdateCheck command to refresh the console and check the settings.
6. Ensure that the value of the IsEnabled configuration variable has changed to False.
   This indicates that the warning for an out of date cmdlet library is disabled for the users specified.
7. To re-enable the update check, run the -IsUpdateCheckEnabled 1 command for either the current user or for the system.

### Configure the MID Server for SCCM activities

To use a MID Server with Microsoft System Center Configuration Management (SCCM) activities, configure it to communicate with the SCCM server.

Role required: admin

1. In the navigation filter, enter cmdb_ci_dns_name.list.
2. Click New.
3. Enter the fully-qualified domain name (FQDN) of the SCCM server in the Name field.
4. Right-click in the form header and select Save.
5. In the IP Address related list, click New.
6. In the IP Address field, enter the IP address of the SCCM server.
7. In the Nic field, select eth0 or your preferred network interface controller.
8. Leave the Netmask field blank.
9. Click Submit.

### Create Windows credentials for SCCM deployments

Microsoft System Center Configuration Manager (SCCM) requires the appropriate credentials to deploy applications using the Client Software Distribution application.

Role required: sn_client_sf_dist.csd_admin or admin

Client software distribution requires Windows credentials that have administrative rights on the SCCM server.

1. Navigate to Orchestraton Credentials.
2. Click New.
3. In the list of credential types, select Windows Credentials.
4. Provide a user name and password with administrative rights on the SCCM server.

   **Important:** Ensure the following:
   - This user must have the Application Administrator role on the SCCM server.
• Use the credentials to log into the SCCM Server and connect via Windows PowerShell from the System Center Configuration Manager console at least once to set the path variable for that credential.

5. Fill in the other fields on the form, as appropriate.
   For details, see Windows credentials on page 1054.
6. Click Submit.

Retrieve SCCM data for client software distribution
Retrieve the collections and the list of applications available for deployment from your SCCM servers.
Role required: sn_client_sf_dist.csd_admin or admin

Before starting this procedure:
• Set up your Microsoft System Center Configuration Manager (SCCM) server, create the applications and collections, and configure the deployments you need. For information, see your SCCM documentation.
• Configure a user with the Application Deployment Manager role on the SCCM server.
• Set up the MID Server to communicate with the SCCM server.
• Add Powershell credentials to the ServiceNow Credentials [discovery_credentials] table for the SCCM user who has the Application Deployment Manager role.

To populate the Client Software Distribution application with SCCM data:
1. Navigate to Client Software Distribution SCCM SCCM Server Instance.
2. Click New.
3. In the SCCM Server Instance form, identify the server by name and provide the fully qualified domain name.
4. Click Submit.
   The new SCCM server appears in the list.
5. Open the new SCCM record and click Discover now under Related links.
   The system runs the Discover SCCM workflow that retrieves the application, collection, and deployment data from the SCCM server.
SCCM server Discovery for client software distribution

A Discovery workflow populates ServiceNow tables with collection, application, and deployment data retrieved from SCCM servers.

Users run the Discover SCCM workflow from an SCCM Server Instance record to populate the following ServiceNow tables:

Table 659: SCCM data populated in ServiceNow tables

<table>
<thead>
<tr>
<th>Table</th>
<th>Fields</th>
</tr>
</thead>
</table>
| SCCM Application [sn_client_sf_dist_sccm_application] | • name  
  • publisher  
  • version  
  • model  
  • sccm_server |
| SCCM Collection [sn_client_sf_dist_sccm_collection] | • name  
  • type  
  • sccm_server |
| SCCM Deployment [sn_client_sf_dist_sccm_deployment] | • application  
  • collection  
  • type |
Set up a software model for an SCCM application

Using the applications discovered on the SCCM server, set up a software model used by the Software Asset Management application to manage licenses.

Role required: sn_client_sf_dist.csd_admin or admin

Before creating software models, you must discover the applications available for deployment on the SCCM server. See Retrieve SCCM data for client software distribution on page 1802 for details.

You can link an SCCM application to an existing software model or create a new model.

1. Navigate to Client Software Distribution SCCM SCCM Applications .
   A list of applications discovered on the SCCM server appears.
2. Open an SCCM application record.
3. To link to an existing model, click the magnifying glass icon in the Model field and select a model from the list.<info>

   ![SCCM Application record](image)

   **Figure 355: SCCM application record**

4. To create a model, click Create Software Model under Related Links.
   a) Complete the software model fields.
      See for details.
   b) Click Submit.
      The view returns to the SCCM Applications form.

Define an SCCM configuration

To create catalog items for SCCM software deployment or to configure your instance to revoke software through SCCM, you must first associate that software with a collection through an SCCM configuration.
Before you create an SCCM configuration record, make sure you have discovered the SCCM applications, collections, and deployments and set up the necessary software models.

Role required: sn_client_sf_dist.csd_admin or admin

The SCCM configuration process associates software with SCCM collections. To deploy software from an SCCM server, the user or device must be a member of an SCCM collection associated with an install deployment. Client Software Distribution (CSD) allows you to revoke unentitled software using an SCCM server when that software can be removed using an uninstall collection. Users requesting revokable software from the Service Catalog also have the ability to define lease start and stop dates and request lease extensions.
Figure 356: SCCM table references

1. Navigate to Client Software Distribution SCCM SCCM Applications.
2. Open an application that has a configured software model.
3. Under Related Links, click Create Software Configuration.
4. Complete the form, using the fields in the table.
Figure 357: SCCM configuration form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Recognizable name for this SCCM software configuration.</td>
</tr>
<tr>
<td>SCCM application</td>
<td>Name of an application hosted on the SCCM server.</td>
</tr>
<tr>
<td>SCCM collection</td>
<td>Name of the collection associated with the install deployment for the selected application on the SCCM server. Only those collections associated with the application are available for selection.</td>
</tr>
</tbody>
</table>
| SCCM uninstall collection | Name of the collection associated with the uninstall deployment for the selected application on the SCCM server. You must specify an uninstall collection to:  
  • Define a lease end date for deployed software.  
  • Allow lease extensions.  
  • Revoke software from a user’s machine. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discovery model</td>
<td>Discovery model that links the unentitled software installation with the SCCM configuration. From the SCCM configuration record, Client Software Distribution can determine which collection to use to revoke the software. Unentitled software is software found on the user's machine that the user is not entitled to use.</td>
</tr>
</tbody>
</table>

Create a catalog item for an SCCM application

Using the applications discovered on the SCCM server, create a catalog item for an application you want to offer for distribution from the service catalog.

Role required: sn_client_sf_dist.csd_admin or admin

Before creating a catalog item, you must link the application to a software model and create at least one software configuration.

1. Navigate to Client Software Distribution SCCM SCCM Applications.
   A list of applications discovered on the SCCM server appears.
2. Open a record for an SCCM application.
3. Under Related Links, click Create Catalog Item.
   A new SCCM Application Catalog Item record appears with preconfigured information.
Catalog items are available to order software applications from the service catalog. Update name and short description to display for the item. Configure approval processes, license checks, order on behalf of, software configuration and other information as needed.

**Figure 358: SCCM application catalog item**
4. Add price information and complete the following fields added to the Client Software Distribution Catalog Item [sn_client_sf_dist_cat_item] table by the Orchestration - Client Software Distribution plugin:

Table 661: SCCM fields in the catalog item form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Skip approval (skip_approval)</td>
<td>Check box that allows skipping approval for this item by the requester's manager when a user orders it from the service catalog. Use this field in conjunction with the Order on behalf of field to ensure that software ordered by a logged in user on behalf of another user is subject to approval. By default, this check box is cleared, requiring manager approval for all new catalog items.</td>
</tr>
</tbody>
</table>

**Note:** There are two levels of approval possible. By default, all category items require group approval for items in excess of $1000. If that approval is given or skipped, the system evaluates the Skip approval check box to determine if the software item requires approval by the requester's manager.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Check license compliance</td>
<td>Check box that forces the system to determine if deploying this item is allowed under the current license.</td>
</tr>
</tbody>
</table>
**Field** | **Description**
--- | ---
Order on behalf of | Check box that allows the logged-in user to order this software from the service catalog for another user. This permits service desk personnel to order SCCM deployments for other users in the system. By default, this feature is enabled. To prevent unauthorized users from ordering software, ensure that approvals are required for this type of deployment by clearing the Skip approval check box.

If an approval is required for software ordered on behalf of a user, the system automatically sends an approval request to the manager of the user receiving the software. The approval is skipped if the requestor is the named user's manager.

Software items requested from the service catalog on behalf of a different user require the following information:

- **User**: User selected for deployment. This field is automatically populated with the name of the logged in user. You can select another user from the list.
- **Device to install this software on**: Device belonging to the selected user on which to deploy the software. Only devices belonging to that user appear in the choice list.
- **Lease start**: Date and time to deploy the software. This is the start time for the lease. A lease can be open-ended or have a lease end time.

**SCCM configuration** | Name of the SCCM configuration record for this application. This record defines the collection and uninstall collection for this application. This configuration is required for all deployments, revocations, and leases performed by the SCCM server.

5. If the catalog item requires approval because of cost, be sure to configure an approval group in the Approved By Group related list.

By default, the Service Catalog Request workflow runs when an item costing more than $1000 is ordered and looks for an appropriate approval group. If no approval group is configured for the item, this workflow skips approval altogether and ends. The system then runs the Order Client Software workflow, which evaluates the Skip approval check box to determine if approval by the requester's manager is required.

6. Click Update.

   The view returns to the SCCM Applications list.
7. To see all client software distribution (CSD) catalog items, navigate to Client Software Distribution Maintain Items Software Items.

**Workflow process for SCCM deployment**

Ordering an SCCM application from a client software distribution (CSD) catalog item in the service catalog triggers the Order Client Software workflow.

This process deploys an SCCM application to a user or device through a service catalog order:

1. If the Skip approval check box is cleared in the software catalog item, the Order Client Software workflow sends the catalog request to the requesting user's manager for approval.

2. If the Check license compliance check box is selected in the software catalog item, the workflow performs a software license check. If there is no license available, the workflow creates a catalog task to procure more licenses and assigns the task to the Client Software Distribution Administrators group.

3. The Order Client Software workflow triggers the Deploy SCCM Application workflow as a subflow. This workflow adds either the user or the device to the SCCM collection using the Add to User Collection or Add to Device Collection SCCM activity.

4. If the software configuration specifies SCCM uninstall collection in the software catalog item, the Deploy SCCM Application workflow checks if the user or device exists in the uninstall collection. The workflow uses the Is Device in Collection or Is User in Collection SCCM activity. If the user or device exists in the uninstall collection, the workflow removes the device or user. The workflow uses the Remove from Device Collection or Remove from User Collection SCCM activity before adding it to the SCCM install collection.

**Client software distribution validation process**

After SCCM deploys software to a target computer, client software distribution (CSD) detects the installation and validates its status.

Client software distribution uses the following methods for detecting software installed on the target machine:

- **Discovery**: CSD is configured to leverage Discovery to detect software installations. You can run Discovery manually at any time, or by a scheduled job.

- **Microsoft SCCM Integration**: You can import SCCM data into the CMDB using the features in the Integration - Microsoft SCCM plugin if Discovery is not active on the instance.

The instance uses the data gathered by Discovery or the SCCM integration plugin to populate the Software Installation [cmdb_sam_sw_install] table. To validate installations using this data, CSD runs a scheduled job called Reconcile Requested Software that uses *CSD property* settings. This process reconciles the software installation data accumulated in the CMDB and makes these status updates:

- **Not installed to Installed**: The user has installed the requested software within the time limit configured in the `sn_client_sf_dist.softwareInstallExpDays` property.
- **Not installed to Status check expired**: The time limit has expired for the user to install the requested software. The system stops checking for installation when the time limit expires.

**SCCM software revocation**

An administrator can revoke software without any user interaction using Microsoft System Center Configuration Manager (SCCM) if the software configuration specifies an SCCM uninstall collection, even if the software was installed by some other process or user.

**Revoke software deployed through the service catalog**

Software deployed by SCCM can be revoked, but only when the software's status is Installed and the application associated with the software configuration has an uninstall collection configured.

- Create an *SCCM configuration record* for the application that names an appropriate uninstall collection.
• Associate the CSD catalog item for the application with the SCCM configuration that specifies the uninstall collection.

Role required: sn_client_sf_dist.csd_admin or admin

A workflow called Revoke SCCM Application moves either the user or the device from its respective collection and adds it to the appropriate uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.

1. Navigate to Client Software Distribution Reports Requested Software.
2. Open the record for the SCCM software package you want to revoke.
   The package must have a Status of Installed to be revocable.
3. Under Related Links, click Revoke software.
   This action runs the Revoke Client Software workflow, which triggers the Revoke SCCM Application subflow that moves the user or device from the install collection to the uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.

Revoke unentitled software

An administrator can revoke software using Microsoft System Center Configuration Manager (SCCM) that a user is not entitled to use even if the software was installed by some other process or user.

To revoke software using SCCM, you must create an SCCM configuration record for the application, in which the appropriate software Discovery model is defined. See Software discovery models.

Role required: sn_client_sf_dist.csd_admin or admin

Client Software Distribution (CSD) uses Software Asset Management (SAM) to identify unentitled software installations. Discovery detects the software on the user's machine, and SAM determines if the user or device is entitled to use that software. This might include software that was not installed through a catalog request or software that the user installed without approval. If the software installation's Discovery model is associated with an SCCM software configuration that has an uninstall collection defined, then an administrator can use CSD to revoke that software from the user's machine without involving the user.

1. Navigate to Client Software Distribution Reports Installed Software Not Entitled.
2. Select the record for the installation that has unentitled users.
3. Under Related Links, click Revoke software.
   This action runs the Revoke Client Software workflow, which triggers the Revoke SCCM Application subflow that moves the user or device from the install collection to the uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.
SCCM software revocation workflow
The Revoke SCCM Application workflow moves a user or device from an install collection to an uninstall collection to revoke software installed from Microsoft System Center Configuration Manager (SCCM).

For the revocation workflow to run, the software package must have a status of *Installed* and must be pre-configured for an appropriate uninstall collection. See *Revoke software deployed through the service.*
catalog on page 1812 for configuration instructions. When an administrator initiates the revocation process, the system launches the Revoke SCCM Application workflow to move the user or device collection associated with installation to the appropriate SCCM uninstall collection. When the SCCM server performs a policy check, it finds the additions to the user or device uninstall collection and revokes the software package associated with that collection.

The workflow employs two custom activities, *Remove from User Collection* and *Remove from Device Collection*, to remove either the user or the device from its original collection. The workflow then adds the user or device to the appropriate uninstall collection on the SCCM server with the *Add to User Collection* or *Add to Device Collection* activity.

**Note:** This workflow is triggered by the Revoke Client Software workflow as a subflow.

Client software distribution dashboard

The CSD dashboard provides a collection of visual reports for the Client Software Distribution application. To access the CSD dashboard, navigate to Client Software Distribution Requested Software Dashboard.

![Figure 360: Sample report from CSD dashboard](image)

**Client software distribution extension framework**

Client software distribution (CSD) provides built-in extension points for integrating a ServiceNow instance with client software distribution providers, such as Casper, Altiris, or LANDesk.

**Caution:** The use of CSD extension points is an advanced procedure intended for use by experienced Now Platform developers only. Instructions for customizing your instance to deploy...
Configure client software distribution providers

Identify the provider and specify the workflows and extension points for a customized software distribution process.

Perform the development tasks described in the CSD Extension Implementation Guide before attempting this procedure.

Role required: sn_client_sf_dist.csd_admin, admin

1. Navigate to Client Software Distribution Extensions Providers.
2. Click New.
3. Complete the form using the fields in the table.

![Figure 361: Provider information for Casper integration](image)

Table 663: Client software distribution provider fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name of the provider.</td>
</tr>
<tr>
<td>Provider server</td>
<td>Table name of the provider server. You must create this table as an extension of the Configuration Item [cmdb_ci] table. For example, you might call your table Casper Server Instance [cmdb_ci_casper_server_instance].</td>
</tr>
<tr>
<td>Discovery workflow</td>
<td>Workflow that discovers the provider server and returns the data from that server back to the instance. This is the workflow you create with custom activities that query the provider server.</td>
</tr>
</tbody>
</table>
**Field** | **Description**  
--- | ---  
Software configuration | Table name of the software configuration for this provider. You create this table as an extension of the Client Software Distribution Software Configuration [sn_client_sf_dist_software_config] table. For example, you might create a table called Casper Software Configuration [sn_client_sf_dist_casper_sf_config].  
Deployment extension key | The SetDeploymentData key provided with CSD. This key sets up the data for the software ordering and deployment workflow.  
Deployment workflow | Workflow that deploys software from the provider server. This is the workflow you created with custom activities that tells the provider where to deploy an application requested from the service catalog.  
Revocation extension key | The SetRevocationData key provided with CSD. This key sets up the data for installation revocation.  
Revocation workflow | Workflow that revokes an installation from a provider server. This is the workflow you created with custom activities that tells the provider which application to remove from a device.  

---

*Client software distribution extension keys*

Client software distribution (CSD) extension keys allow you to customize the deployment and revocation of software from distribution providers.

These pre-defined keys allow you to generate input variables for workflows that deploy and revoke software from external distribution providers:

- **SetDeploymentData**: Sets the software order information and generates the input variables for the deployment workflow.
- **SetRevocationData**: Generates the input variables for the revocation workflow.
- **CheckRevocable**: Specifies the conditions that determine if an installation can be revoked. If the software configuration associated with the installed software allows uninstallation, the installed software can be revoked.

*Client software distribution extension points*

The client software distribution (CSD) extension points create the customization code for the specific provider and the extension keys.

The purpose of the extension points is to associate extension keys with a specific provider, and then create a script that sets input variables for your custom deployment and revocation workflows. Another extension point script tells CSD if the provider has the capability to revoke software. If this is the case, CSD enables the UI action that triggers revocation from the provider.

**SetDeploymentData**

The script associated with this extension key must set the csdExtensionResult object with these attributes:
• deploymentWorkflowInputs: Object that specifies the deployment workflow input variables.
• softwareModel: Software model sys_id.
• deploymentType: An integer. Use 1 for deployment to a user and 2 for deployment to a device.
• softwareApplication: Software application sys_id.

**CheckRevocable**

The script associated with this extension key gets the input parameter csdExtensionInputs.softwareConfiguration, which is a Client Software Distribution record in the Software Configuration [sn_client_sf_dist_software_config] table. All providers’ software configurations are extended from this table, but may have different attributes.

This script must set the csdExtensionResult object to true or false, depending on whether the software configuration specifies uninstallation.

**SetRevocationData**

The script associated with this extension key gets the input parameter csdExtensionInputs.softwareConfiguration, which is a Client Software Distribution record in the Software Configuration [sn_client_sf_dist_software_config] table. All providers’ software configurations are extended from this table, but may have different attributes.

The script must set the csdExtensionResult object with these attributes:

• revocationWorkflowInput: Object that specifies the revocation workflow input variables.
• softwareModel: Software model sys_id.
• deploymentType: An integer. Use 1 for deployment to a user and 2 for deployment to a device.

**Orchestration examples**

These examples demonstrate how Orchestration can be used to automate common tasks.

**Active Directory automation example**

A set of six Orchestration Active Directory activities enables organizations to automate their on-boarding/off-boarding processes with auditable, self-documenting workflows that save time and eliminate mistakes.

The activities in the *Active Directory activity pack* on page 1841 are designed to manage user accounts and reset user passwords. The following activities cover the most common use cases administrators encounter when managing Active Directory user accounts:

• Create AD User Account
• Update AD User Account
• Remove AD User Account
• Disable AD User Account
• Query AD
• Reset AD User Password.

These activities share a common design, have complementary functionality, and share a common set of parameters. They can be used singly or together to create consistent workflows for provisioning and de-provisioning user accounts.
Update Active Directory with Orchestration

An organization plans to make their ServiceNow instance the single system of record for user account data and wants to update Active Directory with the latest changes.

The solution is to create an Orchestration workflow that pushes changes from the ServiceNow user record down to the Active Directory to create a new user record or update an existing record. This is accomplished by creating an Orchestration workflow that can create and update records in Active Directory based on the data in the ServiceNow User [sys_user] table.

Note: This example workflow assumes that ServiceNow is configured for LDAP and an LDAP server is configured to accept the new user accounts. The Active Directory user management activities are not dependent on LDAP, but the presence of LDAP makes this example workflow much easier. You must provide the domain controller’s IP address to the workflow, either by hardcoding it, adding another workflow input, or using a script to look it up from the CMDB.

1. Navigate to Workflow Workflow Editor.
2. In the Workflow tab, click the + icon to create a new workflow using these variables:
   - Name: Sync AD User
   - Table: Global [global]
3. Click Submit.
   A basic workflow with a Begin and End point appears on the canvas.
4. Click the menu icon in the upper left corner of the canvas and select Edit Inputs from the context menu.
5. In the Workflow Inputs form, click New in the Variables record list, and create a new variable, using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Reference</td>
</tr>
<tr>
<td>Label</td>
<td>User</td>
</tr>
<tr>
<td>Column name</td>
<td>u_user</td>
</tr>
<tr>
<td>Reference Specification &gt; Reference</td>
<td>User (sys_user)</td>
</tr>
</tbody>
</table>

6. Click Submit.

7. In the Custom tab, expand Custom Activities Active Directory.
8. Drag and drop the Update AD Object activity onto the transition line between the Begin and End points of the new workflow.
This action automatically links the activity with the end point and opens the Workflow Activity property form.

9. Complete the form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as Update user data.</td>
</tr>
</tbody>
</table>
| Domain controller| The ServiceNow LDAP integration adds a reference to the LDAP server to which the user's account is linked. To identify the LDAP server, enter the following statement:  
${workflow.inputs.u_user.ldap_server.server_url}$ |
| Type            | Type of AD object. In this case, the type is User, which is the default. |
| Object name     | This example assumes that the ServiceNow user name matches the Active Directory sAMAccountName. Enter the following:  
${workflow.inputs.u_user.user_name}$ |
| Object data     | Updates the user's account in Active Directory, if the user exists. In this example, the user's title is updated:  
{"title": "QA"} |

10. Click Submit.
The workflow looks like this:

![updated workflow diagram]

Figure 363: Updating an AD user

11. Attach both activity outcomes (Success and Failure) to the end point.
At this point, the workflow takes a ServiceNow user record as input and updates the First Name, Last Name, and Title of the corresponding Active Directory account. If the account does not exist in Active Directory, the workflow fails.

**Note:** In a normal workflow, some type of alternate action is desirable upon failure. For example, you might send an email notification if the workflow failed to update the record.

12. To prevent the workflow from failing, add a Create AD Object activity to the transition lines between Begin and the Update AD Object activity.

13. Complete the Workflow Activity property form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as Create user data.</td>
</tr>
<tr>
<td>Domain controller</td>
<td>${workflow.inputs.u_user.ldap_server.server_url}$</td>
</tr>
<tr>
<td>Ou</td>
<td>The organizational unit to which this object belongs. For the purpose of this example, you can enter OU=HQ,OU=Managed Objects</td>
</tr>
<tr>
<td>Object name</td>
<td>${workflow.inputs.u_user.user_name}$</td>
</tr>
<tr>
<td>Object data</td>
<td>Creates an account with only the user name in it. For the purpose of this example, you can enter {&quot;givenName&quot;: ${workflow.inputs.u_user.first_name}$, &quot;SN&quot;: ${workflow.inputs.u_user.last_name}} }</td>
</tr>
</tbody>
</table>

14. Click Submit.

15. Connect the Failure outcome of the Create AD Object activity to End.

For this example, we are ignoring errors. The workflow now looks like this:
This procedure builds a simple workflow that creates a bare-bones Active Directory account consisting of a user name only. The workflow then updates that account with additional information provided by the ServiceNow User [sys_user] table. However, we do not want to execute the Create AD Object activity if the user account already exists. The workflow needs to query Active Directory for matching user records and then branch the workflow based on the results of the query. If an account already exists, then the workflow should update the account. If the account does not exist, then the workflow should create the account in Active Directory.

16. Drag and drop the Query AD activity onto the transition between Begin and Create AD Object.

17. Complete the Workflow Activity property form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as Search for existing account.</td>
</tr>
<tr>
<td>Domain controller</td>
<td>${workflow.inputs.u_user.ldap_server.server_url}</td>
</tr>
<tr>
<td>Properties</td>
<td>A comma-separated list of Active Directory properties to return. For example, givenName, SN, title. If the parameter field is blank, then all properties are returned. In this workflow, we leave the field blank.</td>
</tr>
<tr>
<td>Search filter</td>
<td>An LDAP filter string that defines the search parameters. Use any valid LDAP filtering criteria. To find user accounts matching the input record, we use: (samaccountname=${workflow.inputs.u_user.user_name})</td>
</tr>
</tbody>
</table>

18. Click Submit.

19. Connect the Failure outcome for the query activity to the End point.

Remember that we are ignoring errors in this workflow.
20. Connect the Success outcome of the query activity to the Update AD Object activity. The workflow now looks like this:

![Workflow Diagram]

The workflow now looks like this:

21. Drag a standard If activity from the Conditions folder in the Core tab and drop it onto the transition between Query AD and Update AD Object.

22. Complete the Workflow Activity properties form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as Account exists.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to open the Script field.</td>
</tr>
</tbody>
</table>
For the If activity to work correctly, we must return a yes or no in the answer variable (var) which corresponds to the Yes and No outcomes of the query activity. Line 1 converts the Query AD results from a JSON string into a Javascript array called queryResults. Line 2 checks the length of that array. If the array is more than 0, a match to the account was found, and we set our answer to yes. Otherwise, the answer is no.

```javascript
var queryResults = new JSON().decode(data.get(5).output);
answer = (queryResults.length > 0 ? 'yes' : 'no');
```

**Note:** The expression `data.get(5)` in this script identifies the Query AD output in the Databus by order number, since it was the fifth activity added to the workflow.
23. Click Submit.

24. In the canvas, create a transition from the Yes outcome of the If activity to the Update AD Object activity.

25. Create a transition from the No outcome of the If activity to the Create AD Object activity.

This is the final step. This workflow will query Active Directory to determine if an account already exists. If an account exists, the workflow updates that account. If an account does not exist, the workflow creates the account and then updates the Active Directory with the configured user data set.

Figure 366: Query AD outputs in the Databus
Employee Orchestration

Provides a design pattern to implement near-realtime processing of HR events from any HR system. Employee Orchestration enables the ServiceNow instance to receive notifications from an HR system and use this information to trigger workflows. For example, if a new employee is added to Workday, Orchestration analyzes a Workday notification and extracts information on the new employee. Email triggers on the instance launch a workflow containing Workday activities that are configured to retrieve additional information about the new employee. The instance uses this information to create a new sys_user record for the employee or update an existing record.

This process requires configuration on the HR system to send onboarding notifications to the ServiceNow instance. Orchestration identifies notifications from a pre-configured source and extracts information on the new employee from delimited text specified in system properties. Configured values on the HR system and the ServiceNow instance must match for the exchange of information to occur.

Activate Employee Orchestration

Employee Orchestration requires the Orchestration - Workday plugin (com.snc.orchestration.workday), which is available by request with a subscription to Orchestration.

1. In the HI Service Portal, click Service Requests Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
</tbody>
</table>
Specify the date and time you would like this plugin to be enabled

<table>
<thead>
<tr>
<th>Reason/Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Provide any information that would be helpful for the ServiceNow personnel activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows.</td>
</tr>
</tbody>
</table>

3. Click Submit.

Create the Workday credential

The Workday credential allows Orchestration activities to retrieve employee information from Workday.

Role required: admin

1. Navigate to Employee Orchestration Workday Credential.

2. To enable editing of the form, click the link at the top.

![Figure 368: Editing the credential record](image)

3. Update the form using the fields in the table.
Table 664: Workday credential fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Identifying name for this credential. For example, you might enter Workday.</td>
</tr>
<tr>
<td>Username</td>
<td>Workday user who has integration rights using Workday Web Services. For example, you might enter workday_username.</td>
</tr>
<tr>
<td>Password</td>
<td>Password for the workday_username user.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for this credential record. This field is not editable.</td>
</tr>
</tbody>
</table>

4. Click Update.

Configure Workday notifications

You must configure Workday to send notifications to the ServiceNow instance when a new employee is hired, using values that allow the instance to extract the employee identification number.

Administrative privileges on Workday.

Consult the Workday documentation for instructions on performing these procedures.

**Important:** The values configured in the Workday notification must match values configured on the ServiceNow instance. For details about configuring the ServiceNow instance to receive Workday notifications and parse the data for the employee ID, see Employee Orchestration properties on page 1831.

1. Set up email alerts based on the completion of a process on Workday.
   a) In Notification Delivery Settings, ensure that Custom Business Process Notifications is enabled and set to Immediate.
   b) Go to your company's Hire business process and either add a new notification or open an existing notification for edit.
   c) Provide this information for the notification.

Table 665: Workday notification information

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trigger on Status</td>
<td>Set to Completed.</td>
</tr>
<tr>
<td>Recipients</td>
<td>Provide the email ID of the ServiceNow instance, such as <a href="mailto:acme@service-now.com">acme@service-now.com</a>.</td>
</tr>
<tr>
<td>Text</td>
<td>In the Message Content form, provide the Subject content. Employee Orchestration is configured to look for Workday Notification - Employee Hired in the subject line of the notification. This value must match the email trigger that launches the Employee Orchestration workflow.</td>
</tr>
</tbody>
</table>
2. Hire the person for an open position and provide information such as the employee’s address and email ID. This is the data that the Employee Orchestration workflow returns to the instance and uses to populate the sys_user table.

**Employee Orchestration properties**

The Employee Orchestration properties allow a ServiceNow® instance to receive notifications from Workday and to parse the notification for new employee identification numbers.

These properties define important connection settings between the ServiceNow® instance and Workday. Notifications from Workday sent to the email IDs defined here are parsed for the employee ID contained within specified delimiters.

To configure these properties, navigate to Employee Orchestration Properties.

---

**Important:** The values in these properties must match values configured in the Workday notification. For details about configuring Workday to send expected values to a ServiceNow® instance, see Configure Workday notifications on page 1830.

---

**Table 666: Workday properties**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workday.email.body.delimiter.start</td>
<td>Email body delimiter start. This is the starting delimiter that sets off the data in a Workday notification that the ServiceNow instance uses to retrieve information about a new employee. For example, you might use #EmpStart#.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: null</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>workday.email.body.delimiter.end</td>
<td>Email body delimiter end. This is the ending delimiter that sets off the employee ID in the Workday notification that the ServiceNow instance uses to retrieve information about a new employee. For example, you might use #EmpEnd#.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: null</td>
</tr>
<tr>
<td>workday.email.sender</td>
<td>List of comma separated email IDs. Workday uses these email IDs to send notifications to the ServiceNow instance when new employees are hired.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: null</td>
</tr>
</tbody>
</table>

Create a Workday email trigger

An email trigger runs an Employee Orchestration workflow when a specific value appears in a Workday notification subject line.

Role required: admin

An email trigger must match the appropriate subject line of an onboarding Workday notification. For example, you can create a trigger that launches the User Provisioning workflow when the ServiceNow instance receives a notification with Workday Notification - Employee Hired in the subject line.

1. Navigate to Employee Orchestration Email triggers and click New.
2. In the Email Subject Line field, enter the content of a Workday notification subject line that you want to use to trigger the User Provisioning workflow.
3. Select a Notification Type of Onboard.

Figure 369: Workday email trigger
4. Click Submit.

Create a new notification type
You can add new Workday notification types to your instance.

Role required: admin

If you add notification types, they must match the Workday notifications exactly. Also, each notification type must be accompanied with a workflow capable of updating ServiceNow® records using the data retrieved from Workday.

1. Navigate to Employee Orchestration Email Triggers and click New.
2. In the new record, add the exact name of the Workday notification you want to have trigger the workflow in the Email Subject Line field.
   For example, you might enter Life Event - Change of Address.
3. Save the record.
4. Right-click the label in the Notification Type field.
5. In the context menu that appears, select Configure Choices.

Figure 370: Configuring the Notification Type choice list

The choice selection lists appear in read-only format.

6. To edit the choice list, click the link in the notice in the header bar.
Figure 371: Edit control for the selection list

The selection form becomes editable.

7. Enter a logical name for the new notification type in the Enter new item field. For example, you might enter Change of address.

8. Click Add.
Figure 372: Adding a new notification type

The system adds the new choice to the Selected list.

9. Click Save to save your new type.

10. In the Email Trigger form, select the new type from the choices in the Notification Type field.
11. Click Update.

**Workday notifications log**

Orchestration keeps a log record of all inbound emails from Workday regarding employee onboarding activities.

Workday notification records show all the information received from Workday for an employee onboarding event. The employee ID of the new employee is contained within delimiters that the ServiceNow instance is configured to recognize. The value in the notification's subject line is configured to trigger the *Orchestration workflow* that retrieves additional employee information from Workday. To access notification records, navigate to Employee Orchestration Notifications.
Figure 373: Sample Workday notification

Delimited content containing the Workday employee ID

Email trigger that launches the Workday Orchestration workflow
Employee Orchestration workflow

Employee Orchestration provides a default workflow that retrieves employee information from Workday, and then uses that information to update a ServiceNow sys_user record and create an Active Directory account.

The User Provisioning workflow is included with Workday Orchestration. This workflow includes Workday and Active Directory activities that retrieve employee information from Workday, based on the employee's identification number. The workflow then uses this information to create an Active Directory account for the new employee and to ensure that an up-to-date ServiceNow user record exists for that employee.
Figure 374: User Provisioning workflow

Orchestration activity packs

The base Orchestration system includes packs of custom activities you can use to automate typical IT and business processes in your network.
Activity packs allow you to automate several common business processes, such as managing Active Directory accounts and Exchange server mailboxes. Activity packs can also automate IT functions such as starting and stopping Windows servers, joining domains, assigning IP addresses, and configuring load balancers.

Use an activity pack

The Packs tab of the Workflow Editor contains any activity packs downloaded from the ServiceNow Store and any activity packs that you create.

Roles required: admin, activity_admin, activity_creator

You can organize custom activities into packs and upload them to the ServiceNow Store. Your custom packs do not appear in the tree until at least one activity in the pack is published. Activities added to an existing pack are not displayed until they are published. Activity packs from any application scope can appear in the Packs tab, regardless of the current scope setting for the instance.

1. In the Workflow Editor palette, select the Packs tab.
2. Click the download icon.

The hierarchy in the tab organizes packs by vendor, scope, category, and activity.
Active Directory activity pack

The Active Directory (AD) activity pack enables an administrator to create, delete, and manage objects in Windows Active Directory, such as users, groups, and computers, using a ServiceNow Orchestration workflow.

Activities in this pack can reset a password automatically from a user request or manage any user account in Active Directory, whether or not it was created by an Orchestration workflow.

Domain controllers are identified by the IP address of the host machine. To use the hostname of the domain controller, add the Resolve DNS Name activity to resolve the hostname into an IP, and then pass the IP into the Active Directory activity.

Your instance must have access to a MID Server configured to use PowerShell to run these activities.

Note: All Active Directory activities pass through error messages returned from Active Directory. To view these error messages, point to the failed activity in the workflow canvas or select the Workflow Log tab in a Workflow Context record.

Custom Active Directory activities

Orchestration provides custom Active Directory activities that were created with the Orchestration Create a PowerShell activity on page 2055, starting with the Geneva release. These activities perform the same functions as AD activities by the same name from previous releases and replace those activities for all new workflows. Existing workflows from earlier versions that were created with legacy AD activities continue to function normally after an upgrade to Istanbul. However, all new workflows must use these custom AD activities. The Powershell activity template gives workflow administrators the ability to store input and output variables from the Query AD activity in the Databus.

Note: To use the Active Directory custom activities, you must request activation of the Orchestration - Active Directory plugin.

Active Directory credentials with LDAP

If you are using an LDAP Server with MID Servers, note that Orchestration and Active Directory activities do not use the user name and password configured on LDAP Servers. You must create a Windows type orchestration credential record. The username and password in the credentials record is used for LDAP queries that Orchestration and workflow activities perform.

Connection port used by AD Orchestration activities

All Active Directory activities use port 389 for LDAP access. If you are using AD activities with Oracle Virtual Directory (OVD) as a proxy, set up pass-through on port 389 only.

Add User to Group AD activity

The Add User to Group activity adds a user to a group in Windows Active Directory.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Active Directory.
Input variables

Table 667: Add User to Group input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>

<tr>
<td>Failure</td>
<td>An error occurred while attempting to add the user to the group. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>

Change AD User Password activity

The Change AD User Password activity changes the password for an Active Directory user account. This activity requires the user's current password to run, unlike the Reset AD User Password activity. If the new password violates any Active Directory password requirements, such as length or character combinations, the activity fails and returns the appropriate error message. This error message appears in the ECC queue and in hint text when a user points to the activity in the Workflow Editor.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

**Note:** This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer on page 1923.
Input variables

Table 670: Change AD User Password input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>

<td>Password does not comply with the organization's Active Directory requirements.</td>
</tr>
<tr>
<td>Incorrect old password</td>
<td>Password being changed was not entered correctly.</td>
</tr>
<tr>
<td>Failure</td>
<td>An error occurred while attempting to change the password. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>
Active Directory credentials with LDAP

If you are using an LDAP Server with MID Servers, note that Orchestration and Active Directory activities do not use the user name and password configured on LDAP Servers. You must create a Windows type orchestration credential record. The username and password in the credentials record is used for LDAP queries that Orchestration and workflow activities perform.

Create AD Object activity

The Create AD Object activity creates an object in Windows Active Directory. This activity fails if it finds an existing object with matching input variables.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

Note: This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer on page 1923.

Input variables

<tr>
<td>Type</td>
<td>The object type to create: user, group, or computer.</td>
</tr>
<tr>
<td>OU</td>
<td>The organizational unit to which this object belongs.</td>
</tr>
<tr>
<td>ObjectName</td>
<td>The sAMAccountName of the Active Directory object. Object name is also used for the name attribute in Active Directory. This behavior is available in ActiveDirectory.psm1. Whatever is passed as the Object name becomes both the sAMAccountName and the name of the new user in Active Directory.</td>
</tr>
</tbody>
</table>
### Variable Description

ObjectData

A JSON object containing Active Directory property names and their corresponding values. For example:

```json
{  "givenName" : "John",  "SN" : "Doe",  "title" : "Sr. Account Specialist",  "allowLogin" : true}
```

This example sets the first name (givenName), last name (SN), and title on the Active Directory user account and allows that user to log in (allowLogin). This field allows expression evaluation via the ${} variable substitution syntax.

### Output variables

<tr>
<td>Failure</td>
<td>An error occurred while attempting to create the AD object. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>

### Disable AD User Account activity

The Disable AD User Account activity disables a Windows Active Directory user account, making it inactive.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Active Directory.
**Note:** This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the *PowerShell activity designer* on page 1923.

</tbody>
</table>

### Enable AD User Account activity

The Enable AD User Account activity enables a Windows Active Directory user account, making it active.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

**Note:** This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after...
upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the *PowerShell activity designer* on page 1923.

### Input variables

</tr>
</tbody>
</table>

### Is AD Account Locked activity

The *Is AD Account Locked* activity determines whether an Active Directory user account is locked. An account may be locked automatically if a user enters an incorrect password more times than allowed by the Active Directory security policy. You can unlock an account using the *Unlock AD User Account* activity.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

**Note:** This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after
upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the *PowerShell activity designer* on page 1923.

### Input variables

</tr>
</tbody>
</table>

### Query AD activity

The Query AD activity retrieves entries from the Windows Active Directory based on an LDAP search filter and stores the results as a JSON string that can be used in the data bus.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

**Note:** This activity replaces an AD activity by the same name available in releases prior to Geneva. If you have a workflow that uses the deprecated activity, your workflow will continue to
work normally after upgrading to Instanbul and will continue to save query results to the scratchpad. However, all new workflows must use the custom version of this activity. This activity was built with the Create a PowerShell activity on page 2055, which stores input and output variables in the databus instead of the scratchpad.

### Input variables

Table 685: Query AD input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>

</tbody>
</table>
Reset AD User Password activity

The Reset AD User Password activity resets the password of a user account in Windows Active Directory. If the new password violates any Active Directory password requirements, such as length or character combinations, the reset activity fails and returns the appropriate error message. This error appears in the ECC Queue and when you point to the activity in the Workflow Editor.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

**Note:** This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer on page 1923.

Unlock AD Account activity

The Unlock AD Account activity unlocks a locked Active Directory user account.

You can use the Is AD Account Locked activity on page 1847 activity to determine if an account is locked.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

**Note:** This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer on page 1923.

Update AD Object activity

The Update AD Object activity updates an object in Windows Active Directory. This activity only replaces existing values with new values. It cannot add new values to AD records such as adding a new group member to an AD group. For complex AD operations, use the Run PowerShell activity instead. The activity fails if it cannot find an existing account with matching object name and data.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

**Note:** This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer on page 1923.

Azure AD activity pack

The Azure AD activity pack enables an administrator to automate employee onboarding and offboarding functions on Azure AD and manage Office 365 licensing.

Use the Azure AD activities to add and remove users to Azure Active Directory, manage security group membership, and assign or remove Office 365 licenses for individual users.

The Azure AD activities were created with the Orchestration REST Web Service activity template.

Add User to Group Azure AD activity

The Add User to Group activity adds a user to an existing security group in Azure Active Directory.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Azure AD. This activity was built with the REST web service activity template.

Important: The REST message used for this activity must be configured to use OAuth2 authentication.

</tbody>
</table>

Assign User License Azure AD activity

The Assign User License activity assigns an additional Office 365 software license to the named user.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Azure AD. This activity was built with the REST web service activity template.

Important: The REST message used for this activity must be configured to use OAuth2 authentication.

Create User Azure AD activity

The Create User activity creates a user for the Azure Active Directory tenant.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Azure AD. This activity was built with the REST web service activity template.
**Important:** The REST message used for this activity must be configured to use **OAuth2 authentication**.

**Input variables**

**Table 709: Create User input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>display_name</td>
<td>Name of the Azure AD user in the accepted display format, such as jacinto.gawron.</td>
</tr>
<tr>
<td>user_principal_name</td>
<td>User principal name (UPN) in an email format. For example, you might enter <a href="mailto:jacinto.gawron@khitomer.com">jacinto.gawron@khitomer.com</a>.</td>
</tr>
<tr>
<td>mail_nickname</td>
<td>User's email alias that redirects to the user's full address.</td>
</tr>
<tr>
<td>password</td>
<td>User's Azure AD password. This password must be passed as a workflow input with a type of Password (2 Way Encrypted) and must meet the password policy set in Azure AD.</td>
</tr>
<tr>
<td>change_password</td>
<td>Control that requires the user to change his or her password at the next login, if set to true.</td>
</tr>
<tr>
<td>account_enabled</td>
<td>Control that sets the user's account is enabled, if set to true.</td>
</tr>
<tr>
<td>given_name</td>
<td>First name of the user.</td>
</tr>
<tr>
<td>surname</td>
<td>Last name of the user.</td>
</tr>
<tr>
<td>other_mails</td>
<td>List of additional email addresses for the user. For example, you might enter &quot;<a href="mailto:jac@home.com">jac@home.com</a>&quot;, &quot;<a href="mailto:jgawron@fabrikam.com">jgawron@fabrikam.com</a>&quot;.</td>
</tr>
<tr>
<td>country</td>
<td>The country or region in which the user is located. For example, you might enter US or UK. The default value is set to US.</td>
</tr>
<tr>
<td>city</td>
<td>City in which the user is located.</td>
</tr>
<tr>
<td>department</td>
<td>Name of the department in which the user works.</td>
</tr>
<tr>
<td>mobile</td>
<td>User's primary cell phone number.</td>
</tr>
<tr>
<td>job_title</td>
<td>User's job title.</td>
</tr>
<tr>

### Remove User from Group Azure AD activity

The Remove User from Group activity removes an existing user from a security group in Azure Active Directory.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Azure AD. This activity was built with the REST web service activity template.

**Important:** The REST message used for this activity must be configured to use OAuth2 authentication.
Input variables

Remove User License Azure AD activity

The Remove User License activity revokes the specified Office 365 software license for the named user.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Azure AD. This activity was built with the REST web service activity template.

Important: The REST message used for this activity must be configured to use OAuth2 authentication.
Input variables

</tbody>
</table>

Reset User Password Azure AD activity

The Reset User Password activity changes the named user's Azure Active Directory password. The Azure password policy imposes constraints on the complexity, length, and re-use of a password. To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Azure AD. This activity was built with the REST web service activity template.
Important: The REST message used for this activity must be configured to use OAuth2 authentication.

Input variables

Table 724: Reset User Password input variables

</tbody>
</table>
Exchange activity pack

The Exchange activity pack allows workflows to manage Microsoft Exchange mail systems.

The use of Orchestration Exchange activities requires the following:

- Microsoft Exchange 2010 or 2013.
- A MID Server configured to run Powershell 2.0
- A target Exchange server in the same Active Directory domain as the instance.
- Powershell Remoting enabled on the target Exchange server.

**Note:** These activities cannot be used to interact with Microsoft Exchange Online.

Orchestration provides custom Exchange activities that were created with the Orchestration activity designer template. These activities perform the same functions as Exchange activities by the same name from previous releases and replace those activities for all new workflows. The custom Exchange activities were built with a *Powershell activity template*, which gives workflow administrators the ability to store input and output variables in the *databus*.

**Note:** Existing workflows from earlier versions that were created with legacy Exchange activities continue to function normally after an upgrade to Geneva. However, all new workflows must use these custom Exchange activities.

To use the Microsoft Exchange custom activities, you must *request activation* of the Orchestration - Exchange plugin. The custom Exchange activities are available in the Workflow Editor on the Custom tab. Expand the Custom Activities tree and select the Exchange category for the activity you want to use.
Configure MID Server for Exchange

Configure a MID Server with defined IP ranges to use Exchange.
If the MID Server manages resources within defined IP ranges, instead of all computers on your network, you must perform additional configuration steps to run Exchange activities. You do not need to perform these steps if your MID Server uses the default configuration.

1. In the navigation filter, enter cmdb_ci_dns_name.list.
2. Click New.
3. Enter the fully-qualified domain name (FQDN) of your Exchange server in the Name field.
4. Right-click the form header and select Save.
5. In the IP Address related list, click New.
6. In the IP Address field, enter the IP address of your Exchange server.
7. In the Nic field, select eth0 or your preferred network interface controller.
8. Leave the Netmask field blank.
9. Click Submit.

Pass multivalued properties with an Exchange activity

To set a multivalued property using an Exchange activity, you must use a specific parameter format. The Optional parameters shared input variable allows you to set multivalued properties.

- To set a multivalued property, replacing any existing values, use this format: "PropertyName":"(value1, value2, value3)"
- To add values, use this format: "PropertyName":"+(value1, value2, value3);
- To remove values, use this format: "PropertyName":"-(value1, value2, value3);"
- To both add and remove values, use this format: "PropertyName":"-(value1, value2, value3);+(value1, value2, value3);"

Create Address List activity

The Create Address List activity creates a new address list that acts as an alias for emailing all users in the group.

This alias cannot be used to manage user permissions. This activity implements the Microsoft Exchange New-AddressList command.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Exchange Address List.

Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer on page 1923, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Table 727: Create Address List input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.</td>
</tr>
</tbody>
</table>
Variable | Description
---|---
domain | The name of the Exchange server's assigned domain.
nname | Name of the new address list to create.
parameters | Optional parameters to pass to the Exchange server written in JavaScript Object Notation (JSON). Exchange activities cannot pass parameters that reference an object, such as a PSCredential object. Plain text is automatically converted to SecureString objects for parameters that require that data type. Attempting to save an activity that specifies duplicate parameters, including parameters from activity variables, or incorrectly formatted JSON causes a warning message to appear.

**Note:** When passing a switch parameter, such as ForceUpgrade, you must use the format "parameter":"true".

### Output variables

</tr>
</tbody>
</table>

### Delete Address List activity

The Delete Address List activity removes an existing address list from an Exchange server.

This activity implements the Microsoft Exchange *Remove-AddressList* command.
To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Exchange Address List.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer on page 1923, which gives workflow administrators the ability to store input and output variables in the databus.

</table>

Get Address List activity

The Get AddressList activity retrieves all attributes from the specified Exchange address list.

This activity implements the Microsoft Exchange `Get-AddressList` command.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Exchange Address List.

Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer on page 1923, which gives workflow administrators the ability to store input and output variables in the databus.

### Move Address List activity

The Move Address List activity moves a Microsoft Exchange address list to another location in the address hierarchy.

This activity implements the Microsoft Exchange Move-AddressList command.

The Exchange server caches the changes from this activity but does not immediately apply them. Use the Update Address List activity after this activity to apply the changes or wait for the Exchange server to automatically apply cached changes.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Exchange Address List.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer on page 1923, which gives workflow administrators the ability to store input and output variables in the databus.

Set Address List activity

The Set Address List activity modifies a Microsoft Exchange address list.

Use the Optional parameters variable to pass specific values to the Microsoft Exchange server. This activity implements the Microsoft Exchange `Set-AddressList` command.

The Exchange server caches the changes from this activity but does not immediately apply them. Use the `Update Address List` after this activity to apply the changes or wait for the Exchange server to automatically apply cached changes.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Exchange Address List.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer on page 1923, which gives workflow administrators the ability to store input and output variables in the databus.

### Input variables

<table>
<thead>
<tr>
<th>Variables</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.</td>
</tr>
<tr>
<td>domain</td>
<td>The name of the Exchange server's assigned domain.</td>
</tr>
<tr>
<td>identity</td>
<td>Name of the address list to modify.</td>
</tr>
<tr>
<td>parameters</td>
<td>Optional parameters to pass to the Exchange server written in JavaScript Object Notation (JSON). Exchange activities cannot pass parameters that reference an object, such as a PSCredential object. Plain text is automatically converted to SecureString objects for parameters that require that data type. Attempting to save an activity that specifies duplicate parameters, including parameters from activity variables, or incorrectly formatted JSON causes a warning message to appear. <strong>Note:</strong> When passing a switch parameter, such as ForceUpgrade, you must use the format &quot;parameter&quot;:&quot;true&quot;.</td>
</tr>
</tbody>
</table>
**Output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>Either success or failure.</td>
</tr>
<tr>
<td>error</td>
<td>Error message if the operation fails.</td>
</tr>
</tbody>
</table>

**Conditions**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The activity succeeded in modifying the specified address list.</td>
</tr>
<tr>
<td>Failure</td>
<td>The activity failed to modify the specified address list.</td>
</tr>
</tbody>
</table>

**Update Address List activity**

The Update Address List activity adds or removes users from the specified address list and immediately applies any cached address list changes to the server.

Use the optional parameters variable to specify which users to add or remove. This activity implements the Microsoft Exchange `Update-AddressList` command.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Exchange Address List.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer on page 1923, which gives workflow administrators the ability to store input and output variables in the databus.

**Input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.</td>
</tr>
<tr>
<td>domain</td>
<td>The name of the Exchange server's assigned domain.</td>
</tr>
</tbody>
</table>
### Output variables

</thead>
<tbody>
<tr>
<td>result</td>
<td>Either Success or Failure.</td>
</tr>
<tr>
<td>error</td>
<td>Error message if the operation fails.</td>
</tr>
</tbody>
</table>

### Conditions

Table 744: Update Address List conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The activity succeeded in adding or removing users from the specified address list.</td>
</tr>
<tr>
<td>Failure</td>
<td>The activity failed to add or remove users from the specified address list.</td>
</tr>
</tbody>
</table>

### Create Mailbox activity

The Create Mailbox activity creates a new Active Directory user, if that user does not already exist, and a Microsoft Exchange mailbox for that user.

This activity implements the Microsoft Exchange `New-Mailbox` command.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Exchange Mailbox.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the `PowerShell`
activity designer on page 1923, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

<tr>
<td></td>
<td>succeeded in creating a new account.</td>
</tr>
<tr>
<td>Failure</td>
<td>The activity failed to create a new mailbox or an Active Directory account</td>
</tr>
<tr>
<td></td>
<td>for the specified user.</td>
</tr>
</tbody>
</table>

Delete Mailbox activity

The Delete Mailbox activity deletes the Microsoft Exchange mailbox of an Active Directory user.

Optional parameters determine how the Exchange server handles the mailbox after deleting the user. This activity implements the Microsoft Exchange `Remove-Mailbox` command.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Exchange Mailbox.

Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer on page 1923, which gives workflow administrators the ability to store input and output variables in the databus.
### Input variables

</tr>
</tbody>
</table>

Disable Mailbox activity

The Disable Mailbox activity disables the mailbox associated with a specified Active Directory account. This activity implements the Microsoft Exchange *Disable-Mailbox* command.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Exchange Mailbox.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the *PowerShell activity designer* on page 1923, which gives workflow administrators the ability to store input and output variables in the *databus*.

</tbody>
</table>

**Enable Mailbox activity**

The Enable Mailbox activity creates a new mailbox for an existing Active Directory user. This activity implements the Microsoft Exchange *Enable-Mailbox* command.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Exchange Mailbox.

Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated
activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the *PowerShell activity designer* on page 1923, which gives workflow administrators the ability to store input and output variables in the *databus*.

Get Mailbox activity

The Get Mailbox activity gets the mailbox for the specified user or all mailboxes on a Microsoft Exchange server.

This activity implements the Microsoft Exchange *Get-Mailbox* command.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Exchange Mailbox.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the *PowerShell activity designer* on page 1923, which gives workflow administrators the ability to store input and output variables in the *databus*.

<td>The activity failed to retrieve the attributes of the specified mailbox.</td>
</tr>
</tbody>
</table>

### Set Mailbox activity

The Set Mailbox activity modifies the settings of an existing Microsoft Exchange mailbox.

Use the optional parameters variable to pass specific values to the Exchange server. This activity implements the Microsoft Exchange *Set-Mailbox* command.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Exchange Mailbox.
Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer on page 1923, which gives workflow administrators the ability to store input and output variables in the databus.

F5 Network Management activity pack

Orchestration provides custom activities for configuring elements of an F5 load balancer, including pools, pool members, and the virtual servers contained in the pool.

All F5 custom activities are in the F5 Network Management Application scope and are activated by the Orchestration - F5 network management plugin, which must be activated by request.

ServiceNow provides custom F5 activities, built from the REST web service activity template, that you can use to perform the following tasks:

- Add, delete, or verify pools.
- Add, delete, or identify pool members.
- Add or delete virtual servers.
- Add a profile to a virtual server.
- Configure the virtual server for vlans, irules, pool, and persistence.

Add F5 Pool Member activity

The Add F5 Pool Member activity adds a member to an F5 load balancer pool.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

REST settings

- REST message: F5 POOL Membership Management
- REST function: post

Input variables

Table 763: Add F5 Pool Member input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PoolName</td>
<td>Name of this pool, such as testPool.</td>
</tr>
<tr>
<td>F5IPAddress</td>
<td>IP address of the F5 console.</td>
</tr>
</tbody>
</table>
Variable | Description
--- | ---
MemberName | Pool member IP address and port, such as 192.168.2.19:80.

### Output variables

</tr>
<tr>
<td>Failure</td>
<td>Activity failed to add an F5 load balancer pool member.</td>
</tr>
</tbody>
</table>

### Get F5 Pool Member activity

The Get F5 Pool Member activity returns the pool members and verifies the pool’s status. Use this activity to verify that a pool member was created properly.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

</tbody>
</table>

Check F5 Pool activity

The Check F5 Pool activity checks the status of a pool to determine if it is available to accept traffic. Use this activity to determine if a pool you just created is up and running with the proper configuration. This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

</table>
Infoblox DDI activity pack

This activity pack supports Infoblox DDI management through ServiceNow Orchestration.

The Infoblox DDI activity pack manages the IP addresses used in a network by integrating DNS and DHCP. Custom Orchestration activities use Infoblox Web API (WAPI) REST web services to access the Infoblox GRID server.

**Important:** Managing IP addresses through the Infoblox server requires a fully functional MID Server.

Starting with the Jakarta release, the Infoblox activity pack updates to version 2. This update supports Infoblox network views, which can restrict the visibility of network data. The view parameter can be passed as a query parameter or payload content, to do operations in a specific view. Version 2 also supports specifying the version of WAPI to use in integration endpoints.

Supported for Infoblox:

- WAPI version 2.0 for REST messages
- NIOS appliance version 7.0

**Note:** To use the Infoblox DDI activities and workflow, you must request activation of the Orchestration - Infoblox DDI Activity Pack plugin.

Create a REST credential for Infoblox activities

All Infoblox activities require a REST credential to manage IP addresses from the Infoblox DDI server.

Before starting this procedure, make sure you have the following:

- A properly configured and running Infoblox DDI Grid Server.
- REST credentials defined on the Infoblox DDI server.

Role required: admin

You must create a REST credential record on the ServiceNow instance that each Infoblox activity can use to access management features on the Infoblox server.

1. Navigate to Orchestration Credentials and click New.
2. In the list of credential types, select Basic Auth Credentials.
3. Create the credential record with a logical name, such as InfobloxCred.
4. Right-click in the header bar of your new credential record and select Copy sys_id from the context menu. Follow browser instructions to copy the sys_id if browser security measures restrict this function.
5. Paste the sys_id into the restCredentials input field of each activity you use.

Infoblox workflows

The Infoblox DDI activity pack includes two default workflows, one that reserves and registers IP addresses and another that releases IP addresses.

To access these workflows, navigate to Workflow Workflow Editor and select the Workflows tab. Click on a workflow to open it, and then click the information icon in the workflow header to display the properties dialog box.
Infoblox Reserve/Register IP in IPAM

Use this workflow to register IPv4 addresses or request the next available IP address on IPAM. Optionally, you can use it to register IP addresses on DNS. The custom Infoblox activities used in this workflow are:

- *IPAM Register IP Address*
- *IPAM Reserve IP Address*
- *Register DNS A-Record*
- *Get Network Details*

**Table 793: Infoblox Reserve/Register IP input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Infoblox Server</td>
<td>IP address of the Infoblox DDI server.</td>
</tr>
<tr>
<td>Network</td>
<td>Network containing the target IP address.</td>
</tr>
<tr>
<td>Zone</td>
<td>The DNS zone for the IP address being registered.</td>
</tr>
<tr>
<td>Rest Credentials</td>
<td>The sys_id of the REST credentials from the ServiceNow instance.</td>
</tr>
<tr>
<td>DNS Host Name</td>
<td>Name of the DNS server machine on which the IP address is being registered.</td>
</tr>
<tr>
<td>IPv4 Address</td>
<td>IP address being reserved or registered.</td>
</tr>
</tbody>
</table>

Infoblox Release IPAM Reservations

Use this workflow to release (delete) all the IPAM reservations associated with an IPv4 address. The custom Infoblox activities used in this workflow are:

- *IPAM List IP Reservations*
- *List DNS Record*
- *DNS Delete*
- *IPAM Delete*

**Table 794: Infoblox Release IPAM Reservations input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>

<td>Rest Credentials</td>
<td>The sys_id of the REST credentials from the ServiceNow instance.</td>
</tr>
<tr>
<td>IP to Delete</td>
<td>IP address to release.</td>
</tr>
<tr>
<td>Infoblox Server</td>
<td>IP address of the Infoblox DDI server.</td>
</tr>
</tbody>
</table>

Infoblox roles and permissions

Define the roles and permissions that the Infoblox activities need to access the various resources on the Infoblox server.
Admin groups

There are three types of admin groups on an Infoblox server:

- Superuser
- Default
- Limited Access

To perform specific operations on the Infoblox server, the Limited Access user must have a minimum set of privileges for the desired resources, using either the user interface or an API. These privileges are based on read and read/write access. For more information, refer to the "About Admin Groups" section in the Infoblox NIOS Administrator Guide.

Permission hierarchy

1. User: A user can be part of multiple groups.
2. Group: A group can have many roles.
3. Role: Each role consists of specific resource permissions.

Required permissions

The ServiceNow Infoblox activity pack requires appropriate read and read/write privileges for these resources:

- Network
- DHCP
- DNS
- IPAM

This example shows a default DHCP admin role, its resources, and the related permissions for each.

Infoblox DHCP activities

The Infoblox DHCP activities manage the IP addresses reserved for DHCP in your network.

Use these activities to reserve, list, or delete IP addresses that are used for DHCP assignment in your network.

**DHCP Reserve IP v4 Address Range activity**

The DHCP Reserve IP v4 Address Range activity reserves an IP address range for DHCP use.

The DHCP activities use the [REST web service activity template](#) to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI DHCP.

### Input variables

**Table 795: DHCP Reserve IP v4 Address Range input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>InfobloxServer</td>
<td>Name of the Infoblox DDI Grid Server.</td>
</tr>
<tr>

<tr>
<td>Failure</td>
<td>Activity failed to reserve the specified IPv4 address range.</td>
</tr>
</tbody>
</table>

**DHCP Delete IP Reservation activity**

The DHCP Delete IP Reservation activity deletes IP reservations in DHCP using either an IPv4 or IPv6 address range.

An automation can obtain an Infoblox DHCP object to delete from either of these activities:

- **DHCP List IP Reservations**
- **DHCP Reserve IPv4 Address Range**

The DHCP activities use the *REST web service activity template* to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI DHCP.

### Input variables

**DHCP List IP Reservations activity**
The DHCP List IP Reservations activity generates a list of all the DHCP range reservations on a specific InfoBlox server.

The DHCP activities use the REST web service activity template to manage IP addresses using an InfoBlox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities InfoBlox DDI DHCP.

### Infoblox DNS activities

The Infoblox DNS activities manage DNS records in your network using an Infoblox DDI Grid Server. Use these activities to register, list, or delete DNS records managed on an Infoblox server.
**List DNS C-records activity**
The List DNS C-records activity retrieves all canonical (CNAME) records from a specified Infoblox server.

The DNS activities use the REST web service activity template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI DNS.

**Input variables**

<table>

**Register DNS A-record activity**
The Register DNS A-record activity creates a DNS A record on a specified Infoblox server.

The DNS activities use the REST web service activity template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI DNS.

**Register DNS C-Record activity**

The Register DNS C-Record activity creates a DNS canonical (CNAME) record on a specified Infoblox server.

The DNS activities use the REST web service activity template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI DNS.

<td>host</td>
<td>Host machine with which the DNS record is associated.</td>
</tr>
<tr>
<td>ipv4addr</td>
<td>The reserved IPv4 address associated with a DNS record.</td>
</tr>
<tr>
<td>name</td>
<td>Name of the network option returned. For example, the name of the DNS record object from the reference example is cname.test.com.</td>
</tr>
<tr>
<td>view</td>
<td>The assigned view of the DNS data. A given zone can have multiple views, which are accessed depending on the IP address of the source of the query. The default view of DNS data for this activity is the network view.</td>
</tr>
<tr>
<td>error</td>
<td>Displays the message for any REST error encountered.</td>
</tr>
</tbody>
</table>

### Conditions

Table 815: List DNS Record conditions

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully listed all the available DNS record.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to list the available DNS record.</td>
</tr>
</tbody>
</table>

**DNS Delete activity**

The DNS Delete activity deletes DNS records of any type from in Infoblox server, such as C and A records.

The DNS activities use the _REST web service activity_ template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI DNS.

**Note:** It is faster to create a new record than recover one that has been deleted.

Infoblox IPAM activities

The Infoblox IPAM activities manage IP addresses in your network using an Infoblox DDI Grid Server.
Use these activities to register, reserve, list, or delete IP addresses.

**IPAM Register IP Address activity**

The IPAM Register IP Address activity registers an IP address in a network using Infoblox IPAM.

The output of this activity produces an InfoBlox IP address record that can be used for other IPAM functions in the format fixedaddress/<encrypted key>:<reserved ip address>/<view>.

The IPAM activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI IPAM.

### Input variables

**IPAM Reserve IP Address activity**

The IPAM Reserve IP Address activity reserves an IP address in a network using Infoblox IPAM. The output of this activity produces an InfoBlox IP address record that can be used for other IPAM functions in the format fixedaddress/<encrypted key>:<reserved ip address>/<view>.

The IPAM activities use the *(REST web service activity template)* to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI IPAM.

### Input variables

**IPAM List IP Reservations activity**

The IPAM List IP Reservations activity returns an array of all IP Address within the named InfoBlox Server.

The IPAM activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI IPAM .

### Infobloxx network activities

The Infobloxx network activities manage networks using an Infobloxx DDI Grid Server.

Use these activities to create, list, or delete networks on an Infobloxx server.

*Create Network activity*

The Create Network activity creates new networks on a specified Infobloxx server.

The network activities use the *REST web service activity template* to manage network addresses using an Infobloxx DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Infobloxx DDI Network.

### Input variables

Table 831: Create Network input variables

</table>

Get Network Details activity

The Get Network Details activity retrieves the information about a specific network on an Infoblox server. The network activities use the REST web service activity template to manage network addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities. To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI Network.

Input variables

Table 834: Get Network Details input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

*Delete Network activity*

The Delete Network activity deletes a network from an Infoblox server.

The network activities use the [REST web service activity template](#) to manage network addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI Network.

**Input variables**

List Registered Networks activity

The List Registered Networks activity retrieves all the networks associated with an Infoblox server.

The network activities use the REST web service activity template to manage network addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI Network.

Input variables

Table 840: Activity input variables

</tbody>
</table>

**PowerShell activity pack**

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications.

Orchestration provides custom PowerShell activities that were created with the PowerShell activity designer template. These activities perform the same functions as PowerShell activities by the same name from previous releases and replace those activities for all new workflows. These custom activities give workflow administrators the ability to store input and output variables in the **databus**.
Note: Existing workflows from earlier versions that were created with legacy PowerShell activities continue to function normally after an upgrade to Geneva. However, all new workflows must use these custom PowerShell activities.

Starting with the London release, there are the following updates to the PowerShell activity pack:

- A new PowerShell probe (V2), which takes advantage of IntegrationHub functionality
- The ability to insert debug statements in the PowerShell scripts and produce the resulting messages at runtime

To use the PowerShell custom activities, you must request activation of the Orchestration - PowerShell plugin. These activities are available in the Workflow Editor on the Custom tab. Expand the Custom Activities tree and select the PowerShell category for the activity you want to use.

ServiceNow supports PowerShell 2.0 and above. PowerShell 3.0 does not support Windows 2003 Server.

PowerShell activity designer

PowerShell activities are configured to return data to a workflow from a host using Microsoft PowerShell.

You must purchase Orchestration on page 1741 to use this template. For specific information about using the tools in the activity designer, refer to these resources:

- Orchestration activity designer on page 1990
- Create input variables on page 2000
- Create a parsing rule

ServiceNow supports PowerShell 2.0 and above. PowerShell 3.0 does not support Windows 2003 Server.

PowerShell protocols and troubleshooting

PowerShell uses the Windows Management Instrumentation (WMI) and Windows Remote Management (WinRM) protocols to enable Orchestration activities to run commands on remote Windows hosts.

Windows Management Instrumentation (WMI)

WMI provides a uniform interface for any local or remote applications or scripts that obtain management data from a computer system, a network, or an enterprise. WMI contains these components:

- Managed objects and WMI providers: A WMI provider is a COM object that monitors one or more managed objects for WMI. A managed object is a logical or physical enterprise component, such as a hard disk drive, network adapter, database system, operating system, process, or service.
- WMI infrastructure: The WMI infrastructure is a Microsoft Windows operating system component known as the WMI service (winmgmt). The WMI infrastructure is composed of the WMI Core and the WMI repository. The WMI repository is organized by WMI namespaces. The WMI service creates namespaces, such as root\default, root\cimv2, and root\subscription, at system startup and preinstalls a default set of class definitions, including the Win32 Classes, the WMI System Classes, and others. The remaining namespaces found on your system are created by providers for other parts of the operating system or products.
- WMI consumers: A WMI consumer is a management application or script that interacts with the WMI infrastructure. A management application can query, enumerate data, run provider methods, or subscribe to events by calling either the COM API or the Scripting API for WMI.

WMI installation and configuration
For the MID Server to successfully make a remote connection to the target host, TCP port 135 must be open. The Windows firewall automatically creates an inbound rule for WMI connectivity called Windows Management Instrumentation (DCOM-In).

**Windows Remote Management (WinRM)**

WinRM is the Microsoft implementation of WS-Management Protocol, a standard Simple Object Access Protocol (SOAP) protocol that allows hardware and operating systems from different vendors to interoperate.

WinRM contains these components:

- **WinRM Scripting API**: This scripting API enables Orchestration to obtain data from remote computers, using scripts that perform WS-Management protocol operations.
- **WMI Service**: The WMI service continues to run side-by-side with WinRM and provides requested data or control through the WMI plug-in. You can continue to obtain data from standard WMI classes, such as Win32_Process.

WinRM configuration

WinRM is automatically installed on Windows 2008 R2 and above operating systems, but must be configured before use.

1. In a command prompt, enter `winrm quickconfig`. This command is not case sensitive.
2. When the console displays `Make these changes [y/n]?`, enter `y`.

   The `winrm quickconfig` command performs the following operations:
   - Starts the WinRM service, and sets the service startup type to auto start.
   - Configures a listener for the ports that send and receive WS-Management protocol, using either HTTP or HTTPS on any IP address.
   - Creates a firewall exception for the current user profile.

*MID Server PowerShell files*

PowerShell functions are stored in script files (*.ps1) that use a PowerShell Script module (*.psm1) file name extension.

The PowerShell functions are used by the PowerShell MID Server script files included in these activity packs:

- Active Directory
- Exchange
- SCCM
- PowerShell

**PSScript.ps1**

This script performs a few tasks, such as credential testing, password encryption, and the execution of scripts configured in the Orchestration Activity Designer or in MID Script Files. However, this document focuses on how PSScript.ps1 uses the credential.psm1 module for testing access to remote hosts.

The PowerShell variables are generally used directly in the *PowerShell execution command* or as arguments in the MID Server script file you specify. There are special variables that are passed to PSScript.ps1, such as `credType`. 
Figure 377: Using credType in execution parameters

This record is in the System Center Configuration Manager (SCCM) application, but Global is the current application. To edit this record click here.
**PowerShell credTypes**

The PowerShell credential types:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WMI</td>
<td>testCredentialWMI</td>
</tr>
<tr>
<td>Exchange</td>
<td>testCredentialExchange</td>
</tr>
<tr>
<td>AD</td>
<td>testCredentialAD</td>
</tr>
<tr>
<td>SCCM</td>
<td>testCredentialSCCM</td>
</tr>
</tbody>
</table>

If no credential type is passed to the PSScrip.ps1 script, the MID Server defaults to the WMI test function to test access to the target host. If there is a credential type used, the MID Server runs the corresponding test function for that credential type.

**Exit codes**

These exit codes are returned from the PSScript.ps1 script and logged in the MID Server log file.

<table>
<thead>
<tr>
<th>Type</th>
<th>Test function</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>PowerShell command/script ran successfully.</td>
</tr>
<tr>
<td>1</td>
<td>Test finished successfully, but the command/script failed to execute.</td>
</tr>
<tr>
<td>2</td>
<td>Incorrect syntax passed to script.</td>
</tr>
<tr>
<td>3</td>
<td>All credentials including MID Server service account failed to execute command/script.</td>
</tr>
<tr>
<td>4</td>
<td>Passed test and executed the activity, but an error was returned. Example user cannot be found.</td>
</tr>
</tbody>
</table>

**DiagnosticsUtil.psm1**

The MID Server uses this module file to perform PowerShell logging that assists debugging any Orchestration activity using PowerShell scripting. You can also add debugging statements directly to custom scripts.
Table 844: PowerShell diagnostic utilities

<table>
<thead>
<tr>
<th>Utility</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SNCLog-DebugInfo</td>
<td>Log a debug message for a PowerShell script or PowerShell Orchestration activity. Examples:</td>
</tr>
<tr>
<td></td>
<td>• SNCLog-DebugInfo -message &quot;My debug message...&quot;</td>
</tr>
<tr>
<td></td>
<td>• SNCLog-DebugInfo &quot;My debug message&quot;</td>
</tr>
<tr>
<td>SNCLog-ParameterInfo</td>
<td>Log a function parameter value. For &quot;function getHostName{ param( [String] $target )&quot; , the first value to the PowerShell hashtable is a string to indicate which function executes, and the values for each of the function parameters. Examples:</td>
</tr>
<tr>
<td></td>
<td>• Function with single parameter: SNCLog-ParameterInfo @(&quot;Running getHostName&quot;, $target)</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The debug message shows, 'Running getHostName $target: [actual value of $target]'</td>
</tr>
<tr>
<td></td>
<td>• Function with multiple parameters: SNCLog-ParameterInfo @(&quot;Running functionName&quot;, $param1, $param2, $param3)</td>
</tr>
<tr>
<td>SNCObfuscate-Value</td>
<td>Use this utility to encrypt values for security purposes. The function displays &quot;$variableName&quot;:*** , where *** is the obfuscated value. Example:</td>
</tr>
<tr>
<td></td>
<td>• SNCObfuscate-Value $password</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The debug message reads: &quot;$password : ***&quot;</td>
</tr>
</tbody>
</table>

Credentials.psm1

The MID Server uses this module file to test access to a target host. The MID Server loops through all Windows credentials stored in its credentials table using the following access type functions, unless the PowerShell activity has a credential type (credType) defined. All ServiceNow® authored PowerShell activities are hard-coded to use a specific credential type. As a result, the MID Server only tests credential access against the designated function.

Table 845: PowerShell test functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>testCredentialWMI</td>
<td>Tests the given user and password on the target host using the Get-WMI object.</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>testCredentialAD</td>
<td>Tests the given user and password on the target host using the built-in DirectoryEntry object.</td>
</tr>
<tr>
<td>testCredentialExchange</td>
<td>Tests the given user and password to create a session on an Exchange host. This test uses the built-in PowerShell remoting feature on a remote host. WinRM is configured on Exchange servers by default.</td>
</tr>
<tr>
<td>testCredentialSCCM</td>
<td>Tests the given user and password to create a session on an SCCM server. This test uses the built-in PowerShell remoting feature on a remote host. This test requires WinRM to be configured.</td>
</tr>
<tr>
<td>testNoCredentialAccessWMI</td>
<td>Tests the given user and password on the target host, using the Get-WMI object. This test is used when no credType is used.</td>
</tr>
</tbody>
</table>

**Note:** If the test passes using one of these functions, that credential is used to run the PowerShell script/command. If the tests fail to access the target host using these functions, the MID Server runs the PowerShell script/command under the account of the MID Server service.

This diagram illustrates the dependency of the credential selection behavior on the host being targeted by the PowerShell activity. If the target host is the IP address or host name of the MID Server, the MID Server bypasses all credentials in the Credentials table and uses the account of the MID Server service. If the target host is not the MID Server, then all Windows credentials are used first. If all credentials in the Credentials table are unsuccessful in running the PowerShell activity, then the MID Server uses the MID Server service account.
Figure 378: PowerShell credential selection criteria
ActiveDirectory.psm1

This module file stores the functions used by the PowerShell scripts shipped with the *Active Directory* activity pack.

Exchange.psm1

This module file stores the functions used by the PowerShell scripts shipped with the *Exchange* activity pack.

SCCM.psm1

This module file stores the functions used by the PowerShell scripts shipped with the *SCCM* activity pack.

Set up credential tags for a PowerShell activity

Credential tagging gives an administrator more control over the credentials used in a PowerShell activity.

Role required: admin, activity_creator or workflow_admin

Tagging is useful when the activity requires specific credentials to perform a task. By populating the Credential tag field you are telling the activity to use a credential that has a specific tag set for it. Additionally, credential tagging allows you to use a different underlying credential in development, testing, and production systems without having to change the activity for a given target system. For example, you can use the SCCMCred tag and have it point to both a development and test instance.

1. Navigate to Orchestration Credentials .
2. Select the credential you want to tag.
3. Enter a unique name in the Tag field that is descriptive of the credentials purpose.
4. Click Update.
5. Open the Workflow Editor and select the PowerShell activity you want to tag.
6. In the activity's Execution Command, add the name of the tag you created to the Credential tag field.
Figure 380: Adding a credential tag to an activity

**PowerShell troubleshooting**

Authentication and access denied errors can prevent PowerShell activities from running a command on a target host.

Use these procedures for troubleshooting authentication failures with Orchestration PowerShell activities and when the Remote Procedure Call (RPC) server is unavailable or when access is denied. The authentication failure error displays when all credentials, including those of the local MID Server service account, do not have the correct permissions to run the Powershell script/command. The same error displays when the target host is unreachable.

**Figure 381: Authentication error message**

Authentication failure in an Active Directory activity

This example uses the Create AD Object activity to illustrate troubleshooting authentication failure in PowerShell.

Role required: Permissions to access and create accounts on Active Directory

Validate that the account you are using has the proper permissions to run the activity.

1. Log on to the target machine using the account under which you want to run the activity.
   
   Active Directory tools must be installed on this machine.

2. Launch the Active Directory Users and Computers application.

3. Navigate to the OU under which you want to create the Active Directory object.

4. Attempt to create the object.

   If this procedure is successful under the specified user, the following might be the cause of the authentication failure:

   • User name is invalid.
   • Password entered incorrectly.
   • Domain controller is unreachable.

**Note:** The majority of the return codes listed in the MID Server log for this error are 1s and 3s. This is because the Active Directory activities use the ADSI provider and not WMI or WinRM. An error code of 1 means the account was able to connect with the test account, but running the script failed.
An error code of 3 means that the MID Server attempted to run the PowerShell activity under the MID Server service account but failed.

```
Attempting to use credential with username service-now\joe1.zamallo
Running command: -> C:\windows\System32\windowspowershell\v1.0\powershell\PSScript.ps1' --computer '10.11.144.230' --script 'C:\Users\j
useCred $true -isDiscovery $false -debug $true; exit $LASTEXITCODE'}
Thread name is Powershell is executing...
The exit value from waitFor() is 1
The status code returned from running the command is 1
```

Authentication failure in an Exchange activity

This example uses the Create Mailbox activity to illustrate troubleshooting authentication failure in PowerShell.

Role required: Permissions to access and create mailboxes on the Exchange server

1. Validate that the account you are using has the proper permissions to run the PowerShell activity.
2. Log on to a machine that has the Exchange Management Shell (EMS) installed.
3. Create a user using the New-mailbox Exchange commandlet.
If this procedure is successful under the specified credential, the following is the likely cause of the failure:

- User name is invalid.
- Password entered incorrectly.
- Exchange server is unreachable.

4. If the Exchange server is unreachable, examine the MID Server logs. Because the Exchange activities use WinRM to access the Exchange server, the logs can provide more troubleshooting information.

![Remote Procedure Call (RPC) server unavailable or access denied](image)

**Remote Procedure Call (RPC) server unavailable or access denied**

Typically, this error is logged when running a PowerShell script/command that uses WinRM or WMI.

**Possible causes of error**

The target host might have one of these issues:

- WinRM isn’t configured.
- Firewall is blocking access to the host over TCP port 135 (WMI) or HTTP/HTTPs and TCP port 5985 (WinRM).
- Kerberos issue, caused by hopping to multiple hosts using WMI.
Example WinRM error

The Create Mailbox activity from the Exchange activity pack has generated an error in the ECC queue involving authentication using the MID Server service credential. This occurred because the MID Server credential is the last to be used if the targeted host is not the MID Server.

Figure 383: Authentication failure error message

The MID Server log shows that the MID Server tried to run the activity under specific credentials, but wasn’t successful and received an exit code of 1.

Figure 384: MID Server error code
Join Domain activity

The Join Domain activity joins a Windows computer to a domain.

If the computer is already a member of a domain, this activity completes without modifying the computer. Joining a domain requires a username and password. This user must have domain administration privileges or privileges to join a computer to the domain.

**Note:** This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the **PowerShell activity designer** on page 1923, which gives workflow administrators the ability to store input and output variables in the **databus**.

**Input variables**

**Table 846: Join Domain input variables**

<table>
<thead>
<tr>
<th>Variables</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>Hostname or IP address of the Windows server that is joining the domain.</td>
</tr>

<td>The activity failed to join the computer to the domain.</td>
</tr>
</tbody>
</table>

Install Windows App activity

The Install Windows App activity installs an application from an MSI package on a Windows target machine.

**Note:** This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the *PowerShell activity designer* on page 1923, which gives workflow administrators the ability to store input and output variables in the *databus*.

Input variables

Table 849: Install Windows App input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>Hostname or IP address of the target Windows machine on which the service is installed. Use the Resolve DNS <em>MID Server capability</em> to resolve hostnames into IP addresses.</td>
</tr>
<tr>
<td>installerpath</td>
<td>Path to the installer. The installer can be on any machine that is visible to both the MID Server and the target machine (local drive, UNC path, mapped drive, etc.).</td>
</tr>
<tr>
<td>installer</td>
<td>Name of the installer file, such as winzip150.msi. The installer must be an MSI package.</td>
</tr>
<tr>
<td>arguments</td>
<td>The parameter that contains the command line arguments to the MSI package. These are name=value pairs, separated by a space. For example, the argument might appear as: INSTALLDIR=c:\myinstallfolder ADDDESKTOPICON=0. These arguments are dependent on what the actual MSI being installed defines. If there are no arguments, leave the field empty.</td>
</tr>
</tbody>
</table>
Output variables

<td>Either success or failure.</td>
</tr>
<tr>
<td>errorMessage</td>
<td>The executionResult.errorMessages from the Activity designer parsing sources</td>
</tr>
</tbody>
</table>

Conditions

The activity state tells the workflow engine what to do with the activity.

Table 851: Install Windows App conditions

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The Windows application was successfully installed on the target machine.</td>
</tr>
<tr>
<td>Failure</td>
<td>The Windows application failed to install on the target machine</td>
</tr>
</tbody>
</table>

Enable WMI Windows Installer provider

To install software on Windows machines using the Install Windows App activity, enable WMI Windows Installer provider on all target machines.

- It is recommended that the MID Server, the target machine, and the installer source machine be on the same Active Directory domain. However, if these computers are on separate domains, those domains must have a trust relationship established between them.
- If the installer path is a UNC file sharing machine, the Active Directory account of the target computer must be trusted for delegation. For instructions on this configuration, see the posting on the community for installing and uninstalling Windows applications.

Note: See WMI Providers for a list of Windows operating systems that provide this tool by default.

1. Open the Control Panel.
2. Go to Add or Remove Programs.
3. Select Add/Remove Windows Components.
   This action opens a secondary window displaying additional selections.
5. Select WMI Windows Installer Provider check box.
6. Click OK to return to the Windows Components Wizard window.
7. Click Next.
   You might be asked for the Windows installation CD to complete this process.
Change Service State activity

The Change Service State activity starts or stops a Windows service on a remote system.

This activity replaces a Powershell activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the Powershell activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Input Variables

Table 852: Change Service State input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>Hostname or IP address of the target Windows machine on which the service is installed. Use the Resolve DNS activity to resolve hostnames into IP addresses.</td>
</tr>
<tr>
<td>service</td>
<td>Name of the Windows service to start or stop. The service parameter is the service name, not the display name of the service affected.</td>
</tr>
<tr>
<td>state</td>
<td>There are two actions to select for a service state change: StartService or StopService.</td>
</tr>
</tbody>
</table>

Output variables

</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The target service was successfully started or stopped.</td>
</tr>
<tr>
<td>Failure</td>
<td>The update to the target service was unsuccessful, or the service was not found on the target system.</td>
</tr>
</tbody>
</table>
Restart Windows Server activity

The Restart Windows Server activity stops and then restarts a Windows server using PowerShell.

**Note:** This activity replaces a PowerShell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity template, which gives workflow administrators the ability to store input and output variables in the databus.

**Input variables**

**Table 855: Restart Windows Server input variables**

</tr>
</tbody>
</table>

Uninstall Windows App activity

The Uninstall Windows App activity uninstalls an application from a Windows target machine.
The only applications that can be uninstalled using this activity are those that were installed by a Windows Installer.

**Note:** This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the **Powershell activity template**, which gives workflow administrators the ability to store input and output variables in the ***databus***.

### Input variables

</tbody>
</table>
Probe activity pack

Orchestration provides an activity pack customized using the ServiceNow activity designer that runs probes on target hosts to return specific information.

These custom activities were built with the Create a probe activity on page 2083, which gives workflow administrators the ability to store input and output variables in the databus.

To use the custom probe activities, you must request activation of the Orchestration - Probe plugin.

Resolve DNS Name activity

The Resolve DNS Name activity takes an IP address or a fully qualified domain name (FQDN), which it resolves into one or more IP addresses.

The domain name is sent through the MID Server to the domain name system (DNS) to resolve the name. If a single IP address is returned, it is stored in two variables: resolved_ip and resolved_ips. If multiple IP addresses are returned, the first IP address is stored in the resolved_ip variable, and all the addresses are stored in the resolved_ips variable. If an IP address is provided instead of an FQDN, this address is output directly to both variables. Your ServiceNow instance must have access to a MID Server configured to use Resolve DNS to run this activity.

This activity replaces an activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the Probe activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

</tbody>
</table>

SNMP Query activity

The SNMP Query activity queries an SNMP device.

Your ServiceNow instance must have access to a MID Server configured to use SNMP to run this activity. This activity replaces an activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the Probe activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Table 864: SNMP Query input variables

<table>

</tbody>
</table>

SCCM activity pack

The Microsoft System Center Configuration Management (SCCM) activity pack provides Orchestration activities you can use to manage software deployments and collections on an SCCM server.

You can use SCCM Orchestration activities to deploy and revoke software from an SCCM server or manage user and device collections. The system manages software on an SCCM server using Orchestration activities and workflows.

Client software distribution requires:

- SCCM 2012 R2 and later.
- Powershell 3.0.
- Powershell Remoting enabled.
- The Windows PowerShell x86 execution policy must be set to unrestricted mode.
- Latest version of the SCCM cmdlet library installed on the SCCM server.
- Use the credentials to log onto the SCCM Server and connect via Windows PowerShell from the System Center Configuration Manager console at least once to set the path variable for that credential.

Activate SCCM activities

The Orchestration - System Center Configuration Manager plugin installs the SCCM activity pack that deploys software from an SCCM host and manages user and device collections.

The SCCM plugin is activated automatically when the Orchestration - Client Software Distribution [com.snc.orchestration.sccm_mgmt] plugin is activated, but can be activated separately.

**Note:** The activities in the SCCM plugin run in the System Center Configuration Manager scope.

1. In the HI Service Portal, click Service Requests Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
</tbody>
</table>
Specify the date and time you would like this plugin to be enabled

<table>
<thead>
<tr>
<th>Date and time must be at least 2 business days from the current time.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong> Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.</td>
</tr>
</tbody>
</table>

Reason/Comments

| Provide any information that would be helpful for the ServiceNow personnel activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows. |

3. Click Submit.

Configure the MID Server for SCCM activities

To use a MID Server with Microsoft System Center Configuration Management (SCCM) activities, configure it to communicate with the SCCM server.

Role required: admin

1. In the navigation filter, enter cmdb_ci_dns_name.list.
2. Click New.
3. Enter the fully-qualified domain name (FQDN) of the SCCM server in the Name field.
4. Right-click in the form header and select Save.
5. In the IP Address related list, click New.
6. In the IP Address field, enter the IP address of the SCCM server.
7. In the Nic field, select eth0 or your preferred network interface controller.
8. Leave the Netmask field blank.
9. Click Submit.

Add to Device Collection activity

The Add to Device Collection activity adds the specified device into a Microsoft System Center Configuration Manager (SCCM) device collection.

The Add to Device Collection activity uses the *Powershell activity template* to add a specified device to an SCCM device collection. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called AddToDeviceCollection.ps1 to edit the collection.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities System Center Configuration Manager (SCCM).

---

**Note:** The Add to Device Collection activity does not use pre-processing or post processing scripts.
Input variables

</tr>
</tbody>
</table>

Add to User Collection activity

The Add to User Collection activity adds a user to a Microsoft System Center Configuration Manager (SCCM) user collection.

The Add to User Collection activity uses the PowerShell activity template to access the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called AddToUserCollection.ps1 to edit the collection.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities System Center Configuration Manager (SCCM).

**Note:** The Add to User Collection activity does not use pre-processing or post processing scripts.

### Get Applications activity

The Get Applications activity returns a list of all the applications available on a Microsoft System Center Configuration Manager (SCCM) server.

The Get Applications activity uses the *Powershell activity template* to access the applications on the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called GetApplications.ps1. This script filters the results of the GET, so that only specific attributes are returned for the applications on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable application data. The list of available applications is returned as an array in a JSON object.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities System Center Configuration Manager (SCCM).
Note: The Get Applications activity does not use a pre-processing script.

**Input variables**

Table 873: Get Applications input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sccmServer</td>
<td>The fully qualified domain name (FQDN) of the SCCM server.</td>
</tr>
</tbody>
</table>

**Output variables**

The output variables for the Get Applications activity contain an array of objects called applications and an error message. Each object in the array contains the attributes in this table.

Get Deployments activity

The Get Deployments activity returns the list of deployments performed by Orchestration using a Microsoft System Center Configuration Manager (SCCM) server.

The Get Deployments activity uses the Powershell activity template to access the deployments on the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called GetDeployments.ps1 that returns the deployments on the host. This script filters the results of the GET, so that only specific attributes are returned for the deployments on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable deployment data. The list of available deployments is returned as an array in a JSON object.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities System Center Configuration Manager (SCCM).

*Note:* The Get Deployments activity does not use pre-processing scripts.

Get Device Collections activity

The Get Device Collections activity returns the list of available device collections on a Microsoft System Center Configuration Manager (SCCM) host.

The Get Device Collections activity uses the *Powershell activity template* to access the collections on the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called `GetDeviceCollections.ps1` that returns the device collections on the server. This script filters the results of the GET, so that only specific attributes are returned for the device collections on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable device collection data. The list of available collections is returned as an array in a JSON object.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities System Center Configuration Manager (SCCM).

Get User Collections activity

The Get User Collections activity returns the list of available user collections on a Microsoft System Center Configuration Manager (SCCM) server.

The Get User Collections activity uses the *Powershell activity template* to access the user collections on the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called GetUserCollections.ps1 that returns the user collections on the host. This script filters the results of the GET, so that only specific attributes are returned for the user collections on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable user collection data. The list of available collections is returned as an array in a JSON object.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities System Center Configuration Manager (SCCM) .

**Note:** The Get User Collections activity does not use pre-processing scripts.

Is Device in Collection activity

This activity verifies if a device exists in an SCCM device collection.

The Is Device in Collection activity uses the PowerShell activity template to verify if a specific device exists in an SCCM device collection. The activity is configured to use a MID Server with PowerShell capabilities and to run a MID Server script called IsDeviceInCollection.ps1 to perform the test.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities System Center Configuration Manager (SCCM).

Remove from Device Collection activity

The Remove from Device Collection activity removes a device from a Microsoft System Center Configuration Manager (SCCM) device collection.

The Remove from Device Collection activity uses the `Powershell activity template` to remove a device from a device collection on a Microsoft SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called `RemoveFromUserCollection.ps1` to edit the collection.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities System Center Configuration Manager (SCCM).

SFTP File Transfer activity pack

Use the SFTP File Transfer activities to manage files and directories on an SFTP server and to move files from one SFTP server to another.

The SFTP activity pack includes scoped activities for common file transfer tasks and a ready-to-use workflow that includes these activities. Use the SFTP workflow to control which files are going to be moved, what conditions the files need to meet, the order in which the files are moved, and which overwrite options are executed.

Note: To use the SFTP File Transfer activities and workflow, you must request activation of the Orchestration - SFTP plugin.
SFTP File Transfer workflow

The SFTP File Transfer activity pack includes a scoped workflow that uses multiple activities to manage files on SFTP servers.

The maximum activity count for the SFTP File Transfer workflow is set to 10,000. This allows the workflow to move up to 1000 files from one server to another.

Accessing the workflow

- Navigate to Workflow Workflow Editor and select the Workflows tab.
- Click on the SFTP File Transfer workflow to open it.
- Click the information icon in the workflow header to display the properties dialog box.

Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source host</td>
<td>Name or IP address of the server containing the files you want to move.</td>
<td></td>
</tr>
<tr>
<td>Source port</td>
<td>Port number to use to communicate with the source server.</td>
<td>22</td>
</tr>
<tr>
<td>Source directory</td>
<td>Full path to the directory where the source files are located.</td>
<td></td>
</tr>
<tr>
<td>Source files</td>
<td>Names of specific source files to move. Separate the file names in this list with semi-colons. This field supports the use of wild cards. For information about how the values in this field are affected by options in other fields, see the section below the table.</td>
<td></td>
</tr>
<tr>
<td>Excluded files</td>
<td>Names of specific source files to exclude from the move. The system moves all other files found in the source directory or subfolders. Separate the file names in this list with semi-colons. This field supports the use of wild cards. For information about how the values in this field are affected by options in other fields, see the section below the table.</td>
<td></td>
</tr>
</tbody>

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target host</td>
<td>Name or IP address of the server to which the files are being moved.</td>
<td></td>
</tr>
<tr>
<td>Target port</td>
<td>Port number to use to communicate with the target host.</td>
<td>22</td>
</tr>
<tr>
<td>Datetime format</td>
<td>Timestamp format to apply when the $[DateTime]$ variable is used in the Target directory or Target files field. The system uses the current time from the instance to create timestamp values.</td>
<td>yyyy-MM-dd</td>
</tr>
<tr>
<td>Target directory</td>
<td>Path to the directory in the target host where the files are being moved. You can specify a target directory whose name includes the timestamp by adding the $[DateTime]$ variable to the directory name. For example, you might enter this path to a target directory: /user/jacinto.gawron/documents/projects_ $[DateTime]$. This produces the projects_20150505 directory. When the timestamp variable is used, the system uses the format specified in the Datetime format field.</td>
<td></td>
</tr>
<tr>
<td>Variable</td>
<td>Description</td>
<td>Default value</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------------</td>
</tr>
</tbody>
</table>
| Target file                    | Format to use for target file names when a timestamp is added. You can configure the system to add the timestamp as a prefix to the file name or insert the timestamp into the name, using these variables:  
  • \$[DateTime]: Current timestamp, using the format defined in the Datetime format field.  
  • \$[SourceFile]: Complete file name.  
  • \$[SourceFile:Base]: Base file name without the extension.  
  • \$[SourceFile:Ext]: File extension only.  
  A target file name with the timestamp added as a prefix is expressed as: \$[DateTime]_\$[SourceFile]. This produces a file name that looks like this: 20150505_file1.txt  
  A target file name with the timestamp inserted into the name is expressed as: \$[SourceFile:Base]_\$[DateTime]$_[SourceFile:Ext]. This produces a file name that looks like this: file1_20150505.txt | false         |
<p>| Apply move conditions          | Check box to apply conditions to the file transfer. If this check box is selected, additional fields appear for setting conditions.                                                                                                                                                                                                                     | false         |
| Minimum file size, in bytes    | Condition that defines a target file's minimum size requirement. This setting can help determine if the file is valid. This field appears when the Apply move conditions check box is selected.                                                                                                                                                                | 0             |
| Maximum file size, in bytes    | Condition that defines a target file's maximum size requirement. This field appears when the Apply move conditions check box is selected.                                                                                                                                                                                                   | -1            |</p>

**File selection logic**

When selecting the files to move from the source host, the system uses this logic:

- If the Source files and Excluded files fields are empty, the system moves all the files in the source directory.
- When the Include subfolders check box is selected, the following dependencies exist:
  - If no files are specified in the Source files and Exclude files fields, the system moves all files in the source directory and all files in all subfolders of the source directory.
  - If the Source files field contains file names, the system moves those files from their location on either the source directory or any of its subfolders.
  - If the Exclude files field contains file names, the system moves all the files from the source directory and its subfolders except those excluded files.
- When the Include subfolders check box is cleared, the system looks only in the source directory for files to move or exclude.

**Copy File activity**

The Copy File activity copies a file from an SFTP server (source host) to another SFTP server (target host).

**Input variables**

**Table 898: Copy File input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sourceHost</td>
<td>Name or IP address of the server containing the files you want to transfer.</td>
</tr>
<tr>
<td>sourcePort</td>
<td>Port number to use to communicate with the source server. The default port number is 22.</td>
</tr>
<tr>
<td>sourceFilePath</td>
<td>Full path to the file to copy from the source host.</td>
</tr>
<tr>
<td>targetHost</td>
<td>Name or IP address of the server to which you want to move the files.</td>
</tr>
<tr>
<td>targetPort</td>
<td>Port number to use to communicate with the target server. The default port number is 22.</td>
</tr>
<tr>
<td>targetFilePath</td>
<td>Full path to the copied file on the target host.</td>
</tr>
</tbody>
</table>
Variable | Description
---|---
tempFileSuffix | Temporary suffix to use when moving a file. If this field contains a value, the activity deletes the duplicate target file, if it exists, and then copies the source file to a temporary file using targetFilePath + tempFileSuffix as the name. Upon completion, the activity renames the file to the actual target file name. If this field is blank, the activity copies the source file directly to the target file and overwrites it, if it already exists.
sourceCredentialTag | Specific credential alias this activity must use to run SSH commands on the source host.
targetCredentialTag | Specific credential tag this activity must use to run SSH commands on the target host.

Output variables

Table 899: Copy File output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>errorMessages</td>
<td>The executionResult.errorMessages from the Activity designer parsing sources on page 2018. If this variable is not null, the operation has failed.</td>
</tr>
<tr>
<td>result</td>
<td>Text message advising that the command was executed successfully.</td>
</tr>
</tbody>
</table>

Conditions

<td>The activity failed to create the directory.</td>
</tr>
</tbody>
</table>

Get File List activity

The Get File List activity returns a list of files from a given directory and its subdirectories on an SFTP server (source host).
### Input variables

**Table 904: Get File List input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sourceHost</td>
<td>Name or IP address of the server containing the files you want to list.</td>
</tr>
<tr>
<td>sourcePort</td>
<td>Port number to use to communicate with the target server. The default port number is 22.</td>
</tr>
<tr>
<td>sourceDirectory</td>
<td>Path to the target directory containing the files to list.</td>
</tr>
<tr>
<td>sourceFiles</td>
<td>List of target files to return. This is a comma separated list that accepts wildcards, such as *.txt.</td>
</tr>
<tr>
<td>excludedFiles</td>
<td>List of target files to exclude. This is a comma separated list that accepts wildcards, such as *.txt.</td>
</tr>
<tr>
<td>includeSubfolders</td>
<td>True/false variable that determines if files from subfolders are included in the list. The default value for this variable is false.</td>
</tr>
<tr>
<td>sourceCredentialTag</td>
<td>Specific credential alias this activity must use to run SSH commands on the host.</td>
</tr>
</tbody>
</table>

### Output variables

**Table 905: Get File List output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>errorMessage</td>
<td>The executionResult.errorMessages from the Activity designer parsing sources on page 2018. If this variable is not null, the operation has failed. An activity can examine the error message to customize a condition. For example, if the error message contains NO_SUCH_FILE, the activity can be considered successful, depending on circumstances.</td>
</tr>
<tr>
<td>result</td>
<td>List of requested files, returned as a JSON string.</td>
</tr>
</tbody>
</table>
Conditions

Table 906: Get File List conditions

<tr>
<td>Failure</td>
<td>The activity failed to list the requested files.</td>
</tr>
</tbody>
</table>

Remove File or Directory activity

The Remove File or Directory activity removes a file or a directory on an SFTP server, including subdirectories, when configured.

Input variables

Table 907: Remove File or Directory input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sourceHost</td>
<td>Name or IP address of the server containing the files you want to remove.</td>
</tr>
<tr>
<td>sourcePort</td>
<td>Port number to use to communicate with the target server. The default port number is 22.</td>
</tr>
<tr>
<td>sourceFilePath</td>
<td>Full path to the file or directory to remove. To remove multiple files or directories using a single activity, enter a semicolon-separated list of paths in this field.</td>
</tr>
<tr>
<td>isDirectory</td>
<td>True/false variable that determines if the specified file path is a directory. The default value for this variable is false.</td>
</tr>
<tr>
<td>includeSubfolders</td>
<td>True/false variable that determines if the given directory and all of its subfolders should be removed. The default value for this variable is false. If the value for this field is false, then the activity can only remove an empty directory. This field appears when the isDirectory checkbox is selected.</td>
</tr>
<tr>
<td>sourceCredentialTag</td>
<td>Specific credential alias this activity must use to run SSH commands on the host.</td>
</tr>
</tbody>
</table>
Output variables

Table 908: Remove File or Directory output variables

<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The activity succeeded in removing the file or directory specified.</td>
</tr>
<tr>
<td>Failure</td>
<td>The activity failed to remove the file or directory specified.</td>
</tr>
</tbody>
</table>

Rename File or Directory activity

The Rename File or Directory activity renames a file or directory to a new name on an SFTP server.

Input variables

Table 910: Rename File or Directory input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sourceHost</td>
<td>Name or IP address of the server containing the file or directory you want to rename.</td>
</tr>
<tr>
<td>sourcePort</td>
<td>Port number to use to communicate with the target server. The default port number is 22.</td>
</tr>
<tr>
<td>sourceFilePath</td>
<td>Full path to the file or directory to rename.</td>
</tr>
<tr>
<td>Variable</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>targetFilePath</td>
<td>Full path to the renamed file or directory.</td>
</tr>
<tr>

<td>Specific credential alias this activity must use to run SSH commands on the host.</td>
</tr>
</tbody>
</table>

### Output variables

#### Table 911: Rename File or Directory output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>errorMessages</td>
<td>The executionResult.errorMessages from the Activity designer parsing sources on page 2018. If this variable is not null, the operation has failed.</td>
</tr>
<tr>
<td>result</td>
<td>A message saying that the operation has been successful. For example, you might see: Rename /tmp/sftp_test/subdir1 to /tmp/sftp_test/subdir2 complete.</td>
</tr>
</tbody>
</table>

### Conditions

#### Table 912: Rename File or Directory conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The activity succeeded in renaming the file or directory.</td>
</tr>
<tr>
<td>Failure</td>
<td>The activity failed to rename the file or directory.</td>
</tr>
</tbody>
</table>

### Set File Attributes activity

The Set File Attributes activity sets common file attributes, such as timestamps, size, permissions, and UID/GID, for a file or directory on an SFTP server.

A good practice is to use the Get File List activity to return a list of files and their attributes first. Then, when you moved a file from a source host to a target host, use the Set File Attributes activity to set the source file attributes on the target file. This is demonstrated in the SFTP File Transfer workflow.
## Input variables

**Table 913: Set File Attributes input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sourceHost</td>
<td>Name or IP address of the server containing the file or directory whose attributes you want to change.</td>
</tr>
<tr>
<td>sourcePort</td>
<td>Port number to use to communicate with the target server. The default port number is 22.</td>
</tr>
<tr>
<td>sourceFilePath</td>
<td>Full path to the file or directory whose attributes you want to change.</td>
</tr>
<tr>
<td>userID</td>
<td>User ID attribute to apply to the file or directory. The UID and GUID variables must be set together as a pair.</td>
</tr>
<tr>
<td>groupID</td>
<td>Group ID attribute to apply to the file or directory. The UID and GUID variables must be set together as a pair.</td>
</tr>
<tr>
<td>permissions</td>
<td>File or directory permissions to set for the user and group specified. This value must be expressed as an integer, such as 16877, which defines these permissions: rwxr-xr-x.</td>
</tr>
<tr>
<td>accessTimestamp</td>
<td>Override the timestamp when the file or directory was last accessed. The access and modification timestamps must be set together as a pair.</td>
</tr>
<tr>
<td>modificationTimestamp</td>
<td>Override the timestamp when the file or directory was last modified. The access and modification timestamps must be set together as a pair.</td>
</tr>
<tr>
<td>sizeInBytes</td>
<td>Size of the file or directory, expressed in bytes.</td>
</tr>
<tr>
<td>sourceCredentialTag</td>
<td>Specific credential alias this activity must use to run SSH commands on the host.</td>
</tr>
</tbody>
</table>
Output variables

Table 914: Set File Attributes output variables

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The activity succeeded in changing the attributes of the specified file or directory.</td>
</tr>
<tr>
<td>Failure</td>
<td>The activity failed to change the attributes of the specified file or directory.</td>
</tr>
</tbody>
</table>

SSH activity pack

Orchestration provides an activity pack of SSH activities that were customized using the ServiceNow activity designer.

These activities perform the same functions as SSH activities by the same name from previous releases and replace those activities for all new workflows. The custom SSH activities were built with the Create an SSH activity on page 2088, which gives workflow administrators the ability to store input and output variables in the databus.

Note: Existing workflows from earlier versions that were created with legacy SSH activities continue to function normally after an upgrade to Geneva. However, all new workflows must use these custom SSH activities.

To use the SSH custom activities, you must request activation of the Orchestration - SSH plugin.

Secure Copy activity

The Secure Copy activity copies a file from one host to another, without storing the copied file on the MID Server.

This activity replaces an SSH activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity designer template, which gives workflow administrators the ability to store input and output variables in the databus.
**Input variables**

Table 916: Secure Copy input variables

<table>
<thead>
<tr>
<th>Input variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>from_host</td>
<td>Host name or IP address of the source machine.</td>
</tr>
<tr>
<td>from_scp_file</td>
<td>Name of the file to copy, including the absolute path.</td>
</tr>
<tr>
<td>to_host</td>
<td>Host name or IP address of the target machine.</td>
</tr>
<tr>
<td>to_scp_file</td>
<td>Path to the target file. This path can be absolute or relative to the logged in user's home directory.</td>
</tr>
<tr>
<td>debug_mid</td>
<td>Check box that enables debug logging when selected.</td>
</tr>
<tr>
<td>debug_ssh</td>
<td>Check box that enables J2SSH debug logging when selected.</td>
</tr>
</tbody>
</table>

**Output variables**

Table 917: Secure Copy output variables

<table>
<thead>
<tr>
<th>Output variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>payload</td>
<td>The executionResult.payload from the Activity designer parsing sources on page 2018.</td>
</tr>
<tr>
<td>output</td>
<td>The executionResult.output from the parsing sources.</td>
</tr>
</tbody>
</table>

**Conditions**

Table 918: Secure Copy conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully copied the file from one host to another.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to copy the file from one host to another.</td>
</tr>
</tbody>
</table>

**Files Compare activity**

The Files Compare activity compares two files on a Linux or UNIX computer.

This activity replaces an SSH activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this
activity. This activity was built with the *SSH activity designer template*, which gives workflow administrators the ability to store input and output variables in the *databus*.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Global Orchestration - SSH.

### Input variables

**Table 919: Files Compare input variables**

<table>
<thead>
<tr>
<th>Input variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>Hostname or IP address of the destination server for SSH activity.</td>
</tr>
<tr>
<td>Directory</td>
<td>Name of the working directory.</td>
</tr>
<tr>
<td>OldFile</td>
<td>Name of the first file to compare.</td>
</tr>
<tr>
<td>NewFile</td>
<td>Name of the second file to compare.</td>
</tr>
</tbody>
</table>

### Output variables

**Table 920: Files Compare output variables**

<table>
<thead>
<tr>
<th>Output variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>contents</td>
<td>File comparison result. This is the difference of the two compared files.</td>
</tr>
<tr>
<td>result</td>
<td>Either success or failure.</td>
</tr>
<tr>
<td>return-code</td>
<td>Either 0, if the two files are the same, or 1, if the two files are different.</td>
</tr>
<tr>
<td>errorMessage</td>
<td>The executionResult.errorMessages from the <em>Activity designer parsing sources</em> on page 2018.</td>
</tr>
</tbody>
</table>

### Conditions

**Table 921: Files Compare conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully compared the specified files.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity could not compare the specified files.</td>
</tr>
</tbody>
</table>

**File Read activity**

The File Read activity reads a file on a Linux or UNIX computer.
This activity replaces an SSH activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the [SSH activity designer template](#), which gives workflow administrators the ability to store input and output variables in the databus.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Global Orchestration - SSH.

### Input variables

**Table 922: File read input variables**

<table>
<thead>
<tr>
<th>Input variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>Hostname or IP address of the destination server for SSH activity.</td>
</tr>
<tr>
<td>Directory</td>
<td>Name of the working directory.</td>
</tr>
<tr>
<td>File</td>
<td>The name of the file to read.</td>
</tr>
</tbody>
</table>

### Output variables

**Table 923: File read output variables**

<table>
<thead>
<tr>
<th>Output variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>contents</td>
<td>Content of the file to read.</td>
</tr>
<tr>
<td>result</td>
<td>Either success or failure.</td>
</tr>
<tr>
<td>errorMessage</td>
<td>The executionResult.errorMessages from the Activity designer parsing sources on page 2018.</td>
</tr>
</tbody>
</table>

### Conditions

**Table 924: File Read conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully read the contents of the specified file.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity could not read the contents of the specified file.</td>
</tr>
</tbody>
</table>

### File Write activity

The File Write activity writes a file on a Linux or UNIX computer.
The source file can be an absolute or relative path from the Directory. If an absolute path is used, then no value is required in the Directory field.

This activity replaces an SSH activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity template, which gives workflow administrators the ability to store input and output variables in the databus.

**Input variables**

**Table 925: File Write input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>Hostname or IP address of destination server for SSH activity.</td>
</tr>
<tr>
<td>directory</td>
<td>Name of the working (target) directory.</td>
</tr>
<tr>
<td>file</td>
<td>Name of the file to be written.</td>
</tr>
<tr>
<td>behavior</td>
<td>Select one of the following:</td>
</tr>
<tr>
<td></td>
<td>• overwrite: Creates the file if it does not exist and overwrites the file if it does exist.</td>
</tr>
<tr>
<td></td>
<td>• append: Creates the file if it does not exist and appends the new content to an existing file.</td>
</tr>
<tr>
<td></td>
<td>• create only: Creates the file if it does not exist and fails if the file does exist.</td>
</tr>
<tr>
<td>contents</td>
<td>What to write or append (depending on the behavior) to the file</td>
</tr>
</tbody>
</table>

**Output variables**

**Table 926: File Write output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>return_code</td>
<td>Indicates whether or not the file write operation was successful.</td>
</tr>
<tr>
<td>error_message</td>
<td>Message that indicates if an error has occurred. Any value other than 0 indicates a failure.</td>
</tr>
</tbody>
</table>
### Conditions

<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The activity wrote a file in the target directory.</td>
</tr>
<tr>
<td>Failure</td>
<td>The activity failed to write a file in the target directory.</td>
</tr>
</tbody>
</table>

### File Copy activity

The custom File Copy activity copies a file on a Linux or UNIX computer.

This activity replaces an SSH activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the [SSH activity designer template](#), which gives workflow administrators the ability to store input and output variables in the **databus**.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Global Orchestration - SSH.

### Input variables

**Table 928: File Copy input variables**

<table>
<thead>
<tr>
<th>Input variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>Hostname or IP address of destination server for SSH activity.</td>

<td>Activity failed to copy the file on the specified host.</td>
</tr>
</tbody>
</table>

File Replace String activity

The File Replace String activity finds and replaces a string in a file on a Linux or UNIX computer.

This activity replaces an SSH activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Table 931: File Replace String input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>Hostname or IP address of destination server for SSH activity.</td>
</tr>
<tr>
<td>directory</td>
<td>Name of the working (target) directory.</td>
</tr>
<tr>
<td>file</td>
<td>Name of the file in which the string is to be replaced.</td>
</tr>
<tr>
<td>find_pattern</td>
<td>A regular expression of the text to replace.</td>

<td>Failure</td>
<td>The activity has failed to replaced the string in the file.</td>
</tr>
</tbody>
</table>

Reset Linux User Password activity

The Reset Linux User Password activity resets the password for a given user on a Linux computer.

This activity requires that the user executing the command be able to run the chpasswd command and, if expiring the password immediately, to run chage with *sudo privileges*.

This activity replaces an SSH activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the *SSH activity template*, which gives workflow administrators the ability to store input and output variables in the *databus*.

Input variables

Table 934: Reset Linux User Password input variables

### Workday Orchestration activity pack

The Workday Orchestration activity pack allows users to change and get employee information from Workday.

An Orchestration workflow can gather information such as an employee's phone number and email address from Workday and update the employee's sys_user record automatically.

To access each activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Workday Orchestration. For configuration details about the Workday integration, see Employee Orchestration on page 1828.

The Workday Orchestration activity pack is loaded with the Orchestration - Workday plugin, which is active by default with a subscription to Orchestration.

**Note:** This application is in custom scope. To run it globally, you must edit the activity.

### Get Employee Info activity

The Get Employee Info activity gets an employee's information from Workday.
To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities Workday Orchestration. This activity was built with the SOAP Web Service activity template.

**Note:** Before using this activity, configure the SOAP message “Get Worker” with the SOAP endpoint, and update Workday credentials accordingly. To update Workday credentials, navigate to Employee Orchestration Workday Credential.

**Input variables**

Workday Orchestration GlideActions activities

The Workday Orchestration GlideActions activities take employee information returned from Workday and use it to create or update user records in the ServiceNow® instance.

The GlideAction activities were built with the Create a run script activity on page 2093.

Check User Exists activity

The Check User Exists activity checks the ServiceNow sys_user table to determine if a record exists for a new employee named in a Workday onboarding notification.

When the ServiceNow instance receives a notification from Workday that a new employee has been hired, Orchestraion runs a workflow called Employee On/Off Boarding to retrieve additional information about the new employee. This workflow uses the Check User Exists GlideActions activity to determine if a user record already exists for this employee on the instance. If a user record does exist, another GlideActions activity checks the sys_user record and updates it if necessary. If a user record does not exist, another activity in the workflow creates a new ServiceNow user record.

Input variables

Table 946: Check User Exists input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>

*Create User in Users Table activity*

The Create User in Users Table activity uses the employee information returned from Workday to create a user record in the ServiceNow `sys_user` table.

When the ServiceNow instance receives a notification from Workday that a new employee has been hired, Orchestration runs a workflow called Employee On/Off Boarding to retrieve additional information about the new employee. This workflow runs an activity called Check User Exists that determines if the ServiceNow `sys_user` table already has a record for this employee. If no record exists, the Create User in Users Table activity creates one.

</table>
Update User in Users Table activity
The Update User in Users Table activity uses the employee information returned from Workday to update an existing user record in the ServiceNow sys_user table.

When the ServiceNow instance receives a notification from Workday that a new employee has been hired, Orchestration runs a workflow called Employee On/Off Boarding to retrieve additional information about the new employee. This workflow runs an activity called Check User Exists that determines if the ServiceNow sys_user table already has a record for this employee. If a record exists, the Update User in Users Table activity updates the record, if necessary.

Global activities

Global activities are Orchestration activities created in the global scope.

Any activities you create in the global scope are listed in the Global category in the Packs and Custom tabs of the Workflow Editor.
Test Server Alive activity

The Test Server Alive activity determines if a target system is alive by its response to a particular protocol. This activity replaces an activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this
activity. This activity was built with the `Probe activity template`, which gives workflow administrators the ability to store input and output variables in the `databus`.

**Input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>port_probes</td>
<td>A comma separated list of protocols to use to check for signs of activity on the target machine (example: wmi,wins,https,ssh,http,https,snmp,dns)</td>
</tr>
<tr>
<td>hostname</td>
<td>Hostname or IP address of the target system to check.</td>
</tr>
</tbody>
</table>

**Output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alive</td>
<td>Code that indicates whether or not the server is alive. If any value but '1' is returned, the server is not alive.</td>
</tr>
</tbody>
</table>

**Conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity determined that the device is running.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to determine if the target device is running. Failure could be caused by a missing protocol or a device that is not accessible.</td>
</tr>
</tbody>
</table>

**Orchestration activity designer**

The Orchestration activity designer enables a user with either the `workflow_admin` or `activity_creator` and `workflow_creator` roles to construct reusable activities that suit an organization’s business needs.

Activities created by the activity designer offer the following advantages over core activities offered in previous releases:

- Reuse `custom activities` in multiple workflows.
- Upload and download custom activities from the ServiceNow Store.
• Parse data from standard input formats.
• Test input variables against a target host or endpoint and inspect the payload.
• Automatically map values from a test payload to an activity's output variables.
• Share data between activities.
• View previous versions of an activity.

Access to the activity designer requires activation of ServiceNow Orchestration. For instructions about managing transitions and conditions for all activities, see Workflow activities on page 3367.

Orchestration provides numerous pre-defined activities, which are reusable components that can be used in numerous workflows without having to understand the complexities of the underlying system. These activities are grouped into activity packs, which address specific business needs, such as: Active Directory, Azure AD, Exchange, Infoblox DDI, and PowerShell. There are other ServiceNow applications which provide and maintain their own separate activity packs, such as Security Incident Response, Cloud Management, or Release Automation.

Customers can also build their own activities and activity packs. You can construct custom activities with a specified template through the Orchestration Activity Designer. Custom-built activities built with the Activity Designer are referred to as activity elements. Activity elements provide optimal operations, enable code reuse, and minimize the need to write code. They also enable you to follow the flow of data within a given workflow across orchestration activities. Incorporating activity elements limits the dependency on the scratchpad which reduces problems in complex workflows. Limit the use of core activities, like ‘Run Script’, unless you need direct access to the scratchpad, for example, for a counter. Activity elements do not have direct access to the scratchpad. You can, however, pass scratchpad variables as inputs into your activities.

Orchestration activities created by the activity designer:
• Can be uploaded and shared in the ServiceNow App Store
• Use the databus, which allows the activity to have well-defined inputs and outputs
• Share data across activities within a workflow
• Use versioning
• Provide a consistent approach for activity development regardless protocol

Note: Prior to the Fujirelease, activities were built with Activity Definitions. In Fuji, a new architecture was introduced using the Activity Designer. Orchestration Core activities, built originally as Activity Definitions, have been converted to use the new template format (Activity Elements) and the databus offered with the activity designer. Workflows in upgraded instances that use legacy activities continue to work normally.

For instructions on using activities to construct a workflow, see Add an activity to a workflow on page 3456.

Introduction to credentials, connections, and aliases for Orchestration

All application integrations in Orchestration require connection information, credentials, and connection and credential aliases to their respective applications to access resources.

Before you can execute an application integration in Orchestration, you must create and configure the corresponding connection information and credentials. The Connections pertains to an integration with a system, such as an IP address or endpoint with protocols. It contains specific details, such as database particulars, when integrating with a database. The associated Credentials are the authentication data required to make the connection.

Connection information and credentials can vary between QA/Development/Production environments for the same integration. The tight coupling between this data and application metadata, such as workflow or job scheduling, make application metadata obsolete when you change environments. To alleviate this problem, the concept of an alias is introduced, for connections and credentials, to decouple this data from
application metadata. These aliases allow customers to design their application metadata to couple to an alias, which during runtime resolves to connection and credential data.

There are two types of aliases, a connection and credential alias and a credential alias. There are business rules that enforce certain constraints on these aliases. Names should contain alphabets, numbers, and underscores but cannot have special characters. The alias must be unique in a scope. If you choose to have multiple active connections, you can have more than one active connection in the same domain. If you do not choose this option, you can have only one active connection in per domain.

Note: If you enable multiple active connections, when the connection records resolve, your application picks one connection based on an established order. The order of the connections depends on the API you use to retrieve connection data.

You can add additional connection attributes to an alias, which are available in connection data during runtime. Variables overridden by connection administration during runtime should not affect the alias.

The credential alias resolves only credential data. Along with alias data model, you can use a scriptable API which can get connection and credential data during runtime.

Using Connection and Credential Alias with Orchestration

Define an alias to label a credential or connection record.

The Credential and Connection Alias defines an alias that labels a credential or connection record. It is extended from the sys_metadata table. It requires the admin role. The credential_admin and connection_admin have read access to sys_alias. A connection alias contains:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the alias.</td>
</tr>
<tr>
<td>ID</td>
<td>This field is based on the format &quot;scope name.alias name&quot; Unique index on ID to ensure unique record based on scope name + name. If the scope is global, the ID is the alias name.</td>
</tr>
<tr>
<td>Type</td>
<td>You can select either 'Credential' or 'Connection and Credential'. The default is Connection and Credential.</td>
</tr>
<tr>
<td>Connection type</td>
<td>This field is applicable when the alias type is set to Connection and Credential. There are three connection types: HTTP, JDBC, JMS. The default is HTTP.</td>
</tr>
</tbody>
</table>

If you create a workday alias in global scope, the ID is set to workday

If you create a workday alias in hr app scope, the ID is set to x_hr_app.workday

- Name can only contain alphabets, numbers and underscore.
- During the upgrade, the tag in credential record will be migrated to connection alias. If the tag in previous release's credential record contains special characters other than alphabets, numbers and underscore, the tag data will be preserved during the upgrade. The user still can use these connection alias, but the user cannot update these alias, unless he removes these special characters when do the update.

Using credentials with Orchestration

Orchestration requires credentials to access resources.
Credential table

The credential table (discovery_credential) defines credentials that can be used for integration. In the previous release, the Credential table contains a string-type tag field, which labels a credential and the tag is used in orchestration activities. In the london release, we rename tag to credential alias, and change the type from string to GlideList, which is a reference to connection alias table.

Credential types

The following credential types are provided:

<table>
<thead>
<tr>
<th>Credential type</th>
<th>Description</th>
<th>Supports Test Credential option</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Applicative credentials</strong> on page 1028</td>
<td>The credentials to explore the applications on a device or computer. <em>Pattern customization</em> often need applicative credentials.</td>
<td>No</td>
</tr>
<tr>
<td><strong>Amazon Web Service credentials</strong></td>
<td>The Amazon Web Services (AWS) master account, access key ID, and secret access key.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You cannot test AWS credentials through the Test</td>
<td></td>
</tr>
<tr>
<td><strong>Azure Service Principal and Enterprise Agreement credentials</strong></td>
<td>The Azure service principals required for an Azure subscription.</td>
<td>No</td>
</tr>
<tr>
<td><strong>Basic authentication credentials</strong> on page 1029</td>
<td>A user name and password.</td>
<td>No</td>
</tr>
<tr>
<td><strong>CIM credentials</strong> on page 1031</td>
<td>The user name and password required to access a CIMOM - Common Information Model Object Manager (CIM) server, which obtains information about VMware ESX servers.</td>
<td>No</td>
</tr>
<tr>
<td><strong>Cloud credentials</strong> on page 1032</td>
<td>Credentials that Orchestration uses to access cloud resources.</td>
<td>No</td>
</tr>
<tr>
<td><strong>JDBC credentials</strong> on page 1037</td>
<td>A user name and password to access a Java Database Connectivity (JDBC) connection.</td>
<td>Yes</td>
</tr>
<tr>
<td><strong>JMS credentials</strong> on page 1039</td>
<td>A user name and password to access to a Java Message Service (JMS).</td>
<td>Yes</td>
</tr>
<tr>
<td><strong>OAuth 2.0 credentials</strong> on page 1040</td>
<td>OAuth 2.0 credentials enable ServiceNow to obtain access to user accounts on an HTTP service.</td>
<td></td>
</tr>

<td><strong>SNMP community credentials</strong> on page 1042</td>
<td>The community string to access devices via SNMP.</td>
<td>Yes</td>
</tr>
<tr>
<td><strong>SNMPv3 credentials</strong> on page 1044</td>
<td>The user name and keys required to access devices on your SNMP v3 network.</td>
<td>Yes</td>
</tr>
<tr>
<td>Credential type</td>
<td>Description</td>
<td>Supports Test Credential option</td>
</tr>
<tr>
<td>-------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------</td>
<td>---------------------------------</td>
</tr>
<tr>
<td><strong>SSH credentials</strong> on page 1045</td>
<td>The user name and password to access Linux and Unix devices.</td>
<td>Yes</td>
</tr>
<tr>
<td><strong>SSH private key credentials</strong></td>
<td>The private key credentials to access Linux and Unix devices.</td>
<td>Yes</td>
</tr>
<tr>
<td><strong>Note:</strong> For better security, SSH private key credentials are recommended over SSH password credentials.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>VMware credentials</strong> on page 1053</td>
<td>Credentials to access vCenter resources. These credentials are required for any work that is performed on vCenter, such as cloning a virtual machine.</td>
<td>Yes</td>
</tr>
<tr>
<td><strong>Windows credentials</strong> on page 1054</td>
<td>The user name and password required to access Windows computers. Several permission requirements must be met to use Windows credentials.</td>
<td>Yes</td>
</tr>
</tbody>
</table>

How MID Servers use credentials

By default, Windows MID Servers use the login credentials of the MID Server service on the host machine to discover Windows devices in the network. You should configure these service credentials so that they have domain or local administrator privileges. For Linux and UNIX machines and network devices, the MID Server uses the SSH and SNMP credentials configured in the instance in Discovery Credentials.

MID Servers that Orchestration uses must have access to the necessary credentials to execute commands on computers in the network as specified by the Workflow activities. Orchestration can use the same SSH and SNMP credentials as Discovery, but has two additional credentials designed for specific Workflow activities: Windows (for PowerShell) and VMware.

Encryption and decryption

The platform stores credentials in an encrypted field on the Credentials [discovery_credentials] table. Once they are entered, they cannot be viewed.

When credentials are requested by the MID Server, the platform decrypts the credentials using the following process:

1. The credentials are decrypted on the instance with the password2 fixed key.
2. The credentials are re-encrypted on the instance with the MID Server’s public key.
3. The credentials are encrypted on the load balancer with SSL.
4. The credentials are decrypted on the MID Server with SSL.
5. The credentials are decrypted on the MID Server with the MID Server’s private key.

**Note:** The platform does not have separate encryption keys for multi-tenant instances.
**Credential order**

Credentials can be assigned an order value in the Credentials form, which forces the application to try all the credentials at their disposal in a certain sequence. If you do not specify an order value, the application tries the credentials in the Credentials [discovery_credential] table randomly, until it finds one that works, such as when Orchestration attempts to run a command on an SSH server (such as a Linux or UNIX machine), or when Discovery attempts to query an SNMP device (such as a printer, router, or UPS).

After identifying the credentials for a device, Discovery and Orchestration create an affinity between the credentials and the device using the Credential Affinity [dscy_credentials_affinity] table. All subsequent discoveries or Orchestration activities attempt to match the credentials in this table with a device for which an affinity exists. If credentials for a device change, Discovery and Orchestration try all available credentials again until they create a new affinity.

**Note:** If Orchestration and Discovery are installed, and credential alias is enabled, multiple affinities can exist. In this case, the platform looks up credentials for each affinity and inserts the credential for the affinity with the lowest order into the probe.

Ordering credentials is useful in the following situations:

- The credentials table contains many credentials, with some used more frequently than others. For example, if the table contains 150 SSH credentials, and 5 of those are used to log into 90% of the devices, it is good practice to configure those five with low order numbers, which places them at the top of the execution list. Discovery and Orchestration will work faster if they try these common credentials first. After the first successful connection, the system knows which credentials to use the next time for each device.
- The system has aggressive login security. For example, if the Solaris database servers in the network only allow three failed login attempts before they lock out the MID Server, configure the database credentials with a low order value.

**Credential alias**

Credential alias allows flow and workflow creators to:

- Assign individual credentials to any activity in an Orchestration workflow
- Assign individual credentials to any action in Flow Designer
- Assign different credentials to each occurrence of the same activity type in an Orchestration workflow.
- Assign different credentials to each occurrence of the same action in designer flow.

Credential alias also works with credential affinities.

**External credential stores**

If you do not want credentials stored in your instance, you can use external credential repositories. External credential stores save the credentials in an external site that your instance can access. Only CyberArk is supported.

**Connections with Orchestration**

Use the connections table to setup a JMS, JDBC, or HTTP(s) connection to a target host.
Connection Table

The Connection table (sys_connection) is the base table for all connection tables. You can setup connections for the following protocols:

- JDBC
- JMS
- HTTP(s)

The connection table references the connection alias table, which couples the connection alias to connection information. Every connection records the following information:

Table 958: Base connection properties

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the connection. This field must be unique on the table.</td>
</tr>
<tr>
<td>Credential</td>
<td>Specify the credential to use with this connection. This is optional.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>The connection alias resolves your connection and credentials at run time. Only one connection is active per Connection alias at any one time.</td>
</tr>
<tr>
<td>Active</td>
<td>Check to make the current connection active.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain to which the connection belongs.</td>
</tr>
</tbody>
</table>

Credential is unique across active connections, if not empty

Upgrading connection information

The JDBC connection (jdbc_connection) and JMS connection (orch_jms_ds) tables are existing Orchestration connection tables. In London, we re-parent them to extend from Connection (sys_connection) table. They move from Orchestration run time plugins to Credentials & Connections plugins. They are originally extended from sys_metadata. The sys_metadata related data will be removed. JDBC field name changes:

- JDBC server is renamed to host
- Database port is renamed to port

Create custom activities using custom activity designer templates

You can create and update different types of custom activities in the Workflow Editor using a custom template.

Roles required: workflow_admin or activity_creator

The Activity Designer contains common steps which are applicable to all the activities that you create. This procedure guides you through the common steps and the order they should be set up. You specify an activity template before you create a custom activity.

1. Navigate to Orchestration Workflow Editor.
   The Welcome tab of the Workflow Editor opens.
2. On the Custom tab in the palette, click + to create a new activity select the appropriate template from the list.

The Activity Designer form appears, with a stage indicator at the top. All new activities start at the General stage. The current stage shows with a blue underscore.

Figure 386: Activity designer stage indicator

3. Add the general properties.
   This information is standard for each custom activity, include a name, description, and other related information.

4. Create the template Create input variables on page 2000 for the template.
   Create the variables to pass into the activity in the Inputs form of the activity designer.

5. Add a pre-processing script.
   For input validation or transforming input data, you might need a pre-processing script.
6. Click Continue to open the Execution Command form, then fill out the Execution Command step based on the corresponding execution templates:
   • Create a SOAP web service activity
   • Create a JDBC activity
   • Create a JavaScript Probe activity
   • Create a PowerShell activity
   • Create a REST web service activity
   • Create a Probe activity
   • Create an SFTP activity
   • Create a Run Script activity
   • Create an SSH activity
   • Create a JMS activity

7. Test your inputs.

8. In the Outputs form, define local and/or output variables.
   Local variables can be used for temporary storage when cascading parsing rules. For example, you might extract an XML payload from within a JSON payload. A local variable can access the XML document and use that as a source for another parsing rule. The graphic shows a Local1 variable source to parse data for Output2.

![Figure 387: Define local variable](image)

9. Use one of the options to assign values to Outputs:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parsing rule</td>
<td>You can create a parsing rule and map them to the output fields by dragging and dropping the variables into the parsing rules structure. The REST, SOAP, and JDBC templates provide auto-mapping to create the parsing rules automatically. If available from the test inputs form, auto-mapping should be used when possible.</td>
</tr>
</tbody>
</table>
### Post-processing

Post-processing scripts allow you to code your own output data validation, output parsing code, and related tasks. Post-processing executes after the execution command results have been returned and before the parsing rules and conditions are run. Click Go to Post-Processing (Advanced) to create a post-processing script.

**Note:** If you create a script, this step reflects as a stage in the indicator.

---

10. Click Continue to open the *Conditions* form to create exit condition rules for your activity and then click Save.

### General properties for activity designer templates

The following General Property fields are common to all activity designer templates.

**Table 959: General Property fields common to all activity designer templates**

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name of the activity. Select a unique name that makes the activity easily identifiable in the palette. If you do not name the activity, it is identified in the Data tab of the Workflow Editor with an index number when it is added to a workflow. This index reflects the order in which the custom activity was added to the workflow. Only custom activities and their output variables appear in the Data tab.</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of what the activity does.</td>
</tr>
<tr>
<td>Image</td>
<td>Icon that identifies an activity of this type in the workflow palette.</td>
</tr>
<tr>
<td>Execution template</td>
<td>Predefined template selected for this activity.</td>
</tr>
<tr>
<td>Application</td>
<td>Current <em>scope</em> set on the instance. To view the scope, click the gear icon on the right side of the title bar in any record or list and look at the value in the Application field. The activity runs in this scope within a workflow. You cannot view or change the scope for the instance in the Workflow Editor.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Accessibility setting for this activity, by scope. The following options are available:</td>
</tr>
<tr>
<td></td>
<td>• All application scopes: This activity is available to all application scopes.</td>
</tr>
<tr>
<td></td>
<td>• This application scope only: Use of this activity is restricted to the scope named in the Application field.</td>
</tr>
</tbody>
</table>
Create input variables

Create the variables to pass into the activity in the Inputs form of the activity designer.

You must name your activity in the General form before you can advance to the Inputs stage.

Roles required: workflow_admin or activity_creator

**Note:** Variable strings in the Inputs form have a 255 character limit.

1. Click the + icon to create a new input variable.
   
The designer creates a default variable called Input1.

2. Type your new variable name in the field.

3. To change the name of a variable or any of its attributes, double-click the value and then select or enter a new value in the field that appears.

4. Configure your variable using these fields:
### Table 960: Variable configuration

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Data type for this variable. Double-click on the field to display the choice list. In addition to the usual data types, you can create input arrays and encrypt individual variables that contain sensitive data. Encrypted variables are passed to the ECC Queue and then decrypted by the MID Server when they run on the target host. Sensitive data returned from running these variables on the host can then be passed to another activity through encrypted output variables.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Marks an input variable as mandatory. Variables marked as mandatory are required fields in the properties form for the activity in the workflow. The input testing feature allows you to filter on mandatory variables.</td>
</tr>
<tr>
<td>Default</td>
<td>Default value for this input variable. Default values are prepopulated for variables in the properties form for the activity in the workflow. You can override this value when you test the variables.</td>
</tr>
</tbody>
</table>

5. To reorder the variable list, select a row and then drag the row to its new location.

When you select a row to move it, the pointer icon changes to an up/down arrow icon (△).

6. To delete a variable, click the delete icon (Trash) in the row.

7. Click Continue to advance to the Execution Command stage or click Go to Pre-Processing (Advanced) to create a script that runs before the activity executes.

**Map an input variable**

After you create the input variables, map them to the fields in the Execution Command form.

Role required: activity_admin, activity_creator

These fields contain values required by the target host or endpoint to authenticate and query for data. Included in this example are fields for a command to run on the target and the MID Server to use, if one is required.

To map a variable, drag it into the appropriate field.

The designer automatically expresses the variable in the syntax the system requires.
Configure the PowerShell execution command

Use the input variables you created to configure the command that Orchestration executes on the Windows target machine.

Create the input variables you need in the Inputs form before you can advance to the Execution Command stage.

Role required: activity_creator, admin

**Note:** You can test the PowerShell connection between the MID Server and the target computer without having to run the activity in a workflow context. For details, see *test template outputs*.

1. Drag variables from the list of inputs and drop them into command fields.
The system formats the variable in the proper syntax for the command.
Figure 388: PowerShell execution command

2. Complete the fields shown in the table.

Table 961: Powershell command fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. Create variables to map to available fields.</td>
</tr>
<tr>

<td>account check box is selected.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server to use for querying Powershell, by capabilities. By default, the</td>
</tr>
<tr>
<td></td>
<td>system selects a Powershell MID Server.</td>
</tr>
</tbody>
</table>

3. Click Save.
4. Click Continue to advance to the Outputs stage.

Test activity template inputs
You can test the input parameters of a custom activity during its development without having to run the activity in a workflow context.

Create input variables and map them to fields in the Execution Command form or provide actual values for these fields.

Role required: web_service_admin, activity_admin, activity_creator

An input test executes only the input parameters against an endpoint and not the pre-processing or post-processing scripts. You need to use a workflow to test a pre-processing or post-processing script. You do not need to check out the activity to test it, and you can test input variables from any stage in the activity designer, if your activity is properly configured. Typically, the Execution Command stage is the point at which your inputs are ready for testing.

Note: If you intend to use auto-mapping, you must test your input variables.

1. Click Test Inputs.

The list of input source variables appears. If you added default values for these variables, those values appear in the Substitute Value column. Mandatory variables are marked with a red star. In this example, a SOAP endpoint returns a value for a stock quote variable.

![Image: Fill in your test values](image)

2. Filter the variable list with these controls:
   - All Inputs: Displays all input variables. This is the default view.
   - Mandatory Inputs: Displays only mandatory input variables.
   - Inputs Without Defaults: Shows input variables that do not have assigned default values.

3. Reset values as needed.
   - Reset default values: Replaces any test values set in this form with the default values, if they are present.
   - Clear values: Clears all values in the input variable list, even if default values exist.
4. When your test values are configured correctly, click OK. The system runs the values for all the inputs configured against the specified target and returns the resulting payload. The buttons in the Response form display different views of the payload. The entire payload appears in the Raw Output window.

```json
{
    "status_code": 200,
    "body": "<?xml version="1.0" encoding="utf-8"?>
<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/
<soap:Body>
<GetQuoteResponse xmlns="http://www.webserviceX.NET/">
   <GetQuoteResult>
   <StockQuotes>&lt;Stock&gt; &lt;Symbol&gt;NOM&lt;/Symbol&gt; &lt;Last&gt;78.92&lt;/Last&gt; &lt;Date&gt;7/16/2015&lt;/Date&gt; &lt;Time&gt;4:05pm&lt;/Time&gt; &lt;Change&gt;1.34&lt;/Change&gt; &lt;Open&gt;78.15&lt;/Open&gt; &lt;High&gt;79.15&lt;/High&gt; &lt;Low&gt;77.83&lt;/Low&gt; &lt;Volume&gt;865406&lt;/Volume&gt; &lt;MarketCap&gt;12.1486&lt;/MarketCap&gt; &lt;PreviousClose&gt;77.58&lt;/PreviousClose&gt; &lt;PercentageChange&gt;1.7347&lt;/PercentageChange&gt; &lt;AnnRange&gt;54.85 - 83.52&lt;/AnnRange&gt; &lt;Earnings&gt;-1.31&lt;/Earnings&gt; &lt;EarningsPerShare&gt;&lt;/EarningsPerShare&gt; &lt;Name&gt;ServiceNow&lt;/Name&gt; &lt;Stock&gt; &lt;GetQuoteResponse &gt; &lt;/GetQuoteResponse &gt; &lt;/Stock&gt; &lt;/GetQuoteResponse &gt; &lt;/Stock&gt; &lt;/GetQuoteResponse &gt; &lt;/GetQuoteResponse &gt; &lt;/soap:Body&gt;
</GetQuoteResult>
</GetQuoteResponse>
</soap:Body>
</soap:Envelope>

"error": null,
"header": {
    "X-AspNet-Version": "4.0.30319",
    "Date": "Thu, 16 Jul 2015 23:25:01 GMT",
    "Content-Length": "979",
    "Content-Type": "text/xml; charset=utf-8",
    "Server": "Microsoft-IIS/7.0",
    "X-Powered-By": "ASP.NET"
    "Cache-Control": "private, max-age=0"
}
```
5. To map appropriate parameter values in the payload to variables in the Outputs stage automatically, select an *auto-mapping option.*

6. Alternately, you can click Save for parsing rules to copy the entire payload to the parsing rules. This allows you to manually select values for the output variables directly from the payload. This action completely overwrites any previous payload that existed in the parsing rules.

7. Click the X in the upper right corner of the window to close it.

**Data encryption for activity variables**

You can protect sensitive data passed from Orchestration activities by encrypting input and output variables.

The system never stores encrypted variables as clear text. If the MID Server is used to fulfill the activity, the corresponding ECC Queue’s input payload is encrypted if an *encrypted output variable* is defined in the template. Output variables passed to a downstream activity as input variables maintain their encryption throughout processing.

Inputs that require data encryption come from one of these sources:

- Workflows: These inputs are provided through the Workflow Editor and must be in the password2 format for two-way encryption.
- Service catalog requests: These input values are provided to an activity as encrypted variables from a service catalog item.
- GlideRecord: These are variables attached to any ServiceNow table. The source column in the table must be a password2 type variable.
- Activity outputs: These are variables passed as outputs from one activity to a downstream activity as inputs, through the data bus.
- Empty string: The system allows you to define encrypted input variables but never pass a value into the variable.

**Activity designer template pre-processing fields**

Use the Pre Processing form of the activity designer to define a script to run before the activity executes.

**Pre-processing fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input process script</td>
<td>Script to run before the activity executes.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the input process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution parameters and input variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the pre-processing script with this syntax: activityInput.variable. Before the activity executes and makes a call to the service or host, you can override the effective execution value of this variable by assigning values to the executionParam.variable_name execution parameter. Refer to the specific execution parameters for your template.</td>
</tr>
</tbody>
</table>

**Logging**

Activity designers can add logging to the pre-processing using the ActivityLogger API, which works for scoped or global applications. Logged data from the script appears in the Workflow Log related list in the context records for any workflow that uses the activity. The Source for these messages in the workflow log is ACTIVITY.

**Important:** To display the debug messages in the workflow log, set the glide.workflow.log.debug property to true.

The supported messages are:

- ActivityLogger.debug("Pre Processing Log Message");
- ActivityLogger.info("Pre Processing Log Message");
- ActivityLogger.warn("Pre Processing Log Message");
- ActivityLogger.error("Pre Processing Log Message");
Template post-processing fields

From the Post Processing form in the activity designer you can define a script to run after the activity executes.

**Post-processing fields**

To use the results returned by the activity, append the `executionResult.` prefix to these parameters.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output process script</td>
<td>Script to run after the activity executes.</td>
</tr>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the output process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution results and the variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the post-processing script with this syntax: <code>activityInput.variable</code>. For parameter descriptions, refer to the table in the post-processing parameters topic for this activity.</td>
</tr>
</tbody>
</table>

**Logging**

Activity designers can add logging to the post-processing script using the `ActivityLogger` API, which works for scoped or global applications. Logged data from the script appears in the Workflow Log related list in
the context records for any workflow that uses the activity. The Source for these messages in the workflow log is ACTIVITY.

**Important:** To display the debug messages in the workflow log, set the glide.workflow.log.debug property to true.

The supported messages are:

- `ActivityLogger.debug("Post Processing Log Message");`
- `ActivityLogger.info ("Post Processing Log Message");`
- `ActivityLogger.warn ("Post Processing Log Message");`
- `ActivityLogger.error("Post Processing Log Message");`

![ActivityLogger API](image)

**Figure 391: ActivityLogger API**

**Auto-map activity output variables**

You can map parameter values in a test payload to variables in the Outputs tab automatically.

Role required: admin

1. From the Execution Command in the template, select the Inputs tab.
2. Click Test Inputs to test the input parameters.
   - If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.
3. Provide test values, if requested, and click OK to display the payload.
   - The entire payload appears in the Raw Output tab of the Response form.
4. Select an auto-mapping option:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Auto-Map to Local | Translates the entire payload into a JSON object and places it in the data bus. This allows for post-processing manipulation in JavaScript. This selection causes the entire data field on the right to disappear and the inputs structure to be auto-populated with these default variables:  
  - output  
  - totalRows  
  - errorMessage  
  - eccSysId                                                                                                                                     |
| Auto-Map to Output| Automatically populates the output variables in the activity with the same default variables used as inputs for the local variable.                                                                           |

*Note:* No parsing rules are available with auto-mapping selections.

Create an output variable

The Outputs form in the designer contains a variable builder for creating data structures of objects and arrays.

Roles required: activity_admin, activity_creator

Elements in this structure are mapped with Create a parsing rule on page 2014 to specific data contained in payloads returned from an endpoint or host. These variables and their values are then made available locally or for reuse in other activities.

1. Click the + icon in the Outputs column to create a local or output variable.
   
   Local variables are only available within an activity and are not visible in the data structures displayed in the Custom tab. Output variables are available for reuse in other activities, either individually or as an entire data structure. When you create a new variable of either type, the designer provides a default name of Local1 or Output1.

2. Type your new variable name in the field and select a data type.

   Variable names must be unique within an array or an object. You can assign a data type of Encrypted to output variables that contain sensitive data. Data protected by encryption is passed to other activities or processes encrypted and is never displayed in plain text.
3. To change the name of a variable or any of its attributes, double-click the value, type a new value in the editing field, and then press Enter. The icon to the left of the name reflects the data type of the variable.

4. To reorder the variable list, select a row and then drag the row to its new location. When you select a row to move it, the pointer icon changes to an up/down arrow icon.

5. Drag and drop the row into another location.

6. To reuse a variable from another activity, drag it from the Custom tab in the palette and drop it onto the Local or Output heading at the top of the variable list. To copy an entire data structure, drag the parent object or array into the variable list header. The designer duplicates the copied data structure in the outputs variable builder.

Figure 392: Reuse of data structures
7. To delete a variable, click the delete icon in the row.

Activity designer template outputs
Output variables contain messages returned from a destination that are available to other activities in a workflow or internally to the activity.

Table 962: Activity designer output fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable name</td>
<td>Name of a variable, either Local or Output, that this activity passes.</td>
</tr>
<tr>
<td>Local</td>
<td>Variable that contains a value used within an activity. For example, use a local variable to identify metadata that is processed within an activity before the final value is exported to an output variable.</td>
</tr>
<tr>
<td>Output</td>
<td>Variable that contains a value that is passed to other activities in the workflow.</td>
</tr>
</tbody>
</table>

Map an output field
Mapping is configured with parsing rules that allow you to build expressions in the appropriate data format for the selected payload.

Role required: activity_admin, activity_creator

When you are finished creating the output data structure, map each variable to the specific data you want to extract from the target host.

To map a variable, drag it from the Outputs variable builder and drop it into an empty Variable name field in the Parsing rules section.

See create a parsing rule for instructions on configuring parsing for output variables.
Create a parsing rule

Populate output variables defined in a custom activity with payload data returned from an inputs test on an external host or endpoint.

Roles required: activity_admin, activity_creator

1. Navigate to Workflow Workflow Editor.
2. From the Custom tab in the palette, open a custom activity.
3. In the Activity Designer form, advance to the Output stage.
4. Drag an output variable from the data structure builder into the Variable name field in the Parsing rules builder.
Figure 393: Mapping variables to parsing rules

The parsing rules form appears for the selected variable. By default, the parsing type is set to Direct, which populates the variable with all the data from the selected payload, without parsing the contents. Each template has a specific default parsing source.

5. Complete the form using the fields in the table.
   In this example, the parsing type selected is XML, which allows you to select specific parameters from the payload to parse.
### Parsing rule for localBody

<table>
<thead>
<tr>
<th>Parsing source</th>
<th>Variable Name</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>executionResult.body</code></td>
<td><code>activityLocal.localBody</code></td>
</tr>
</tbody>
</table>

**Expression**

```
$age
```

**Sample payload data**

```xml
<xml version="1.0"?>
<data>
  <user>
    <user>
      <name>user one</name>
      <age>42</age>
    </user>
    <user>
      <name>user two</name>
      <age>27</age>
    </user>
    <user>
      <name>user three</name>
    </user>
  </user>
</data>
```

**Parsing result**

27
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parsing source</td>
<td>Source of the data returned from the target host or endpoint. Each template opens to a specific, default payload. Available choices depend on the execution template selected for the activity. You can also use local variables as a parsing source if a parsing rule has previously been defined for them. For a list of the available payloads for each template, see <a href="#">Activity designer parsing sources</a> on page 2018.</td>
</tr>
<tr>
<td>Expression</td>
<td>Expression used to extract specific data from the selected parsing source. This expression is created from clickable data in the sample payload and appears in the format selected in the Parsing type field. When testing, the expression can return multiple results. Discern which choice gives reliable or predictable results before choosing your expression.</td>
</tr>
<tr>
<td>Note</td>
<td>The system cannot generate clickable RegEx expressions from sample data. You must write all regular expressions manually.</td>
</tr>
<tr>
<td>Variable name</td>
<td>Revised variable name as it is used in the final output expression. The system adds the activityOutput or activityLocal prefix to the variable you specify.</td>
</tr>
<tr>
<td>Parsing type</td>
<td>The language to use for querying the target host's payload. The selections are:</td>
</tr>
<tr>
<td></td>
<td>• Direct: Maps to the entire content of the payload selected in the Parsing source field, without any parsing. This is the default parsing type.</td>
</tr>
<tr>
<td></td>
<td>• XML: XPath query used for selecting nodes from an XML payload.</td>
</tr>
<tr>
<td></td>
<td>• JSON: JSONPath query for selecting parts of a JSON payload.</td>
</tr>
<tr>
<td></td>
<td>• RegEx: Parsing method that uses a regular expression to extract data from a payload. The RegEx parsing type does not support multi-line parsing and is not case sensitive.</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of this parsing rule.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Sample payload data</td>
<td>Sample data from the source containing the data requested. This field is not available for Direct parsing types. After you click Parse sample data, the data in this field cannot be edited, but becomes clickable for the purpose of creating expressions. Click Edit sample data to make the field editable again.</td>
</tr>
<tr>
<td>Parsing results</td>
<td>Displays the data returned from the source by the selected expression. This field is not available for Direct parsing types.</td>
</tr>
</tbody>
</table>

6. To retest the inputs, click Get sample payload from test. This action reopens the test form, allowing you to substitute different test values and create a different payload.

7. Click Save to have the parsing rules overwrite the previous payload with the one you just created.

8. To create an expression for the parsing rule, click the specific parameter you want to see in the sample payload.

   The value for that parameter appears in the Parsing result field, and the system creates the appropriate expression in the Expression field.

9. Click Submit to save the parsing rule for that variable.

### Activity designer parsing sources
This table lists the parsing sources available with each execution template.

<table>
<thead>
<tr>
<th>Template</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAP Web Service</td>
<td>• executionResult.body (Default)</td>
</tr>
<tr>
<td></td>
<td>• executionResult.status_code</td>

**Activity designer parsing rule example**

In this example, the parsing rule is configured to populate the activityOutput.ipv4 variable with the value for the IP address from a domain server, using PowerShell.

Role required: activity_creator, activity_admin

To generate the sample data, the administrator must actually run the command on the host and then paste the data returned into the Sample payload data field when creating the parsing rule. The administrator can then create an expression that returns IP addresses from that sample in two formats: ipv4 and ipv6. In this example, the system produces two expressions to use for the parsing rule.

1. Navigate to Workflow Workflow Editor and open the activity that runs on the host.
2. Click the Inputs tab, and note the Command.
3. In a PowerShell console, run the Command on the host to extract the XML sample that contains the values you need.

4. Copy the data that is returned to the clipboard.

5. In the activity designer, click the Outputs tab and paste the returned data into the Sample payload data field.
   In this example, the data includes IP addresses in two different formats and the domain name.

6. Select the parsing type for the source. In this example, select XML.
7. **Click Parse sample data.**

The system displays the XML in the proper format, and it becomes *clickable*. In this view, the system can translate clicked data from the sample into an expression.
8. To create the expression, click the elements in the data sample you want to map to the variable. Based on the sample data you clicked, the system creates two expressions.
9. Select an expression from the list.

The desired result is the IP address that has a type attribute of ipv4. The system populates the Expression field with this choice.
10. Click Test expression.

The system parses the payload using the selected expression and returns the requested data in the Parsing result field.
11. Click Submit.

The view returns to the Outputs tab of the activity designer. The new parsing rule is listed, and a blank row is available for another rule.
Activity conditions

Create the exit conditions for your activity in the Condition column and set the order for each.

The system evaluates the condition with the lowest order number first and stops when it finds the first true condition. The system delays evaluation of conditions with an Else value set to true until all conditions with an Else value set to false are evaluated. If the system does not find a true condition, it looks for a default condition in which the value for Else is true and takes this exit. You must have at least one default exit condition, or the activity hangs when the workflow runs.

The following are possible conditions you might create for an activity:

<table>
<thead>
<tr>
<th>Condition</th>
<th>Evaluation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Tests for a success condition. Else is set to false and the Order is set to 100. If this condition is true, the activity takes the Success exit. If this condition is false, the system evaluates the next condition in order.</td>
</tr>
<tr>
<td>Retry</td>
<td>Tests for a condition that runs the activity again. Else is set to false. If this condition is true, the activity runs again. If this condition is false, the system takes the default Failure exit.</td>
</tr>
<tr>
<td>Failure</td>
<td>Default condition that allows the workflow to continue if the other conditions in the activity are false. Else is set to true.</td>
</tr>
</tbody>
</table>
Orchestration custom activity templates

Orchestration provides customizable activity templates to create and manage custom activities in the Workflow Editor.

You create and update different types of Orchestration activities with the Activity Designer using activity templates for SSH, PowerShell, REST, SOAP, JMS, SFTP, JDBC, JavaScript Probes, and Probes.

Hundreds of workflows can share these activities simultaneously. Before you change an activity, you should check the workflows that they are part of by clicking the form menu icon and selecting Used In. Any central change to a versioned activity automatically updates across workflows unless you have pinned that activity.

All the Orchestration Core activities are built using the Activity Designer in scoped applications. Custom activities can be developed in the global scope or their own application scope even if that scope is different from the scope of the workflow. Use Activity scoping on page 2098 when build your own activity packs.

Create a JDBC activity

Create a custom JDBC activity to automate SQL commands and stored procedure calls to relational databases from workflow.

Role required: activity_admin, activity_creator

The JDBC activity template allows you to execute ANSI SQL statements or stored procedures on a target database. Support for stored procedures with IN, OUT, and INOUT parameters are available in London. To learn how to set up these parameters, see JDBC stored procedure parameters on page 2033.

**Note:** If you are transferring bulk data into a ServiceNow instance from an external data source, use Import sets. The JDBC activities allow you to transfer data between external data sources and ServiceNow within a workflow. It is not intended to replace the bulk import features of data sources.

1. Create or verify your JDBC credential.
Your JDBC credentials must have permission for the target database and proper configuration for the corresponding JDBC connection. Credentials must be set up before you can create a JDBC activity.

2. Create or verify your **JDBC connection**.
   Your JDBC connection must be configured with valid JDBC credentials set up before you can create a JDBC activity.

3. Create a **custom activity**.
   This action creates a custom activity using a template.

4. After setting up **general properties** and **creating input variables**, configure the JDBC Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>JDBC Connection</strong></td>
<td>Configure or reference the appropriate JDBC Connection for the database. The connection selected provides the activity with the following information:</td>
</tr>
<tr>
<td></td>
<td>• Target database information (server and database names)</td>
</tr>
<tr>
<td></td>
<td>• Connection URL</td>
</tr>
<tr>
<td></td>
<td>• Target database port (if different from standard port number)</td>
</tr>
<tr>
<td></td>
<td>• Database instance name</td>
</tr>
<tr>
<td><strong>Credential</strong></td>
<td>JDBC credential to use for your JDBC connection.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SQL statement</td>
<td>Input the ANSI SQL to execute on the JDBC target database.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is hidden when the Stored Procedure check box is selected.</td>
</tr>
<tr>
<td></td>
<td>You can map the input variables you created to configure the SQL statements. By default, you can run the following SQL statements.</td>
</tr>
<tr>
<td></td>
<td>• select</td>
</tr>
<tr>
<td></td>
<td>• insert</td>
</tr>
<tr>
<td></td>
<td>• update</td>
</tr>
<tr>
<td></td>
<td>• delete</td>
</tr>
<tr>
<td></td>
<td>• show</td>
</tr>
<tr>
<td></td>
<td>• create</td>
</tr>
<tr>
<td></td>
<td>• describe</td>
</tr>
<tr>
<td></td>
<td>For added security measure, a MID Server property controls the operations that this JDBCOrchestrationProbe executes, which restricts the SQL commands used. This property protects against potentially destructive commands, such as drop database. The mid.property.jdbc_operations contains the MID Server property controls.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You cannot run multiple statements of different types. For example, you cannot run a select statement and an update statement together, but you can run two insert statements. However, you cannot run multiple select statements in this activity.</td>
</tr>
<tr>
<td>Maximum rows</td>
<td>Maximum number of records to retrieve from database. The default is 1000.</td>
</tr>
<tr>
<td>Maximum payload size (KB)</td>
<td>You can set a limit on the maximum payload size of data retrieved from the database. The default is 64 kilobytes.</td>
</tr>
<tr>
<td>Connection timeout</td>
<td>How long the activity waits to make the connection. This field is populated automatically from the data source, but can be changed for this activity.</td>
</tr>
<tr>
<td>Query timeout</td>
<td>Elapsed time to wait after running the query until the data is returned. This field is populated automatically from the data source, but can be changed for this activity.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server to use for querying JDBC, by capabilities. By default, the system selects a MID Server that has JDBC capability.</td>
</tr>
</tbody>
</table>
Option | Description
---|---
Use stored procedure | If checked, you can run a stored procedure on MySQL, Oracle, or SQL Server databases by entering the procedure name and parameters. See JDBC stored procedure parameters on page 2033.

Note: You can map parameter values in a test payload to variables in the Outputs tab automatically. See automap output variables.

- Test JDBC activity inputs
- Use auto-mapping to generate outputs and parsing rules (recommended for JDBC)
- If you do not use auto-mapping, you can manually create output variables and create parsing rules

Create a JDBC connection for an Orchestration activity
The JDBC Connection [jdbc_connection] table provides the information custom JDBC Orchestration activities use to connect to various target databases.

You must have an appropriate JAR file, whether it is supplied with the instance or a custom JAR file.

Note: The ServiceNow instance supplies mysql-connector-java-5.1.21.jar, sql-server-jdbc-4.0.jar, and ojdbc6.jar files as part of the current release, which supports MySQL, SQLServer, and Oracle databases. Other databases, such as Sybase or DB2 Universal, must use a custom JAR file that must be uploaded to the instance before setting the JDBC connection.

Role required: activity_admin, activity_creator

JDBC credentials are retrieved separately by the activity designer template and support external credential storage, such as CyberArk.

1. Navigate to Orchestration Credentials & Connections JDBC Connections and click New.
2. Complete the form using the fields in the table.
   The database selection in the Format field determines which fields are available.

Table 966: JDBC connection fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Database Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>All</td>
<td>Unique name of this JDBC connection. For example, you might enter JDBC MySQLProd.</td>
</tr>
<tr>
<td>Query timeout</td>
<td>All</td>
<td>Maximum elapsed time the JDBC query is allowed to run without a response.</td>
</tr>
<tr>
<td>Connection timeout</td>
<td>All</td>
<td>Maximum elapsed time for the JDBC activity to wait while attempting to connect to the target database.</td>
</tr>
<tr>
<td>Application</td>
<td>All</td>
<td>Scope for this table. By default, the JDBC Connection [jdbc_connection] table runs in the Global scope.</td>
</tr>
<tr>
<td>Domain</td>
<td>All</td>
<td>Domain for this table. By default, the JDBC Connection [jdbc_connection] table runs in the global domain.</td>
</tr>
<tr>
<td>Field</td>
<td>Database Format</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Format</td>
<td>All</td>
<td>Database type for this connection. The default choices are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• MySQL</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Oracle</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• SQLServer</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• None</td>
</tr>
<tr>
<td></td>
<td></td>
<td>You can add Sybase or DB2 Universal to the choice list by uploading the appropriate JDBC driver JAR file to the instance. Orchestration automatically recognizes these drivers when they are loaded into the system and adds them to this list.</td>
</tr>
<tr>
<td>Server</td>
<td>Oracle, MySQL, SQLServer</td>
<td>Host name or IP address of the database server.</td>
</tr>
<tr>
<td>Oracle sid</td>
<td>Oracle</td>
<td>The Oracle database site identifier. The default value is orcl.</td>
</tr>
<tr>
<td>Oracle port</td>
<td>Oracle</td>
<td>Port that the Oracle database is using. The default value is 1521.</td>
</tr>
<tr>
<td>Database name</td>
<td>MySQL, SQLServer</td>
<td>Name of the database.</td>
</tr>
<tr>
<td>Database port</td>
<td>MySQL, SQLServer</td>
<td>Port that the selected database is using.</td>
</tr>
<tr>
<td>Instance name</td>
<td>SQLServer</td>
<td>Instance name for the selected SQLServer</td>
</tr>
<tr>
<td>Connection URL</td>
<td>All</td>
<td>URL that the MID Server uses to connect to the specified database. The URL is created automatically when you save the form, and is read-only for the default databases.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> If the format selected is not one of the default databases, you must create the connection URL manually so that the MID Server knows how to create the connection.</td>
</tr>
<tr>
<td>JDBC driver</td>
<td>None, DB2 Universal, Sybase</td>
<td>The JDBC driver to use for this connection when it is not a default database.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> If you add a Sybase or DB2 Universal database, you must enter the driver name in this field and upload the driver JAR file to the instance.</td>
</tr>
</tbody>
</table>
3. Click Submit.

**Auto-map JDBC activity output variables**

The ServiceNow activity designer allows you to map parameter values in a JDBC test payload to variables in the Outputs tab automatically.

Role required: admin

1. In the JDBC provider template form, select the Inputs tab.
2. Click Test Activity to test the input parameters.
   - If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.
3. Provide test values, if requested, and click OK to display the payload.
The entire payload appears in the Raw Output tab of the Response form.

4. Select one of these auto-mapping options.
   - Auto-Map to Local: Directly maps values to a local variable for use within the activity.
   - Auto-Map to Output: Directly maps values to the output variable to pass to other activities in the workflow. Auto-mapping to an output variable creates an array of objects, each of which contains the column names from the query result.

**JDBC stored procedure parameters**
You can use Orchestration to run a stored procedure on MySQL, Oracle DB, and MS-SQL databases. There is support of multiple data types, with the following limitations:

- Only one result-set is returned.
- The order of input and output data types in the stored procedure parameters must match the activity definition.
- Binary, Blob, Varbinary, and LongBinary should be base64 encoded.
- Date, Time, and Timestamp have a specific format:

  **Date format:** `yyyy-mm-dd`  
  `yyyy-mm-dd` is the supported format.

  **Time format:** `hh:mm:ss[.sss]`  
  `hh:mm:ss[.sss]` is the supported format. Precision is in milliseconds only, microseconds or nanoseconds cannot be handled.
  
  **Note:** 10:30:59 and 10:30:59.999000 are correct but 10:30:59. is incorrect.

  **Timestamp format:** `yyyy-mm-dd hh:mm:ss[.ffffff]`  
  `yyyy-mm-dd hh:mm:ss[.ffffff]` is the supported format. Precision is to microseconds.

  - ResultSet is the first result set coming back from database server.
  - MS-SQL does not support INOUT parameters. If you use INOUT parameters, the Activity Template transparently maps them to OUT parameters.

  **Note:** If you do not want to do a validation of data types in stored procedure parameters, like the legacy behavior, you set the glide.stored_proc.data_type.validation as false. See [MID Server properties](https:// servicenow. com) for more information.
<table>
<thead>

<td>• VARCHAR</td>
</tr>
<tr>
<td>Name/Value</td>
<td>Name-value pairs to pass to the host. You can create these parameters manually, or drag and drop input variables into the parameter fields and assign a value.</td>
</tr>
</tbody>
</table>

**Note:** Not all database providers support the entire realm of JDBC data types. Reference your database reference manual to understand the supported datatypes for your installation.
**Test JDBC activity template inputs**

You can test the input parameters of a custom JDBC activity during its development without having to run the activity in a workflow context.

Create input variables and map them to fields in the Execution Command form or provide actual values for these fields. Role required: web_service_admin, activity_admin, activity_creator

This test executes only the input parameters against an endpoint and not the pre-processing or post-processing scripts. It is not necessary to check out the activity to test it.

**Note:** If you provide enough information for Orchestration to contact the endpoint or host and return data, you can test the input variables. You can test from any stage in the activity designer. Typically, the Execution Command stage is the point at which your inputs are ready for testing.

1. From the JDBC Execution Command, click Test Inputs.

   The list of input source variables appears. If you added default values for these variables, those values appear in the Substitute Value column. Mandatory variables are marked with a red star.

   **Note:** The test fails if the MID Server cannot be found or if it cannot connect to the target.

   ![Fill in your test values](image)

   **Figure 396: JDBC input test values**

2. Filter the variable list with these controls:
• All Inputs: Displays all input variables. This control is the default view.
• Mandatory Inputs: Displays only mandatory variables.
• Inputs Without Defaults: Shows input variables that do not have assigned default values.

3. Reset values as needed.
   • Reset default values: If values are present, this control replaces any test values set in this form with the default values.
   • Clear values: Clears all values in the input variable list, even if default values exist.

4. When your test values are configured correctly, click OK.
   The system runs the values for all the inputs configured against the specified target and returns the resulting payload. The buttons in the Response form display different views of the payload. The entire payload appears in the Raw Output window.
5. To map appropriate parameter values in the payload to variables in the Outputs stage automatically, select an **auto-mapping option**.
7. Click the X in the upper right corner of the window to close it.

Create a SOAP web service activity

Use this template to create a custom SOAP activity.

Role required: web_service_admin, activity_admin, activity_creator

For instructions on using the activity template process flow, see create custom activities.

1. Create a custom activity.
   This action creates a custom activity using a template.

2. After setting up general properties and creating input variables, configure the SOAP web service Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Map the input variables</strong></td>
<td>Use the variables you created to configure the command that Orchestration executes on the SOAP web service.</td>
</tr>
<tr>
<td><strong>Web service message</strong></td>
<td>Specify the SOAP web service message to use for this activity. If you need information on SOAP web services messages, see SOAP message.</td>
</tr>
<tr>
<td><strong>Web service message function</strong></td>
<td>Specify the SOAP message function available in conjunction with the SOAP web service.</td>
</tr>
<tr>
<td><strong>Endpoint</strong></td>
<td>If you enter an endpoint in this field, it overrides the endpoint URL configured in the SOAP message web service. Click the lock icon to open the input field and add the endpoint.</td>
</tr>
<tr>
<td><strong>SOAP message parameters</strong></td>
<td>Name-value pairs to pass to the SOAP endpoint. You can create these parameters manually, or drag input variables into the parameter fields and then assign a value. Parameters defined in the SOAP message that use ${} can be assigned data from this activity template. Use the Additional attribute column to configure the system to not escape the text. By default, text sent to the SOAP message is escaped. The Name column is auto-populated if the users have provided variables using variable substitution in the SOAP message.</td>
</tr>
<tr>
<td><strong>Use MID Server</strong></td>
<td>Check box that determines if a MID Server must be used to invoke the SOAP web service. If the SOAP web service message function defines a MID Server, that MID Server is used instead of the one selected here.</td>
</tr>
<tr>
<td><strong>Required MID Server capabilities</strong></td>
<td>MID Server with the appropriate capabilities for connecting to the SOAP endpoint. By default, the system selects a MID Server with SOAP capabilities. This field is available when the Use MID Server check box is selected.</td>
</tr>
<tr>
<td><strong>Timeout</strong></td>
<td>Allowed duration of the SOAP web service request before it times out, in seconds. The default is 10.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Authentication</td>
<td>Determines what type of authentication is required for the endpoint. The options are:</td>
</tr>
<tr>
<td></td>
<td>• Use existing credentials in SOAP message: Uses credential definitions from the SOAP message definition.</td>
</tr>
<tr>
<td></td>
<td>• Override with Basic Authentication credentials: Uses basic authentication credentials. Overrides the credentials in the SOAP message definition.</td>
</tr>
<tr>
<td></td>
<td>• Override with Certificate Authentication credentials: Overrides the credentials in the SOAP message definition with certificate authentication credentials.</td>
</tr>
<tr>
<td></td>
<td>• Override with Both Basic and Certificate Authentication credentials: Overrides the credentials in the SOAP message definition with both basic authentication or certificate authentication credentials.</td>
</tr>
<tr>
<td></td>
<td>• Override with WS-Security Username profile: Overrides the credentials in the SOAP message definition with credentials defined a WS Security Profile.</td>
</tr>
<tr>
<td>Credentials</td>
<td>Required REST endpoint basic authentication credentials. This field is available when Override with Basic Authentication credentials is selected in the Authentication field. Only basic authentication credentials appear in the selection list, which includes credentials stored on the instance and credential IDs from an external storage system. If you are using credentials stored in a CyberArk safe, you can override the default safe defined in the MID Server configuration file by adding the name of a different safe as a prefix to the credential ID, separated by a colon. For example, newsafe:orch-test-f5. See Configure the MID Server for CyberArk for details.</td>
</tr>
<tr>
<td>Protocol Profile</td>
<td>Protocol profile to use for authentication. This field is available when the authentication type is either Override with Certificate Authentication credentials or Override with Both Basic and Certificate Authentication credentials.</td>
</tr>
</tbody>
</table>

**Note:** You can map parameter values in a test payload to variables in the Outputs tab automatically. See `automap output variables`. 

- Use `auto-mapping` to generate outputs and parsing rules (recommended for JDBC)
• If you do not use auto-mapping, you can manually create output variables and create parsing rules

**Auto-map SOAP activity output variables**
The ServiceNow activity designer allows you to map parameter values in a SOAP test payload to variables in the Outputs stage automatically.
Role required: web_service_admin, activity_admin, activity_creator

**Note:** You can test input variables from any stage in the activity designer if you have provided enough information for Orchestration to contact the endpoint and return data. Typically, the Execution Command stage is the point at which your inputs are ready for testing.

1. In the activity designer, proceed to the Execution Command stage.
2. Define an appropriate MID Server, if requested.
   The test fails if the MID Server cannot be found or if it cannot connect to the target.
3. Click Test Activity to test the input parameters.
   If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.
4. Provide test values, if requested, and click OK to display the payload.
   The entire payload appears in the Raw Output tab of the Response form.

5. Select one of these auto-mapping options.
   • Auto-Map to Local: Directly maps values to a local variable for use within the activity.
   • Auto-Map to Output: Directly maps values to the output variable to pass to other activities in the workflow. Auto-mapping to an output variable creates an array of objects, each of which contains the column names from the query result.

**Provide credentials to access a SOAP message WSDL**
If the SOAP WSDL you are requesting in a test payload requires authentication, you must provide basic auth credentials in either the SOAP message or the SOAP activity.
Role required: web_service_admin, activity_admin, activity_creator

The ServiceNow instance only supports basic auth credentials for accessing a WSDL. If the SOAP function or the SOAP message does not provide these credentials, you must configure them in the SOAP activity template. Orchestration uses these priorities for deciding which basic authentication credentials to use:

• SOAP message: Credentials for a SOAP message are used if no other credentials are defined.
• SOAP function: Credentials for a SOAP function override the credentials configured for the SOAP message.
• SOAP activity template: Credentials for a SOAP activity template override both the SOAP function and SOAP message credentials.

1. Navigate to System Web Services Outbound SOAP Message.
2. Select the SOAP message you want the activity to use.
3. In the SOAP Message record, select the Download WSDL check box.
4. In the Authentication type field, select Basic.
   The Basic auth profile field appears.
5. Select the basic auth profile to use with this SOAP message.
6. Alternately, you can configure basic authentication credentials in *Configure the SOAP execution command* on page 2043.
   a) In the Authentication field, select Override with Basic Authentication credentials.
The Credentials field appears.

b) Select the basic auth credentials to use to access the WSDL. This setting overrides any credentials configured in the SOAP message.

Figure 399: Override basic auth credentials

Configure the SOAP execution command
Use the input variables you created to configure the command that Orchestration executes on the SOAP endpoint.
Create the input variables you need in the Inputs form before you can advance to the Execution Command stage.

Role required: web_service_admin, activity_admin, activity_creator

**Note:** You can test the SOAP connection between the MID Server and the endpoint without having to run the activity in a workflow context. For details, see *test template outputs*.

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
Figure 400: SOAP execution command

2. Complete the fields shown in the table.
Table 968: SOAP template execution command fields

<table>

<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. Create input variables on page 2000 to map to available fields.</td>
</tr>
<tr>
<td>Web service message</td>
<td>SOAP message to use for this activity. Users must have the web_service_admin role to configure this field.</td>
</tr>
<tr>
<td>Web service message function</td>
<td>SOAP message function to use for this activity. Users must have the web_service_admin role to configure this field.</td>
</tr>
<tr>
<td>Endpoint</td>
<td>Endpoint URL for the SOAP web service this activity uses. Enter an endpoint in this field to override the endpoint configured in the SOAP message. Click the lock icon to open the input field.</td>
</tr>
<tr>
<td>SOAP message parameters</td>
<td>Name-value pairs to pass to the SOAP endpoint. You can create these parameters manually, or drag input variables into the parameter fields and then assign a value. Parameters defined in the SOAP message that use $() can be assigned data from this activity template. Use the Additional attribute column to configure the system to not escape the text. By default, text sent to the SOAP message is escaped. The Name column is auto-populated if the users have provided variables using variable substitution in the SOAP message.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>Check box that determines if a MID Server must be used to invoke the SOAP web service.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong></td>
</tr>
<tr>
<td></td>
<td>If the SOAP web service message function defines a MID Server, that MID Server is used instead of the one selected here.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server with the appropriate capabilities for connecting to the SOAP endpoint. By default, the system selects a MID Server with SOAP capabilities. This field is available when the Use MID Server check box is selected.</td>
</tr>
<tr>
<td>Timeout</td>
<td>Allowed duration of the SOAP web service request before it times out, in seconds. The default is 10.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Authentication        | Determines what type of authentication is required for the endpoint. The options are:  
  • Use existing credentials in SOAP message: Uses credential definitions from the SOAP message definition.  
  • Override with Basic Authentication credentials: Uses basic authentication credentials. Overrides the credentials in the SOAP message definition. Basic authentication credentials must be provisioned before they are available for selection.  
  • Override with Certificate Authentication credentials: Overrides the credentials in the SOAP message definition with certificate authentication credentials.  
  • Override with Both Basic and Certificate Authentication credentials: Overrides the credentials in the SOAP message definition with both basic authentication or certificate authentication credentials.  
  • Override with WS-Security Username profile: Overrides the credentials in the SOAP message definition with credentials defined a WS Security Profile.  
| Credentials           | Required REST endpoint basic authentication credentials. This field is available when Override with Basic Authentication credentials is selected in the Authentication field. Only basic authentication credentials appear in the selection list, which includes credentials stored on the instance and credential IDs from an external storage system. If you are using credentials stored in a CyberArk safe, you can override the default safe defined in the MID Server configuration file by adding the name of a different safe as a prefix to the credential ID, separated by a colon. For example, newsafe:orch-test-f5.  
| Protocol Profile      | Protocol profile to use for authentication. This field is available when the authentication type is either Override with Certificate Authentication credentials or Override with Both Basic and Certificate Authentication credentials.  

3. Click Save.  
4. Click Continue to advance to the Outputs stage.
**SOAP template execution parameters**

You use execution parameters to create the input process script in the Pre processing form of the activity designer.

For descriptions of the SOAP web service command fields, see the table in *Configure the SOAP execution command* on page 2043.

**Note:** You must use the `executionParam.` prefix with all variables in this table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web service message</td>
<td><code>web_service_message</code></td>
<td>Reference</td>
<td>The <code>sys_id</code> of the corresponding SOAP message.</td>
</tr>
<tr>
<td>Web service message function</td>
<td><code>web-service_message_function</code></td>
<td>Reference</td>
<td>The <code>sys_id</code> of the SOAP message function.</td>
</tr>
<tr>
<td>Web service endpoint</td>
<td><code>web_service_endpoint</code></td>
<td>String</td>
<td>URL of the SOAP endpoint.</td>
</tr>
<tr>
<td>Parameters</td>
<td><code>parameters</code></td>
<td>Array of JavaScript objects</td>
<td>Array of JavaScript objects, expressed with the <code>executionParam.</code> prefix. For instructions on creating arrays using this parameter, see <em>Create a JavaScript array in a SOAP template</em> on page 2049.</td>
</tr>
<tr>
<td>Use mid server</td>
<td><code>use_mid_server</code></td>
<td>Boolean</td>
<td>When true, indicates that a MID Server is used.</td>
</tr>
<tr>
<td>MidCapabilities</td>
<td><code>midCapabilities</code></td>
<td>String (comma separated)</td>
<td>List of references to required MID Server capabilities.</td>
</tr>
<tr>
<td>Time out</td>
<td><code>time_out</code></td>
<td>String</td>
<td>Allowed duration of the SOAP web service request before it times out, in seconds. The default is 10.</td>
</tr>
<tr>
<td>Name</td>
<td>Variable</td>
<td>Type</td>
<td>Usage</td>
</tr>

<td>----------</td>
<td>---------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| ValueCapabilities    | valueCapabilities | Array of hashmap          | Capability values used to select the MID Server. For more information, see [MID Server capabilities](#) on page 1716. Use this example to customize the MID Server selection if there are additional capabilities that are assigned by value:  
  ```javascript
  var valueCapability = {'NEW_MID_CAPABILITY': 'NEW_MID_CAPABILITY_VALUE'};
  executionParam.valueCapabilities.push(valueCapability);
  ``` |
| Auth Type            | auth_type | Boolean                   | Type of credentials to use. The choices are:                                                                                                                                                     |
|                      |           |                           | • basic_auth_pick_credentials  
|                      |           |                           | • use_existing_credentials |
| Credentials          | credentials | Reference               | Credentials to use for this SOAP message when the auth_type is basic_auth_pick_credentials.                                                                                                      |

*Create a JavaScript array in a SOAP template*

These are instructions for creating JavaScript arrays using SOAP execution parameters.

Role required: web_service_admin, activity_admin, activity_creator

To add more name-value pairs to the parameter's array, append the values to the existing array.

1. Create a JavaScript object with the following syntax, and add it to the executionParam.parameter array:

   ```javascript
   var newParameter = {
   "name": "parameterName",
   "value": "parameterValue",
   "additional_attribute": "none"
   }; 
   executionParam.parameters.push(newParameter);
   ```

   By adding the new parameter JavaScript object to the array, you ensure that any elements already available in the array are not impacted.

2. Make sure to set the value in the Additional attribute column in the SOAP message parameters input field to Do not escape text.

   In this case, the system does not escape the value specified for the value attribute. An example of this is:

   ```javascript
   var newParameter = {
   "name": "parameterName",
   "value": "parameterValue",
   "additional_attribute": "do_not_escape_text"
   }; 
   executionParam.parameters.push(newParameter);
   ```

© 2018 ServiceNow. All rights reserved.
Note: If the value for the additional_attribute field is None, then the system escapes the value specified by the value attribute. In the first example, parameterValue is escaped.

SOAP template post-processing parameters
Use these parameters to create a post-processing script.

Table 970: Activity designer post-processing parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status code</td>
<td>status_code</td>
<td>Integer</td>
<td>Contains the status code returned from the web service.</td>
</tr>
<tr>

<td>header</td>
<td>Hashmap of JavaScript object</td>
<td>Contains the key value paired hashmap associated with the header values passed into the web service. You can access each value with executionResult.header[keyName].</td>
</tr>
<tr>
<td>Body</td>
<td>body</td>
<td>String</td>
<td>Contains a string value representing the output from the SOAP message</td>
</tr>
<tr>
<td>Error</td>
<td>error</td>
<td>String</td>
<td>Returns the error string from the SOAP web service, unless there are no errors, in which case it returns null.</td>
</tr>
</tbody>
</table>

Create a JavaScript Probe activity
Create a JavaScript Probe activity to instruct a MID server to execute server-side javascript.
Role required: activity_creator or workflow_admin
The JavascriptProbe activity has the same functionality as making 'Packages' calls into standard Java libraries. It allows you to have more control over the Java libraries on the MID Server. You can load your own JAR files on the MID Server and have the JavascriptProbe make Package calls into those java files.

1. Create a custom activity.
   This action creates a custom activity using a template.
2. After setting up general properties and creating input variables, configure the JavaScript probe activity.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Map the input variables</td>
<td>Use the variables you created to configure the command that Orchestration executes on the MID server.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Script type</td>
<td>Select the type of script to include. Available options are:</td>
</tr>
<tr>
<td></td>
<td>• Custom JavaScript</td>
</tr>
<tr>
<td></td>
<td>• MID Server script include</td>
</tr>
<tr>
<td>Script</td>
<td>Custom JavaScript to run with this probe.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available when the Script type selected is Custom JavaScript.</td>
</tr>
<tr>
<td>MID Server script include</td>
<td>Script for the MID Server to run with this probe.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available when the Script type selected is MID Server script include.</td>
</tr>
<tr>
<td>Select MID Server by host</td>
<td>MID Server on which the probe runs.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server to use, by capabilities.</td>
</tr>
<tr>
<td>Parameters</td>
<td>Name-value pairs to pass to the host with this probe. You can create these parameters manually, or drag input variables into the Parameters fields and assign a value.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You can map parameter values in a test payload to variables in the Outputs tab automatically. See <a href="#">automap output variables</a>.</td>
</tr>
</tbody>
</table>

Finish creating your JavaScript probe activity by [creating output variables](#), [creating a parsing rule](#), or [creating template conditions](#). Refer to the [create custom activities](#) topic to know your template options.

*JavaScript probe template execution parameters*

You use execution parameters to create the input process script in the Preprocessing form of the activity designer.

For descriptions of the JavaScript Probe command fields, see the table in Configure the JavaScript Probe execution command on page 2053.

**Note:** You must use the `executionParam` prefix with all variables in this table.

Table 971: JavaScript template execution parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>

<td>Contains output data returned from the JavaScript Probe.</td>
</tr>
<tr>
<td>EccSysId</td>
<td>eccSysId</td>
<td>String</td>
<td>Contains the reference ID associated with the ECC Queue input message.</td>
</tr>
<tr>
<td>Error Messages</td>
<td>errorMessages</td>
<td>String</td>
<td>Contains the error messages returned from the JavaScript probe. If no error messages are returned, this value is null.</td>
</tr>
</tbody>
</table>

Configure the JavaScript Probe execution command
Use the input variables you created to configure the command that Orchestration executes on the JavaScript Probe target host.

Create the input variables you need in the Inputs form before you can advance to the Execution Command stage.

Role required: activity_creator, admin

**Note:** You can test the JavaScript Probe connection between the MID Server and the target without having to run the activity in a workflow context. For details, see test template outputs.

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
Figure 401: JavaScript Probe execution command

```javascript
var str = new Packages.java.lang.String("TestString");
this.probe.createOutputResult(str);
```
2. Complete the fields shown in the table.

### Table 973: JavaScript Probe execution command fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. <a href="#">Create input variables on page 2000 to map to available fields.</a></td>
</tr>
<tr>
<td>Script type</td>
<td>Select the type of script to include. Available options are:</td>
</tr>
<tr>
<td></td>
<td>• Custom JavaScript</td>
</tr>
<tr>
<td></td>
<td>• MID Server script include</td>
</tr>
<tr>
<td>Script</td>
<td>Custom JavaScript to run with this probe. This field is available when the Script type selected is Custom JavaScript.</td>
</tr>
<tr>
<td>MID Server script include</td>
<td>Script for the MID Server to run with this probe. This field is available when the Script type selected is MID Server script include.</td>

<tr>
<td>capabilities</td>
<td></td>
</tr>
<tr>
<td>Parameters</td>
<td>Name-value pairs to pass to the host with this probe. You can create these parameters manually, or drag input variables into the Parameters fields and assign a value.</td>
</tr>
</tbody>
</table>

3. Click Save.
4. Click Continue to advance to the Outputs stage.

### Create a PowerShell activity

Create a custom PowerShell activity return data to a workflow from a host using Microsoft PowerShell.

Role required: activity_creator or workflow_admin

ServiceNow supports PowerShell 2.0 and above. PowerShell 3.0 does not support Windows 2003 Server.

1. Create a custom activity.
   This action creates a custom activity using a template.
2. After setting up general properties and creating input variables, configure the PowerShell Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Map the input variables</td>
<td>Use the variables you created to configure the command that Orchestration executes on the MID Server.</td>
</tr>
<tr>
<td>Target host</td>
<td>Host name or IP address of the target server for this PowerShell activity.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Script type</strong></td>
<td>Type of PowerShell script to run on the PowerShell host. Available options are:</td>
</tr>
<tr>
<td></td>
<td>• Custom PowerShell command</td>
</tr>
<tr>
<td></td>
<td>• MID Server script file</td>
</tr>
<tr>
<td><strong>MID Server script file</strong></td>
<td>The MID Server script file contains the PowerShell scripts. This field is available when the Script type selected is MID Server script file.</td>
</tr>
<tr>
<td><strong>Command</strong></td>
<td>PowerShell command the activity executes. This field is available when the Script type selected is Custom PowerShell command. You can create your commands by dragging and dropping input variables from the variable builder into this field.</td>
</tr>
<tr>
<td><strong>PowerShell variables</strong></td>
<td>Name-value pairs to pass to the host with PowerShell. You can create these variables manually, or drag input variables into the Value field. Encrypted input variables retain their encryption, regardless of the data type settings in this field. If you type in a value and select the Encrypted data type, your value appears in plain text. It is only encrypted when it passes to the ECC Queue.</td>
</tr>
<tr>
<td><strong>Use MID Service Account</strong></td>
<td>If checked, this activity authenticates on the target host using the credentials of the MID Server service account only, without trying any other credentials.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The Credential tag field is not available.</td>
</tr>
<tr>
<td><strong>Credential tag</strong></td>
<td>Credential tag this activity must use to run PowerShell commands on the host. If this field is left blank, the MID Server tries all the available credentials until it finds a valid one, ending with the MID Server service account. If a credential tag is defined, the MID Server tries the credentials with that tag specified only and does not try the MID Server service account.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is not available when the Use MID service account check box is selected.</td>
</tr>
<tr>
<td><strong>Required MID Server capabilities</strong></td>
<td>MID Server to use for querying PowerShell, by capabilities. By default, the system selects a PowerShell MID Server.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You can map parameter values in a test payload to variables in the Outputs tab automatically. See automap output variables.</td>
</tr>
</tbody>
</table>
Finish creating your PowerShell activity by creating output variables, creating a parsing rule, or creating template conditions. Refer to the create custom activities topic to know your template options.

**PowerShell template execution parameters**

You use execution parameters to create the input process script in the Pre Processing form of the activity designer.

For descriptions of the Powershell command fields, see the table in [Configure the PowerShell execution command](#) on page 2002.

**Note:** You must use the executionParam. prefix with all variables in this table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source</td>
<td>source</td>
<td>String</td>
<td>Target host on which to execute the command.</td>
</tr>
<tr>
<td>Script type</td>
<td>script_type</td>
<td>Enumeration</td>
<td>Type of script to run. The possible types are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• command: Custom PowerShell command.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• file: Identifies the MID Server script file to run.</td>
</tr>
<tr>
<td>Command</td>
<td>command</td>
<td>String</td>
<td>Command sent to the MID Server for it to run on the target host.</td>
</tr>
<tr>
<td>MidScriptFile</td>
<td>midScriptFile</td>
<td>Reference</td>
<td>Reference sys_id of the MID Server script file to execute, when the script_type is file.</td>
</tr>
<tr>
<td>PowershellVariables</td>
<td>powershellVariables</td>
<td>Array of hashmap</td>
<td>Hashmap of JavaScript objects with name, value, and type for each object. The type of each object can be one of plain, encrypted, boolean, or null, corresponding to the PowerShell variable type selected in the inputs tab. For example, you might enter:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>var newParameter = { &quot;name&quot; : &quot;parameterName&quot;, &quot;value&quot; : &quot;ParameterValue&quot;, &quot;type&quot; : &quot;plain&quot; }; executionParam.powershellVariables.push(newParameter);</td>
</tr>
<tr>
<td>Name</td>
<td>Variable</td>
<td>Type</td>
<td>Usage</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------</td>
<td>-----------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Credential tag</td>
<td>credential_tag</td>
<td>String</td>
<td>Specific credential tag this activity must use to run PowerShell commands on the host.</td>
</tr>
<tr>
<td>MidCapabilities</td>
<td>midCapabilities</td>
<td>String (comma separated)</td>
<td>List of required MID Server capabilities.</td>
</tr>
<tr>
<td>ValueCapabilities</td>
<td>valueCapabilities</td>
<td>Array of hashmap</td>
<td>Capability values used to select the MID Server. For more information, see MID Server capabilities on page 1716. If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection: var valueCapability = {'NEW_MID_CAPACITY': 'NEW_MID_CAPACITY_VALUE'}; executionParam.valueCapabilities.push(valueCapability);</td>
</tr>
</tbody>
</table>

*Powershell post-processing parameters and payload parsing*

Use these parameters to create a post-processing script, payload parsing, and tagging.
### Table 975: Powershell post-processing parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tags</td>
<td>tags</td>
<td>Hashmap of tag values to return from the PowerShell command.</td>
<td></td>

</tbody>
</table>

Create a REST web service activity

Use this procedure to create a custom REST web service Orchestration activity.

Role required: web_service_admin, activity_admin, activity_creator

To create and use a REST web service workflow activity:

- Create a **REST message** if an appropriate one is not already configured.
- Assign the web_service_admin role to any user who must create or edit a custom REST activity.
- Determine an application, or **scope**, for this activity.
- Determine the **REST endpoint** to use for the activity. Use this value to override the endpoint configured in the REST message.
- Optionally, create **basic authentication credentials**. Use this value to override the credentials configured in the SOAP message.

1. Create a **custom activity**.
   This action creates a custom activity using a template.

2. After setting up **general properties** and **creating input variables**, configure the REST web service Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Map the input variables</strong></td>
<td>Use the variables you created to configure the command that Orchestration executes.</td>
</tr>
<tr>
<td><strong>REST message</strong></td>
<td>Name of an existing REST message to use in this activity.</td>
</tr>
<tr>
<td><strong>REST message function</strong></td>
<td>REST message function to use for this activity.</td>
</tr>
<tr>
<td><strong>Endpoint</strong></td>
<td>Endpoint URL for the REST web service this activity uses. Enter an endpoint in this field to override the endpoint configured in the REST message. Click the lock to open the input field.</td>
</tr>
<tr>
<td><strong>Variable substitutions</strong></td>
<td>Name-value pairs to pass to the REST endpoint. You can create these parameters manually, or drag input variables into the parameter fields, and then assign a value. Parameters defined in the REST message that use $() can be assigned data from this activity template. Use the Additional attribute column to configure the system to not escape the text. By default the text sent to the REST message is escaped. If the users have provided variables using variable substitution in the REST message, then the Name column is automatically populated.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Additional Headers</td>
<td>Additional HTTP header parameters for the REST message selected. You can also use these values to override parameters inherited from the REST message.</td>
</tr>
<tr>
<td>Additional Query Parameters</td>
<td>Additional query parameters for the REST message selected. You can also use these values to override parameters inherited from the REST message.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>Check box that determines if a MID Server should be used to invoke the REST web service.</td>
</tr>
<tr>
<td>Note:</td>
<td>If the REST web service message function defines a MID Server, that MID Server is used instead of the one selected here.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server with the appropriate capabilities for connecting to the REST endpoint. By default, the system selects a MID Server with REST capabilities. This field is available when the Use MID Server check box is selected.</td>
</tr>
<tr>
<td>Timeout</td>
<td>Allowed duration of the REST web service request before it times out, in seconds. The default is 10.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Authentication</strong></td>
<td>Determines what type of authentication is required for the endpoint. The options are:</td>
</tr>
<tr>
<td></td>
<td>• Use existing credentials in REST message: Uses credential definitions from the REST message definition.</td>
</tr>
<tr>
<td></td>
<td>• Override with Basic Authentication credentials: Uses basic authentication credentials to override the credentials in the REST message definition. Basic authentication credentials must be provisioned before they are available for selection.</td>
</tr>
<tr>
<td></td>
<td>• Override with Certificate Authentication credentials: Uses a certificate, such as a private key, to override the credentials in the REST message definition.</td>
</tr>
<tr>
<td></td>
<td>• Override with Both Basic and Certificate Authentication credentials: Uses both basic authentication and certificate authentication to override the credentials in the REST message definition.</td>
</tr>
<tr>
<td></td>
<td>• Override with OAuth Authentication credentials: Uses OAuth 2.0 credentials to override the credentials in the REST message definition. The REST message selected for this activity must have its <strong>Authentication type</strong> set to OAuth 2.0 and its <strong>OAuth profile</strong> configured appropriately.</td>
</tr>
<tr>
<td><strong>Credentials</strong></td>
<td>Required REST endpoint basic authentication credentials. This field is available when Override with Basic Authentication credentials is selected in the Authentication field. Only basic authentication credentials appear in the selection list, which includes credentials stored on the instance and credential IDs from an external storage system. If you are using credentials stored in a CyberArk safe, you can override the default safe defined in the MID Server configuration file. See <strong>Configure the MID Server for CyberArk</strong> for details. Add the name of a different safe as a prefix to the credential ID, separated by a colon. For example, newsafe:orch-test-f5.</td>
</tr>
<tr>
<td><strong>Protocol Profile</strong></td>
<td>Certificate authentication to use. This field is available when the selections in the Authentication are either Override with Certificate Authentication credentials or Override with Both Basic and Certificate Authentication credentials.</td>
</tr>
<tr>
<td><strong>OAuth profile</strong></td>
<td>Profile for the OAuth provider for this REST message. See <strong>Specify an OAuth profile</strong> for more information.</td>
</tr>
</tbody>
</table>
**Note:** You can map parameter values in a test payload to variables in the Outputs tab automatically. See *automap output variables*.

Finish creating your Rest web service activity by *creating output variables*, *creating a parsing rule*, or *creating template conditions*. Refer to the *create custom activities* topic to know your template options.

**Auto-map REST activity output variables**

The ServiceNow activity designer allows you to map parameter values in a REST test payload to variables in the Outputs stage automatically.

Role required: web_service_admin, activity_admin, activity_creator

**Note:** You can test input variables from any stage in the activity designer if you have provided enough information for Orchestration to contact the endpoint and return data. Typically, the Execution Command stage is the point at which your inputs are ready for testing.

1. In the activity designer, proceed to the Execution Command stage.
2. Define an appropriate MID Server, if requested.
   The test fails if the MID Server cannot be found or if it cannot connect to the target.
3. Click Test Activity to test the input parameters.
   If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.
4. Provide test values, if requested, and click OK to display the payload.
   The entire payload appears in the Raw Output tab of the Response form.

5. Select one of these auto-mapping options.
   - Auto-Map to Local: Directly maps values to a local variable for use within the activity.
   - Auto-Map to Output: Directly maps values to the output variable to pass to other activities in the workflow. Auto-mapping to an output variable creates an array of objects, each of which contains the column names from the query result.

**REST template execution parameters**

You use execution parameters to create the input process script in the Pre Processing form of the activity designer.

For descriptions of the REST web service command fields, see *Configure the REST execution command* on page 2066.

**Note:** You must use the executionParam. prefix with all variables in this table.
<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web service message</td>
<td>web_service_message</td>
<td>Reference</td>
<td>The sys_id of the corresponding web service message.</td>
</tr>
<tr>
<td>Web service message function</td>
<td>web_service_message_function</td>
<td>Reference</td>
<td>The sys_id of the REST message function.</td>
</tr>
<tr>
<td>Web service endpoint</td>
<td>web_service_endpoint</td>
<td>String</td>
<td>URL of the REST endpoint.</td>
</tr>
<tr>
<td>Parameters</td>
<td>parameters</td>
<td>Array of JavaScript objects</td>
<td>Array of JavaScript objects, expressed with the executionParam. prefix. For instructions on creating arrays using this parameter see <a href="#">Create a JavaScript array in a REST template</a> on page 2065.</td>
</tr>
<tr>
<td>Use mid server</td>
<td>use_mid_server</td>
<td>Boolean</td>
<td>Selects whether or not to use the MID Server. A value of true uses the MID Server, and a value of false does not use the MID Server.</td>
</tr>
<tr>
<td>MidCapabilities</td>
<td>midCapabilities</td>
<td>String (comma separated)</td>
<td>List of references to required MID Server capabilities.</td>
</tr>
<tr>
<td>Time out</td>
<td>time-out</td>
<td>String</td>
<td>Allowable time out duration, expressed in seconds.</td>
</tr>
<tr>
<td>ValueCapabilities</td>
<td>valueCapabilities</td>
<td>Array of hashmap</td>
<td>Capability values used to select the MID Server. For more information, see <a href="#">MID Server capabilities</a> on page 1716. Use this example to customize the MID Server selection if there are additional capabilities that are assigned by value: var valueCapability = {'NEW_MID_CAPABILITY': 'NEW_MID_CAPABILITY_VALUE'}; executionParam.valueCapabilities.push(valueCapability);</td>
</tr>
</tbody>
</table>
Create a JavaScript array in a REST template

These are instructions for creating JavaScript arrays using REST execution parameters.

Role required: web_service_admin, activity_admin, activity_creator

To add more name-value pairs to the parameter's array, append the values to the existing array.

1. Create a JavaScript object with the following syntax, and add it to the executionParam.parameter array:

   ```javascript
   var newParameter = {
     "name": "parameterName",
     "value": "parameterValue",
     "additional_attribute": "none"
   };
   executionParam.parameters.push(newParameter);
   ```

   By adding the new parameter JavaScript object to the array, you ensure that any elements already available in the array are not impacted.

2. Make sure to set the value in the Additional attribute column in the REST message parameters input field to Do not escape text.

   In this case, the system does not escape the value specified for the value attribute. An example of this is:

   ```javascript
   var newParameter = {
     "name": "parameterName",
     "value": "parameterValue",
     "additional_attribute": "do_not_escape_text"
   };
   executionParam.parameters.push(newParameter);
   ```

   **Note:** If the value for the additional_attribute field is None, then the system escapes the value specified by the value attribute. In the first example, parameterValue is escaped.

REST template post-processing parameters

Use these parameters to create a post-processing script.

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status code</td>
<td>status_code</td>
<td>Integer</td>
<td>Contains the status code returned from the REST web service.</td>
</tr>
<tr>
<td>Name</td>
<td>Variable</td>
<td>Type</td>
<td>Usage</td>
</tr>
<tr>
<td>------</td>
<td>----------</td>
<td>------</td>
<td>-------</td>
</tr>
<tr>
<td>Header</td>
<td>header</td>
<td>Hashmap of JavaScript object</td>
<td>Hashmap of key value pairs associated with the header values passed into the web service. You can access each value with executionResult.header[keyName].</td>
</tr>
<tr>
<td>Body</td>
<td>body</td>
<td>String</td>
<td>Contains a string value representing the output from the REST message</td>
</tr>
<tr>
<td>Error</td>
<td>error</td>
<td>String</td>
<td>Returns the error string from the REST web service, unless there are no errors, in which case it returns null.</td>
</tr>
</tbody>
</table>

Configure the REST execution command

Use the input variables you created to configure the command that Orchestration executes on the REST endpoint.

Create the input variables you need in the Inputs form before you can advance to the Execution Command stage.

Role required: web_service_admin, activity_admin, activity_creator

**Note:** You can test the REST connection between the MID Server and the endpoint without having to run the activity in a workflow context. For details, see test template outputs.

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
Figure 402: REST execution command
2. Complete the fields shown in the table.

**Table 978: REST execution command fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. Create input variables on page 2000 to map to available fields.</td>
</tr>
<tr>
<td>REST message</td>
<td>Name of an existing REST message to use in this activity. Users must have the web_service_admin role to configure this field.</td>
</tr>
<tr>
<td>REST message function</td>
<td>REST message function to use for this activity. Users must have the web_service_admin role to configure this field.</td>
</tr>
<tr>
<td>Endpoint</td>
<td>Endpoint URL for the REST web service this activity uses. Enter an endpoint in this field to override the endpoint configured in the REST message. Click the lock to open the input field.</td>
</tr>
<tr>
<td>Variable substitutions</td>
<td>Name-value pairs to pass to the REST endpoint. You can create these parameters manually, or drag and drop input variables into the parameter fields, and then assign a value. Parameters defined in the REST message that use ${} can be assigned data from this activity template. Use the Additional attribute column to configure the system to not escape the text. By default the text sent to the REST message is escaped. The Name column is automatically populated if the users have provided variables using variable substitution in the REST message.</td>
</tr>
<tr>
<td>Additional Headers</td>
<td>Additional HTTP header parameters for the REST message selected. You can also use these values to override parameters inherited from the REST message.</td>
</tr>
<tr>
<td>Additional Query Parameters</td>
<td>Additional query parameters for the REST message selected. You can also use these values to override parameters inherited from the REST message.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>Check box that determines if a MID Server should be used to invoke the REST web service.</td>
</tr>
</tbody>
</table>

**Note:** If the REST web service message function defines a MID Server, that MID Server is used instead of the one selected here.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server with the appropriate <em>capabilities</em> for connecting to the REST endpoint. By default, the system selects a MID Server with REST capabilities. This field is available when the Use MID Server check box is selected.</td>
</tr>
<tr>
<td>Timeout</td>
<td>Allowed duration of the REST web service request before it times out, in seconds. The default is 10.</td>
</tr>
<tr>
<td>Authentication</td>
<td>Determines what type of authentication is required for the endpoint. The options are:</td>
</tr>
<tr>
<td></td>
<td>• Use existing credentials in REST message: Uses credential definitions from the REST message definition.</td>
</tr>
<tr>
<td></td>
<td>• Override with Basic Authentication credentials: Uses <em>basic authentication</em> credentials to override the credentials in the REST message definition. Basic authentication credentials must be provisioned before they are available for selection.</td>
</tr>
<tr>
<td></td>
<td>• Override with Certificate Authentication credentials: Uses a certificate, such as a private key, to override the credentials in the REST message definition.</td>
</tr>
<tr>
<td></td>
<td>• Override with Both Basic and Certificate Authentication credentials: Uses both basic authentication and certificate authentication to override the credentials in the REST message definition.</td>
</tr>
<tr>
<td></td>
<td>• Override with OAuth Authentication credentials: Uses <em>OAuth 2.0</em> credentials to override the credentials in the REST message definition. The REST message selected for this activity must have its <em>Authentication type</em> set to OAuth 2.0 and its <em>OAuth profile</em> configured appropriately.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Credentials</td>
<td>Required REST endpoint basic authentication credentials. This field is available when Override with Basic Authentication credentials is selected in the Authentication field. Only basic authentication credentials appear in the selection list, which includes credentials stored on the instance and credential IDs from an external storage system. If you are using credentials stored in a CyberArk safe, you can override the default safe defined in the MID Server configuration file by adding the name of a different safe as a prefix to the credential ID, separated by a colon. For example, newsafe:orch-test-f5.</td>
</tr>
<tr>
<td>Protocol Profile</td>

</tr>
<tr>
<td>OAuth profile</td>
<td>Profile for the OAuth provider for this REST message. See Specify an OAuth profile for more information.</td>
</tr>
</tbody>
</table>

3. Click Save.
4. Click Continue to advance to the Outputs stage.

Create an SFTP activity

Create an activity that executes basic SFTP commands on a remote server.

Roles required: activity_creator or workflow_admin

You can create a custom activity that manages files and directories on a target host or copies a file from one SFTP server to another. The file content is streamed through a MID Server, which avoids having to store the data on the hard drive of the MID Server host machine.

**Note:** This activity requires the credentials of a user who can execute SFTP commands on the source host. The Copy File activity, provided in the activity pack, requires separate credentials to access the target host.

1. Create a custom activity.
   This action creates a custom activity using a template.
2. After setting up general properties and creating input variables, configure the SFTP Execution Command:
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command</strong></td>
<td>Type of activity to create. The choices are:</td>
</tr>
<tr>
<td></td>
<td>• Copy file</td>
</tr>
<tr>
<td></td>
<td>• Create directory</td>
</tr>
<tr>
<td></td>
<td>• Get file list</td>
</tr>
<tr>
<td></td>
<td>• Remove file or directory</td>
</tr>
<tr>
<td></td>
<td>• Rename file or directory</td>
</tr>
<tr>
<td></td>
<td>• Set file attributes</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>The fields that display on the form depend on the command you select.</td>
</tr>
<tr>
<td><strong>Source host</strong></td>
<td>Name or IP address of the server containing the files targeted by the activity.</td>
</tr>
<tr>
<td><strong>Source port</strong></td>
<td>Port number to use to communicate with the source server. The default port number is 22.</td>
</tr>
<tr>
<td><strong>Source file path</strong></td>
<td>Full path to a file (/temp/test_data_file.txt) or directory (/temp/test_dir) on a source host depending on the selected command. Field available on following commands:</td>
</tr>
<tr>
<td></td>
<td>• Copy file</td>
</tr>
<tr>
<td></td>
<td>• Remove file or directory</td>
</tr>
<tr>
<td></td>
<td>• Set file attributes</td>
</tr>
<tr>
<td><strong>Source directory</strong></td>
<td>Path to the directory where the source files are located. Field available on following commands:</td>
</tr>
<tr>
<td></td>
<td>• Create directory</td>
</tr>
<tr>
<td></td>
<td>• Get file list</td>
</tr>
<tr>
<td><strong>Source files</strong></td>
<td>Names of specific source files to include in the file transfer. Separate the file names with semi-colons. This field supports a semi-colon separated list of wild-card patterns. For example: *.txt; a?cd.pdf. If this field is blank, all files are included. Field available on following command:</td>
</tr>
<tr>
<td></td>
<td>• Get file list</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>For information about how the values in this field affect options in other fields, see the logic explanation which follows.</td>
</tr>
<tr>
<td><strong>Is a directory</strong></td>
<td>If checked, specifies the file path is a directory. Field available on following command:</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Credential tag for source</td>
<td>Specific credential tag this activity must use to run SFTP commands on the source host.</td>
</tr>
<tr>
<td>Credential tag for target</td>
<td>Specific credential tag this activity must use to run SFTP commands on the target host. Field available on following command:</td>
</tr>
<tr>
<td></td>
<td>• Copy file</td>
</tr>
<tr>
<td>Excluded files</td>
<td>Names of specific source files to exclude from the file transfer. The activity acts on all other files found in the source directory or subfolders. Separate the file names with commas. This field supports comma-separated list of wild-card patterns. For example: *.txt, a?cd.pdf. Field available on following command:</td>
</tr>
<tr>
<td></td>
<td>• Get file list</td>
</tr>
<tr>
<td>Note:</td>
<td>For information about how the values in this field affect options in other fields, see the logic explanation which follows.</td>
</tr>
<tr>
<td>Include subfolders</td>
<td>If checked, includes the files from subfolders in the source directory. Field available on following command:</td>
</tr>
<tr>
<td></td>
<td>• Get file list</td>
</tr>
<tr>
<td>Note:</td>
<td>For information about how your selection affects other fields in the form, see the logic explanation which follows.</td>
</tr>
<tr>
<td>Target host</td>
<td>Name or IP address of the server to which the files are being transferred. Field available on following command:</td>
</tr>
<tr>
<td></td>
<td>• Copy file</td>
</tr>
<tr>
<td>Target port</td>
<td>Port number to use to communicate with the target host. The default port number is 22. Field available on following command:</td>
</tr>
<tr>
<td></td>
<td>• Copy file</td>
</tr>
<tr>
<td>Target file path</td>
<td>Full path to a file on a target host. Field available on following commands:</td>
</tr>
<tr>
<td></td>
<td>• Copy file</td>
</tr>
<tr>
<td></td>
<td>• Rename file or directory</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| **Suffix for temporary file** | If a file exists on a target host, this command enables a temporary suffix to use for a file name. If this field contains a value, the activity first copies the source file to a temporary file on the target host using targetFilePath + tempFileSuffix as the name. Upon completion, the activity renames the file to the actual target file name. If this field is blank, the activity copies the source file directly to the target file and overwrites it, if it exists. Field available on following command:  
  - Copy file                                                                                                                       |
| **UID**                      | User ID attribute to apply to a file or directory. The UID and GID values must be set together as a pair or they are ignored. The UID and GID numbers are internal values returned by the Get File List activity. Typically, you first use the Get File List activity to return a list of files and their attributes. Then you can move a file from a source host to a target host and set the source file attributes on the target file. This flow is demonstrated in the SFTP File Transfer workflow on page 1959. Field available on following command:  
  - Set file attributes                                                                                                             |
| **GID**                      | Group ID attribute to apply to a file or directory. The UID and GID values must be set together as a pair or they are ignored. The UID and GID numbers are internal values returned by the Get File List activity. Typically, you first use the Get File List activity to return a list of files and their attributes. Then you can move a file from a source host to a target host and set the source file attributes on the target file. This flow is demonstrated in the SFTP File Transfer workflow on page 1959. Field available on following command:  
  - Set file attributes                                                                                                             |
### Option | Description
--- | ---
Permissions | File or directory permissions to set for the user and group specified. This value must be expressed as an integer, such as 16877, which defines these permissions: rwxr-xr-x. The permissions numbers are internal values returned by the Get File List activity. Typically, you first use the Get File List activity to return a list of files and their attributes. Then you can move a file from a source host to a target host and set the source file attributes on the target file. This flow is demonstrated in the *SFTP File Transfer workflow* on page 1959. Field available on following command:
- Set file attributes

Access timestamp | Override the timestamp when the file or directory was last accessed. The access and modification timestamps must be set together as a pair. Field available on following command:
- Set file attributes

Modification timestamp | Override the timestamp when the file or directory was last modified. The access and modification timestamps must be set together as a pair. Field available on following command:
- Set file attributes

Size in bytes | Size of a file, expressed in bytes. Field available on following command:
- Set file attributes

Required MID Server capabilities | MID Server with the appropriate *capabilities* for connecting to the source and target servers.

The system uses this logic to determine which files to move from the source host:
- If the Source files field is empty, the system selects all the files in the source directory. Otherwise, it only selects those files whose names match one of the file name patterns given in the field.
- If the Excluded files field is empty, the system excludes nothing. Otherwise, it excludes those files whose names match one of the file name patterns given in the field.
- The exclude rule has a higher preference than the include rule. If a file name matches one of the file name patterns in the Excluded files field, it does not get into the selection regardless of the include rule.
- When the Include subfolders check box is cleared, the system looks only in the source directory for files to include or exclude. Otherwise, it looks in the source directory and any of its subfolders for files to include or exclude.

**Note:** You can map parameter values in a test payload to variables in the Outputs tab automatically. See *automap output variables*.
• Use *auto-mapping* to generate outputs and parsing rules (recommended for JDBC)
• If you do not use auto-mapping, you can manually *create output variables* and *create parsing rules*

### SFTP template execution parameters

You use execution parameters to create the input process script in the Preprocessing form.

For descriptions of the command fields, see *Configure the SFTP execution command* on page 2078.

**Note:** You must use the *executionParam.* prefix with all variables in this table.

<tr>
<td>GID</td>
<td>Group ID attribute to apply to a file or directory. The UID and GID values must be set together as a pair or they are ignored.</td>
<td>Set file attributes</td>
</tr>
<tr>
<td>Permissions</td>
<td>File or directory permissions to set for the user and group specified. This value must be expressed as an integer, such as 16877, which defines these permissions: rwxr-xr-x. The permissions number is an internal value returned by the Get File List activity. Typically, you first use the Get File List activity to return a list of files and their attributes. Then you can move a file from a source host to a target host and set the source file attributes on the target file. This is demonstrated in the SFTP File Transfer workflow on page 1959.</td>
<td>Set file attributes</td>
</tr>
</tbody>
</table>
Field | Description | Command
--- | --- | ---
Access timestamp | Override the timestamp when the file or directory was last accessed. The access and modification timestamps must be set together as a pair. | Set file attributes
Modification timestamp | Override the timestamp when the file or directory was last modified. The access and modification timestamps must be set together as a pair. | Set file attributes
Size in bytes | Size of a file, expressed in bytes. | Set file attributes
Required MID Server capabilities | MID Server with the appropriate capabilities for connecting to the source and target servers. By default, the system selects an SSH MID Server. | All

The system uses this logic to determine which files to move from the source host:

- If the Source files field is empty, the system select all the files in the source directory. Otherwise, it only selects those files whose names match one of the file name patterns given in the field.
- If the Excluded files field is empty, the system excludes nothing. Otherwise, it excludes those files whose names match one of the file name patterns given in the field.
- The exclude rule has a higher preference than the include rule. A file whose name matches one of the file name patterns in the Excluded files field does not get into the selection, even though it would be selected by the include rule.
- When the Include subfolders check box is cleared, the system looks only in the source directory for files to include or exclude. Otherwise, it looks in the source directory and any of its subfolders for files to include or exclude.

3. Click Save.
4. Click Continue to advance to the Outputs stage.

Create a probe activity
Create an activity that runs a probe on the target host that is configured to return specific information..

Role required: activity_creator or workflow_admin

For instructions on using the activity template process flow, see create custom activities.

1. Create a custom activity.
   This action creates a custom activity using a template.
2. After setting up general properties and creating input variables, configure the Probe Execution Command:
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Map the input variables</td>
<td>Use the variables you created to configure the command that Orchestration executes.</td>
</tr>
<tr>
<td>Probe</td>
<td>Probe to run with this activity, from the list of probes in the system</td>
</tr>
<tr>
<td>Target host</td>
<td>Host name or IP address of the target server for this activity.</td>
</tr>
<tr>
<td>Parameters</td>
<td>MID Server to use, by capabilities.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>Name-value pairs to pass to the host with this probe. You can create these parameters manually, or drag and drop input variables into the parameter fields and assign a value.</td>
</tr>
</tbody>
</table>

**Note:** You can map parameter values in a test payload to variables in the Outputs tab automatically. See [automap output variables](#).

- Use auto-mapping to generate outputs and parsing rules
- If you do not use auto-mapping, you can manually create output variables and create parsing rules

**Probe template execution parameters**
You use execution parameters to create the input process script in the Pre Processing form.

For descriptions of the command fields, see [Configure the Probe execution command](#) on page 2086.

**Note:** You must use the executionParam. prefix with all variables in this table.

### Table 982: Probe activity execution parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Probe</td>
<td>probe</td>
<td>Reference</td>
<td>The sys_id of the MID Server probe.</td>
</tr>
<tr>
<td>Source</td>
<td>source</td>
<td>String</td>
<td>Intended target host</td>
</tr>
<tr>
<td>Name</td>
<td>Variable</td>
<td>Type</td>
<td>Usage</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------</td>
<td>-------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Parameters       | parameters    | Array of JS object      | Array of JavaScript objects, expressed with the executionParam. prefix. To add more name-value pairs to the parameters array, append them to the existing array. Create a JavaScript object with the following syntax, and add it to the executionParam.parameters array. This assigns additional parameters to the message:  
  ```javascript
  var newParameter = {
    "name": "parameterName",
    "value": "parameterValue"
  };
  executionParam.parameters.push(newParameter);
  ``` |
| MidCapabilities  | midCapabilities | String (comma separated) | List of required MID server capabilities. |
| ValueCapabilities| valueCapabilities | Array of hashmap | Capability values used to select the MID Server. For more information, see MID Server capabilities on page 1716. If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection:  
  ```javascript
  var valueCapability = {
    'NEW_MID_CAPABILITY': 'NEW_MID_CAPABILITY_VALUE'
  };
  executionParam.valueCapabilities.push(valueCapability);
  ``` |

**Probe template post-processing parameters**

Use these parameters to create a post-processing script.

**Table 983: Probe post-processing parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Payload</td>
<td>payload</td>

<td>Contains raw payload returned from the probe.</td>
</tr>
<tr>
<td>Output</td>
<td>output</td>
<td>String</td>
<td>Contains output data returned from the probe.</td>
</tr>
<tr>
<td>Name</td>
<td>Variable</td>
<td>Type</td>
<td>Usage</td>
</tr>
<tr>
<td>--------</td>
<td>----------</td>
<td>-------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>EccSysId</td>
<td>eccSysId</td>
<td>String</td>
<td>Contains the reference ID associated with the ECC Queue input message.</td>
</tr>
</tbody>
</table>

**Configure the Probe execution command**

Use the input variables you created to configure the command that Orchestration executes on the target.

Create the input variables you need in the Inputs form before you can advance to the Execution Command stage.

Role required: activity_creator, admin

**Note:** You can test the activity connection between the MID Server and the target without having to run the activity in a workflow context. For details, see [test template outputs](#).

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
Figure 404: Probe execution command

2. Complete the fields shown in the table.
Table 984: Probe execution command fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. [Create input variables](page 2000) to map to available fields.</td>
</tr>
<tr>
<td>Probe</td>
<td>Probe to run with this activity, from the list of probes in the system.</td>
</tr>
<tr>
<td>Target host</td>
<td>Host name or IP address of the target server for this activity.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server to use, by capabilities.</td>
</tr>
<tr>
<td>Parameters</td>
<td>Name-value pairs to pass to the host with this probe. You can create these parameters manually, or drag and drop input variables into the parameter fields and assign a value.</td>
</tr>
</tbody>
</table>

3. Click Save.  
4. Click Continue to advance to the Outputs stage.

Create an SSH activity

Create an activity that extracts data from a target host that uses the SSH network protocol.  
Role required: activity_creator or workflow_admin  
For instructions on using the activity template process flow, see [create custom activities](create custom activities).

1. Create a [custom activity]. This action creates a custom activity using a template.  
2. After setting up [general properties] and [creating input variables], configure the SSH Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Map the input variables</strong></td>
<td>Use the variables you created to configure the command that Orchestration executes.</td>
</tr>
<tr>
<td>Target host</td>
<td>Host name or IP address of the target server for this activity.</td>
</tr>
<tr>
<td>Command</td>
<td>Command this activity runs on the target host. You can invoke a MID Server script from this field using any script type that the SSH command line supports. For more information, see Advanced SSH script options below the table.</td>
</tr>
<tr>
<td>Directory</td>
<td>Directory on the target host where the command is run.</td>
</tr>
<tr>
<td>Credential tag</td>
<td>The Orchestration credential tag to use when running the command.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server with the appropriate capabilities for connecting to the host. By default, the system selects a MID Server with SSH capabilities.</td>
</tr>
</tbody>
</table>
Option | Description
---|---
**Long running** | If checked, disables the SSH connection timeout for commands that might take longer to run than the default 60 seconds. Orchestration periodically checks the running process to determine its status until it is finished.

**Must Sudo** | If checked, enables the use of `sudo` to run commands.

**Note:** You can map parameter values in a test payload to variables in the Outputs tab automatically. See [automap output variables](#).

- Use **auto-mapping** to generate outputs and parsing rules
- If you do not use auto-mapping, you can manually [create output variables](#) and [create parsing rules](#)

**SSH template execution parameters**
Use execution parameters to create the input process script in the Pre Processing form of the activity designer.

For descriptions of the command fields, see [*Configure the SSH execution command*](#) on page 2091.

**Note:** You must use the `executionParam` prefix with all variables in this table.

### Table 985: SSH execution parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source</td>
<td>source</td>
<td>String</td>
<td>Intended target or host.</td>
</tr>
<tr>
<td>Command</td>
<td>command</td>
<td>String</td>
<td>Comment to run on the host.</td>
</tr>
<tr>
<td>Directory</td>
<td>directory</td>
<td>String</td>
<td>Directory on the host in which to run the command.</td>
</tr>
<tr>
<td>Credential tag</td>
<td>credential_tag</td>
<td>String</td>
<td>Orchestration credential tag to use when running the command.</td>
</tr>
<tr>
<td>MidCapabilities</td>
<td>midCapabilities</td>
<td>String (comma separated)</td>
<td>List of required MID Server capabilities.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
</table>
| ValueCapabilities   | valueCapabilities | Array of hashmap | Capability values used to select the MID Server. For more information, see [MID Server capabilities](#) on page 1716. If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection:  

```javascript
var valueCapability = {
  'NEW_MID_CAPABILITY': 'NEW_MID_CAPABILITY_VALUE';
};
executionParam.valueCapabilities.push(valueCapability);
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Long running</td>
<td>long_running</td>
<td>Boolean</td>
<td>Indicates whether or not the command is long running. A value of true indicates that the command is long running.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Must sudo</td>
<td>must_sudo</td>
<td>Boolean</td>
<td>Indicates whether or not this activity must use sudo to run root commands. A value of true indicates that sudo must be used.</td>
</tr>
</tbody>
</table>

**SSH post-processing parameters and payload parsing**

Use these parameters to create a post-processing script, payload parsing, and tagging.

#### Table 986: SSH post-processing parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output</td>
<td>output</td>
<td>String</td>
<td>Contains the output returned from the SSH command.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>EccSysID</td>
<td>eccSysID</td>
<td>String</td>
<td>Contains the reference ID associated with the ECC Queue input message returned by the activity.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>ErrorMessages</td>
<td>errorMessages</td>
<td>String</td>
<td>Contains the error messages retrieved from the SSH command. This value is null if there are no error messages.</td>
</tr>
<tr>
<td>Name</td>
<td>Variable</td>
<td>Type</td>
<td>Usage</td>
</tr>
<tr>
<td>------</td>
<td>----------</td>
<td>------</td>
<td>-------</td>
</tr>
</tbody>
</table>
| Tags | tags     | Hashmap of tag values returned from the SSH command | Contains the tags used to extract output using the SSH commands. The tag output is delimited by double percentage signs, as in `%%tagname%% ... %`. Set up the command using the following format:  
`%%tagname1%%
output1 line 1
output1 line 2
...
%%

`%%tagname2%%
output2 line 1
output2 line 2
...
%%`

The tags returned are JavaScript hashmap objects in which each key is prefixed with tag appended with the tagname.  
`{"__text__": ",
"tagtagname1":"output1
line1
output1
line2\n",
"tagtagname2":"output2
line1
output2
line2\n"}`

---

**Configure the SSH execution command**

Use the input variables you created to configure the command that Orchestration executes on the host target.

Create the input variables you need in the Inputs form before you advance to the Execution Command stage.

Role required: activity_creator, admin

---

**Note:** You can test the SSH connection between the MID Server and the target without having to run the activity in a workflow context. For details, see test template outputs.

---

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
2. Complete the fields shown in the table.

Figure 405: SSH execution command
### Table 987: SSH activity inputs

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. <em>Create input variables</em> on page 2000 to map to available fields.</td>
</tr>
<tr>
<td>Target host</td>
<td>Host name or IP address of the target server for this activity.</td>
</tr>
<tr>

<td>Check box to disable the SSH connection timeout for commands that might take longer to run than the default 60 seconds. Orchestration periodically checks the running process to determine its status until it is finished.</td>
</tr>
<tr>
<td>Must Sudo</td>
<td>Check box to allow the use of <em>sudo</em> to run commands.</td>
</tr>
</tbody>
</table>

3. Click Save.  
4. Click Continue to advance to the Outputs stage.

**Create a run script activity**

Create an activity that runs any script.  
Role required: activity_creator or workflow_admin  

1. Create a *custom activity*.  
   This action creates a custom activity using a template.  
2. After setting up *general properties* and *creating input variables*, configure the Run Script Execution Command:  
   Create a script for this activity to execute.

**Note:** You can map parameter values in a test payload to variables in the Outputs tab automatically. See *automap output variables*. 

© 2018 ServiceNow. All rights reserved. 2093
• Use auto-mapping to generate outputs and parsing rules
• If you do not use auto-mapping, you can manually create output variables and create parsing rules

*Run Script template processing script*
Use the Run Script custom template Script form to enter a script to call and use with other activities.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Processing script</td>
<td>Script that the activity runs.</td>
</tr>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the input process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays input variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the processing script with this syntax: activityInput-variable.</td>
</tr>
</tbody>
</table>

*Create a JMS activity*
Create a custom JMS activity to retrieve or send messages to external systems using the Java Messaging Service.

Role required: activity_creator or workflow_admin

The JMS activity supports third party JMS providers whose JMS client application is written with a typical Java EE pattern and can support these operations:

• Using JNDI to find a ConnectionFactory object.
• Using JNDI to find one or more destination objects.
• Using the ConnectionFactory to create a JMS connection object.
• Using the JMS connection to create one or more JMS session objects.
• Using a JMS session and the destinations to create the MessageProducer and MessageConsumer objects.
• Starting the JMS connection to enable delivery or consumption of messages.

*Note:* The JMS activity designer has been tested with the JMS providers ActiveMQ and Tibco EMS. When connecting to a JMS provider, refer to your third party user documentation.

1. Create or verify your JMS credential.
   Your JMS credentials must have permission for the target database and proper configuration for the corresponding JMS connection. Credentials must be set up before you can create a JMS activity.

2. Create or verify your JMS connection.
   Your JMS connection must be configured with valid JMS credentials set up before you can create a JMS activity.

3. Create a custom activity.
   This action creates a custom activity using a template.

4. After setting up general properties and creating input variables, configure the JMS Execution Command:
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configure your credential</td>
<td>Fill in the fields necessary for your database connection.</td>
</tr>
<tr>
<td>Connection Factory</td>
<td>Name of the JMS Connection Factory. You should create or verify your JMS connection. This configuration links the name of the Initial Context Factory with the URL of the JMS provider.</td>
</tr>
<tr>
<td>Destination Type</td>
<td>Type of destination used for this message:</td>
</tr>
<tr>
<td></td>
<td>• Queue: Message is queued for point-to-point communications.</td>
</tr>
<tr>
<td></td>
<td>Note: The GET operation is only supported for the Queue destination type.</td>
</tr>
<tr>
<td></td>
<td>• Topic: Message is used for publish and subscribe communication.</td>
</tr>
<tr>
<td>Destination Name</td>
<td>Name of the queue or topic destination that is configured on the JMS provider.</td>
</tr>
<tr>
<td>Message Type</td>
<td>The JMS message type value. Only the Text Message type is supported. The queue or topic destination must be configured to receive or send only Text Message. Other message types are dropped, since the JMS Activity cannot process them.</td>
</tr>
<tr>
<td>Operation</td>
<td>The programmatic operation to perform on the destination. The choices are PUT or GET.</td>
</tr>
<tr>
<td>Timeout (Secs)</td>
<td>Allowed time to wait for a message in the message queue before it times out, in seconds. The default is 30.</td>
</tr>
<tr>
<td>Custom message headers</td>
<td>The custom header values in a name/value pair format, that is available on the JMS destination.</td>
</tr>
<tr>
<td>Message payload</td>
<td>Actual message content or payload that is sent to the JMS destination.</td>
</tr>
<tr>
<td>Credential tag</td>
<td>A tag for an individual credential for a JMS activity in an Orchestration workflow.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server to use, by capabilities.</td>
</tr>
</tbody>
</table>

- Use auto-mapping to generate outputs and parsing rules
- If you do not use auto-mapping, you can manually create output variables and create parsing rules
Create a JMS connection for an Orchestration activity
Configure your system to use Java Messaging Service (JMS) with a custom Orchestration JMS activity.

Role required: admin

The MID Server must have the correct JMS connection factories for your organization. Configure those values in the mid.property.jms.command.allowed_factory_names property, found in MID Server Properties. The default values for this property can be changed to any value or comma-separated list of values that the third-party JMS provider advertises.

1. Navigate to MID Server JAR Files.
2. Click New and add:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique and descriptive name for identifying the file in the instance.</td>
</tr>
<tr>
<td>Version</td>
<td>A version number for the file, if one is available.</td>
</tr>
<tr>
<td>Source</td>
<td>Location of the JAR file for reference purposes. Source information is not used by the system.</td>
</tr>
<tr>
<td>Description</td>
<td>Short description of the JAR file and its purpose in the instance.</td>
</tr>
</tbody>
</table>

3. Click the paper clip icon in the banner and attach the JMS driver jar file.
The JMS driver jar file should be available as part of JMS provider installation. Few JMS vendors make them available as a separate product. Refer to the JMS provider documentation to determine which JMS client driver jar files require the client applications to connect to the JMS provider. For example, if you are trying to connect to ActiveMQ V5.10 (JMS provider), you need the activemq-all-5.10.1.jar file.

5. Click New, add the following, and click Submit:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of this connection factory.</td>
</tr>
<tr>
<td>Initial Context Factory</td>
<td>Name of the JNDI class that is used to create the InitialContext.</td>
</tr>
</tbody>
</table>

**Note:** For example, to connect to ActiveMQ V5.10 (JMS Provider), the value is org.apache.activemq.jndi.ActiveMQInitialContextFactory.

<table>
<thead>
<tr>
<th>Provider URL</th>
<th>Location of the running JMS provider installation.</th>
</tr>
</thead>
</table>

**Note:** For example, to connect to ActiveMQ V5.1: tcp://ipAddressOrHostName:61616.

6. Navigate to Orchestration Credentials.
7. Click New, select JMS Credentials, and provide the user name and password the MID should use to communicate with the JMS provider.
   For more information, see JMS credentials.
8. Click Submit.
   You are ready to create a custom JMS activity.
**JMS template execution parameters**

You use execution parameters to create the input process script in the Preprocessing form. You must use the executionParam. prefix with all variables in this table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Jms ds</td>
<td>jms_ds</td>
<td>Reference</td>
<td>Selected JMS data source.</td>
</tr>
<tr>
<td>Destination type</td>
<td>destination_type</td>
<td>Enumerated</td>
<td></td>
</tr>
<tr>
<td>Destination name</td>
<td>destination_name</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>Message type</td>
<td>message_type</td>
<td>Enumerated</td>
<td></td>
</tr>
<tr>
<td>Operation</td>
<td>operation</td>
<td>Enumerated</td>
<td></td>
</tr>
<tr>
<td>Time out</td>
<td>time_out</td>
<td>Integer</td>
<td>Length of time to wait for the query to return results.</td>
</tr>
<tr>
<td>Custom headers</td>
<td>custom_headers</td>
<td>Array of JavaScript objects</td>
<td></td>
</tr>
<tr>
<td>Message payload</td>
<td>message_payload</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>Credential tag</td>
<td>credential_tag</td>
<td>String</td>
<td>List of required MID Server capabilities.</td>
</tr>
<tr>
<td>MidCapabilities</td>
<td>midCapabilities</td>
<td>String (comma separated)</td>
<td></td>
</tr>
<tr>
<td>ValueCapabilities</td>
<td>valueCapabilities</td>
<td>Array of hashmap</td>
<td>Capability values used to select the MID Server. For more information, see MID Server capabilities on page 1716. If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection:</td>
</tr>
</tbody>
</table>

```javascript
var valueCapability = {'NEW_MID_CAPABILITY': 'NEW_MID_CAPABILITY_VALUE'};
executionParam.valueCapabilities.push(valueCapability);
```

**JMS template post-processing parameters**

Use these parameters to create a post-processing script.
## Table 990: JMS post-processing parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>status</td>
<td>String</td>
<td>Status of the operation (Put or Get) on the JMS destination.</td>
</tr>
<tr>
<td>StandardHeaders</td>
<td>standardHeaders</td>
<td>String</td>
<td>All the standard headers, as specified by JMS, that are obtained as part of the JMS message during a Get operation. This field is applicable only for Get operations.</td>
</tr>
<tr>
<td>CustomHeaders</td>
<td>customHeaders</td>
<td>String</td>
<td>All custom headers added by a producer or publisher application that are obtained as part of the JMS message during a Get operation. This field is applicable only for Get operations.</td>
</tr>
<tr>
<td>MessagePayload</td>
<td>messagePayload</td>
<td>String</td>

<td>Contains any error messages retrieved from the JMS command. This value is null if there are no error messages.</td>
</tr>
</tbody>
</table>

### Activity scoping

Custom activities run in their own scope, even if it is different from that of the workflow.

Any script that runs inside a custom activity with a scope can only access outside artifacts that are within the scope of that activity or artifacts that are configured to run in any scope. Conversely, an outside artifact can only access the script inside that private activity if the outside artifact is running in the same scope. Activities with public scopes can interact with outside artifacts in any application scope.

You can use private activities as part of a workflow that has a public application scope. These activities are protected from reaching outside of the workflow or from being reached from outside the workflow.
For details about setting application scoping for custom activities, see the field description table for the appropriate activity template.

**Note:** Custom activities uploaded to the ServiceNow Store must be configured as accessible to all application scopes.

---

## Publish a custom activity

When a user creates a custom activity and saves or submits it, that activity appears in the Custom and Packs tabs of the designer palette, but is visible only to the user who created it.

Roles required: admin, activity_admin, activity_creator

1. When you finish configuring the activity, click Publish. This makes the activity accessible to other users on the instance with the workflow_admin or activity_creator role. Published activities are available for upload to the ServiceNow Store, can be added to workflows, and can be edited by any user with the proper roles.

2. To edit a published activity, click Checkout. When an activity is checked out by a user, only that user can modify it. The fields of a checked out activity are read-only for all other users.

3. When you are finished editing the checked out activity, publish it again. The system adds a new version of this activity to the Custom tab in the Workflow Editor palette.

**Note:** Activities you create and publish are visible in the Packs tab only if they were created in the current application scope.

---

## Return a locked activity to a published state

Problems can arise if an activity version is checked out by a user and not checked back in. An activity in this state cannot be checked out for update.

Role required: admin, activity_admin, activity_creator

An administrator can return a locked activity to a published state.

1. Open the Workflow Editor.
2. From the Custom tab, open the activity that is locked.
3. Click the menu icon in the title bar and select Versions from the context menu. A list of all the versions of that activity appears. The locked version displays the user who checked it out.
4. Select the checked out version.
   The system opens the record in the activity designer.
5. Click the menu icon again and select Force Checkout from the context menu.
   The activity fields become editable.
6. Click Publish.
   The activity becomes available to users with the appropriate roles.

Copy a custom activity

You can copy activities for reuse from the Custom tab in the global scope.

Role required: admin, activity_admin, activity_creator

**Note:** You cannot copy an activity in a private scope.

1. To reuse an activity in the global scope, expand the parent category to display the activities.
2. Right-click the activity you want to copy and select one of these options:
   - Copy into global scope as new activity: Copies the activity with the new name you provide, uses the same version number as the original activity, and moves it to the global scope in the Custom tab.
Figure 406: Naming an activity copy

- Copy into global scope as new version: Copies the activity using the same name, increments the version number, and moves it to the global scope in the Custom tab. The system automatically adds the parent category to the Custom tab if it does not already exist. This action will overwrite another activity with the same name and version number.

Figure 407: Creating a new activity version

---

**Note:** If the activity is in any other scope but global, the system displays this message: Cannot copy privately scoped activity.

---

**Orchestration databus**

The databus allows workflow designers to track the flow of data through an Orchestration workflow and provides access to output data that can be consumed by other custom activities.

Data is made available in a workflow when you use activities created with the *Orchestration activity designer* on page 1990. The activity designer provides the ability to specify well defined inputs and outputs for your activities. When you use those activities on the workflow canvas, the outputs appear in the Data tab and are available for use as inputs in subsequent activities.

---

**Note:** Orchestration does not filter the data you are given for reuse in the Data tab. You must make sure an activity in the workflow canvas has executed before you consume its output data.

---

When you drop a custom activity onto the workflow canvas, the system assigns it an index. If you delete an activity from the canvas and add a new one, the indexes are not reused. This ensures that you don't accidentally start subscribing to data you did not intend to use. If you update an activity in the activity designer, the system automatically updates the activity on the canvas to ensure the data you are subscribing to downstream is not affected.
Reuse data in the activity designer

The Data tab in the Workflow Editor lists all custom activities used in the current workflow that produce data and displays that data for reuse in other custom activities.

Roles required: workflow_creator

Activities are categorized by application in this tab and are available for use as data sources for other activities. The Data tab is a graphical representation of the workflow Databus, which manages all the temporary data used by the current workflow.

1. Drag output variables from an activity in this tab into the inputs of another activity on the workflow canvas to link the activities together.

   You can use any of the outputs in the structure, regardless of the the application to which they belong. An index number in parenthesis after the activity name provides a unique identifier for the parameters that you use as input data in other activities. If you do not name a custom activity, the only identifier for that activity in the Data tab is the index number. Index numbers indicate the sequence in which custom activities were added to the workflow and are not reused. When you drag a custom activity onto the workflow canvas, the system adds that activity and its output data to the structure. Conversely, if you remove a custom activity from the canvas, that activity and its outputs disappear from the data list.

2. Point to an activity to display information about it in a pop-up window.

   Any output data reused by the activity is listed in the Databus Output field of the the pop-up window.
MID Servers for Orchestration

Orchestration automatically selects an appropriate MID Server based on the capabilities that you configure in activities, the IP addresses of target devices, and the application that the MID Server is allowed to use.

To allow a MID Server to work with Orchestration, it must have the Orchestration application or the ALL application assigned to it. See Configure a default MID Server for each application on page 1633 for instructions.

You can have MID Servers focus on different capabilities and separate sections of your network. See:

- MID Server capabilities on page 1716
- Map an IP address to a DNS name on page 1682

You can also specify a default MID Server to use if no MID Servers meet the capability and IP range criteria for an activity. See Select the default MID Server for Orchestration.

MID Server capabilities

MID Server capabilities define the specific functions of a MID Server within an IP address range.

Several applications, such as Discovery, Service Mapping, Cloud Management, and Orchestration can use capabilities, IP ranges, and MID Server selection on page 1630 to narrow the pool of MID Servers the applications need.

**Note:** At least one capability is required for each MID Server used by Orchestration. See MID Servers for Orchestration on page 2103 for more information.
The following capabilities are available by default with Discovery:

- All
- Cloud Management
- Nmap
- PowerShell
- Resolve DNS
- REST
- SNMP
- SOAP
- SSH
- VMware
- WMI

**Nmap capability**

The Nmap capability is only assigned to MID Servers for which the Network Mapper (Nmap) scanner has been installed for *credential-less Discovery*. This capability cannot be added to or removed from any MID Server manually. For instructions on installing or uninstalling Nmap, see *Install and uninstall Nmap on a MID Server* on page 1694

**MID Server capability values**

Capabilities provided in the base system do not have a defined value string. A MID Server configured to use a capability that has no value can locate any device using that capability's protocol. If a capability has a defined value, the MID Server using that capability finds only those devices using that protocol that match the value string exactly. The exception to this is the Resolve DNS capability, which is configured to resolve any DNS name into an IP address using a partial string match.

Starting with the London release, the [capability name]:[value] combination appears in the slushbucket when you add a capability to a MID Server. This combination allows you to see all the capabilities that have different values, even if the capability name is the same. For example, if you are using the Cloud Management capability, and you use the value field to specify the us-west logical datacenter on one of the capability records, you can see the combination in the Collection list.
Scripted MID Server capability value matching

You can use value tests to create capabilities that find devices using values without requiring exact string matching. Action on these values is controlled by a user-defined script.

The Resolve DNS capability is provided in the base system and is configured to resolve DNS names into IP addresses for devices whose names end with a specified domain name. The capability Value entered is automatically prefaced with a dot during processing to match domain syntax. This value can contain one or more sub-domains, but must include the end of the domain string. Matching devices must end with the identical syntax. The script for the Resolve DNS capability determines if a device name matches the criteria defined by Value. If a match exists, the platform performs the address resolution automatically. For example, if the value for the Resolve DNS capability is service-now.com, the MID Server with this capability finds lnxlab01.sandiego.service-now.com and dbsrv101.sanjose.service-now.com. If the value is changed to sandiego.service-now.com, then the MID Server finds only lnxlab01.

Note: If Value in the Resolve DNS capability is blank, then all domains match.

To view the script for evaluating this capability, navigate to MID Server Capability Value Tests and select Resolve DNS from the list.
Configure MID Server capabilities

A capability is required for each MID Server to work with Orchestration, Cloud Management, Service Mapping, and alert aggregation and RCA.

Role required: admin or sm_admin

1. Navigate to MID Server Capabilities.
2. Select an existing capability. You can also select ALL to include all capabilities.

   **Note:** Ensure that each IP address range has MID Servers with the necessary capabilities to complete the Orchestration activities on that network segment.

3. Create a new capability:
   a) Click New.
   b) Configure the value for a custom capability. An example is a capability for DOMAIN, with a value of service-now.
   c) Click Submit.

4. Click Edit in the MID Servers related list to add MID Servers to the capability.
5. Select one or more MID Servers for this capability from the slushbucket.
6. Click Save.

   The capability defined here also appears in the primary record for this MID Server.

**Select the default MID Server for Orchestration**

Orchestration uses the default MID Server if it cannot find a MID Server with the correct IP range and capability.

Specify the default MID Server in either of these locations:

- The Default MID Server field on the Orchestration application record. See *Configure a default MID Server for each application* on page 1633 for instructions.
- The Default MID Server to use for Orchestration Activities property. Navigate to Orchestration MID Server Properties to set this value.

These two values are automatically kept in synch. You can change the default MID Server in either location.

**PowerShell probe version 2 system property**

View detailed PowerShell credential information and view extended logging information.

Starting with the london release, there is a new system property for the PowerShell probe which enables the version 2 of the probe. This new version enables you to view detailed credential information on why PowerShell credentials fail or succeed. You can also view logging information for an ECC Queue payload and Workflow Context log.

```
mid.server.rba_powershell_v2
```

Enables the PowerShell probe version 2 for use with all PowerShell activities. The default value is true. If you choose false, the legacy PowerShell probe is used. Unless there are issues, use version 2, as the legacy version is going to be deprecated.

**Note:** This property only applies to Orchestration activities. Discovery probes are not affected.

You can access the property by selecting the MID Server Properties link in the navigation pane:
PowerShell log property

Enable debug messages to display from PowerShell.

This property enables control of when and where to display debug messages generated by debug statements embedded in the PowerShell scripts.

mid.property.powershell.log_info

The new MID Server PowerShell log property:

- Displays logging information.

Note: Once logging is enabled, OOB PowerShell scripts log information.

- Adds logging information to your developed PowerShell scripts and PowerShell activities.

Note: Logging information is only available when property is enabled.

- Logging is not enabled by default.

If the property is set to true, debug messages display from the workflow context or from the Response popup after you test inputs. The ecc_queue entry payload for each of the PowerShell activities is going to show all the debug messages that were logged.

Enable the PowerShell log property for each MID Server. If the MID Server field is empty, the property applies to all MID Servers. There are separate credential debug messages that always come back regardless of this setting. The credential debug messages show which credentials have been used and other related information.
Use the Orchestration Usage dashboard

This dashboard shows an overview of Orchestration usage metrics to show customers how their organization uses Orchestration and to support license compliance.

Role required: orchestration_manager

1. To view the dashboard, navigate to Orchestration Operations & Troubleshooting Orchestration Usage Dashboard.

   The Orchestration Usage dashboard displays. The tabs on the dashboard include Licensable Usage and Orchestration Usage. Reports on these tabs include:

   **Table 991: Orchestration Usage Metrics**

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>

</tbody>
</table>

2. You can add more widgets to the dashboard by clicking the Add Content icon (+) in the upper right corner of the dashboard.

Note: You should not modify the first tab in this Dashboard. If you want a different dashboard experience, add a tab and customize that with your usage reports.

Password Reset application

The ServiceNow® Password Reset application enables an end user to use a self-service process to reset or change the password. Alternatively, your organization can implement a process that requires a service desk agent to reset passwords for end users.

Password Reset setup guide

A simple version of the Password Reset application is active by default. You can install a plugin to extend functionality.

Requirements

Role required: admin

Note: The Password Reset application is not available during upgrade.

Active and available plugins

• A simple version of the Password Reset application is active by default and includes example verifications. The base system enables connections only to the Local ServiceNow Instance credential store type. For details, see Credential stores for Password Reset on page 2145.
• To enable connections to Active Directory (AD) and Remote (SOAP) ServiceNow Instance credential store types, you must activate the Password Reset - Orchestration Add-on plugin. The plugin also activates the Password Reset Windows Application (com.glideapp.password_reset_desktop). No other components are installed. Orchestration is available as a separate subscription. See Activate the Password Reset - Orchestration Add-on plugin on page 2112.

Next steps

Plan and configure the Password Reset processes for your organization. See the Password Reset admin guide on page 2129.
Activate the Password Reset - Orchestration Add-on plugin

The Password Reset - Orchestration Add-on plugin activates the Password Reset Windows Application (com.glideapp.password_reset_desktop) and enables connections to the Active Directory (AD) and 'Remote (SOAP) ServiceNow instance' credential store types. No other components are installed.

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and sub-production instances, generally within a few days.

If you do not have an account manager, decide to delay activation after purchase, or want to evaluate the product on a sub-production instance without charge, follow these steps.

Role required: none

1. In the Hi Service Portal, click Service Requests Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Provide any information that would be helpful for the ServiceNow personnel activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows.</td>
</tr>
</tbody>
</table>

3. Click Submit.

Installed with Password Reset

Tables, roles, business rules, scripts, and workflows are installed with the Password Reset application.

<td>UI for verifying questions.</td>
</tr>
<tr>
<td>$pwd_verify_simple_ui</td>
<td>Input section for a simple verification method. This field is a single input field.</td>
</tr>
</tbody>
</table>

**UI scripts installed with Password Reset**

You can create a UI script and reference the script from a UI macro or UI page by using a `<g:include_script>` Jelly tag. The following example shows how the $pwd_enroll_questions_ui UI macro can reference the $pwd_enroll_questions_ui script. In the example, [UI Script Name]+".jsdbx" is the name of the script:

```
<g:include_script src="$pwd_enroll_questions_ui.jsdbx" />  
```

By referencing an external script, you can maintain separation between client JavaScript code and Jelly code, which simplifies maintenance. You can use the following installed scripts with Password Reset UI macros:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$pwd_csrf_common_ui_script</td>
<td>Common UI script for handling a Cross-site Request Forgery (CSRF).</td>
</tr>
<tr>
<td>$pwd_enroll_email_ui</td>
<td>JavaScript code for the $pwd_enroll_questions_ui UI macro.</td>
</tr>
<tr>
<td>$pwd_enroll_google_auth_ui</td>
<td>JavaScript code for the $pwd_enroll_google_auth_ui UI macro.</td>
</tr>
<tr>
<td>$pwd_enroll_questions_ui</td>
<td>JavaScript code for the $pwd_enroll_questions_ui UI macro.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>$pwd_enroll_sample_ui</td>
<td>Included sample client JavaScript for the $pwd_enroll_sample_ui UI macro.</td>
</tr>
<tr>
<td>$pwd_enroll_sms_ui</td>
<td>SMS enrollment UI script.</td>
</tr>
<tr>
<td>$pwd_enrollment_submit_event</td>
<td>UI script for an enrollment submission event.</td>
</tr>
<tr>
<td>$pwd_util</td>
<td>Utilities for password reset UI pages and UI macros.</td>
</tr>
<tr>
<td>$pwdWfManager</td>
<td>Helper class to handle workflow activities and post-processing.</td>
</tr>
</tbody>
</table>

**Password Reset workflows**

The Password Reset plugin adds workflows that you can use as examples to create custom workflows for Password Reset processes.

Domain separation in the Password Reset application

A password reset process that you define in any domain is isolated from a process that you create in any other domain. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

Support: Level 2

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

Each password reset process follows these steps:

1. The end user asks to reset the password.
2. The user provides identifying information (typically username or email address).
3. The user verifies the identity — proves that they are who they say they are (typically by answering questions or submitting a code number that was delivered securely).
4. The instance connects to the credential store to confirm the user credentials.
5. The instance generates the new password and displays it to the user.

How domain separation works in Password Reset

Domain separation for Password Reset is applied at the process level. The admin configures the following elements to define a password reset process: A connection to a credential store, user groups that can use the process, method of identification, and verifications to use during the process.

- A connection to the credential store where user credentials (like username/password) are securely stored. Each connection inherits the domain setting from a template called a connection type. Each connection type is tied to a domain (the connection type record has a domain field). There are uniqueness constraints on connection names within a domain.
- One or more user groups on the ServiceNow instance that can use the password reset process. User accounts are members of one or more domains — they use the standard ServiceNow domain
separation. When a user enrolls to use one of the password reset processes that is configured for the organization, the user is allowed to choose only from the processes in the user’s domain.

- The identification — the method that the end user employs to claim identity for the public password reset or password change process. Each identification inherits the domain setting from a template called an identification type. Each identification type is tied to a domain (the identification type record has a domain field). There are uniqueness constraints on identification names within a domain.
- One or more verifications — methods to verify the identity of the person who is attempting to reset the password. Each verification inherits the domain setting from a template called a verification type. Each verification type is tied to a domain (the verification type record has a domain field). There are uniqueness constraints on verification names within a domain.
- All Password Reset tables have a domain column.
- Password Reset process tables include a sys-overrides column on business rules, UI actions, and so on.
- The Password Reset application is built using Orchestration. Orchestration supports "Data only" domain separation — the data security model of separating visibility of data from one domain to another.

Self-service and Service desk-assisted processes

In addition to configuring the connections, user groups, identifications, and verifications that are used in each process, the admin specifies one of the following operational methods for the organization:

- Self-service process: End users reset passwords over the Internet using a browser on any supported interface, including mobile devices. The end user can select from any configured process in the end user’s domain (or child domain of an end user’s domain).
- Service desk-assisted process: End users do not reset passwords. An end user requests the assistance of a service desk agent, over the phone or in person. The agent processes the request. Each service desk agent has the Password Reset Admin service desk role. The "reset request" form that the agent works in presents a User field and a Process field. On the form, the agent can view all processes in the end user's domain, even if the agent is not a member of one or more of the domains.

Password Change process

The Password Change application extends the Password Reset application by letting admins define how users change their passwords. A service desk-assisted process is not supported. An admin must publish the URL for the self-service password change form.

The Password Change application enables an end user to change a password over the Internet using a browser on any supported interface, including mobile devices. The end user can select from any configured process in the end user's domain (or child domain of an end user's domain).

A password change process uses the same elements as a password reset process (connections, user groups, identifications, and verifications), with the same domain-separation features.

Password Reset Windows Application

The Password Reset Windows Application enables a user who forgets the password or is locked out of a Windows computer to reset the password directly from the Windows login screen.

Installer and documentation

Download the installer and installation instructions from KB0542328 in the ServiceNow Knowledge Base. The installer uninstalls any earlier version of the Password Reset Windows Application.
How the Password Reset Windows Application works

Administrators download and run an EXE or MSI file to install or distribute the application to user computers. The application installs a link on the Windows login screen. The user clicks the link (Forgot Password? in the examples on various Windows versions) and is then guided through the process of resetting the password.
By default, when a user requests a reset, the instance sends the user a URL with a user-specific token. After the user opens the URL, the instance prompts the user to enter and confirm the new password. The instance does not send a temporary password.

**Restrictions on the Password Reset Windows Application**

- The Password Reset Windows Application does not support custom verifications.
- The Password Reset Windows Application uses the base-system CAPTCHA service even if the Password Reset application is configured to use Google reCAPTCHA with the web interface. See the section titled "Settings on the Details tab" in *Configure your Password Reset process* on page 2136.
- The Password strength indicator is not supported. See *Configure the connection to a credential store for the Password Reset processes* on page 2148.
- For some verification types, you can use only one verification. Custom verifications are not supported. See *Password Reset verifications* on page 2155 for details.
- Custom UI macros configured on the Process Advanced page are not supported (for example, entry, success, or failure macros). The system displays only the default success and failure messages.
- The Password Reset Windows Application supports newline characters in the Password rule hint text. Other formatting is not supported (bold, underline, hyperlink, and so on). See *Configure the connection to a credential store for the Password Reset processes* on page 2148.

**Password Reset Windows Application installation requirements**

You must activate the Password Reset Orchestration Add-on plugin to use the Password Reset Windows Application.

• Windows 8.1  
• Windows 10 Enterprise  
• Windows 10 Pro |
| **Supported processor architecture** | • X86  
• X64 |
| **Supported network architecture** | • Password Reset Windows Application clients must have direct access to both the Internet and the ServiceNow instance where the Password Reset Windows Application is configured  
• To reset an AD password, the client must be on the corporate network. |

---

### Password Reset admin guide

The Password Reset application enables an end user to reset or change a password using a self-service process. Alternatively, your organization can implement a process that requires a service desk agent to reset passwords for end users.

Watch the video: *Introducing Password Reset (Video)*

### Password Reset processes

Users with the password_reset_admin role configure how the process of resetting a password works for an end user.

- **Self-service process:** Users reset passwords over the Internet using a browser on any supported interface, including mobile devices.
- **Service desk-assisted process:** A user requests the assistance of a service desk agent, over the phone or in person. Users do not reset passwords.
End-user experience of the self-service process

The following example is typical:

1. On the login page, the user clicks the Forgot Password? link to start the process.

2. The Identify page opens and the user enters their identifying information (typically username or email address). The example includes the default Google reCAPTCHA security feature:
3. On the Verify page, the user verifies their identity by providing information that proves that they are who they say they are. You, the admin, configure the method of verification and you can require multiple verifications. In the example, the admin has configured the Security Question verification. The user must answer a question to prove identity. (Earlier, the user selected the question and provided a secure private answer while enrolling for the password reset process.) Other possible verifications require the user to enter a code number that was sent to a mobile device by SMS text, through the Google Authenticator app, or by email.

4. The system checks the credential store to verify identity and then displays the new password on the Reset page.
Elements of a password reset process

You configure the following elements of the process for your organization:

- A connection to the credential store for your organization where user credentials (like username/password) are securely stored.
- One or more user groups on the ServiceNow instance that can use the password reset process.
- The type of identification that users must enter to identify themselves (typically username or email address).
- One or more verifications — methods to verify the identity of the user. Examples:
  - Answer a question that only the user knows how to answer — the QA Verification (based on the Security Question verification type).
  - Enter a code number that was emailed to the user — the Email verification.
  - Enter a code number that was texted to a mobile device — the SMS verification.
• Enter a code number that appears on the Google Authenticator app on a mobile device — the Google Authenticator verification.

How you implement a password reset process

1. Plan your implementation: Ensure that all applicable organizational guidelines, security policies, and areas of the organization are considered.
2. Set up the elements of the password reset and password change processes according to the plan:
   • Connection to the credential store.
   • User groups that will use the password reset process.
   • Identification type to use.
   • Verifications to use.
3. In the service desk-assisted model, assign service desk agents to monitor and reset passwords as needed.
4. Monitor password reset activity to identify security threats and to ensure compliance with the password policy requirements of your organization.

Password Reset Windows Application

If a user forgets the password or gets locked out of a Windows computer, the user can reset the password directly from the Windows login screen. The user clicks the Forgot Password? link and is then guided through the process of resetting the password. To learn more, see Password Reset Windows Application on page 2126.

Password Change application

The Password Change application extends the Password Reset application by letting admins define how users change their passwords. Only a self-service process is supported and an admin must publish the URL to the password change form.

1. The user logs in to the instance and then selects the Change Password module or link from the user profile record. Password change is supported on mobile devices.
2. On the Change Password page, the user selects the credential store where the password resides.
3. The user enters the old password and then enters and confirms a new password.
4. Workflows validate the old password and then implement the new password.
5. The system notifies the user that the password was changed.

What to do next

Plan your Password Reset processes on page 2136

Example: The default self-service Password Reset process

The default self-service Password Reset process enables a user to reset the password without assistance from service desk agents.
The default self-service password reset flow

1. If a user does not remember the password, the user can click the Forgot Password? link on the login screen.

2. The Password Reset application starts. On the Identity page, the user identifies himself or herself by entering a Username.

3. On the Verify page, the user proves that they are the person who is associated with the username. In this example, the user enters the email address that is associated with the user profile. The admin can configure a different verification method or can require additional verifications, for example, a personal question that only the user can answer.

4. The Reset page tells the user to check email for instructions.
5. The user opens the email and clicks the here link to reset the password. The link is valid for a period that you specify (use the password_reset.request.expiry property).

Preview email

Hello

A password reset was requested for your user account on the ServiceNow instance https://demonightyplatformsecurity.service-now.com/.

Click here to reset your password. If you do not want to reset your password, please disregard this email.

The link will expire in 12 hours.
If you did not request this password reset, please notify your company's ServiceNow administrator.

6. The Reset Password page guides the user to reset the password.

The default self-service Password Reset process (com.glideapp.password_reset) defines:

- The URI that specifies where users are redirected when they click Forgot Password?. By default this value is /$pwd_reset.do?sysparm_url=ss_default, which is the same value used in the glide.security.password_reset.uri property. In previous releases, this value was set to /reset_password.do.
- The Enable Password Reset URL option, which specifies that the user should receive an email with a link to reset their password after they click Forgot Password?.
- The Personal Data Enter Email Address verification flow that specifies the three-step password reset flow.

See Configure your Password Reset process for instructions on accessing this form and configuring the fields.

Note:

- This feature works for locally authenticated users who enter the username and password specified in their user record. Users logging in to the instance via an SSO solution or an LDAP integration cannot reset passwords with self-service Password Reset.
- The end user must enable and configure notification preferences. See Subscription-based notifications on page 822. Administrators can modify the email that is sent to the end user.
Plan your Password Reset processes

To ensure security and efficiency, take the time to plan your Password Reset implementation.

Role required: password_reset_admin or admin

1. Decide on the password reset process:
   - Self-service process: Users reset their password over the Internet using a browser on any supported interface, including mobile devices. To make the Password Reset application with Orchestration available to all users publicly, create a new Password Reset process only for this purpose and make it accessible to all users by setting the Public access property. See Example: The default self-service Password Reset process on page 2133.
   - Service desk-assisted process: Users reset passwords by requesting the assistance of a service desk agent, over the phone or in person. Only service desk agents with the password_reset_service_desk role can reset user passwords. Watch the videos: Resetting User Passwords (Video) and How to Set Up a Service Desk-Assisted Password Reset Process (Video).

2. Decide how groups and roles differ in access and security needs.

Analyze and assess how members of each group in your organization access the system. For example, if members of the sales group primarily access the system remotely, consider using a stronger method or multiple methods to verify the identity of each user.

Identify user roles that have access to critical information and resources. For example, stronger verifications might be required for roles that have access to employee data, accounting information, or network configurations.

Based on your analysis of groups and roles, determine the number and variety of verifications needed for the different Password Reset processes.

3. Decide how to manage credentials.

Determine whether single sign-on is enabled with the type of directory service or other credential store used. If the directory service is configured for single sign-on, consider increasing the level of security by using multiple methods to verify identity of a user. A compromised user name and password can easily allow access to associated systems in a single sign-on environment.

4. Decide how to implement enrollment in the Password Reset program.

For example, will enrollment be optional or required? Will users be auto-enrolled? How will users be notified to enroll in the program? The answers to these questions will help you determine the appropriate verification types to use.

5. Decide which Password Reset options to offer to users.

   - If your organization uses single sign-on, how will users reset their password if they are unable to log on?
   - What options are available to users working off-site?

Configure your Password Reset process

To implement the process, you configure credentials, verification methods and settings, and enrollment settings. You also specify which users the process applies to.

Role required: password_reset_admin or admin

1. Be sure to Plan your Password Reset processes on page 2136.
2. Create the credential store record for usernames and passwords that are managed.

Note: For LDAP integrations: If the Active Directory settings require users to reset the password when logging in, the results depend on the Password Reset plugin that is installed.
• The Password Reset plugin cannot change an AD password. End users will not be able to log in to the instance.
• The Self Service Password Reset plugin depends on the Password Reset Basic plugin. Self service is intended for password reset only on the local ServiceNow instance and cannot change an AD password.
• The Password Reset Orchestration Add-on plugin is built on top of Orchestration AD activities. The plugin supports changing the AD password.

3. Define the verifications that the process will use.
4. Configure Password Reset to auto-enroll users or to enable users to enroll for the program. See Configure your Password Reset process to auto-enroll users on page 2160 and Enable users to enroll for Password Reset on page 2161.

A Password Reset process consists of the following elements:
• The credential store that contains user login credentials.
• Optionally, the user groups that are authorized to use the Password Reset process.
• The verifications that verify the identity of the requesting user and that enable the service desk agents to authorize reset of the password. (Verifications are implemented by script includes.)

1. Navigate to Password Reset Processes.
2. Click New and then specify a meaningful Name and Description for the process.
3. Select the Credential store that contains the user credentials that the process applies to.
4. Specify the process that you are defining: Select the Password Reset check box, the Password change check box or both check boxes.
5. Specify the Apply to all users setting.

<table>
<thead>
<tr>
<th>Setting of the Apply to all users check box</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Selected</td>
<td>All users use the process that you are defining. This setting is useful only if all users have access to the authentication methods that are defined in this process.</td>
</tr>
<tr>
<td>Not selected</td>
<td>Only the users in the groups that you specify use the process. You specify the groups in the Groups related list.</td>
</tr>
</tbody>
</table>

6. For Password Reset, configure settings on the Password Reset Details tab.
Table 999: Settings on the Details tab

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Public access</td>
<td>The check box is available only when Password reset is selected.</td>
</tr>
<tr>
<td></td>
<td>• Select the check box to enable a self-service process with public user access to the Password Reset or Password Change form through a URL.</td>
</tr>
<tr>
<td></td>
<td>• Clear the check box to define a Service desk-assisted process in which only service desk agents can reset a password at the request of a user.</td>
</tr>
<tr>
<td>Public URL</td>
<td>The field is available only when Public access is selected.</td>
</tr>
<tr>
<td></td>
<td>URL of the page where users go to reset or change the password. The value from the URL suffix field is appended to the URL when you tab out of the URL suffix field. For the Default self-service Password Reset process, this value must be /$pwd_reset.do?sysparm_url=ss_default.</td>
</tr>
<tr>
<td>URL suffix</td>
<td>The field is available only when Public access is selected.</td>
</tr>
<tr>
<td></td>
<td>Suffix used to create a unique URL for the Password Reset or Password Change form.</td>
</tr>
<tr>
<td>Field</td>
<td>Value</td>
</tr>
<tr>
<td>------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Display CAPTCHA</td>
<td>The check box is available only when Public access is selected. Select the check box to display a CAPTCHA on the user identification page. The Password Reset application uses Google reCAPTCHA as the default CAPTCHA service. See <a href="#">Configure Google reCAPTCHA for the password reset process</a> on page 2178. Note: The Password Reset Windows Application uses the base-system CAPTCHA service even if the Password Reset application is configured to use Google reCAPTCHA. Because on-premises instances do not have access to the Internet, the instances cannot use the Google reCAPTCHA service. Set the password_reset.captcha.google.enabled system property to false for on-premises instances. To use the CAPTCHA service that is provided with the base system, change the password_reset.captcha.google.enabled system property to false.</td>
</tr>
<tr>
<td>Identification type</td>
<td>Method that the user employs to claim identity for the public Password Reset or Password Change process. Any selection overrides the default identification that is associated with the process. The base system includes the Email and Username Identification identification types. You can create a custom identification type (some knowledge of JavaScript is recommended). See <a href="#">Personal data identification types and confirmation type verifications</a> on page 2157.</td>
</tr>
<tr>
<td>Field</td>
<td>Value</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Post-reset URL</td>
<td>URL to go to after a successfully resetting a password — typically, the URL of the original login page.</td>
</tr>
<tr>
<td></td>
<td>Enter a complete path, including the protocol (for example, <a href="https://myDomain.myURL.com">https://myDomain.myURL.com</a>). If the path is under the same domain as the Public URL, then start the path with the / character.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If the Auto-generate password check box is selected, then the instance displays the new password. The user must click Done to go to the URL.</td>
</tr>
<tr>
<td>Minimum verifications</td>
<td>Number of verifications that a user must successfully submit to reset the password.</td>
</tr>
<tr>
<td></td>
<td>If the number exceeds the number of mandatory verifications, then the user must submit enough additional optional verifications to meet the number specified for Minimum verifications.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Each user must submit all mandatory verifications regardless of the number specified.</td>
</tr>
<tr>
<td></td>
<td>By default, during the password reset process, the system presents optional verifications to the user based on the Order values for the verifications. If you selected Allow user to choose from optional verifications, then the Verification page presents all optional verifications to the user. The user then selects the appropriate number of verifications. In this example, the Minimum verifications value is 1. Because no mandatory verifications are configured, the user can choose an optional verification.</td>
</tr>
<tr>
<td></td>
<td>Also, see Allow user to choose from optional verifications.</td>
</tr>
<tr>
<td>Field</td>
<td>Value</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Allow user to choose from optional verifications</td>
<td>Select the check box to enable a user, on the Verifications page during the process of resetting the password, to select which optional verifications to use. The choice of optional verifications appears only if the Minimum verifications setting is greater than the number of mandatory verifications. The number that you specify for Minimum verifications determines how many optional verifications that the user is allowed to select. In the example, the Minimum verifications setting is 2 and there are no mandatory verifications. The user has selected two optional verifications, so cannot select a third verification.</td>
</tr>
<tr>
<td>Email Password Reset URL</td>
<td>Select the check box to enable users to reset the password by clicking a link in an email that the instance sends to them. By default, the self-service Password Reset processes enable this option. When you select this option, the Auto-generate password check box is not available.</td>
</tr>
</tbody>
</table>

**Note:** See [Example: The default self-service Password Reset process](#) on page 2133 for an outline of the process that is enabled by default.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
</table>
| Enable account unlock | This check box is available only when Password reset is selected.  
Select the check box to allow user accounts on credential stores to be unlocked without resetting the password.  
**Note:** Not supported by the default self-service Password Reset process. |
| Unlock user account  | Select the check box to unlock user accounts on credential stores after a password reset. |
| Auto-generate password | Select the check box to auto-generate a new password for the user. When this check box is selected, you must select the Email password or Display password check box, or both. This setting is useful for service desk-assisted processes.  
This check box is available only when:  
- The Password reset check box is selected.  
- The Email Password Reset URL check box is cleared.  
**Note:** If you use the credential store on your local ServiceNow instance or an Active Directory credential store: Clear the check box to enable the Enforce history policy option for a credential store.  See *Configure the connection to a credential store for the Password Reset processes* on page 2148. |
<table>
<thead>
<tr>

</tr>
</tbody>
</table>

8. For Password Reset, fill in any fields of interest on the Enrollment Reminder tab.
10. From the Password Reset Process Verifications related list, select one or more verifications. See [Password Reset verifications](on page 2155).
11. From the Password Reset Process Groups related list, select the user groups that will use the process that you are defining.
    The Password Reset Process Groups related list appears only if the Apply to all users check box is not selected.
12. Save the record and then select the Active check box to enable the Password Reset process that you configured. The check box is available only after the record has been saved.
13. Click Update.
14. Navigate to Password Reset Properties to set the properties that configure the Password Reset experience for end users.

**Credential stores for Password Reset**

Credential stores hold user information such as user names and passwords that can be used as login credentials. Examples include the User table [sys_user] or an Active Directory server.
Users with the password_reset_admin or password_reset_credential_manager role can create and modify connections to credential stores.

**Credential store types installed with the base system**

A credential store type is a set of workflows that specify how to connect to a credential store. Navigate to Password Reset Credential Stores to view the list of example credential stores that are based on the base-system types. The base system includes the following credential store types:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local ServiceNow Instance</td>
<td>Represents the current (local) ServiceNow instance.</td>
</tr>
<tr>
<td>AD Credential Store</td>
<td>Represents an Active Directory credential store. Installed with the Password Reset - Orchestration Add-on plugin.</td>
</tr>
<tr>
<td>Remote (SOAP) ServiceNow instance</td>
<td>Represents a remote ServiceNow instance. Installed with the Password Reset - Orchestration Add-on plugin.</td>
</tr>
</tbody>
</table>

**Remote credential stores**

A remote credential store refers to any credential store other than the local ServiceNow instance. Remote credential stores, such as Active Directory, manage user names and passwords outside of the local instance. A remote credential store can also be a remote ServiceNow instance, a UNIX or Linux server, or any other directory-like service that relies on the SOAP protocol. The Password Reset Orchestration Add-on plugin is required to connect to remote credential stores. Review the information in the section on credential store types before you create, test, or delete credential stores.

**Connection workflows for credential store types**

A credential store type workflow requires a subflow that defines how to connect to the store, and can include an optional subflow that defines how to test the connection. Use the Pwd reset – AD and Pwd Reset - Local subflows as models for your custom connection workflows.
Figure 408: Pwd Reset Local sub workflow
Creating a custom credential store type

You can use a credential store type as a model to create a custom type. See Create a credential store type for Password Reset on page 2188.

Configure the connection to a credential store for the Password Reset processes
You create a Password Reset credential store record to configure access to your credential store server while a user is changing or resetting a password. In addition to host connection information, you can specify the password hints that users should see, restrictions on password reuse, the allowed number of failed reset attempts, and other settings.

For an AD credential store, skip this procedure and instead follow the instructions in Integrate Password Reset with your Active Directory service on page 2150. The Password Reset Windows Application supports only AD credential stores.

1. Navigate to Password Reset Credential Stores.
2. Select one of the following sample credential stores:
   - Local ServiceNow Instance credential store.
   - Remote (SOAP) ServiceNow credential store (installed with the Orchestration Add-on).
3. Enter a unique and meaningful Name and Description, and then fill in the form.
<table>
<thead>
<tr>
<th><strong>Type</strong></th>
<th>Type of credential store that you are connecting to. A ServiceNow credential store type is a template that provides the required set of capabilities for a particular kind of credential store. Credential stores inherit the functionality of the credential store type.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong></td>
<td>For an AD credential store, skip this procedure and see <em>Integrate Password Reset with your Active Directory service</em> on page 2150. The Password Reset Windows Application supports only AD credential stores.</td>
</tr>
</tbody>
</table>
| **Auto-generate password** | Script include that generates a temporary password for use during the reset process.  
If you select the Enforce history policy check box, then you must specify a value for Auto-generate password. |
| **Enforce history policy** | Appears only if you select a credential store Type of AD Credential Store or Local ServiceNow Instance. For information on configuring the setting for an AD credential store, see *Configure the connection to an AD credential store* on page 2151.  
Select the Enforce history policy check box to ensure that users do not reuse passwords. For example, you might configure the history policy to not allow the user to reuse any of the previous 10 passwords. Follow this procedure:  
1. Select the Enforce history policy check box.  
2. In the Password Reset Credential Store Parameters related list, create a password_history_limit parameter.  
3. Set the value of the parameter to the number of previous passwords that cannot be used (maximum 10). The default value of 0 (zero) enables use of any previous password. |
| **Hostname** | URL or IP address of the credential store. |
| **User account lookup** | Script include that maps the user ServiceNow platform ID to the user credential store ID. A default script, PwdDefaultUserAccountLookup, returns the user ServiceNow platform user name. |
| **Password rule hint** | Specify the text that appears on the password reset page to help the user to create a password that meets all requirements. The Password rule script enforces the requirements.  
**Note:** The Password Reset Windows Application supports newline characters in the hint. Other formatting is not supported (bold, underline, hyperlink, and so on). |
| **Password rule** | Specify the client script that validates the new password that the user enters. The script is invoked when the user enters a new password and clicks Password Reset. You can use the script to enforce password strength/complexity requirements. |
4. Click Submit.
5. If you use the Local ServiceNow Instance credential store and you selected the Enforce history policy check box, then follow these steps:
   a) Open the Password Reset process that is associated with the credential store: Password Reset Processes.
   b) On the Password Reset Details tab of the Password Reset Process form, clear the Auto-generate password check box and then save the process definition.

6. Test the connection to the credential store.

Integrate Password Reset with your Active Directory service
When the Orchestration Add-on plugin is activated, the Password Reset application can change passwords on an Active Directory credential store. The application changes passwords by referencing an Active Directory user role with the appropriate password change privileges.
Role required: admin

Active Directory must have a user role with the following privileges:

Descendent User objects:
- Reset password
- Read/Write pwdlastset
- Read/Write UserAccountcontrol
- Write Account Restrictions
- Read/Write lockouttime
- Read MemberOf

Descendent Group objects:
- Read Members
- Read MemberOf

1. **Install MID Server** on a Windows computer that can connect to Active Directory.
2. **Configure the MID Server.**
3. In the ServiceNow instance, navigate to Orchestration Credentials.
4. Click New, complete the form with the following values for the AD credential, and then click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select Windows.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter your Active Directory domain user. For example, domain \admin.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter your Active Directory domain user password.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Server that is used to access the Active Directory server.</td>
</tr>
</tbody>
</table>

Create a connection to the credential store as described in Configure the connection to an AD credential store on page 2151.

### Configure the connection to an AD credential store

You create a Password Reset credential record to configure access to your Active Directory server while a user is changing or resetting a password. In addition to host connection information, you can specify the password hints that users should see, restrictions on password reuse, the allowed number of failed reset attempts, and other settings.

The Orchestration add-on installs the AD Credential Store type. The Password Reset Windows Application supports only AD Credential Store.

1. Navigate to Password Reset Credential Stores and select Sample AD Credential Store to use as a template.
2. Enter a unique and meaningful Name and Description and then fill in the form.

<p>| Type                      | Select AD Credential Store. A ServiceNow credential store type is a template that provides the required set of capabilities for a particular type of credential store. Credential stores inherit the functionality of the credential store type. |</p>
<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Auto-generate password</td>
<td>Specify a script include that generates a temporary password for use during the reset process.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>If you select the Enforce history policy check box, then you must specify a value for Auto-generate password.</td>
</tr>
</tbody>
</table>
| Enforce history policy | Appears only if you select a credential store Type of AD Credential Store or Local ServiceNow Instance. For information on configuring the setting for credential store types other than AD, see Configure the connection to a credential store for the Password Reset processes on page 2148. Select the Enforce history policy check box to enforce both of the following password reset policies:  
  - History policy (password reuse): Active Directory domains can be configured to include a history policy that ensures that users do not reuse passwords. For example, the history policy might be configured to not allow the user to reuse any of the previous 10 passwords when resetting a password.  
  - Maximum number of reset attempts: You can configure the maximum number of attempts to reset a password. A user who fails to reset the password (by failing password policies or the history policy) the specified number of times is blocked.  

Follow this procedure to enforce the history policy that is configured for the AD credential store and to enforce the password policy:  
1. Select the Enforce history policy check box.  
2. In the Password Reset Credential Store Parameters related list, set the value of the max_reset_attempts parameter to the number of allowed attempts to change or reset the password. Attempts fail when password policies which are set up on the remote AD server. The max_reset_attempts setting applies only to Password Reset processes that use AD credential stores. The default value of 0 (zero) enables an unlimited number of reset attempts.  

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>Specify the URL or IP address of the credential store.</td>
</tr>
<tr>
<td>User account lookup</td>
<td>Specify the script include that maps the user ServiceNow platform ID to the user credential store ID. The default script, PwdDefaultUserAccountLookup, returns the user ServiceNow platform user name.</td>
</tr>
</tbody>
</table>
| Password rule hint    | Specify the text that appears on the password reset page to help the user to create a password that meets all requirements. The Password rule script enforces the requirements.  
  **Note:** The Password Reset Windows Application supports newline characters in the hint. Other formatting is not supported (bold, underline, hyperlink, and so on). |
| Password rule         | Specify the client script that validates the new password that the user enters. The script is invoked when the user enters a new password and clicks Password Reset. You can use the script to enforce password strength/complexity requirements. |
Enable Password Strength

Select the check box to:

• Display the text box for the Strength rule script so you can update the script.
• Display the graphical Password Strength bar to the user while the user changes or resets the password.

**Note:** The Password Reset Windows Application does not support Password Strength.

Strength rule

This text box appears only if you select Enable Password Strength.

Specify the client script that calculates the strength/complexity of the password that the user enters. The script is invoked when the user begins to enter a new password during the reset process.

Default settings:

• Selected for local ServiceNow credential stores
• Not selected for other credential stores

**Note:**
To guide the user during the reset process, the system displays a graphical bar labeled Password Strength under the New password field.

**Note:** The Password Reset Windows Application does not support Password Strength.

3. Click Submit.
4. On the domain controller, set Password Aging (MIN_PASSWORD_AGE) to zero.
5. To enforce the history policy that is configured for the AD credential store, follow these steps:
   a) Open the Password Reset process that is associated with the credential store: Password Reset Processes.
   b) On the Password Reset Details tab of the Password Reset Process form, clear the Auto-generate password check box and then save the process definition.
   c) On the domain controller, set the history policy to twice the desired number of passwords. For example, to enforce that the last 11 passwords are not repeated, set the history policy to 22.

**Note:** To enforce the history policy that is configured for the AD credential store, the system auto-generates a new temporary password for each reset cycle. The system auto-generates the temporary password even though you cleared the Auto-generate password check box on the Password Reset Process form. Because the user immediately replaces
the temporary password with a new password, two passwords are created for each reset cycle.

6. To enforce the maximum number of attempts to reset the password: In the Password Reset Credential Store Parameters related list, set the value of the max_reset_attempts parameter to the number of allowed failed attempts. The default value of 0 (zero) enables an unlimited number of reset attempts.

   **Note:** The max_reset_attempts setting applies only to Password Reset processes that use AD credential stores.

7. Click Submit.

8. **Test the connection to the credential store.**

   **Test the connection to a credential store**
   You should test the connection to a credential store after you configure a new credential store or when users experience problems that might involve the connection.

   Role required: admin

   1. Navigate to **Password Reset Credential Stores** and then open the credential store record.
   2. In the header bar, click **Save and Test Connection**.
   
      A progress page displays the result of the test.

   **Set up SOAP credentials for Password Reset**
   When the Orchestration Add-on plugin is activated, the ServiceNow platform can use the SOAP protocol to interact with remote credential stores such as a remote ServiceNow instance.

   Role required: admin or web_service_admin

   1. Navigate to **System Web Services Outbound SOAP Message**.
   2. Click **Password Reset Request**.
   3. From the Soap Message Functions related list, configure both the password_reset and sys_user_get_record functions by completing the following steps.
      a) In Basic auth user ID, enter the user ID for the remote system user who has privileges to update records on the User [sys_user] table.
      b) In Basic auth user password, enter the password for the remote system user who has privileges to update records on the User [sys_user] table.
      c) Select Use basic auth.
      d) Click Update.

      You do not need to enter a value in the SOAP endpoint field. The field shows the name of the ServiceNow instance used for Password Reset.

   **Delete a connection to a credential store for Password Reset**
   Important: Before you delete the connection to a credential store, check all Password Reset processes to ensure that the credential store is not in use. If the credential store is being used by a process, update the process before deleting the credential store.

   Role required: password_reset_admin or password_reset_credential_manager

   1. Navigate to **Password Reset Credential Stores** and then select the check box for the credential store.
   2. In the Actions choice list, select **Delete**.
Password Reset verifications

Each verification specifies the method and process for verifying the identity of the user that is requesting password reset.

Verifications included with Password Reset

The Password Reset application includes the following verifications in the base system. You can create a verification based on either a base-system verification or a verification type (a template).

Note: The Password Reset Windows Application does not support custom verifications.

| QA verification | Implements a self-service Password Reset model with questions that are included with the base system or custom questions that the admin defines. While enrolling for the process, the user decides which questions to provide answers for. Questions are presented in the language that the user requested during login.

When a user requests password reset, the system poses a specified number of the questions that the user selected during enrollment. The user must answer all questions correctly to verify identity.

For information on the user enrollment experience, see Users: Enroll in the Password Reset program using questions and answers on page 2219.

This verification is based on the Security Questions verification type.
<table>
<thead>
<tr>
<th>Verification Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email verification</td>
<td>This verification relies on auto-generated code numbers. You typically implement Email verification as a self-service Password Reset model. When a user requests password reset, the system sends a verification code to an email address that the user authorized during enrollment. To verify identity, the user then submits the code on the Password Reset Verify page. For information on the user enrollment experience, see Users: Enroll in the Password Reset program using emailed codes on page 2220. The Password Reset Windows Application supports Email verification. This verification is based on the Email Code verification type.</td>
</tr>
<tr>
<td>SMS verification</td>
<td>Implements a self-service or service desk-assisted Password Reset model that relies on auto-generated code numbers. When a user requests password reset, the system sends a code to an SMS-capable device that the user has authorized. To verify identity, the user then submits the code on the Password Reset Verify page. You can use the ServiceNow Notify feature to send the codes. For information on the user enrollment experience, see Users: Enroll in the Password Reset program using SMS codes on page 2220. This verification is based on the SMS Code verification type.</td>
</tr>
<tr>
<td>Google Authenticator verification</td>
<td>Password Reset model that relies on auto-generated code numbers. You typically implement Google Authenticator verification as a self-service Password Reset model. When a user requests password reset, the user reads a code from the Google Authenticator app on a device that the user has paired. To verify identity, the user then submits the code on the Password Reset Verify page. For information on the user enrollment experience, see Users: Enroll in the Password Reset program using Google Authenticator on page 2221. The Password Reset Windows Application supports Google Authenticator verification. This verification is based on the Google Authenticator verification type.</td>
</tr>
<tr>
<td>Personal Data — Confirm Email Address</td>
<td>Implements a self-service Password Reset model that relies on user information that is available in the user profile on the instance. This verification is based on the Personal Data Confirmation verification type.</td>
</tr>
</tbody>
</table>
Verifications included with the demo data

The following demo data is based on the Mock verification type:

• Sample Mock verification #1
• #2

Personal data identification types and confirmation type verifications

Personal data verifications allow users to verify their identity by providing answers to questions that are generated from personal information stored in the User table [sys_user].

User experience

For an example of how a user might enroll for Personal data verification, see Users: Enroll in the Password Reset program using questions and answers on page 2219.

Personal data identification types

The Password Reset application provides the email and username identification types. You can use either type as provided or as a model to create a custom identification type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Identification</td>
<td>Identifies users by their email addresses.</td>
</tr>
<tr>
<td>Username Identification</td>
<td>Identifies users by their user names.</td>
</tr>
</tbody>
</table>

Personal data confirmation verifications

• Personal data verification: If users are associated with a Password Reset process that uses a personal data verification, the users are typically not required to enroll for Password Reset.
• Personal data confirmation verifications allow employees with the password_reset_service_desk role to access personal data from the sys_user table when assisting a user with a password reset request.

To configure personal data and personal data confirmation verifications, you specify parameters as name/value pairs that correspond to a particular piece of user information. For example, to verify users by their email address:

1. Set the label parameter (the text that the end user should see) to Email (that is, label=Email).
2. Set the column parameter (the column in the table that holds the verification data) to email (that is, column=email).

Note: You can use only one set of name/value pair parameters per verification. Additional parameters are ignored.
To use multiple pieces of personal information for user verification, create more personal data or personal data confirmation verifications and add the verifications to the related Password Reset process.

**Personal data and personal data confirmation type verifications**

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>Text to display as a label for the field that the user fills in during the password reset request. Data Type: string Default Value: n/a</td>
</tr>
<tr>
<td>column</td>
<td>Column of the sys_user table that provides the data that is used to verify the identity of the user. Data Type: string Default Value: n/a</td>
</tr>
</tbody>
</table>

*SMS Code Verification type for Password Reset*

Using the Simple Message Service (SMS) Code Verification type, a user can verify identity with the help of any SMS-enabled device, like a cell phone that accepts text messages. When a user requests password reset, the system sends a numerical code to the device and the user then enters the code on the Password Reset Verification page.

You can change the default behavior of an SMS code verification using either of the following methods:

- Set parameter values, as shown in the table.
- Update property settings for the Password Reset application.

**Note:** The system allows only one instance of each SMS code parameter.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expiry</td>
<td>Number of minutes the verification code is valid. Data Type: integer (any positive integer) Default Value: 5</td>
</tr>
<tr>
<td>complexity</td>
<td>Number of digits in the numerical verification code. Data Type: integer (any positive integer) Default Value: 4</td>
</tr>
<tr>
<td>pause_window</td>
<td>Number of minutes before the user can request another SMS code for verification. Data Type: integer (any positive integer) Default Value: 2</td>
</tr>
</tbody>
</table>
**User experience**

For information on how users enroll for SMS verification, see *Users: Enroll in the Password Reset program using SMS codes* on page 2220.

Use NotifyNow to send SMS codes for enrollment and verification

You can configure the Password Reset application to send SMS codes for enrollment and verification using the ServiceNow NotifyNow application (via the Twilio SMS Messaging system). NotifyNow is tightly integrated with the workflow engine and business rules and delivers a highly configurable and trusted way to deliver SMS messages.

Role required: admin

NotifyNow requires a separate contract with Twilio.

1. Enroll for a Twilio account and telephone number at [https://www.twilio.com/](https://www.twilio.com/)
2. Activate the Notify plugin.
3. Associate the Twilio account with Notify.

No other configuration is required. Users who request password change or password reset receive SMS codes through NotifyNow.

*Specify the number of required security questions*

When designing a Security Questions verification for Password Reset, you can specify the number of questions to display when users enroll. You can also specify the number to display when a user is verifying identity while resetting the password.

Role required: password_reset_admin or admin

1. Navigate to Password Reset Verifications and then open a verification that uses the Security Questions Verification Type.
2. Configure the parameters in the Password Reset Verification Parameters related list.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max_per_day</td>
<td>Maximum number of codes sent for verification in one day.</td>
</tr>
<tr>
<td></td>
<td>Data Type: integer (any positive integer)</td>
</tr>
<tr>
<td></td>
<td>Default Value: 10</td>
</tr>
</tbody>
</table>
Table 1004: Parameters for Security Questions Verification

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>num_enroll</td>
<td>Number of questions that a user must provide answers to while enrolling for the Password Reset process. The value that you specify here overrides the setting of the Number of security questions required during enrollment property. See Configure Password Reset properties on page 2164. Data Type: Positive integer that does not exceed the number of questions in the security questions list (Password Reset Security Questions). Default Value: 5</td>
</tr>
<tr>
<td>num_reset</td>
<td>Number of security questions that are displayed on the Verify page while a user is attempting to reset the password. The user must answer all questions correctly to verify identity. The questions are selected at random and are presented in random order. The value that you specify here overrides the setting of the Number of security questions required during the password reset request property. See Configure Password Reset properties on page 2164. Data Type: Positive integer that does not exceed the value of the num_enroll parameter Default Value: 3</td>
</tr>
</tbody>
</table>

3. Click Update.

Configure your Password Reset process to auto-enroll users

To simplify management, many organizations auto-enroll users in the Password Reset program. Every base-system verification type enables you to specify automatic enrollment for your process.

Role required: password_reset_admin or admin

To enable automatic enrollment, you configure settings for the verification type that your Password Reset process is based on.

1. Navigate to Password Reset Extensions Verification Types.
2. Click the verification type for the verification that your Password Reset process uses. The verification type for each base-system verification is identified in Password Reset verifications on page 2155.
3. On the Verification Types page, specify the following settings:
Enable users to enroll for Password Reset

To enable users to enroll for the Password Reset program, you specify a UI macro that takes the user through the enrollment process and a script that processes the enrollment data that the user entered. The base system includes a functioning macro and script.

Role required: password_reset_admin or admin

To enable users to enroll, you configure settings for the verification type that your Password Reset process is based on.

1. Navigate to Password Reset Extensions Verification Types.
2. Click the verification type for the verification that your Password Reset process uses. The verification type for each base-system verification is identified in Password Reset verifications on page 2155.
3. On the Verification Types page, specify the following settings:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automatic enrollment</td>
<td>Clear the check box to disable automatic enrollment.</td>
</tr>
<tr>
<td>Enrollment UI</td>
<td>Enrollment UI macro that takes the user through the enrollment process.</td>
</tr>
<tr>
<td>Enrollment processor</td>
<td>Enrollment processor script that processes enrollment data.</td>
</tr>
</tbody>
</table>

4. Repeat the procedure for all verifications that your Password Reset process uses.

**Enabling user enrollment**

This example verification type uses the pwd_enroll_sms_ui enrollment UI macro and the PwdEnrollSMSProcessor enrollment processor script.
A verification type must also define a verification UI macro and a corresponding verification processor script. The example uses the pwd_verify_sms_ui verification UI macro and the PwdVerifySMSProcessor verification processor script.

Figure 410: Verification type
**Figure 411: Verification UI macro**

```xml
<?xml version="1.0" encoding="utf-8" ?>
<j:jelly trim="false" xmlns:js="jelly:core" xmlns:g="glide" xmlns:j2="null" xmlns:g2="null">
<script language="javascript">
    addLoadEvent(getVerificationInfo);
    function getVerificationInfo() {
        var gc = new GlideAjax('PwdAjaxPublicEnrollSMS');
        gc.addParam('sysparm_name', 'getSMSVerificationInfo');
        gc.addParam('sysparm_user_id', 'sysparm_user_id');
        // add CSRF token for AJAX handling.
        gc.addParam('sysparm_pwd_csrf_token', findCERFElement().value);
        gc/XMLRequests('handleGetVerificationInfoResponse', null);
    }
    function handleGetVerificationInfoResponse(response, args) {
```
Configure Password Reset properties

You can specify properties that configure the Password Reset experience for end users.

Role required: password_reset_admin
While there are no range limits for the values you can enter for properties, consider using only positive integer values starting at 1. When you determine the limit for the upper range of a property, consider the task that the user is performing.

For example, you would not want to allow 100 attempts for users to verify their identity. A more common value is 3 attempts. Similarly, you may not want to force users who are completing the enrollment process to spend time selecting and answering 30 security questions. The more commonly used number of security questions is between 5 and 7.

1. Navigate to Password Reset Properties.
2. Update settings as needed and then click Save.

### Table 1005: Password Reset properties

<table>
<thead>
<tr>
<th>Property Label</th>
<th>Property Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password Reset Global properties</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Email template for reminders to users</td>
<td>password_reset.enrollment_reminder.email_template</td>
<td>Email template to use for the email messages that remind users to enroll for the password reset process. See <a href="#">Send email to remind users to enroll for Password Reset</a> on page 2173.</td>
</tr>
<tr>

| Number of minutes before the SMS code expires | password_reset.sms.expiry | Time, in minutes, until the SMS code sent to the user expires.  
  - Type: integer  
  - Default value: 5 (minutes)  
  
  **Note:** You can override this SMS code property by the expiry parameter in the SMS code verification. |

**Password Reset Monitoring and Reporting properties**

| Time interval, in minutes, for counting blocked users | password_reset.activity_monitor.incident_window | Time window to count the number of blocked users.  
  - Type: integer  
  - Default value: 60 (minutes)  |

| Number of blocked users, in the defined time interval, that triggers a system log event | password_reset.activity_monitor.incident_threshold | Number of blocked (or locked) users, within the specified time window, that triggers a system log event.  
  - Type: integer  
  - Default value: 10 (blocked users)  |

**Password Reset Style Sheet**

| Style sheet to apply to end-user pages during the password reset process. | password_reset.stylesheet | Name of a custom CSS style sheet in the Style Sheet [content_css] table. You can use the default style sheet as a template for the custom style sheet. You cannot add element definitions to the style sheet.  
  - Type: string  
  - Default value: css_pwd_reset_default |
<table>
<thead>
<tr>
<th>Property Label</th>
<th>Property Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Email template for reminder emails                                           | password_reset.email_template_default             | Template to use to specify the subject and body of the email messages to remind users to enroll for the Password Reset process. For example:  
• [Subject] Reminder: Enroll in the Password Reset program  
• [Body] Click here to enroll for the password reset service.  

**Note:** You must create an email template in the password_reset table to use it as a reminder.  
• Type: string  
• Default value: email_template_default

**Note:** Several components in the Self Service Password Reset (com.snc.password_reset) plugin and the Password Reset (com.glideapp.password_reset) plugin control the password reset flow. The following properties affect Password Reset, but do not appear on the Password Reset Properties page:  
• You can add the glide.pwd_reset.onetime.token.validity property to the System Properties [sys_properties] table to specify the number of hours that the Password Reset token should be valid. Default: 12.  

**Note:** The setting for the password_reset.request.expiry property (time period during which a user must perform the Password Reset process) takes precedence over the setting for glide.pwd_reset.onetime.token.validity.

Properties accessible from the System Properties [sys_properties] table:  
• For Password Reset on mobile devices, you can specify the URL that the user is taken to when user taps the Forgot password? button. See the glide.security.password_reset.uri property in High Security Settings. Default: /$pwd_reset.do?sysparm_url=ss_default  
• If glide.security.forgot_password.display.link is set to true, displays the Forgot Password? link on the login page.
Send email to remind users to enroll for Password Reset

You can automatically send messages that remind users to enrolled in the Password Reset process. You specify the text of the message and can configure the messages to repeat at intervals.

Role required: password_reset_admin

The default email content is:

- **Subject**: Reminder: Enroll in the Password Reset program
- **Body**: Click here to enroll in the Password Reset program.

To customize the email, see *Customize the Password Reset enrollment reminder email* on page 2174.

1. Navigate to Password Reset Processes and select your process.
2. Click the Enrollment Reminder tab, configure the following settings, and then click Update. (The tab appears only when the Password reset check box is selected.)

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send reminder</td>
<td>Select the check box to send reminder emails to users (either all users or users in the specified groups, as you configured). Clear the check box to send no reminders.</td>
</tr>
<tr>
<td>Sender alias</td>
<td>Enter a non-functional email alias that should appear in both the To and From fields of the message. For example, <a href="mailto:do-not-reply@myCompany.com">do-not-reply@myCompany.com</a>. Users will not be able to respond to the alias. The alias is required by the email system to use the bcc field for all of the users who receive the message. The intent is that the users should not see the other addressees. Default: <a href="mailto:do-not-reply@ServiceNow.com">do-not-reply@ServiceNow.com</a></td>
</tr>
</tbody>
</table>
| Send, Day, and Time | Specify a schedule of one message each month or one message each week.  
  • If you set Send to Monthly, then enter the day of the month and optionally the time of day when the message should be sent.  
  • If you set Send to Weekly, then enter the day of the week and optionally the time of day when the message should be sent.  
  Default: Weekly message at 00:00 on Monday |
| Starting          | Date and time to send the first message. Click the calendar button to specify the setting. Default: [Now] |
Customize the Password Reset enrollment reminder email
The email message that reminds users to enroll for the Password Reset process is based on an email template. To customize the message, you can modify the default template or create a custom template.

Role required: password_reset_admin

The default email content is:

- Subject: Reminder: Enroll in the Password Reset program
- Body: Click here to enroll in the Password Reset program.

1. To modify the email subject text:
   a) Navigate to System Policy Email Templates.
   b) Open the Password reset enrollment reminder template.
   c) Update the Subject field as needed.
   d) In the Message HTML text box, you can add code as needed, but do not modify the default text.

2. To modify the email body content:
   a) Navigate to System Notifications Email Notification Email Scripts.
   b) Open the pwd.enrollment_reminder script.
   c) Modify only the indicated portion of the script.
3. To create a custom email template:
   a) Make a copy of the Password reset enrollment reminder template and edit as described above.

```javascript
function runMailScript(/* GlideRecord */ current, /*
TemplatePrinter */ template,

// Optional EmailOutbound w/ email,
// Optional
// GlideRecord w/ email_action,
// Optional GlideRecord w/ event) {

var board = "Password Reset Notification <do-not-reply@servicenow.com>;";
email.setFrom(board);
email.setReplyTo(board);

var users = event parm2.split(';');

//get user records
var user = new GlideRecord("sys_user");
user.addIndex("sys_id", users);
user.query();
while (user.next()) {
    var userContact = new GlideRecord("sys_user_contact");
    userContact.setSysId(user.getSysId());
    userContact.query();
    while (userContact.next()) {
        var enrollmentURL = gs.getProperty('glide.servlet.uri') + "$pwd_enrollment_form_container.do";
        template.print("Click <a href=" + enrollmentURL + ">here
</a> to enroll for the password reset service.");
    }
}
}(current, template, email, email_action, event);
```
b) Navigate to Password Reset Properties and enter the template name in the Email template for enrollment reminder emails field.

Configure the required strength for passwords

The password that a user defines must meet certain requirements — for example, it must contain at least 12 characters, it must include a numeral, and so on. You can configure the requirements as needed for your organization.

Role required: password_reset_admin

The base system includes example credential stores with various password requirements. You can modify password requirements and provide users with hints for creating a password. The default requirements are:

- At least eight characters
- At least one uppercase and one lower case letter
- At least one numeral

**Note:** In addition to configuring password strength requirements, you can configure several other settings for the credential store, as described in [Configure the connection to a credential store for the Password Reset processes](#) on page 2148.

1. Navigate to Password Reset Credential Stores.
2. Select the credential store in the list and then configure the following settings:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password rule hint</td>
<td>Specify the text that appears on the password reset page to help the user to create a password that meets all requirements. The Password rule script enforces the requirements.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The Password Reset Windows Application supports newline characters in the hint. Other formatting is not supported (bold, underline, hyperlink, and so on).</td>
</tr>
<tr>
<td>Password rule</td>
<td>Specify the client script that validates the new password that the user enters. The script is invoked when the user enters a new password and clicks Password Reset. You can use the script to enforce password strength/complexity requirements.</td>
</tr>
<tr>
<td>Enable Password Strength</td>
<td>Select the check box to:</td>
</tr>
<tr>
<td></td>
<td>• Display the text box for the Strength rule script so you can update the script.</td>
</tr>
<tr>
<td></td>
<td>• Display the graphical Password Strength bar to the user while the user changes or resets the password.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The Password Reset Windows Application does not support Password Strength.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Strength rule   | This text box appears only if you select Enable Password Strength. Specify the client script that calculates the strength/complexity of the password that the user enters. The script is invoked when the user begins to enter a new password during the reset process. Default settings:  
- Selected for local ServiceNow credential stores  
- Not selected for other credential stores |

**Note:**

To guide the user during the reset process, the system displays a graphical bar labeled Password Strength under the New password field.

![Password Strength Image](image)

**Note:** The Password Reset Windows Application does not support Password Strength.

3. Click Submit. You should test the connection to a credential store after you configure a new credential store or when users experience problems that might involve the connection.

4. Navigate to Password Reset Credential Stores and then open the credential store.

5. In the header bar, click Save and Test Connection. A progress page displays the result of the test.

**Specify lockout for failed login attempts**

The system provides inactive script actions that enable you to specify the number of failed login attempts before a user account is locked and to reset the count after a successful login.

Role required: admin

Navigate to System Policy Script Actions to view or activate the scripts.

**Note:** Starting with the Kingston release, following a zBoot, the script actions SNC User Lockout Check with Auto Unlock and SNC User Clear are activated.
### Script action

<table>
<thead>
<tr>
<th>Script action</th>
<th>Description</th>
</tr>
</thead>
</table>
| SNC User Lockout Check with Auto Unlock           | • Uses the value of the glide.user.max_unlock_attempts property to set the limit for failed login attempts.  
  • Unlocks the user account after the time period that is specified for the glide.user.unlock_timeout_in_mins property. If no value is specified, then the system unlocks the user account after the default period of 15 minutes. |
| SNC User Lockout Check                            | Tracks the number of failed login attempts and locks the user account after a specified number of failed login attempts (default: 5).       |
| SNC User Clear                                    | Updates the user record after a successful login: Resets the number of failed login attempts and updates the date of the last login.        |

Each time a user attempts to log in, the action is recorded in an event log. You can view a log of failed login attempts.

1. Navigate to System Policy Event Logs.
2. Filter for login.failed in the Name field. You can view the attempted login name, date, and IP address logged for the attempt.

### Configure Google reCAPTCHA for the password reset process

To use the Google reCAPTCHA service, instances that are running on a domain other than service-now.com require an API key pair from Google.

**Role required:** admin

- The procedure described in this topic is optional for instances that are running on the service-now.com domain.
- Because on-premises instances do not have access to the Internet, they cannot use the Google reCAPTCHA service. Do not follow the procedure described in this topic. Instead, set the password_reset.captcha.google.enabled system property to false. This setting enables the CAPTCHA service that is provided with the base system.
- The Password Reset Windows Application uses the base-system CAPTCHA service even if the Password Reset application is configured to use Google reCAPTCHA.

1. Request an API key pair (a site key and a secret) from Google at https://www.google.com/recaptcha.
2. Set the following system properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>password_reset.captcha.google.enabled</td>
<td>Set to true.</td>
</tr>
<tr>
<td>Type: string</td>
<td>Default: true</td>
</tr>
<tr>
<td>Property</td>
<td>Value</td>
</tr>
<tr>
<td>-----------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>google.captcha.site_key</td>
<td>Set to the site key that Google provided.</td>
</tr>
<tr>
<td></td>
<td>Type: string</td>
</tr>
<tr>
<td></td>
<td>Default: A site key that Google provided to ServiceNow</td>
</tr>
<tr>
<td>google.captcha.secret</td>
<td>Set to the secret that Google provided.</td>
</tr>
<tr>
<td></td>
<td>Type: password2</td>
</tr>
<tr>
<td></td>
<td>Default: An encrypted secret that Google provided to ServiceNow</td>
</tr>
</tbody>
</table>

Settings on the Advanced tab of the Password Reset Processes form

UI macros and script includes can extend the basic functionality of a Password Reset process.
The Advanced tab appears when you are configuring a Password Reset process (Password Reset Processes).

Table 1006: Advanced tab

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Entry UI macro</td>
<td>UI macro that displays a customized message to users when they access the initial Password Reset screen.</td>
</tr>
<tr>
<td>Success UI macro</td>
<td>UI macro that displays a customized message to users on the final Password Reset screen when their password is successfully reset.</td>
</tr>
<tr>
<td>Failure UI macro</td>
<td>UI macro that displays a customized message to users on the final Password Reset screen when their password reset fails.</td>
</tr>
<tr>
<td>Post reset script</td>
<td>Script include that performs actions after the Password Reset process completes whether the outcome is success or failure. For more information on customizing post processor scripts, see the Post reset script category as described in Password Reset extension script categories on page 2197.</td>
</tr>
</tbody>
</table>
Customizing Password Reset processes

Password Reset scripts enable you to customize Password Reset by creating your own credential store, verification, and identification types, and extend them by defining extension scripts. You can also create a custom credential store type, custom verification type, or verification.

Password Reset scripting is available to users with the password_reset_admin role. The easiest way to customize Password Reset is:

1. Create custom types and scripts as described in Password Reset extension script categories on page 2197.

   Extension scripts are example script includes that enable you to extend functionality in a password reset process. The extension script category refers to the specific types of behavior for an extension script (for example, credential store, verification, identification type, or as a post-processor).

2. Follow the configuration steps described in Configure your Password Reset process on page 2136.

3. Select the new types that you created. You can customize the following components:
   - Credential store types: Define new types for how to connect to your credential stores by creating custom workflows for connection and testing. See Create a credential store type for Password Reset on page 2188.
   - Verification types: Define new types for how users are verified. See Create a custom Password Reset verification type on page 2184.
Identification types: Define new types for how users can identify themselves. See Create a custom identification type for Password Reset on page 2187.

Advanced password reset configuration

You can customize the Password Reset and Password Change applications to meet your organization's needs. See Password Reset and Password Change applications for more information. Also see Configure Password Reset properties on page 2164 for a list of properties that control several aspects of password reset.

Add a custom question to the Security Questions verification

To enroll for the 'Security Questions' verification, the user selects several questions and supplies confidential answers that only the user knows. You can add a custom question to the set of questions that are included with the base system.

Role required: password_reset_admin or admin

The base system provides a large set of default questions in all supported languages. Questions are presented to each user in the language that the user requested during login. Creating a custom English language question is a one-step process. To create a custom question in a non-English language, you can use either of the following options:

- Create a custom question in the non-English language.
- Create a custom English-language question plus one or more translations of the question into other languages.

1. Navigate to Password Reset Security Questions.

   **Note:** Each question in the list is presented to users when they enroll for the Password Reset process. The user selects each question to use by providing a confidential answer to the question.

2. Follow this procedure to create a custom question in a single language.

   **Note:** To enter non-English question text, you must request the language when logging in.

   a) On the Password Reset Questions page, click New.
   b) Enter the text in the Question (Translated field) field and then click Submit.

   The question is added to the list of questions that is presented to users when they enroll. No additional steps are needed and you can skip the remaining steps.

3. Follow this procedure to create a custom question in English and the same question in one or more other languages:

   a) Click New, enter English language text in the Question (Translated field) field, and then click Submit.
   b) Create a record in the sys_translated table for the non-English language question. Details appear at Translated Name / Field table and Languages table.

<table>
<thead>
<tr>
<th>Field (translate)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label (translate)</td>
<td>Non-English equivalent of the English text in the Value field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Element</td>
<td>Name of the field in the Password Reset Question [pwd_question] table: question_translated</td>
</tr>
<tr>
<td>ID</td>
<td>Two-character ISO 639.2 code for the language.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that you are adding the translated question to: the Password Reset Question [pwd_question] table.</td>
</tr>
<tr>
<td>Language</td>
<td>Language name.</td>
</tr>
<tr>
<td>Value</td>
<td>English-language question that you added in the Security Questions table.</td>
</tr>
</tbody>
</table>

c) Repeat the process for each language that users might request.

Add a custom header or footer to the user pages for Password Reset

You can specify UI macros that add a header or footer to the pages that end users work in while resetting a password (the Identify, Verify, and Reset pages).

Role required: password_reset_admin

1.  Configure a UI macro for the header or footer: Navigate to  System UI UI Macros , click New, and then enter a meaningful Name and Description.

2.  In the XML text box, enter the macro text. The example macro adds the text "Trust Acme to Deliver!" to the footer of the page that users work in while resetting a password.
3. Select the Active check box and then click Submit.

4. Navigate to Password Reset Processes and select the process to update.

5. On the Advanced tab, click

   ( )

   for the Header UI macro or Footer UI macro and select the macro that you created.

6. Click Save.

7. Verify the appearance of the end-user pages.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If the reset pages are Public Access</td>
<td>On the Password Reset Details tab, click the Public URL.</td>
</tr>
<tr>
<td>If the reset pages are not Public Access</td>
<td>Log in as an end user and request password reset.</td>
</tr>
</tbody>
</table>

Create a Password Reset verification from an existing verification

The Password Reset application includes several example verifications that you can use as they are or as the basis for a custom verification. If the verification types in the base system do not meet your needs, you can create a custom verification type.
Role required: password_reset_admin

**Note:** The Password Reset Windows Application does not support custom verifications.

1. Navigate to Password Reset Verifications and select a verification.
2. If needed, modify the parameters on the Password Reset Verification Parameters tab. The parameters are described in the instructions for the type of verification that you are working on.
3. Click Submit.
4. Each verification type has properties that control the user experience. Review the property settings and update as needed.

Create a custom Password Reset verification type

Each verification in Password Reset is based on the settings for a verification type. If the verification types in the base system do not meet your needs, you can create a custom verification type.

Role required: password_reset_admin or admin

Review the verification types that are provided in the base system to determine whether to create a custom verification type. Then review the verification type components to develop.

1. Navigate to Password Reset Extensions Verification Types.
2. Click New, enter a unique and meaningful Name and Description, and then fill in the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enrollment check</td>
<td>Script that determines whether a user is enrolled for verification. Automatic enrollment requires an enrollment check. If no script is specified when Automatic Enrollment is selected, a default script is provided.</td>
</tr>
<tr>
<td>Automatic enrollment</td>
<td>Select the check box to auto-enroll users. If Automatic enrollment is not selected, then you must provide an enrollment UI macro and enrollment processor script.</td>
</tr>
<tr>
<td>Enrollment UI</td>
<td>Enrollment UI macro that provides the UI for the enrollment.</td>
</tr>
<tr>
<td>Enrollment processor</td>
<td>Enrollment processor script that processes the enrollment.</td>
</tr>
<tr>
<td>Verification UI</td>
<td>Verification UI macro that provides the UI for the verification.</td>
</tr>
<tr>
<td>Verification processor</td>
<td>Verification processor script (extension scripts) that processes the verification.</td>
</tr>
</tbody>
</table>

3. Click Submit.

Create a custom Password Reset verification

Use a verification type in the base system as a template to design a custom verification. The Password Reset Windows Application does not support custom verifications.

Role required: password_reset_admin
Table 1007: Verification types in the base system

<table>
<thead>
<tr>
<th>Verification type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Personal Data Confirmation</td>
<td>Verifies user identity using data from the User [sys_user] table. The user data is displayed to a service desk agent. The agent verifies the data. Enrollment is not required for this type. Recommended for service desk-assisted processes.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The Password Reset Windows Application does not support the Personal Data Confirmation Verification type.</td>
</tr>
<tr>
<td></td>
<td>See <a href="#">Personal data identification types and confirmation type verifications</a> on page 2157.</td>
</tr>
<tr>
<td>Personal Data</td>
<td>Verifies user identity using data from the User [sys_user] table. The user is required to answer questions. Enrollment is not required for this type.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The Password Reset Windows Application allows you to define and use multiple verifications of the Personal Data type.</td>
</tr>
<tr>
<td></td>
<td>See <a href="#">Personal data identification types and confirmation type verifications</a> on page 2157.</td>
</tr>
<tr>
<td>Email Code</td>
<td>When a user requests password reset, the system sends a verification code to the email address in the user profile or to an email address that the user authorized during enrollment. To verify identity, the user then submits the code on the Password Reset Verify page.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The Password Reset Windows Application allows you to define and use multiple verifications of the Email Code type.</td>
</tr>
<tr>
<td></td>
<td>See <a href="#">Personal data identification types and confirmation type verifications</a> on page 2157.</td>
</tr>
<tr>
<td>Google Authenticator</td>
<td>While requesting password reset, the user reads a code from the Google Authenticator app on a device that the user has paired. To verify identity, the user then submits the code on the Password Reset Verify page.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The Password Reset and Password Reset Windows Application support only a single verification of the SMS Code type.</td>
</tr>
<tr>
<td>Verification type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Security Questions | Verifies user identity by presenting personal security questions that the user must answer correctly.  
  **Note:** The Password Reset and Password Reset Windows Application support only a single verification of the Security Questions type.  
  See [Add a custom question to the Security Questions verification](#) on page 2181. |
| SMS Code | When a user requests password reset, the system sends a code to an SMS-capable device that the user has authorized. To verify identity, the user then enters the code on the Password Reset web page.  
  **Note:** The Password Reset and Password Reset Windows Application support only a single verification of the SMS Code type.  
  See [SMS Code Verification type for Password Reset](#) on page 2158. |
| Mock | Not a functional identity verification. Demonstrates how to add a verification type in a Password Reset process.  
  **Note:** The Password Reset Windows Application does not support the Mock verification type.  
  - The enrollment UI macro for this verification gets the user input and returns the entered value in the enrollment processor.  
  - The Password Reset UI macro for this verification gets input from the user and returns the entered value through the verification processor. |

1. Navigate to **Password Reset Extensions Verification Types**.
2. Click New, enter a unique and meaningful Name and Description, and then fill in the form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Create verifications based on one of the verification types in the base system. Password Reset supports the following types. You can create multiple instances of any type.</td>
</tr>
</tbody>
</table>
|                              | • Personal Data Confirmation Verification  
• Personal Data Verification  
• Security Question Verification  
• SMS Code Verification                                                                                                                                                                        |
| The Password Reset Windows Application supports the following types:  
• Personal Data Verification. You can create only a single instance.  
• Security Question Verification. You can create multiple instances.  
• SMS Code Verification. You can create only a single instance.  |
| Order                        | Position of the verification as it appears on the Enrollment form and Password Reset form.                                                                                                                                                         |
| Password Reset Verification  | Parameters used by a verification to configure specific behaviors, like number of questions required to enroll, request expiration time, and columns used. Set parameters for any behavior that should be different from the value that is specified in the Password Reset properties.                               |
| Parameters                   | The available parameters are described separately for each verification type.                                                                                                                                                                             |

3. Click Submit.  
4. Each verification type has properties that control the user experience. Review the property settings and update as needed.

Create a custom identification type for Password Reset

A custom identification type enables the user to enter alternative verification information such as an employee ID while resetting the password.  
Role required: password_reset_admin or admin

1. Navigate to Password Reset Extensions Identification Types.  
2. Click New, enter a unique and meaningful Name and Description, and then fill in the form.  

| Identification field label | Text to display as a label for the Identification field.  
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Identification processor</td>
<td>Identification processor script. Choose an existing script or create your own using the Identification form processor category (extension script).</td>
</tr>
</tbody>
</table>

3. Click Submit.
Create a credential store type for Password Reset

You can create a custom credential store type if the base-system types do not meet your needs.

Role required: password_reset_admin or password_reset_credential_manager

1. Navigate to Password Reset Extensions Credential Store Types.
2. Click New, enter a unique and meaningful Name and Description, and then fill in the form.

**Note:** You may need to configure the form to see the Get user lock state workflow and the Unlock user workflow.

### Table 1008: New credential store fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password Reset workflow</td>
<td>Subflow that defines the credential store processing. Password Reset workflows are available to use as a model. Provide scripts for each of the activities defined for the subflow. For more information about how to create a workflow, see Create a workflow on page 3222. For installed workflows, see Installed with Password Reset on page 2112.</td>
</tr>
<tr>
<td>Connection test workflow</td>
<td>Subflow that defines how to test the connection. Connection test workflows are available to use as a model. If you create a connection test subflow, provide scripts for each of the activities defined for the subflow. For installed workflows, see Installed with Password Reset on page 2112.</td>
</tr>
<tr>
<td>Get user lock state workflow</td>
<td>Subflow that defines how to get the user lock state. Get user lock state workflows are available to use as a model. Provide scripts for each of the activities defined for the subflow. For more on how to create a workflow, see Create a workflow on page 3222. For installed workflows, see Installed with Password Reset on page 2112.</td>
</tr>
<tr>
<td>Unlock user workflow</td>
<td>Subflow that defines how to unlock a user. Unlock user workflows are available to use as a model. If you create a connection test subflow, provide scripts for each of the activities defined for the subflow. For installed workflows, see Installed with Password Reset on page 2112.</td>
</tr>
</tbody>
</table>

3. Click Submit.
Password Reset script includes

The Password Reset plugin installs script includes that implement password reset processes. To enable you to extend functionality, each base-system script include provides extension points that you can use to invoke "extension scripts" that you customized.

The extension script category refers to the specific types of behavior for an extension script (for example, credential store, verification, identification type, or as a post-processor).

'Enrollment check' script includes

All enrollment check script includes take the following parameters and return a boolean indicating whether the user is enrolled for Password Reset.

- params.userId: The sys_id of the user being checked (table: [sys_user]).
- params.verificationId: The sys_id of the verification being checked (table: [pwd_verification]).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdAlwaysEnrolled</td>
<td>Default check of whether a user is enrolled that always returns true.</td>
</tr>
<tr>
<td>PwdMockIsEnrolled</td>
<td>Default check of whether a user is enrolled that always returns true.</td>
</tr>
<tr>
<td>PwdQuestionsEnrollmentCheck</td>
<td>Determines whether a user has enrolled for Password Reset using security question verification.</td>
</tr>
<tr>
<td>PwdSMSEnrollmentCheck</td>
<td>Determines whether a user has enrolled for Password Reset using SMS verification.</td>
</tr>
</tbody>
</table>

'Identification form processor' script includes

Identification form processor script includes provide functionality for extending identification processing.

All identification form processor script includes take the following parameters, and return the sys_id of the user that corresponds to the requested input. If the user was not identified, it returns null.

- params.processId: The sys_id of the calling Password Reset process (table: [pwd_process]).
- param request: The form request object. Fields in the form can be accessed with request.getParameter('<element-id>'). The supported request parameter is sysparm_user_id, the user identifier value entered in the form.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdIdentifyViaEmail</td>
<td>Verifies a user's identity by checking the email address.</td>
</tr>
<tr>
<td>PwdIdentifyViaUsername</td>
<td>Verifies a user's identity by checking the user name.</td>
</tr>
</tbody>
</table>
'Enrollment form processor' script includes

Enrollment form processor script includes provide functionality for extending enrollment form processing. All enrollment form processor script includes take the following parameters, and return a boolean indicating whether the user was successfully enrolled.

- params.userId: The sys_id of the user trying to enroll (table: [sys_user]).
- params.verificationId: The sys_id of the verification used to enroll (table: [pwd_verification]).
- params.enrollmentId: The sys_id of this enrollment process.
- request: The form request object. Fields in the form can be accessed with request.getParameter('<element-id>').

You should add the following information to the state of the enrollment process:

- gs.getSession().putProperty("result.status",status): Whether the user was successfully enrolled.
- gs.getSession().putProperty("result.message",message): An associated message to be returned to the UI, such as a detailed error message.
- gs.getSession().putProperty("result.value",value): A custom value associated with the enrollment.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdEnrollQuestionsProcessor</td>
<td>Handles questions and answers for verification.</td>
</tr>
<tr>
<td>PwdEnrollSampleProcessor</td>
<td>Provides an enrollment processor for sample verification.</td>
</tr>
<tr>
<td>PwdEnrollSMSProcessor</td>
<td>Provides an enrollment processor for SMS verification.</td>
</tr>
</tbody>
</table>

'User account lookup' script includes

User account lookup script includes return the credential store account_id for a given user. The following parameter returns the credential store account_id for a given user.

- params.userId: The sys_id of the user being checked (table: [sys_user]).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdDefaultUserAccountLookup</td>
<td>Provides a default script for user account lookup from a user_id to the account in a credential store. The default mapping is to use the user name as the account name.</td>
</tr>
</tbody>
</table>

'Password generator' script includes

Password generator script includes take the following parameter, and return an auto-generated string password.

- params.credentialStoreId: The sys_id of the calling Password Reset process (table: [pwd_process]).
### 'Verification processor' script includes

If the user identity is verified, the verification processor script includes return `true`.

Verification processor script includes take the following parameters:

- `params.resetRequestId`: The sys_id of the current Password Reset request (table: `[pwd_reset_request]`).
- `params.userId`: The sys_id of the user to be verified (table: `[sys_user]`).
- `params.verificationId`: The sys_id of the verification (table: `[pwd_verification]`).
- `request`: The form request object. Access the fields in the form with `request.getParameter('<element-id>')`.

### Name | Description
--- | ---
PwdDefaultAutoGenPassword | Generates a password from a random word and 4 digits.

### 'Post processor' script includes

Post processor script includes execute custom actions after the Password Reset process has completed.

All post processor script includes take the following parameters.

- `params.resetRequestId`: The sys_id of the current Password Reset request (table: `[pwd_reset_request]`).
- `params.wfSuccess`: A flag indicating whether the workflow completed successfully: `True` if, and only if, successful.

### Name | Description
--- | ---
PwdPostProcessor | Executes actions after the process completes for success, failure, or both conditions.

---

**Example custom scripts for Password Reset**

The example scripts perform a user account lookup and processes an identification form, define a credential store, and create an identification type.
Perform a user account lookup and process an identification form

The main script calls two extension scripts, one to perform the user account lookup, and the other to process the identification form.

```javascript
// User account lookup
var lookupExtensionSysId =
  getExtensionScriptSysId('SampleUserAccountLookupExtension', 'user_account_lookup');
var lookupExtension = new SNC.PwdExtensionPoint(lookupExtensionSysId);

// Setup parameters required for this extension type - userId
var params = new SNC.PwdExtensionPointParameter();
params.userId = 'joe.employee';

// Invoke the extension
var answer = lookupExtension.process(params);
gs.print('user: ' + answer);

// Form processor sample - Identification form processor
var identExtensionSysId =
  getExtensionScriptSysId('SampleIdentificationProcessorExtension', 'identification_form_processor');
var identificationExtension = new SNC.PwdExtensionPoint(identExtensionSysId);

// Setup parameters required for this extension type - processId
var params = new SNC.PwdExtensionPointParameter();
params.processId = 'pwdreq1234';

// Simulate the posted form parameter for the identification processor
var request = new SNC.PwdExtensionPointParameter(); // A real life case will inject its own request object
  request.setParameter('sysparm_user_id', 'joe.employee');

var userIdentity = identificationExtension.processForm(params, request);
gs.print('identity: ' + userIdentity);
```

Define a credential store

The following is an example of an extended process function in the User Account Lookup category used to define a credential store. To create this extension script, go to Password Reset Extensions New extension script and create a new script as described in Create an Extension Script. To configure the User Lookup in a Password Reset process, see Credential Stores.

```xml
<?xml version="1.0" encoding="UTF-8"?>
```
* Returns the credential-store account id for a given user
* @param params.userId The sys-id of the user being checked (table: sys_user)
* @return The credential-store account-id (string) for a given user
*/
process: function(params) {
  return params.userId;
},

type: 'SampleUserAccountLookupExtension'
Create an identification type

The following is an example of an extended processForm function in the Identification Form Processor category that can be used to create an identification type. To create this extension script, go to Password Reset Extensions New extension script and create a new script as described in Create an Extension Script.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<record_update table="sys_script_include">
    <sys_script_include action="INSERT_OR_UPDATE">
        <active>true</active>
        <client_callable>false</client_callable>
        <description>Script that processes an identification form.\nReturns the sys-id of the user that corresponds to the requested input; if no user was found, null should be returned.\n</description>
        <name>SampleIdentificationProcessorExtension</name>
        <script><![CDATA[
var SampleIdentificationProcessorExtension = Class.create();
SampleIdentificationProcessorExtension.prototype = {
    category: 'password_reset.extension.identification_form_processor', // DO NOT REMOVE THIS LINE!

    processForm: function(params, request) {
        var sysparm_user_id = request.getParameter('sysparm_user_id');
        return sysparm_user_id + '_' + params.processId;
    },

    type: 'SampleIdentificationProcessorExtension'
};]]></script>
    </sys_script_include>
</sys_script_include>
```

© 2018 ServiceNow. All rights reserved.
Use the process and processForm extensions

This example shows a script that uses two sample extensions, one process extension and one processForm extension.

```java
// User account lookup var lookupExtensionSysId =
  getExtensionScriptSysId('SampleUserAccountLookupExtension','user_account_lookup');
var lookupExtension =new SNC.PwdExtensionPoint(lookupExtensionSysId);

// Setup parameters required for this extension type - userId
var params =new SNC.PwdExtensionPointParameter();
params.userId='joe.employee';

// Invoke the extension var answer = lookupExtension.process(params);
gs.print('user: '+ answer);

//Form processor sample - Identification form processor
var identExtensionSysId =
  getExtensionScriptSysId('SampleIdentificationProcessorExtension','identification_form_processor');
var identificationExtension =new SNC.PwdExtensionPoint(identExtensionSysId);

// Setup parameters required for this extension type - processId
var params =new SNC.PwdExtensionPointParameter();
params.processId='pwdreq1234';

// Simulate the posted form parameter for the indentification processor
var request =new SNC.PwdExtensionPointParameter();// A real life case will inject it's own request object
request.setParameter('sysparm_user_id','joe.employee');

var userIdentity = identificationExtension.processForm(params, request);
gs.print('identity: '+ userIdentity);
```

```
function getExtensionScriptSysId(scriptName, category){
var result;var gr =new GlideRecord('sys_script_include');
gr.addQuery('name', scriptName);
gr.addQuery('script','CONTAINS','category: \"password_reset.extension.\"');
gr.addQuery('script','CONTAINS',category +\"\"');
gr.query();

if(gr.next()){
    result = gr.getValue('sys_id');
}
return result;}
```
<?xml version="1.0" encoding="UTF-8"?>
<record_update
    table="sys_script_include">
    <sys_script_include
        action="INSERT_OR_UPDATE">
        <active>true</active>
        <client_callable>false</client_callable>
        <description>
            Simple account lookup that returns the supplied user id
        </description>
        <name>SampleUserAccountLookupExtension</name>
        <script><![CDATA[
            var SampleUserAccountLookupExtension = Class.create();
            SampleUserAccountLookupExtension.prototype={
                category:'password_reset.extension.user_account_lookup',// DO NOT REMOVE THIS LINE!
                process:function(params){return params.userId;},
                type:'SampleUserAccountLookupExtension'
            }
        ]]]>
    </sys_script_include>
</record_update>

<?xml version="1.0" encoding="UTF-8"?>
<record_update
    table="sys_script_include">
    <sys_script_include
        action="INSERT_OR_UPDATE">
        <active>true</active>
        <client_callable>false</client_callable>
        <description>
            Script that processes an identification form.
            Returns the sys-id of the user that corresponds to the requested input; if no user was found, null should be returned.
        </description>
        <name>SampleIdentificationProcessorExtension</name>
        <script><![CDATA[
            var SampleIdentificationProcessorExtension = Class.create();
            SampleIdentificationProcessorExtension.prototype={
                category:'password_reset.extension.identification_form_processor',// DO NOT REMOVE THIS LINE!
                processForm:function(params){return params.user;},
            }
        ]]]>
    </sys_script_include>
</record_update>
**Password Reset extension script categories**

You can use a custom extension script to extend Password Reset functionality for credential store, verification, or identification types.

---

**Note:** To use a script include as an extension script, you must set it to Active status.

---

**Password Reset extension script categories**

Extension scripts must specify a category that indicates which script include is being extended, for example, category: 'password_reset.extension.enrollment_check'. The ServiceNow platform installs several scripts in each category. A script in the Enrollment check category can perform the enrollment check for a verification. Detailed information on each extension script appears in *Password Reset extension scripts* on page 2198.
<table>
<thead>
<tr>
<th>Extension script category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enrollment check</td>
<td>Defines how to check that a user is enrolled in the Password Reset process. Scripts of this category are available in the Enrollment check field when you define a verification type (Password Reset Verification Type form).</td>
</tr>
<tr>
<td>Enrollment form processor</td>
<td>Defines how an enrollment form is processed (if automatic enrollment is not configured). Scripts of this category are available in the Enrollment form processor field when you define a verification type (Password Reset Verification Type form).</td>
</tr>
<tr>
<td>Identification form processor</td>
<td>Defines how a user identification is processed. Scripts of this category are available in the Identification processor field when you define a verification type (Password Reset Identification Type form).</td>
</tr>
<tr>
<td>Password generator</td>
<td>Defines how to generate a password. Scripts of this category are available in the Auto generate password field when you configure a credential store (Password Reset Credential Store Type form).</td>
</tr>
<tr>
<td>Post reset script</td>
<td>Executes at the end of a Password Reset process. Scripts of this category are available in the Post reset script field when you configure a process (Password Reset Process form).</td>
</tr>
<tr>
<td>User account lookup</td>
<td>Defines how to look up a user account. Scripts of this category are available in the User account lookup field when you configure a credential store (Password Reset Credential Store form).</td>
</tr>
<tr>
<td>Verification form processor</td>
<td>Defines how a verification form is processed. Scripts of this category are available in the Verification processor field when you define a verification type (Password Reset Verification Type form).</td>
</tr>
</tbody>
</table>

**Password Reset extension scripts**

Extension scripts allow you to extend Password Reset functionality in credential store, verification, or identification types.

**Password Reset extension script includes**

Each script include is associated with a specific category, which is available in the appropriate field of a Password Reset form.

**Note:** Create extension scripts only from the Password Reset Extension Script form (Password Reset Extensions New extension script). Extension scripts are special purpose script includes that are not created in the System Definition Script Includes interface. To use a script include as an extension script, you must set it to Active status.
'Enrollment Check' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enrollment Check</td>
<td>Checks whether a user is enrolled for a given verification.</td>
<td>process(params)</td>
<td>Parameters:</td>
<td>Returns: (boolean)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• params.userId - The sys_id of the user to check (table: sys_user).</td>
<td>true, if the user is enrolled in the specified verification; otherwise, false.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• params.verificationId - The sys_id of the verification to check (table: pwd_verification).</td>
<td></td>
</tr>
</tbody>
</table>

This Enrollment Check example signals that the user is enrolled if both expected parameters are supplied. The code would be contained in the Script field of an extension script named SampleEnrollmentCheck:

```javascript
var SampleEnrollmentCheck = Class.create();
SampleEnrollmentCheck.prototype = {
  category: 'password_reset.extension.enrollment_check', // DO NOT REMOVE THIS LINE!

  /**
   * Returns boolean telling whether the user is enrolled.
   * This sample returns true if both parameters are supplied, false otherwise
   *
   * @param params.userId         The sys-id of the user being checked (table: sys_user)
   * @param params.verificationId The sys-id of the verification being checked (table: pwd_verification)
   * @return Boolean indicating whether the user is enrolled into the specified verification
   */
  process: function (params) {
    return (params.userId && params.verificationId) ? true : false;
  },

type: 'SampleEnrollmentCheck'};
```
**'Enrollment Form Processor' script include category**

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enrollment Form Processor</td>
<td>Checks whether all necessary information has been collected from the user. Stores the information so it can be used for verification when the user resets their password.</td>
<td>process(params)</td>
<td>Parameters:</td>
<td>Returns: (boolean) true, if the user is enrolled in the specified verification; otherwise, false.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• params.resetRequestId - The sys_id of the current Password Reset request (table: pwd_reset_request).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• params.userId - The sys_id of the user to be verified (table: sys_user).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• params.verificationId - The sys_id of the verification to be processed (table: pwd_verification).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• request - The form request object. Fields in the form can be accessed with request.getParameter('&lt;element-id&gt;').</td>
<td></td>
</tr>
</tbody>
</table>

The following information should be added to the state of the enrollment process:

- `gs.getSession().putProperty("result.status",status)` - Whether the user was successfully enrolled.
- `gs.getSession().putProperty("result.message",message)` - An associated message to be returned to the UI, such as a detailed error message.
- `gs.getSession().putProperty("result.value",value)` - A custom value associated with the enrollment.
This example processes an enrollment form submission successfully if the user-submitted response was success. The code would be contained in the Script field of an extension script named SampleEnrollmentProcessor:

```javascript
var SampleEnrollmentProcessor = Class.create();
SampleEnrollmentProcessor.prototype = {
    category: 'password_reset.extension.enrollment_form_processor', // DO NOT REMOVE THIS LINE!

    processForm: function (params, request) {
        var verificationId = params.verificationId;
        var sampleInput = request.getParameter('sample_input');

        if (gs.nil(verificationId) || (sampleInput != 'success')) { return false; }

        var gr = new GlideRecord('sys_user');
        gr.get(params.userId);
        gs.print('User: ' + gr.getValue('user_name') + ' successfully enrolled');
        return true;
    }
};
```

The following information should be added to the state of the enrollment process:
- `gs.getSession().putProperty("result.status",status)` - whether the user was successfully enrolled
- `gs.getSession().putProperty("result.message",message)` - an associated message to be returned to the UI. Eg. a detailed error message
- `gs.getSession().putProperty("result.value",value)` - custom value associated with the enrollment
'Identification Form Processor' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identification Form Processor</td>
<td>Processes an identification form request.</td>
<td>processForm(params, request)</td>
<td>params: processId - The sys_id of the calling Password Reset process (table: pwd_process). request - The form request object. Fields in the form can be accessed with request.getParameter('element-id'). Use request.getParameter('sysparm_user_id') to get the user ID that was entered into the form.</td>
<td>Returns: the sys_id of the user that corresponds to the requested input. Returns null, if no user was found.</td>
</tr>
</tbody>
</table>

This example attempts to identify the user within the sys_user table given a user name submitted from the identification form. The code would be contained in the Script field of an extension script named PwdIdentifyViaUsername:

```javascript
var PwdIdentifyViaUsername = Class. create();
PwdIdentifyViaUsername.prototype = {
  category: 'password_reset.extension.identification_form_processor', // DO NOT REMOVE THIS LINE!
  initialize: function() {},

  processForm: function(params, request) {
    var processId = params.processId; // The sys_id of the calling Password Reset process (table: pwd_process)
    var request = request; // The form request object. Fields in the form can be accessed with request.getParameter('element-id')
    var sysparm_user_id = request.getParameter('sysparm_user_id'); // The user identifier value entered in the form
    gr = new GlideRecord('sys_user'); // The sys_id of the user that corresponds to the requested input; if no user was found, null should be returned
    gr.addQuery('user_name', sysparm_user_id);
  }
};
```

© 2018 ServiceNow. All rights reserved. 2202
gr. query ( ) ; if ( !gr. next ( ) ) { return null ; } return gr. sys_id ; }

    
    type : 'PwdIdentifyViaUsername' }

'Password Generator' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password Generator</td>
<td>Returns an auto-generated password.</td>
<td>process(params)</td>
<td>Parameters:</td>
<td>Returns: (String) an auto-generated password.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• params.processId - The sys_id of the calling Password Reset process (table: pwd_process).</td>
<td></td>
</tr>
</tbody>
</table>

This example randomly generates a password from a base word and numbers. The base word is selected depending on the credential store. The code would be contained in the Script field of an extension script named SamplePasswordGenerator:

var SamplePasswordGenerator = Class. create ( ) ;
SamplePasswordGenerator. prototype = {
    category : 'password_reset.extension.password_generator' , // DO NOT REMOVE THIS LINE!

    /**********
    * Returns an auto-generated string password.
    * This sample randomly generates 4 digits to add to the password.
    *
    * @param params.credentialStoreId The sys_id of the target Password Reset credential store to generate
    * a password for (table: pwd_cred_store)
    * @return An auto-generated string password
    **********/
    process : function (params) { var basePassword ;

    var gr = new GlideRecord ( 'pwd_cred_store' ) ;
gr. addQuery ( 'name' , 'Local ServiceNow Instance' ) ;
gr. query ( ) ; if (gr. next ( ) ) { if (params. credentialStoreId == gr. getValue ( 'sys_id' ) )
    basePassword = "Password" ; else
    basePassword = "Dorwssap" ; } return this. generateSimple (basePassword ) ; } ,

    generateSimple : function (base) { var pwd = base ; var numbers = '0123456789' ; var length = 4 ;

    for ( var i = 0 , n = numbers. length ; i < length ; i ++ ) {
        pwd += numbers. charAt (Math. floor (Math. random ( ) * n ) + 1 ) ;
    }
return pwd ; } ,

    type : 'SamplePasswordGenerator' } ;
'Post Reset' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Post Reset</td>
<td>Performs additional operations after the completion of the Password Reset process.</td>
<td>process(params)</td>
<td>Parameters:</td>
<td>Returns: void</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• params.resetRequestId</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- The sys_id of the calling Password Reset process (table: pwd_process).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• params.wfSuccess</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- A flag indicating whether the workflow completed successfully. True if, and only if, successful.</td>
<td></td>
</tr>
</tbody>
</table>

This example adds failed reset requests to the system log. The code would be contained in the Script field for an extension script named PwdPostProcessor:

```javascript
var PwdPostProcessor = Class.create();

PwdPostProcessor.prototype = {
    category : 'password_reset.extension.post_reset_script', // DO NOT REMOVE THIS LINE!

    initialize : function () {},

    //**********
    // Execute custom actions after the Password Reset process has completed.
    // @param params.resetRequestId The sys_id of the current Password Reset request (table: pwd_reset_request)
    // @param params.wfSuccess A flag indicating if the workflow completed successfully.
    // True if (and only if) successful.
    // @return no return value
    //**********/
    process : function (params) {
        if (!params.wfSuccess) {
            gs.log('[PwdPostProcessor.process] failure post processing for request [' + params.resetRequestId + ']');
        }

        // We could place actions here that we always want executed
        return;
    },

    type : 'PwdPostProcessor'
};
```

© 2018 ServiceNow. All rights reserved.
'User Account Lookup' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
</table>
| User Account Lookup    | Gets the credential store account ID for a given user. | process(params) | Parameters:  
  - params.userId - The sys_id of the user being checked (table: sys_user). | Returns: (String) the credential store account ID for the given user. |

This example gets the credential store account for a user. This code would be contained in the Script field of an extension script named SampleUserAccountLookupExtension:

```javascript
var SampleUserAccountLookupExtension = Class.create();
SampleUserAccountLookupExtension.prototype = {
  category: 'password_reset.extension.user_account_lookup', // DO NOT REMOVE THIS LINE!

  process: function (params) {
    return params.userId;
  },

  type: 'SampleUserAccountLookupExtension'
};
```

© 2018 ServiceNow. All rights reserved.
### 'Verification Form Processor' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Verification Form Processor</td>
<td>Processes a verification form request and indicates whether the user was verified or not.</td>
<td>processForm(params, request)</td>
<td>Parameters:</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• params.resetRequestId - The sys_id of the current Password Reset request (table: pwd_reset_request).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• params.userId - The sys_id of the user to be verified (table: sys_user).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• params.verificationId - The sys_id of the verification to be processed (table: pwd_verification).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• request - The form request object. Fields in the form can be accessed with request.getParameter('&lt;element-id&gt;').</td>
<td>Returns: (boolean) true, if the user is verified; otherwise, false.</td>
</tr>
</tbody>
</table>

This example shows a verification processor that returns true only if the user sent ok in the input field; otherwise, it returns false. The code would be contained in the Script field of an extension script named SampleVerificationFormProcessor:

```javascript
var SampleVerificationFormProcessor = Class.create();
SampleVerificationFormProcessor.prototype = {
    category: 'password_reset.extension.verification_form_processor', // DO NOT REMOVE THIS LINE!

    processForm: function(params, request)
    {
        // This is a sample verification processor returns true only if the user sent "ok" in the input field;
        // otherwise, it returns false.

        // @param params.resetRequestId The sys_id of the current Password Reset request (table: pwd_reset_request)
        // @param params.userId The sys_id of the user trying to be verified (table: sys_user)
        // @param params.verificationId The sys_id of the verification to be processed (table: pwd_verification)
    }
};
```
* @param request               The form request object. Fields in the form
can be accessed with
  * request.getParameter('<element-id>')
* @return Boolean indicating whether the user is successfully verified
**********/
processForm : function (params , request ) { if (request. getParameter
  ('sysparm_simple_input' ) == "ok" ) return true ; else return false ; } ,
type : 'SampleVerificationFormProcessor' } ;

Create a Password Reset extension script

Create extension scripts only from the Password Reset Extension Script form. Do not create extension
scripts in the System Definition Script Includes interface.

Role required: password_reset_admin or admin

__________________________
Note: To use a script include as an extension script, you must set it to Active status.
__________________________

1. Navigate to Password Reset Extensions New extension script.
2. Enter a name in the Extension script name field.
   Use CamelCase to construct a name without spaces, for example, PwdEnrollmentCustom.
3. Select an Extension script category.
   • Enrollment check
   • Enrollment form processor
   • Identification form processor
   • Password generator
   • User account lookup
   • Verification form processor
4. Click Submit.
   A new instance of the script include for the selected category opens.
5. Edit the script by providing an implementation in the body of the process or processForm function,
   depending on the script category. You can add additional functions as long as the process or
   processForm function accepts the defined parameters and returns the expected results.

__________________________
Note: Do not edit or delete the Category declaration.
__________________________
6. Click Update.

Service desk: Reset a password or unlock a user account

In a service desk-assisted Password Reset process, service desk agents with the password_reset_service_desk role reset user passwords—users cannot reset passwords. Watch a video example of service desk agents resetting passwords: Resetting User Passwords (Video).

Role required: password_reset_admin or password_reset_service_desk

**Note:**

- You must set the Public access property to enable the service desk-assisted process. See Configure your Password Reset process on page 2136.
- You can perform this activity on a mobile device.

1. Navigate to Password Reset Service Desk.
2. Select a user and the Password Reset process to use.
3. Click Verify Identity.
4. On the Verify Identity form, enter the answers that the user provides and then click Continue.
   If the user identity is verified, the Reset Password form displays identity verification and status of the account lock.
5. Perform one of the following actions.
• If the user is not locked, the form displays the Reset password button. Enter the new password and click Reset password.
• If the user is locked, the form displays the Reset password and Unlock account buttons. You can enter a new password and click Reset password to reset the password and unlock the account. If the Enable account unlock check box is selected for the password process, you can unlock the account without resetting the password by clicking Unlock account.

6. To reset the password for a different user, you must first navigate out of the Service Desk and then navigate to Password Reset Service Desk.

View user requests for password reset

The Reset Requests module displays the status of each password reset request from the Password Reset Request table [pwd_reset_request].

Role required: password_reset_admin or password_reset_service_desk

Navigate to Password Reset Reset Requests.

Table 1009: Password Reset request fields

<table>
<thead>
<tr>
<th>Field</th>

</tbody>
</table>

### Unblock a Password Reset user

If a user is manually banned or is flagged as exceeding max attempts, the user can be blocked (not allowed to use the Password Reset application). You can unblock a blocked user.

**Role required:** password_reset_admin or password_reset_service_desk

**Blocking events include:**

- The user exceeded the limit for the number of failed password attempts.
- The most recent password reset occurred before the wait time required until the next reset.
- The user failed to provide the correct information while attempting to reset the password.

If the number of blocked or locked users exceeds the limit within a defined time interval, it triggers a system log event. You can configure the number of blocked or locked users and the time interval required to generate the log event by setting the password_reset.activity_monitor.incident_threshold and password_reset.activity_monitor.incident_window properties.

1. To view the list of blocked users, navigate to Password Reset Blocked Users.
2. To unblock a self-service user:
   a) Navigate to Password Reset Blocked Users.
   b) Select a user from the list.
c) Select Delete on the Actions on selected rows list.

3. To unblock a user whose password was reset by a service desk agent:
   If a user is manually banned or flagged as exceeding max attempts, the user can be blocked (not allowed to use the Password Reset application). When the password reset request is made through self-service, the user is unblocked when the password is successfully reset.

   In contrast, service desk agents are allowed any number of retries. The max_attempt_reached limit does not apply and the Blocked status for the user is not reset after the password is reset. As a result, after you successfully reset a user password, you must unblock the user manually.

   If the user is not unblocked manually, then the system resets the blocked state only when the max_attempt_window time period elapses and the user tries to reset the password using self-service.

   a) After you successfully reset a user password, navigate to Password Reset Blocked Users .
   b) Change the Blocked setting for the user from true to false.

Integrate Password Reset with a Service Portal widget

You can enable a Password Reset process in a Service Portal page by adding a widget that opens the password reset pages inside the portal.

Role required: admin or sp_admin

1. On the Service Portal Designer for the portal, create a new page — the page where the user will perform the password reset process.

2. On the Widget tab, under Layouts, select the 12-column layout and drop it onto the page.

3. Drop the Pwd reset widget into the 12-column layout and then save the page.
   The three tabs of the password reset process appear in the layout.

4. In the "Reset my password" link on the login page for the portal, specify the URL of the new password reset page. The URL must include one required parameter and may contain one optional parameter:
   • Required: sysparm_show_custom_header_footer=false. This parameter disables the native header and footer feature of the password reset page.
   • Optional: sysparm_redirect_url=<portalName>?id=<pageName>. This parameter specifies the page to go to after a successful reset — typically the login page for the portal.

   For example, https://server.acme.com/acme_community?id=password_reset_page&sysparm_show_custom_header_footer=false&sysparm_redirect_url=acme_community?id=communities_login

Integrate Password Reset with a CMS integration

You can configure a site in the ServiceNow content management (CMS) application to define a single-site access point that includes the Password Reset service. For example, you can create an employee self-service site that provides Password Reset service.

Role required: content_admin

Each Password Reset process requires a separate CMS page.

1. Navigate to Content Management Specialty Content iFrames and create an iFrame record.

2. Go to Content Management Sites and create a site that has no login page.
3. Go to Content Management Pages and create a password reset page.
4. Enter the name of the site that you created in the Content site field (Password Reset self-service in the example).
5. Right-click the form header and click Save.
6. Click the Edit Page related link and then click Add content.
7. In the Content Blocks section, select the iFrame that you created. Add more content as needed.
8. Click Update.

Password Reset and Password Change reports and logs

The Password Reset application provides several tools for monitoring and troubleshooting password reset activities.

Users with the password_reset_credential_manager or password_reset_admin role can view the status of password reset activities, identify potential security threats, and monitor for compliance with password security policies.
The Reset Requests, Activity Log, and Blocked Users modules are useful for monitoring password reset activities and for troubleshooting password reset issues. They also provide access to more detailed information than is provided on the Overview module.

To make room for new data, the system periodically purges the data that is used for password reset monitoring and reporting.

**Password Reset Overview module**

The Password Reset Overview module displays reports on password reset and password change activities. Users with the `password_reset_admin` role can customize the layout of the reports that appear in the Overview module.

<table>
<thead>
<tr>

</tbody>
</table>
Password Reset activity log

The activity log (Password Reset Activity Log) provides detailed information that you can use to troubleshoot and to generate reports on password reset metrics. Information contained in the activity log is stored in the Password Reset activity log [pwd_reset_activity] table.

You must have the password_reset_credential_manager or password_reset_admin role to view the log.

Password Reset event log

The event log is a valuable resource for troubleshooting. On the Start menu, click Programs (or All Programs) Administrative Tools Event Viewer.

If the log does not appear, then, on the Windows Logs menu, click Applications Service Logs.

You must have the admin role to view the log.

To write to the Password Reset event log

Edit the DebugFlag registry key entry at: Computer > HKEY_LOCAL_MACHINE > SOFTWARE > Microsoft > Windows > CurrentVersion > Authentication > Credential Providers > {B6EFF27D-C1C4-481F-B81B-F3547C47D58A}

By default, the key is set to 0. Set the key to 1 to write log entries to the ServiceNowPwdReset event log.

You must have the password_reset_credential_manager or password_reset_admin role to write to the log.

Password Reset blocked user notification

You can receive email notifications when the number of users that are blocked or locked exceeds the password blocked threshold. Notifications can alert you to suspicious activities. The default threshold is 10.

To subscribe: Add an email notification device or modify an existing device and then subscribe to the Password Reset-Activity Monitor Lockout notification.

You must have the password_reset_credential_manager or password_reset_admin role to subscribe.

Schedule for purging Password Reset data

To make room for new data, the system periodically purges the data that is used for password reset monitoring and reporting. Information contained in reports and monitoring tools could change dramatically immediately after a data purge. Contact ServiceNow Technical Support to modify purge intervals.
Table 1011: Purge intervals for Password Reset tables

<table>
<thead>

User guide: Resetting your password

Your experience might differ, but the self-service process is a typical process that you might follow to reset your password.

Example experience of the self-service process

Your experience might differ, but here:

1. On the login page, you click the Forgot Password? link to start the process.
2. The Identify page opens and you enter your identifying information (typically username or email address). The example includes the default Google reCAPTCHA security feature:

![ServiceNow Identify Page](image)

3. On the Verify page, you verify your identity by providing information that proves that you are who you say you are. The admin configured the method of verification and can require multiple verifications. In the example, the admin has configured the Security Question verification. You must answer a question to prove your identity. (Earlier, while enrolling for the password reset process, you selected...
the question and provided a secure private answer.) Other possible verifications require you to enter a code number that was sent to a mobile device by SMS text, through the Google Authenticator app, or by email.

4. The system checks the credential store to verify your identity and then displays, on the Reset page, the new password.
Enroll in the Password Reset program

Some organizations auto-enroll users in a Password Reset program. Your organization could offer end users the option to enroll for one or more methods of verifying identity when resetting the password. End users can enroll for most Password Reset programs on a mobile device.

End users might enroll for any combination of the following methods:

**Verify your identity using security questions (QA verification)**

- To enroll, you choose multiple questions that only you can answer (like the name of your first pet) and then supply answers. The system stores your answers securely.
- Later, when you want to reset your password, the system presents one or more of the questions. You answer the questions to verify your identity. See
Verify your identity using an SMS code (SMS verification)

- To enroll, you authorize a device like a cellular phone for SMS verification.
- Later, when you want to reset your password, you get a code number on the device and enter the code on the web page to verify your identity.

Verify your identity using an Emailed code

- To enroll, you authorize one or more email addresses.
- Later, when you want to reset your password, the system sends a code number to the email address. You then enter the code on the web page to verify your identity.

Verify your identity using the Google Authenticator app

- You enroll on a computer that you normally use to access the instance (you use Google Authenticator to reset your password, but cannot use Google Authenticator to enroll for Password Reset Windows Application.). After you have enrolled, you load the Google Authenticator app on one or more devices and then authorize the devices for Google Authenticator verification.
- Later, when you want to reset your password, read the Google Authenticator code on your device and then enter the code on the web page to verify your identity.

Users: Enroll in the Password Reset program using questions and answers

Your organization might ask you to select the questions to use when resetting your password. You select the questions and provide answers that only you know. At another time, when you reset your password, your answers verify your identity. You can enroll on a mobile device.

Role required: none

The list of questions is presented in the language that you requested while logging in.

1. Navigate to Password Reset Enroll and then click the QA Verification tab.
   If you are required to enroll for the QA verification method, then the tab is marked with an asterisk (*).
2. For each Question field, select a question from the list and then enter the answer in the Answer field.
   Repeat the process until the required number of Question and Answer fields are filled in.
3. Click Submit.
4. Enroll for an extra identity verification using any of the other methods that your organization offers.
   See:
   - Users: Enroll in the Password Reset program using SMS codes on page 2220
   - Users: Enroll in the Password Reset program using Google Authenticator on page 2221
   - Users: Enroll in the Password Reset program using emailed codes on page 2220
Users: Enroll in the Password Reset program using SMS codes

To prove that you are who you say you are (verify your identity) while resetting your password, you can use a code number (the SMS code) that was delivered to your mobile phone or device. You can enroll on a mobile device.

Role required: none

1. Navigate to Password Reset Enroll and then click the SMS Verification tab.
   If your organization requires you to enroll for the SMS verification method, then the tab is marked with an asterisk (*).

2. If you had previously added an SMS-enabled device to your Password Reset profile, the device is listed. To add and verify a device, click Add Device and then follow the instructions. Provide a meaningful Name for each device. Repeat the process for as many devices as you need.

3. After you verify each device, select the Authorized check box for each device that you expect to use to change or reset your password.

   **Note:** You can deauthorize a device at any time by clearing the Authorized check box.

4. Click Submit.

5. Enroll for an additional identity verification using any of the other methods that your organization offers. See:
   - Users: Enroll in the Password Reset program using questions and answers on page 2219
   - Users: Enroll in the Password Reset program using Google Authenticator on page 2221
   - Users: Enroll in the Password Reset program using emailed codes on page 2220

Users: Enroll in the Password Reset program using emailed codes

To prove that you are who you say you are (verify your identity) while resetting your password, you enter a code that was sent to your email address. You can enroll for this program on a mobile device.

Role required: none

During this enrollment process, you add the email address, the system sends you a code so you can verify the address, and then you authorize the address to be used for the Password Reset process. By default, the system sends the code to the email address that is associated with your ServiceNow profile. You can send the code to additional email addresses.

1. Navigate to Password Reset Enroll and then click the Email Verification tab.
   If your organization requires you to enroll for the Email verification method, then the tab is marked with an asterisk (*). Email addresses that were added previously are listed on the tab.

2. Click Add Email, enter the Email address and a meaningful Email name to associate with the address and then click Add Email. Repeat the process for as many email addresses as you need.

3. On the Email Verification tab, for each email that should receive Password Reset codes, click Verify. The system sends an email message with a code and then displays the Verify the Email Address pop-up.

4. On the Verify the Email Address pop-up, enter the code and click Verify. If this process fails, click Send a New Code to send a different code and try again.

5. After you verify each email address, select the Authorized check box for each address that you expect to use to change or reset your password.

   **Note:** To deauthorize an email address so that it does not receive Password Reset codes, clear the Authorized check box.
6. Click Submit.
7. Enroll for an additional identity verification using any of the other methods that your organization offers. See:
   • Users: Enroll in the Password Reset program using questions and answers on page 2219
   • Users: Enroll in the Password Reset program using SMS codes on page 2220
   • Users: Enroll in the Password Reset program using Google Authenticator on page 2221

Users: Enroll in the Password Reset program using Google Authenticator

To prove that you are who you say you are (verify your identity) while resetting your password, you get a code number from Google Authenticator on your cell phone or mobile device and then enter the code on the Password Reset web page. If you already paired a device (for example, to log in to the ServiceNow instance), you can skip this enrollment process.

Role required: none

You cannot enroll for the Password Reset program on a mobile device.

1. Navigate to Password Reset Enroll and then click the Google Authenticator Verification tab.

   **Note:** If your organization requires you to enroll for the Google Authenticator verification method, then the tab is marked with an asterisk (*).

2. Download the Google Authenticator app to your device.
3. Open the app and then use the device to scan the QR code on the tab.
4. When the device generates a code, enter the code in the text box and then click Pair Device.
5. Click Submit.
6. If the system displays a success message, click Submit. If the system displays a failure message, enter the code again, click Pair Device, and then click Submit.

   When you submit the enrollment, the tab displays the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generate New QR Code</td>
<td>Enables you to pair a device with a new code. This option is useful if you have a new device. Existing multi-factor authentication data is replaced with the new data.</td>
</tr>
<tr>
<td>Disable Multi-factor Authentication</td>
<td>Deletes existing multi-factor authentication data. The Google Authenticator verification is no longer available.</td>
</tr>
</tbody>
</table>

7. Enroll for an additional identity verification using any of the other methods that your organization offers. See:
   • Users: Enroll in the Password Reset program using questions and answers on page 2219
   • Users: Enroll in the Password Reset program using SMS codes on page 2220
   • Users: Enroll in the Password Reset program using emailed codes on page 2220

Users: Reset your password on Windows systems

If your organization uses the Password Reset Windows Application, you can reset your password directly from your Windows login screen.
Role required: none

1. Start your computer or press Ctrl+Alt+Delete to go to the Windows login screen.
2. Click the Forgot Password? link. (Your administrator may configure different text for the link.)
3. On the Identify page, enter the requested information and then click Next.
4. On the Verify page, enter the requested information, and then click Next.

**Note:** You might be given the option to choose the method used to verify your identity.

If your identity is verified, the Reset page displays whether you were successfully verified and the state of your account (either locked or unlocked).

5. Based on your locked/unlocked state, perform one of the following actions:
   - If your account is not locked, the page displays the Reset Password button. Enter and reenter the new password and then click Reset Password.
   - If your account is locked, the page displays the Reset Password and Unlock Account buttons.
     - You can enter a new password and click Reset password to reset the password and unlock the account.
     - If your administrator has selected Enable account unlock for the password process, you can unlock the account without resetting the password by clicking Unlock account.

**Response templates**

Response templates (formerly known as templated snippets) are reusable messages that can be copied to any case form that meets the specified conditions. You can use response templates to provide quick and consistent messages to users, allowing agents to resolve cases faster and more efficiently.

**Assign response template roles**

The roles of response template administrator, writer, and reader are installed when you activate the response templates plugin. Before you begin using response templates, you must assign these roles to the appropriate roles, groups, or users in your application.

- *Assign response template roles* on page 2226
For example, in the HR Service Delivery application, users with the HR administrator role are assigned the response template administrator role, users with the HR manager role are assigned the response template writer role, and users with the HR case writer role are assigned the response template reader role.

**How to use response templates**

Response template writers can create response templates. Each template is associated with a table that is an extension of the Task [task] table. The template can be configured to include variables pulled from that table. You can also specify the conditions that a case must meet for the template to be available for use.

- *Create or modify a response template* on page 2226

Response template readers can then copy response template content to any field on a form that meets the specified conditions.

For example, in the HR Service Delivery application, HR case writers with the response template reader role can copy response template content to any field on an HR case form that meets the specified conditions. See *Copy a response template to an HR case* for an HR-specific example.

**Escalating payroll discrepancy cases**

An enterprise HR organization using the HR Service Delivery application wants to create a template to use when responding to payroll discrepancy cases that need to be escalated.

A user with the response template writer role, such as an HR manager, can create the template to escalate payroll discrepancy cases. The template can be associated with the HR Payroll Case [sn_hr_core_case_payroll] table, and a condition can be set to filter on cases that match the appropriate HR service called Payroll Discrepancy. In the template body, the text to be used can be provided and variables added, such as the subject person name in the salutation.

After the template is created, users with the response template reader role, such as HR case writers, can copy the template content and use it in their responses to employees when working on payroll discrepancy cases.

**Activation information**

To use response templates in your application, you must *activate response templates*. For information on what components are installed with the feature, see *Components installed with response templates* on page 2225.

**Activate response templates**

You can activate response templates (formerly known as templated snippets) [com.sn_templated_snip] if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Role required: admin

Response templates activate these related plugins if they are not already active.
Table 1012: Plugins for response templates

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scoped Application Restricted Caller Access</td>
<td>Allows scoped applications to restrict access to public tables and script includes.</td>
</tr>
</tbody>
</table>

1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
   - If the plugin has optional features that depend on other plugins, those plugins are listed under Some files will not be loaded because these plugins are inactive. The optional features are not installed until the listed plugins are installed (before or after the installation of the current plugin).
4. If available, select the Load demo data check box.
   - Some plugins include demo data—Sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good practice when you first activate the plugin on a development or test instance.
   - You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.
5. Click Activate.

Components installed with response templates

Several types of components are installed with activation of the response templates (formerly known as templated snippets) plugin, including tables and user roles.

Note: To view all other components installed with this plugin, see the Application Files table. For instructions, see Find components installed with an application.

Demo data is available for this feature.

Roles installed

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Templated snippets administrator</td>
<td>Grants access to scoped administration of the templated snippets feature.</td>

</tr>
</tbody>
</table>

### Assign response template roles

You must assign the roles of response template (formerly known as templated snippet) administrator, writer, and reader to the appropriate roles, groups, or users in your application.

**Role required:** sn_templated_snip.template_snippet_admin

The following roles are installed when you activate the response templates plugin. See *Components installed with response templates* on page 2225 for more information.

- Response template administrator [sn_templated_snip.template_snippet_admin]
- Response template writer [sn_templated_snip.template_snippet_writer]
- Response template reader [sn_templated_snip.template_snippet_reader]

You must assign these roles to the appropriate roles, groups, or users in your application. For example, in the HR Service Delivery application, users with the HR administrator role are assigned the response template administrator role, users with the HR manager role are assigned the response template writer role, and users with the HR case writer role are assigned the response template reader role.

- To assign a response template role to another role.
  See *Add a role to an existing role.*
- To assign a response template role to a group.
  See *Assign a role to a group.*
- To assign a response template role to a user.
  See *Assign a role to a user.*

### Create or modify a response template

As a response template writer, you can create or modify a response template (formerly known as a templated snippet). Each template is associated with a table that is an extension of the Task [task] table, and the template can be configured to include variables pulled from the table. You can also specify the conditions that a case must meet for the template to be available for use.

**Role required:** sn_templated_snip.template_snippet_writer

1. Navigate to System Definition Response template configuration.
2. Click New or open a record.
3. Fill in the fields on the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the response template.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Table</td>
<td>Name of the table that the response template is associated with.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The table must be an extension of the Task [task] table.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions under which the response template is made available for use.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The conditions available to use are dependent on the table you select.</td>
</tr>
<tr>
<td>Template body</td>
<td>Text of the response template.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Rich text is not supported with response templates.</td>
</tr>
<tr>
<td>Select variables</td>
<td>Variables that can be added to the template body.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The variables available to use are dependent on the table you select.</td>
</tr>
</tbody>
</table>

The following GIF shows an example of an HR manager in the HR Service Delivery application creating a response template to escalate payroll discrepancy cases. The template is associated with the HR Payroll Case [sn_hr_core_case_payroll] table, and a condition is set to filter on cases that match the Payroll Discrepancy HR service. The template text is pasted into the body, and then a variable for the subject person is added to the salutation.
4. Click Submit or Update.

You can copy response template content to any field on a form that meets the specified conditions.

The following GIF shows an example of an HR case writer in the HR Service Delivery application opening a payroll discrepancy case and copying a payroll discrepancy escalation template to the comments field in the HR case form for the employee to read.

Self-service

The Self-Service application gives supported end users a clean, simple front end to their IT support organization.

By default, the Self-Service application provides access to common actions, such as viewing your homepage, accessing the Service Catalog, viewing knowledge articles, working with incidents, and taking surveys.

Service catalog requests

This page contains links to content on service catalog requests.

Add new request items

Use ServiceNow's web-based interface to add new items to a request.

Roles required: Only an administrator or a user with the catalog_admin role can add a new item to a submitted request.

Modifying a request does not resubmit it to the approval process.

1. Navigate to Service Catalog Open Records Requests and open an existing request.
2. Click Add New Item.
3. In the dialog box that appears, choose an item and a quantity to add.
4. Click OK.

Amazon EC2 instance request from the Service Catalog

Users can request the provisioning and deletion of virtual computers (Linux or Windows) in the Amazon EC2 virtual computing environment through the ServiceNow Service Catalog.

The Amazon EC2 offering requires the purchase and activation of ServiceNow Orchestration Automaton.

Request an instance

Request the provisioning of a new Amazon EC2 instance through the service catalog.

1. Navigate to Self-Service Service Catalog
2. Select Amazon EC2 Instance from the Request Application Infrastructure category.
Figure 413: EC2 Service Catalog 2

3. Select the operating system, the type of instance (Large or Small), and the number of instances requested.
   See the specifications for Large and Small instances in Amazon EC2 Instance Types.

4. Type a reason for the request.
5. Click Order Now to order the instance.

The Order Status form appears, summarizing the request. A status bar tracks the progress of the approval and provisioning of the EC2 instance.

Figure 414: EC2 Service Catalog
Terminate an instance

Shut down an Amazon EC2 instance through the service catalog.

1. Navigate to Service Catalog Routine Changes Terminate Amazon EC2 Instance.
   
   A list appears displaying the instances that are assigned to you.

2. Select an instance from the list and click Order.
   
   This list does not support multi-line selection, and there is no undo feature.

Check-out redirect property

A property called One-step checkout redirect (glide.vm.checkout_redirect) controls the view presented to virtual machine requesters in the service catalog.

By default, this property is set to false, which redirects the view to the Order Status form when the requester clicks Order Now. When this property is set to true, ServiceNow redirects the requester to his or her My Virtual Assets portal. This property is located in Cloud Management Administration Properties.

Delete request items

Use ServiceNow's web-based interface to delete items from a request.

All users can delete items from their own requests any time prior to delivery. Modifying a request does not resubmit it to the approval process.

1. Navigate to Service Catalog Open Records Requests and open an existing request.

2. In the Requested Items related list, select the check box beside the item to delete.
3. In the Actions choice list, select Delete.
   ServiceNow recalculates the price and delivery date for the order.

Place a request

Use ServiceNow's web-based interface for ordering predefined goods and services.

1. Navigate to Self-Service Service Catalog.
   The default catalog view organizes items in categories and subcategories.

```
[Image: Default catalog view]
```

2. Select an item to order.
   **Note:** Some items are order guides, which combine related items for easier ordering.
   For example, an order guide called New Employee Hire presents a list of items that new
   employees typically receive (desk, phone, computer, email account). After you select the items
   you want to order, the order guide requests the information required and shows a separate
   time to delivery for each item ordered.

   The order screen requests any additional information that's needed, such as the requester's name or
   location and the date the item is needed. It also displays the item's delivery time after approval.
3. Enter complete and accurate information to expedite your order.
4. Order any other items required.
5. Click Order Now when the order is complete.

ServiceNow displays a confirmation screen for your order:
You can view the order's progress in the Stage column.

**Note:** It may be useful to note the order number for future reference.

ServiceNow automatically notifies the approvers if approval is required and creates work orders to fulfill the order according to your organization's process. For example, if you order a new notebook computer, the purchasing group might receive a work order to order the computer, and the desktop services group might receive a work order to configure the new computer and deliver it to your office after it arrives.

**Create incidents and change requests from a requested item**

You can quickly open an incident or a change request from a requested item. It also maintains a relationship between the requested item, and its associated incidents or change requests.

The administrator must enable the Create Change and Create Incident UI actions for the Requested Item [sc_req_item] table. The administrator must set the Active field to true when editing these UI actions.
Role required: itil

1. Navigate to Self-Service Requested Items.
2. Open a requested item.
3. Click the Additional actions menu icon and select Create Change or Create Incident.

View request status

Use ServiceNow’s web-based interface to view the status of a request.

1. Navigate to Self-Service Requested Items.
2. Click your order number to view details.
3. View the order’s progress in the Stage field.

Customize homepages

If you are assigned at least one role in the system, you can create a customized homepage that you can see when you log in.

The content on your homepage comes from a variety of sources, such as graphs and charts generated from a report, application modules, a service catalog category, the scrolling news widget, which is the News knowledge category.

1. Navigate to Self-Service Homepage.
2. Add any item to the homepage by clicking the add content icon or the Add content link at the top.
   A window will open that lets you select from a number of different homepage items you can add. Some items pertain to specific features and applications, such as CMS content blocks and the Work Management dispatch map. So the list of items varies depending on what is active on your system.
3. Reposition elements on your homepage by dragging and dropping them to a new location.
4. To remove a homepage item, click the [X] on the right side of the item's header.

Delete custom homepages

You can delete any of your custom homepages if you no longer need them.

1. Click the Delete page link at the bottom of the homepage.
2. Click Ok to confirm the deletion.

How Help the Help Desk identifies devices

Help the Help Desk uses a predefined series of queries to identify and update existing CIs in the CMDB or to create a new CI if no match is found.

These queries attempt to match devices using the three criteria listed here, in this order. Updates to an existing CI require only a single match as the list is evaluated. For example, if a device's name has changed, but the MAC address is the same, the CI with the matching MAC address is updated.

- Serial number in the cmdb_ci_computer table#
- MAC address in the cmdb_ci_network_adapter table
- Computer name in the cmdb_ci_computer table

**Note:** Discovery Identifiers are incompatible with Help the Help Desk queries.

Script Include

The script include CIIdentifierForHelpDesk provides the logic for updating existing CIs or creating a new CI if no matching device exists in the CMDB. Do not modify this script. Errors introduced into this script can result in update failures or in new CIs being created for every device found.

Running Help the Help Desk

Help the Help Desk is a tool that enables users to populate the CMDB automatically with information about their Windows computer. Help the Help Desk is a small Web application that downloads and runs locally, using a login script to gather information such as serial number, computer name, disk configuration, network configuration, installed software, memory, and much more.
To detect all system software successfully on a 64-bit machine, make sure to run the Help the Help Desk script from a 64-bit browser. A 64-bit browser can detect both 64-bit and 32-bit software, but a 32-bit browser cannot detect 64-bit software.

1. On your instance, navigate to Self Service > Help the Help Desk.
2. Click Start the Scan to Help the Help Desk.
   You are prompted to run or save the discovery.hta script.
3. If your browser is Internet Explorer, run the script. If you are using any other browser, click Save and save the script to the local machine.
4. To execute the saved script, double click the file.
   The script runs a series of WMI queries to gather information about the Windows machine. When it is done, the data is sent back to your ServiceNow instance and used to populate the configuration database (CMDB).

Service Delegation

Service delegation is the ability to designate other users to view and interact with approvals and tasks assigned or sent to you, and to receive copies of all email notifications sent to you.

---

**Note:** Users to whom you delegate responsibility see all pending tasks and approvals regardless of the delegation period.

**Note:** Delegation does not cascade. When a user acts as a delegate for another user, the delegate cannot in turn delegate to a third party. The original delegate is the only user who receives assignments and notifications.

---

Add the Delegates related list to a user profile

To delegate approvals and tasks to another user, configure your user profile form to display the Delegates related list.

Role required: personalize_form or admin.

1. Navigate to Self-Service My Profile.
2. On the form context menu, navigate to Configure Related Lists, and then add the Delegate->User related list.

The Delegates related list displays at the bottom of the user profile form.

Delegate approvals and tasks to another user

If a user is out of the office, that user can delegate responsibilities to other users for a period of time.

1. Navigate to Self Service My Profile.
2. In the Delegates related list, click New.
Figure 420: Delegates Related List

If the list is not visible, configure the form to add the Delegate->User related list.

3. Select the Delegate (User).
4. Set the period of time.
5. Specify the responsibilities the delegate will assume using the following check boxes. You can delegate:
   - Approvals: The delegate can approve items on your behalf.
   - Assignments: The delegate can view and work on tasks assigned to you.
   - CC Notifications: The delegate receives a copy of Change Control email notifications sent to you, except those marked as Meeting Invitation.
**Note:** If the Approvals check box is selected but CC Notifications is not, the delegate does not receive change-related approvals.

- **Meeting Invitations:** The delegate receives a copy of email notifications sent of the type Meeting Invitation.

**Note:** You must select an active user as your delegate. The instance only delegates to active users.

A sample delegation looks like this:

![Delegation Options](image)

**Figure 421: Delegation Options**

**Note:** If your delegate gets email notifications, they will be the same email notifications sent to you. The delegate may be confused to see "Incident assigned to you" emails, so make sure they know they are a delegate.

---

**Service administration**

Configure settings for services that support business applications or the platform.

**Assessments**

Use assessments to evaluate, score, and rank records from any table in the system.
You can assess projects that executives want to evaluate for effective management, or rate and compare a vendor’s goods and services. Use assessments to send custom questionnaires to selected users or write scripts that query the database directly. You can then compare assessment results for the records using unique graphical views designed to highlight key performance information. Share an assessment between ServiceNow instances by using update sets, which is the recommended way to move assessment data from one instance to another.

The Assessments plugin is enabled by default.

You can only edit an assessment that has the same application scope as that of your current session.

### Installed with Assessments

Several types of components are installed with activation of Assessments.

- Demo data is available for assessments and surveys.
- Vendor Performance offers an additional set of vendor assessment demo data.

<td>Assessment Metric Type [asmt_metric_type]</td>
<td>Generates the following business rules if an assessment administrator creates or updates a metric type:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Business rule called Auto business rule for Assessments, which monitors the Table selected for the metric type. When someone adds a record that meets the metric type conditions, this business rule generates an assessable record. If someone changes the metric type's Table or conditions, the Create Business Rule on Remote table business rule updates the automatic business rule script to reflect the changes.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Business rule called Auto deletion rule for Assessments, which prevents users from deleting a record on the metric type's Table if the record is associated to metric or category results. If the record has no associated results and a user deletes it, this business rule deletes any associated assessable records.</td>
</tr>
</tbody>
</table>

The Create Business Rule on Remote table business rule generates automatic business rules only for metric types with Evaluation method set to Assessment.

| Update records that match filter          | Metric Category [asmt_metric_category]      | Automatically performs these tasks when an assessment administrator edits the Filter field:  
• Associates the category to assessable records that meet the filter conditions.  
• Disassociates the category from assessable records that do not meet the filter conditions.  
The Assessable records related list reflects these changes when the record is saved. |
| Update scheduled job on schedule change    | Assessment Metric Type [asmt_metric_type]   | Updates the survey creation scheduled job to reflect schedule period changes. |
| Validate mandatory and not applicable     | Assessment Metric [asmt_metric]             | Sets the Mandatory and Allow not applicable fields to false if the metric method is Script. If the metric data type is Percentage, the business rule sets the Allow not applicable field to false. |
| Verify min/max                            | Assessment Metric [asmt_metric]             | Ensures that the Min is greater than or equal to zero and less than the Max. Sets the Min to 0 and the Max to 1 if the data type is Checkbox or Yes/No. |
Assessment administrator tasks

Before you create assessments, assign the assessment_admin role to the appropriate users in your organization and determine your objectives for the assessment.

Decide which sets of records in the system to assess, which themes you are interested in, and which traits to measure. Consider your organization's options for obtaining the data to compare. If you intend to use assessment questionnaires, consider which people can answer the questions.

Assessment terminology

Assessment admins use several terms when working with assessments.

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metric type</td>
<td>A metric type defines a set of records to evaluate, such as vendors, projects, or employees.</td>
</tr>
<tr>
<td>Assessable record</td>
<td>An assessable record links a record to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees. You define sets of assessable records when you create metric types.</td>
</tr>
<tr>
<td>Metric category</td>
<td>A metric category represents a theme for evaluating assessable records. Categories contain one or more individual metrics, which define specific traits or values that comprise the theme. Examples of categories include overall vendor performance or quality of delivery services. You can also set filter conditions that control which assessable records to evaluate for the metrics in a category.</td>
</tr>
<tr>
<td>Term</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Metric</td>
<td>A <em>metric</em> is a trait or value used to evaluate assessable records. A metric can measure subjective values in an assessment questionnaire, or gather objective values in a database query run by a script. Examples of metrics include perceived courtesy of sales representatives or number of incidents per vendor.</td>
</tr>
<tr>
<td>Category user</td>
<td>A <em>category user</em> is a person who knows about a specific category. One person can be a category user for multiple categories. Examples of category users include a vendor manager who oversees all purchasing operations or a supervisor of a sales team.</td>
</tr>
<tr>
<td>Stakeholder</td>
<td>A <em>stakeholder</em> is a category user who knows about a specific assessable record. Examples of stakeholders include a vendor manager who coordinates purchases from Amazon or a supervisor of a sales team who manages a specific employee.</td>
</tr>
</tbody>
</table>
| Assessment instance| An *assessment instance* represents one assessment questionnaire assigned to one user. The system generates a new assessment instance for each assigned user when:  
  - The assessment generation scheduled job runs.  
  - An assessment administrator creates an on-demand assessment. |
| Scorecard          | A *scorecard* provides a visual illustration of an assessable record's performance, based on assessment results. Use scorecards to view a variety of data summaries for one assessable record and to compare the ratings with other assessable records.                                                      |
| Decision matrix    | A *decision matrix* is a graph with two axes that plots the assessment results for multiple assessable records. Use decision matrixes to determine the relative standing of assessable records in selected categories.                                                                                       |
| Bubble chart       | A *bubble chart* is a graph with three axes that plots the assessment results for multiple assessable records. Use bubble charts to determine the relative standing of assessable records in selected categories, with an emphasis on one category.                                                                    |
Assessment roles

The Assessments application requires certain roles to perform assessment tasks. No role is required to take assessment questionnaires that are assigned to you.

<table>
<thead>
<tr>
<th>Role Title</th>
<th>Role Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment administrator</td>
<td>assessment_admin</td>
<td>Assessment administrators set up assessments. They know which records to evaluate, the criteria on which to evaluate the records, and who to assign assessments to.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> By default, users with the assessment_admin role have limited system rights and might not have access to all source records to assess. When planning assessments, grant additional roles to assessment administrators as needed. For example, to create and manage vendor assessments, the assessment administrator must also have the vendor_manager role, which grants access to the Company table and other relevant tables.</td>
</tr>
<tr>
<td>ITIL user</td>
<td>itil</td>
<td>ITIL users perform basic technician operations in the system. In the Assessments application, they have read access to the Assessable Record table.</td>
</tr>
<tr>
<td>Administrator</td>
<td>admin</td>
<td>Administrators have access to all aspects of the assessment process. Only administrators can set up assessment schedules.</td>
</tr>
</tbody>
</table>

Assessment methods

The available methods are Assessment, for non-scripted metrics, and Script, for scripted metrics. Each method serves a different function and can be used with certain data types.
Use the Method field to specify how to use the metric.

**Assessment method**

Metrics with the Method set to Assessment are called non-scripted metrics. Use each non-scripted metric to define a question for assessment questionnaires. Non-scripted metrics are useful if you want to obtain subjective data like personal opinions.

You can use the Assessment method with these Data type values:

- Attachment
- Checkbox
- Choice
- Date
- Date/Time
- Likert Scale
- Number
- Percentage
- String
- Template
- Yes/No

**Script method**

Metrics with the Method set to Script are called scripted metrics. Use each scripted metric to define a custom script for database queries. Scripted metrics are useful if your system contains reliable data for the traits you want to evaluate.

You can use the Script method with these Data type values:

- Duration
- Number
- Percentage

Use the Script field to write JavaScript code. By default, the field contains information about available variables and an example, which you can use as the basis of your script or replace entirely:

```
// The following variables are available:
// actual_result: the script sets the actual value for this metric to this variable
// scaled_result: the script sets the scaled value (used in calculations) for this metric to this variable

// For example:
var gr = new GlideRecord('cmdb_ci');
gr.addquery('manufacturer', primary);
gr.query();
actual_result = gr.getRowcount();
if (actual_result > 100) scaled_result = 5;
else scaled_result = 1;
```

**Figure 422: Metric form script field**
You must use the following variables in your script:

- **primary**: Input variable used to access the sys_id of the record being assessed.
- **actual_result**: Output variable that contains the actual value for this metric. The system uses this variable to populate the Actual value field on the Metric Result form. For each actual_result, you must specify a corresponding scaled_result value.
- **scaled_result**: Output variable that contains a numerical scaled value to represent an actual value. The system uses this variable to populate the Scaled value field on the Metric Result form. Ensure the scaled values you specify are between or equal to the Min and Max values for the metric. The Scale definition field determines how the system uses the scaled value. A scale definition of Low means smaller numbers are better, such as for a metric that measures the number of incidents for a vendor. High means larger numbers are better, such as for a metric that measures user satisfaction on a scale of one to five.

**Script example**

The metric Number of active devices uses the script pictured below. The primary variable is used to find CIs that are associated to the vendor record being assessed. The script retrieves the actual_result, the number of CIs associated to the vendor, then calculates the correct scaled_result. The script uses a series of scaled values, from the Min to the Max value, to represent actual values. Because the Scale definition is set to High, the greatest scaled values are best, meaning a vendor associated to the most CIs scores highest. The system stores the actual and scaled values in a metric result record for the vendor.
Data types for assessments

Metric data types have functions that depend on the method that you select.

Table 1015: Assessment data types

**Assessment generation**

In the Assessments application, administrators or assessment administrators can trigger the system to generate scheduled assessments or on-demand assessments when all the prerequisite steps are completed.

An assessment administrator must publish the metric type to enable assessment generation.

The system performs these tasks when it generates assessments:

- Creates assessment questionnaires from non-scripted metrics and assigns the questionnaires to users. When users complete their assigned questionnaires, the system uses their responses to calculate assessment results.
- Runs scripted metrics from each category to query the database and calculate assessment results.

Each time the system generates assessments, it creates some or all of the following components. Consider having an administrator set a schedule for recurring data cleanup, as the system can potentially generate a considerable amount of assessment data.

- **Assessment group**
- **Assessment instances**
- **Assessment results**
Assessment groups

An assessment group is a container for assessment instances and assessment results generated in a single occurrence.

The system generates an assessment group every time the scheduled job runs or the API is called, when there is at least one assessable record associated to a category in the type. You can find assessment group records in Assessments Assessment Groups.

The Assessment Group form displays the group Number, the associated Metric type, and these related lists:

- **Assessment Instances**: Lists all assessment instances within this group. There may be no records in this related list. The system does not generate assessment instances if there are only scripted metrics for the type.
- **Metric Results**: Lists all metric results for this group. There may be no records in this related list initially. The system generates metric results immediately for scripted metrics, but not for non-scripted metrics, which appear as questions on assessments and require user response. The system dynamically updates the records in this list as users complete assessment questionnaires.
- **Assessment Category Results**: Lists all category results for this group. There may be no records in this related list initially. The system generates category results immediately if there are only scripted metrics in a category. Otherwise, the system does not calculate category results until a user completes an assessment questionnaire that contains questions from the category.

**Note**: To prevent the loss of important assessment data, you cannot delete an assessment group if it contains any assessment instances, metric results, or category results.

Create an assessment category

Assessment categories are used with assessment metric types and assessment metrics to generate bubble charts.

**Role required**: it_pps_admin

The Demand Management application comes with the Demand assessment metric type, five assessment metric categories, and assessment metrics. From the Assessment Categories section of the application menu, you can modify existing assessment categories and create ones.

1. Navigate to Project Administration Settings Assessments Metric Categories.
2. Click New to create a new record.
3. Fill in the fields and click Submit.

### Table 1017: Default demand management assessment categories

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Size</td>
<td>Assesses demand size relative to the size of other demands.</td>
</tr>
<tr>
<td>Strategic Alignment</td>
<td>Assesses how closely the demand aligns with strategic goals of the organization compared to other demands.</td>
</tr>
<tr>
<td>Risk</td>
<td>Assesses demand risks compared to other demands.</td>
</tr>
<tr>
<td>ROI</td>
<td>Assesses demand return on investment compared to other demands.</td>
</tr>
</tbody>
</table>
Assessment metric categories

In the Assessments application, a metric category represents a theme for evaluating assessable records in a given metric type.

Each category has a numeric weight value to indicate its importance relative to other categories. Within a category, records called metrics are the traits or values used to evaluate assessable records. For example, there are many categories within the Vendor metric type, including Support Rating, which contains metrics that measure the quality of vendors’ customer support services. Assessable records must be associated to categories to be eligible for evaluation. Assessment administrators create categories and manage which assessable records each category is associated to.

Weight categories and metrics

When you create a metric category or metric, you must specify a weight, a numeric value that indicates the importance of the category or metric relative to other categories and metrics.

The greater the weight value, the more important the item is. The system uses weight values in assessment result calculations. Consider these recommendations when choosing weight values.

• Determine a weighting scale and use it consistently. In general, use a scale with a small numeric range. A standard 1-10 scale is usually appropriate, where 1 is least and 10 most important. Understand that increasing the maximum value of a weighting scale impacts all related result calculations.
• Use the same weighting scale for metric categories and metrics. Though there is no limitation, consider using the same or very similar weighting scales for both categories and metrics to make it easier to remember which values to use. A scale of 1-10 is an effective and simple weighting system, but may not be suitable for all organizations.

Note: If you do not want to use weighting, set the same weight value for all categories and metrics. The default weight value is 10.

Create a category for assessable records

After you create a metric type and generate assessable records, create categories for the themes you are interested in using to evaluate the assessable records.

Role required: none

1. Navigate to Assessments Metric Definition Categories.
2. Click New to create a new metric category and then complete the Metric Category form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the metric category. The name appears on assessment questionnaires.</td>
</tr>
<tr>
<td>Type</td>
<td>[Required] Metric type this category is used for. Metrics in this category can be used to evaluate assessable records for the type you select. This field becomes read-only after you save the record.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Create stakeholders</td>
<td>Check box that enables (selected) or disables (cleared) automatic stakeholder creation for this category. When the check box is selected, the system makes all associated category users stakeholders for each assessable record associated to this category. This saves the time required to manually create stakeholders. For more information, see Create Stakeholders Automatically. Existing stakeholders are not impacted if you clear the check box.</td>
</tr>
<tr>
<td>Table</td>
<td>[Read-Only] Table that contains the records to evaluate with metrics in this category. The system automatically populates this field with the same table as the metric type selected. The table does not appear in the field until you save the form. This field is visible depending on whether a Type is selected.</td>
</tr>
<tr>
<td>Weight</td>
<td>[Required] Numerical value that represents the importance of this category relative to other categories. A greater value indicates greater importance. For more information, see weight categories and metrics. The default value is 10.</td>
</tr>
<tr>
<td>Scoring type</td>
<td>Scoring method for an attestation category. This field appears only when the metric type is an attestation with a Scoring type of Percent. Use this field to configure different scoring types for specific attestation categories. Possible selections are: • Percent: Attestation score as a weighted percentage of correct answers for scored questions. • All or nothing: All answers for attestation type questions must be correct or the score is zero for the entire category.</td>
</tr>
<tr>
<td>Total metrics</td>
<td>[Read-Only] Number of metrics associated to this category.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Filter</td>
<td>Filter conditions that assessable records must meet to be evaluated using metrics in this category. The filter operates on fields on the selected table. If you specify a filter condition, the system automatically associates matching assessable records to the category when you save the record. If you change the filter conditions, the system removes and creates assessable record associations as needed. The system also deletes stakeholders for assessable records it disassociates. The system does not remove assessable record associations created by users, even if the assessable records do not match the filter conditions. This field is visible only when a Type is selected.</td>
</tr>
<tr>
<td>Description</td>
<td>Descriptive information about the category that appears on assessment questionnaires.</td>
</tr>
<tr>
<td>Roles</td>
<td>Only those users with the specified roles can perform the assessment for this category. If no role is specified, then users with any role can perform the assessment for this category.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If the Roles property does not appear on the form, ask your admin to add the property.</td>
</tr>
<tr>
<td>Details</td>
<td>Text field containing an HTML editor. Use this field to present important details about this category to assessment recipients. Details can include formatted lists, images, videos, or links to external websites. You may need to configure the form to see this field.</td>
</tr>
<tr>
<td>Related Lists</td>
<td>Assessment Metrics: All metrics associated to this category. There must be at least one metric associated to the category to use any assessments with the category.</td>
</tr>
<tr>
<td></td>
<td>Assessable records: All assessable records associated to this category. There must be at least one assessable record associated to the category to use any assessments with the category. This related list is hidden if the Evaluation method is Attestation.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Users</td>
<td>All users associated to this category. There must be at least one category user to create scheduled assessments using metrics in this category. This related list is available only when the associated metric type has schedule type set to Scheduled. Category users are not a part of the on-demand assessment process.</td>
</tr>
</tbody>
</table>

Assessable record associations

Only the assessable records associated to a category can be evaluated using metrics in that category. Manage which assessable records you evaluate for each category by creating and removing the associations.

Manage which assessable records you evaluate for each category by creating and removing the associations.

**Note:** You can also manage which categories an assessable record is associated to using the Assessable Record form.

Manage an assessable record automatically

You must define at least one filter condition in the Metric Category form to automatically associate assessable records with the category.

Role required: assessment_admin or admin

1. Navigate to Assessments Metric Definition Categories.
2. Open a category.
3. In the Filter field, create a condition statement that defines the records you want to associate to this category. The available fields are from the table defined for the metric type.
   
   For example, for a category in the Vendor type, you might create the condition `[Country] [is] [Germany]`. Metrics in the category will be used only to evaluate vendors that meet this condition.
4. Save the record.
   
   The system associates this category to all assessable records that match the filter condition. As the system generates new assessable records that match the condition, it associates them to this category. If you change the filter condition, the system removes and creates assessable record associations, as appropriate. Note the following:

   - The system does not remove assessable record associations created manually, even if the assessable records do not match the filter conditions.
   - The system deletes any related stakeholders, if applicable, when it disassociates assessable records from a category.
   - The system does not create or remove assessable record associations if the related source records change. For example, consider the previous example in which all assessable records for vendors based in Germany were associated to a particular category. Assume that a user changes the Country of one of the vendor records from Germany to Canada. The system does not disassociate the related assessable record from the category, even though it no longer matches the filter condition.

   **Note:** To configure the system to automatically associate all assessable records from a metric type to a category, use the same category condition as the metric type condition. For example,
if the Vendor metric type has the condition [Vendor] [is] [true], create the same condition for the category. If the metric type does not have a condition specified, you can use the category condition [Sys ID] [is not empty], which includes all records from any table.

Manage an assessable record manually

You can manually create and remove assessable record associations for a category using a related list on the Metric Category form.

Role required: assessment_admin or admin

Keep in mind that when you disassociate an assessable record from a category, the system deletes any related stakeholders, if applicable, and you can no longer evaluate the assessable record using metrics in that category.

1. Navigate to Assessments Metric Definition Categories.
2. Open a category.
3. In the Assessable records related list, click Edit and use the slushbucket to add or remove one or more assessable records.

Only assessable records associated to this category's metric type are available for selection.

Delete a category

When you delete a category, the system also deletes the associated category users and stakeholders.

Role required: assessment_admin or admin

1. Navigate to Assessments Metric Definition Categories.
   Alternatively, navigate to a record that contains a related list for categories.
2. Open a record from the list.
3. On the Metric Category form, click Delete.
4. Click OK when asked to confirm the action.

The system displays messages at the top of the form describing the actions taken.

Assessment metrics

In the Assessments application, a metric is a trait or value used to evaluate assessable records.

Depending on the metric method, a metric can be used as either of the following:

- A question on assessment questionnaires, to obtain a subjective value such as how much people enjoy using each cell phone offered in the service catalog.
- A script that queries the database, to obtain an objective value such as the number of incidents related to each cell phone.

Each metric is associated to one metric category and can be used to evaluate assessable records for that category only. For example, the Support Rating category contains metrics that measure the quality of vendors' customer support services. One metric addresses the quality of product documentation. Others address the strength of the user community, self-service options, online training, and other support services. Each metric has a numeric weight value to indicate its importance relative to other metrics in the same category.

Assessment administrators can create and administer metrics and metric templates, which define reusable sets of answer options for metrics used as assessment questions. If you decide to use metric templates, you may want to create them before you create metrics.

Note: Changes to assessment metrics and metric templates are reflected in assessment questionnaires and results, even if users have saved responses already. If possible, avoid
changing the original meaning of a metric question, the data type, or any metric templates in use by existing assessments.

Create a metric for a category

After you create a category, create metrics you can use to evaluate the assessable records for that category.

Role required: assessment_admin or admin

When you create metrics, consider the focus of the category and what characteristics you want to measure for the items you will assess. If you plan to use metrics for assessment questionnaires, you may want to review tips for writing good questions.

1. Navigate in one of the following ways:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessments Metric Definition Categories</td>
<td>Open a category, and locate the Assessment Metrics related list. This is the suggested navigation path, as the system links metrics to the category from which they are created.</td>
</tr>
</tbody>
</table>

**Assessments Metric Definition Metrics**

2. Click New.

3. Fill in the fields, as appropriate.

Table 1018: Assessment Metric form

<table>
<thead>

<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Order  | Numeric value that determines the order of the metric question on assessment questionnaires, relative to other metric questions in the same category. The metric with the smallest order value appears as the first question in the category section. By default, the order is 100. For more information about questionnaire layout, see *Complete Assessment Questionnaires.*  
**Note:** It does not matter which order value you use for metrics with the Script method, as they do not appear on questionnaires. |
| Active | Check box that determines whether this metric is used to gather assessment results. If a non-scripted metric (Assessment method) is inactive, the question does not appear on assessment questionnaires generated after the metric becomes inactive. If a scripted metric (Script method) is inactive, the script does not run. |
| Mandatory | Check box that makes the metric question mandatory (selected) or optional (cleared) on assessment questionnaires. Users cannot submit questionnaires until they provide valid responses to all mandatory questions, which display a red *field status indicator.*  
This field is visible only if the Method is Assessment, the Depends on field is empty, and the data type is not Checkbox. |
<table>
<thead>
<tr>

The default available values are Asset Management, CMDB, Core, Cost Management, Procurement, and Software Asset Management. If the Method is Script, select a plugin. This field is visible only if the Method is Script.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> An administrator may need to add more choices of plugins to the field.</td>
</tr>
<tr>
<td>Scale definition</td>
<td>Setting that determines whether lesser or greater numerical values equate to a good score in assessment result calculations. Select Low if lesser numerical values are better, such as for a metric that measures the number of incidents for a vendor. Select High if greater numerical values are better, such as for a metric that measures user satisfaction on a scale of one to five. The default value is High.</td>
</tr>
<tr>
<td></td>
<td>This field is visible and required unless the Data type is Date, Date/Time, or String. The results for these data types are not included in results calculations.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> For information about how to set the scale definition for data types that do not require you to set a numerical value, see Data Types.</td>
</tr>
<tr>
<td>Min</td>
<td>Lowest numerical value to be used as an answer option on assessments or as a scaled value in a scripted metric. This field is visible and required only if certain data types are selected. If the data type is Choice or Likert Scale, this field is read-only and is set automatically based on the smallest metric definition Value.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max</td>
<td>Highest numerical value to be used as an answer option or scaled value. This field is visible and required only if certain data types are selected. If the data type is Choice or Likert Scale, this field is read-only and is set automatically based on the largest metric definition Value.</td>
</tr>
<tr>
<td>Script</td>
<td>Script that obtains the desired system information. This field is visible and required only if the Method is Script.</td>
</tr>
<tr>
<td>Related List</td>
<td>Assessment Metric Definitions: Lists all metric definitions, which appear as answer options for questions on assessment questionnaires. Click New to create a new metric definition. This related list is available only if the Data type is Choice or Likert Scale.</td>
</tr>
</tbody>
</table>

4. Save the record.
   When you create a Choice or Likert Scale question, reopen the Assessment Metric form after you submit it to create a metric definition. If you distribute a questionnaire without creating the answers for questions with these data types, recipients are unable to answer the questions. If the questions are mandatory, the recipients are unable to submit their questionnaires.

### Create a metric definition

Metrics with Choice or Likert Scale data types must have metric definitions defined to represent answer options on questionnaires.

Role required: assessment_admin or admin

Each metric definition appears as one answer option for a question on an assessment questionnaire. For example, a metric for the question "How satisfied are you with the quality of this vendor?" has three metric definitions to create these answer options: Very satisfied, Somewhat satisfied, and Not at all satisfied.

1. Open the metric record you want to edit.
2. In the Assessment Metric Definitions related list, click New to create a new metric definition.
3. Fill in the fields:
   - Display: Enter the text you want to appear as the answer option.
   - Value: Enter the numeric value, greater than or equal to zero, to which the answer option equates. Values are used to calculate metric results. When you view assessment questions, metric definitions appear in order from least to greatest value.
     - The system sets the minimum and maximum values according to the metric definition values.
     - To prevent reporting confusion, no two metric definitions for a given metric should have the same Value.
4. Click Submit.
Change the order of an answer

By default, the order of answer options is established when a question is created with a data type of Choice or Likert Scale.

Role required: assessment_admin or admin

The system creates an Order value for each choice based on where it appears in the original list when you submit it. This order corresponds to the Value setting you give the answer. The choice with the lowest order number appears first, and the choice with the highest order number appears last. If you want to reconfigure the order of the answer options, you must do so by editing the Order field and not the Value field.

The Order column is hidden in the base system.

To edit these records, configure the Assessment Metric Definitions related list in the question record to show the Order column, and then edit the order number in the list. The Value setting remain the same for each answer option after reorganization.

Metric types and assessable records

In the Assessments application, assessment administrators create and administer metric types and assessable records.

A metric type defines a set of records an organization wants to evaluate, such as vendors, projects, or employees. For each type, the system generates unique assessable records that link the type to records that need to be evaluated, such as the individual records for the vendors Amazon and Intel. There may be multiple assessable records for the same source record if the source record meets the criteria for more than one type. For example, you might want to evaluate a record on the Company table, such as Intel, as a vendor and as a manufacturer, with different categories and metrics.

For configuration suggestions, see Assessment administrator tasks on page 2259.

Assessable records

An assessable record links a source record you want to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees.

You use assessments to evaluate the assessable record. The system generates assessable records from the source records that match the table and conditions set on the Assessment Metric Type form. You evaluate the assessable records with metric categories and metrics, which define traits and values to assess. For metric types with the On demand schedule type, you can generate on-demand assessments from the Assessable Record form. This method of assessment generation makes it easy to create and preview short questionnaires or to quickly obtain assessment results for specific assessable records.
You can set up an assessment description that includes information from multiple fields on an assessable record and is displayed on multiple lines. This setup provides the user who is taking the assessment with a more detailed and understandable description of the information being requested on the assessment questionnaire. Create a multi-line description using table titles, which can be defined to use one or more fields from the selected table. See Define a new smartphone table title for more information.

Create metric types and generate assessable records
Each metric type sets a table and filter conditions that define a set of records to evaluate.

Role required: assessment_admin or admin

For example, the Vendor Performance application provides the Vendor metric type, which defines an assessable record for each source record in the Company [core_company] table that has the Vendor field selected. Create a metric type for each set of records you want to evaluate, such as vendors, users within an organization, or projects.

In addition to defining assessable records, metric types also determine how to filter decision matrix data and set the schedule type, which determines whether assessments are on-demand or scheduled.

1. Navigate to Assessments Metric Definition Types.
2. Click New.
3. Fill in the fields, as appropriate (see table).
4. When you are satisfied with the type settings, click Generate Assessable Records to save the record and create assessable records. The page redirects to the list of assessable records created.

You must click Generate Assessable Records to create the initial set of assessable records based on the table and conditions specified on the type record. After that, the system creates an assessable record each time a new matching record is created. Generate Assessable Records is located under Related Links.

**Note:** Clicking Generate Assessable Records can trigger the deletion of existing assessable records under certain circumstances. For more information, see Enforce a condition to delete an assessable record on page 2301.

**Table 1019: Metric types**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>[Required] Name of the type. It may be practical to give the type a name that indicates which records it defines.</td>
</tr>
<tr>
<td>Assessment duration</td>
<td>Amount of time assessors have to complete their assigned questionnaires, starting from the time the assessment is generated. The assessment duration sets the Due date that appears on assessment instances. Changes made to the duration of an attestation in the GRC Control Test Definition form are updated dynamically in this field. The default duration is 14 days.</td>

</tr>
<tr>
<td><strong>Schedule type</strong></td>
<td>Setting that determines which assessment process to use. Select On demand or Scheduled.</td>
</tr>
<tr>
<td><strong>Scheduled job</strong></td>
<td>[Admin only] Scheduled job the system creates to generate assessments for this metric type. This field is populated the first time you save the record. The scheduled job name follows the format <code>&lt;type name&gt; Assessment Creation</code>. Administrators can configure a recurring assessment generation schedule for the metric type. This field is visible only when the schedule type is Scheduled.</td>
</tr>
</tbody>
</table>
| **Evaluation method** | [Admin only] Indicates the evaluation method for this metric type. The system sets this field based on how the metric type is created. The possible evaluation methods are:  
  • Assessment: Default filter value for metric types. Only this evaluation method uses assessable records, conditions, and stakeholders.  
  • Attestation: For details, see [Attestation](https:// servicenow.com).  
  • Survey: For details, see [Survey definitions](https:// servicenow.com) on page 2495. |
| **Scale factor**    | [Required] Number to represent the best possible score for assessment results. All results for assessments of this type are scaled to this number. 10 is generally a good scale factor. |

**Note:** If you change the schedule type from Scheduled to On demand, the system deletes the scheduled job. If you change the schedule type back to Scheduled, the system creates a new scheduled job. The previous assessment generation schedule is not saved, but can be reconfigured if desired.  

**Note:** This field becomes read-only when it contains a value and you save the metric type. Choose a scale factor that you are satisfied with before you save the metric type.

</tr>
<tr>
<td>Filter condition</td>
<td>Condition builder that defines which records from the table are available as choices on the filter menu. For example, if the filter field is Vendor type and you create the filter condition [Name] [does not contain] [Hardware], only records with vendor types of Applications, Services, and Software are possible choices as decision matrix filters.</td>
</tr>
</tbody>
</table>
Delete a metric type

Deleting a metric type entails deleting many related records.

Role required: assessment_admin or admin

You must delete some of these records manually before deleting the type, while the system deletes others automatically with the type.

1. Delete the records associated with the type to delete:
   - Assessment results (metric and category results)
   - Assessment instance (questions and assessment instances, in that order)
   - Assessment groups

2. Delete the type.
   A confirmation dialog box appears and alerts you that certain records associated with the type will also be deleted.

3. Click OK to delete the type and these related records:
   - Scheduled job for assessment generation
   - Business rule for assessable record generation
   - Assessable records
   - Metric categories
   - Category users
   - Stakeholders
Export an assessment
You can share assessments between ServiceNow instances by exporting an assessment and then importing the assessment on another instance.

Role required: assessment_admin or admin

Note: Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see System update sets.

Note: The system exports a single XML file that does not contain result data.

The XML file contains a metric type [asmt_metric_type] and the following records that are associated with the type:
- Assessable records [asmt_assessable_record]
- Metric categories [asmt_metric_category]
- Metrics [asmt_metric]
- Metric definitions [asmt_metric_definition]
- Category users [asmt_m2m_category_user]
- Stakeholders [asmt_m2m_stakeholder]
- Decision matrixes [asmt_decision_matrix], [asmt_m2m_xcategory_matrix], and [asmt_m2m_ycategory_matrix]

1. Navigate to Assessments Metric Definition Types.
2. Right-click the record and select Export Assessment.
3. Save the XML file.

Import an assessment
Share assessments between ServiceNow instances by importing a previously exported assessment.

Role required: admin

Note: Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see System update sets.

1. Ensure that the target instance has assessments enabled.
2. Follow the procedure detailed in Import a Record as XML Data.

Use update sets for surveys and assessments
Use an update set to capture changes to surveys and assessments.

Role required: admin or survey_admin

When developing surveys and assessments, you can use an update set to capture the changes and move them from a development instance to a production instance. Once an update set is created and marked current, all of the updates to the following tables are recorded in the update set.

The following tables are now update set enabled and also extend the application file:
- Assessment Metric Templates [asmt_template]
- Assessment Template Definitions [asmt_template_definition]
Create an assessment signature

A signature on an assessment questionnaire contains assertions that can communicate directions, a legal statement, or any text that you want the recipient to consider.

Role required: assessment_admin or admin

You can require the recipient to select a check box or provide a full signature to acknowledge acceptance of the assertion before submitting the form. You can display assertions without requiring a signature. An assessment property called Require authentication for user signature allows you to require users to provide their user name and password when an assessment asks for a full name signature.

1. Navigate to Assessments Metric Definition Signatures.

All signatures in the system appear in this list.

2. Click New.

3. Complete and submit the form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name for this signature</td>
</tr>
<tr>
<td>Signature type</td>
<td>Type of signature required. The selections are Checkbox, Full name, or Assertion only. If Assertion only is selected, no signature is required to submit the questionnaire. By default, the system requires user authentication for a full name entry.</td>
</tr>
<tr>
<td>Assertion</td>
<td>Text to present to recipients that requires acknowledgement.</td>
</tr>
</tbody>
</table>

Assessable records

An assessable record links a source record you want to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees.

You use assessments to evaluate the assessable record. The system generates assessable records from the source records that match the table and conditions set on the Assessment Metric Type form. You evaluate the assessable records with metric categories and metrics, which define traits and values to assess. For metric types with the On demand schedule type, you can generate on-demand assessments from the Assessable Record form. This method of assessment generation makes it easy to create and preview short questionnaires or to quickly obtain assessment results for specific assessable records.

You can set up an assessment description that includes information from multiple fields on an assessable record and is displayed on multiple lines. This provides the user who is taking the assessment with a more detailed and understandable description of the information being requested on the assessment questionnaire. Create a multi-line description using table titles, which can be defined to use one or more fields from the selected table. See Define a new smartphone table title for more information.

View an assessable record
View the Assessable Record form to edit preferences and perform various actions.
Role required: assessment_admin or admin
1. Navigate to Assessments Assessable Records.
2. Open a record from the list.
   By default, the list displays only assessable records with Active metric types.
3. On the Assessable Record form, edit fields and perform other actions as necessary (see table).

### Table 1021: Viewing Assessable Records

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>[Read-Only] Assessable record name based on the display value of the source record. The name appears on assessment questionnaires.</td>
</tr>
<tr>
<td>Source</td>
<td>[Read-Only] Source record the assessable record is linked to. The Source reflects the table name and source record display value. For example, if the Name field is the display value for the Company table, the assessable record for a company record named Amazon has the Source value Company: Amazon.</td>
</tr>
<tr>
<td>Live feed</td>
<td>Check box that, when selected, creates a live feed group for the assessable record, which appears on the scorecard. If you clear the check box after a live feed group has been created, the system deletes the live feed group and all its messages.</td>
</tr>
<tr>
<td>Type</td>
<td>[Read-Only] Metric type from which the assessable record was generated.</td>
</tr>
<tr>
<td>Decision matrix</td>
<td>Check box that, when selected, enables this assessable record's results data to appear on decision matrixes of the same metric type. Decision matrixes are graphs that plot the assessment results for multiple assessable records. If you clear the check box, the assessable record still appears on the default decision matrixes if you click the View Matrix related link on the assessable record's scorecard.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Live feed group</td>
<td>[Read-Only] Live feed group for this assessable record. When you select the Live feed check box and save the record, the system populates this field.</td>
</tr>
</tbody>
</table>

### Related Links

- **View Scorecard**: Opens the scorecard for the assessable record.

### Related Lists

<table>
<thead>
<tr>
<th>Category</th>
<th>All metric categories associated with the assessable record. An assessable record must be associated to a category to be evaluated. Click Edit to add or remove category associations. Note that it is often more efficient to associate assessable records to categories using theMetric Category form.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category users</td>
<td>All stakeholders who can take assessment questionnaires about this assessable record. Click Edit to create and delete stakeholders. For more information about this and other methods of creating stakeholders, see Stakeholders. This related list is available only when the associated metric type has the Scheduled schedule type.</td>
</tr>
</tbody>
</table>

---

**Enforce a condition to delete an assessable record**

By default, the system does not delete assessable records, even if you change the table or conditions for the type and the existing assessable records no longer match.

Role required: assessment_admin or admin

The system can be configured so you can trigger the deletion of assessable records that do not match the type table and conditions.

1. **On the Assessment Metric Type form**, select the Enforce condition check box to enable deletion of existing assessable records of this type that do not match the table or conditions specified.

   When the check box is cleared, the system retains existing assessable records of this type, even if they do not match the table and conditions specified.

2. **Click Generate Assessable Records** to delete all assessable records associated with the type that do not match the current table and conditions.

   The system does not automatically delete assessable records, even if the Enforce condition check box is selected. You must click Generate Assessable Records with the check box selected every time you want the system to delete non-matching assessable records.

---

**Delete an assessable record**

When you delete an assessable record, the system deletes any stakeholders for the record.

Role required: assessment_admin or admin
**Note:** If a source record is deleted, the system deletes the associated assessable record. To delete the source record, you must first delete all associated metric results and category results.

Delete the assessable record:
- To delete a single record, open the record and click Delete.
- To delete multiple records, use the Assessable Records list.

**Copy an assessment**

Create a copy of an assessment with at least one category. All associated questions (type), configurations, categories, metrics, domain separation rules, and role-based categories are copied. Assigned users, category users, instances, and trigger conditions are not copied.

Role required: assessment_admin or admin

1. Navigate to Assessments Metric Definition Types.
2. Select an assessment metric type.
3. Click Copy on the title bar or select Copy from the context menu on the title bar.

**Create a metric template**

Create a metric template to define reusable rating scales for evaluating non-scripted metrics.

Role required: assessment_admin or admin

1. Navigate to Assessments Metric Definition Templates.
2. Click New.
3. Fill in the Name field on the Assessment Metric Template form.
4. To use images for template choices, such as for image scale questions, select Allow Image.
5. Click Submit.
6. Under the Assessment Template Definitions related list, click New.
   Create a template definition for each answer option you want to appear on an assessment question.
7. Fill in the following fields:
   - Display: Enter the text to appear as the answer option.
   - Value: Enter a numeric value, equal to or greater than zero, that you want the answer option to equate to. Values are used in results calculations.
   - Selected Image: Click to add the image to use for selected state.
   - Unselected Image: Click to add the image to use for unselected state.

When you view assessment questions that use templates, answer options appear in order from least to greatest Value.

---

**Tip:** To prevent reporting confusion, no two template definitions for a given template should have the same Value.

8. Click Update.

**Metric templates**

Metric templates define reusable rating scales for evaluating non-scripted metrics.

Each answer option on the scale is defined as a template definition, much like a metric definition. For example, the metric template named Satisfaction contains the template definitions: Very Satisfied, Satisfied, Neutral, Dissatisfied, and Very Dissatisfied.
Metric templates are available for metrics that have Template as the Data type. The following metric templates are available by default.

<table>
<thead>
<tr>
<th>Name</th>
<th>Assessment template definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Likert 5</td>
<td>Strongly Disagree, Disagree, Neutral, Agree, Strongly Agree</td>
</tr>
<tr>
<td>Satisfaction</td>
<td>Very Dissatisfied, Dissatisfied, Neutral, Satisfied, Very Satisfied</td>
</tr>
<tr>
<td>Frequency</td>
<td>Never, Seldom, Sometimes, Most of the time, All of the time</td>
</tr>
<tr>
<td>Amount</td>
<td>None, Few or little, Average amount, Many, Quite a lot</td>
</tr>
<tr>
<td>Size</td>
<td>Very Small, Small, Average, Large, Very Large</td>
</tr>
<tr>
<td>Quality</td>
<td>Very Poor, Poor, Average, Good, Very Good</td>
</tr>
<tr>
<td>Complexity</td>
<td>Very Complex, Complex, Moderate, Simple, Very Simple</td>
</tr>
</tbody>
</table>

*Update a metric minimum and maximum value to match a template*

For assessment results to be properly calculated, the Min and Max values of a metric that uses a template must be equal to the smallest and largest template definition Value, respectively.

Role required: assessment_admin or admin

The system sets the Min and Max fields automatically when you create a metric of the Template data type, based on the template definition values. However, the system does not update these fields for existing metrics if you add a new template definition to a template or if you update the Value of an existing template definition. If the new Value is less than the minimum value of any metrics that use the template or greater than the maximum value, update the metrics accordingly.

To edit the minimum and maximum values for a question that has the Template data type:

1. Navigate to Assessments Metric Definition Metrics.
2. Configure the list to show the Min and Max columns.
3. Run the following list filter condition: [Template] [is] [<select the template you updated>]
4. Ensure the Min and Max values match the smallest and largest template definition Value for the selected template, respectively.

   If the values do not match, edit the Min and Max directly from the list.

   **Note:** When the data type is Template, a UI policy prevents the editing of Min and Max from the form.

*Category users and stakeholders*

Users who take assessments are individuals in your organization who have specific knowledge of the assessment categories and the records being assessed. A person who is qualified to answer assessment questions from metrics in a specific category becomes a category user when associated to that category. A category user then becomes a stakeholder when associated to a specific assessable record.
The system determines which assessable records and questions a user receives by looking at the metric categories and assessable records for which those users are stakeholders. Assessment administrators can create and manage category users and stakeholders.

**Note:** Category users and stakeholders are used only for scheduled assessments.

### Category users

Category users are users who can potentially answer assessment questions about a particular metric category for scheduled assessments. Category users should have special knowledge of the categories and the metrics those categories contain. A category user becomes a stakeholder when associated to an assessable record. Create at least one category user for each category you want to use for assessment questionnaires. There is no need for category users if the category contains only scripted metrics.

### Stakeholders

A stakeholder is a category user with specific product or service knowledge, who is associated to an assessable record. A stakeholder is familiar with the assessable record and all the metrics within a specific category. The same category user can be associated to multiple assessable records, in which case the system creates a stakeholder record for each association.

There are multiple ways to create stakeholders:

- Configure the system to create stakeholders automatically.
- Associate multiple category users to multiple assessable records.
- Associate multiple category users to one assessable record.
- Associate one category user to one assessable record.

**Note:** Ensure you establish the desired user and assessable record associations to categories before attempting to creating stakeholders.

### Create a category user

Create category users by associating users in the system to metric categories.

Role required: assessment_admin or admin

When you create category users, choose users who are knowledgeable and can answer questions from that category. For example, a purchasing agent is a good category user for metrics that evaluate a vendor’s discount practices.

1. Navigate to Assessments Metric Definitions Categories.
2. Open a category record.

**Note:** The category must be associated to a metric type that has the Schedule type set to Scheduled.

3. In the Users related list, click Edit.
4. Select the appropriate users for this category.

### Create stakeholders automatically

You can configure the system to create stakeholders automatically from all category users and assessable records associated with a category using the Create stakeholders check box on the Metric Category form.

Role required: assessment_admin or admin
If you associate a user to the category, the system makes the resulting category user a stakeholder for all the assessable records associated to the category. Similarly, if you associate a new assessable record to the category, the system makes all category users stakeholders for that record if they are not already stakeholders.

**Note:** Use the Create stakeholders check box with caution. You can end up with more stakeholders than you want and a large amount of unnecessary assessment data. Automatic stakeholder creation is best suited to assessment implementations in which category users are knowledgeable about all or most of the assessable records associated to each category.

1. Navigate to Assessments Metric Definition Categories.
2. Select a category.
3. Associate category users and assessable records to the category.
4. Select the Create stakeholders check box.
5. Click Update.
   All the category users are associated to all the assessable records as stakeholders.
6. In the Assessable Records related list, click Edit.
7. Using the slushbucket, associate an assessable record to the category.
8. Click Save.
   The system makes all category users stakeholders for the new assessable record.
9. Delete stakeholders as needed.

Associate multiple category users to multiple assessable records
The stakeholder list helper in the create stakeholders module is the most efficient way to associate multiple category users to multiple assessable records in a single interface.

Role required: assessment_admin or admin

You can select category users from one category at a time.

Note: You cannot edit or delete stakeholders using the list helper.

1. Navigate to Assessments Advanced Create Stakeholders.
The stakeholder list helper appears.
2. Select a metric type from the list of available types.

**Note:** Only metric types for scheduled assessments are available. On-demand assessments do not use category users or stakeholders.

3. Select a category from the list of available categories.

**Note:** Only categories within the selected metric type are available.

The system populates the Category User and Assessable Records lists with category users and assessable records associated to the selected category.

4. Select one or more category users from the Category Users list.
5. Select one or more assessable records from the Assessable Records list.
6. Click the Associate arrow between the lists to complete the association.

A message above the list helper advises you that the selected category users are now stakeholders for the selected assessable records.

Delete a stakeholder for multiple assessable records
You can delete stakeholders for multiple assessable records.

Role required: assessment_admin or admin

1. Navigate to Assessments Advanced Assessment Stakeholders.
2. Sort the list by Assessable Record or Category User depending on the perspective you want.
3. Select the check box for each stakeholder you want to delete.
4. Select Delete in the Actions choice list.
5. Click OK to confirm the action.

The system deletes the stakeholders.
**Associate one category user to one assessable record**

You can create a single stakeholder using the list in the Assessment Stakeholders module.

Role required: assessment_admin or admin

Associate any category user to any assessable record.

1. Navigate to Assessments Advanced Assessment Stakeholders.
2. Click New. On the Assessment Stakeholders form, fill in these fields:
   - Category user: Select a category user.
   - Assessable record: Select an assessable record.
3. Click Submit.
   The selected category user becomes a stakeholder for the selected assessable record. To verify the association, navigate to the assessable record and note that the selected category user is on the Category users related list.

**Note:** Do not create stakeholders from category users and assessable records of different metric types.

**Associate multiple category users to one assessable record**

You can create many stakeholders for a single assessable record from the Assessable Record form.

Role required: assessment_admin or admin

You can also edit or delete stakeholders from the form.

1. Navigate to Assessments Assessable Records.
2. Open a record from the list.
3. In the Category users related list, click Edit.
   These category users are the stakeholders for this assessable record.
4. Use the slushbucket to edit the category users associated to this assessable record. Add category users to create stakeholders. Remove category users to delete stakeholders. The system only shows category users for categories associated to the assessable record. For example, if an assessable record is only associated to the Compliance Score and Support Rating categories, you do not see User Satisfaction category users.

Delete a stakeholder for one assessable record
You can delete stakeholders for one assessable record.

Role required: assessment_admin or admin

1. Navigate to Assessments Assessable Records.
2. Open an assessable record.
3. In the Category Users related list, select the check box for each stakeholder you want to delete.
4. Select Delete in the Actions choice list.
5. Click OK to confirm the action.
The system deletes the stakeholders.

Generate an on-demand assessment

Use on-demand assessments to familiarize yourself with the basic assessment process and test your questionnaires using minimal configuration.

Role required: assessment_admin or admin

Select the assessable records to evaluate, create the categories and questions, and then assign an assessment to a user in the system. Pre-configured stakeholders are not used for on-demand assessments.

1. Create a metric type and set the Schedule type to On demand to allow for testing of your assessment configuration.
2. Generate the assessable records for the metric type you created.
3. Create the metric categories required to evaluate the assessable records selected.
4. Create one or more assessment questions, or metrics, for each category.
5. Publish the assessment.
6. Perform an on-demand assessment to test your categories and metrics.
7. Analyze the assessment ratings in an assessment scorecard or decision matrix.

On-demand assessments

On-demand assessments can be generated for metric types with the Schedule type field set to On demand.

For the system to properly generate on-demand assessments, the metric type must be active and published. The metric type must also be associated to at least one metric category. That metric category must be associated to one or more of each of the following items:

- Assessable record
- Metric

By default, an assessment administrator can generate an on-demand assessment for one assessable record or multiple assessable records.

Generate an on-demand assessment for one assessable record

When you generate an on-demand assessment from the Assessable Record form, the resulting assessment contains questions from the categories associated to the assessable record.

Role required: assessment_admin or admin

1. Navigate to Assessments Assessable Records.
2. Open an assessable record associated to a metric type that has the On demand schedule type.
3. On the Assessable Record form, click Assign Assessment.
The Select Assessor dialog box appears.
4. Select a user from the Recent Assessors list or select a different user.
5. Click OK.

The system generates an assessment instance assigned to the selected user.

Generate an on-demand assessment for multiple assessable records
When you generate an on-demand assessment from the Assessment Metric Type form, the resulting assessment contains questions from all categories associated to any assessable records for the metric type.

Role required: assessment_admin or admin

For example, if there are 15 assessable records associated to at least one category with assessment metrics, the assessment contains questions for all 15 assessable records.

1. Navigate to Assessments Metric Definition Types.
2. Open a metric type that has the On demand schedule type.
3. On the Assessment Metric Type form, click Assign Assessment.

The Select Assessor dialog box appears.
4. Select a user from the Recent Assessors list or select a different user.
5. Click OK.

The system generates an assessment instance assigned to the selected user.

Generate an assessment with the on-demand API
The Assign Assessment buttons call an API to generate on-demand assessments.

Role required: assessment_admin or admin

1. To generate an assessment, call the from any script in the system, such as a business rule or client script.
2. Use the sys_ids of these items:
   • An assessable record to evaluate. The assessable record must be associated with an on-demand type and at least one category that contains non-scripted metrics.
   • One or more users who should perform the assessment. The API generates a questionnaire about the specified assessable record for each user.
Schedule an assessment

After you have evaluated your questionnaires using on-demand assessments, edit your categories and metrics as needed, reset your metric type record, and select the users who are qualified to evaluate the assessable records.

Role required: assessment_admin or admin

1. Open the metric type you created for the on-demand assessment and set the Schedule type to Scheduled.
2. Make sure the categories and metrics you created for the on-demand assessment are correct.
3. Create category users who have special knowledge of your categories.
4. Create stakeholders by associating category users to specific assessable records.
5. Set a schedule for automatic assessment generation or generate the assessment manually. This procedure must be done by a system administrator.
6. Configure email notifications to remind users of their assigned assessments and to report to managers when an employee misses an assessment deadline.
7. Analyze the assessment ratings in an assessment scorecard or decision matrix.

Schedule types
You can schedule assessments for preconfigured users or send them to any user on demand.

On-demand assessments require less setup. Scheduled assessments define users, or stakeholders, who have specific knowledge of the records being evaluated, and automatically send out assessment questionnaires to those users at scheduled intervals. The best practice is to configure an on-demand assessment first to familiarize yourself with the process and test your questionnaires. When you are satisfied with your categories and questions, reconfigure for a scheduled assessment. These configuration paths are the easiest for both assessment types. Refer to Key Terms for definitions of the terms used in these procedures.

Set an assessment generation schedule
You can set assessment generation schedules. You must set a schedule for each metric type individually.

Role required: assessment_admin or admin

1. Navigate to Assessments Metric Definition Types.
2. Open the appropriate metric type record.
3. Click the reference icon next to the Scheduled job field to open the Schedule Item record.
4. Locate the Trigger type field and set a recurring schedule for the scheduled job.

   For example, if you want to generate assessment components each month, select the Interval or Repeat trigger type and specify a Repeat value of 30 days. Alternatively, select Day in Month and specify a Run time and Run day of month.

   The optimal frequency of assessment generation is subjective. When you set the schedule, keep in mind the number of records to evaluate, how often your organization requires updated assessment results, the time and effort required of users to complete assessments, and other relevant factors.

Publish a metric type
Before it is possible to generate assessments, an assessment administrator must publish the associated metric type.

Role required: assessment_admin or admin

The State field on the Assessment Metric Type form indicates whether the type is published. The default state is Draft, which disables the system from generating assessments.

1. Navigate to Assessments Metric Definition Types.
2. Open a metric type record, and click Publish. 
   The Publish button is available only if the state is Draft and there is at least one metric associated with 
   the type. 

   **Note:** A metric type cannot be moved back to the Draft state after it has been published. 

**Scheduled assessments**

The system generates a unique scheduled job for each metric type with the Schedule type field set to 
Scheduled. Each scheduled job generates assessment components for the related metric type. By default, 
the scheduled job runs when an administrator executes it manually, but administrators can set a schedule 
to generate assessments automatically on a recurring basis. 

For the system to properly generate scheduled assessments, the metric type must be active and 
*published*. The metric type must also be associated to at least one metric category. That metric category 
must be associated to one or more of each of the following items: 

- **Assessable record** 
- **Stakeholder** associated to one of the assessable records 
- **Metric**

**Generate a scheduled assessment manually**

Administrators can generate scheduled assessments manually. 

Role required: assessment_admin or admin 

Use this option, for example, if you have set a schedule but want to generate assessments before the next 
scheduled run date. 

1. Navigate to Assessments Metric Definition Types. 
2. Open the appropriate metric type record. 
3. Click Generate Assessments to trigger the scheduled job immediately. 

   **Note:** Be careful to click Generate Assessments, not Generate Assessable Records. 

**Generate a vendor type assessment manually**

The Vendor Performance feature provides a direct method of generating assessments for the Vendor 
metric type. 

Role required: admin 

1. Navigate to Vendor Performance Admin Generate Assessments. 
2. Click Generate Assessments to execute the scheduled job for the Vendor type. 

**Clean up assessment data**

The assessment process generates a considerable amount of data, some of which is not useful after a 
short time. 

Role required: assessment_admin or admin 

The assessment process generates a considerable amount of data, some of which is not useful after a 
short time. Assessments include a scheduled job called Remove Old Assessment Data that is available to
